The recent Paris issue was for £11 million, in French francs, for the European Coal and Steel Community, which had previously been to America to raise money. Admittedly a large part of the capital will be spent in France but part of it will be available for E.C.S.C. operations abroad. Germany's role this year has been quite impressive. In the first six months it amounted to just over £70 million, if one includes loans announced but still to come to the market. Up till the end of last year all Germany would handle was the occasional issue for the Common Market or a Japanese municipality. By comparison, this year's Deutschemark issues have included one for Finland and another for the Inter-American Development Bank. The other European countries have also been making efforts to raise domestic finance in their own markets which they would earlier have sought abroad.

A criticism of many of the flotations in Europe is that they have been in currencies other than local money. There has been a great dependence on the Euro-dollar market, especially so in London. Before Europe's markets can be expected to take a larger share of the world capital issues some technical obstacles will have to be ironed out and old-fashioned ideas, particularly prevalent on the continent, will have to be overcome. Most important of all, though, the gap between interest rates in the old and the New World will have to be reduced. So long as rates are lower in America than Europe there will be no incentive for borrowers to raise money in the latter. This is sometimes seen as an argument for raising American rates, since the European ones are universally higher. But it is thought that the real movement should be the other way round in order to get satisfactory operations in the world's capital markets.

Trade Problems for the Six

A 16 per cent rise in imports from third countries in the first quarter of this year, compared with the same quarter of 1963, has created serious problems for the Common Market Commission. The Common Market's trade deficit reached over £350 million in the three months, for which Italy was responsible for more than half. The import surplus was widely based, only Germany having a export surplus (nearly £65 million). Although Italy's was the most serious position, imports from third countries actually rose fastest in France (23 per cent, compared with Italy's 21 per cent). Benelux imports from outside the Market rose by 17 per cent and Germany's 7 per cent. The problems of maintaining a trade balance have been made more difficult by the extent to which imports have outstripped exports. Aggregate exports rose by 15 per cent, with the Benelux countries doing the best.

In the quarter intra-Community trade rose by 24 per cent on the corresponding quarter of 1963 to £1,570 million. If allowance is made for the severe winter of 1963 the real increase was in fact rather slower—19 per cent. Total imports from all sources reached £2,407 million. Achieving equilibrium is all the more difficult because of the built-in tendency for exports to increase in Germany and for imports (stimulated by internal inflations) to rise in Italy and France. The former is almost as much of a problem for the Commission as the latter. The only relative stability is offered by the Benelux countries, but this is not a great deal of consolation to the Commission since these countries are the market's minor traders.

Rumania Stands Firm on Comecon

Rumania appears to have taken a further step towards winning independence from Russia in the control of her own economic affairs. In a recent meeting between the premier, Mr. Ion Maurer, and Mr. Khrushchev in Moscow the Rumanian is believed to have made it clear to Mr. Khrushchev that his country intended to maintain its economic contacts with the United States, China and Western Europe. Nub of the contention between the two countries has been the Russian insistence that Rumania should play a full part in Comecon, the Eastern European common market. This would have meant Rumania had to concentrate on certain lines and give others up in favour of the rest of the bloc.

The Rumanians, anxious to plan their own economy without outside interference but within the Soviet orbit, were unwilling to go all the way with the Russians. In particular, they are believed to have objected strongly to the bad quality of consumer goods and raw materials supplied by the rest of the bloc. Here, also, is thought to lie one of the causes of the split. If Rumania joined Comecon she would have to accept the growth rate laid down. But Rumania is thought to want to concentrate more on consumer goods and to break free from the rigid Soviet attitude to non-capital-goods consumption. Consequently, Mr. Maurer has argued with the Russians that dealings between Comecon countries and the West should be carried out directly, and not through Comecon. He has also pressed for the right to make trade agreements with the West wherever the individual economy needs it. Both these views are thought to have been received favourably by Mr. Khrushchev.

Japan's Aid Programme Criticised

Japan is being increasingly criticised for her policy on aid to developing countries. Although claiming to be one of the biggest donors of aid, she is accused of inflating her total by adding extraneous factors. Although official aid was £67 million last year this included reparations. Strictly speaking, it is claimed, this item is not aid at all. Some economists also feel that the countries Japan classifies as those being aided, particularly some of the Latin American ones, are not really developing nations. Total aid, official and private, in 1962 (the last year for which full figures are available) was just over £100 million, representing 0.65 per cent of national income. This was well below the previous year's £133 million (0.97 per cent).

Japan is also criticised for tying aid closely to her own exports and concentrating aid on those areas, especially South-East Asia, where she will stand to benefit most when the recipient nations manage to stand on their own feet. She has, for instance, practically pulled out of Africa. Of her total aid, 69 per cent went to Asia and the bulk of the rest to Latin America (where there is a considerable Japanese population).

Japan, it is felt, is still using her aid programme as a means of gaining advanced-nation status, rather than considering it an obligation arising out of that status. But how to integrate Japanese aid programmes with those of other donor nations is not easy to solve, in spite of her entry into the Organisation for Economic Co-operation and Development, since Japan seems unwilling to increase contributions to organisations, such as the World Bank, which work on a multilateral principle.

Progress Report on Norway

Foreign demand for Norwegian goods is contributing materially to the upswing in the country's economy. Not even a new wage settlement, inevitably forcing some prices up, is thought likely to hinder this growth. There is, however, felt to be a danger that the continuing boom and the wage rise taken together will endanger the balance of payments by leading to a rise in imports. In particular, it is thought that stockpiling may rise in the future.

Production in mining, manufacturing and power increased rapidly in the first four months of this year. In the first two months it rose by 5 per cent; by April it had risen 11 per cent, compared with the same period of 1963. Export production went up even more rapidly in the four months, and at the end of April was 13.2 per cent above the previous year. By comparison, consumer-goods production was up by 4.8 per cent and investment goods by 7.3 per cent.

Labour: One of the dangers facing expansion is a shortage of labour. At the end of May there were some 8,000 unemployed, a drop of 500 compared with the end of May 1963. But over the year total employment rose by some 13,300. There is a very real fear that demand for labour will outstrip the available supply and force wage rates up even further.

Prices: Some picture of the extent to which prices are moving up can be seen from the fact that while the value of retail trade turnover rose in March-April by over 9 per cent compared with the same months in 1963, the volume rose by only 5.5 per cent.

Topical Briefs

A target for Britain's next national growth plan, expected in the autumn, will probably be delayed because of the impending general election. The next meeting of the National Economic Development Council is to be held on 7th October but it is extremely unlikely that a target will be announced then because of the imminence of the election (favourite forecast date: 15th October). To announce a plan and then possibly have it altered within a week or two following the assumption of power by another Government would not be in the best interest of N.E.D.C. Some dissention surrounds the present 4 per cent growth rate. It is felt by some that this should be higher for the second period, between 1966 and 1970. Other economists believe that it would stretch resources too much to try for a rate higher than 4 per cent, particularly in the vital building industry. A shortage of labour, estimated to rise by about one per cent a year, will not make it any easier to hit a rate higher than four per cent.

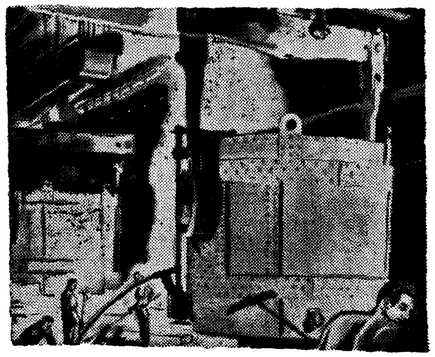
Renewed support for a European Miners' Code has been expressed by the President of the High Authority of the European Coal and Steel Community. The idea of a code was first mooted at Aix-en-Chapelle in 1956 and was supported by the High Authority as a means of easing the difficult problem of recruiting miners. The Authority was bound, according to the president, by the Treaty of Paris and consequently could not support matters relating to wages and social-security systems in the code. But he felt that there were other aspects where there was a good chance of successful implementation —guaranteeing a real career to the miner, a bonus on appointment, a regular bonus for satisfactory work, an improvement in accident and sickness benefits. In these fields it was suggested that the Authority and the miners could work towards a common goal. Such measures would need finance, the President said, and this should be found by the Community itself, the Governments and the producers.

The French steel industry has staged a recovery during the first half of this year after three years of stagnation. Production is up by 12 per cent and orders by a quarter. But there are still two bear points: the slow but regular decline of France's net trade balance in steel continues; and the level of financial debt has mounted to 70 per cent of its yearly turnover compared with a planned 45 per cent. A call has been made for lower coke prices, Government measures to bring down loan costs and a fundamental review of corporation and personal income taxes.

Deliveries of refrigerators to the home market in Britain were 13.2 per cent up in May over the previous May and reached 116,534. And deliveries in the first five months of the year, at 410,694, were 16.9 per cent up. But there was a fall in the number of exports in May for the first time this year (down 19.6 per cent). However, total exports for the first five months were 67,744, an increase of 10 per cent.

A steady increase of bicycle production in West Germany is reported by the Institute for German industry. In the first four months of the year production rose by 29,000 to 323,000. On top of this figure, another 210,500 frames were manufactured, an increase of nearly 44,000. All types of lighter motorised two-wheelers, principally mopeds and motor cycles, also increased in production.

DEVELOPMENTS IN THE EAST



With the improving living standards in the East comes the prospect of trade expansion and of increasing opportunities for profitable marketing. The world-wide facilities of three great banking organizations, merged into a single comprehensive service, are at your disposal with up-to-date information and expert advice on all aspects of finance and trade in these areas.

DEVELOPMENT WITH STABILITY

A REVIEW OF INDIA'S FISCAL AND MONETARY POLICIES

THE story of India's strategy for economic growth and of the fiscal and monetary techniques in the context of our development plans has never been fully told. It is true that the voluminous Plan documents and evaluation or progress reports contain elaborate data (largely imperfect and incomplete) and arguments (often platitudes, but more often misleading). It is also true that a lot more is written on the problems and policies of Plans by academic theoreticians, officials who regard it their duty to defend every aspect of policy formulation and implementation, and the economic commentators who are concerned more with evaluation than with implementation. Special mention must be made of that little gem of a publication by the Ministry of Finance, *India: Pocket of Economic Information*, and of the various *Annual Reports* of the Reserve Bank of India, which contain detailed and authentic record of the objectives and techniques of specific policy measures. But the published materials are clearly inadequate in telling the entire story, for all that they do is to describe or, at the best to analyse the problems and statistics.

Viewed thus, Mr. S. L. N. Simha's recent book *Development with Stability—The Indian Experiment* (Vora & Co. Publishers Pvt. Ltd., Bombay-2. Pp 131 + xii. Price $2.50) is, indeed, unique in many respects. It is unique not merely because it tells the story of India's development effort nor because it is primarily concerned with the financial aspects of development about which very little has been written, but more than that. Mr. Simha's effort is basically an *interpretation*, even when it attempts to be an objective account on a sympathetic analysis. Intimate knowledge of and association with formation and implementation of fiscal and monetary policies, which could have proved to be a handicap in any other case, have given the author a new perspective, particularly since he also had the advantage of viewing the problems and policies of the country from a distant and a more comprehensive point of view of a world monetary organisation.

Two Aspects of Inflation

In his evaluation of the Indian experiment during the past thirteen years (1951-63), Mr. Simha considers the problems of accelerating the growth rate and the compatibility of rapid growth with stability. In other words, he distinguishes between two aspects of inflation: one, inflation as a *byproduct* of growth with its consequences on wholesale and consumer prices and balance of payments, and the other, inflation as an *instrument* of growth, both to mobilise savings and to stimulate investment. There is considerable diversity of opinion and experience on these two aspects of inflation in different countries and at different times even in the same country. In the immediate post-war years, for example, there was widespread and enthusiastic support for the view that inflation could be used as an instrument of growth. But experience over the years have diminished this enthusiasm a great deal. This has been largely the result of the failures to take appropriate action for altering the structure of the economy as well as of the limitations inherent in the social, political and economic environment of the country.

In the ultimate analysis, the entire problem resolves itself into a basic proposition—whether rapid growth is compatible with stability. There is the brave, albeit inconclusive, view that high rates of growth can *only* be achieved in an environment of stability. Experience, however, shows that deliberate inflation is not only an essential preliminary but also inevitable consequence of the periods of high growth. May be, the conflicting evidence and views are the result of insufficient or inadequate data, besides the scattered and limited range and depth of our experience of developmental processes and problems. And may be, a lot more unbiased empirical research work in this field is called for than has been done so far. But an intimate and real understanding of the complex relationship between growth and stability and of the role of fiscal and monetary policies can no longer be postponed, particularly as upsurge in inflationary pressures and exhaustion of foreign exchange resources and sources of aid mark the passage of the third Five-year Plan into the fourth. Mr. Simha's book has appeared at the most appropriate time, for 1964 may well be a turning point in India's plans for economic development any may determine whether we succeed or succumb. In the rethinking on fundamentals that is now being done all round here, it may be well to remember the conditions for achieving success on the basis of our experience of the past thirteen years.

The general conclusion drawn by Mr. Simha that inflationary financing could be helpful to growth, *provided* it is used on a modest scale only and with some *regulatory* apparatus, is extremely relevant to our present experience which perhaps tends to show that planners may have forgotten all the simple truths with which they started. What is a *modest* degree of inflation may be a matter of judgment and, although Mr. Simha may be justified in regarding a 30 per cent rise in wholesale prices during the second Plan period as a "very moderate" rise as compared with the performance of the underdeveloped countries generally, even he is sharp in commenting that the Indian authorities were *quite* concerned about this and, consequently, in framing the third Plan estimates, care was taken to provide for budgetary deficits of an order no more than sufficient to facilitate an expansion of money supply equivalent to the estimated increase in national income. In the face of and in spite of all this, it is a tragic commentary on our planning and achievements that prices have been rising at an annual rate of about 7 per cent since the beginning of the third Plan (the rate being almost 10 per cent per annum during the third year of the third Plan) and that both budgetary deficits and money supply (as well as population) have been increasing much faster (or at least as fast as) than national income.

Persistent or Intermittent?

An aspect of the rising prices is to see whether the rise is persistent or intermittent. Mr. Simha has rightly pointed out that a persistent rise in prices, even if small, could have rather serious repercussions and grave effects. An intermittent rise is, perhaps, preferable, even if it means a "stop-and-go" policy, for, this way, it may be possible to render inflation "self-liquidating." While it was possible to moderate the rise in prices during the first two Plans by alternating periods of a stiff dose of deficit financing and of credit squeeze and monetary discipline, the third Plan period has so far witnessed an almost continuously rising prices largely on account of inflationary pressures resulting from Government deficits, though the contribution of physical shortages and failure of Government policies—both economic and fiscal—cannot be entirely ruled out. The social, economic and political dangers of a persistently upward trend of prices are only too apparent today to need any recounting.

The planners and the policy makers will, therefore, do well to realise, as Mr. Simha has done, that inflation (or inflationary financing) could make a modest, but only a modest, contribution to the development process, for it cannot bring about any marked and sustained increase in the rate of savings. Moreover, an adequate, competent and efficient administrative and organisational framework is essential to counter inflationary side-effects of deficit financing. India has already a comprehensive framework of extensive economic controls, but it has largely obstructed the smooth and proper functioning of the economy; it has actually added to a mis-direction or mis-allocation of resources, rather than positively channelling investment in a continuous flow into desired directions. The tax system has been streamlined more than once, with the ostensible object of encouraging savings and investments for mobilising resources. In terms of sheer effort and structure of taxation, India's tax effort during the third Plan so far could hardly be matched even by developed countries. Whether an income is earned or unearned, whether it is saved, spent or invested, whether any property is gifted away or inherited, whether profits are distributed or ploughed back, and whether any goods are produced or sold, substantial tax is payable at every point. The worst part of the tax system is that it has not merely failed to generate incentives for savings and investment but also created incentives for evasion and avoidance of taxation, besides a parallel money and capital market which is beyond all control and regulation.

The first Plan was on the whole a modest effort, essentially of a preparatory character, its objectives being related mostly to immediate requirements and possibilities. Yet the accent and emphasis was on growth with stability. Most of the troubles with which the third Plan has now been saddled arise from the failure to implement faithfully what was apparent even before the era of planning began in our country. Both the first Plan documents and the technical mission from the International Monetary Fund, headed by the then Director of Research, Dr. E. M. Bernstein, had hoisted the red signals when they recognised that, in the development process, money incomes were likely to rise more rapidly than production and that the consequent rise in consumer expenditure was bound to affect prices. Although the stability of prices cannot be an end in itself and some increase may, in fact, be necessary and even desirable for the smooth functioning of a developing economy, it is important to realise that the scope for deficit financing is intimately bound up with the policy for supply and distribution of foodgrains, cloth, *gur*, sugar and oil, in order to meet the essential minimum requirements of a growing population. In this sense, therefore, it is not finance as such that limits the scale of investment effort but rather the limitations of policy and administration regarding the supply and distribution of essential commodities.

The most important contribution of Mr. Simha's book is that it traces the evolution of monetary policy during the thirteen years of planning. The Indian authorities have taken the view that monetary policy, despite its many limitations, particularly in developing countries like India where comprehensive development plans have been undertaken with Government initiative and direction, can play a useful role in the task of accomplishing growth with stability. Monetary policy has to be expansionist, but this expansion must be controlled. While the need for expansion of credit and money supply commensurate with the rapid development and diversification is fully recognised, the excessive expansion of money supply would be inflationary and it would ultimately jeopardise the financial stability and the development process itself. In the face of this considerable inflationary potential, the direction of credit policy should be one of general restraint without jeopardising the functioning and progress of essential productive sectors of the economy.

Bank Rate

Against this background, we find that, in the very first year of the first Plan—in November 1951, to be precise—Bank rate was raised for the first time in sixteen years since the inception of the Reserve Bank. The rise marked the formal abandonment of the cheap money policy of the war years, although, in fact, if not in form, it had already been given up in 1946, when the rate of interest on the non-terminable Government loan was raised by offering conversion facilities. During the second Plan period, there was a definite levering up

EMPLOYEES' STATE INSURANCE SCHEME

NEED FOR AN INTEGRATED SOCIAL SECURITY SET-UP

THE Employees' State Insurance Scheme has been in force since 1952 as one of the principal social security measures in the country. The scheme operated under the Employees' State Insurance Act 1948 has provided compulsory insurance for factory workers against the risks of sickness, maternity and employment injury. At present the scheme covers over 2.7 million workers in 200 centres throughout the country. Under the scheme, medical care is being provided not only to the workers but also, in most centres, to members of their families; as many as 9.7 million men, women and children are so benefited. The E.S.I. scheme affords five benefits (referred to as *Panch Deep* or five lights)—four in cash (against sickness, disablement, maternity and death) and the fifth, medical care, in kind. Cash benefits under the scheme are disbursed directly by the Employees' State Insurance Corporation through about 340 local and pay offices. The administration of medical benefit is the statutory responsibility of State Governments, E.S.I.C. paying seven-eighths of the cost, where families are also given medical care, and three-fourths of the cost, where such facilities are provided only to insured persons.

The Corporation derives its resources from contributions from employers and employees. Employers pay 2½ per cent of the wage-roll in areas where the scheme is implemented and ¾ per cent in other areas; employees pay varying amounts according to their wage-group, the average incidence being a little less than 2½ per cent of wages. The budget for 1964-65 envisages a revenue of Rs. 17.2 crores. The main expenditure relates to cash benefits and payments to State Governments as E.S.I.C.'s share of medical care. During 1963-64, the Corporation spent about Rs. 5.4 crores on cash benefits and about Rs. 6.5 crores on medical care. During 1964-65 the figures are expected to rise to Rs. 6.2 crores and Rs. 7.0 crores respectively.

Common Complaints

The third Plan has proposed to extend the scheme to all centres with an insurable population of 500 and above, and also to cover the families of the insured workers. The E.S.I.C., which administers the scheme, has estimated the total number of medical beneficiaries, including family members, to rise from its present 8.25 million to 10 million by 1966. However, all this planned progress has failed to cover all the workers and the complaints of red-tapism, high costs and non-welfare attitude of the enforcing agency have not been uncommon.

Hence, with a view to ensuring a more satisfactory functioning of the E.S.I. scheme, the twentieth session of the Standing Labour Committee in 1962 had recommended the setting up of a Tripartite Committee to review its working. Accordingly, a Review Committee under Mr. C. R. Pattabhi Raman, the then Union Deputy Minister for Labour, Employment and Planning, was appointed in June 1963, consisting of three representatives each of State Governments, employers and workers. The Review Committee has prepared and sent out a very comprehensive and detailed questionnaire of 111 questions covering all aspects of the working of the Employees' State Insurance Act and scheme. The Engineering Association of India, in its replies to the above questionnaire of the E.S.I.'s Review Committee, has urged the need for the immediate integration of the various social security programmes like the Employees' Provident Fund Scheme, Employees' State Insurance Scheme, the Workmen's Compensation Scheme, etc. into a single agency or organisation as recommended earlier by the Study Group on Social Security. Such a co-ordination of the different agencies, in the opinion of the Association, would not only yield better benefits, but also reduce the cost of providing security.

Contribution

The Association has further suggested that a contribution at a rate of 2½ per cent of the wage bill to the E.S.I. Fund would be simple and straightforward. The above proposal, doing away with the present cumbersome system of dividing employees in a dozen wage groups, would bring in more revenue with every rise in wages. With the State mainly interested in the health and welfare of the insured persons and social insurance being a compulsory scheme, the Association has recommended that the contribution from employers, employees and the Government should be equal, that is, at the rate of one-third each. Another important suggestion of the Association relates to the elimination of conflict regarding the term "employee." It has requested that the term "employee" ought to be defined in conformity with the provisions of the Employees' Provident Fund Act. The Association also agrees with the proposal for enhancing the wage limit for coverage of the insured person from Rs. 400 to Rs. 500.

Referring to the lacunæ in the procedure for payment of cash benefits, which result in insured persons receiving wages from the employers and cash benefits from the E.S.I. Corporation, the Association has felt that the drawing of double benefit for the same period should be legally prohibited. Further, the organisational set-up and administrative machinery of the Corporation should be so remodelled as to provide quick payment of cash benefits and facilities to the insured persons, even if it involves some extra expenditure. Similarly, in cases where the insured person is reported to be engaged in any other occupation, while absenting from his work-place on grounds of illness, the Association has pointed out that the real remedy should be to prosecute the panel doctor concerned, and declare the illness certificate as null and void. The employer should also be at liberty to take disciplinary action against the insured person concerned in accordance with the provisions of the Standing Orders. On the question of protection of an insured person against discharge, dismissal or any other punishment during the period of medical treatment, the Association has suggested that protection may be granted provided the person applies well in advance and complies with the requirements of the Standing Orders. As an incentive for regular attendence, the Association has recommended a "good health bonus" to the insured persons who do not claim benefit for a period of one year and also do not avail of medical facilities, and the quantum of such bonus should be 25 per cent of his own contribution.

Inadequate Facilities

As the present hospitalisation and other medical facilities available to the insured persons are not adequate, the Association has stressed the neeed for increasing the number of hospitals and beds and other medical benefits at an early date. In fact, it has felt that the service system for medical treatment throughout the country would be more beneficial. The Association has further pointed out that there should be a provision for a periodical check up, preferably once a year, on a national basis. A National Health Scheme covering the entire population should be really ideal. In addition, the medical benefits admissible under the National Health Scheme should be administered under the overall control of the E.S.I. Corporation. Laying emphasis on the quality of medicines which can be prescribed under the scheme, the Association has felt that there is no need for a specialists' list and the specialists should be free to prescribe whatever medicines they consider necessary for the speedy recovery of the worker.

Suggestions

In conclusion, the Association has made certain constructive suggestions for the E.S.I.S. Review Committee to consider. Firstly, it has pointed out that the rising capital expenditure should be met by raising loans and should be spread over a number of years. The reserves, instead of being frittered away, should be utilised for extending the benefits to the insured persons. Secondly, an all-out attempt should be made to broad-base the benefits under the E.S.I. scheme. Thirdly, the procedure for deduction and deposit of contributions and disbursement of cash benefits should be so simplified as to ensure efficient and quick service to the insured persons. This could be achieved by simplifying the administration of the scheme by delegation of financial and administrative powers to the regional boards and directors. Lastly, the Association has felt that, if integration is likely to be delayed, the meagre benefit of the scheme needs to be augmented substantially.

It is to be hoped that the E.S.I.S. Review Committee will bear in mind all these factors while framing its report, and recommend an integrated social security scheme that would go some way towards the introduction of universal coverage as in the United Kingdom and New Zealand.

RUBY GENERAL INSURANCE CO., LTD.

The Ruby General Insurance Company Ltd. (Chairman: Mr. B. M. Birla, Calcutta) ever since its inception in 1936, more particularly in the past few years, has been making commendable progress in the general insurance field where it ranks next only to New India Assurance and Oriental Fire so far as net premium income is concerned. During the 13-year period from 1950 to 1962, the net premium income of the Company nearly trebled from Rs. 66.36 lakhs to Rs. 185.12 lakhs and capital funds were marked up from Rs. 79.50 lakhs to Rs. 167.75 lakhs. It is heartening to note that this progress is still continuing and that the Company has gained further ground during the year ended 31st December 1963, despite some difficulties. Net premium income has advanced from Rs. 185.12 lakhs to Rs. 189.86 lakhs and the capital funds have expanded to Rs. 181.05 lakhs from Rs. 167.75 lakhs. But the net profit has actually declined, though modestly, from Rs. 30.36 lakhs to Rs. 28.56 lakhs, the reasons for which will be explained later. The provision for taxation has naturally gone down from Rs. 17 lakhs to Rs. 14.50 lakhs, so that the amount available for distribution to shareholders and amongst the various reserves remains more or less the same. The dividend has been maintained at 15.5 per cent (subject to deduction of tax), claiming Rs. 5 lakhs as before, but the Directors have decided to take steps to utilise a sum of Rs. 6.40 lakhs out of the share premium account to issue fully paid bonus shares of Rs. 8 each in the proportion of one share for every five shares held.

The follwoing table presents a clear picture of the progress made by the Company during the past four years:

(In lakhs of rupees)

	For the year ended 31st December			
	1963	1962	1961	1960
Fire:				
Net premiums	83.86	78.21	71.99	70.51
Claims	33.74	32.78	31.46	29.15
Commission and expenses	28.53	25.79	21.23	28.19
Underwriting profit or loss	+18.40	+16.43	+16.13	+4.99
Fire fund	41.68	39.11	36.00	34.20
Marine:				
Net premiums	17.97	13.84	15.79	14.76
Claims	13.08	9.99	13.98	12.99
Commission and expenses	4.31	4.46	3.33	3.55
Underwriting profit or loss	—3.99	+1.31	—7.41	+3.91
Marine fund	17.97	13.84	15.79	10.33
Miscellaneous:				
Net premiums	88.53	93.07	94.037	87.38
Claims	55.10	55.45	58.22	46.18
Commission and expenses	31.07	33.69	32.54	32.04
Underwriting profit or loss	+4.48	+4.17	—0.39	—7.25
Miscellaneous fund	44.26	40.54	47.01	43.69
Net profit	28.56	30.36	12.75	4.17
Provision for taxation	14.70	17.00	4.60	2.69
Dividend	5.00 (15.5%)	5.00 (15.5%)	4.20 (10% +B. 8.1½)	3.20 (10%)
Carry forward	0.36	0.14	4.96	1.00

It will be observed that, with the exception of the Miscellaneous department, the other two departmeents showed a commendable improvement in their net premium earnings during the year under review. The decline in the net premium income of the Miscellaneous department was due mainly to the reduction in overseas business which had not been profitable. To set matters right, the Company followed a policy of planned reduction of this class of business in overseas territories. It is pertinent to note that, despite a reduction in premium income, the underwriting profit has actually risen from Rs. 4.17 lakhs to Rs. 4.48 lakhs.

After earning a small underwriting profit of Rs. 1.31 lakhs during 1962, the Marine department again went into red in 1963 by suffering a loss of Rs. 3.99 lakhs. Although this was apparently due to the increase in the marine fund from Rs. 13.84 lakhs to Rs. 17.97 lakhs, the main reason was the keen competition and rate-undercutting among insurers both in India and abroad. The fire department again showed a profit, but this was earned at a much reduced rate, the reason being the reduction in premium rates effective from 1st July 1962.

So far as the current year is concerned, the most important event in the Indian insurance industry is the entry, with effect from 1st April 1964, of the Life Insurance Corporation in the general insurance field. It is good that the L.I.C. has decided to follow the tariff rates for the present, though the Corporation has been registered as a non-tariff insurer. The Tariff Committee as well as various individual offices are reported to have extended their fullest support to the Corporation which in return has entered into certain insurance arrangements with the existing offices with a view to retaining as much premium in India as possible. The voluntary code of conduct in the general insurance industry has proved very useful in improving the tone of the industry. It is, therefore, to be hoped that L.I.C. and the general insurers in the private sector will extend full co-operation to each other and work to the benefit of the industry and the insuring public.

TEXTILE INDUSTRY IN DEVELOPING COUNTRIES

NEED TO AVOID OVER-CAPACITY STRESSED

By J. B. M. Evans

IN judging the usefulness of setting up a textile industry in primary producing or underdeveloped countries, a broad view of the particular nation and its well-being must be incorporated with an even broader view of world trade, its priorities and its freer development. That the world should not suffer from over-capacity, over-production and unrealistic pricing is plain However, at the same time, it is also clear that an unnatural situation is created when a cotton producing country has to rely completely, or in the main, on imports of textile goods. This latter situation was widespread until fairly recently when post-war shortages, awakening nationalism in underdeveloped parts and the spread of economic knowledge, all helped to encourage the foundation of domestic textile sectors. International schemes and organisations of every kind have done much to foster viable cotton textile industries.

Some idea of the rapidity of expansion may be gained from the rise in machinery capacity, both loom and spindle production and raw material consumption in numerous nations with newly established cotton industries. The rapidity of expansion may easily become a mixed blessing, if planning is inadequate or over-optimistic, based on inexact views of the size of domestic consumption or the growth rate of *per capita* textile offtake. The time has now come, too, when Western nations are taking a larger volume of exports of textile goods and it would be wrong to include a too optimistic view of export potential in this area, although it is likely that some increase in Western offtake will have to occur and is indeed partly secured under the G.A.T.T. Long-Term Arrangement on cotton textiles of 1962. Growth in capacity based on incorrect forecasts is as bad as, if not worse than, no growth at all, for it leads to chronic wastage of all resources and general disruption in textile trade through the existence of unrealistic pricing.

Waste of Capital

Perhaps foremost in the category of resource wastage is the wastage of capital and foreign exchange. Throughout the underdeveloped areas of the world, a shortage of capital and foreign exchange remains one of the most pressing economic problems and indigenous textile industries are only set up at the sacrifice of considerable sums of capital and exchange. The cost of developing a cotton textile industry is immense and the installation of too much machinery only serves to waste much needed monetary resources, besides reducing the efficiency of that machinery which is used, hence increasing the costs of production. Much capital used in this wasteful manner might be much more usefully employed in a range of other industries with the resultantly greater economic safety which comes from national industrial diversification.

Of course, other wastage occurs, including that of management skill, which is often at a premium in a developing nation. Indeed, one of the obstacles to be overcome in the formation of a textile industry is a disheartening lack of management and technical skill, qualities which are only obtained through thorough training of likely candidates. The process is complicated, lengthy and costly and wastage in the sphere is to be deplored. Land, buildings and public services are wasted also in a state of over-capacity as well as manual labour, though this last may seem a boon in the short-term for nations with a surplus of labour.

An increasing trend throughout world textile consumption is that towards increasing usage of man-made fibres. This is a potential danger to those developing countries which rely totally on home-grown cotton to feed their newly erected mills. The trend to a certain percentage of fibre consumption falling to man-made fibres will doubtless steadily spread to the developing countries, as their living standards improve and tastes become more sophisticated. The danger is evident that undue imports of these artificial and synthetic fibres will nullify the foreign exchange benefits accruing from the foundation of a viable domestic textile industry. As far as possible, developing nations must endeavour to combat the threat by entering into agreements with patentees to produce some man-made fibres themselves for use in the domestic market. Some nations have already followed this principle and a few have even used exports of man-made fibres, yarns and cloth to avoid existing textile trade regulations on cotton manufactures. This would appear to be a rather short-sighted policy and likely only to engender opposition to the legitimate claims of developing countries, even cotton producers, to develop their domestic textile industries. There are, however, certain limitations to the expansion of man-made fibre production and consumption, particularly in countries which are mainly agricultural producers in warmer climates.

As in the case of the typical botanical example of the bean seed, certain basic growth conditions are needed for the development of a cotton textile industry. With the bean seed, heat, light and moisture are required; the textile industry demands rather more complex and numerous growth conditions. Basic is a ready supply of raw materials which, in the majority of cases, provides little problem, save in the importation of man-made fibres. However, certain countries are unable to meet their domestic requirements despite a useful cotton crop. In most cases, improved techniques and yields as well as increased acreage would serve to increase the crop and eliminate the supply shortage. Progress is marked in this direction, in a number of countries. The problem of man-made fibre supply has already been mentioned.

Demand Factor

The other basic, of course, is demand and here the majority of developing nations have an assured condition of growth. The market is the textile needs of the home population which, in most cases, increases itself at a high rate and, what is more, has an increasing *per capita* consumption of textiles as the standard of living rises. In this connection, it is not necessarily correct to assume that the wearing of Western style dress will assist textile consumption, since, in some cases, the typical style of dress of a developing country demands more textile yardage.

Other conditions for growth are the availability of adequate transport and power facilities as well as water which themselves can ensure the viability of the industry. A highly efficient buying and distribution system must be evolved to avoid the experience of a number of countries where the infant textile industry has been brought almost to a standstill by the inefficient supply and distribution channels. Such a system would also tend to ensure that the highest possible prices were secured and that pricing was on a rational basis. Efficiency in the use of machinery is, of course, a prime requisite of a viable cotton textile industry and this depends on a high standard of training for all employees, whether manual, technical or managerial, and the existence of suitable labour to train.

A sensible, well planned approach to the formation of a domestic cotton textile industry, together with a fair degree of political stability, will attract the other great condition for growth capital. The bulk of capital is largely subscribed by foreign firms or Governments either in the form of private investment loans or inter-governmental aid. This capital will only be attracted by sensible, firmly based schemes which aim to fill a well-defined industrial gap and which will be well implemented by reliable staff. From the viewpoint of the developing country, offers of capital assistance should be realistic and quickly implemented; otherwise, development will be disrupted and hard won confidence destroyed.

Protective Legislation

In the short-term, Government encouragement and some protective legislation will normally be necessary. This encouragement usually comes in the form of freedom from import tax on raw cotton, export subsidies and bounties and severe licensing or banning of imports of yarn and cloth. Tax concessions are also made on profits and capital investment. In the longer view, such controls and protection should be ended or at least lessened in the interests of world trade and in the cause of the continuing efficiency of the industry. Perhaps also in the long-term, individual spinners and weavers should combine in central organisations to promote domestic cotton textile goods and to disseminate new ideas. In many nations these already have been created.

Benefits Many

The benefits accruing to an underdeveloped cotton producing country which sets up a viable domestic textile industry are many. Foreign exchange is saved on textile imports, work is provided for large numbers of workers who subsequently set the economic multiplier to work when they spend their wages, so that the mechanism of prosperity is to some extent set in motion. Textile self-reliance is perhaps the greatest boon, because economic development and progress is held back when almost complete reliance on textile imports is necessary. However, there is a conundrum to be dealt with, for setting up a domestic textile industry normally reduces the amount of raw cotton available for export and hence reduces the foreign exchange earning of the raw material. Textile exports may fill the gap, but, quite clearly, there are limitations to the outlets for textile goods in "hard currency" markets, and thus much of the export surplus must go to non-hard currency nations with a resultant diminution in the hard currency earnings of the developing nation. Capital and exchange for investment in foreign machinery is in short supply. Foreign aid schemes, besides loans, made privately, help in the short-term alleviation of the shortage, but the long-term solution must lie solely with the plans of the developing nation. Efforts should be made to increase raw cotton yield so that, after domestic requirements have been met, a surplus for export still remains to augment and diversify foreign exchange holdings. The newly established textile industry should aim to achieve a volume of production which covers the basic domestic requisites leaving a small balance for export. Having reached this stage, industrial activities should be extended to other sectors not concentrated on further textile expansion which relies entirely on exporting for its viability, when export markets are far from assured and especially not in the "hard-currency" nations towards which most present plans are orientated.

MANCHESTER LETTER

FURTHER AMALGAMATIONS AMONG TEXTILE FIRMS

GARMENT IMPORTS RISE MARKEDLY

From Our Special Correspondent

MANCHESTER, 21st July

INDUSTRIAL deals between some of the larger companies merging their interests have become so much a part of every trade that new announcements rarely startle. The absorption of Combined English Mills (Spinners) Ltd. by Viyella International marked a further phase in the consolidation of output and marketing in textiles which has been going on for the past fifteen months. Speculation over the future of the chief horizontal groups in the spinning trade has persisted throughout this time. The policy of "vertical thinking," propagated and so effectively carried out by the C.E.M. management team, made it appear that even closer links with some other organisation might be the eventual outcome.

Financial observers have suggested that, on its own, the Atherton based company might have continued to find progress difficult. This comment, however, does less than justice to the keen executives who have been running this business for the past few years and have guided its fortunes through a period of intense modernisation and large-scale changes which are by no means yet complete.

Progress in Concentration

This development, the latest in a long line of integration in which Viyella and Courtaulds have played the major roles, has caused some re-thinking on ideas about the future of the industry which were put forward less than two years ago. At the 1962 Cotton Board conference, Mr. A. M. Alfred, head of the Economics Department of Courtaulds, gave an outline of the concentration which had taken place at that time. Some seventy firms, he pointed out, between them controlled 80 per per cent of the spindles, 35 per cent of the looms, perhaps 40 per cent of converting and 40 per cent of finishing. Fifteen of these firms, he continued, were already important vertically, controlling 130,000 or more spindles, 2,000 or more looms and being in the top 40 converters. Together with three horizontal weavers and two finishers, these groups controlled around 30 per cent of the spinning, weaving and converting industry.

"What is now needed is action towards further amalgamations among these firms to produce groups large enough to rationalise their production and to finance and control their own marketing," Mr. Alfred added. Groups of around 250,000 spindles and 5,000 looms, producing 100 million square yards of cloth annually and converting perhaps 140 million yards, appeared to be about the right magnitude. It had been suggested that nine such groups could market two-thirds of the industry's output.

Vertical Nucleus

The revolutionary concept of vertical nucleus had already been outlined in an earlier and somewhat controversial paper given to the British Association by Mr. Alan Ormerod, Managing Director of Ashton Brothers. In this document, he had forecast that the nucleus of vertical developments would be large-sized verticals with established marketing organisations. Such units could amalgamate with other viable and assimilable vertical or horizontal units consonant with a general plan. The horizontal combines, said Mr. Ormerod, could assist the development of the group by allowing suitable mills to be integrated into vertical firms, the horizontal members taking a share in the profitable operation of the latter. The remaining horizontal spinning and finishing units could service the partial verticals and specialist units.

The section of the industry for which there appeared to be no hope of revival, Mr. Ormerod declared, was the horizontal weavers manufacturing basic products in units of less than 250 looms. At that time, these constituted nearly 17 per cent of total weaving capacity and the majority were operating non-automatic looms on single shifts. The greatest impediment to this development, in his opinion, was not the inability to recognise its necessity but the dearth of top management capable of organising and controlling the combined operations. This, said Mr. Ormerod, provided all the more reason for the 750 firms then operating in the industry to be drastically reduced and the few existing large combined units or partial verticals expanded.

Garment Imports

Quite apart from the growing volume of imports of grey and finished cloth into this country so far this year, the supply of made-up cotton articles has been increasing at an even larger rate. In the first quarter of 1964, the cost of these goods was £13,872,000, as against £9,972,000 in the same period last year and the quarterly average in 1963 of £10,197,000.

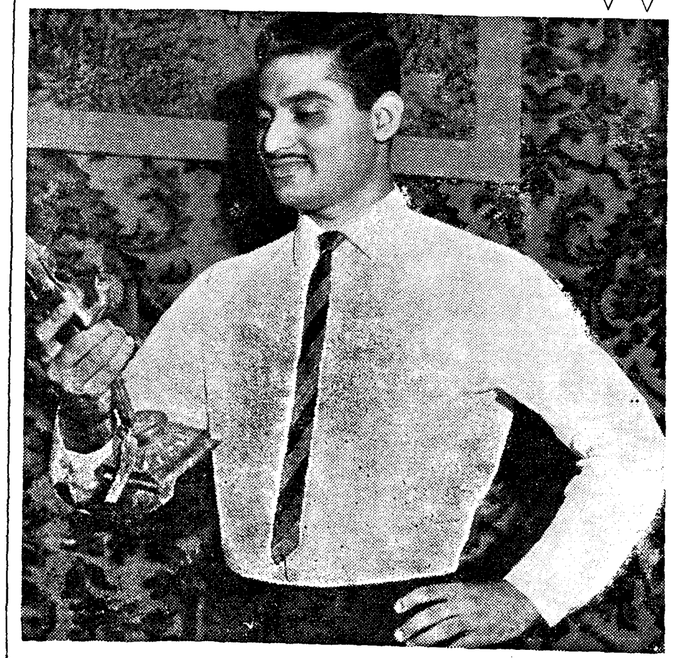
Woven clothing represented the major proportion of these imports, the value of these goods entering British ports in the first three months this year being £8,196,000, as against £5,761,000 in the first quarter of 1963 and the quarterly average last year of £5,985,000. There was a marked rise in the quantity of dresses imported, aggregating 1,414,000, as against 1,155,000 in the first quarter of last year and the quarterly average of 692,000 in 1963.

The cost of imports of men's and boys' coats, waistcoats, trousers, etc., also rose substantially, from £1,131,000 in the first quarter last year to £1,732,000 in 1964. Another marked increase was in purchases of proofed outer garments for women and girls which amounted to 192,000 this year, as against only 60,000 in the first quarter of 1963.

Cost of Reorganisation

Although the Government-aided scheme to assist the cotton industry launched in 1959 has now been officially completed, eligibility for the re-equipment grant in some instances has still to be assessed. It is, therefore, not possible to provide a final answer as to how much money the Treasury will be called upon to make available to those firms which have modernised their plant. The latest situation at the time of the closing of the books at the end of the first week of July was that payments made aggregated about £19,600,000. Mr. Edward Heath, Minister for Industry, told the House of Commons that £11,200,000 had been paid on account of the scrapping scheme and £8,400,000 distributed in re-equipment grants. Further sums will obviously be payable in due course as a number of outstanding claims have yet to be negotiated. The Cotton Board has estimated that the financial aid for the industry is likely to reach about £26 million.

Double Diamond



A Poplin for privileged people by BINNY

Double Diamond is a new quality poplin woven from fine Egyptian cotton. It's cool and comfortable to wear, handsome in appearance and, above all, has that built-in durability characteristic of every BINNY fabric.

TEA INDUSTRY'S FINANCIAL NEEDS

HIGH-POWERED COMMITTEE SET UP

FINANCIAL hardship at home and intensified competition in markets abroad are the two major problems facing the Indian tea industry which contributes as much as 16 per cent to the foreign exchange earnings of this country. Despite a fall in output from 345.3 million kgs. in 1962 to 343.7 million kgs. in 1963, the industry has recorded an increase of about 16 million kgs. in its total exports over the 1962 figure. In terms of value, tea exports in 1963 have come to Rs. 133 crores, as compared with Rs. 124 crores in 1962. This performance is all the more creditworthy, considering the fact that the industry has had to face intense competition from East Africa and other countries whose tea industry is not handicapped by problems of the kind present in India. Incidentally, unless these problems are solved, it will be difficult for the Indian tea industry to build up its competitive capacity in the overseas markets.

Terms of Reference

Seen in this context, the appointment of a high-powered committee under the Chairmanship of Mr. V. V. Chari, Additional Secretary, Ministry of Finance, for examining the financial needs of tea industry is most welcome and timely. This move indicates that the Union Government is alive to the needs of an industry which has, of late, been manifesting a climate of pessimism in view of the rising costs and the lack of finances for implementing the programme of replanting, etc. The Chari Committee, which is expected to submit its report to the Government within three months, has the following terms of reference:

(i) To examine the financial position of the tea industry with particular reference to the requirements of increase in production and exports;

(ii) to review the financial assistance available to the industry from the Tea Board and banking institutions and to suggest simplification of procedures relating thereto;

(iii) to make recommendations regarding the provision of finances required by the industry;

(iv) to examine the structure of taxes on tea and to suggest appropriate measures for giving tax relief where necessary; and

(v) to make any other recommendation that the Committee may deem appropriate for the development of tea industry.

The task before the Committee is immense, as the replantation programme, with which the tea industry is chiefly concerned at present, is defying implementation, due to the considerable cost of new openings taxation, wages, etc. Other factors like the uncertainty of fair return on capital

Table I: Production of Tea
(In million kgs.)

	January-June		Whole of	
	1964	1963	1963	1962
Total production	95.4	93.8	343.7	345.3
Of which:				
N. E. India	58.8	47.1	255.1	261.4
South India	37.1	46.7	88.6	83.9

have also been responsible for the postponement of replanting and expansion schemes. Due to the failure of the industry to plough back sufficient earnings, this programme has fallen in arrears. About eight years ago, it will be recalled, it was estimated that the industry needed replantation of 88,000 hectares. Against this, it is disappointing to note that only around 13,000 hectares have been replanted so far. Replantation being a costly and long-term affair, it is imperative that the industry should be sure of earning sufficiently on its new investments to return the loans taken for the purpose.

Reasonable Return

A recent survey conducted by the Reserve Bank of India has revealed that the tea industry was unable to earn even a reasonable return on its investments. According to the R.B.I. study of company finances, the tea industry earned just six per cent on the capital it employed, as against nearly ten per cent earned by all industries together. Investments are finding their way into engineering and consumer goods industries which are reaping rich dividends. There is, accordingly, no inducement for investment in the tea industry. This is a major reason why tea gardens have to depend on their own resources and loans for financing acreage expansion and replanting programmes. Added to this deficiency is an increase in the production costs of the industry due mainly to increase wages, rising commodity prices and heavy State levies. The Central Wage Board, incidentally, has unanimously recommended a second interim increase in wages. In the context of rising prices of essential commodities, labour has chosen to put up further demands without caring for that higher productivity on which the Wage Board itself has laid emphasis.

Planned Targets

Despite the fact that the third Plan's original production and export targets for tea have been reduced from 408 million kgs. and 277 million kgs. to 377 million kgs. and 241 million kgs., respectively, the industry has so far failed to achieve them. The exports during the year 1963 aggregated about 225 million kgs., recording an increase of about 16 million kgs. over 1962. But the output in fact fell from 345.3 million kgs. in 1962 to 343.7 million kgs. in 1963, as will be observed from the tables accompanying this article. The prospects for 1964, however, are quite bright, with the output during the period January-June 1964 having touched 95.4 million kgs., as compared with 93.8 million kgs. during the corresponding period last year. But, it must not be overlooked in this context, that the production potential of the other major tea producing countries has also increased at the same time. The possibility of an abundant supply of tea in the world market should not, therefore, be ignored. This development, which may lead to a fall in the world prices of tea, will create further complications for the home industry with its increasing production costs. In this situation it would be an uphill task for the industry to achieve a target of 455 million kgs. by 1970-71, that is, by the end of the fourth Plan, as proposed at present, unless vigorous efforts are made betimes to finance adequately the replantation and expansion schemes.

Formidable Task

A possible fourth Plan target of 455 million kgs. would mean an increase of 25 per cent over the record level of production of 364 million kgs. expected for the year 1964. The task is formidable, for it will require new planting over an area of about 6,500 hectares per year. It has been estimated by trade that this order of expansion will entail an expenditure of about Rs. 75 crores, but the official view allows for only one-third of this figure. If the Chari Committee is to find satisfactory solution these divergent estimates about financial requirements for the achievement of physical targets during the next Plan would have to be reconciled. The inclusion in the Committee of representatives of a few leading commercial banks and the State Bank, as also of the Agricultural Refinance Corporation, which is evidently meant to induce these agencies to invest in the industry, is certainly welcome. Again, in view of the fact that the taxation policies of certain States differ from the policy followed by the Centre, representation in the Committee for the Governments of tea-growing States should help evolve a uniform tax policy covering the Centre and the States.

There is a controversy whether the expenditure on replanting should be treated as a revenue or capital expenditure. If the cost of new planting is treated as revenue expenditure, as advocated by the tea industry, the tax-saving would go a long way towards alleviating the heavy financial burden involved. But, in itself, even this concession may not be adequate. What is also required is the creation of an atmosphere for channelling finance into tea replantations which normally bear fruit after about five years. There is, therefore, a crying need for an institutional set-up for catering to the long-term needs of the industry. At present, three lending schemes are being operated by the Tea Board for financing hire-purchase of machinery, new plantings and purchase of irrigation equipments. These schemes have no doubt helped the industry to some extent. But in view of its other functions, the Board may not find it feasible to provide any further substantial financial assistance beyond the Rs. 13 crores it has already provided. Financial help should, therefore, be made the principal business of a financial institution, specially designed for the purpose. The Chari Committee, it is to be hoped, will recommend a suitable set up in this connection.

As the Chari Committee has been asked to make any other recommendation for the development fo tea industry, it will not be out of place to examine the questions relating to quality in tea exports and to their countrywise direction. The acute competition in overseas markets has, in fact, compelled the tea planters

Table II: Exports of Tea
(In million kgs.)

U.A.R.	8.26	7.44	16.93	18.67
Sudan	1.90	1.75	3.59	5.40
Rest of Middle East	1.18	0.90	N.A.	1.08
Australia and New Zealand	2.07	1.78	3.99	5.71
Tunisia	1.51	0.87	2.37	N.A.
Other Countries	0.06	0.04	N.A.	11.38
Total	55.58	73.34	224.99	208.77
Of which:				
North India	39.35	51.80	176.20	166.87
South India	17.28	21.54	48.79	42.40

N.A.—Not available.

and the Government to keep a strict watch on the export of sub-standard teas. A recently proposed amendment in the Prevention of Food Adulteration Rules, 1955, which lays down an I.S.I. specification has been objected to by some tea planters. It is held by them that the new specification for black tea is impracticable. As quality is an important element in our exports of tea, this issue also needs a careful examination.

Export Promotion

As for the direction of export trade in Indian tea, it will be noticed from Table II that during the first half of 1964, tea exports to the United Kingdom have been only to the tune of 22.49 million kgs., as against 41.32 million kgs. during the corresponding period last year. It is a dismal sign for the industry that it is losing its hold in the traditional U.K. market which used to consume more than 50 per cent of India's total exports of tea. The Indian tea industry would have to make great efforts in new markets like those of the U.A.R., the U.S.S.R., and the Middle Eastern countries. The increase of about five million kgs. in tea exports to U.S.S.R., from 12.62 million kgs. in 1962 to 17.08 million kgs. in 1963, may be noted here with some gratification. But the fall in exports to U.A.R. from 18.67 million kgs. in 1962 to 16.93 million kgs. in 1963 and to Iran from 4.32 million kgs. to 3.17 million kgs. should, at the same time, be given some anxious thought. This country should not only make efforts to cultivate the new markets but also seek to maintain the traditional ones. It is heartening to note, in this connection, that a concerted programme of developing tea consumption in Western Europe is under way in collaboration with Ceylon. The Tea Board's programme of spending between £17,000 and £20,000 in Britain this year on propaganda is also in the direct direction. The Chari Committee, it is to be further hoped, will outline suitable measures for exports promotion, in view of its organic connection with the planned expansion of production.

OIL INDIA LIMITED

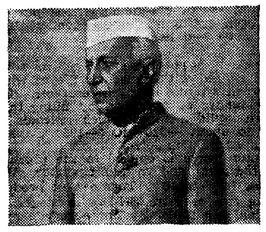
(A 50:50 Cooperative Enterprise of the Government of India and The Burmah Oil Company for Prospecting, Drilling, Production and Transport of Crude Oil from Assam to Refineries in Gauhati, Assam and Barauni, Bihar)

STATEMENT OF THE CHAIRMAN, SHRI KHANDUBHAI K. DESAI, M.P., TO THE SHAREHOLDERS ON THE OCCASION OF THE FIFTH ANNUAL GENERAL MEETING OF OIL INDIA LIMITED, HELD AT DULIAJAN, ASSAM, ON TUESDAY, JUNE 23RD, 1964.

GENTLEMEN,

I have pleasure in presenting to you the report of the Directors and the Annual Accounts of the Company for the year 1963. Under the new order issued under Rule 52 of the Defence of India Rules it will not be possible for us to circulate these reports as usual. This rule also imposes restrictions in regard to publication of news concerning the activities in individual fields and details in respect of the other aspects of our work. Within these limitations I shall endeavour to present a general view of our activities during the last year and a continuation of these efforts in the next year.

TRIBUTE TO LATE SHRI JAWAHARLAL NEHRU



We are meeting under the shadow of a great tragedy which struck the nation in the death of Jawaharlal Nehru, whose unique role as a leader in the forefront of India's struggle for independence and as Prime Minister of independent India for over 17 years has contributed a new and glorious chapter in the history of this ancient land. He was the architect of modern India and took a keen interest in all activities directed to promote the welfare of the country and the people. Only in June 1963 we were honoured by his visit to our oilfields in Assam and his appreciation of our work had been a source of encouragement and inspiration to us. The best way to honour his memory is to work hard in our limited spheres and thus contribute our mite to India's prosperity.

General: Oil is fast assuming a place of first importance in the industrial economics of the world and recent trends in uses of various commercial fuels indicate that the popularity of petroleum products and their proportionate use in industry has been going up steadily. Although India has a very low *per capita* consumption of oil products, the economy of the future will require a rapid and steady increase of these energy sources. In the long run coal and hydraulic power sources may prove inadequate and nuclear energy will take a considerable time to replace traditional sources of energy. The combined requirements of energy and petro-chemicals in India leave no alternative therefore to the rapid development of the oil industry.

In the recent past the demand for petroleum products has been increasing at the rate of nearly 10 per cent per annum and during the Fourth Plan period it is now expected to increase by 2 to 3 million tonnes annually. By the end of the Fourth Plan period, demand for all products is likely to go up to about 28 or 30 million tonnes. However, there is some difference of opinion about the total demand and how it will shape in future during the Fourth Plan period and it is not necessary for me to go into these details except to stress that the refineries based on imported crude should produce more of kerosene and fuel oil, for which there is a spurt in demand. The purpose of this review is to set a background for the functions of Oil India and the role it has to play in meeting this demand for petroleum products.

The country hopes to have a production of about 6 million tonnes of indigenous crude oil by the end of the current Plan and, of this, more than half will be contributed by the oilfields in Assam. When this quantity of oil is produced and refined at the public sector refineries of Gauhati and Barauni it will save imports of petroleum products of the value of nearly Rs. 40 crores per annum.

Oil Field Development: Despite the difficulties faced in acquiring land for drilling sites, Oil India Limited have achieved their drilling targets. An average of 74,154 feet per drilling rig was achieved which compares favourably with similar drilling efforts elsewhere in the world. Of the total wells drilled during this year, two wells were completed with a view to producing oil from two zones independently, popularly known as dual completion wells, and three deviational wells directed to tap oil reserves under the river bed. These were the first deviated and dual production wells to be drilled in India and Oil India can legitimately lay claim for these two "firsts" in their drilling programme. Another noteworthy feature of the drilling activities in Oil India's areas is that increases in the cost of material and labour and heavy expenses involved in exploration drilling have been offset by speed in drilling.

With the wells drilled and completed, Oil India is in a position to meet the requirements of the public sector refineries at Gauhati and Barauni, to the extent of its commitments. The refinery at Gauhati has been taking regular supplies of crude oil particularly since the latter half of this year, while the first unit of the refinery at Barauni is expected to go on stream in the near future. In fact some quantities of crude oil are being supplied to this refinery for "trial runs."

Exploration Activities: For the first working season, a seismic party from the Oil and Natural Gas Commission was employed to do seismic surveys in the New Exploration Licence Areas. In the second working season a seismic party from the Seismograph Services Limited was engaged in the fields. Both parties made excellent progress. Over 900 line miles of seismic reflection survey were completed during the two working seasons commencing February 1963 as against a target of about 700 line miles for this period.

The permits required to enable the personnel to enter the Exploration Licence Area in NEFA were not received until 5th February 1964. However a ground survey was commenced on 6th February but later heavy monsoon interrupted the work and the party had to be evacuated with the assistance of helicopters.

Exploration drilling in the New Exploration Licence Areas was taken up side by side with seismic survey. This programme of surveys and test drilling, costing a total of about Rs. 2 crores will be continued throughout 1964 and early 1965.

Pipelines: Oil India's pipeline system in North East India connecting the oilfields with Government refineries at Gauhati, Assam and Barauni, Bihar, has been completed. This is the second longest crude oil pipeline in the East and one of the most modern and automatic of its kind in the whole world. This pipeline was constructed for Oil India by The Burmah Oil Company (Pipe Lines) Limited and I would like to pay here a tribute to all the project staff—labour, clerical and executive—and the various contractors and their men who worked hard to complete this extremely difficult job. After the completion of the pipeline The Burmah Oil Company (Pipe Lines) Limited, have been required to operate and guarantee the pipeline for a period of 12 months from 1st January 1964. Meanwhile the operational control without affecting the guarantee is being taken over by Oil India with the necessary integration of staff to which I propose to revert later. A little known fact of this project is that the final completion cost of about Rs. 45 crores was a little below the original estimate of Rs. 46 to Rs. 47 crores.

Crude Conditioning Plant: The crude conditioning plants at Nahorkatiya and at Moran, the first of their kind in the world and which were especially designed to make Nahorkatiya-Moran crude pumpable, were completed and operated during the year. These plants were actually constructed for Oil India by the Assam Oil Company, a subsidiary of The Burmah Oil Company—Government's partner in Oil India. Oil India has taken charge of these plants after thorough test and these are now operational. The tests showed that the completed plants conform to pilot plant expectations and our thanks are due to Assam Oil Company and their staff for this job.

Industrial Installations and Domestic Buildings: Almost all the programmed construction work for 1963 on the various industrial installations and domestic buildings was completed during the year. One more oil collecting station was installed at Nahorkatiya, making a total of six such stations there, an another similar station was completed at Moran. Ninety-five domestic buildings of various types, together with the necessary roads, drainage and other services, were completed during the year and what was an impenetrable jungle a decade ago has turned into a thriving and prosperous town due to the oil find at Nahorkatiya.

Crude Supplies: The requirements of crude of the refineries at Gauhati and Digboi were met in full. The production will go up once the first unit of the Barauni Refinery goes on stream to be followed by the second unit.

Gas: Apart from nearly 10 million cubic feet of natural gas which will be required for oilfield uses, there is still a large balance which can be utilised for other projects. As at present, commitments have been made for the supply of nearly 45 million cubic feet of natural gas per day to various industrial projects; 18 million cubic feet per day to the Assam State Electricity Board; about 10 million cubic feet per day to the Assam Gas Company; 8 million cubic feet per day to Assam Oil Company; 8 million cubic feet per day to the Fertilizer Plant at Namrup; and small quantities to brick kilns and tea gardens. Here I would like to assure the Government of India and the State Government of Assam that we, on our part, are prepared to supply the balance of the gas available with us to the industrial projects approved by them, and we can do so at a price which will be sufficient to enable Oil India to compress and store gas to the extent necessary to provide for uninterrupted supplies over the period required by the consumer.

Finances: The delay in the commissioning of the Barauni Refinery resulted in the offtake by the Indian Refineries Limited being much lower than originally anticipated. The consequent reduction in the anticipated cash inflow necessitated the use of larger overdraft facilities for working capital and general purposes and arrangements were made with the State Bank of India to make these available.

The rupee cost of pipeline construction was financed by Rs. 30 crores received in full on 6¼ debenture stock 1968/77. The foreign exchange expenditure on this project was financed partly by a loan of £3 million from the U.K. Government to the Government of India under a U.K./India (Oil Pipeline) Credit Agreement 1959 and a sterling loan of £10,250,000 from the Bank of Scotland, U.K.

Dividend: The profit and loss account shows a net surplus of Rs. 336 lakhs after providing for depreciation, taxation and development rebate. This leaves funds available for the declaration of a dividend of Rs. 120 per share of paid-up equity capital which is a minimum dividend of 9 per cent after payment of all taxes including taxes payable on dividend. An interim dividend of Rs. 40 per share of paid-up equity capital was declared in December 1963, and a final dividend of Rs. 80 per share is now being recommended.

Staff: We are making advance arrangements now to take over the Pipeline and for this purpose additional staff have been taken on the payroll for maintenance and operation of the Pipeline. This process has almost been completed. The last years have been formative ones for Oil India and organisational problems have been tackled side by side with development work in the Mining Leases and exploration activities in the New Exploration Licence Areas. This has been rendered possible by the spirit of co-operation shown by all concerned at all levels—workers, clerical and executive—and here I would like to pay a tribute to their sense of duty and constancy. In particular I would like to mention that there was no industrial unrest, which is evidence of the consciousness on the part of the workers of their participation and keen interest in the national endeavour to produce more oil.

Lastly, I would like to thank my colleagues on the Board for their active assistance. In particular I would like to mention Mr. J. C. Finlay, M.C., Managing Director, and Shri P. Govindan Nair, I.C.S., Financial Director, who have worked most closely together to make this year a successful year for Oil India. I also take this opportunity of expressing my thanks to various Ministries of the Government of India, especially the Ministry of Petroleum and Chemicals and the State Governments of Assam, West Bengal and Bihar for their assistance in our work.

NATURAL GAS UTILISATION IN INDIA

INCIPIENT TRENDS POINT TO BRIGHT POSSIBILITIES

NATURAL gas is not only a versatile fuel but an important raw material for petro-chemicals. The uses to which it is extensively put in the United States and Europe (including the Soviet Union) are many and varied. For instance, 90 per cent of 108 million meals served every day by America's restaurants, hotels, military mess halls, schools, etc. are cooked by natural gas. Much of the canned and processed food in the United States is also prepared with gas heat. In the field of petro-chemistry, the ingredients of natural gas, namely, methane, ethane, propane and butane are being used as raw materials for the plastic, synthetic rubber and synthetic fibre industries in that country. Seventy-five per cent of the ammonia produced in the United States comes from the use of natural gas as the raw material, and the largest use of this ammonia is in fertilisers. Residential consumption of gas is also very large in that country. It is stated that the most exciting possibility for natural gas lies in energy converters and that at least four devices are now in various stages of development by 500 U.S. companies for producing electricity. In Europe, where natural gas accounts for a relatively small proportion of total energy, its use tends to be more heavily concentrated in chemical industries. In Soviet Russia, too, natural gas, which is to be found in as many as 300 deposits, is put to a variety of uses, both industrial and residential.

But in India natural gas is still in the preliminary stage of exploitation and utilisation. In fact, according to an expert who has dealt with his subject in *Indianoil News Annual*—1964 (just published by the public-sector Indian Oil Co., Ltd., Clarke Road, Bombay-34), the total gas reserves in India have not been fully assessed yet. The gas reserves estimated so far cover only Assam and Gujarat. In Assam, the Nahorkatiya, Moran and Upper Assam fields have 22,000 million cubic metres of gas reserves. The Gujarat field includes Cambay, Ankleshwar and Kalol areas. Cambay, it has been estimated, can yield 7,000 million cubic metres of gas annually; the existing wells, it is said, can produce about 200,000 cubic metres per day (approximately equivalent to 60,000 tons of oil per year). While the individual gas reserves of Ankleshwar and Kalol fields are not yet known, an estimate is at least available for the amount of gas associated with their oil production. This estimate is that, on an oil production of two million tons per year, the total gas available is 1.05 million cubic metres per day and that, after gas separation, 850,000 cubic metres per day will be available. Incidentally, the Oil and Natural Gas Commission continues its gas exploration activities in Gujarat, for, apart from the Commission's gas supply commitments to the power stations of Utran and Dhuvaran and the industries of Baroda, other demands are foreseen. It is also stated, in this connection, that in view of the discovery in recent months that the Cambay gasfield is actually bigger than was originally believed, the Commission is going ahead with the programme of further drilling to delineate the boundaries of the field fully.

Still in Infancy

As for gas utilisation, the position in India at present is that it is still in its infancy. For instance, Oil India Ltd. produced 5,789 million cu. ft. of natural gas in 1963 and sold only 2,332 million cu. ft. of it to Assam Oil Company and Derial Tea Estates. Taking both associated gas (that is, gas associated with oil production) and non-associated gas together, Oil-India's daily output at Nahorkatiya can well be of the order of 85 to 125 million cu. ft. per day or 31,000 to 46,000 million cu. ft. per annum. But that much output, if available, cannot be easily absorbed within Assam itself. Actually Oil-India's present commitments are to the tune of only 55 million cu. ft. per day—10 million cu. ft. for oilfield uses and 45 million cu. ft. for various industrial projects. It is, however, gratifying to find that the daily supply of 45 million cu. ft. of Oil-India's natural gas will be used by a variety of industries—18 million cu. ft. by the Assam State Electricity Board, about 10 million cu. ft. by the Assam Gas Company, eight million cu. ft. by the Assam Oil Company, eight million cu. ft. by the Fertiliser Plant at Namrup and small quantities by brick kilns and tea gardens. Still Oil-India will have a large surplus of gas. The Chairman of the Company, in this connection, has just assured the Government of India and the Government of Assam that the Company is prepared to supply the balance of gas available with it to industrial projects approved by the two Governments and that it can do so at a price which would be sufficient to enable Oil-India to compress and store gas to the extent necessary to provide for uninterrupted supplies over the period required by the consumer.

In view of the large surplus of Nahorkatiya gas that will be available, several new industrial projects have been proposed to utilise it. The Indian Oil Company's expert has referred to several proposals in this connection. First, the associated gas is to be fractionated into lower (mainly methane) and higher (mainly liquifiable) fractions. Secondly, the dry gas is to be used for the production of power (50,000 k.w.), fertilisers (50,000 tons of urea, 50,000 tons of ammonium sulphate per annum) and gas furnace black (10,000 tons per annum) and as domestic and industrial fuels. Thirdly, higher fractions are to be used for the manufacture of polyethylene (14,000 tons per annum) and polybutadiene rubber (20,000 tons per annum). A recent development of note, in this context, is that a licence has been granted for the setting up of an acrylic fibre plant based on Nahorkatiya gas. This unit will have an authorised capital of Rs. 8 crores and will require foreign exchange to the extent of Rs. 3 crores. It is estimated to consume four million cu. ft. of gas per day to produce 300 tons of acrylic fibre, resembling wool, every month.

Gujarat Gas

The utilisation of Gujarat gas will be in accordance with the order of priorities laid down by the Government of India. According to the Government's decision, the supply of gas will be given, first, for the generation of electricity, next for fertilisers, third, for other State projects and then for private industries. Gas supply to the Dhuvaran power station is expected to commence in September and to the Utran power station in November 1964. The Gujarat Fertiliser Factory will be supplied from about June 1966, when it is expected to go into production. The requirements of some industries in Baroda can be supplied towards the last quarter of 1964. There is no delay in this supply schedule, as the supply will synchronise with the consumers' readiness to receive the gas. The price of gas to be charged from the various industries in Gujarat has been tentatively fixed as follows:

(Per thousand cubic metres)

Supply to Gujarat Fertiliser Factory	Rs. 90
Supply to Gujarat State Electricity Board ...	Rs. 80-100*
Supply to industries around Baroda	Rs. 100

*Rs. 80 for Cambay gas and Rs. 100 for Ankleshwar gas.

The price of gas to be supplied for industries and power generation has been related to the price of residual fuel oil on thermal value equivalence. The price of gas to be supplied for fertilisers has been related to the price of naphtha on thermal value equivalence. Negotiations regarding price between the Gujarat Government and the State Electricity Board, on the one hand, and the Oil and Natural Gas Commission and the Central Government, on the other, have recently broken down. Following this breakdown, the issue of pricing has been referred to arbitration.

It has been estimated that, if the production of oil is 2.5 million tons per annum and the gas-oil ratio is about 1,000 cu. ft. per barrel, the total quantity of gas available in Gujarat from the existing fields would be of the order of 250 million cu. ft. The Oil and Natural Gas Commission has planned to supply progressively one million cubic metres of gas (equal to 1,000 tons of coal) per day to three thermal power stations (including Dhuvaran and Utran) by the middle of 1964. A scheme of gas pipelines has also been formulated to link oilfields and the power stations.

It would appear from the above review that India has a long way to go in the exploration, exploitation and utilisation of natural gas. Although the country's natural gas reserves (not yet fully estimated) may not be comparable to those of the United States, U.S.S.R. and Middle East, they should be pretty substantial. Their planned exploitation and utilisation should go some way towards meeting the country's increasing energy requirements and developing a variety of petro-chemical industries.

SYSTEM FOR VACUUM PUMPING

Extremely clean vacuums can now be produced efficiently and economically by a new vacuum pumping system developed by Union Carbide Corporation. Based on the principle of gas adsorption at cryogenic temperatures, Union Carbide's cryosorption pumps have no moving parts or working fluids, thereby completely eliminating the danger of contamination from back-streaming of oil from mechanical or diffusion equipment. The first commercially available Union Carbide unit is the SN-12 cryosorption vacuum pump, which can be used to evacuate volumes up to 20 cubic feet (0.57 m.³). Pump-down performance is improved if the space to be evacuated is first purged with dry nitrogen gas to eliminate uncondensable gases such as neon and helium.

The SN-12 consists essentially of an adsorption chamber packed with Molecular Sieves which can be sealed in a liquid nitrogen reservoir. The unit is made ready for operation by filling the reservoir with liquid nitrogen which precools the adsorbent to about —320° F. (—195° C.) in 10 to 20 minutes. Pump-down begins as soon as the vacuum valve is opened in the pipeline connecting the pump and vacuum chamber. Vacuums as low as 10^{-6} to 10^{-7} Torr can be produced by operating two or more SN-12's in stages. In an actual field test utilising a three-stage pump-down system, these pumps produced ultra-clean vacuums of 10^{-4} in two hours, 10^{-6} Torr in three hours, and 10^{-7} Torr in approximately four hours.

Operating performances indicate that higher vacuums and faster pumping speeds are obtained with the SN-12 than with other commercially available liquid nitrogen cryosorption pumping systems. An improved reactivation process has also been developed for Union Carbide's pumping systems.

Because it has no moving parts, the SN-12 cryosorption pump is virtually maintenance-free and simple to operate. Its outstanding operating efficiency results from a combination of the high gas adsorption characteristics of Union Carbide's Molecular Sieve adsorbents and proprietary design features. For further information, Union Carbide International Company, Division of Union Carbide Corporation, (270 Park Avenue, New York, N.Y., U.S.A., 10017) is to be addressed.

ATLAS OF SOUTH-EAST ASIA

The term 'South-East Asia' had its origin in the Second World War when the Allied Organisation, South-East Asia Command, was formed to direct operations against the Japanese in the area. South-East Asia is densely populated. And it is an area of ancient cultures, where great empires existed and were destroyed, leaving behind trails both in stone and tradition. This region today, with a favourable climate, vast areas of fertile land and large rich mineral resources, has become a centre of attraction and holds a very important position in world economy. This prompted Macmillan and Company of London, the world reputed firm of publishers, to bring out a separate atlas for this area, which is, incidentally, the second of a series of regional atlases. The atlas under review contains 64 pages of coloured maps (with a total of 130 maps) and introduces the territory as a whole in general maps. However, the major part of the volume is devoted to individual countries of the region. The relevant maps cover physical and political conformation, geology, climate, vegetation, land use, population, industries, communications, minerals, town plans of the main cities, etc.

The great Indian sub-continent, though a part of South-East Asia from the point of view of natural environment, is excluded. One may wonder why. The publishers themselves have provided an answer in their preface. They say: "The Indian sub-continent has been excluded from this atlas because, in our opinion, it deserves separate treatment, owing to its situation, extent and political importance."

The atlas is also noteworthy for its brief but comprehensive introductory note from the pen of Prof. D. G. E. Hall of the University of London, its fine collection of photographs and its exhaustive index It is priced 50 shillings.

NEW PRODUCTS AND PROCESSES

Welding Machines for Thin Lines

THE A. S. Popov Telecommunications Institute in Prague has designed a thermo-compression welding machine which is able to weld wires 10-50 microns thin to the electrodes of transistors. In order to achieve a high degree of accuracy of the welding, the whole process is enlarged on the screen of a closed circuit television apparatus where it is viewed. The welding machine is an important part of the equipment being built in Czechoslovakia for the mass production of transistor microtechnique parts.

Concrete Testing Device

Engineer Yordan G. Pashev and Todor D. Tedorov, a technician, both from the Construction Frame Works in Kremikovtsi, Bulgaria have thought out a new device for testing the strength of concrete, without harming it. The device called 'Kremikovets" works on the imprint method and is better than the devices that are similar and that have been used so far (Baumann and Schmidt devices). The Kremikovets device is very precise in testing both low and high grade brands of concrete. It can also be used effectively in testing the strength of metals. The device has been recognised as an invention.

Checking Method for Car Headlights

A small device for checking whether a car's headlights are working properly is being marketed by BOVORST, Merelaan 1, The Hague (Holland). This device, dubbed as the 'headlight spy,' consists of a chromium-plated metal element containing two very powerful reflectors measuring 1 sq. cm. It is fitted centrally on the front of the car's bonnet. There the reflectors pick up the diffused light of the headlights and reflect it towards the driver. All departures from normal, such as when the headlights are not burning uniformly or one light is not working at all, can be spotted immediately. The device has no moving or electrical parts, so that no technical trouble is possible. It can easily be fitted by the layman and works under all weather conditions. A separate 'spy' is made for each make of car. Models are already in production for a few of the commonest makes while new devices for other makes will successively be added to the production programme.

Power Transmission Calculating Method

A new method of calculating flash-over voltage for overhead power transmission lines has been developed by Dr. Arie Braunstein, in Sweden.

Dr. Braunstein, who is an Israelite, has based his studies on a loop-voltage method developed by a former Chalmers professor, Raknar Ludholm, whose theories he confirmed experimentally. In the course of his experiments, Dr. Braunstein has found that Lundholm's circulations are valid only when earthing cables are installed as lightning arresters for the transmission lines, whereas the results are different if no such cables are used. The so-called compensating currents have proved to be of decisive importance in this context, and Bernstein has developed a technique, the "CC-method," to calculate them properly. The CC-method, which is likely to be of interest to electrical engineering in general, may make it possible to simplify the design of pylons for overhead transmission lines and also discard the use of earthing cables. Technical solutions of this kind are at present being discussed for several transmission lines in Sweden.

Automatic Calculator

The latest addition to the range of automatic desk calculators produced by Archimedes Diehl, of Chandos House, Buckingham Gate, London, S.W.1, is known as the Math-Matic. Its principal features comprise automatic multiplication and division with automatic decimal point in the result, an independent visible storage register, a multiplier memory and direct transfer between the storage register, the results register and the keyboard. Colour coding is incorporated so the operator need only follow a red code to divide, a blue code to multiply or a grey code to add or substract. It is suitable for both commercial and scientific use.

Platinum Adds to Anodes Life

Combined lead and platinum anodes, used for protecting ships, are said to last longer than zinc or magnesium anodes. The Marine Services Division of Lockheed Aircraft Service Company, Ontario, California, has applied the system to the wine carrier s.s. Angelo Petri, a converted tanker. The anodes are made of lead with platinum pins inserted. The lead reacts with the sea water to form lead peroxide, and current is passed through this into the water. The platinum aids in re-conversion of the peroxide, extending the life of the anodes. The reaction keeps the sea water from corroding the hull and its metal fittings.

Printing Machine

The latest Rondec screen process printing machine is designed especially for the printing of a wide variety of flat objects. Basically a printing unit built on to a pedestal to which is added a feed hopper and guides designed for handling the object to be printed, it is pneumatically operated and fully automatic. A separate compressor can be supplied if piped air is not already available. The maximum print area is 6 inches by 6 inches and the machine operates at rates up to 2,000 strokes per hour.

Shapes Hard Metals

A Soviet engineer, G. M. Kirilitsev, of 5/20, 1st Basmanny Lane. Flat 156, Moscow, has devised an improved spark erosion machine for shapping very hard components like hardened forged dies and tungsten carbide tools. Great versatility is claimed for the machine and it is said to be capable of cutting a big range of die and tool shapes in many sizes. The movement of the tool electrode is automatically or manually controlled.

New Patent

A patent for the manufacture of coin blanks from carbonyl-nickel pellets has been taken by Henry Wiggin & Co. Ltd. of U.K. (inventor P.G. Turner). In the manufacture of high-quality nickel strip for coining, planing the ingot results in a scrap loss of some 27 per cent and the processes involved in reducing the ingot to strip of the required thickness and width produces a scrap loss of some 25-30 per cent of the planed ingot. A further scrap loss of about 30 per cent of the strip is incurred in punching the coin blanks, and the overall conversion of virgin metal to finished coins is only about 35 per cent. In the invention claimed, these losses are reduced, and the process is simplified, by eliminating the need to use strip. The coin blank is produced using a substantially carbon-free nickel pellet made by decomposing nickel carbonyl, and of a volume at least equal to that of the desired coin blank. The pellet is stamped to the desired thickness and shape between dies, and any excess metal is removed by clipping.

Cutting Concrete with Water

A water torch capable of cutting through six inches and more of concrete or about ½ inch of stainless steel, has been developed by World Research and Engineering, 5527 Cleon Avenue, North Hollywood, California, U.S. It is backed by pumping equipment capable of delivering a steady stream of water at 20,000 p.s.i. Applications include cutting a way into crashed aircraft where speed and absence of heating effects are vital. Used in conjunction with contracting equipment, the system could provide virtually silent road breaking or demolition. A water torch has also been used to dismantle large bombs which had been stored in a war-time dump for so long that handling had become a serious problem.

Pneumatic Hoist for Fish

A plant something like a grain elevator which will automatically discharge a fish catch at a rate of 220 lbs. per 5 to 11 seconds on to a conveyor belt on shore has been developed in the Netherlands.

The fish are sucked up from the hold by an air stream moving at 15 to 25 metres per second and delivered undamaged to an air lock.

Depending on the size of fish and the distance it has to be conveyed average power consumed is 2 h.p. per ton and per hour

Two models are being made, one for 20-40 tons and the other for 40-80 tons per hour.

While the fish are travelling through the pipeline, it has been found that they barely touch the walls and at the receiving end, specially shaped guide boards minimise damage to them.

Hamycin Patent

Hamycin, an anti-fungal antiobitic developed in the Research Laboratory of Hindustan Antibiotics, has been granted a patent in the U.K. Hamycin is a potent anti-fungal and anti-protozoal antibiotic obtained from broth cultures of "streptomyces pimprina" isolated from Pimpri soil by HAL scientists. Hamycin is a new antibiotic discovered and clinically established at HAL.

Dust Remover

Particles of dust, which are a health hazard if inhaled, can be extracted from the air by the Airflo unit specially developed to overcome this type of pollution. It is known as an hydrostatic precipitator, into which the dust-laden air is drawn and "scrubbed" before recirculation. The clean air is drawn through a series of eliminators designed to return any entrained droplets and the water carrying the dust falls into a collecting sludge tank. The machine is stated by the manufacturer, Industrial Fan and Heater Company, of Evelyn Road, Birmingham 11, to have low water consumption and maintenance cost.

With the Compliments of

THE NEW INDIA INDUSTRIES LIMITED, BARODA

Bombay Office:

Industrial Assurance Building, Churchgate

Foremost Manufacturers of:

"INDIA" BRAND

Best Egyptian Cotton Healds, Steel Reeds, Brass Reeds, Striking Combs, Dobby Harness with and without rubber and Heald Piecing Yarn

AGFA

SYNCHRO BOX CAMERAS

and

AGFA PHOTO-PAPERS

Office Intercom

The President is the name of a new, fully transistorised, loud-speaking, intercommunication system for offices and similar places, introduced by The British Home and Office Telephone Company, of 73, Great Peter Street, London, S.W.1. It consists basically of a master station which has 14 or 21 lines. Extensions can themselves be wired for 7, 14 or 21 lines. More than one master station can be incorporated in a system and as many simultaneous conversations can be carried on as there are pairs of instruments. To operate the system, the executive at the master station simply flicks a key labelled with the identification of the person he wishes to call.

Decimal System Computing

A ceramic material recently developed by Sandia Corporation of Albuquerque, New Mexico, may make it possible to produce a computer memory working on the ten digits of the decimal system rather than the common computer language of 0 and 1. The material is a lead zirconate-titanate with an addition of niobium, bismuth or potassium. Computer memory units, made from it in the form either of bars or discs can store information in any of ten stable states, permitting the use of the decimal system. Information is fed into memory units by applying voltage pulses which change the characteristics of tiny areas within the ceramic units. The most important property claimed for the new compound is the stability of the changes produced in these tiny areas. This means that once data has been stored, they can be retrieved time and again. The ceramic is not affected by temperature changes and other factors that would cause trouble in other systems. The company claims that little energy and time are needed to switch from one storage state, or digit, to another.

Portable Liferaft Radio

The introduction of a new portable transmitter-receiver for use in survival craft is just announced by Marconi Marine. It is believed to be the first survival craft radio to have facilities for working on three frequencies. Named "Survivor," it is designed for maximum portability. The entire equipment, including masts and aerials, is contained in a single case weighing less than 30 lb. Other features are a case and cover in resin bonded glass fibre, painted bright yellow for instant recognition in water, capable of floating, and designed to withstand damage after being dropped overboard, if necessary, from a ship in distress. It is powered by a hand-driven generator of high efficiency or can be operated off an alternative static power source. The "Survivor" can be operated by any unskilled personnel in the boat or raft. With an output of some 3 watts, ranges of 100 miles on medium frefrequency and 400 miles on high frequency have been obtained during recent service trials.

Fruit-gatherer

A French firm has produced a machine for gathering fruit from the ground. This pedestrian driven machine which permits both gathering and sorting was recently exhibited at the 35th International Agricultural Machinery show at Paris. The "pick-up" unit consists of a "hedgehog" cylinder formed by juxtaposing eight-point stars in fairly stiff rubberised canvass. The motion of the cylinder collects the fruit and sends it by a tongue piece and duct to a sorting table. This motion causes all the leaves, grass and impurities to fall between the rollers, while the fruit itself is fed to the rear due to the angle of inclination towards the collecting basket.

Stair-mounting Wheel Chair

A new invention enables wheel-chair patients to get up and down stairs unassisted. The only difference between this and the conventional type of wheel chair is a well-thought-out second undercarriage, which is powered by two electromotors and can be swung out if and when required. It uses two non-skidding hard-rubber chains which, caterpillar-fashion, adapt to the ground and slowly pull patient and wheel chair up or down the stairs. For the present, the electric motors are directly connected with the net, a model with chargeable battery is under construction. A third motor has the task of keeping the chair level at any ground-inclination. Together with many other technical innovations, designed to ease patients' lot, the new invalid chair was shown for the first time at the recent special hospital-equipment exhibition at the "Planten un Blomen" exhibition grounds in Hamburg.

X-ray Camera for Industrial and Medical Use

The world's smallest x-ray unit—about the size of a pack of cigarettes—has been developed by the Illinois Institute of Technology in Chicago. The hand-held unit, which needs no outside electric current, has special and very practical applications. It can make on-the-spot checks on installed electronic equipment and aerospace components in situations where it would be difficult or impossible to use bulky standard X-ray units. X-ray inspection of such equipment detects internal defects which cannot be found by any other method without damaging the equipment. The tiny unit has already been used to check thin castings and welds and enclosed electronic circuitry. The device is described as a camera in reverse. Instead of film it contains a pellet of radioactive Promethium-147 which emits X-rays through the open shutter toward the object under study. X-ray sensitive film is placed behind the object to get the pictures. Because the radiation is emitted in a straight column with little scattering, no safety problems are involved if simple precautions are taken. The inventors suggest the operator keep out of the beam's line as much as possible and that his time of operation of the unit be limited. The device is being tested at Michael Rese Hospital in Chicago in diagnosing fractures, bone diseases and foreign bodies lodged in thin area such as limbs.

DEPRECIATION ON BUSINESS BUILDINGS—II

ASSESSEE'S CLAIM FOR INCLUDING LAND TENABLE

By Premjus Roy

THE next provision of law to be examined is Clause (iv) of sub-section (1) of Section 32 of the Income Tax Act which refers to the allowance of initial depreciation in respect of certain buildings which satisfy the conditions mentioned in that clause. This clause reads as under:

"*S.* 32(1)(*iv*).—In the case of any building which has been newly erected after the 31st day of March 1961, where the building is used solely for the purpose of residence of persons employed in the business and drawing a remuneration not exceeding two hundred rupees per mensem, or where the building is used solely or mainly for the welfare of such persons as a hospital, creche, school, canteen, library, recreational centre, shelter, rest-room or lunch-room, a sum equal to twenty per cent of the actual cost of the building to the assessee in respect of the previous year of erection of the building; but any such sum shall not be deductible in determining the written down value for the purposes of clause (ii) of sub-section (1)."

It might be argued that since the words used in this clause are "building erected," and "erection" of a building can refer only to superstructure and not land, 'building' in the preceding clause (ii) of Section 32(1) should also be construed in a restricted sense to mean only superstructure, exclusive of land. Such a contention would, however, be entirely futile, because clause (iv) of sub-section (1) of Section 32 which provides for initial depreciation is entirely separate from the allowance of normal depreciation prescribed under clauses (i) and (ii) of that sub-section. Where the building of the description mentioned in clause (iv) has been newly erected after 31st March 1961, the conditions are more restrictive than under clause (ii) although the allowance itself is more liberal. For instance, sub-section (iv) requires that the building should be "newly erected" after 31st March 1961, while for allowance under sub-clause (ii) the building could be old and need not be erected by the owner, but might have been purchased old by the owner. Clause (iv) requires that the building is either "used solely for the purpose of residence of persons employed in the business" or is used "solely or mainly for the welfare of such persons as a hospital, etc.," while for the purpose of clause (ii) the building should be "used for the purposes of the business or profession" and such use could be only fractional. If the building fulfils the various other conditions of clause (iv), initial depreciation is allowed at the rate of 20 per cent of the cost in the year of erection of the building, which is not to be deducted for determining written down value for purposes of normal depreciation under clause (ii). To take another instance, for the purpose of allowance of development rebate under Section 33, the requirements are, *inter alia*, that the machinery or plant should be 'new,' and should be 'installed' while for the purpose of allowance of normal depreciation under Section 32, the plant and machinery should neither be new, nor should it be installed, but it will do if the plant and machinery is old, and is not installed, such as would be the case of books, scientific apparatus and surgical equipment used for business and treated as 'plant' under the definition given in Section 43(3) of the Income Tax Act. It would be futile to contend that the restrictive words for the purpose of allowance under Section 33 should also apply to the allowance for plant and machinery under Section 32(1). Hence, the use of the words "newly erected" with the building for the purpose of initial depreciation under clause (iv) cannot have any bearing on the use of the word 'building' for the purpose of clause (ii) which provides for normal depreciation of building, irrespective of whether they are newly erected or not.

The Income Tax Act prescribes that the total amount of depreciation allowable in respect of building, plant, machinery, etc., will not exceed total cost of the asset. This would apply equally whether building includes mere superstructure, or includes superstructure and land. Further, when any building, machinery, plant or furniture is sold, discarded, demolished or destroyed, there is provision for a "balancing charge." If the sale or the scrap value, as the case may be, is less than the written down value, the difference is allowable as a deduction under sub-clause (iii) of sub-section (1) of Section 32, while if the sale value is in excess of the WDV, the difference is assessable to tax under sub-section (2) of Section 41 in the year of sale. Obviously, for the purpose of the balancing charge, there will be no difficulty if building is treated as including not only the superstructure but also the land. If a building is purchased as such for business, instead of land being first acquired and subsequently built upon, it would be clearly convenient to deal with the building, i.e. superstructure and the land attached thereto, as a unit, instead of placing an artificial value upon the land and the superstructure separately, and to allow depreciation on the cost of superstructure alone. Equally, at the time of sale of a business building, it would obviously be convenient to treat the sale of the building as a unit, instead of splitting the value of the superstructure and land, for the purpose of treating the superstructure alone for the balancing charge.

Section 43 of the Income Tax Act gives definitions of certain terms relevant to income from profits and gains of business or profession, used in Sections 28 to 41 and in Section 43 of the Act. Under one of the definitions, it is stated that "'plant' includes ships, vehicles, books, scientific apparatus and surgical equipments" used for the purposes of the business or profession. It will be seen that this definition is only inclusive, and comprehends such items as vehicles, books, scientific apparatus or surgical equipments, which, as commonly understood, could not be treated as plant, and in respect of such items as well, depreciation would be allowable under Section 32. If, for the purpose of allowing depreciation under Section 32, 'plant' is taken to include such items as books, scientific apparatus or surgical equipment, it would be a violence on language to say that 'building' would exclude land appurtenant thereto.

Exemption from Wealth Tax

By an amendment made by the Finance Act 1964, in clause (iv) of sub-section (1) of Section 5 of the Wealth Tax Act 1957, exemption from wealth tax is provided for "one house or part of a house belonging to the assessee exclusively used by him for residential purposes," subject to the proviso that where the value of such house or part, situate in a place with a population exceeding ten thousand, exceeds one lakh of rupees, the exemption shall be restricted to rupees one lakh. It would be unfair, or perhaps even absurd, to suggest that this exemption would apply only to the value of the superstructure, and not the house as a whole including also the land. Likewise, by another amendment made by the Finance Act 1964, a new clause (n) has been added in sub-section (1) of Section 33 of the Estate Duty Act, 1953, which similarly granted exemption from estate duty in respect of "one house or part thereof exclusively used by the deceased for his residence, to the extent the principal value thereof does not exceed rupees one lakh if such house is situate in a place with a population exceeding ten thousand, and the full principal value thereof in any other case." Obviously, the exemption would extend to the house, including the land appurtenant thereto, and not to the superstructure alone.

It would be clear from the above that far from there being repugnance if 'building' in Section 32 is understood in its grammatical meaning as including land appurtenant thereto, the only way to harmonise the provisions of Section 32(1)(ii) with other provisions of the Act is to treat 'building' as meaning the superstructure and the land appurtenant thereto. Assuming, for the sake of argument, that the word 'building' is capable of two interpretations; one that it means only superstructure, and the other that it means the superstructure and the land appurtenant thereto, even then the courts should hold in favour of the latter interpretation, since that would be more favourable to the assessee. As observed in *Escorts (Agencies) Private Ltd., Delhi,* vs. *C.I.T. and another,* 1958 P.L.R. 613, where there is a possibility of two equally forceful interpretations being put on a provision in a financial Act, the interpretation must proceed in a fashion that is favourable to the subject rather than against him.

It could be argued that no depreciation should be allowed on land even as part of the cost of a building used for business, because depreciation allowance is to cover "wear and tear" when a fixed asset is used for the purposes of business producing profits, while the land does not in fact suffer any such wear and tear in such use. While this argument would appear superficially attractive, it will not be a permissible interpretation of a statute to depart from plain and grammatical meaning of the word 'building' in Section 32(1) of the Income Tax Act, and when the meaning is clear, intention cannot be gone into. When land is attached to building, it becomes necessarily a part of that building. As stated by Kanga and Palkhiwala in their book on *Income Tax* (1963 Edition, Volume I, at page 347), "the assessee is entitled as of right to the full amount of allowance prescribed by r. 5 read with Part I of Appendix I to the Income Tax Rules 1962, irrespective of the actual wear and tear caused to the assets in question." Suppose there is a structure made of solid steel, it will not suffer any wear and tear for a considerable period of time, and perhaps the steel materials such as girders would be capable of being used in another building after remaining in use for almost hundred years in one building. This obviously would not justify the exclusion of the value of such steel structure from the cost of the building on which depreciation is allowable under Section 32. Equally, a building used for the purposes of business might have a solid construction like that of a fort, such as, for instance, it might be made of stone boulders, which do not suffer any perceptible wear and tear for scores and scores of years. Obviously, depreciation at the prescribed rate will be available under Section 32 even in respect of such a solid structure without any consideration as to its actual wear and tear. It would be futile to reject the claim for allowance of depreciation on a building inclusive of land on the ground of supposed equity when, under the Income Tax Act, there are various items of capital expenditure which get consumed or wasted in the course of being exploited for business, such as wastage of mining leases, and still no allowance is made for income-tax on account of actual wastage of such assets. It is only in the case of prospecting etc. for mineral oil that a concession has been made under Section 42 of the Income Tax Act, while in all other cases, the law shuts its eyes to the actual depletion of a wasting asset in the course of being used for business, although equity would fully justify such capital expenditure being treated as allowable deduction for business, spread over the estimated useful life of the asset. The rationale behind the allowance of depreciation is to allow capital cost of building, plant and machinery used for the purposes of business as a charge on the profits earned from the use of such assets, but spread over a certain number of years, and it would be perfectly logical and equitable to allow depreciation to be charged in respect of a building, including the superstructure and the land, just as much as in the case of plant or machinery.

Question of Discrimination

In Kailash Motors case referred to above, which went before the Income Tax Appellate Tribunal, the member who thought that depreciation should be allowed only on the superstructure, and not on the building including the land, cited the following two examples in support of his view:—

(1) Suppose there is a big plot of land of 5 acres and if an assessee has a shed on it, say 1,000 sq. ft. in area for the use of a factory for his business then does it stand to reason that he should get depreciation on the value of the 5-acre plot even though the superstructure utilised for factory is only 1,000 sq. ft. in extent? On the other hand, the assessee having only that much of area of land as that of the shed will get less depreciation as he will be getting depreciation only in respect of that small bit of land on which the factory shed stands.

(2) Supposing an assessee who has got a plot of land with an old superstructure on it, he will get only normal depreciation. That means, normal depreciation even in respect of that land, if we are to give the assessee's meaning to the word 'building.' If, on the other hand, on the very said land, in the place of the old structure, a new structure was erected on it, then on the value of the land initial depreciation will have to be given if the assessee's contention is to be accepted.

From these two examples, he came to the conclusion that, when one assessee gets lesser depreciation, while another assessee possessing the same extent of land will get a larger amount by way of depreciation, this will amount to discrimination offending Article 14 of the Constitution. Frankly, the argument is far-fetched. In the first example, if the assessee uses for the purpose of his business a large plot of land attached to a small superstructure, it is only right and fair that he gets a larger depreciation in respect of that building, as against another assessee who does not require any land for the use of his business and can carry on his business only within the compass of the superstructure. So far as the second example is concerned, the allowance for initial depreciation is quite separate from the allowance for normal depreciation, and it is only on fulfilment of certain conditions that initial depreciation is allowable on buildings which comply with those conditions. The initial depreciation on building is available only in certain cases on new buildings, and the legislature thought fit to encourage construction of such new buildings by providing for a larger initial depreciation. Such initial depreciation is allowable only in the first year of construction, and in subsequent years, there is no difference in the allowance of depreciation between such new building and any other building. Such classification would be perfectly permissible, and it is entirely futile to contend that such classification would be treated as discriminatory under Article 14 of the Constitution of India. Article 14 states that "the State shall not deny to any person equity before the law or the equal protection of the laws within the territory of India." Equal protection means the right to equal treatment in similar circumstances both in the privileges conferred and in the liabilities imposed by law, *vide State of West Bengal* vs. *Anwar Ali* (1952) S.C.R. 284 (320). The principle does not take away from the State power of classifying the persons for legitimate purposes. Every classification is in some degree likely to produce inequality, and mere production of inequality is not enough. Differential treatment does not *per se* constitute violation of Article 14. It denies equal protection only when there is no reasonable basis for the differentiation—*Ameeroonissa* vs. *Mehboob* (1953) S.C.R. 404 (414).

Differential Treatment

It was recently held by the Supreme Court of India in the case of the *State of Madhya Pradesh* vs. *Bhopal Sugar Industries Ltd.* that an applicant pleading that equal protection of laws has been denied to him must make out that not only he has been so treated from persons, others, but he has been so treated from persons similarly circumstanced without reasonable basis and such differential treatment is unjustifiably made. The Legislature has always the power to make special laws to attain particular objects and for that purpose has authority to select or classify persons, objects, or transactions upon which the law is intended to operate. Differential treatment becomes unlawful only when it is arbitrary or not supported by a rational relation with the object of the statute. As stated in *Budhan* vs. *State of Bihar* (1955) I.C.C.R. 1045 (1049), if a law deals equally with members of a well-defined class, it is not obnoxious and it is not open to the charge of denial of equal protection on the ground that it has no application to other persons. The classification may be founded on different bases, namely, geographical, or according to objects or occupations or the like. What is necessary is that there must be a nexus between the basis of classification and the objects of the Act under consideration. The classification may be according to the difference in time—*Ramjilal* vs. *I.T.O.* (1951) S.C.R. 127. In view of such clear exposition of law, it is clear that if the word 'building' is construed as meaning the superstructure and the land attached thereto, for the purpose of Section 32 of the Income Tax Act, it cannot be attacked on the ground of discrimination.

From what has been stated above, it would be clear that for the purpose of allowance of depreciation under Section 32 of the Income Tax Act, 'buildings' include not only the superstructure but also the land appurtenant thereto, which is used for the purpose of business. This construction would not only be grammatical but also logical and in harmony with other provisions of the Act.

When a building is purchased by a person for purposes of his business, it would be all right to show the entire cost under 'buildings' and to claim depreciation thereon as such. When, on the other hand, land alone is first purchased and debited to land account, and subsequently building is erected upon it, the value of land pertaining to the building should then be transferred to building account, by a corresponding credit to land account, and this might be so as well in the case of companies as in the case of firms or sole proprietorships. Even if the cost of land is not transferred to building account but remains separately in the balance sheet, this really makes no difference to the claim of the assessee for depreciation on building, including the land appurtenant thereto, if the claim is otherwise tenable.

(Concluded)

EFFICIENCY OF CALCUTTA PORT

A MATTER OF ALL-INDIA CONCERN

By A Special Correspondent

THE port of Calcutta recently hit the headlines because of the acute congestion that prevailed in June and in the first few days of July this year. The situation at present seems to have improved. But it does not mean that all is well with the port. There are many aspects relating to the port's working which require immediate attention in the interests of the economic development not only of West Bengal but of the country as a whole.

The importance of the Calcutta port to the Indian economy will be evident from the fact that in 1963-64 it accounted for 42 per cent of the country's exports. Out of the total earnings of Rs. 763 crores from the export of merchandise in 1963-64, the share of Calcutta port was Rs. 321 crores. The port serves not only West Bengal but also the States of Assam and Bihar.

The major commodities exported through Calcutta port are jute goods, tea, sugar, mica, iron ore, manganese ore, iron and steel and scrap, coal and engineering goods.

In 1963-64, tea worth Rs. 97.29 crores and jute goods valued at Rs. 155 crores were exported through this port. The port also handled in that year sugar worth Rs. 10 crores out of the total export of Rs. 26.87 crores from the whole of India.

The value of some other commodities exported through Calcutta port in 1963-64 was: mica Rs. 6.87 crores, iron ore Rs. 3.54 crores, hides and skins Rs. 4.51 crores, shellac Rs. 3.40 crores, woollen carpets (handloom) Rs. 4.94 crores and crude opium Rs. 2.16 crores. Details showing the quantity and value of goods exported through Calcutta in relation to all-India exports are given in the accompanying table.

But despite its great importance, sufficient attention has not been given to keep the Calcutta port always at a high level of efficiency. The Estimates Committee of the Lok Sabha, in the forty-eighth report issued in March this year, suggested that the turnround of ships in Indian ports, particularly Calcutta, needed to be improved. "There is heavy detention of ships at Calcutta port," said the Committee, and recommended that it would be worthwhile to undertake a study of the effect of heavy detention of ships at this port, on the c.i.f. value of exports.

To some extent, natural factors are responsible for the deficiencies of the Calcutta port. The port is not on the seaboard and the condition of the river Hooghly has been deteriorating. This will be clear from the fact that while formerly ships with a draught of 28 ft. could steam up to Calcutta, in recent years the draught has been reduced to 21 ft. At times in the summer it even goes down to 18 ft.

The Farakka barrage will help to reduce the forces and frequency of the bore tides and improve the navigability of the Hooghly. But this project will take another five years or so for completion. It is, therefore, necessary that greater attention has to be concentrated on measures which in the short-term will increase the port's efficiency.

Intensive dredging will, of course, be useful but it appears that the lack of up-to-date navigational aids and facilities for prompt repair and maintenance of dredgers are standing in the way.

At present about Rs. 3½ crores are being spent every year on the proper maintenance of the Hooghly river; and this is the main reason why port charges in Calcutta are higher than those of Madras, Bombay and Cochin. Industrial associations in Calcutta and the authorities of Calcutta port have been urging the Centre

Export of commodities through Calcutta Port together with all-India totals during 1963-64
(Value in lakhs of rupees)

Commodity description	Calcutta		All-India	
	Quantity	Value	Quantity	Value
Tea (m. kg.)	161	97,29	209	1,23,19
Jute and jute manufactures:				
(a) Raw jute ('000 tons)	26	2,91	26	2,91
(b) Jute manufactures ('000 tons)	904	1,54,88	904	1,54,88
Sugar ('000 tons)	163	9,99	525	26,87
Mica (m. kg.)	17.2	6,87	29 7	9,17

(a) Cotton yarn ('000 kg.)	312	12	14,357	6,62
(b) Cotton fabrics (m. met.)	19	90	520	49,66
Woollen carpets, handloom (m. sq. m.)	1.4	4,94	1.5	5,16
Coir cordage (m. kgs.)	1.6	20 3	2.4	30
Sewing machine and parts	..	24.6	..	28
Electric fans and parts	..	50	..	58
Opium, crude ('000 kg.)	348	2,16	475	2,97

Government that the latter should bear the cost of maintaining and servicing the Hooghly and that this should not be financed by charges levied on the users of the port. The Centre however, has not agreed yet.

The low labour output is another cause for concern. It was recently disclosed that till a few years ago, a steamer could discharge about 6,000 tons of general cargo in six days and an equal quantity of foodgrains in 60 hours. But now it takes 12 days and 8 days, respectively for discharging the same quantity of cargo. It is alleged that the stevedore labour is deliberately resorting to go-slow tactics. The replacement of the present mode of payment of wages by an incentive scheme, it is felt, will help to improve labour productivity in Calcutta port. This matter is now under the active consideration of the Port authorities.

The slow progress in regard to modernisation is another obstacle to efficiency. It is reported that the port does not have an adequate number of mobile cranes and other equipment to handle heavy weight cargo. Shortage of special types of wagons, dry dock facilities, lack of berths and godown space are some of the other difficulties experienced by the trade. The construction of the Haldia port will help to relieve the pressure on Calcutta to some extent because coal, iron ore and some other types of cargo will be diverted to the former. But Haldia, according to present indications, will take more than five years to be completed.

Meanwhile, the Calcutta port will continue to handle a steadily increasing volume of goods both in regard to export and import. It is, therefore, necessary that the question of improving its efficiency and providing better facilities should receive the serious attention of the Government of India, the Government of West Bengal and the authorities of the Calcutta Port.

TATA ENGINEERING AND LOCOMOTIVE COMPANY LIMITED

STATEMENT OF THE CHAIRMAN, MR. J. R. D. TATA

THE following is the statement of Mr. J. R. D. Tata, Chairman of the Tata Engineering and Locomotive Company Ltd., for the year 1963-64:

Before I review the Company's operations during the past year, I must give expression to our profound sorrow at the passing away of our late Prime Minister. Although his failing health during the last year had given rise to some anxiety, his sudden death at the end of May stunned the people of India and, indeed the whole world, for Jawaharlal Nehru's status as a statesman and as a man transcended political and geographical frontiers. His fame, his writings, his struggles and sacrifices in the cause of freedom and peace were known in every country of the world and it is probably true to say that more people mourned his passing than that of any other man in modern history, with the exception perhaps of Mahatma Gandhi. It was possible to disagree with some of his and his Government's policies and decisions on political, international or economic issues, but it was impossible not to be deeply affected and influenced by his intellectual brilliance, his single-minded devotion to the causes he espoused, his courage, his innate goodness, the depth and tenderness of his solicitude for the afflicted, the oppressed and the poor and the love which he inspired amongst the people. Jawaharlal played a dynamic role in shaping world history during these two decades, but it is as the Maker of Modern India that he will be remembered and his memory forever enshrined in the hearts and minds of the people of India.

I am glad to report that the Company made good progress in its operations, profits and expansion during the past year which, however, was also marked by certain unhealthy developments culminating in the tragic events of March 1964, to which I shall revert later in this review.

Output rose appreciably; the first stage of expansion to 18,000 vehicles is now virtually complete and work has started on the second stage intended to bring production up to 24,000 vehicles per annum. I am glad to report that the Agency for International Development has just approved of a further loan of $11.80 million (Rs. 5 62 crores) to finance the foreign exchange element of the second stage of the expansion programme. Orders for imported machine tools and equipment will be released shortly.

Operating profits for the year were Rs. 114.75 lakhs higher than in the previous year, but most of the excess was absorbed by increased allocations to depreciation, development rebate reserve and taxation, so that the net increase in disposable profit was only Rs. 20.62 lakhs. The total amount available for distribution was thus Rs. 136.15 lakhs, which is some Rs 8 lakhs short of the amount required to maintain the current dividend of 14½ per cent on our enlarged capital. Your Directors have, therefore, transferred Rs. 8 lakhs from the general reserve and recommended the same dividend as last year. A total of Rs. 14 lakhs will thus have been drawn from reserves over the last two years towards the payment of dividends. This will have been fully justified as barring some totally unforeseen setback, the increased profit resulting from our expanding output should enable us without difficulty to continue paying the same dividend on ordinary shares in future. In fact, there are in my view, good prospects of the Company being able to maintain the same rate of dividend even after the additional issue of 200,000 ordinary shares in the ratio of one new share for every five shares held, which is being recommended to you at such premium, not exceeding Rs. 50 per share, as the Controller of Capital Issues may prescribe and as may be agreed to by the Directors.

In view of the issue for the same amount made as recently as 1963, your Directors would have normally preferred to postpone the present recommendation for a year or so, but the extraordinarily large and rapid expansion of the Company and the growing imbalance in the Company's capital structure make a further issue imperative and urgent.

In relation to total funds employed of about Rs. 44 crores (including Rs. 25 crores of debt), which are expected to rise to about Rs. 60 crores by 1966, our present share capital of Rs. 12 crores is clearly disproportionately small, while our debt equity ratio will be unacceptably large if the share capital is not increased and the amount is borrowed instead. An issue of shares is therefore required not only to provide urgently needed funds but also to improve the debt-equity ratio to which the A.I.D., like the World Bank, attaches considerable importance.

Your Directors realise that these are difficult times for shareholders to find additional funds to invest. In view, however, of the special and urgent requirements of the Company, the recent indications of a revival in the state of the market and the fact that the new shares may be expected to earn a dividend of 14½ per cent from the date of issue, equivalent to 9.7 per cent on capital plus premium, I am sure shareholders will approve the recommendation which is also subject to the approval of the Controller of Capital Issues.

Although about half of the capital of the Company is institutionally held and only one and a half crores rupees or so will therefore be obtained from individual subscribers, the Directors have recommended, in order to lighten the burden on shareholders, payment of the amount for the new issue in two instalments, one in November this year and the other in May, six months later.

The demand for Tata Mercedes-Benz vehicles continues unabated and in spite of the steady increase in our output, we have so far failed to catch up with it. Ever since we commenced production of these vehicles, they have been the first choice of the transport operator because of the quality, performance and ruggedness built into them. There are today more Tata Mercedes-Benz vehicles on the road than any other make.

There are misguided people who assume that bigness in private sector enterprises, particularly those which supply a significant proportion of the total market for any product, results in the exploitation of the consumer and is therefore against the public interest. The manner in which your Company has used its pre-eminent position in the field of commercial vehicles should provide a telling answer to such a belief.

Between October 1959, when the Company completed the initial phase of its truck manufacturing programme, and today, the price to a customer in Bombay of the TMB 312/42 model —the most popular model in our range—increased from Rs. 30,455 to Rs. 37,619, i.e., by Rs. 7,164. During the same period, the sales, excise and other taxes charged on this vehicle by the Central and State Governments increased by Rs. 6,780, while the cost of imported materials and components rose by Rs. 739, a total of Rs. 7,519. Therefore, over the last five years which witnessed a disturbing and continuous rise in the price of practically every product, commodity or service in the country, the price of the TMB vehicle excluding the above two items has actually fallen in spite of the continuous incorporation of a number of major improvements to the vehicle, the cost of which was absorbed by the Company, and in spite also of the fact that the price of locally made ancillary items invariably exceeded the price of the imported ones which they replaced.

The point to be noted in this context is that the Company could not have fulfilled its desire to keep its prices low in the interests of the consumer and the country if it did not have the benefits of large-scale production.

If Government had not sanctioned the successive expansion schemes of Telco, as they wisely did, there is no doubt that the user of Tata Mercedes-Benz vehicles would be paying a substantially higher price than he is paying today, while the country would have been deprived of the full benefits of a powerful, versatile and highly productive engineering unit, geared to meet both civilian and military requirements, and also of most of the substantial contributions which have accrued to the public exchequer as a result of the Company's operations. It is noteworthy that during the year under review, public revenues were enriched, as a result of Telco's operations, by as much as Rs. 16 crores, in import and excise duties, sales taxes and taxes on profits.

But this is by no means the full measure of our Company's contribution to the Indian economy, The Company has created direct employment for over 16,000 men, whom it has, over the years, trained to a high degree of skill. The importance of this contribution should not be underestimated, for the economic growth of a country depends just as much on the specialised skills of its workers, technicians and managers as on machines, raw materials and finance.

Finally, the large-scale development of Tata Mercedes-Benz vehicles has helped to establish a number of ancillary industries in the country, the lack or insufficiency of which in the past has been one of the main obstacles to the rapid development of the automobile industry. All in all, we can be justly proud of our performance during the last decade which, in terms of growth and service to the country is probably unsurpassed by any other company in the country.

I have referred earlier to the large revenues accruing to the national exchequer as a result of our operations. As the cost of Government's various imposts is largely included in the price of our vehicles, it is the user who ultimately bears this heavy initial burden; but that is only the beginning so far as he is concerned. On an average, every commercial vehicle in regular use for highway transport pays every four years in taxes alone a sum in excess of its original cost. Of all economic activities in the country, none to my knowledge bears such a crushing burden of tax as the road transport industry. It is, I believe, a fact that the incidence of taxes and duties alone in every ton-mile of road transport equals the total amount charged by the railways for a ton-mile by rail. In addition to crippling taxation, the road transport industry suffers in a number of ways from Government policies and is burdened with such a maze of outmoded restrictions as to prevent it from playing in full the role it would in the country's economic development. That in spite of these conditions, road transport in India has grown to such an extent that it is now estimated to carry half the country's passenger traffic and over a fifth of its freight, reflects the road transport industry's technological advantages as well as the initiative, perseverance and resiliency of its operators.

India has one of the world's largest railway systems borne long before motor vehicles came into existence. As a result, the transport policies of successive administrations have invariably been based on "railway thinking" with little consideration given to alternative forms of transport. This thinking has dominated official attitude to transport problems to a degree which is probably unique in the world. India must surely be one of the few countries where such numerous and oppressive barriers continue to be placed in the way of the development of road transport while railway mileage continues to be expanded at tremendous cost. How else can one explain the restrictive regulations that are imposed by the numerous State Governments which make inter-State trucking a nightmare for operators and long-distance trucking virtually impossible? These restrictions include difficulties and long delays in obtaining permits for inter-State operations, limitations on the number of permits issued for some routes and the temporary nature of permits that make long-term investment in motor transport hazardous. Multiple taxation of vehicles and sometimes taxation of the cargo add to the difficulties. The result is that inter-State traffic is reserved to the railway to a degree which fails to take into adequate account that for some goods the speed and other advantages of highway transport are very important. What is needed is a system where inter-State trucking permits for operating through any State should be issued by a central authority. The permits should carry a fee sufficient to absorb all the State and local vehicle taxes at present levied. The permits should be given for one year and automatically renewed unless the holder has his permit revoked for some violation. These should not be limited in number for the trucking business attracts thousands of small operators who should be permitted to develop the traffic.

It is unfortunately apparent, from a recent announcement of the railway's share of about 70 per cent of the total proposed investment in surface transport in the fourth Five-year Plan, that Government's thinking on the subject is as railway-dominated as ever and that the prospects of some relief to the road transport industry and of an improvement in the operating conditions are dim indeed. I feel that the time has come when a comprehensive and impartial study of the economics of transportation in India needs to be undertaken by an independent body. An explicit analysis of benefits and costs will, I am sure, reveal that greater investments in highways and some relief to the road transport industry are not only fully justified but urgently needed.

I have kept to the last a reference to the unhealthy developments mentioned in my opening paragraph which marred an otherwise satisfying year of progress. I am referring to the labour situation as it developed at Tatanagar during the past twelve months and to the shocking events which brought such misery and shame to Jamshedpur during the month of March last.

The labour situation at the Telco Works has been increasingly unsatisfactory during the last year and particularly since the beginning of 1964. Internal rivalries between two groups within the recognised Telco Workers' Union have been mainly responsible for the deteriorating situation and the blame must squarely attach to the dissident group which, notwithstanding the fact that its claim for control of the Union was, and still is, the subject of proceedings before the Patna High Court, carried on an intensive agitation which far exceeded the bounds of legitimate trade union activities. In its attempt to force its demand for recognition, this group resorted to widespread intimidation not only of workers but also of supervisory personnel. Indiscipline, defiance of constituted authority and unpunished intimidation, threats of violence and actual violence create an atmosphere where crime and lawlessness find it easy and profitable to rear their ugly heads.

We have constantly sougth the assistance of the Central and State Governments, in addition to doing everything possible ourselves, to restore normalcy and are grateful to them for their assistance. I earnestly hope that stern action will be taken against those who, under the guise of trade unionism, deliberately create problems of law and order and prevent the full utilisation of industrial capacity urgently needed by the country. The recent communal disturbances have shown how easy it is for a handful of mischievous and anti-social persons to lead masses of people to planned acts of violence.

With its thousands of tough and hardy men drawn from all parts of the country, a large industrial centre like Jamshedpur-Tatanagar obviously contains explosive possibilities of trouble and therefore requires the maximum of alertness coupled with firm and timely action on the part of the management of factories and those charged with the maintenance of law and order. The scope for Management to maintain discipline and prevent acts of violence and intimidation is largely limited to the shop floor whereas in this case, agitation and violence grew and flourished largely outside the works.

Perhaps one of the reasons for the inadequacy of law and order enforcement in the area, is the fact that although the city of Jamshedpur-Tatanagar is the second largest in the State of Bihar and one of the largest and most vital industrial centres in the whole country, it is still constitutionally treated for administrative purposes as a sub-division of a district, the headquarters of which are not even Jamshedpur but Chaibassa which is a minor town in the area. We have urged that consideration should be given to upgrading Jamshedpur to an administrative status within Bihar commensurate with its importance and the magnitude of the task and problems of administering it.

While looking forward to another year of progress, I wish to acknowledge the diligent efforts of our employees, suppliers and dealers which have made possible the good results before you in spite of the many difficulties and obstacles which faced them. In particular, our officers at Tatanagar, Indian and German, deserve our gratitude for the hard work they put in and the fortitude with which they faced difficult and harrassing situations.

J. R. D. TATA,
Chairman.

BOMBAY, *9th July, 1964.*

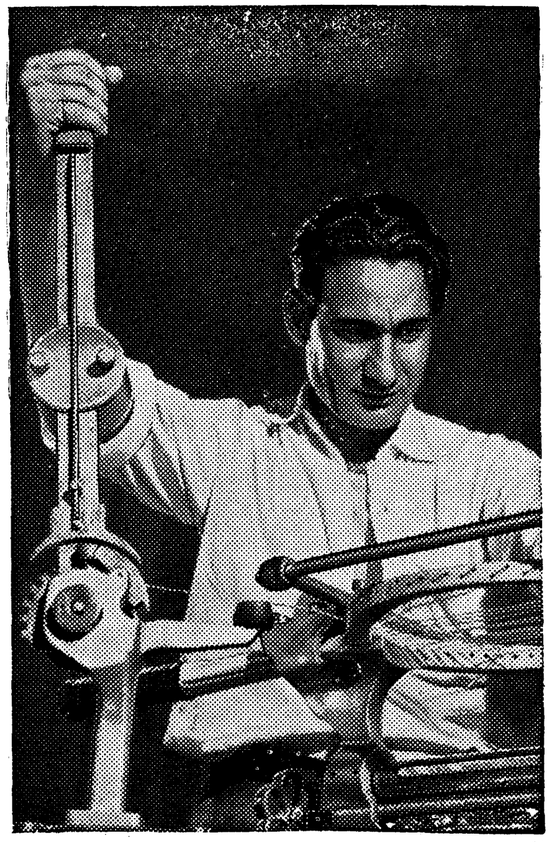
Prakash is a small industrialist who needs money badly for purchasing raw materials. But he cannot afford high interest and has little security to offer. Who will help him?

THE STATE BANK HELPS
For the biggest bank— no client is too small.



Through their 1600 offices all over the country, the State Bank and its subsidiaries give the following financial facilities to small-scale industries.

Advance against security of raw materials and finished goods.

Factory type advances where security cannot be kept under the Bank's lock and key. Borrowers have free access to raw materials.

Clean credit facilities where no securities are obtainable.

Medium-term loans for modernisation and expansion.

Instalment credit for purchase of machinery.

Interest is as low as 6%. In special cases the outer limit is 7% inclusive of incidental charges.

THE STATE BANK OF INDIA
Big scale help for small scale industry.

PRODUCTIVITY IN WORLD OIL INDUSTRY

COMPANY MANAGEMENTS TRYING TO CUT COSTS

DESPITE the depredations of the tax collector, the relentless rise in wage and other costs, and the weakness of selling prices, the advance in oil company earnings continues. This somewhat paradoxical result is due in part to the healthy growth of demand for petroleum products. It is due also to strenuous efforts on the part of company managements to cut unit costs and to improve efficiency all along the line. Evidence of success can be found in the rising figures of output per worker: the staff employed by leading companies has been reduced by 10 to 20 per cent in the past few years, despite large increases in the volume of oil handled. It can be found also in the recent improvement in earnings per unit of capital employed: of the 22 companies whose 1963 results were reviewed in these columns two months ago, only two failed to show a higher return on shareholder's equity than in 1962. Even so, the rates of return remained substantially below the peaks of 1956-57 owing to the drop in prices.

Maximising the return from a given input of resources is not merely a question of raising efficiency at each stage of the Company's operations. It may call for a redeployment of resources to secure the most rapid expansion in the most profitable markets or sectors of the business; and in extreme cases this may mean pushing out the frontiers of the industry into new territory. Advances are being made along many different lines, as the Company reports clearly reveal. But there is no reason to suppose that the end of the road is yet in sight.

Exploration and Production

The exploration sector absorbs a great deal of the effort of every integrated oil company because a firm's future is largely dependent on the maintenance and expansion of its raw material base. Since the search for oil is so time-consuming and costly, there is a powerful incentive to seek for improved exploration techniques. Some progress in this direction is being achieved by the marriage of advanced scientific knowledge with modern methods of electronic data processing. Prospective oil-bearing areas within a sedimentary basin are being more accurately defined by improved geological techniques, while more effective seismic shooting procedures are yielding better sub-surface maps. An intricate system for measuring traces of magnetism is leading to new methods of examining and orienting rock structures. The information thus obtained, by contributing to improved understanding of underground formations, will help both the search for oil and the planning of well patterns in producing fields.

So far as drilling is concerned, one company, Mobil, reports that the use of air or gas as a drilling medium in place of conventional mud has brought considerable savings in the areas where the technique can be employed. In some fields costs are also being reduced by the installation of automatic well-testing units and other automatic facilities. A "mud separator" employed offshore in Nigeria and in the Gulf of Mexico permits the recovery, for re-use, of valuable chemicals from the fluid, making possible a significant saving in costs.

Having found oil, a company's next problem is to produce it as economically as possible and to recover the highest feasible proportion of the oil in place. A sand-consolidation method of well completion that increases productive efficiency has been developed by the Royal Dutch/Shell group in its Netherlands laboratories. This consists of injecting a plastic that holds back the sand but allows the oil to flow through. The method has recently been proved in practice and has been licensed to companies providing specialist services to the oil industry.

Again, scale models simulating the flow processes in oil-bearing strata have yielded valuable information leading to the recovery of oil that would otherwise have been left untapped. Recovery rates are also reported to have been improved by the construction of mathematical "models" of oilfields and the use of high-speed computers to find the optimum solution.

Almost all important producing companies in the United States and many elsewhere are pressing ahead with secondary recovery projects—which may in some cases double or treble the recoverable reserves of the field at comparatively low cost. To take one company as an example, Texaco reports two important developments in this field: the use of "attic oil recovery"—the injection of gas into the crest of the reservoir in highly faulted salt-dome fields; and the co-operative development in Texas of a supply system capable of delivering 600,000 barrels a day of salt water to producing areas which have inadequate water supplies for secondary recovery projects. Standard of California mentions that over the past decade secondary recovery projects have accounted for more than 10 per cent of its western hemisphere production, at a cost of only 4 per cent of its total development expenditure. Among other companies, Continental derived about 17 per cent of its 1963 net output of crude in the U.S.A. from secondary production, while for Phillips the proportion was as high as 25 per cent.

Reducing Transport Costs

In the marine transport sector by far the most important contribution to cost-cutting is still being made by increases in the average size of tankers employed. (Costs per ton are about half as much with, say, a 70,000-tonner as they are with a T2.) Oil companies continue to report progress in the elimination of small and obsolescent vessels from their fleets, and in the construction of terminal facilities capable of accommodating the largest tankers afloat; improvements in hull design that make for higher speeds and better performance generally; and the installation of labour-saving electronic controls on the bridge and in the engineroom. The most recent development is the fitting of tankers with equipment enabling them while at sea to transmit automatically details of their performance. Analysis of this information by computer enables the owners to improve the operating efficiency of their whole fleet.

Pipelines as well tankers offer substantial potential economies of scale, provided, of course, that the available capacity can be fully utilised; and lines with diametres of 40 inches or more are likely to become increasingly common for the transport of crude oil and natural gas. The large reduction in costs offered by such lines is leading increasingly in the direction of joint ownership; and control by computers is becoming more common. Oil consumption in western European countries is now reaching levels at which it is possible to take advantage of the economy of pipeline transportation for products. In the U.S.A. the most remarkable development in the sphere of products lines is the Colonial Pipeline system, which will be completed this year: with a total mileage of about 2,600, stretching between Houston and New York, this system will have an ultimate capacity of 1.2 million barrels a day (say 60 million tons a year) making it by far the largest products line in the world.

Efficiency in Refining

In refining as in transport there is a natural tendency for unit costs to fall as the scale of operations increases. But because Governments of developing countries with relatively small oil consumption are often anxious to have local refining plants, a great deal of thought has lately been devoted to the design of economical small plants. And a fair measure of success has been achieved. In both large and small plants, productivity is being raised by the employment of the most modern equipment and techniques, by improved budgeting and control, by planned maintenance, and by other means. Hence the cost of refining to produce a barrel of products is reckoned to have been cut by about a fifth in a decade.

The fundamental problem of the refinery manager is to obtain the maximum financial return from a given throughput of crude, and there is a growing inclination today to employ computers to determine the optimum operating programme to match the changing pattern of demand. In North America and elsewhere much attention is being devoted to the development of new processes, including new catalysts, to maximise the yield of high-valued products. The Gulf report, for instance, speaks of new hydro-cracking catalysts that can be tailored to maximise the production of either gasoline or middle distillates. Such new catalysts help to expand the capacity of existing cracking plants, thus increasing the Company's ability to manufacture high-grade gasoline without additional capital investment.

A striking example of cost-cutting in the refining sector which has come in for a good deal of publicity lately is that provided by Esso's Fawley plant in the United Kingdom. Here the problem of underutilisation of labour, which is alleged to be all too common in British industry generally, was solved by a comprehensive agreement between the management and the trade unions concerned. In exchange for a substantial increase in wages and reduction in working hours, the men agreed to changes in working practices which are said to have resulted in a 50 per cent improvement in productivity in two years. These results are spurring other companies in the U.K. to seek similar agreements, with a view to reducing their labour costs in this sector. But the hammering out of such agreements can be a lengthy process.

The Overall Picture

An integrated company is more than the sum of its several parts. Most fundamental and most intractable of all the problems of management is that of co-ordinating the whole range of the Company's operations. This involves the allocation of crudes to individual refineries and the movement of products to marketing areas, taking account of differences in refinery and transport costs, the availability of ships, changes in the pattern of demand and so on. The complexity of the problem increases as new types of crude oil are brought into the picture, additional refineries constructed, new products introduced and product specifications made more exacting. With such a degree of complexity, the optimum solution of this fundamental problem of management can be found only by the use of large-scale computers. This is a field in which oil companies have been pioneers. To take one example, the British Petroleum Co., after seven years' experimental work with smaller models, is to utilise the fantastic capacity of London University's new Atlas computer to help co-ordinate its world-wide operations.

Sometimes, as has been suggested, the search for the most profitable investment opportunities may take a management to the fringes of the oil industry, or beyond. Thus, oil companies have in the past taken a large stake in the manufacture of synthetic rubber, various plastics, fertilisers, and other chemical products; and they have pioneered the ocean transport of liquefied methane. Now one U.S. concern, Pure Oil, has diversified into a new energy field—geothermal power, brought to useful form as steam which can be used to drive power station turbines. Completed on 1st January this year, the Company's unique steam well in southern California also yields a brine containing potash and other minerals. Another company, Jersey Standard, has just purchased the business of American Cryogenics Inc., a company engaged primarily in the manufacture and sale of liquefied industrial gases and associated equipment used to create extremely low temperatures. Jersey hopes that this investment will be highly profitable, since new developments in cryogenics are making a significant contribution to a wide range of industries—which suggests that the demand for such equipment will expand greatly during the next few years.

Challenge and Opportunity

There is no reason to suppose that the oil companies' quest for productivity is approaching a limit, assuming that the forces of competition continue to function. It is a truism that every successful cost-cutting innovation reduces the scope for further progress in the same direction. But the very rapidity of the industry's growth enlarges the opportunities for the replacement of obsolescent plant and equipment, the attainment of the full economies of large-scale operation, and the improvement of labour productivity without the distasteful necessity of discharging employees already on the payroll.

Within the industry's existing frontiers there is room for further advance, particularly perhaps in the sphere of exploration and production. The industry needs more reliable methods of finding oil, further improvement in drilling techniques, and even more efficient methods of production that will step up recovery rates. Indeed, every sector offer its challenge and its opportunities. In the interests of shareholders, consumers and host Governments alike, it is important that managements should continue to face the challenge and to grasp the opportunities with both hands.—(*By Special Arrangement with the Petroleum Press Service.*)

U.S. FOOD-FOR-PEACE PROGRAMME

INDIA RECEIVES MORE THAN A FIFTH OF ALL P.L. 480 AID

NO other country has contributed so much to the economic advancement of the free world as the United States. Indeed, it would be no exaggeration to say that, but for the massive aid extended by the U.S., the tempo of world economic development, especially in the underdeveloped region, would not have been so high. The U.S. aid, which consists of grants, loans and technical assistance, is channelled through three agencies: The U.S. Agency for International Development, the Export-Import Bank and the U.S. Food-for-Peace Programme. It is the Food-for-Peace Programme that is most fascinating, a "twentieth century form of alchemy," to borrow the phrase of Senator Hubert Humphrey. The basis of this Programme is Public Law 480, popularly called "P.L. 480," which was passed by the U.S. Congress on 10th July 1954. On the occasion of the Programme's tenth anniversary last month, while the Government and the people of the U.S. felt justly proud of the vital contribution made by P.L. 480 to the welfare and progress of other peoples, all the aid-receiving countries expressed their sense of gratitude for the immense benefits conferred by the Programme. Indeed, the Programme has, as Mr. Richard W. Reuter, Director of the Programme, has very aptly stated, provided the means for converting America's agricultural productivity and abundance into schools and text-books, hospitals, bridges and roads, the vital ingredients of economic and social growth in the developing nations of the world."

Incidentally, the P.L. 480 Programme has been of great importance to the American economy itself, in that it has provided an outlet for a considerable part of the surplus agricultural commodities. Every year, the U.S. produces much more than what it actually consumes. An idea of the huge surplus of foodgrains and cotton can be had from the table at the foot of this page which gives actual production and stocks during the last thirteen years. It will be noted from that table that, just before the shipments of P.L. 480 commodities began (end of 1953-54), the unsold stocks in the U.S. aggregated over 25 million metric tonnes of wheat, 29 million tonnes of coarse grains and 5.6 million bales of raw cotton.

U.S. Agricultural Exports Under Title I of P. L. 480
(From 1st July 1954 to 31st December 1963)

Commodity	Unit	Quantity	Export market value (Million $)
Wheat and wheat flour	Million bushels	2,909.20	4,829.50
Foodgrains	,,	48.51	516.20
Rice	Million cwt.	83.66	485.40
Cotton	Million bales	8.13	1,184.80
Cotton linters	'000 bales	7	0.80
Meat products	Million lbs.	113.19	38.10
Tobacco	,,	411.72	300.80
Dairy products	,,	583.83	102.10
Fats and oils	,,	7,657.55	990.10
Poultry	,,	32.84	9.70
Dry edible beans and peas	Million cwt.	1.02	8.00
Fruits and vegetables	Million lbs.	198.15	18.10
Seeds	Million cwt.	10.00	0.40
Total	..	..	8,483.20

*Since the inauguration of the Food-for-Peace Programme on 10th July 1954, more than $11.4 billion worth of U.S. farm products have been sent overseas. On an average, five 10,000-ton ships, we are told, leave the U.S. every day carrying Food-for-Peace cargoes. The P.L. 480 products are sold against payment in local currencies (that is, the currencies of the countries to which the products are supplied). The major part of the currencies so acquired by the U.S. is given back to the purchasing country as grants and loans to be used as capital for economic development. During the calendar year 1963, for instance, over three-fourths of more than $1,700 million worth of commodities made available under P.L. 480 were sold for local currencies, of which $740 million were loaned back to the Governments of the respective countries for financing economic development. The total amount loaned back since 1954 is estimated at $4 300 million, besides the $1,800 million provided as grants. The local currencies are also used, instead of dollars, to pay the costs of U.S. installations and programmes (for example, U.S. buildings, trade fairs, educational exchange, translation of books and periodicals, American schools and military housing). In the fiscal year 1963, about $211 million of U.S. bills overseas were paid for by local currencies generated by the sale of American food.

Of special importance is the provision of capital for U.S. investment overseas. Under the "Cooley Amendment" to P.L. 480—the Amendment is named after Mr. Harold D. Cooley who introduced it in the U.S. House of Representatives—it will be recalled, up to 25 per cent of the local currencies generated by the sale of surplus products can be used by the Agency for International Development to grant loans to U.S. firms or branches for business development in other countries. The total of such loans as on 30th June last stood at $149 million, the number of firms investing being 232. What is more, American farm products are being used as a supplementary wage for about 700,000 workers in 22 countries. "These food-for-work projects," to quote Mr. Richard W. Reuter, provide an essential incentive for self-help community and economic development activity. The use of food as a catalytic force in economic and social development is one of the most exciting potentials of the programme. Food-for-Peace is vigorously expanding programmes that use food as partial payment for work done on a broad range of economic development projects: construction of schools, child-feeding centres, roads, bridges, irrigation projects, resettlement and land reform projects, livestock and poultry-feeding projects, reforestation and sanitation...." To what extent the programme has benefited some countries has been highlighted by Mr. Richard Reuter thus:

Philippines: More than 6,000 young men will find work in a one-year reforestation programme. Patterned after the Civilian Conservation Corps camps of the U.S. in the 1930's, the Philippine Youth Conservation Service will plant new trees over 150,000 acres.

Dahomey (West Africa): Over 7,000 unemployed or semi-employed workers and their families are engaged in a training and works programme that includes land clearance and road repair, farm relocation and experimental teak and cashew cultivation.

Tunisia: A Labour Intensive Development Programme has provided full or part-time employment to 300,000 people in the past five years.

Taiwan (Republic of China): 45,000 workers and 14,000 veterans are employed in irrigation, flood control, land reclamation, soil conservation, forestry development and fishing harbour construction projects.

Ecuador: Some 6,900 people benefit from the work of 1,150 heads of families who are working on village improvement programme in 46 Ecuadorean towns, building roads, community baking ovens, washing stations and village sanitary facilities.

Colombia: 120 rural families are being grubstaked in a resettlemeent project that includes land cultivation and access roads.

Bolivia: 1,500 colonists are building schools, medical posts.

Algeria: 60,000 jobless are being put to work on programme designed to bring about better use and management of land and water resources and to improve agricultural production.

Mexico: An estimated 150,000 workers and dependents will benefit directly from the labour involved in a village improvement programme which includes housing and home improvement, well and reservoir construction, fishing projects and road construction.

Morocco: 30,000 previously unemployed workers built in a three-month period 1,200 new school houses and 600 homes for teachers.

Brazil: Some 600 farm families will be grubstaked during the next two years in a co-operative land clearing and resettlement project in the Pindorama area.

Western Europe: P.L. 480 shipments since 1954 aggregate $3,500 million in value. Of this total, $1,800 million worth of products are sold for local currencies, $1,500 million bartered for strategic materials or distributed in relief programme through American voluntary agencies operating overseas, another $106 million used in emergency feeding and economic development programme and $44 million sold for dollars on long-term credit terms. Most Food-for-Peace Programme in Western Europe have now been concluded, as the nations concerned have reached new levels of progress and prosperity and repaired their economies from wartime damage.

India, too, has benefited greatly from the U.S. P.L. 480 programme. Since July 1954, eight P.L. 480 agreements have been concluded between India and the U.S. The agreements together cover agricultural commodities worth Rs. 1,190 crores ($2,500 million), representing as much as 22 per cent of the aggregate P.L. 480 shipments so far. Indeed, India is the largest single recipient of the U.S. P.L. 480 aid. The bulk of India's food imports in the past few years has been met from out of P.L. 480 arrivals. The total actual arrivals up to the end of May 1964 amount to over 22 million tons of wheat, 1.38 million tons of rice and 738,000 tons of foodgrains. It is stated that one shipload of P.L. 480 food is arriving in India every day throughout the year.

P.L. 480 Assistance to India

Commodity	Agreement signed up to 15th July 1964		Commodity arrivals up to 31st May 1964
	Programmed quantity (In thousand metric tons)	Value (In million dollars)	Approximate quantity (In thousand metric tons)

Total market value	..	2,138.3	..
Ocean transportation	..	358.37‡	..
Grand total	..	2,491.67‡	..

* Cotton is reported in thousand Indian bales of 392 lbs. each.
† Preliminary arrivals through 31st March only.
‡ Includes approximately 86.4 million ocean transportation differential costs for which the Commodity Credit Corporation is not reimbursed by the recipient country.

Of the total value (Rs. 905 crores) of agricultural commodities obtained by India from the U.S. up to the end of April last, about Rs. 726 crores (representing 80.5 per cent of the total) have been made available to the Government of India as grants and loans for agreed development projects. The rupee loans made out of P.L. 480 proceeds aggregate about Rs. 390 crores, the projects covered being mainly in industrial, transport and power spheres. The terms of loans are very liberal. Since they are repayable in local currencies over 40 years, including a ten-year grace period, they do not impose any burden on balance of payments. Some Rs. 33 crores have been given as loans to the American participants in joint undertakings in the private sector. Assistance in the form of grants (sometimes in rupees and sometimes in dollars) has been made available to projects in the field of developing human resources, the most prominent being education, agriculture and health; the total of such grants up to the end of April 1964 is put at Rs. 178.3 crores.

Note:—The season ends on 30th June for wheat and coarse grains and 31st July for rice and cotton. Figures relating to stocks are end-season totals. Figures for rice are milled equivalents. Figures for cotton are in million bales of 478 lbs. net.
* Exclude sorghum. † Includes sorghum. N.A.—Not available.

ZENITH STEEL PIPES FARES WELL

SALES, PROFIT, DIVIDEND AND RESERVES HIGHER

THE progress made by the Zenith Steel Pipes Ltd. (Director: Mr. B. K. Birla, Bombay) during its second year of production ended 30th April 1964—the factory went into production in May 1962—is quite encouraging. Sales have shown nearly a threefold rise from Rs. 148.23 lakhs to Rs. 433.73 lakhs and gross profit has jumped up from Rs. 34.78 lakhs to Rs. 52.70 lakhs. This improvement in turnover and profit has stemmed from the Company having produced about 32,000 tonnes of pipes of different classes during the year, as against about 12,000 tonnes in the previous year. Whereas gross profit is up by nearly Rs. 18 lakhs, the net profit shows only a small increase of a little more than Rs. 1 lakh, from Rs. 29 65 lakhs to Rs. 30.98 lakhs, mainly because of the sharp rise in the tax provision from just Rs. 27,000 to Rs. 13.85 lakhs (on account of a lower credit for development rebate reserve and the increase in gross profit) and also because of the higher provision for depreciation of Rs. 7.87 lakhs, as compared with Rs. 4.86 lakhs a year before. But the dividend on the Rs. 10 fully paid ordinary shares has been raised by two points to 8 per cent per annum, subject to tax. It absorbs Rs. 1.40 lakh more at Rs. 5.60 lakhs. At the same time, the amount transferred to reserves, including the Rs. 1.32 lakh (Rs. 12.58 lakhs a year before) carried to statutory development reserve and Rs. 44,138 (Rs. 4.19 lakhs) carried to development rebate reserve, has been increased from Rs. 24.27 lakhs to Rs. 25.66 lakhs, at which level it is about 41 per cent of gross profit, as against 70 per cent in the previous year, and as much as 84 per cent of the distributable surplus, as against 80 per cent.

The dividend liability amounting to Rs. 5.60 lakhs is to be met out of general reserve to which a total of Rs. 29.50 lakhs has been credited out of the year's profit. In the previous year, however, the dividend amount of Rs. 4 20 lakhs was separately provided from profit. The dividend will be paid, as in the previous year, out of the portion of the profit subject to relief under Sections 84 and 101 of the Income Tax Act, 1961, and, as such, the whole of it will be exempt from tax in the hands of the shareholders.

One will agree with the Directors that the results for the year under review, which are compared below with those for the previous year, are very satisfactory, especially in the prevailing circumstances:

(In lakhs of rupees)

	For the year ended 30th April	
	1964	1963
Sales	433.73	148.23
Other income	1.47	1.05
Stocks, including in-process	52.08	36.38
Materials and stores consumed	341.69	127.49
Staff expenses	20.36	8.30
Other expenses	36.15	15.09
Gross profit	52.70	34.78
Depreciation	7.87	4.86
Taxation	13.85	0.27
Net profit	30.98	29.65
Preliminary expenses written off	..	1.19
Development rebate reserve	0.44	4.19
Other reserves	25.22	20.08
Dividend	5.60	4.20
	(8%)	(6%)
Carry forward	0.05	0.29

The higher production during the year, the Directors say, was possible because of better efficiency and steady and adequate supply of steel strips. It will be recalled that the Company, having already achieved the licensed capacity of 24,000 tonnes of pipes per annum on the basis of production on two shifts in the previous year, had approached the Government for an additional 12,000-tonne capacity to enable it to work third shift. The Government has not formally recognised this additional capacity but approved the operation of three shifts, subject to availability of steel. The working of the factory was uninterrupted. The Indian staff is gradually taking over duties and responsibilities from the foreign technicians.

Although the offtake of pipes continued to be fairly satisfactory during the year, the annual sale contracts covering the production of the year had to be made at prices lower than those for the previous year, owing to various circumstances. The need for reducing prices further was felt in respect of the production of the current year, that is, 1964-65, also. A notable feature, however, is that the Company has been able to secure orders for almost the whole of its production for 1964-65. Orders for export have also been substantial. The import entitlements against the resulting exports will be utilised mainly to import the much needed spare parts and zinc, which is in short supply. The Company has also entered into a rate contract with the D.G.S. & D. of the Government of India.

Letters of intent were obtained during the year for annual production on two-shift basis of 48,000 tonnes of seamless pipes, 3,000 tonnes of steel castings and 12,000 tonnes of heavy structurals. These schemes are being actively considered by the Directors and an application for foreign exchange for the seamless project has already been made to the International Finance Corporation, Washington. The industrial licence for distilling zinc dross has not been utilised, because of the Government's proposal to deduct the quantity of distilled zinc from the Company's import quota of zinc.

The existing cash credit facilities with the United Commercial Bank were raised further to Rs. 1.5 crore for meeting working capital requirements consequent on the increase in production.

With the paid-up share capital of Rs. 69.97 lakhs and reserves and surplus (excluding Rs. 5.60 lakhs from general reserve for meeting the year's dividend liability) of Rs. 49.99 lakhs making a total of "own" funds of Rs. 119.96 lakhs, the Company has a gross block of Rs. 130.88 lakhs (Rs. 112.50 lakhs a year before) which has been written down to a net value of Rs. 117.96 lakhs. Secured loans of Rs. 152.58 lakhs comprise Rs. 52.39 lakhs from the I.C.I.C.I. Ltd. and Rs. 100.19 lakhs from banks, as against Rs. 51.97 lakhs and Rs. 65.85 lakhs, respectively, in the previous year, when the Company had also carried unsecured loans of Rs. 20.17 lakhs. Taking only the bank loans and current liabilities and provisions (including the year's dividend liability), the total short-term indebtedness amounts to Rs. 139.41 lakhs and is well covered by current assets, book debts and investments aggregating Rs. 193.80 lakhs.

Currently quoted at Rs. 16.04 *cum-div.*, the Rs. 10 fully paid ordinary shares of the Company offer a net yield of 4.1 per cent per annum.

(*Concluded from next column*)

SOUTH MADRAS ELECTRIC'S PROFIT UP

DIVIDEND RAISED

THE South Madras Electric Supply Corporation Ltd. (Managing Agents: Messrs. Seshasayee Brothers Private, Ltd., Tiruchirapalli) has reported further progress in all its spheres of activities during the year ended March 1964. The realisation from the sale of energy has risen by almost 13.4 per cent from Rs. 103.19 lakhs to Rs. 116.97 lakhs and, although there has been an unavoidable increase in expenses—from Rs. 44.64 lakhs to Rs. 49.15 lakhs in cost of distribution and from Rs. 29.10 lakhs to Rs. 34.46 lakhs in other expenses—the gross profit has increased from Rs. 33.15 lakhs to Rs. 37.52 lakhs. A major portion of this increase, however, has been neutralised by essential provisions that for Managing Agents' commission claiming Rs. 80,000 as before, for depreciation Rs. 10 94 lakhs (as against Rs. 9.72 lakhs) and for taxation Rs. 12.53 lakhs (as against Rs. 8.80 lakhs). The resulting net profit, therefore, is slightly lower at Rs. 13.25 lakhs, as compared with Rs. 13.83 lakhs. From this, and inclusive of the amount written back from past provisions and that brought in from the previous accounting period, the Directors have transferred Rs. 2.34 lakhs (as against Rs. 3.75 lakhs) to reserves, besides setting aside Rs. 2.14 lakhs for payment of preference dividend. They have also proposed a higher final dividend—the interim dividend was maintained at 5 per cent per annum—of 6 per cent, as against 5.5 per cent, both subject to deduction of tax, so as to make a total dividend of 11 per cent for the year. This claims Rs. 7.70 lakhs, as against Rs. 7.35 lakhs, besides leaving a higher carry forward of Rs. 12,430, as against the Rs. 990 brought in.

The following comparative table presents synoptically the progress made by the Company during the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sale proceeds of energy	116.97	103.19	95.81	96.95
Other income	4.16	3.70	2.93	3.43

Preference	2.14	2.14	3.15	2.29
Ordinary	7.70	7.35	7.00	6.30
	(11%)	(10.5%)	(10%)	(9%)
Carry forward	0.12	0.01	0.23	0.12
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	12.00	11.25	10.25	10.25
Low	10.90	9.86	9.83	9.70

During the year, the Company added a total of 202 miles to its transmission lines, bringing the mileage to 2,617 from 2,415 a year ago. Number of sub-stations also increased by 57 to 683. Supply of electric energy was extended to 63 more villages, thereby bringing the total number of villages electrified as at 31st March 1964 to 832. The extension of transmission lines and electrification to rural areas naturally brought about an increase in the number of service connections from 71,269 to 76,687 and in the connected load from 16,365 h.p. to 18,323 h.p. A break-down of service connection by type of customer shows that as many as 67,488 or over 88 per cent connections were for domestic consumers, while the balance 12 per cent was shared almost equally by industrial and agricultural users.

The works covered by Government loans were almost fully completed during the year under review. Works on systems improvements, extensions in the developed rural areas, etc., financed by the Company from its own funds and including the specific sanctioned extensions covered by Government loans referred to earlier, made up altogether an outlay of Rs. 17.84 lakhs under capital expenditure during the year. In order to accelerate and at the same time rationalise rural electrification in certain areas within the Company's licensed areas, the Government of Madras suggested that the Company should hand over to the State Electricity Board such parts of its areas as could be comparatively more economically developed from the Board's system. The Directors state, in their report to shareholders, that after due and care-

(*Continued in previous column*)

ful consideration of each case some areas were ceded to the State Electricity Board. They further observe that the retained area has a considerable development potential and could be managed economically at the same time. To do full justice to this task, an outlay of over Rs. 2 crores in the next seven or eight years would be necessary. The Company's officials, the Directors inform, are engaged in preparing master plans to reach this target according to a steady rate of progress year by year. It is, however, to be noted that the Madras State Government has advised the Company that, due to pressure on its resources, the Company should not expect further loans from the Government, at least for the present, to undertake rural extensions. The Company will have, as such, to resort to lending institutions and other sources to obtain the finances required to discharge its obligations as a licensee. It is heartening to note, therefore, that this matter also is receiving careful attention from the Directors.

There has been no change in the Company's share capital which stands at Rs. 100 lakhs, made up of Rs. 30 lakhs in preference shares and Rs. 70 lakhs in ordinary shares of Rs. 10 each. But the reserves have moved up from Rs. 38.19 lakhs to Rs. 42.75 lakhs, so that 'own' funds amount to Rs. 142.75 lakhs, as against Rs. 138.19 lakhs previously. Loans, including Rs. 33.31 lakhs from the State Government, aggregate Rs. 37.18 lakhs, while current liabilities and provisions amount to Rs. 98.01 lakhs. Including the additions of Rs. 17.84 lakhs during the year, the block account is Rs. 293.14 lakhs and this has been written down to Rs. 192.74 lakhs through the depreciation account. Current assets, loans and advances are placed at Rs. 81.97 lakhs, and investments, mostly in Government securities, are carried in the books at a cost of Rs. 3.23 lakhs and are actually worth Rs. 3.20 lakhs at market price.

The Rs. 10 paid ordinary shares of the Company are currently priced at Rs. 12 *cum-final-div.* The net annual yield at an *ex-div.* price works out to 7.6 per cent.

T.E.L.CO. PAYS SAME ON HIGHER CAPITAL

FURTHER ISSUE—BORROWINGS FOR EXPANSION

IN his statement for the year ended 31st March 1963, Mr. J. R. D. Tata, Chairman of the Tata Engineering and Locomotive Company Ltd. [Managing Agents: Messrs. Tata Industries (Private) Ltd., Bombay] had observed that, "notwithstanding the minor setback in the profit last year (1962-63) and the difficulties and uncertainties during the current (1963-64) year, the fact remains that the Company's productive capacity and financial strength continue to grow and that the prospects continue to be bright." And he had hoped that the profit for the year 1963-64 would be enough to maintain the dividend on the enhanced capital following the offer of 200,000 additional ordinary shares on 26th March 1963 at a premium of Rs. 50 per share. Nobody doubted Mr. Tata's robust confidence about the Company's near-term outlook at the time he made the statement and even subsequently. But the strike by the Company's workmen in January 1964 (due to internal rivalries between two factions of the T.E.L.Co. Workers' Union) which hampered production and disturbed industrial peace in Jamshedpur early this year with serious communal violence in March, caused some serious concern to many about T.E.L.Co.'s performance during the year ended 31st March 1964. The stock market especially had entertained grave fears and was almost unanimous in its opinion that the Company's Directors might be obliged to enforce a cut in dividend on increased capital. The preliminary announcement of excellent results with the same dividend as in the previous year, however, came as a welcome surprise to the stock market and the shares of the Company shot up 25 points in barely two days. It needs no saying that this reflects well on the Company's able management in whom shareholders will be well advised to continue their faith.

The table below gives a clear idea of the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sale of products and services, less excise	46,60.92	39,86.84	37,93.00	34,27.00

Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	317.50	301.50	332.50	390.00	349.00
Low	259.00	245.50	251.00	278.00	200.00

* Stock of finished goods being Rs. 399 69 lakhs for 1963-64, Rs. 385 04 lakhs for 1962-63, Rs. 308.76 lakhs for 1961-62 and Rs. 235.29 lakhs for 1960-61.

Net sales (that is, excluding excise duty paid) have spurted by nearly Rs. 7 crores from Rs. 39.87 crores to Rs. 46.61 crores, as against the improvement of about Rs. 2 crores noted in the previous year. Gross profit, which had dropped from Rs. 616.65 lakhs to Rs. 573.15 lakhs in 1962-63, has risen sharply to Rs. 689.78 lakhs. Net profit, down by Rs. 47.65 lakhs in the previous year, has gone up by Rs. 61.25 lakhs to Rs. 204.25 lakhs, after providing Rs. 260.53 lakhs for depreciation (against Rs. 222.53 lakhs a year before), Rs. 200 lakhs, including Rs. 8.70 lakhs for dividend tax and Rs. 2 lakhs for surtax, for taxation (Rs. 184.50 lakhs including Rs. 23.30 lakhs for S.P.T.), and Rs. 25 lakhs for Managing Agents' remuneration (Rs. 23.12 lakhs). Out of the net profit, Rs. 68.10 lakhs (Rs. 27.47 lakhs) have been carried to development rebate reserve, leaving a distributable surplus of Rs. 136.15 lakhs. This surplus slightly falls short of the aggregate amount of Rs. 143.65 lakhs required for preference and ordinary dividends. The Directors have, therefore, withdrawn Rs. 8 lakhs from reserves, as against Rs. 6 lakhs a year before. The year's dividend liability is to be met from dividend reserve to which Rs. 144 lakhs have been transferred out of the year's profit.

Reviewing the Company's operations, the Directors give the following details:

Automobile Division: *Tata Mercedes-Benz* output increased by 5 per cent. First stage of expansion programme to 18,000 vehicles will be completed on schedule; from this month (August), the monthly production will be 1,500 vehicles. Indigenous content, 84 per cent at present, will be 90 per cent by December this year. But the resulting foreign exchange saving is frittered away, because steels of which the vehicles are built are still imported. Because of Defence orders, a large part of the civilian demand could not be met during the year.

Steam Locomotives: Labour trouble and communal disturbances caused the output to decline from 63 to 57 in numbers. A further 200 locomotives are contracted to be supplied to the Railway Board during the fourth Plan period on the understanding that, on completion of these supplies, the Company would cease to produce steam locomotives and direct its manufacturing capacity to other engineering products.

Excavators: Non-availability of foreign exchange for importing certain components and raw materials restricted output during the year. Within two years, a pretty high 77 per cent indigenous content has been achieved. This year, excavators of 1¼ cu. yd. size will also be produced.

Paper and Pulp Machinery: Inadequate and uncertain supply of various categories of steel not only makes it extremely difficult for the Company to offer the fixed deliveries which the purchasers demand but also raises appreciably the cost of manufacture. The Company's experience so far has been that a disproportionate amount of engineering capacity and managerial effort is required to secure even a modest turnover from the production and sales of such custom-built items of heavy machinery and plant. Instead of making complete plants, the Company is concentrating on making a limited number of standardised items of paper and pulp machinery for efficient utilisation of its capacity. During the year, a series of large pulp digesters were delivered.

Forge Division: Up-to-date forging facilities, including high production mechanical forging presses of 1,300 and 2,000-ton capacity, have been installed and a large 6 000-ton press is expected to be in operation before the end of 1964. The output will result in very substantial foreign exchange saving. The division will have capacity to meet the entire requirements of forgings for the production of 24,000 *Tata Mercedes-Benz* vehicles per annum, as well as most of the forgings for the other engineering products.

Steel Foundry: Production of castings rose and the quality remained high.

Alloy Foundry: Latest techniques and processes are being introduced. A substantial expansion to make the foundry capable of meeting the full needs of alloy iron castings of diverse specifications required for the automobile industry is under way.

Export Business: Exports of vehicles to the South and Middle East countries increased over the year by Rs. 20 lakhs to Rs. 23 lakhs. Recently the Company introduced a luxury air-conditioned coach for export to Thailand and other neighbouring countries.

Some progress has been made in regard to the Poona project, as land for setting up a factory has been secured. To begin with, the Company will establish there an apprentice training centre and a well-equipped facility for producing large press tools and complex dies which the mass production industries in the country require. Such items are now being imported. Messrs. Raymond F. Tompson (Engineers) Ltd. of Britain are collaborating in this project.

The second stage of expansion programme in the automobile division, envisaging production of 24 000 *Tata Mercedes-Benz* vehicles, has been taken up and finance for it is being arranged. The loan of $13.7 million (Rs. 6.52 crores) secured from the Agency for International Development (A.I.D.) for the first stage has been utilised to the extent of $8.5 million (Rs. 4.10 crores) up to March 1964. The balance amount will be used this year. In addition, plant and equipment worth Rs. 1 crore were ordered from West Germany. A major portion of them has been received and is in operation. Negotiations are in progress with the A.I.D. for a further loan of $11.8 million (Rs. 5.62 crores) for financing the import of equipment for the second stage. This loan is expected to be granted shortly. Meanwhile, the Government has agreed to allow the contribution of Rs. 48 lakhs made by the Company's associates, Daimler-Benz A.G., to its increased equity capital to be utilised for importing machine tools and equipment from West Germany for the second stage of expansion. Additional finance is proposed to be raised through another rights issue of 200,000 ordinary shares of Rs. 100 each at such premium not exceeding Rs. 50 per share as the Controller of Capital Issues may prescribe and may be agreed to by the Directors. These new shares will be offered to the existing shareholders in the ratio of one share for every five shares held. Besides long-term foreign exchange borrowings and fresh share capital issue, it is proposed to arrange with bankers additional cash credit facilities amounting to Rs. 3 crores secured by hypothecation of stores, stocks, work-in-progress and book debts. The Company's short-term borrowings and withdrawals from cash credits increased by about Rs. 3 crores towards the end of the year under review. The interest charges were higher by Rs. 28 lakhs because of increased borrowings as well as higher rates of interest.

Secured loans have increased during the year from Rs. 16.03 crores to Rs. 22.42 crores, of which Rs. 14.46 crores (Rs. 12.12 crores a year before) are of a short-term nature, being loans from banks on cash credits and overdraft accounts. Besides, there are unsecured loans of Rs. 2.27 crores, bringing the total of short-term borrowings to Rs. 16.73 crores. These and current liabilities are provisions (including the year's dividend liability) bring the aggregate short-term indebtedness to Rs. 32.96 crores which is fully covered by current assets, book debts and investments together amounting to Rs. 37.27 crores. The paid-up share capital, including Rs. 2 crores in 5 per cent 100-rupee cumulative preference shares, has increased from Rs. 10 crores to Rs. 11.98 crores following the rights issue of 200,000 ordinary shares at a premium of Rs. 50 per share in March 1963. This capital is backed by reserves and surplus (excluding Rs. 1.44 crore from dividend reserve required for meeting the the year's dividend liability) aggregating Rs. 5.59 crores. The gross block, which has expanded during the year from Rs. 32.81 crores to Rs. 39.20 crores, has been written down to a net value of Rs. 21.18 crores. It will be seen thus that the Company's financial position is pretty sound.

The general benefits of the Company's increased capacity have been highlighted by Mr. J. R. D. Tata in his statement for the year under review. One is that the price to a customer in Bombay of the *Tata Mercedes-Benz* 312/42 model—the most popular model in the range—increased between October 1959, when the Company completed the initial phase of its truck manufacturing programme, and today by Rs. 7,164 to Rs. 37.619, as against an increase of Rs. 7,519 on account of rates and excise (Rs. 6,780) and the cost of imported materials and components (Rs. 739) during the same period. It will be seen that the price, excluding the increase on account of rates and excise and cost of imported materials and components, has actually fallen in spite of the continuous incorporation of a number of major improvements to the vehicle. The other important benefit of the expanded capacity of the Company is the creation of direct employment for over 16,000 men trained by the Company to a high degree of skill over the years.

Discussing the outlook, Mr. Tata has called for stern action against those who, under the guise of trade unionism, deliberately create problems of law and order and prevent the full utilisation of industrial capacity urgently needed by the country. He looks forward to another year of progress. According to him, the new shares to be offered may be expected to earn a dividend of 14.5 per cent from the date of issue, equivalent to 9.7 per cent on capital plus premium.

The net yield on the Company's 100-rupee ordinary shares at their current market value of Rs. 288.50 *cum-div.* works out to 5 per cent per annum.

TRAVANCORE RAYONS LTD.

In the review of the working results of the Travancore Rayons Limited for the year 1963 appearing on page 79 of *Commerce* dated 11th July 1964, certain lines in the paragraph following the table are inadvertently missing. These lines relate to issued share capital, reserves and own funds. The correct position is indicated below:

The issued share capital of the Company remains unchanged at Rs. 150 lakhs, comprising Rs. 50 lakhs in preference shares and Rs. 100 lakhs in ordinary shares. This is supported by reserves aggregating Rs. 117.12 lakhs, including Rs. 5.50 lakhs as provision for gratuity to employees. The total own funds thus amount to Rs. 267.12 lakhs, against which outside interest is Rs. 219.68 lakhs, made of Rs. 163.20 lakhs as borrowings and Rs. 56.48 lakhs as current liabilities and provisions (excluding the provision for gratuity which is included under reserves).

SYNOPSES OF COMPANY REPORTS

Apollo Mills Ltd.

(*Chairman*: Mr. C. P. Wadia, Bombay.)

Forty-fourth Annual General Meeting—Held on 24th July 1964.

Working Results:

	For the year ended 31st December (In thousand rupees)	
	1963	1962
Sales of cloth, yarn, waste, etc. ..	2,52,40	2,16,66
Closing stocks ..	69,91	76,69
Gross profit (+) or loss (—) ..	+ 59*	— 4,00*
Debits relating to past years:		
To rates and taxes for period 1-4-1958 to 31-12-1962 ..	75	Nil
,, Bonus for past years ..	7,92	6,58
,, sales-tax for 1949-55 ..	Nil	24
,, compensation for market shop ..	Nil	22
Final debit balance carried forward ..	—17,32†	— 9,41†

* After providing Managing Agents' commission (minimum of Rs. 25,000) but without providing for depreciation.
† Net loss after adjusting with refund of income-tax on dividends Rs. 17,651 and the year's profit of Rs. 58,720.
‡ Loss after taking into account the refund of income-tax on dividends Rs. 27,092 and the credit balance of Rs. 1,35,878 brought in from 1961.

Extracts from the Directors' report: The working results of the year which show a small profit as against the loss suffered in the previous year, while being a good augury for the future, have not come up to the Directors' expectations owing to unforeseen stresses and strains created by fresh fiscal imposts, direct and indirect, and the rising cost of raw materials. To a marginal unit like this company with low priced products such burdens weigh more adversely than in other cases. The Directors are endeavouring to change the pattern of production by supplementing modern machinery to effect economies. Some encouraging signs are evident in the working of the Mills since the close of the year.

In order to ensure better working results, despite the hardships and strains of external features beyond the control of the management, the Directors have been continuously examining ways of reducing the production costs through programmes of rehabilitation and modernisation of the Mills' machinery and equipment. During the year under report, five *Ring Frames*, two *Doubling* and *Folding Machines* and four *Humidification* sets have been installed. Furthermore, an up-to-date Printing Plant was put into commission to make use of the printing quota of three million yards allotted to the Mills by the Government. The printing process has been giving satisfactory results and in order to use the full capacity of the printing plant, the Government has been moved for a sizable increase in the printing quota. Over and above these actual installations during the year under review, orders have been placed for 64 new *Lakshmiratan Toyoda Ring Frames* with *High-draft Conversion* out of which 5 frames have already been put into commission and 5 more frames are under installation and will be put into commission very shortly. Most of the remaining frames will be received during the course of this year. Besides, in order to achieve better quality and production and reduce the manufacturing costs, orders have also been placed for NGM-AAA *High Draft Conversion Material* for 35 *Ring Frames* delivery of which is expected to commence from August 1964 onwards. Having regard to the aforesaid programme of renovation and modernisation that is being steadily implemented and the growing popularity of the Company's printed fabrics, the Directors look forward to better working results hereafter.

With regard to the further issue of 25 lakhs shares of Rs. 2 each, the Company received applications in respect of 10,87,482 *Right Equity Shares* out of which 10,86,732 *Right Equity Shares* have been allotted to the respective applicants while 750 shares were not allotted for technical and other reasons.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	58,79,460	Gross block ..	1,48,55,248
Reserves ..	17,16,185	—Depreciation ..	50,60,009
Other liabilities ..	1,53,83,338	Net block ..	97,95,239
		Current liabilities ..	1,07,20,912
		Investments ..	9,39,421
		Cash	29,364
		P.L. a/c deficit ..	16,94,384
		Miscellaneous expenditure ..	7,685
	Rs. 2,31,87,005		Rs. 2,31,87,005

* Paid-up capital consists of 25,00,000 equity shares of Rs. 2 each and 8,79,460 equity shares of Rs. 2 each issued by way of right shares on which rupee one per share has been paid up.

Pesticides Ltd.

(*Chairman*: Madanmohan R. Ruia, Bombay.)

Registered Office: 28, Sayani Road, Bombay-28.

Extracts from the Directors' fourth annual report for the year ended 31st December 1963: The profit and loss account shows a revenue surplus of Rs. 1,19,368 before making any provision for depreciation. However, after making a provision for depreciation of Rs. 3,14,837 and adding the previous year's deficit of Rs. 9,680 a net loss of Rs. 2,05,149 has been carried forward to next year.

The total expenditure upto 31st December 1963 under the head "Expenditure during Construction" as shown in the balance-sheet amounts to Rs. 5,06,156 out of which Rs. 4,92,609 has already been allocated to the appropriate heads leaving a balance of Rs. 13,547 to be allocated at a later date.

Progress of various projects of the Company: B.H.C., Malathion, Zinc Phosphide and Copper Plants (taken over from Kirti Chemical Works) have been functioning satisfactorily to the rated capacity. During the first year of working, it was not possible for the Company to make any appreciable profit as the Company was affected by the emergency, due to which there was an acute shortage of wagons, which resulted in difficulty in obtaining *Benzene*, one of the chief raw materials in the manufacture of B.H.C. The cost of raw materials has also increased due to various levies. During the current year, however, excise duty on certain items has been lifted, one of them being *Chlorine* which is one of the main raw materials used in the manufacture of B.H.C.

New Projects: For Phenyl Mercury Acetate plant, the capital goods licence is awaited. In the meantime, the design, development and research work on the same has been completed. Further steps would be taken as soon as the licence is received.

Parathion: The Company intends to engage the services of Mr. Gunnar Andreasen, a Danish expert in this field, who has agreed to give the Company an improved method of manufacture of *Parathion* which would bring down the cost and consumption of raw materials, thus making the finished goods competitive both for local market and for export purposes. This would also mean saving of a considerable amount of foreign exchange. Engaging the services of Mr. Gunnar Andreasen would mean an extra expenditure of Rs. 2 lakhs approximately which would be a permanent benefit to the Company.

The Company also proposes in future to cover one by one the entire agro-chemical field. If these projects are implemented, there will be a considerable saving in foreign exchange. The implementation of some of these projects would mean an additional capitall outlay of Rs. 90 lakhs which would be raised by obtaining finances from other sources.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	46,81,550	Gross block ..	45,25,382
Other liabilities ..	13,69,584	—Depreciation ..	3,14,837

Low	2.35	1.46 X.R.	2.60

* Only a small sum of Rs. 522.
† On the increased equity capital of Rs. 9.75 lakhs.
‡ On a paid-up equity capital of Rs. 6.50 lakhs.
§ High and low upto 17th July 1964.

Extracts from the Directors' report: *Reserves.*—A sum of Rs. 3,25,000 was capitalised from the general reserve by the issue of *Bonus Shares* during the year and including Rs. 70,000 transferred from profit and loss account this year, the general reserve now stands at Rs. 2,70,000.

Crop and Costs.—A total crop of 229.900 metric tonnes was harvested during the year and delivered to the Coffee Board. This has been valued at Rs. 2.30 per point or Rs. 3,134 per metric tonne. A comparative statement of production and costs for the last three years is given below:—

Year	Crop (Metric tonnes)	Estate Expenditure per metric tonne	All-in-cost per metric tonne
1961-62*	166.052	Rs. 2,094	Rs. 2,369
1962-63*	165.814	,, 2,105	,, 2,482
1963-64*	229.900	,, 1,634	,, 1,999

* Inclusive of Sulgodu Estate.

A bonus payment of Rs. 9.362 at 5.3 nP per point has been received on 1959-60 crop making the total for the year Rs. 2.29 per point and this is equivalent to Rs. 2.995 per metric tonne. A similar payment has been received also in respect of Sulgodu Estate amounting to Rs. 3,285.

The 1962-63 season's crop has been revalued at Rs. 2.30 per point being the final figure declared by the Coffee Board for that season and this is equivalent to Rs. 3.255 per metric tonne including the Bonus Points awarded on the basis of 20 points per tonne on *Arabica Parchment* and 140 points per tonne on *Robusta*.

The 1964-65 crop has been estimated at 219 metric tonnes and the all-in-cost of production at Rs. 2,167 per metric tonne.

Capital Expenditure.—Rs. 6.446 was spent on capital account during the year. Capital expenditure for the year 1964-65 is estimated at Rs. 10,400.

Accounts in brief as at 31st *March* 1964 are as under:—

Liabilities	Rs.	Assets	Rs.

Low	150.00	178.00 X.R.	247.50

* Loss after providing for depreciation and development rebate reserve.
† High and low upto 17th July 1964.

Extracts from the Directors' report: A sum of Rs. 6,93,362 being bonus to the employees for years 1961 and 1962 paid during the year has been fully debited to the accounts of the year under review.

There was a considerable increase in the prices of cotton, stores, spare parts, power and fuel etc., during the year under review. Besides, new machineries were installed in various departments and due to shortage of space in the Mills, the production suffered to a great extent during the course of erection of these machineries. At the same time a good number of workers were reduced in the process of rationalisation and a sum of Rs. 5 lakhs approximately was paid to them by way of gratuity and compensation, and this has also reflected in the working results of the Company.

Since the workers were not accustomed to the working of the new machineries the scheduled product on could not be achieved. However, the Directors are doing their best to improve the working results and hope to have better results during the current year.

The Company has spent Rs. 30,75,377 towards additions to the block by installing various machineries and constructing buildings etc. required for the purpose of renovation and modernisation.

Orders have been placed for various machineries worth Rs. 12 lakhs approximately for which contracts remained unexecuted on capital account at the end of the year under review.

During the current year upto 30th June 1964 orders for machineries etc., have been placed for Rs. 11 lakhs approximately in addition to the unexecuted orders at the end of 1963.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs
Capital* ..	42,95,700	Gross block ..	2,12,73,292
Reserves and surplus..	14,52,369	—Depreciation ..	1,07,27,301
Other liabilities ..	1,74,08,854	Net block ..	1,05,45,991
		Block in progress ..	3,59,863

		Cash	3,12,675
		P.L. a/c deficit ..	16,37,419
	Rs. 2,31,56,923		Rs. 2,31,56,923

* Paid-up capital consists of 34,046 equity shares of Rs. 100 each and 4,000—5¼ per cent. cumulative preference shares of Rs. 200 each. Application money received is Rs. 1,100. Of the above, 15,000 equity shares of Rs. 100 each are allotted as fully paid bonus shares by capitalising reserves.

NEWS IN BRIEF

THE U.S. Agriculture Department has announced the issuance of a P.L. 480 authorisation to India covering the supply of about 800,000 tonnes of wheat in bulk (grade U.S. No. 2 or better) worth, $54.86 million.

A tripartite labour panel under the Chairmanship of Dr. V. K. R. V. Rao will be constituted shortly to advise the Planning Commission on the programmes relating to labour and employment to be included in the fourth Plan.

The last date for submitting the first set of the returns by non-banking companies and financial institutions fixed under the Orders dated 15th July 1964 has been extended up to the end of this month.

The fourth Finance Commission (Chairman: Mr. P. V. *Rajamannar*) proposes to begin tours of the States from November next, by which time the Commission hopes to receive and study the estimates of the States' likely receipts and expenditure.

The cotton mills' production in the month of June 1964 is provisionally placed at 72 million kilograms of cotton yarn and 379 million metres of cotton cloth. At the end of the month, the composite mills of the cotton textile industry held an estimated cloth stock of 80,000 *metric* bales as unsold and 148,000 metric bales as sold (unlifted).

Under a second long-term agreement signed recently by the Indian Oil Company and the Soviet Union, the former will import approximately 500,000 tons of oil products in 1964, 800,000 tons in 1965 and 400,000 tons in 1966. The first agreement, it will be recalled, was signed in 1960 and it covered import 1.5 million tons of oil products.

A Five-man Committee has been set-up, with Mr. A. V. Venkateswaran, Joint Secretary, Union Ministry of Commerce, as Chairman, to review the scheme of woollen yarn distribution to hosiery units and suggests suitable modifications. The Committee has been asked to submit its report by 15th September next.

The Union Home Ministry has appointed an official committee, headed by Mr. G. Mukherji, Joint Secretary in the Ministry, to examine the existing security arrangements at various airports and to suggest measures to strengthen them. The Committee will review the present arrangements and procedures at airports, in addition to customs migration, health checks and passenger facilities.

The Union Government has constituted an expert-committee headed by Dr. B. R. Nijhawan, Director, National Metallurgical Laboratory, to suggest technological improvements in the public sector steel plants with a view to raising output. It is estimated that the production of pig-iron can be raised from 1.7 million tonnes in the fourth Plan with some improvements in the blast furnaces of the various steel plants.

A draft outline of the fourth Plan and a memorandum on the fifth Plan will be presented by the Planning Commission at the meeting of the National Development Council towards the end of this month, according to Mr. Shriman Narayan, a member of the Planning Commission. The fourth Plan draft is expected to be published in April next and will be submitted to Parliament for discussion.

India will participate in the Food and Domestic *Equipment Trade Fair to be held at Brussels* from 10th to 25th October next. A selected and suitable range of products, such as, tinned fruits, canned vegetables, juices, alcoholic beverages, meat, fish, shrimps, tea, coffee, spices of all kinds, cigarettes and snuff, domestic and kitchen equipment, table-ware, cutlery and sewing machine will be displayed.

The sale of the Indian Telephone Industries Ltd. exceeded Rs. 9 crores during the year 1963-64, recording an increase of Rs. 1.5 crore over the previous year. Equipments worth Rs. 5.6 lakhs were exported during the year to Ceylon, Nepal, Uganda, Egypt, Singapore and Malaysia. Production of co-axial equipment, special signalling equipment of remote type and flasher units has lately been undertaken.

An agreement to provide for non-project loan of about Rs. 13.3 crores (£10 million) by Britain to India for the fourth year of the third Plan was signed at New Delhi on Tuesday this week. This is the first instalment of *the sum of £30 million* promised by Britain to India for 1964-65 during the last meeting of the Aid India Consortium. Negotiations are in advanced stage for determining the purposes for which the balance of £20 million is to be used.

In the Western region comprising Maharashtra, Gujarat, Madhya Pradesh and the Union territory of Goa, as many as 88 companies with a total authorised capital of Rs. 18.67 crores were registered during the first quarter of the current financial year, as compared with 86 companies with an authorised capital of Rs. 14.41 crores in the preceding quarter. Of these, 64 were registered in Maharashtra, 11 in Gujarat, 7 in Madhya Pradesh and 6 in Goa. They include 12 public companies, 75 private companies and one non-profit association.

The findings of a recent market survey conducted by India's Trade Representative in the *Lebanon* revealed that India has a potential market for many items of pharmaceutical and drugs. If only India can supply these articles according to International specifications, it is said, there is a great future for Indian goods. The average annual imports of pharmaceuticals into the Lebanon amounts to about 300 tons. These come mainly from Austria, U.S., Switzerland, France, West Germany, the U.K., Italy, Belgium, Holland and Denmark. The average annual imports of antibiotics aggregate 310 kg.

A manpower division will be set up in the Planning Commission to assess the manpower shortages and future needs for managerial and non-managerial positions in the country. This was disclosed by Dr. V. K. R. V. Rao, a member of the Planning Commission, at a meeting of the heads of *public sector undertakings* held at Bangalore on Monday this week. According to him, a conference is likely to be convened in September next to find out the manpower requirements, in specified categories during the fourth and subsequent plans.

The *foundation stone of the Hindustan* Machine Tool's Rs. 8-crore machine tool factory at Hyderabad was laid by Mr. S. M. Patil, Managing Director of the Company. This is the fifth unit of the H.M.T. and is expected to go into production by the end of the next year. The factory will be built entirely by Indian personnel without any foreign collaboration. With the commissioning of this plant, the combined annual output of the five units of the H.M.T. is expected to be of the order of Rs. 25 crores, the total number of the persons employed being about 15,000. The Hyderabad plant will produce gear shapers, gear hoppers, gear cutting machines, sophisticated *machine tools* and special purposes machines required by automobile and *mass* production-oriented industries.

• • • •

From Abroad

A contract worth £2.3 million for the construction *of a 300-mile gas* pipeline has been awarded by the Pakistan Government to the E.N.I. Oil Corporation *of Italy*.

An Italian-built circular knitting machine which can produce 16 different types of seamless nylon stockings, the first of its type in Europe, has begun production at the works of Nichols and Wileman in Earl Shilton, (Leicestershire). The machine costs about £14,000.

The Boeing Aircraft-Company (U.S.) began producing a convertible cargo version of its three-jet short hauls 727 airliner, the 727C. The 727C will operate as an all-passenger, all-cargo or mixed passenger-cargo aircraft. The first is due to fly early in 1966. A contract for the delivery of three such aircraft has already been placed by the *North-West Orient Airlines*.

The Government of Japan has reported to the G.A.T.T. Secretariat the measures it has taken in the year ended 30th June 1964, to implement the G.A.T.T. Action Programme for expansion of trade of developing countries. The measures include removal of quotas on specified types of lumber and lead and reduction or suspension of customs duties on *groundnuts*, specified woods, etc.

Deposits in Sweden's commercial banks decreased by Dr. 151 million to Dr. 24,259 million during the first six months of 1964 as compared with the corresponding period last year, while advances showed an increase of Kr. 1,150 million to Kr. 20,498 million. During the last five-year period deposits in the commercial banks have increased by 43.4 per cent, or Kr. 7,344 million, and advances by 62.5 per cent or Kr. 7,885 million.

Poland will be given compensation for the loss of its German *markets for eggs* and pigs due to Common Market farm policy under an agreement signed between the two countries. The total volume of Polish exports in the current and next years is to remain at the same level as DM 468 million agreed for 1963. But industrial quotas have been stepped up by DM 50 million. The quotas for German exports have also been increased by DM 70 million to DM 460 million. The chemical and pharmaceutical products alone accounts for half of the total quotas.

The report on a comprehensive scheme for the quality control of drugs and medicated products for Britain, prepared by a technical committee of the *Pharmaceutical Society of Great Britain*, has just been published. The scheme provides for the registration and licensing of all manufacturers of drugs and medicated products, importers of drugs drug wholesalers, manufacturing and dispensing units of hospitals, practitioners who dispense, clinics and all retailers handling drugs. In the opinion of the committee, the inspectors, should be empowered to sample products at any stage of production or formulation (the sampling techniques are indicated), importers must be told to supply samples on request and all dispensaries should be subjected to some form of control, the inspectors being authorised to take samples of any medicine or form of treatment.

A credit equivalent to $58.54 million has been granted by the International Development Association to the Government of Pakistan for use in the Indus Basin Development Fund, an international fund which is helping to finance the construction of irrigation and other works in West Pakistan. The works will give effect to an agreement reached between India and Pakistan in 1960 for sharing the waters of the Indus system of rivers, and will develop the use of Indus waters in West Pakistan. The credit is for a term of 50 years. Repayment of principal will begin from 1st March 1975, after a 10-year period of grace. Thereafter 1 per cent of the principal will be repayable annually for 10 years and 3 per cent will be repayable annually for the final 30 years. The credit is free of interest but a service charge of ¾ per cent per annum on the amount withdrawn and outstanding will be made to meet I.D.A.'s administrative costs.

The International Monetary Fund has approved a stand-by arrangement with the U.S. Government authorising the drawing of currencies of other members of the Fund up to the equivalent of $500 million during the next twelve months. It succeeds a similar one-year arrangement in the same amount which expired on 21st July 1964. The Fund's Articles of Agreement stipulate that the Fund may accept repayments from its members only in convertible currencies of which the Fund's holdings are less than 75 per cent of quota. The Fund at present holds dollars amounting to 81 per cent of the U.S. quota, and is therefore precluded from accepting dollars from other members in repayment. Under its stand-by arrangement, the U.S. may draw the currencies of other members and sell them for dollars to countries wishing to make repayments to the Fund. The U.S. has followed this practice with respect to the previous arrangement under which drawings equivalent to $250 million were made.

PERSONAL

SIR Paul Gore-Booth, British High Commissioner in India, has arrived in Delhi after a period of leave in Britain.

Dr. Rustom C. Cooper, a well-known Chartered Accountant, has been nominated a non-official member of the Central Direct Taxes Advisory Committee.

Mr. R. E. Grant, formerly resident Vice-President of the First National City Bank, has been appointed a Vice-President of the Bank. His present assignment in India is as overall executive in charge of all Indian branches of the Bank.

The Punjab National Bank Limited
New Delhi
NOTICE OF INTERIM DIVIDEND

The Directors of the Punjab National Bank Limited, New Delhi, have decided to pay an Interim Dividend for the current year at the rate of Re. One gross per share. The dividend will be payable at the Registered Office of the Bank at Parliament Street, New Delhi, on or after September 11, 1964.

The Transfer Books and Register of Members of the Company will remain closed from August 11, 1964 to September 5, 1964 (both days inclusive).

By Order of the Board of Directors,
R. L. TULI
General Manager.

Dated: July 14, 1964.

NOTE:- Shareholders are requested to intimate change of addresses, if any, to the Bank immediately.

FOOD AND POPULATION GROWTH

A BOLD APPROACH IMPERATIVE

By Dr. S. Chandrasekhar, M.P.

PERHAPS the greatest problem we are facing today in our country is that of increasing population and lagging food supply. This growing imbalance between growing numbers and dwindling food resources has been with us for such a long time before and after freedom that hunger seems to be a near-perennial and accepted part of things. The answer to this chronic problem is apparently simple in print. Increase food production, ensure better distribution of what is produced and reduce the number of mouths, or at any rate reduce the rate of population growth in the country. But this seemingly simple answer is not put into effect for a variety of reasons.

First, we have been used to approaching various national, economic and social problems on a compartmental basis. But our problems are so intertwined and interdependent that a single or compartmental approach cannot be of any lasting help. We need a multi-pronged attack, not one after the other but all at the same time. The problem is so intractable that only such a cumulative attack can give us some results. The problem of food supply must be attacked from several points: more irrigation, scientific farming, minimum agrarian legislation, incentives to the farmer, women's education, dietary reform, reduction in the number of cattle, etc.

The second general observation I want to make is that we should undertake a campaign of compelling general education of the public for a more scientific, rational, and less obscurantist approach to life and its problems. The average Indian has a nineteenth century outlook in this atomic age. Unless we give up our traditional, sentimental and superstitious attitudes, we cannot solve our socio-economic problems. What is needed is a scientific outlook and a rational temper, whether it is about our diet or about our attitude to cattle.

War-like Approach

The third point is that agriculture should be put on a war basis. It is well known that we are a nation without much discipline. While individual liberty is precious, discipline in a nation is priceless. We are supposed to be in a period of national emergency since the Chinese attack, but "business as usual" seems to be the order of the day. Everyone—the Government and the people—knows what is wrong with agriculture. We know the answers. We, however, do not want to implement them because it entails disciplined hard work. Lord Boyd-Orr pleaded a few years ago that our agriculture be put on a war basis, but nothing was done about it. All these seventeen years we have been hearing slogans of "No foreign bread," "Grow more food," "More wheat and less rice," etc., but we have not gone beyond the slogan stage. We pass pious resolutions and promptly forget them. Our Government has done much but not enough, and I am sure this nation could rise to the occasion if the Government were to demand from the people a war-like approach to the problem of our food supply.

Cattle Situation

The ills of our agriculture are too well known to need repetition. But a few aspects of the overall problem need emphasis. Our cattle situation is part of this problem. When we talk of the food supply, we should add to the 450 million people to be fed some 210 million cattle. India has a quarter of the world's bovine population but the returns, in terms of milk, meat or muscle power, are disproportionately meagre. When the *per capita* land is shrinking, there is no point in maintaining these cattle. We simply cannot have quality without sacrificing quantity.

Then there is the problem of women's education. People may wonder what women's education has to do with the problem of food supply. By and large, our women are in charge of feeding the nation. They preside over our kitchens and dictate our diet. If we can educate our women on the need for simple, nutritive food and convince them to give up those of our traditional habits which are detrimental, new foods can be consumed and there will be less wastage and more conservation of foodstuffs. Gradually wheat can take the place of rice. The consumption of fish can be greatly increased adding badly needed protein to our diet. Various foods which have been traditionally ignored but are nutritionally valuable can become part of our diet and improve the general health of our people. If we can convert our women to a whole new attitude of mind in this area, half the battle of the food front can be won.

Science and Agriculture

As for our agricultural system itself, much can be done with slight improvements within the existing framework. Once we effect even to a small extent the marriage of science with agriculture, we can:

(*a*) raise the yield per acre not just on demonstration farms but in the country as a whole;

(*b*) increase the acreage under irrigation and reduce the eternal dependence on the monsoons, and

(*c*) raise the acreage under double cropping.

To do this, the farmer must be given an adequate incentive, peasant proprietorship should not be interfered with, and the State must introduce minimum legislation. There nearly need be no contradiction in putting agriculture on a war basis and a plea for minimum legislation, once the tiller's ownership and security are not questioned.

Self-sufficiency

There is too much of a cry for national self-sufficiency as far as our food supply is concerned. The available evidence shows that we have had no self-sufficiency in the past and we are not likely to have it in the future. Once we realise this, we can become reconciled to the fact that we shall in the foreseeable future be a food importing nation like some European countries. In other words, we must explore the possibility of improving our balance of payments and pay for the food imports we require. Then we need have no qualms about importing more and more of P.L. 480 foodgrains and paying for them as best we can.

As regards the population problem, we have exceeded the 450-million mark today. We have added more than 120 million since independence. We shall probably exceed 525 million by the time the next census in 1971 comes around. All thoughtful people want our birth rate to be halved from 40 to 20 per 1,000. We have advocated and attempted several methods to do this. But almost all these methods have disadvantages in our peculiar backward socio-economic context. We need a simple foolproof method. I believe vasectomy after the third child is the answer. One is tempted to plead for compulsory sterilisation under certain circumstances, but this is difficult in a vast democracy of illiterates. Therefore, some incentives must be provided. If we can pay one hundred rupees for each vasectomy after the third child, the Government will find this cheaper in the long run. Our overall problem is so desperate that we need drastic remedies. The Government has taken a bold and progressive action on some of these issues. But if we mean business, we must act much more boldly before it is too late. Otherwise, our political freedom will have been won in vain. What is the use of political freedom without economic advancement and social progress?

THE APOLLO MILLS LTD.

CHAIRMAN, MR. C. P. WADIA'S SPEECH

SPEAKING at the Forty-fourth Annual General Meeting of the Apollo Mills Limited held at Bombay on 24th July 1964, the Chairman of the Company, Mr. C. P. Wadia, stated that the improvement in the working results of the Company had been due mainly to the internal efficiency achieved through renovation and modernisation of machinery and equipment, as also to the launching of new items of production such as printed fabrics. Mr. Wadia hoped that a more realistic official policy in relation to textile industry would be forthcoming and that the Company would be able to earn reasonable return on large capital outlay.

The following is the text of the speech of Mr. Wadia:

GENTLEMEN,

I have pleasure in welcoming you to the forty-fourth annual general meeting of the Company.

At the outset I must refer to the great calamity that befell our nation nearly two months back in the sudden and sad demise of our beloved Prime Minister, Pandit Jawaharlal Nehru. We are meeting today in the lingering gloom left behind by the departure of a resplendent jewel of India, which was source of refreshing light and inspiration to every field of human endeavour in the country.

Now reverting to the business of this meeting, the Directors' report and the audited accounts of the Company for the year ended 31st December 1963, which have been in your hands for sometime past, must have been carefully perused by you. With your kind permission, I shall take them as read.

The outcome of the working of the year under report is a small profit as against the sizable loss suffered during the previous year. The noticeable improvement in the working of the mills despite the continuance of the adverse circumstances must be regarded as a heartening sign for the future. In the context of textile prices remaining frozen at the level obtaining four years ago under the Voluntary Price Regulation Scheme with the cost structure rising by about 20 per cent, the only way left to the management to show better results was in the direction of improving internal efficiency by renovation and modernisation of machinery and equipment and launching new items of production. This they have been doing with unflinching determination and you will observe that the additions to the capital block during the year under review exceed Rs. 7 lakhs in value.

New Field

Printing is a new field we have ventured into, since the beginning of 1963, and our printed fabrics are gradually gaining popularity. As the printing quota of three million yards granted by the Government is being exhausted within ten months by working one shift per day, we have approached the Government for allotment of sufficient quota to enable us to work three shifts per day in the printing section.

You might have already noticed from the Directors' report that your Directors have taken in hand the programme of renovation and modernisation of the mills' machinery and necessary orders have been placed for the purpose. However, much more needs to be done in respect of this renovation and modernisation programme which necessitates much more finance than is readily available. With that end in view, your Managing Agents have arranged to secure future finance, as you must have observed from the accounts.

Since the close of the accounting year, as a result of continued efforts towards economy and changeover of patterns, some beneficial results are visible. It is hoped that a more realistic official policy in relation to the textile industry would be forthcoming to enable units like this Company to earn reasonable returns on their large capital outlay.

The total number of spindles and looms worked during the year was 4,84 67.557 and 6,96.174 respectively as against 4,89,72,945 and 8,29,559 respectively worked in the previous year.

I would also like to inform you that the Registrar of Companies, Maharashtra, has very kindly granted one month's extension of time for holding this meeting.

In conclusion, I wish to thank the technical and administrative staff as also the workers on the production side and the Managing Agents who have worked for the Company with singular devotion in the face of adverse circumstances.

TREND OF MARKETS

MONEY EASY AGAIN

(From Our Own Correspondent)

BOMBAY, 29th July

The short-term money market continued to rule distinctly easy during the week under review. The supply of funds available was much more than what was actually needed to meet demand, with the result that the money left unemployed at the end of each day was quite sizable. Turnover was restricted, with inter-bank call rate for both renewals and fresh money standing at the low level of ½ per cent. Conditions at Calcutta, however, were firm and borrowers had to look around for accommodation. The call rate jumped up from ½ per cent to 4 per cent.

The rates of interest for short-term deposits remain unchanged at the ceilings prescribed under the inter-bank agreement. For purposes of ready reference, the ceilings are quoted below:

(*a*) Category I (banks with deposits above Rs. 50 crores and exchange banks): 3 to 30 days (inclusive): 3 per cent, 31 to 60 days (inclusive): 3½ per cent, 61 to 90 days (inclusive): 3¾ per cent, 91 days and over but less than 12 months: 3¾ per cent, 12 months: 4 per cent.

(*b*) Category II (banks with deposits of more than Rs. 25 crores but upto and including Rs. 50 crores): ¼ per cent higher than the rates for Category I.

(*c*) Category III (banks with deposits of more than Rs. 10 crores but upto and including Rs. 25 crores): ¼ per cent higher than the rates for Category I.

The distinctly easy tone of the market is reflected in the renewed support evoked by the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 28th inst. The total amount offered, namely, Rs. 4.05 crores, was more than twice the amount invited (and also accepted), that is, Rs. 2 crores. The average rate of accepted tenders was a shade lower at Rs. 2.399 per cent per annum, as against Rs. 2.400 per cent. The response to Intermediate Treasury Bills, too, was excellent, the Bills actually sold from the 22nd to 25th inst. aggregating Rs. 19.06 crores.

India's foreign exchange reserves fell by a further Rs. 2.63 crores to Rs. 92.83 crores during the week ended 24th July. The fall occurred despite the rise of Rs. 1.36 crore to Rs. 7.37 crores in balances held abroad, for this rise was more than offset by the decline of Rs. 4 crores to Rs. 85.46 crores in foreign securities held in the Issue Department of the Reserve Bank. Deposits of scheduled banks receded by Rs. 8.21 crores to Rs. 95.96 crores, and loans and advances obtained by them from the Reserve Bank were small, being Rs. 45 lakhs. Notes in circulation decreased by Rs. 35.11 crores to Rs. 2,443.76 crores.

A further sharp fall of Rs. 25.56 crores to Rs. 1,741.80 crores in the total credit made available by scheduled banks to their clients was noted in the week ended 17th July. At the same time, there was a fresh accretion of Rs. 12.87 crores to the deposit portfolio of banks. Consequently, borrowings from the Reserve Bank were negligible, being just Rs. 42 lakhs. Total cash improved by Rs. 2.31 crores to Rs. 163.61 crores and investments by Rs. 3.49 crores to Rs. 679.02 crores.

There was no development of importance to the Gilt-edged market this week. Since the market is awaiting the announcement of State Government loans, activity in this section was restricted, with values showing no change. Among Central loans, 3½ per cent 1968 was keenly bid 45 P higher at Rs. 98.85. 4¼ per cent 1972 gained a like amount to Rs. 100.15. 6½ per cent 1977 Gold Bonds were fully maintained at Rs. 118.10, at which rate the redemption yield works out to Rs. 4.65 per cent. 3½ per cent 1965, however, encountered selling and dropped 40 P to Rs. 100.10.

In the foreign exchange market, the banks' selling rate for U.S. dollars was unaltered at Rs. 480 per $100, while their buying rate declined by 25 nP to Rs. 476.50. In New York, the pound sterling ruled irregular *vis-a-vis* the dollar. Thus, the spot rate rose by 0.040 cent to 278.880-278.900 cents, while the three months' forward eased by 0.010 cent to 278.390-278.410 cents.

SILVER DECLINES

(From Our Own Correspondent)

BOMBAY, 29th July

A divergent trend prevailed in the bullion market during the week under review. Silver shed a part of its last week's gains owing to the reluctance of dealers to enter into fresh commitments. Enquiries from upcountry centres were poor. The easiness of silver had no effect on gold which moved up on good support.

Silver, which had shot up from Rs. 250.50 to Rs. 254.50 last week declined steadily and touched Rs. 252 today. While the daily average arrivals were unchanged at 18 bars, offtake was lower at 8 bars, as against 13 bars.

Fourteen-carat gold opened at Rs. 70.50 and, after declining to Rs. 70.25 in the earlier sessions, recovered subsequently and closed at Rs. 71 today. In unofficial trading, primary gold was quoted higher at Rs. 124. Sovereign was firm at Rs. 92.50.

The international price for gold at the London market rose from $35.07½ to $35.07¾ per fine ounce. The sterling price, however, declined to 251s. 6¾d., after moving up to 251s. 7½d. Ready and forward silver were steady at 112d. and 112½d., respectively, as also silver in New York at 129.3 cents.

The Parliamentary Select Committee on Gold Control Bill has been told by some interests that the gold control policy has failed in achieving its desired objectives of checking smuggling and bringing down the price of gold. These interests have, therefore, urged the Committee to recommend withdrawal of the Bill. According to them, the manufacture of new ornaments of 22-carat purity has not come to an end and that ornaments of 14-carat purity have failed to become popular. Further, the making charges for higher purity ornaments have gone up considerably. Gold itself, it is said, has to be procured from dealers at rather exhorbitant rates. They have also objected to the severe penalties in the provisions of the Bill. The Committee, it is presumed, might recommend the grant of more concessions to dealers through some modifications in the Bill.

The retiring President of the Surat Jari Merchants' Association has appealed to the Union Government to announce its decision about the revised jari export promotion scheme as soon as possible. He has requested that the industry will be given gold equivalent to 75 per cent of its requirements. He has also called for the implementation of the remaining recommendations of the Jari Industry Enquiry Committee of 1958 for the all-round development of the jari industry.

The following table shows the trend of prices during the week under review:

	29-7-1964 (closing)	High	Low	22-7-64 (closing)
SILVER				
Ready (996 fine) ..	Rs. 252 50	Rs. 254.50	Rs. 252.00	Rs. 254.50
GOLD				
Ready (14-carat) ..	71 00	71.00	70.25	70.50
Sovereign ..	92 50	—	92.50	92.50*
London—				
Gold ..	251s. 6¾d.	251s. 7½d.	251s. 6¼d.	251s. 7¼d.
Silver Ready ..	112d.	—	—	112d.
Silver Forward ..	112½d.	—	—	112¾d.
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

COTTON FUTURES FIRM AT CLOSE

(From Our Own Correspondent)

BOMBAY, 29th July

Starting on a quiet note, cotton futures moved up due mainly to hectic bear covering. On Saturday the 25th inst., the market became almost overspeculative, for there was not only hectic bear-covering but also sustained bull support, in view of the nearness of the delivery period to commence. The two parties failed to reach an understanding over the rates for squaring up open positions. The bulls were not prepared to yield ground. The failure of the efforts made by the Chairman of the East India Cotton Association calling on the parties to reach an understanding led to a further rise in prices. The upward trend was, however, halted on Monday when, following fears of official intervention in this regard, coupled with lack of enthusiasm and heavy unloading by tired bulls in private deals, cotton futures suffered a setback. Rumours that bears sold afresh in private and were understood to be ready to offer about 5,000 bales in tender against the maturing contract also imparted easiness. The easiness persisted till today when the market picked up strength again, thanks to emergence of buying support at lower levels. The undertone of the market at the time of writing was distinctly firm.

The Jarilla August contract opened Re. 1.25 higher at Rs. 741.50 and, after touching a new high of Rs 749.25 on the 25th inst., receded to Rs. 743.50 yesterday. It, however, recovered to Rs 747.25 before finishing at Rs. 746.25. The net gain over the week was Rs. 3.25. The contract, it may be noted here, is maturing on the 3rd of next month. According to knowledgeable sources, the first day tenders are expected to aggregate around 5,000-7,000 bales. The outstanding volume of business in the August contract is said to be about three lakh bales. Trade circles feel that the price movements in Jarilla August contract have not been very wide and that the rate of Rs. 746 per candy (three quintals) is not at all high especially when 25/32" Moglai Jarilla is being quoted at Rs. 798 in the spot market.

Trading in the new crop contract for March 1965 delivery will commence tomorrow. In the meantime, the Board of the East India Cotton Association Ltd. has decided to apply the terms and conditions applicable for the I.C.C. August 1964 delivery to the hedge contract for 1964-65 season with some modifications. The Board has also decided to revise the arbitration procedure in By-law 38 in order to make it more equitable and speedy. Trade circles, it will be recalled, had represented to the E.I.C.A. that the terms of the March 1965 contract should be similar to those of the current one excepting that fixing of difference should be done around the maturity date so that it truly reflects the spot positions at that time. But the E.I.C.A. has not taken any decision about this. The authorised representatives of the cotton trade are understood to meet tomorrow to consider the amendments to by-laws and the hedge schedule applicable to the contract for 1964-65 season.

In the Sewri spot market, mill buying was confined as usual to varieties like Co2, L.147 and Laxmi. Some of the popular varieties were quoted at the following rates:

Dhulia Rs. 1,000; Karanja L.147 Rs. 1,150 K; Hubli Laxmi RA Rs. 1,241; Amravati red label Rs. 1,275; Burhanpur Rs. 1,235; Sholapur delivery Khangaon L.147 Rs. 1,250; Bilingual Jayadhar Rs. 1,045 and Bijapur Laxmi Rs. 1,080.

In the export section, revival of interest in Bengal *Deshi* by Japan was reported. The import section was dominated by developments regarding the Egyptian cotton. Trade circles got perturbed over the reports about the promulgation of the new exchange control regulations by the Egyptian Government authorities. According to the new procedure, letters of credit are required to be opened for the entire purchases of Egyptian cotton by all importers and spinners here by the end of this month. Although both the East India Cotton Association and the Cotton Buyers' Association have sought the good offices of the Egyptian cotton authorities for a possible relaxation of the new stipulations, no reply seems to have been received so far. It is understood that Japan and the U.K., to whom similar stipulations had been made by the U.A.R. have refused to open letters of credit.

In the meantime, the Textile authorities in India have agreed to all the conditions insisted by the U.A.R. Government. Heavy rush was reported at the office of the Joint Chief Controller of Exports and Imports on Tuesday (28th inst.) from applicants seeking import licences for Egyptian cotton. With the issue of the import quotas to mills by the Textile Commissioner, the issue of import licences in respect of Egyptian cotton is proceeding at full swing. Though the payment is stipulated by U.A.R. authorities in sterling, it will depend on the terms settled in the agreement to be concluded shortly between India and the U.A.R. The U.A.R. Delegation was expected to arrive on Sunday last, but postponed the visit. It is now expected to arrive here next week.

OILSEEDS BUOYANT

(From Our Own Correspondent)

BOMBAY, 29th July

Trading in oilseeds futures was practically at a standstill this week also. For the ceilings are low and bear no relation to the intrinsic worth of the contracts. The ceiling on castor futures is Rs. 181.50, but the spot price works out to about Rs. 200. The spot rate for linseeds has touched Rs. 50, whereas the ceiling is Rs. 45.

The cottonseeds contract is virtually a dead one. In unofficial dealings, astor September had been bid up to around Rs. 184.75, although, at the close of the week, it eased a little to Rs. 184. The spot section was extremely active and buoyant, the Madras Small variety being bid up to Rs. 41 and Bihar bold to Rs. 40. At the close of the week, they were slightly shaded at Rs. 40.12 and Rs. 39, respectively. Oil B.S.S. and commercial was done at Rs. 18.60 and commercial at Rs. 17.80.

The talk of the market is the imposition of the ban by the Gujarat Government on exports of groundnut oil and oilseeds from the State and its possible repercussions here. About a third of Maharashtra's needs are met by imports and the daily requirement of groundnut oil is put at 600 to 700 tonnes, including 200 tonnes on account of the *vanaspati* industry. If the ban were to continue—and the market at least is not hopeful of any early relaxation of restrictions—there would be a virtual famine of groundnut oil in the State. Oilseeds and oil interests here are extremely critical of the Gujarat Government's policy which they term as purely retaliatory in nature. How long will this ban continue is anybody's guess, but the general comment is that it will stay at least until such time as it begins to recoil on the farmers of Gujarat and through them on the economy of the State itself. The surplus of groundnut oil there is estimated at 40,000 tonnes.

The result of the ban was a scramble for oil in Bombay and the rise in its price to around Rs. 2,650 per tonne. It was said that at upcountry centres, the commodity had been bid up to as high as Rs. 3,000 after the Gujarat Government's decision regarding the ban became known. In the spot section, Madras quality was done at Rs. 67. The Sangli and Kanpur varieties were taken up to Rs. 64 and Rs. 63, respectively. At the end of the week, they were quoted at Rs. 65.75, Rs. 64 and Rs. 63, respectively.

The announcement regarding the import of 100,000 tons of soyabean oil under P.L. 480 was welcomed wholeheartedly. It was felt that the imports would help ease the situation, but on second thoughts, the trade wondered whether the imports would exercise any real effect on prices here. It was said that the receipts would average 8,000 tonnes a month and that it would, therefore, take a long period of 12 months for the entire quantity to be received here. Even if larger quantities could be obtained at any single time, lack of bulk handling and storage facilities here would preclude such receipts. A quantity of 8,000 tonnes a month was considered chicken feed.

In keeping with the trend in castor and groundnuts, linseeds maintained a firm tone. Price movements in the September contract were narrow and outside interest was virtually absent. The contract hovered just under the ceiling and, with the spot rate being much higher than the forward quotation, business in futures was virtually impossible. The same was more or less true of cottonseeds. Apart from the defective terms and conditions, few would care to touch it so long as its ceiling is sheer of reality. Linseed bold was quoted at Rs. 50 and oil at Rs. 21. The undertone was distinctly firm.

Groundnut extractions showed a tendency to weaken. The rate was around Rs. 417 a tonne with sellers eager but buyers reserved. United Kingdom advices indicated £37-10 for August, £37-7-6 for September, £36-7-6 for October-December, £36 for December, £35-15 for December-January-February and £35-7-6 for January-February-March. Knowledgeable circles think that the market in extractions is heading for

a rather big decline particularly in view of the bearish advices from overseas markets. The trend here will be induced by the availability or otherwise of soyabean meal, but current ideas are that its supplies would be such as to induce a downtrend in the market. Expellers were mentioned at about Rs. 495 a tonne in Bombay and Rs. 475 in Saurashtra. No doubt supplies are tight at the moment, but overseas buyers at the same are generally reluctant for commitments for the end-of-the-season stuff. Locally, demand is poor and it is said that nearly half the number of plants have been closed down and the orders are working at only one-half to a third of their rated capacity.

With trading in the present forward contracts at a standstill, interest has naturally shifted to the new crop contracts. The trade is fondly hoping not only for permission but also for higher ceilings. Respresentations had been made to the Government about the desirability of raising the *ceiling rates*. Informed sources, however, think that the Government may postpone consideration of forward trading in castor and groundnuts until November. The question of linseeds may not come up for consideration until February, at any rate not before some idea of the mustard crop becomes available. This can happen only in January or sometime in February. There is a feeling that trading in cottonseeds might be allowed, but, under the existing conditions, it matters little to the trade whether permission is given or withheld. With regard to groundnuts, the trade is rather confused in that, under the present contract of the Bombay Oilseeds Exchange, oils and oilseeds are tenderable in various centres of Gujarat, and the point is whether this would not lead to complications, in view of the present ban on exports from the State. The feeling, therefore, is that, unless the ban is removed, the contract as it stands will become inoperative. But permission for forward trading within the limits of the present ceilings has no meaning.

The first estimates of the new crop groundnuts indicate a rise of 24 per cent in the acreage and, although about 400,000-500,000 tons more might be harvested, informed sources do not anticipate a decline in the prices both on account of the inflationary tendencies and a possible increase in demand. However, speculations of this nature are rather premature and risky.

The following table shows the closing prices of oilseeds and oils as on 29th July as compared with those of the two previous weeks:

	29-7-1964	22-7-1964	15-7-1964
Groundnuts	Rs.	Rs.	Rs.
Nizam bold	65.00	64.50	63.75
Khandesh quality	65.75	65.50	65.50
Oil ex-mill	26.25	26.00	25.25
Oil Rly. Receipt	25.80	25.70	25.15
Castorseed			
September 1964 contract	181.50	181.50	181.50
Ready Madras	40.12	39.00	37.25
Ready Kanpur	39.00	37.75	36.00
Oil B.S.S.	18.60	17.80	15.80
Oil commercial	17.80	17.00	15.30
Linseed			
September 1964 contract	44.81	44.75	44.78
Bold ready	49.25	47.50	47.50
Linseed oil	21.30	19.90	19.75
Cottonseed			
September 1964 contract	104.00	104.00	104.00

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

PEPPER RECEDES

(Messrs. Parekh and Co.)

BOMBAY, 29*th July*

A persistent downward slide characterised trading in Malabar pepper during the week. In Bombay, though spot remained unchanged steady, forward delivery in *Shrawan* lost Rs. 15 and *Bhadrapad* Rs. 10. In Cochin; August delivery lost Rs. 14 and October was pressed down to Rs. 368. Several factors have been mentioned as reasons for the decline. Some quarters were of the opinion that the heavy arrivals of Lampong black pepper in New York during July acted as pressure on spot which went down to $0.34½ and that it had its natural reflection on the Indian markets. Other quarters felt that weakness in India was due to bear selling by some trade interest in forward deliveries at both Bombay and Cochin. The floating stock of ready pepper on all primary markets being small, the fall in spot was only sympathetic.

A section of the trade, on the other hand, believes that the present fall in New York is only a temporary one, as there is no selling pressure from Lampong where old stocks of Lampong is estimated at 1,000-2,000 tons only and that A.S.T.A. quality new crop is not likely to come to the market before October. A knowledgeable source also expects that the Indonesian Government is likely to increase its check price to $0.42 for the U.S.A. in the near future, as now its selling policy is being shaped according to the advice of one or two Dutch experienced firms which are collaborating with the Indonesian State Trading Corporations in both Europe and New York. They also express concern over the tense South-East Asian situation and renewed clash between Indonesia and Malaysia in North Borneo. If the political situation deteriorates, the prices are likely to be lifted unexpectedly.

If the trend on the New York Produce Exchange is any criterion for the future, one can safely forecast that the future of the world's black pepper is rosy, inasmuch as that September on the New York future market is bade at $0.35, while $0.37.50 is asked, as against the spot price of $0.34½. October and November remain unquoted.

Technical position in India being strong, the growers refused to be unnerved by bear hammering on forward rings at Bombay and Cochin and are unwilling to part with goods unless at their price.

Singapore, after remaining closed for a couple of days owing to riot there, is now fairly steady.

Ready ungarbled at Calicut is quoted at Rs. 330 to Rs. 350.

Ready pepper in Bombay is quoted at Rs. 185 per 50 kilos.

STAPLE FIBRE YARNS LOOK UP

(From Our Own Correspondent)

BOMBAY, 29*th July*

Staple fibre yarns ruled distinctly firm during the week under review, while art silk yarns and cotton yarns drifted downward. The firmness of staple fibres yarns was engendered by sustained buying support and good demand and small supplies from local manufacturers. It was said that some composite mills were themselves utilising their production of staple fibre yarn for weaving fabrics. One or two mills are reported to have reduced their production of staple fibre yarn. It was, therefore, feared that the inflow of yarn into the market would decline. Prices, as a consequence, moved up. Art silk yarns, however, encountered selling induced by easy availability of import licences at a reduced premium and comfortable supply position, thanks to poor demand in the wake of large arrivals. Cotton yarns ruled easy.

Among art silk yarns South India Viscose 120D fell by 33 P to Rs. 13.62. Bright Century 75D slumped by 68 P to Rs. 18.28. National Rayon 150D and 120D were neglected, the former at Rs. 11.18 and the latter at Rs. 11.92.

Staple fibre yarn (2x34 French count) Citys firmed up from Rs. 9.55 to Rs 9.79. Sitalaxmi put on 4 P to Rs. 9.94. Vasantha strengthened by 13 P to Rs. 9.35.

In the cotton yarn section 34s Madura declined by Rs. 3 to Rs. 36. 68s Minerva fell by Rs. 7 to Rs. 86. 8s Podar and 12s Modern were dull at Rs. 21 and Rs. 24.

RAW JUTE ADVANCES

(From Our Own Correspondent)

CALCUTTA, 28*th July*

A feature of trading in the jute markets during the week under review was the sharp rise in fibre prices as a result of restricted arrivals of new crop. Prices of heavy goods also rose impressively due to covering demand against earlier purchase orders and hectic activity in the hedge market, although actual business taking place with overseas buyers was limited. For a time, the news of the end of strike in certain Pakistani jute mills caused recession in prices of heavy goods, but soon sentiment was buoyed up following covering demand. After weeks of continued dullness, the New York burlap market picked up a measure of liveliness during the week under review, and spot 40" 7½ oz. hessian hardened from 8.60 cents a yard to 8.70 cents. At 11.50 cents a yard, the heavier hessian recorded a similar rise. In Calcutta, hessian prices recorded a small rise, mainly in sympathy with the rising fibre and heavy goods markets. Although an encouraging note was taken of the rise in U.S. burlap consumption in June—from 63.5 million yards in May to 70 million yards—this failed to have an impact in sentiment in Calcutta. For, with the knowledge that mills in both India and Pakistan were operating up to their maximum capacities, U.S. inquires continued to be for small quantities only. Despite the increase in U.S. consumption in June, total consumption for the first six months of this year was only 436.8 million yards, a decrease of 27.1 million yards as compared with the corresponding period of 1963.

The falling trend of U.S. consumption has naturally caused anxiety in trade and industry circles. In the twelve months to June 1964, consumption in that country aggregated 886 million yards, showing a decline of 10 million yards as compared with 1962-63. In the second half of 1964, consumption was sharply down at 449 million yards, as against 432 million yards in the second half of the previous year. As already stated, consumption in the first six months of the current year continued to fall. This unwelcome trend, attended by a fall in the price trend, reflects the steady progress made by the man-made fibre industry and carpet backing fabrics in the United States. The paltry support accorded to Calcutta hessian by U.S. buyers underlines the non-changing character of hessian prices, despite the continued hardening in fibre prices ever since the new crop began arriving mills' stations. In this context, the rise in new crop prices above the I.J.M.A. minimum levels is causing anxiety.

The rise in the prices of goods during the week under review, as already stated, was principally due to covering against earlier orders. In addition, increased demand on account of internal buyers served as a sentiment booster. It is expected that, as a result of loss of production in Pakistan on account of labour troubles recently, some overseas demand normally going to Pakistan would be diverted to Calcutta. Although during the week port conditions considerably eased following the series of steps taken by the port authorities and the delay for ships for entry and re-floating was cut down sharply, ready loaders for several destinations, including River Plate ports, failed to carry the size of jute goods cargo originally expected. The sharp rise in prices has made shippers to proceed cautiously, as, considering the estimate of the new crop, they felt that the rise in prices would be only temporary. Keen activity in the hedge market was a feature on Tuesday last, and so ready B. twills rose from Rs. 116.75 to Rs. 117.05, despite the news of easiness in the labour situation in Pakistani mills. On the other hand, ready hessian 40" 10 oz. was quiet at Rs. 44.30. Against earlier orders, there was covering in both ready delivery hessian and heavy goods on Wednesday. B. twills and hessian 40" 10 oz. were firm at Rs. 117.05 and Rs. 44.35, respectively. Prices rose further on Thursday and, though genuine business was lacking, dealers were anxious to cover against earlier orders before prices added more gains. B. twills were pushed up to Rs. 117.85 and hessian 40" 10 oz. in sympathy to Rs. 44.65. At this stage, buoyancy set in in the hedge market to take ready B. twills to Rs. 118.85 and ready hessian 40" 10 oz. to Rs. 45.20 on Friday. These levels induced profit-taking over the week-end, when quotations were Rs. 118.50 and Rs. 45.00, respectively. Short-covering in ready goods, coupled with continued buoyancy in hedge, led ready B. twills to move up to Rs. 119.40 yesterday. In B. twills, some business was done with Government, but overseas buyers did not respond to the rise. Ready hessian 40" 10 oz. added a small gain at Rs. 45.35.

As already stated, fibre prices rose. New crop arrivals were small, as harvesting and retting had not started on a large scale, and transport was affected due to bad weather. This gave rise to doubts as to whether the new crop would be as large as last year's. Assam bottoms rose from Rs. 33.00 a maund to Rs. 33.50, daisee bottoms from Rs. 33.50 to Rs. 35.00, and northern bottoms from Rs 31.50 to Rs. 33.00. Mills are worried at the rising trend, as already simultaneous business in fibre and goods is putting them to loss. If prices of goods rose in tune with the rise in fibre prices, exports of goods are bound to suffer. Sellers of fibre were cautious as upcountry prices were above Calcutta's parity. Despite the rising trend and mills' need to purchase the selected grades, their support was small. Fibre prices in Pakistan also tended to move up, despite the increased trend of arrivals. Quality also showed some improvement. Shippers of Pakistani fibre as well as their agents in Dundee were pleased with the announcement that fibre exports on contracts entered into prior to 13th June, when the rates of duty were revised, would attract the new rates. There had earlier been a stalemate when immediately after the revision, the official interpretation was that the new rates were applicable only to shipments taking place in respect of contracts entered into after 13th June only. At this interpretation, shipments of pre-13th June contracts came to a standstill. Dundee buyers were agitated and made strong representations to the Pakistani authorities.

KIPS QUIET

(From Our Own Correspondent)

MADRAS, 27*th July*

There was no appreciable change in the kip market, and the tempo of export trading was similar to the previous week. Demand centered round lower selections in light weight cowhides. Heavy weight cowhides were not available at reasonable prices, and tanners were holding stocks. Inquiries for cow calf were mostly for light averages, and a few sales were reported. Export inquiries for buff calf were negligible; and stockists are expecting American demand after a few weeks to crop up.

In the tanned skins section, trading was at a low ebb. Beyond a few sales of 8/9 lbs. goat skins and 7/8 middle class sheep skins, there was not much to report. It is believed that importers are waiting for prices to decline at origin, to make purchases at economical levels. Raw prices in the supply centres rule firm for goat and quiet for sheep skins.

The next tanned skins public sales in London will take place on the first of August 1964; and the consignors do not expect good clearance.

TEAS IN GOOD DEMAND

(From Our Own Correspondent)

CALCUTTA, 28*th July*

Quality teas during the export sale held yesterday met with good demand. A small improvement in demand in last week's dusts sale was also discernible. A further increase in tea arrivals meant more shipments aided by favourable conditions in the port. The prompt U.K. loaders carried a good portion of cargo in tea. There was good demand for forward space for both U.K. and Continental destinations.

The appointment of a committee by the Government of India to investigate the financial needs of the tea industry has been welcomed. The tea industry has been pointing out that its costs are steadily increasing and that capital return had gradually shrunk in recent years.

Dusts on offer during last week's internal sale aggregated 16,799 chests, which met with a good general demand. As the sale progressed, demand became strong. Plain orthodox teas were steady at invoiced rates. Medium Assam teas showed good demand. Legg-cut teas exhibited initial weakness, but soon returned to opening levels. C.T.C teas were irregular; though in good demand prices at one time eased up to 20 P. The brighter teas hardened. The quotations per 1 kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.90 to Rs. 7.30, medium Assam C.T.C. dust Rs. 5.80 to Rs. 6.40, medium Assam dust Rs. 5.00 to Rs. 5.80 (nominal), legg-cut dust Rs. 4.80 to Rs. 5.30, and plain orthodox dust Rs. 4.10 to Rs. 4.50.

A strong general demand met export offerings aggregating 41,219 chests of leaf during the sale held yesterday. All liquoring teas were particularly favoured. The strongest feature of the sale was provided by bright Assam orthodox teas prices of which rose impressively. Selected B.O.P. teas showed a considerable addition to price. An irregular trend was recorded in plain orthodox teas; while the brokens were about firm, fannings eased. Whole leaf grades came to a dearer market, but tippy teas eased. Assam C.T.C. teas with useful liquors advanced, but the rest of this category eased. Legg-cut teas added small addition to prices. Darjeeling teas met with better demand. The quotations per 1 kg. inclusive of excise duty were: best Assam C.T.C. fannings Rs. 7.20 to Rs. 8.00, medium Assam C.T.C. B.P. Rs. 6.00 to Rs. 7.00, best Assam C.T.C. B.P. Rs. 7.20 to Rs. 8.00, medium Assam C.T.C. fannings Rs. 6.00 to Rs. 7.00, clean plain pekoe Rs. 5.10 to Rs. 5.40, plain fannings Rs. 4.00 to Rs. 4.30, and plain B.P. Rs. 4.40 to Rs. 4.60.

TIN AND ZINC RISE AGAIN

(From Our Own Correspondent)

CALCUTTA, 28*th July*

With good support, firmer conditions were in evidence in the Calcutta metal market during the week under review, and both tin and electrolytic zinc recorded liberal gains. On the London Metal Exchange, copper and zinc rose, while tin and lead were maintained. Reports from London make no mistake of the anxiety entertained by producers in regard to the rapid rise in prices, as they fear that the tendency among consumers to substitute aluminium in place of copper and zinc would become more marked and basal and that, if machines were re-modified to take aluminium, a reversal to copper and zinc when prices declined would be difficult. The need for reversion would not be felt either. For this reason, producers prefer to make supplies direct to consumers, and it is apprehended that, if this tendency were to continue, the usefulness of the L.M.E. as a forum to reflect free market prices would diminish gradually but surely.

Despite the anxiety of producers, it should be recognised that one of the important causes for the uptrend on the L.M.E. quotations since the beginning of this year is the rise in world consumption. Although production has risen, the rise has been below that in consumption. That explains why the consumers, despite direct supplies from producers at prices lower than the L.M.E. quotations, take to the medium of the L.M.E. for satisfying their demand. It follows, therefore, that, unless producers are able to lower the free market prices by increasing supplies more rapidly than in recent months, the price trend would continue to reflect the world shortage. It should be remembered that a more abnormal rise in tin price is being avoided only by the periodic releases from the U.S. stockpiles. The U.S.A. has now decided to release substantial quantities of lead and zinc, but it is reported that such releases would only meet the increased requirements within the country. This being the situation, it is not seen as to how the tendency for substitution of aluminium for copper and zinc can be stemmed altogether.

In Calcutta, utensil copper scrap was firm at Rs. 650 per 100 kgs. Demand was keen. According to the annual report of the Indian Copper Corporation Ltd. for 1963, sales showed a small rise at £4.27 million as against £4.02 million in 1962, despatches having totalled 14,029 tonnes, a rise of 1,376 tonnes. These included 3,057 tonnes of copper ingots as against 3,019 tonnes. As a result of lower demand in world markets, kyanite sold fell from 33,184 tonnes to 21,597 tonnes. Output of rolled products at 10,598 tonnes, including copper sheets and strip showed a rise of 959 tonnes, while that of refined copper fell slightly from 9,781 tonnes to 9,582 tonnes. The Corporation's new electrolytic refinery is now expected to be commissioned by September, which is some eight months away from the target. This is attributed to the delay in receiving the import licences and supplies of controlled stores. On the London Metal Exchange, spot copper wire-bars scored from £305 to £314 a ton, cathodes from £297 to £305, and fire-refined copper from £282 to £284. The strike threat in Chile influenced the uptrend.

Spot tin in London opened at £1,260 a ton and closed lower on balance at £1,250. Meanwhile, the trade has noted that the immediate prospect for recession in the L.M.E. price has receded in view of the growing uncertainty caused by the deepening Indonesian-Malaysian crisis. Communal troubles in Singapore have also caused anxiety. The steady rise in prices in Penang reflects the disturbed political conditions in South-East Asia as well as to the shortfall in output in both Bolivia and Nigeria. In Calcutta, with good demand, the price gained from Rs. 3,000 per 100 kgs. to Rs. 3,050. Electrolytic zinc rose from Rs. 323 per 100 kgs. to Rs. 331. The L.M.E. quotation continued to rise, this week's closing rate for the spot metal at £144 comparing with the opening of £136. The announcement of the U.S. decision to release 75,000 tons of zinc from its strategic stocks failed to arrest the rise, as it is held that this quantity would not be able to close the gap between consumption and demand. Spot lead in London was firm at £99¼ a ton, and the U.S. decision to release 50,000 tons from its surplus stocks failed to have an impact on the firm trend. Locally, lead was in good demand with the quotation displaying firmness at Rs. 293 per 100 kgs.

FURTHER SPURT IN FOODGRAINS

(From Our Own Correspondent)

HAPUR, 27*th July*

Firmness in foodgrain and pulses prices continued unabated and prices touched all-time high levels. Scarcity conditions exist all over U.P. and there is heavy demand even at higher price levels. According to the final crop estimates the foodgrain output in 1963-64 was only 79 million tons and not 81 million tons as was indicated by the earlier provisional estimates. The latest estimate of the country's needs this year at the 1960 *per capita* consumption level is around 90 million tons. Part of the additional need will be met by pumping into the market about six million tons of imported grain. Last year only 4 million tons imported grain was used. But there may be a gap of about five million tons despite increased supplies. An unfortunate result of the present situation has been that during the next few crucial years the country will have practically no buffer stocks at all. A break-up of this year's production figures shows that while the output of cereals has risen from 67 million tons last year to 70 million tons this year that of pulses has fallen from 11.6 million tons to 9.6 million tons. There has been no increase in the output of cereals except rice. The production of wheat was 9.7 million tons *jowar* 9.2 million tons and barley 2 million tons.

Wheat prices advanced by Rs. 5 to Rs. 7.50 per quintal according to quality during the week on good local demand and brisk east U.P. buying support. Prices touched an all-time high level and were quoted between Rs. 74 to Rs. 77.50 for *dara* quality and between Rs. 80 to Rs. 82.50 per quintal for farm produce. The corresponding prices last year were much lower at Rs. 43.25 to Rs. 48.75 per quintal according to quality. Daily arrivals were small due to heavy rains and stocks now left were estimated around 2,000 quintals. The State has been facing acute food crisis during the past few days. Arrangements have been made to bring wheat from ports at a quicker pace. The Centre has also doubled supplies to the State. Bullish conditions continued in rice market also and prices rose sharply by Rs. 2.50 to Rs. 8 per quintal according to quality on good local and outside buying support in face of declining stocks position. Weekend prices were: Rice *basmati* superior Rs. 99.13 to Rs. 103.77, *sela* Rs. 96.45 to Rs. 99.13, *mainpuri* Rs. 89.75, *ramajwayan* Rs. 93.77, *raimunia* Rs. 93.77 and *gadda* Rs. 89.75 per quintal.

Gram also attracted good demand and its prices hardened upto Rs. 3 per quintal to be quoted now Rs. 68.50 for local produce and Rs. 67.50 per quintal for Punjab quality. Stocks left with the trade were reported to be nominal. Prices on the corresponding date last year were at Rs. 42.53 per quintal for Punjab quality. Barley and *bejhar* prices also registered sharp gains on brisk east U.P. demand against meagre supplies. Prices advanced by Rs. 4.50 and Rs. 4 per quintal respectively to be quoted between Rs. 60 to Rs. 62.50 and Rs. 60 to Rs. 62.50 per quintal respectively. Arrivals of both cereals were small. *Juwar* and *guwar* prices sought higher levels on good demand for seed purposes and touched new high levels. *Methi* and oats were almost stationary while maize was steadier on good demand. Weekend prices were: *Methi* Rs. 55 to Rs. 60, oats Rs. 60 to Rs. 62.50, *guwar* Rs. 65.64 to Rs. 66.98 and maize Rs. 55 to Rs. 58 per quintal.

"GUR" SHOOTS UP

(From Our Own Correspondent)

HAPUR, 27*th July*

Crystal sugar continued to rule firm during the week at Rs. 175 to Rs. 180 per quintal in the open market, due to tight supply position, coupled with the non-availability of *desi khandsari*. Controlled prices of the commodity were Rs. 135 to Rs. 140 per quintal. The acreage under cane for the next season has gone up by 15 to 20 per cent, and the heavy timely rains so far are likely to yield a bumper cane crop this year. Some sources estimate an increase of about 50 per cent in the supplies of cane to the sugar factories next season, leading to a marked increase in the sugar production. The restrictions imposed on the movement and manufacture of *gur* and *khandsari* and the fixation of prices of *khandsari* would be a sufficient deterrent to the production of these commodities.

The stocks of *khandsari* which had been sealed by the State Government last month were released partially during the week at prices fixed by District Magistrates. Trading in *khandsari* in the open market was however slack due to acute monsoonish conditions during the last three days. Prices in the open market declined by Rs. 10 to Rs. 15 per quintal on expectations of the releases of stocks and were now quoted from Rs. 135 to Rs. 150 per quintal as against Rs. 106 to Rs. 127 fixed by the Government for the sale of the freezed stocks.

Ready *gur* flared up in the later part of the week following the receipt of heavy import quotas from Rajasthan, Punjab, Gujarat and Maharashtra. Daily arrivals were negligible and the *gur* stocks here as well as in mofussil markets were fast depleting. Cane crop prospects were bright, thanks to the fairly heavy rains in July. The week-end prices (in Rs. per 40 kilogram) were:—*gur* superior 31, *dara* 29.50, *shakker* 31 to 33 and *balti* 29.

FAIR ENQUIRY FOR TEAS

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 23*rd July*

A total of just under 725,000 kgs. was catalogued in leaf tea sale No. 29 held here on Tuesday the 21st inst. Nilgiri quality was often improved as were a few mediums, but on average it remained unchanged. There was only fair enquiry with generally less demand at irregular and lower rates for most descriptions. Improved quality Nilgiri brokens were sold at only around last rates, whereas the plainer sorts again eased in price. Fannings in these categories, however, were sold well and were often dearer than their equivalent brokens. Good mediums descriptions were about steady, while medium and low medium brokens shaded in price even where quality was maintained, but the plainer sorts registered quite considerable declines in price. Clean medium and low medium fannings were irregular, but sometimes a little dearer while fibrous sorts came to a lower market. Plainest varieties declined further, but support for black leaf kinds was strong. Whole leaf grades were irregular and often lower except for liquoring sorts which were dearer with quality. Teas of unorthodox manufacture came to an irregular market.

The quotations (per kg.) were as follows:

	1964	1963
	Rs.	Rs.
Low mediums	4.00-4.15	4.10-4.40
Mediums	4.15-4.40	4.40-4.65
Good mediums	4.55-5.20	4.70-4.65
Nilgiri B.O.P.	4.50-6.20	4.70-6.70

The average price realised in sale No. 29 was Rs. 4.36 per kilo, as against Rs. 4.38 a week ago and Rs. 4.41 in the corresponding sale last year.

In dust sale No. 29 held today, 255,000 kgs. were offered. The market met with fair general demand. Medium descriptions received only fair support and prices were appreciably easier. Coloury mediums, however, encountered better enquiry, but here again prices eased. Best highgrowns were fully firm, but others declined a little. Unorthodox types were steady on last rates.

The average price realised in dust sale was Rs. 4.36 per kilo, as against Rs. 4.33 a week ago and Rs. 4.07 in the corresponding sale last year.

Colombo: In Monday's auction there was strong general demand with best dimbulas firm while other highgrowns were occasionally easier. Good mediums also ruled fully firm, but others were 5 cents dearer. There was strong demand for improved quality uvas.

London: *North Indian and other growths*: In Monday's sale there was good general demand with best dooars firm, but other descriptions on offer came to an irregular and easier market. There are no quotations for Assams as there were none available.

Ceylon and South Indians: On Tuesday there was quieter demand and although best liquoring teas were firm others came to a lower market following the decline in quality.

COMMERCE AND INDUSTRY

(Concluded from page 176)

P.L. 480 rupees are also allocated to meet the legimate needs of the U.S. Government for paying its own bills in India. Quite a significant part (Rs. 140 crores or 13 per cent of the total as of December 1963) of even the so-called "U.S. uses" rupees is earmarked for projects jointly agreed to between the U.S. and Indian Governments for the benefit of both the countries. Mention, for instance, may be made of publication of low-priced textbooks, academic exchange programme and the Fulbright programme, and research schemes carried out in Indian institutions (agricultural research and health research are the most notable). Since 1952, about 1,700 American technicians have come to India under the aid programmes to share their skills with their Indian counterparts and more than 3,700 Indians have studied in the U.S. A large number of Indian industries have received Cooley loans.

The foregoing account will clearly indicate that the U.S., under the Food-for-Peace Programme, has been sharing the fruits of its high agricultural productivity with other countries, especially the developing countries. The Programme, besides meeting a large part of the shortfalls in available supplies of foodgrains and other farm products, has helped greatly in financing the implementation of several economic development projects without entailing any heavy burden of servicing loans obtained from the U.S.

LONDON LETTER

(Concluded from page 176)

of the past six months is simply not enough to substantiate that claim. If a 4 per cent growth rate per annum in national productivity is to be achieved (and in the past fourteen years the growth rate has been under 2½ per cent per annum) then the export growth rate required is 6 per cent or a little better. That is the March/May average of £373 million per month must be somewhat bettered over the rest of the year: unless July/December exports average not less than £375 million the country will fall behind the essential target.

And since the national production index has now been stationary for some three months, it looks as if the export performance is simply a reflection of a loss of impetus in the economy as a whole. Maybe the next production and the next export figures will belie this somewhat gloomy conclusion, but for the moment this is how the City is beginning to view matters in spite of its desire to be optimistic.

Notices

THE KARANPURA COLLIERIES LIMITED

NOTICE IS HEREBY GIVEN THAT AN Annual General Meeting of THE KARANPURA COLLIERIES LIMITED, will be held at the Registered Office of the Company, Chartered Bank Buildings, Calcutta, on Friday the 28th August, 1964, at 11 a.m., for the following purposes:

1. To consider and adopt the Audited Accounts of the Company for the year ended 29th February, 1964, and to receive the Directors' and the Auditors' Reports thereon.
2. To declare Dividends recommended by the Directors.
3. To appoint Auditors and fix their remuneration.
4. To appoint a Director in place of a retiring Director.

AS SPECIAL BUSINESS

5. To appoint a Director in place of Mr. N. K. Kejriwal, who retires, and in this connection to consider and if thought fit, to pass with or without modification the following resolution of which a notice has been received by the Company from one of its members under Section 257 of the Companies Act, 1956, which will be proposed as ordinary resolution.

"That Mr. N. K. Kejriwal be and is hereby appointed a Director of the Company."

The Share Transfer Registers of the Company will be closed from the 13th August, 1964, to the 28th August, 1964, both days inclusive.

By Order of the Board,
BIRD & CO. (PRIVATE) LIMITED
Secretaries & Treasurers.

CHARTERED BANK BUILDINGS,
CALCUTTA, *23rd July*, 1964.

Notes:

(a) A member entitled to attend and vote at this meeting may appoint a proxy to attend and vote in his stead. A proxy need not be a member of the Company.

(b) The Dividend, if declared, will be paid on or after 10th September, 1964, to those members so entitled whose names appear in the Company's books on the 28th August, 1964, or to their mandatees. No application for Dividend Warrants will be necessary.

(c) The relative Explanatory Statement pursuant to Section 173 of the Companies Act, 1956, in respect of the Special Business set out above is being sent to all members.

THE KARANPURA COLLIERIES LIMITED

AT A MEETING OF THE BOARD OF Directors held on Thursday, the 23rd July 1964, the following dividends were recommended for declaration at the Annual General Meeting to be held on Friday the 28th August 1964, subject to deduction of tax.

On 5½ per cent Cumulative (Taxable) Preference Shares at 4·579 per cent (being dividend at the stipulated rate of 5½ per cent per annum increased by 11 per cent thereof, and deducting therefrom Income-tax at Company's rate of 25 per cent in accordance with the provisions of the Preference Shares (Regulation of Dividends Act 1960) subject to deduction of tax).

On Ordinary Shares at the rate of 12 per cent per annum.

By Order of the Board,
BIRD & CO. (PRIVATE) LTD.,
Secretaries & Treasurers.

Registered Office:
CHARTERED BANK BUILDINGS,
CALCUTTA: *23rd July* 1964.

STOCK & SHARE QUOTATIONS

Abbreviations:—D.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. I.—Interim Dividend. C.R.—Cum. Right. XR.—Ex. Right.

Shares:—If a company has different classes of shares—as for example: 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up' per share.

Accounts:—Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends:—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

SHOULD U. K. BANK RATE BE RAISED?

By Our London Correspondent

As the holiday season closes in the City tends to become distracted by trivialities and movements which develop on the markets and the exchanges are given more than their usual significance: it is known as the beginning of the "silly season" when commentators must be more than usually careful to distinguish wheat from chaff. And there have been plenty of subjects to provide excuse for speculation: the collapse of the firm referred to by this correspondent last week has gone on providing food for gossip though its economic significance is nil. On balance the markets showed a gain on the week (though there was no excuse for last week's losses). Of much greater significance than the collapse affair has been the proposed merger between Courtaulds, Lancashire Cotton and Fine Cotton Spinners, which, if it goes through, would create a giant textile monopoly of £370 million. Views are mixed: there has been general astonishment at the magnitude of the deal and its commercial implications, but some are prepared to say that the British textile industry is still in need of rationalisation and that this is the way to do it. The anti-monopolists are worried, the efficiency seekers pleased.

The May production figures are now out and show that for five months running the British economy has apparently stood still, while employment has crept up. "Down goes productivity" murmur the pessimists and most people are inclined to agree the position is unsatisfactory, but now comes the revelation that it is all due to the fine summer. People are using less gas and electricity, so the utilities, which account for one-eighth of U.K. output, are producing less and thus counteracting the other rising elements in the economy. There is something, but not much, in the point.

Retail Trade

What is less satisfactory is that the volume of retail trade is actually down over the past three months, but retail prices are two per cent up—or three per cent up on the past six months.

Economic growth is clearly lagging behind, public spending is in no way responsible for any inflationary tendency, yet imports have risen much more steeply than exports and prices have risen. This suggests that old spectre cost inflation, one of whose components is poor productivity. A main danger about the rise in retail prices in these circumstances is that cause is given for more wage claims in the autumn. After all three per cent in six months is a higher rate than the agreed formula (agreed by the Government and industry, that is, not by the unions who still demand a "proper" incomes policy before agreeing to any such thing) for wage increases. Thus all workers who have had gains of no more than three per cent since last autumn have already had them wiped out.

This gives point to the insistence by the postmen that they should receive much more than the four per cent the Government offered them. In the event they have now had 6½ per cent and called off their strike, but other workers will now say that their claims also must be looked at without prejudice, that is without being measured against a national yardstick of 3½ per cent.

The Immediate View

On the immediate view, the British economy certainly appears to be nodding. Why then should a rise in Bank rate be expected week by week? First, because domestic money rates have been rising (the Treasury Bill rate is now almost up to Bank rate); secondly, because international factors are bearing against sterling. Such a rise is unlikely to inhibit the expansion in industrial investment which must surely begin to show itself before long. In building it is already here; bricks and now timber are in short supply and the constructional industries fully extended. Only a lack of confidence can hold back substantial industrial investment. Can anything be done to assist confidence in the future if Bank rate is raised? Should the Budget cautionary cry be reversed? For instance, should "regulator" taxes (the indirect taxes that the Chancellor can move by 10 per cent without Parliamentary authority) be dropped?

These questions are already being asked, but just as importantly it is being urged that an incomes policy is more than ever necessary. The pessimists are going so far as to say that, if something is not done before long (and how can it be done before the election?) then the alternative will be devaluation. But this looks like a bad estimate of the future; the present Government is not going to set the seal on defeat at the polls by devaluing before October and, if Labour wins, it would hardly start off by devaluing, even if it could say that its predecessors made that inevitable. It would be a point of honour and of economic principle to cure the nation's ills without that, especially as such a Government could resort to physical controls to relieve import pressures. But a returned Conservative Government might conceivably devalue and put the blame on the trade unions for resisting an incomes policy: however, this is a long shot in speculation.

In conclusion, there seems little doubt that Britain's problem is too low productivity and too high costs. And it is improbable that anything will be done about these things till after the election.

BANKING

(*Concluded from page 180*)

of interest rates. A special feature of this growing importance of dear money which has escaped general notice has been emphasised by Mr. Simha: Contrary to public impression, India is not a land of very low interest rates. Taking into account all the sectors—the organised and the unorganised, the industrial borrower and the agricultural borrower, the large borrower and the small borrower—the structure of interest rates is reasonably high. The endeavour of the authorities has been to raise interest rates for the organised and the industrial sector but to lower it for the unorganised and the agricultural sector, and to hold it down as far and as much as possible for Government borrowing. In fact, during the second Plan, a fairly active monetary policy was in operation. In addition to interest rates, quantitative and selective credit regulations were used to control direction and flow of credit. Above all, variable reserve ratios were operated for the first time.

By the time we came to the second year of the third Plan, there were indications of stresses and strains following substantial stepping up of investment effort. The accent on monetary policy during the third Plan period has, therefore, been on restraint, though there have been short periods of some liberalisation thrown in between.

Mr. Simha's analysis of fiscal and monetary policies is fairly intensive and, even when he has emphasised the achievements, he is not unaware of the inadequacies, difficulties and the importance of the time factor in taking important policy decisions. But what is of the greatest value is his stress on proper organisational economic, fiscal and monetary framework within which the instrument should be employed and that too on a modest scale. A proper appreciation of his findings by the policymakers could suggest a way out of the present impasse in which the thrd Plan and the economy have landed themselves at present.

SALE OF UNIT TRUST'S UNITS

The response to the sale of units by the Unit Trust of India which have been on offer since 1st July 1964, has so far been good. Over 40,000 applications, according to the Trust, have been received upto 22nd July and there is a regular flow of applications from all over the country. The majority of applications are for amounts ranging from Rs. 100 to Rs. 1,000 reflecting the subscriptions from small and medium income groups. In response to the requests to extend the initial sale period beyond 31st July and with a view to providing fuller opportunity particularly to persons in the remoter parts of the country to take advantage of the initial offer of the units, the Board of Trustees has extended the initial sale (at par value) period, which ended on 31st July upto the 14th of this month. Sale of units, therefore, continue at par value, namely, Rs. 10 per unit.

Janmabhoomi Bhavan, Ghoga Street Fort, Bombay-1

NOTICE

To
THE SHAREHOLDERS
TAK MACHINERY LTD.

NOTICE is hereby given that the Second Annual General Meeting of the above Company will be held at the Registered Office of the Company on Saturday, the 29th day of August 1964, at 10.30 A.M. (S.T.), to transact the business, details of which have been given in our Notice together with the Explanatory Statement dated 27th July 1964 which is being sent individually to all the members together with the audited Statements of Accounts for the year ended 31st March 1964.

The Share Transfer Books of the Company have been closed since the 21st day of July 1964 and will remain closed upto 3rd August 1964 (both days inclusive).

By Order of the Board,
(D. S. MAHADEVIA),
Managing Director.

Dated 27th July, 1964.

N.B. A MEMBER ENTITLED TO ATTEND AND VOTE AT A MEETING IS ENTITLED TO APPOINT A PROXY OR PROXIES TO ATTEND AND VOTE INSTEAD OF HIMSELF AND THE PROXY NEED NOT BE A MEMBER.

TEXTILE CONTROL: THINK AGAIN

QUITE a bright and interesting speech, albeit provocative and controversial in parts, was delivered by Mr. Ramnath A. Podar, Chairman of the Indian Cotton Mills' Federation, at the sixth annual general meeting of the Federation on Thursday this week. After impressively highlighting in the introduction of his speech the vicious circle of rising prices, wages and taxes induced by the self-defeating fiscal policy of the Government, Mr. Podar straightaway proceeded to deal with the problems pertaining to textile industry. The first to be tackled by him was the issue of prices of cloth. He was frank enough to admit that the Federation had accepted the scheme of partial control recently put forward by the Government with certain misgivings, because its practicability and usefulness were doubtful. As readers are aware, the Government's scheme provides for price and production controls over 40 per cent of cloth supplied by mills, leaving the balance free. This scheme, which is yet to come into force, will replace the existing voluntary price regulation. Much has been said about the voluntary regulation that came into being in January 1961. Suffice it to add that it had ceased to be effective long ago and that the protection offered by it to consumers was more illusory than real, especially in the last two years. Upto a stage, the mills had, no doubt, made a real sacrifice in an attempt to keep the prices of cloth from rising, but, when cost inflation assumed unbearable proportions and the Government failed to heed the industry's plea for a realistic revision of the prices voluntarily agreed to, the whole understanding broke down. The vast majority of mills found ways and means of circumventing the scheme.

Really speaking, the scheme was not all that voluntary as is made out, because the industry had no freedom to vary the prices in accordance with the changes in production costs. It was actually foisted on the industry, with the Government not wanting to take the responsibility for imposing statutory controls. In any case, it was meant to be a stop-gap arrangement, pending more effective measures for bringing about a sizable increase in the supply of cloth. Indeed, "the industry as a whole would have lost nothing," to quote Mr. Podar, "if the voluntary scheme, which had lost most of its sanctity, was continued." Then, why did the Federation, of all the interests concerned, raise its voice against the continuation of the voluntary scheme? Mr. Podar's explanation is that the Federation, far from aiming at putting more money in the pockets of millowners, was anxious "to re-establish discipline and orderliness in regard to textile prices." What Mr. Podar apparently means here is that the Federation did not want to be a party to an arrangement which had become a failure.

The scheme that has now been evolved to replace the so-called voluntary control is also of dubious value, particularly from consumers' point of view, and may create more problems than it seeks to solve. Mr. Podar, who has now publicly accepted this view, ought to have disassociated himself with it when the Cotton Textile Consultative Board gave its approval. But, in their anxiety not to be dubbed as non-co-operators, few of our businessmen choose to take such a forthright stand. This is not a commendable attitude. It is the duty of businessmen to point out the defects in any scheme, especially when they know that the ultimate sufferers will be consumers, and make it clear that, if the Government still wants to proceed with its implementation, it must take the entire responsibility for the consequences. Any way, it is gratifying to find that at least now Mr. Podar has thought it prudent to air his misgivings in public, though he still says that the industry would give a fair trial to it and expects the trade, as well as others concerned, to do likewise.

Some of the difficulties inherent in the scheme were spelt out in these columns a few weeks ago (*vide* page 54 of *Commerce* dated 11th July). The Government already seems to be feeling them, as is evident from its move to alter the scheme in a fundamental respect. If it finally gives effect to this amendment to the earlier scheme, it would only make things worse. The contemplated change and the further complications it would cause would be clear from the following extract from Mr. Podar's speech:

"... the scheme to which representatives of the industry agreed to give a trial envisaged control being extended to a cross-section of the entire production, so that, on the one hand, the consumer gets all types of his requirements from the pool of controlled varieties and, on the other, all units of the industry contribute the same proportion of their production for civilian market. Now, however, Government, it transpires, are thinking in terms of bringing under control all *dhotis, saris*, longcloth and shirting. Under the present pattern of production, the quantity of *dhotis, saris*, longcloth and shirting manufactured by each mill bears to its total production a different percentage ranging from nil to 100. This means that, under the scheme, the contribution of each mill to the controlled pool will also vary widely from nil to 100. To be successful, the scheme of controls must be equitable to all and I would like to request Government not to proceed with their new proposals which, besides being iniquitous, might result in loss of production and consequent imbalance between demand and supply to the detriment of the consumer.

"If the proposals have been framed by Government with the idea that they are going to eliminate the simultaneous supply of controlled and non-controlled *dhotis, saris*, longcloth and shirting, the existence of the decentralised sector seems to have been overlooked. That sector does produce these qualities. The market will, therefore, continue to have *dhotis, saris*, etc., both with price-stamping and without price-stamping; and the scheme does not fulfil even the limited purpose of eliminating non-price-stamped cloth in the controlled sector."

So what is the alternative? The answer is either complete control or no control. A half-hearted solution of the type now sought to be thrust on the industry is tantamount to eye-wash. It not only ignores the realities of the situation, but confers benefit, if any, only on a small section of the public. There was a time—1951 to be precise—when the mill sector accounted for about 79 per cent of total production of cloth in the country and the decentralised sector (handlooms and powerlooms) for the balance. But now its share has gone down to about 60 per cent, while that of decentralised sector has risen to 40 per cent. Meanwhile, the population has increased by not less than 100 million. The prices of cloth made in the decentralised sector have never been, and could never be, controlled, so that, even when the entire mill-made cloth is controlled, only 60 per cent of domestic production is subjected to price and production controls. But what is now sought to be done is to restrict controls to only 40 per cent of the production of a sector that accounts for less than 50 per cent of availability of cloth for home consumption, considering that exports of mill-made cloth vary from 12 to 15 per cent of production. Such a control, therefore, will not be of much benefit to a large section of consumers.

Mr. Podar goes a step further and avers that "it is impracticable to devise a really foolproof control" even if the entire mill-made cloth available for domestic market is subjected to price and production controls. He proves his point effectively when he says:

"Out of some 7,400 million yards made available to the civilian market in 1963, about 3,100 million yards were supplied by the decentralised sector. From the balance of 4,300 million yards supplied by mills, 2,000 million yards were grey cloth. If one estimates that 1,000 million yards thereof were, before reaching the consumer, subjected by processing houses to various finishes like bleaching, dyeing and printing, it means only about 3,300 million yards out of 7,400 million yards, or 45 per cent of the total internal supply, reached the consumer in the form in which it left the mills. Thus, any regulation of prices of mill cloth would, under the present pattern of production, extend to only 45 per cent of the supply in the internal market. Lakhs of persons must necessarily be engaged in the distribution of all this cloth to a population of over 460 million spread all over the country—more in villages and in hamlets than in big cities. This analysis clearly brings out the utter impossibility of exercising any control over this gigantic operation of distribution. Things have not been made easier by the indistinguishability of mill cloth from the cloth manufactured by the decentralised sector."

A logical extension of this argument is this: If more than half of the domestic supply is uncontrolled, why not leave the remainder also out of control? That, in our opinion, would be the right thing to do, for, though this solution might cause some temporary inconvenience to the public, it would lead to a better situation in due course, provided the Government permits the mill industry to expand not only its spinning capacity but also the weaving capacity through the introduction of automatic looms. More and more production of mill cloth to keep pace with the clothing demands of a growing population with a progressively increasing volume of purchasing power is the only way of preventing a recurring shortage of cloth.

But with the Congress Party in this country logic is invariably at a discount. Further, consequent upon the sharp rise in price levels in the past one year and the countrywide agitation stirred up by political parties out to discredit the party in power, the climate is not favourable for freeing any necessity of life from controls. It would require an extraordinary degree of political courage to take this step. And this is clearly absent in the Congress Party. Again, if cotton manufactures are decontrolled, it would be politically difficult to defend the continued retention of controls on cotton. If controls on cotton were removed, growers of other crops, including foodgrains, would also clamour for similar freedom which the country cannot obviously afford at this juncture of its economic career. Accordingly, some form of control, designed to ensure stability in the prices of cloth, seems to be unavoidable. This control, however, should be such as not to (*a*) retard the growth in the production of mill-made cloth which indeed is looked upon as the barometer of cloth supply situation, (*b*) result in a fall in the quality of cloth and (*c*) run counter to consumer preference. The system of partial control now being worked out does not satisfy these canons. The Textile Consultative Board [illegible]

and the Government should, therefore, get together and think again. Why not rectify the defects that have reduced the gentlemen's agreement to a farce? This may not be an ideal solution, but it may prove to be better than the partial control now on the anvil.

The authorities, as well as the spokesmen of industry and trade, are of the view that there is no scarcity of cloth in the country and quote in support of it the absence of any complaint from consumers about non-availability of cloth. If there is so much agreement among them on this point, the case for controls on production and prices falls to the ground. The fact, however, is that stocks of cloth in the country are thin; in any case, they are not large enough to prevent prices of cloth from going up in a free market. The unsold stock of cloth with mills as at the end of March 1964 was only 146 million metres, equivalent to about nine days' production and 12 days' delivery at the then prevailing level. There could not have been any significant improvement in the position since then. Production has no doubt been better, but so have been sales and deliveries. On the face of it, this state of affairs is also not conducive to freedom from all controls to trade and industry. If, however, there are no complaints from consumers, it may be because of the ready availability, though at high prices, of cloth made on powerlooms and handlooms as well as of rayon and synthetic fabrics.

The basic cause of the present unsatisfactory state of affairs is the defective textile policy of the Government under which loomage in the mill sector has remained frozen in the neighbourhood of 200,000 during the last 15 years, so that the decentralised sector could expand. There has been some thawing in the past two or three years, but it has been halting and half-hearted. Unless there is a drastic modification in this policy in favour of mills, cloth shortage will be a perennial malady of Indian economy. This is no exaggeration. It is pertinent to note, in this connection, that, though production in the decentralised sector has more than doubled since the early 'fifties (the estimated average monthly production in 1963 is 262 million yards, as against 119 million yards in 1952), the supply position of cloth continues to be difficult, necessitating controls that are irksome to prducers, traders and consumers alike. In this context, the advance reports about the contents of the Asoka Mehta Committee's recommendations on the place of powerlooms and handlooms in the decentralised sector are disquieting, as they credit the Committee of having favoured the continuation of the freeze on the loomage of mills. In the light of this, Mr. Podar's warning to the Government to the effect that continuation of the present policy would only result in a further worsening of the textile situation in the coming years is quite pertinent. This journal shares his fervent hope that the lesson that has or should have been learnt from a freeze on the mill sector ever since India became independent would not be ignored by the powers-that-be.

U.S. AID FOR AGRICULTURE

THE food situation, characterised by shortfalls in production, shortages in supply and consequent high prices, has deteriorated rapidly in recent months and brought about, in the process, a renewed awareness of the supreme importance of strengthening the agricultural foundation as much for feeding and clothing the increasing population as for sustaining the tempo of industrialisation. Thanks to this awareness, the Central Government and the Planning Commission have begun to think in terms of according a higher priority to agriculture in the fourth Plan. Of course, this higher priority is not reflected in the currently-proposed relative share of agriculture (including irrigation) in the aggregate *public* investment of about Rs. 14,000 crores envisaged by the Perspective Planning Division of the Planning Commission for the next Plan; in fact, this share is only 16 per cent, as compared with 21 per cent of the third Plan's public outlay of Rs. 6,300 crores. But the fact that the likely absolute investment in agriculture will represent 60 per cent more than under the third Plan, taken along with the trend of accent on intensive cultivation and minor irrigation, would seem to suggest that a higher priority is being envisaged for such agricultural schemes as will yield quicker and better results for the planned outlay.

Noteworthy, in this context, is the critical view recently expressed by Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, about poor planning and faulty execution in the *crucial* sector of irrigation. In his judgment, quick-yielding schemes in agriculture are not being attended to; although it was always known that major and medium irrigation schemes would take time to complete—and more time to give a return—they have not been properly phased so as to help reduce the unproductive period; and poor planning and faulty execution have delayed the completion and utilisation of minor irrigation schemes. As two-thirds of all cultivated lands lack irrigation facilities or are inadequately watered by rainfall, better planned efforts to extend irrigation—a factor which, other things remaining constant, can raise yields by 50 per cent—is of crucial importance for securing higher productivity in agriculture. That this improvement is urgently called for from the wider point of view of balanced economic development, too, is better said in the words of Mr. Asoka Mehta himself:

> "Development, irrespective of ideology, involves investments in items such as generation of power, expansion and modernisation of transport, improvement of productive tools and techniques, etc. Long before these investments find an industrial application and even while the plants are coming up, the transmission lines are being laid or while the transport network is being improved and extended, money incomes must tend to rise and need to be balanced by improvements in agricultural productivity. In a situation where development has not been based upon available agricultural surpluses, it is crucial that priority should be given to generating these surpluses and thus achieving a balance with the many schemes that require a longer time to mature."

The shift in emphasis from major to minor irrigation, canvassed by Mr. Asoka Mehta, has just been reflected in the Planning Commission's decisions which are to form part of its forthcoming draft memorandum on the fourth Plan. One of these decisions is to the effect that special surveys should be conducted in command areas of *old* major and medium irrigation projects to determine the dimensions of supplementary minor irrigation works in order to provide optimum intensity of irrigation in relation to requirements of crops. The second decision is to the effect that the minor irrigation programme, chalked out on the basis of the aforesaid surveys, should be over and above the 16 million-acre programme recommended by working groups for minor irrigation and that both these programmes should be given equal priority. And the third decision is that *new* major and medium irrigation projects should be scrutinised by the Union Ministry of Food and Agriculture and could be undertaken only if and when they have been cleared by that Ministry.

These are not the only commendable decisions, for there are quite a few others from the short-term point of view too. The High-power Agricultural Production Board, for instance, has just taken the decision to give complete freedom to State Governments to implement quick-yielding minor irrigation projects. Another related decision is that the Central subsidy would be extended to the working of irrigation tube-wells, as is now done in respect of canal irrigation or open-well irrigation. By another decision, the Board has sought to cut red-tape to the utmost, laying down, in this connection, that no approval of the Centre should be awaited for implementing production projects in the agricultural sector so long as they are within the overall ceiling. The practical recommendations made by the recent Annual Conference on Community Development and *Panchayati Raj* regarding village production plans, expeditious excavation of field channels in command areas of new major and medium irrigation projects, and financial assistance to *panchayats* for the maintenance of minor irrigation works may also be recalled here. All these measures, proposed by the Planning Commission, the Agricultural Production Board and the Community Development Conference, are generally on right and realistic lines. But much will depend on how earnestly and diligently the State Governments implement them over the next six years.

Taken along with the progressive extension of the package plan of intensive cultivation to more districts and crops and the proposed agricultural orientation to community development, the plans under contemplation augur well for the future of agriculture. The present mood of despondency caused by food scarcity and high prices is bound to give place sooner or later to a mood of confidence, now that aid-giving countries like the United States and the Soviet Union have begun to display a more active interest than ever before in strengthening India's agricultural foundation. It is the United States, in particular, that has provided so far massive assistance for relieving food scarcity and for constructing several major irrigation and tube-well projects; it has once again offered a spectacular aid package. This is what Mr. Chester Bowles, U.S. Ambassador to India, said at New Delhi last week:

> "This is not the first time in India's long history when she has faced serious shortages. However, this time there is solid basis for confidence. For the short-term, massive shipments of grain are now on their way from the United States. For the longer term, the Indian Government, backed by all the scientific skill that the United States can bring to bear, is launching a bold, carefully planned, scientifically sound programme designed rapidly to increase India's food production.
>
> "With a reasonably fair break from the monsoon rains and with a determined implementation of the programme I have described, India will successfully meet her food problem in the coming years, and I can assure you that the United States Government is determined to help."

The short-term plan outlined by Mr. Bowles involves delivery of four million tons of U.S. wheat and a substantial amount of rice over the next seven months. With these shipments, the aggregate P.L. 480 aid provided by the United States since 1956 will have exceeded 27 million tons of foodgrains. As another P.L. 480 agreement, covering as much as 17 million tons of foodgrains, is likely to be concluded after the U.S. Congress has acted on legislation to extend the life of the law this month, it may also be reasonably taken as forming part of the food aid plan which, incidentally, has the capacity to curb inflation by increasing the food supply. Moreover, the U.S. will have supplied during this year alone 433,000 tons of fertilisers—almost as much as it has supplied through its aid programme in the last 13 years. While the Trombay fertiliser factory, entirely financed by the United States, will commence production shortly, that country is also financing the construction of another major fertiliser plant at Visakhapatnam. While all this is good in more ways than one, it is to be hoped that the Central and State Governments will avail themselves of the breathing space provided by this generous U.S. food aid plan for the second time in succession to maximise agricultural production and achieve relative self-sufficiency at least by the end of the fourth Plan. It is here that the longer-term American plan to assist agricultural and related programmes will be seen to be even more relevant and imaginative. The varied elements of this plan are:

1. An offer by American companies to build five fertiliser plants in India with a total capacity of one million tons that can close the present gap in fertiliser requirements within three years.

2. American experts, with long experience in the pricing of food products, to help set incentive prices for producers and fair prices for consumers.

3. An American expert to co-operate with the Indian authorities in developing and expanding a programme of a large-scale aerial spraying against insects and plant diseases.

4. Four U.S. scientists to work on a new programme involving a major expansion of the output of grain legumes (beans and peas).

5. Present plans pertaining to hybrid maize to be carried forward to double maize production. The development of hybrid varieties of *jowar* to be expedited.

6. Nine American technicians to work with Indian experts for extending soil and water conservation programmes.

7. Eight additional U.S. experts to work in the 15 "Package Plan" districts where intensive cultivation has been under way.

8. U.S. co-operation to continue in the setting up of seven agricultural universities.

9. A thousand pedigree bulls to be supplied to improve the milk-production of Indian cattle.

10. American shipping and handling experts to advise on the unloading and distribution of foodgrains at ports.

This is, indeed, a well thought-out longer-term programme covering fertiliser production and effective technical assistance at crucial points. As far as fertilisers are concerned, the expectation is that the Government of India would take a realistic stand on the American private offer and reach a mutually beneficial agreement. The other elements of the programme would call for readjustments in some of the Plan schemes and for understanding and co-operation between American technicians and Indian experts and administrators. Difficulties there will always be in the implementation of this or any other programme relating to agriculture, but, given the will to overcome them, they will cease to be so many discouraging factors. Now that the Soviet Union, too, in spite of its own agricultural problems, has offered to provide some machinery, technical know-how, fertilisers and pesticides and to set up another large-scale mechanised State farm like the one at Suratgarh in Rajasthan, this country should feel further encouraged in its efforts to increase agricultural production. Although Soviet aid in this field will be relatively insignificant in comparison with the proposed massive U.S. aid, it may be welcomed as one more friendly gesture by a country which has recently decided to build the Bokaro steel plant.

MARKET GOSSIP

Thirteen State Loans

BARRING Punjab and Jammu and Kashmir, the Governments of all the remaining thirteen States have announced their borrowing programmes for the current financial year. The programmes together envisage loans aggregating Rs. 100 crores, of which exactly half, that is Rs. 50 crores, represents the combined share of four States alone, namely, Maharashtra, Madras, Andhra Pradesh and Uttar Pradesh; the actual loan amounts of these four States are Rs. 15 crores, Rs. 14 crores, Rs. 11 crores and Rs. 10 crores, respectively. Orissa is raising Rs. 8 crores, Gujarat, Mysore and West Bengal Rs. 7 crores each, Rajasthan and Madhya Pradesh Rs. 5 crores each, Bihar and Kerala Rs. 4 crores each, and Assam Rs. 3 crores. All loans except the Kerala loan will open for subscription on Monday the 24th inst.; the Kerala loan will open a day later.

The terms of all the thirteen loans are similar in two respects. In the first place, the loans bear a uniform rate of interest at 4½ per cent. Secondly, the period of repayment (at par) also is uniformly twelve years. In regard to the issue price, however, there are some differences. Only Maharashtra and Gujarat are issuing the loans at par (Rs. 100). Madras, Uttar Pradesh and West Bengal are issuing at a discount of 25 nP, and the discount is larger at 50 nP in the case of Andhra Pradesh, Assam, Bihar, Kerala, Madhya Pradesh, Mysore, Orissa and Rajasthan.

Of the thirteen loans, eight loans are cash loans, while the other five loans are cash-*cum*-conversion loans. The latter include Maharashtra, Madhya Pradesh, Madras, Uttar Pradesh and West Bengal. The details of the maturing (1964) loans that will be accepted at par for conversion into the new loans of these five States are:

State	Loan	Outstanding amount (Rs. lakhs)
Maharashtra	4% Bombay State Development Loan	346.78
	4% Saurashtra *State* (Local Bodies Development Loan)	251.00
Madhya Pradesh	3½% Madhya Pradesh Loan	208.29
Madras	4% Madras Loan	524.81
Uttar Pradesh	4% U.P. Loan	589.00
West Bengal	4% W. Bengal Loan	200.00
	Total	21,14.88

Quite a substantial part of the outstanding amounts of the aforesaid six loans is likely to be converted into new loans. The chances of such conversion are brighter in respect of Madhya Pradesh, Madras, Uttar Pradesh and West Bengal loans. For the redemption yields on these loans are very attractive: 4.81 per cent in the case of Madhya Pradesh and 4.78 per cent in that of the *remaining three loans.*

The response to all the thirteen loans is expected to be fully encouraging. By the time the subscription lists open, conditions in the money market will be distinctly easy; the present temporary stringency that has developed due to the disorganisation of banking services caused by unrest among clerical and subordinate staff will have ended by then. The attractive yields will naturally induce banks to go in for them on a large scale. The banks themselves are said to be having surplus cash in India. In any case, the banks will have to enlarge their portfolio of gilt-edged securities, in view of the higher statutory liquidity requirements (28 per cent, as against 20 per cent at present) of the banking system with effect from about the middle of next month. There will also be the usual official promptings by State Governments to banks to lend support to their loans. Besides good offtake by banks, the L.I.C., provident funds not governed by the Industrial Disputes Act and Trusts may also be expected to invest largely in the State loans, as the yields on them are relatively better than those available on existing State loans.

The total amount (Rs. 100 crores) of the thirteen State loans this year—no account is taken of either the conversion or the right of Governments to retain subscriptions up to 10 per cent in excess of the notified amounts—is less by a crore of rupees than the Rs. 101 crores which the fifteen States (including Punjab and Kashmir) got as their share in the Centralised borrowing programme last year. It is not known whether the Punjab and Kashmir Governments intend to enter the market some time later. In the Punjab budget for 1964-65, it will be recalled, the State's Finance Minister had merely stated that the Government would be able to borrow a "substantial amount" from the people, particularly for flood control schemes. Assuming that this State and Kashmir do not raise any loans, the total (Rs. 100 crores) of the State loans and the Central loans aggregating about Rs. 293 crores together amount to Rs. 393 crores, as against the Centralised borrowing programme covering Rs. 367 crores in 1963-64.

States' Overdrafts

The combined Rs. 100-crore borrowing target of State Governments for the current financial year is not surprising. For the financial position of several State Governments has not been as satisfactory as one would wish, thanks largely to high level of non-Plan expenditure and heavy outlays on development projects with a long gestation period such as irrigation and power. Indeed, the finances of several State Governments are in the red. They have resorted to heavy overdrafts from the Reserve Bank. It is reported that the Government of India has had to pay nearly Rs. 23 crores to the Reserve Bank in lieu of overdrafts made by some State Governments in 1963-64. The bulk of the overdrafts is accounted for by Andhra Pradesh, Assam, Bihar, Kerala, Madhya Pradesh and Orissa. Since the amount of Rs. 23 crores is being adjusted against the current year's Central assistance to States, the overall deficit of all the States put together for 1964-65 will be higher than the figures revealed in the budgets. The States have accordingly chosen to rely greatly on market borrowings with a view to reducing the ways and means difficulties that would crop up later in the year. The marked rise in the public debt of States as a result of loans could have been avoided if only the Governments had, besides taking prompt measures to collect arrears of revenue due to them and effectively preventing evasion of taxes (sales tax, for example), cared to cut down non-Plan expenditure as much as possible. Such a reduction, incidentally, is imperative especially in the present context of the urgent need to break the rising spiral of prices.

World Coffee Agreement

By the time these lines appear in print, the outcome of the International Coffee Council's meeting which began at London on Tuesday last week will probably have been known. Three important subjects were on the agenda of the meeting: (1) election of Chairman and members of the Executive Board for the second year (beginning on 1st October next) of the International Coffee Agreement; (2) measures to strengthen the Agreement (including procedures to be followed on over-exporting, or, conversely, shortfalls), to stimulate coffee consumption and to rationalise production; and (3) fixation of export quotas. Doubts have been expressed about the possible agreement on the question of export quotas. The Executive Board of the Council, at its preparatory meeting early last month, failed to agree on estimates for basing the quotas.

The decision on the quota issue is most eagerly awaited by India which, as is well known, has pleaded for a more liberal quota than that (about 22,100 tonnes) fixed for the current year. Mr. H. Sitarama Reddy, Chairman of the Coffee Board, who attended the Council's meeting, is believed to have presented an impressive case for a larger export quota.

Meanwhile, the World Coffee Agreement continues to be without any real force. For, although the U.S. Government had ratified the Agreement in December last, the Bill giving effect to the ratification has still not been approved by the Senate. Since the Republican Presidential candidate, Senator Goldwater, is opposed to world commodity pacts, some wonder whether Mr. Johnson will now risk a vote on this issue so close to the election.

Stock Exchange Presidents' Plea

"The stalemate on the stock market continues unchecked. Activity is on a very limited scale and price variations negligible, while the overall trend remains downward for lack of support." These two sentences, taken from a recent review of a leading firm of share brokers in Bombay, aptly describe the real state of the capital market in India at present. That the capital market is in a depressed mood is clearly borne out by the official index numbers of security prices themselves. The average all-India index number (base: 1952-53=100) of variable dividend industrial securities for the week ended 25th July 1964 stands at as low as 163.9, as against 174.3 prevailing just before the presentation of the Central Government budget for 1964-65 on 29th February. The extent of the decline will be more marked if the figure of 163.9 is compared with the index number of 188.00 for the week ended 1st September 1962, that is, before Chinese aggression. The conclusion is obvious that the latest Central budget has not, as is often claimed by its author, toned up the market. Actually, some of the regressive tax proposals contained in the budget—the 7½ per cent tax on equity dividends, to mention just one instance—and the continuance of Emergency measures introduced in the wake of Chinese aggression have resulted in a sharp decline in stock prices, eroding the value of securities held by investors and severely affecting their enthusiasm to subscribe to new issues. Pointed attention to this disquieting trend has been drawn by the Presidents of the recognised Stock Exchanges in a joint memorandum submitted to the Union Finance Minister. Here is the relevant description (it is not a verbatim version) of the state of the capital market as contained in the memorandum:

> There has not only been a sharp decline in the amount of capital issues from Rs. 73.8 crores in 1962 to Rs. 54.6 crores in 1963, but the burden of large portions of the new issues fell on the shoulders of underwriters. The extent of the decline can be seen from the fact that, in 1960-61, new issues were often oversubscribed. There has also been a sharp fall in the prices of the new issues floated during the past few years. A comparison of the pre-slump highest price and the current price shows a 51 per cent fall. The decline is attributable to the dismal economic, corporate, fiscal and political trends of the time. With the present rates of taxation, the Annuity Deposit Scheme and the surtax on companies, individuals and corporate bodies are unable to generate more savings. The present trend in the market is merely a continuation of the debacle that had overtaken it following the price crash in Wall Street early in 1962. Hardly had the market recovered from that shock, when the Chinese aggression in 1962 again unnerved it. After that a series of emergency measures, beginning with the suspension of forward trading and ending with the levy of the Super Profits Tax in February 1963, gave it a severe jolt. By the spring of 1963, the market had become greatly crippled as a result of which investors left the market. The withdrawal of the ban on forward trading in the second half of 1963 gave the stock market some hope, but the 1964 budget proposals belied it.
>
> The Stock Exchange Presidents have certainly not cried 'wolf' when they say that the present state of the capital market, if it is allowed to continue, will blacken the future of new issues, thereby directly affecting the industrialisation of the country. In their anxiety to avoid such a development and to ensure the active functioning of the capital market, the Presidents have put forward the following specific suggestions:
>
> 1. The 7½ per cent tax on dividends and the levy of tax on notional gains from bonus shares should be reviewed, because they are likely to discourage provision of risk capital by investors.
>
> 2. Companies should be encouraged to pay larger dividends. This is necessary, since inflation has brought about a depreciation in the value of the rupee, thereby reducing the real income of investors from dividends.
>
> 3. The existing invidious treatment of income from dividends as unearned income must be done away with.
>
> 4. The margin system must be reviewed and rationalised.
>
> 5. The Reserve Bank should urge the banks to liberalise their policy of lending against stocks and shares.
>
> Comments on these suggestions are superfluous. This journal itself has time and again made similar suggestions. The capital market is, after all, a sensitive one and requires careful nursing, if it is to make its due contribution to the rapid development of the country's economy in the years to come.

Unutilised P.L. 480 Funds In India

Under the P.L. 480 agreements signed between India and the U.S., it will be recalled, 12.7 per cent of the total sale proceeds of commodities is reserved to cover the expenses of the U.S. Administration in India. Since the sale proceeds are pretty large, the amount so reserved (nearly Rs. 129 crores as of 30th June 1964) is much more than the expenditure actually incurred so far by the Administration. It is true that several projects of mutual benefit jointly agreed to between the Governments of the two countries have been financed from out of this amount. Even so, a significant part is remaining unutilised. The question of ensuring a quicker and more effective utilisation of the unspent money has been engaging the attention of the U.S. Government for some time now. Among the various proposals mooted in this connection, the one pertaining to the creation of a special trust with an initial capital of Rs. 100 crores for financing programmes such as slum clearance, agricultural improvement and rural development, as well as for underwriting the rupee shares of American businessmen interested in making investments in India, is interesting indeed.

Details regarding the scope and functions of the proposed trust, it is said, are now being worked out. The proposal can, however, be given effect to only after some time. The Governments of India and the U.S. will first have to reach an understanding. The U.S. Congressional approval, too, will be necessary. Nothing concrete is likely to emerge until after the forthcoming U.S. Presidential election is over.

Chinese Loan To Pakistan

It is not so much economic or humanitarian considerations as political tactics that seem to have prompted Communist China to offer a loan of $60 million to Pakistan, though the country cannot afford it. How else is one to explain the very liberal terms of the loan? Not only is the loan interest-free but the Chinese are prepared to accept repayment in the shape of goods (cotton, raw jute, jute goods, and other manufactures) from Pakistan extended over as long as 30 to 40 years or even beyond that. The only condition attached to the loan is that Pakistan should utilise it to buy Chinese machinery, equipment and commodities. The Chinese offer of a loan to Pakistan has followed the visit of the Pakistan Commerce Minister to China which was preceded by a Pakistan delegation to China and an earlier visit by a Chinese trade team to Pakistan.

Giving the impressions of his visit to China, Pakistan's Commerce Minister told pressmen at Rawalpindi last week that China could supply Pakistan various types of machinery like textile, sugar and cement plants, as also electrical goods at internationally competitive prices. He expressed satisfaction over the quality of machinery. Incidentally, he revealed that the Chinese Government had offered to supply railway coaches, wagons and rails on credit basis, to construct railway lines, and to make available services of engineers and other technical experts whose emoluments would not be more that those of Pakistani personnel. Replying to a query whether there was any possibility to Sino-Pak joint ventures, the Minister said: "This will have to wait and can be examined by the Pakistan experts after the loan is formally accepted. The loan is available for use during 1964-65 or afterwards."

Pakistan's economic relations with China have improved greatly in the past two years, as is evident from the increase in Sino-Pakistan trade. Pakistan's imports of Chinese goods have gone up from Rs. 1.65 crore in 1961-62 (July-June) to Rs. 2.32 crores in 1962-63 and its exports to China from Rs. 1.05 crore to Rs. 3.56 crores. During the first six months of 1963-64, Pakistan imported goods and commodities worth Rs. 1.66 crore, whereas its exports were higher at Rs. 2.60 crores. Thus, Pakistan enjoys a favourable balance of trade with China.

DELHI LETTER

DIALOGUE ON THE FOURTH PLAN

A CONVERSATION WITH MR. ASHOKA MEHTA

From Our Special Correspondent

NEW DELHI, 4*th August*

THE streams of figures flowing out of various sections or divisions at Yojana Bhavan, the seat of the Planning Commission, with or without official clearance, have in recent weeks added to the confusion over the strategies of perspective and practical approaches. Some of the projections have been leaked out by officials overzealous about their own concepts and are half-baked versions which have not been fully processed even by the individual divisions at Yojana Bhavan. The paper of the Perspective Planning Division, which has been discussed in detail in the open in print and in conversation, is still officially labelled "secret" although members of the Planning Commission and the Finance Minister and officials of other Ministries freely discuss the merits and flaws in the Division's paper which was adopted as a starting point for the fourth Plan at the last meeting of the Planning Commission to be presided over by Mr. Nehru in May.

When Mr. Ashoka Mehta, Deputy Chairman of the Planning Commission, Prime Minister Lal Bahadur Shastri or Finance Minister T. T. Krishnamachari talk of a new strategy for the fourth Plan—as different from what had been followed in earlier planning years—the votaries of forced development, who base their targets almost solely on perspective needs, begin crying wolf, and beat their breasts, mourning that the Nehru concepts on planning are being thrown to the winds so soon after the leader's death. Such an interpretation of the coming changes in the planning structure is an oversimplification. According to those who want some fundamental changes in long-term planning strategy and short-term tactics, the changes would have been inevitable even if Mr. Nehru had continued to be at the helm of affairs in the Administration and the Planning Commission. One major difference between the days before and after May 27 is perhaps that there is no longer anyone in power who can expect to be listened to while pleading to the people to wait long and patiently for the harvests of planned development.

According to Mr. Ashoka Mehta, the strategy which he now advocates is largely a by-product of the circumstances created by the process of planned development hitherto. In conversation with this correspondent, Mr. Ashoka Mehta understandably refused to discuss specific policies which he firmly believes are the responsibility of the executive Ministries—a stand forcefully indicated by the Prime Minister also. Mr. Ashoka Mehta's emphasis on the need immediately to take up quickly yielding projects and the Prime Minister's underlining of the need to provide more jobs as well as to decelerate the trends of rising prices are complementary concepts. The base for the advance programming for the fourth Plan has to be the present level of low economic activity. Perspective expectations of growth of resources have been belied by the stagnation of agriculture in the past three years and to this difficulty has been added the burden of heavy defence expenditure—unproductive and wasteful but unavoidable following the Chinese aggression. When the third Plan was framed, enough resources had not been located to fulfil the physical targets and the resources position has been further strained by the agricultural and military setbacks. Even without the defence effort at a higher level than originally assumed, the third Plan targets may not have been attainable, since the availability of resources has shrunk.

While the agriculture-based industries have suffered in the past three years, the chemical and mineral based industries have registered considerable progress. A developing economy invariably is an inflation-tinted economy and the take-off in prices has been easy in the absense of consumer articles to anchor the price level. Mr. Mehta admits that enough attention has not so far been paid to quickly yielding projects which would have mopped up some of the increasing purchasing power which has come into the hands of the people. The projects which may produce goods and facilities to meet the demands for consumer goods which may help ease inflationary trends, according to Mr. Mehta, are in what he calls the diffused industrial and other sectors whose development cannot be as efficiently controlled and directed as large organised industries can probably be. While agricultural production increases can certainly soften the impact of inflation, concentration on agricultural increases alone is not enough. Mr. Mehta says that about five crores of people today spend an annual Rs. 2,500 crores on non-food consumer goods. Added to this is a major shift in food consumption patterns. Mr. Mehta cites the example of Kashmir where there has been an increasing demand for rice while several years ago the food habits of the people were such as to permit the sale of coarse grains on a large scale.

The record of several Yojana Bhavan experts on estimating resources has been suspect, and, therefore, Mr. Krishnamachari is today in a strong position when he repeats that a Rs. 18,000-crore fourth Plan is all that will be feasible. Estimates outside the Perspective Planning Division seem to indicate that the growth rate and the targets prescribed by the Division may need more resources than the P.P.D. has estimated. The various working groups' estimates may add up to a larger investment total than the P.P.D. projections. Here again, if the record of preparations by working groups for earlier Plans is any indication, the Ministerial groups have a tendency to inflate estimates of outlay, because they are firmly convinced that the planners, anyway, will slice the demands of various Ministries to smaller shares than asked for.

The Prime Minister, the Deputy Chairman of the Planning Commission and the Finance Minister are all agreed on the straightforward assumption that the most intensive fourth Plan drive should be on the agricultural front. There is no shortage of cynics among economists and administrators in Delhi who think that massive investments in agriculture may just wither away in droughts or be washed away in floods. Immediate food problems will be alleviated somewhat by the larger injections of American wheat supplies, at double the rate hitherto or four million tons in the seven months to the end of February. Already, the United States, according to Ambassador Chester Bowles, has supplied 23 million tons to India in seven years.

Mr. Ashoka Mehta explains that, when one talks of the drive in agriculture, it should not be in isolation but in integration with numerous associated sectors which comprise a variety of inputs—extension and utilisation of electricity in rural areas, measures to tap underground and overground water and fertilisers which in

12.	UTTAR PRADESH	10	99.75
13.	WEST BENGAL	7	99.75

All loans, except Kerala Government's loan, will open for subscription on Monday, 24th August 1964 and close on Saturday, 29th August 1964 or earlier without notice as soon as subscriptions approximate to the amount of each issue. The Kerala Government's loan will open for subscription on Tuesday, 25th August 1964 and close on Monday, 31st August 1964 or earlier without notice as soon as subscriptions approximate to the notified amount. All the State Governments reserve their right to retain subscriptions upto ten per cent in excess of the notified amounts.

The loans will be redeemable at par after 12 years i.e. 24th*/25th @ August 1976 and interest will be paid half-yearly on 24th*/25th @ February and 24th*/25th @ August each year.

Subscriptions may be in the form of CASH/CHEQUE in respect of all the loans.

Securities of 4% Bombay State Development Loan, 1964 and 4% Saurashtra State (Local Bodies Development) Loan, 1964 will be accepted AT PAR for conversion into the new loan of the Government of Maharashtra. Securities of 3% Madhya Pradesh Loan 1964, Madras Government 4% Loan 1964, 4% Uttar Pradesh Loan 1964 and 4% West Bengal Loan 1964 will also be accepted AT PAR for conversion into the new loans of the respective State Governments.

Interest on the securities of 4% Bombay State Development Loan, 1964, Madras Government 4% Loan 1964, 4% Uttar Pradesh Loan, 1964 and 4% West Bengal Loan, 1964 tendered for conversion will be paid at the rate of 4% per annum upto 31st July 1964 inclusive and at 4½% per annum for the period 1st to 23rd August 1964 inclusive. Interest on the securities of 4% Saurashtra State (Local Bodies Development) Loan, 1964 and 3% Madhya Pradesh Loan, 1964 tendered for conversion will be paid at the rate of 4% and 3% upto and inclusive of 23rd August 1964 and 31st August 1964 respectively.

Applications for *all the loans* will be received at the offices of the Reserve Bank of India at Bangalore, Bombay (Fort and Byculla), Calcutta, Madras, Nagpur and New Delhi, the branch of the State Bank of India at Patna and the branch of the State Bank of Hyderabad at Hyderabad.

Applications will also be received *at other places within the respective States* as follows:—

(i) Branches of the Subsidiary Banks of the State Bank of India conducting Government treasury work.

(ii) Branches of the State Bank of India at places where there is no branch of its Subsidiary Banks conducting Government treasury work.

(iii) Treasuries and Sub-treasuries (except in the States of Assam and West Bengal) at places not served by the aforesaid branches.

Copies of the Notifications and Application Forms may be obtained at any Receiving Office.

Applicants tendering applications at the offices of the Reserve Bank of India at Bangalore, Bombay (Fort and Byculla), Calcutta, Madras, Nagpur and New Delhi will, in the event of oversubscriptions to the loan applied for, be given the option of transferring their cash refunds to any of the other State Government loans which may still be open for subscription. To avail themselves of this facility, the applicants should complete the "Special Option Form" copies of which can be obtained at any of the foregoing offices of the Reserve Bank of India and tender the form along with their applications.

* For other Loans.

CORPORATE MANAGEMENT

WHEN the Union Finance Minister, Mr. T. T. Krishnamachari, said in London the other day that several Indian business houses were being managed "dynastically," he was criticised by some in this country for having run down India's corporate sector before a foreign audience. There was certainly some point in the criticism that T.T.K. should not have made such a disparaging remark outside India. That apart, was there no element of truth in his caricature of the Indian corporate sector? It would appear, at any rate from the luncheon address delivered by Mr. P. C. Bhattacharyya, Governor, Reserve Bank of India, at the Delhi Management Association on the 3rd instant, that the Finance Minister's view was substantially correct. For, although the Reserve Bank Governor did not refer to T. T. K.'s view as such, what he said about the managing agency system was, in effect, calculated to buttress that view. This is what Mr. Bhattacharyya said:

"While the growing interest in this country in the study of management problems is to be heartily welcomed, we would do well in recognising the limitations of existing economic and social realities which have, in a way, fashioned our attitudes and outlook on management of industry.... Many of the now big industries in India owe their growth to the hard labour, initiative and foresight of a few family groups. This nature of industrial organisation was reinforced by the system of managing agency which facilitated control and supervision by one small group over a large number of industries. The management of these industries, therefore, became highly personalised and subjective.... its inadequacy was felt once the calls of modernity, the size of the firm, and technology became compelling. The management of industries based on a *dynastic* (italics ours) elite became ill-suited to the needs, and in fact impeded the dynamic growth, of industries. It was inherent in this system that status was preferred to ability, autocracy to delegation of authority, and docility to discipline."

This old form of family-based industrial management, according to Mr. Bhattacharyya, has become obsolete and obsolescent now, thanks to the increase in the size of a firm and to the change in corporate personality whereby ownership is substantially divorced from management. A new form of management, where only the broad policy framework is laid down by the shareholders through the Board of Directors and the day-to-day operations in all their complexity are looked after by a professional cadre of managers, has, therefore, become imperative. But the old era of personalised management has not wholly ended and the new era of functional management has scarcely begun. In fact, the corporate sector is passing through a period of transition, and the Companies Act is slowly but surely bringing about changes in the structure of corporate management. If adoption of scientific attitudes towards management in keeping with trends in the advanced countries is to become more general, it is needless to add that healthy institutional changes would have to be brought about by periodical reform of company law in the light of experience. All this will necessarily take time.

The Reserve Bank Governor's treatment of management in its relationship with profit, however, reflects some confused thinking. If, as he says, in the larger context of planned economic development, profits should be viewed more as social obligation than as purely private gains, there could be no valid objection to augmenting the size of retained profits in the corporate sector. After all, according to Mr. Bhattacharyya himself, economic growth would depend on a steadily rising rate of saving and an increasing use of new technology and both of these, in their turn, would be governed by the size of profits and the manner in which they are put to use. In other words, if more corporate savings can ensure further development and if such savings can result from appropriate fiscal policies, the social good would be adequately served. But, surely, those who have invested in corporate enterprises must have a return reasonable and appropriate to the risks taken, sufferings undergone and profits made. Otherwise, why should one invest in equities? If distribution of good dividends is bad, why have equities at all? Mr. Bhattacharyya's view that public enterprises should be efficiently run so as to yield surpluses and that these surpluses should become an important means of financing industrial expansion itself may well be applied to the private corporate sector too. Only, if ownership of corporate sector is to be dispersed by attracting an increasing number of investors and, if concentration is to be prevented, there should be no excessive restraint on distribution of dividends and issue of bonus shares. The point is that the present fiscal policy does not fulfil this healthy condition. It may appear to be socialistic, but, in actual practice, it is not.

ISSUES BEFORE MONOPOLIES COMMISSION

It is a very cogent and well-argued memorandum that the Indian Chamber of Commerce (Calcutta) has just submitted to the Monopolies Commission on the issues pertaining to monopolies, concentration of economic power and restrictive trade practices. The Chamber has rightly argued at the outset that, as 'monopoly' means exclusive possession of the trade in some commodity, there is no single corporation in the private sector that commands the entire Indian market and could be called a monopoly in that sense. It is in the public sector, on the other hand, that there are monopoly concerns such as the Indian Telephone Industries, the Railways, the Indian Airlines, the Life Insurance Corporation, and the State Trading Corporation in respect of several commodities. The creation of such State monopolies, according to the Chamber, seems to be based on the mistaken belief that a monopoly is likely to be harmful to the public interest when it is in private hands, but not so when it is in the hands of the State. The Chamber's pertinent comment, in this connection, is that, as State enterprises are expected to provide a substantial part of the financial resources for the Plans, the urge towards profits maximisation is likely to be just as strong in the case of State monopolies as in the case of private monopolies (if there are any). But, in fairness to the Government, the Chamber should have recognised the fact that the pricing policies of public-sector enterprises are generally not governed by monopolistic considerations in actual practice.

The Chamber, however, has done well to recognise that there may be a 'monopoly' stage in the development of new industries in the private sector. A marked degree of industrial concentration in that early stage is, however, bound to diminish with the development of the demand for the particular product and the subsequent entry of new units in the same field of production. Even where monopolies, controlling one-third or more of the market, exist, they are to be found only in the case of one or two commodities. Here, too, according to the Chamber, the share of the dominant firm in the total sales turnover of the country is fast declining as more units are coming into being. In any case, even if monopolies are unavoidable in some cases or at some stages, the Government can regulate their functioning, as in the United States, in a manner conducive to public interest.

Adverting to the issue of "concentration of economic power," the Chamber has regarded it as vague and underfined. The expression has an ideological origin which often disregards the economic issues involved in the normal process of industrial growth. With production being regulated by the Industries Act, investment by the Capital Issues Control, management by the Company Law and distribution of income and wealth by egalitarian tax measures, there can be no undue concentration of economic power in India today. On the contrary, excessive regulation seems to be inhibiting that rapid economic growth so very necessary for the country's underdeveloped economy. As for restrictive practices, there can be no scope for them in the background of controls and regulations at every stage of production and distribution of finished products and raw materials. The fact is glaring that industries in India today are unable to expand fast enough to cater to the growing market because of Government's restrictive fiscal policies and licensing procedures in the context of foreign exchange difficulties and raw material shortages. It is not as if the Indian economy has reached such a high level of development and competition that industrial units feel impelled to follow restrictive policies harmful to economic expansion or to the consumer. As industry's best interests can continue to be served by producing as much as possible to cater to a market that is expanding all the time, there is no need for it to adopt "price rings" and the like. On all these grounds, therefore, the Chamber's view is that no legislative or other action is called for to restrain the "non-existent" concentration of economic power or restrictive practices. But this generalised view cannot be expected to prevail with the Monopolies Commission, if its objective investigations bring to light any disquieting facts regarding, or specific instances of, industrial concentration or monopolistic and restrictive practices.

4¾ PER CENT

GUJARAT STATE DEVELOPMENT LOAN, 1976

ISSUE PRICE Rs. 100.00 PER CENT

OPENS FOR SUBSCRIPTION ON 24TH AUGUST 1964

The loan will be closed as soon as a total of approximately Rs. 7 crores has been subscribed, and in any case not later than the close of business on 29th August 1964.

THE LOAN WILL BE UTILISED TOWARDS THE DEVELOPMENT PROGRAMME OF THE STATE OF GUJARAT. ALL ARE REQUESTED TO SUBSCRIBE GENEROUSLY TO THE NEW LOAN.

The Loan applications will be received at:—

(1) Offices of the Reserve Bank of India at Bangalore, Bombay (Fort and Byculla), Calcutta, Madras, Nagpur and New Delhi.

(2) State Bank of India, Patna.

(3) State Bank of Hyderabad, Hyderabad.

(4) Branches of the State Bank of Saurashtra conducting Government treasury work in Gujarat.

(5) Branches of State Bank of India in Gujarat (At places not covered by (4) above).

(6) Treasuries and Sub-treasuries in Gujarat (At places not covered by (4) and (5) above).

APPLICATION FORMS AND FULL PARTICULARS CAN BE OBTAINED AT ANY OF THE ABOVE OFFICES

DEVELOPMENT ASSISTANCE

To India and other developing countries, this year's "Annual Aid Review" of the O.E.C.D.'s Development Assistance Committee (D.A.C.) which concluded its long session at Paris last week, is of special importance. For the "review" raises high hopes of a much larger development assistance on a more liberal scale from the O.E.C.D. member-nations to the developing countries. Thanks are due to Mr. Willard L. Thor, Chairman of the D.A.C., who most forcefully and impressively highlighted the urgency for strengthening the assistance effort. Indeed, Mr. Thor put forward a number of concrete proposals to this effect which, it is gratifying to find, have been accepted in full by the O.E.C.D. member-countries. Reassuring is the statement made on behalf of these countries that they "have every wish to contribute as effectively as possible to the acceleration of the process of development in the less developed countries." The countries have agreed to give particular attention in the coming months to three major problems pertaining to development assistance. They are: (*a*) the requirements of assistance in the light of self-help measures by the less developed countries and the adequacy of aid to meet these requirements; (*b*) terms and conditions, indebtedness suppliers' credits, and other short and medium-term credits; and (*c*) co-ordination of various aid programmes.

Incidentally, it is certainly encouraging to note that the total financial outflow from the O.E.C.D. countries to the developing countries during the calendar year 1963 amounted to $8,100 million, comprising $5,700 million in official bilateral flows, $2,000 million of private capital flow and $400 million of official contributions to multilateral agencies. Since the extent of assistance rendered by multilateral agencies substantially exceeded payments made by O.E.C.D. members to these agencies, the total flow of funds actually received by the developing countries in 1963 was higher than the figure of $8,100 million. The D.A.C.'s estimate puts the total flow in 1963 at $8,400 million, representing a rise of $700 million as compared with $7,700 million in 1962. A further improvement is anticipated in the current year.

The new initiatives to expand the assistance flow to developing countries which the D.A.C. Chairman has urged cover increased budgetary appropriations for economic assistance, maintenance of a high rate of increase in the volume of technical assistance, more active support to multilateral agencies, and vigorous efforts to expand the capacity of developing countries to use external resources effectively. "The donor countries," to quote the Chairman, "should have a more dynamic attitude in helping less developed countries to identify opportunities for the development of their natural and human resources, to formulate development projects and to implement them efficiently. Procedures by members for examining assistance requests, their activities during the pre-commitments stage, their eligibility criteria, and their methods for appraising implementation of programmes must also be constantly reviewed and adapted to the needs and circumstances of the less developed countries." It is possible that the aid-receiving nations may regard all this as undue interference by the aid-giving nations. But they must remember that such reviews will help them considerably in finding out pitfalls and taking proper action for their elimination.

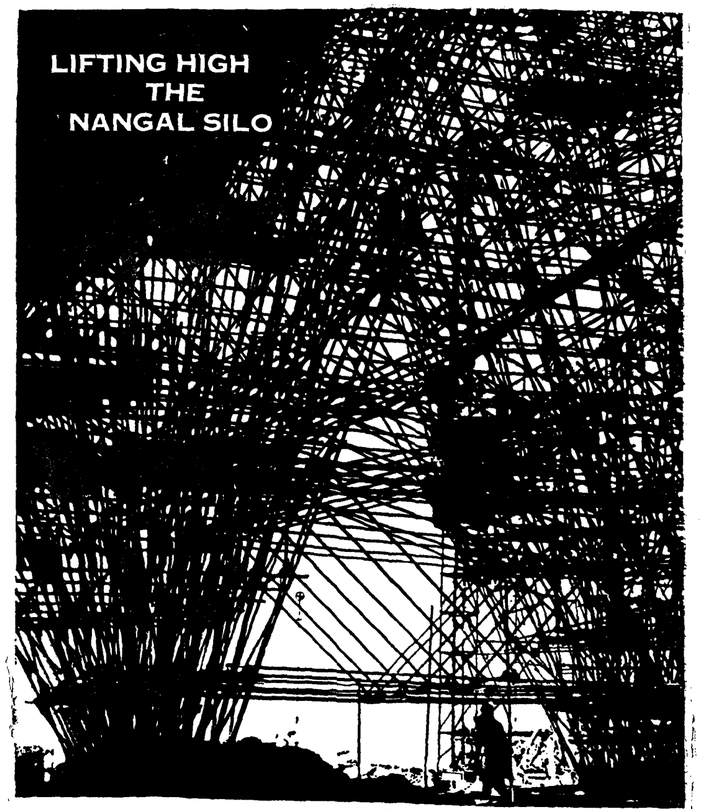
Besides calling for new initiatives to expand assistance flow, the D.A.C. Chairman has urged liberalisation of the terms and conditions attached to aid. Without such liberalisation, many developing countries are bound to be faced with the problem of debt servicing which is already acute enough. Increasing harmonisation of loan terms among the different suppliers of capital, as Mr. Thor has rightly stated, appears highly desirable.

As for the effective utilisation of external assistance, Mr. Thor has done well in advocating increased financial and technical support to agriculture, rural development, small and medium-scale industries, and agricultural and industrial development banks. He has also laid special emphasis on large-scale non-project assistance, simplification and standardisation of administrative arrangements for assistance, and co-ordination of capital project assistance. In the sphere of technical aid, he has stressed the importance of further strengthening training facilities and institutions, especially in respect of student and trainee programmes. Since the limitations to an increase in technical assistance are largely physical ones, a more active policy to overcome these limitations is considered desirable. This, according to Mr. Thor, may require, for example, the setting up of additional special courses for training advisers and a planned increase in facilities for trainees and students from developing countries. The O.E.C.D. member-countries have been asked to give special attention to the ways and means of augmenting rapidly the supply of middle-level personnel in developing countries.

Whatever be the scale of foreign assistance received by the developing countries, it will not by itself be sufficient to accelerate the tempo of economic development, not to speak of the burden of repayment. It is imperative that foreign assistance must be accompanied by an increasingly larger inflow of private capital. The rate of inflow is, of course, influenced predominantly by the economic and political conditions which private investors can expect in the capital-importing countries. But there is much that the foreign countries themselves can do to encourage larger outflow of private capital. Appropriately enough, the D.A.C. Chairman has called upon the member-countries to give prompt attention to O.E.C.D. proposals relating to the use of tax incentives, a possible multilateral guarantee scheme, and official encouragement to private non-profit organisations in providing technical assistance and other help.

The results of the development efforts of the less developed countries, as well as of the foreign assistance programmes, are decisively affected by the ability of these countries to augment their foreign exchange earnings through exports. This aspect was widely recognised by practically every country at the recent United Nations Conference on Aid and Development held at Geneva. It is somewhat surprising that the D.A.C. Chairman has been content with a mere recounting of the proposals that have emerged from the Conference and a reiteration that they should be studied carefully "to the extent they have a bearing on assistance policies and objectives." One wishes he had been more specific on this issue and urged the O.E.C.D. countries to open their gates a little wider to the products of the developing countries.

The rate of growth in the circulation of newspapers and periodicals in India slowed down from 8.8 per cent in 1962 to 5.4 per cent in 1963, according to the annual report of the Registrar of Newspapers for the year 1963. The slower growth is attributed to the very restricted supplies of newsprint. There were 7,790 newspapers and periodicals at the end of 1962. The total circulation of 4,570 newspapers was 20.95 million, as compared with 19.26 million for 4,467 newspapers in 1962. The total number of newspapers and periodicals at the end of the year stood at 9,750, including 2,121 dailies and news and current affairs weeklies.



WITH MILLS
TUBULAR SCAFFOLDING

The Nangal Silo is just one site where Gammon India Ltd. have used MILLS Scaffolding. Safe, practical and economical, MILLS Tubular Scaffolding is being used in the building of more and more projects because it can be used over and over again. Simple to erect, this versatile scaffolding saves time, labour and money. Free advice on installation with drawings can be supplied by Stewarts and Lloyds. The tubes for the scaffolding are made by The Indian Tube Company (1953) Limited. The fittings are made by Guest, Keen Williams Ltd.

AMERICAN LETTER

IMPLICATIONS OF MR. GOLDWATER'S ASCENSION

GRAVE DANGER TO THE WORLD

By N. Pattabhi Raman

NEW YORK, 1st *August*

SEEKING nomination as the Republican Party's standard-bearer, Senator Barry Goldwater of Arizona emphasised time and again that, as the Grand Old Party's candidate for the Presidency, he would offer the electorate "a choice, not an echo."

This was a challenge to the moderates who were in control of the Republican Party for more than a generation, until they were shouted down and smothered in the Cow Palace putsch in July by Goldwater's militant, rightwing supporters. Goldwater was saying that the Republican Party's platform, as constructed by the moderates and liberals, was an edifice to "me-tooism," merely reflecting the liberal and "socialist" programmes of the Democratic Party. He was saying that the G.O.P., instead of playing Tweedledee to the Democratic Party's Tweedledum, should put forward a truly conservative programme and offer the American people a real alternative to the New Deal, Fair Deal and New Frontier concepts of the party in power.

Now that Barry Goldwater has been chosen as the G.O.P. (Grand Old Party) candidate and that he in turn has chosen for his running mate a man who echoes his ideas, it can be said that he does offer a choice to the electorate. This is clear not only from the candidate's own numerous pronouncements on different issues, but also from the Party's election platform (programme) which mirrors his concepts quite sharply. But it cannot be said that the programme he offers is a conservative one; as a matter of fact, it is quite reactionary.

Not A True Conservative

Since the dark days of the Great Depression, both the major political parties in the U.S. have moved to the left. At a time when the free enterprise system seemed threatened, Franklin Delano Roosevelt stole the thunder from socialists like Norman Thomas by adopting and adapting many of their ideas and implementing new-fangled programmes to build in social and economic stabilisers. The Republican Party frowned on Roosevelt's New Deal concepts and measures, but, by the early fifties, the moderate wing of the Party which put Dwight D. Eisenhower in the White House willy-nilly accepted many of them, including progressive labour legislation and social security. This did not mean that the moderate wing turned its back on conservatism. Actually, it parted company with the rest of the Party mainly on the issue of internationalism *versus* isolationism in foreign policy. With regard to fiscal and monetary policies and also welfare measures, it was still conservative in its orientation. But, even in its conservatism it embraced new ideas and changes that seemed appropriate for the times.

True conservatism cherishes what is best in tradition, yet accepts and seeks advances in the human condition. Goldwater, despite his claim to being a conservative, would not only close the door to the future, but would sweep aside the progress of ideas and the achievements of many years and decades to go back to a romantic past. His answer to the complexities of the modern age is to invoke a simplistic image of supposedly free men, free from the bureaucracy of a big Government and the wishy-washy philosophy and the fettering chains of a welfare State.

Some Typical Remarks

Typical is his view on the progressive income-tax. "The graduated (income) tax is a confiscatory tax," he has said. "Its effect, and to a large extent its aim, is to bring down all men to a common level. We are all equal in the eyes of God, but we are equal in no other respect. Artificial devises for enforcing equality among unequal men must be rejected." This is the philosophy that apparently led him to cast a negative vote on the Civil Rights Bill last month. (Goldwater claims that he is "unalterably opposed to discrimination of any sort" and that as a half-Jew—his grandparents were Polish Jews—he himself has suffered discrimination.)

The Senator from Arizona has said too: "Let welfare be a private concern," meaning thereby that, instead of the society organised in the State concerning itself with the welfare of its members, the individual should fend for himself by buying insurance or seeking help from private organisations. He amplified this point in a television interview in 1961 and said: "When you say to Johnny, '*Don't worry about the old man or your mother, we are going to take care of them when they get older,*' you have destroyed his freedom there, the freedom of responsibility." Perhaps, the man who embraced the church does not lack Christian charity, but, if he has any understanding of the complex society and its social and economic problems, he has given no evidence of it.

Goldwater's simplistic "solutions" to complex problems have an emotional appeal to many, but several of his "solutions" are dubious and also mutually contradictory. In this sense, the choice he offers to the electorate is not at all a clear one.

Goldwater would, for instance, reduce the role of the Federal Government—which he often discusses as though it is a foreign Government imposing its rule on the people of the United States—and would substantially reduce Federal Government spending. But he also says he would seek to develop more powerful and sophisticated weapons of war and take a militant diplomatic and military posture in foreign affairs. These would involve more, and not less, centralisation and perhaps also additional spending on armaments.

Dangerous

If many of the domestic policies Goldwater espouses appear antedeluvian, the foreign policy approaches he advocates are reckless and dangerous. His role as the Rip van Winkle of American politics might be amusing, but it is certainly unnerving to see him play the sheriff of the world, shooting from the hip, Western style. On foreign aid, he once said: "If we have to live with foreign aid—and I don't think we do have to live with foreign economic aid—I think it should be used as a 'rifle' aimed at specific areas where we can gain an advantage over the Russians." The new platform of the Republican Party endorses this concept and asserts that foreign aid should be given only to America's allies in the war against Communism. But Goldwater's position on foreign aid is *relatively* innocuous. More terrifying is his view that, in the global contest between the United States and the Communist Powers, especially the Soviet Union, the U.S. should seek "total victory." He believes that there can be no such thing as peaceful co-existence, that Russia must be vanquished as a power if it is not to "bury" the U.S. In 1962, the Senator who later on voted against the limited nuclear test ban treaty called disarmament "a dangerous exercise in complete and total futility." Last year, he said: "I don't give a tinker's dam what the rest of the world thinks about the United States as long as we keep strong militarily." Earlier this year, he said: "We should get back to the Eisenhower-Dulles doctrine of brinkmanship, where everybody knows we have the power and will use it."

"Senator Goldwater believes that he can confront the Soviet Union and China without the risk of war," Walter Lippmann commented recently. "He is not trying to bluff. It is more serious than that. He is suffering from a delusion that the United States is omnipotent and irresistible."

Naive he may be, but he is no less a fanatic than Mao Tse-tung in his ideology and considerably more irresponsible, in that, if elected, he *would have the power* to pursue his mad policies.

Extremism No Vice

His statement on extremism gives no clue to a sober Goldwater tomorrow. In the speech accepting the Republican nomination in July, he observed: "I would remind you that extremism in the defence of liberty is no vice. And let me remind you also that moderation in the pursuit of justice is no virtue." In the abstract, this may not sound so significant, but in the context of his refusal to condemn fascist groups like the John Birch Society and, in fact, his readiness to have their support in the elections, this could only be interpreted to mean that he believes the end justifies the means. More than a year ago, he made another statement that supports this interpretation. He told a television interviewer: "I don't object to a dictatorship as violently as some people do, because I realise that not all people in the world are ready for democratic processes. If they have to have a dictator in order to keep Communism out, then I don't think we can object to that."

It is tempting to say that only the odd balls are for Goldwater and that the odds are against his election, but it could be a terrible mistake to say so. For Goldwater has the support not only of the extremist elements of the right, the reactionaries and the fascists. He has the support, current and potential, of millions of others with a variety of attitudes and prejudices. "Mr. Goldwater may attract all the ultras, and the antis—the forces that are anti-Negro, anti-labour, anti-foreigner, anti-intellectual—but he also attracts something else that is precisely the opposite of these vicious and negative forces." a *New York Times* writer commented recently. He explained: "Mr. Goldwater touches the deep feeling of regret in American life: regret over the loss of religious faith; regret over the loss of simplicity and fidelity; regret over the loss of the frontier spirit of pugnacious individuality; regret, in short, over the loss of America's innocent and idealistic youth."

Defeat Not to be Taken for Granted

Goldwater's voting strength lies in the Mid-west, North-west and the Far-west. In particular, the businessmen and career men and others with comfortable living in these areas support his advocacy of less Federal Government action in the domestic sphere, his call for a return to *laissez-faire*. He has the support also of Southern segregationists who appreciate his negative stand on civil rights. He might gather the votes also of those Northern whites, particularly the minority groups represented by European immigrants, who are reacting with fear to the Negro's vigorous drive for equal opportunities. Many Northern whites who are sympathetic to the Negroes' drive for equality are nonetheless not happy to have the Negroes as their neighbours or are resentful of the Negroes' militant tactics and demonstrations. Moreover, with unemployment at high levels and automation disemploying thousands at a gathering pace, they are fearful too that equal opportunity for the Negroes might mean their displacement. The fashionable term to describe these white reactions is *white backlash*. (It is not widely realised that the present militant struggle of the Negroes is itself a backlash or reaction to years and decades of oppression and exploitation by the white majority.)

A recent survey indicated that the white backlash has so far not assumed fearful proportions, but there is no assurance that it will not grow and be translated into votes for Barry Goldwater. The Arizonan's election strategy actually seeks to exploit it. Already, there are indications that the forthcoming election in November will be preceded by a mean and dirty campaign. Senator Goldwater gave a taste of what is to come when, prior to the San Francisco convention of the Republican Party, he disputed President Johnson's sincerity on civil rights and called him a "faker" and the "phoniest individual" to come on the Washington scene. The Goldwater faction, which has gained control of the Party apparatus, is, moreover, composed of ruthless, ambitious persons, who can be expected to employ every device to put their man in power. While recent popularity polls show that President Johnson would easily beat Goldwater, anything can happen between now and November.

U.S. STEEL PRICE

An increase in steel prices in the U.S. is hinted at in New York. The Chairman of both the United States Steel (Mr. Roger M. Blough) and Bethleham Steel (Mr. Edmund F. Martin) are of the view that, notwithstanding the increase in prices effected last year in two stages and rise in production this year, the current prices are not remunerative enough. "They certainly are not," according to Mr. Martin, "at the level they should be." "Bethleham's profit-margins are between 6 and 7 per cent of sales; they should be," he said, "9 or 10 per cent to be where other industries are."

LONDON LETTER

IS ANYTHING WRONG?

KALDOR TAKES MAUDLING TO TASK

(From Our Own Correspondent)

LONDON, 1st *August*

"BLACK day for the City" announced a subhead at the close of the week and everyone knew what that was about: coming on top of the Rolls Razor collapse (now followed by a Board of Trade inquiry), was the hammering of a Stock Exchange firm; announcement of the suspension in share dealings of three companies; and police inquiries into various share dealings. But what the City was bemoaning was its smirched public image, for the stock market indices barely faltered. They stand now just a shade below their July peak which is practically an all-time high.

It is also noteworthy that the stock markets have been able to maintain their strength, in view of the amount of general concern about the U.K's Balance of Payments. Half-yearly figures have now been published which confirm the lugubrious calculations made month by month. For the first half of 1964, exports averaged £354 million a month (to which add £12 million for re-exports). This is a 4 per cent rise over the 1963 average, though only 2 per cent over the average for the last half of 1963. But imports averaged £457 million a month, or £406 million reduced to f.o.b. terms to make them comparable with the export figures. This is some 14 per cent over the 1963 average and 9 per cent over the average for the last half of 1963.

Payments Deficit

Thus, there is an adverse balance of trade of £40 million a month, ten times the 1963 average. The first half of 1964 has, therefore, piled up a payments deficit, approaching £200 million. Even if imports tail off a little more steeply than they have been doing in the past three months, the deficit must certainly exceed £300 million over the year.

In order to guard against pressure on sterling, the British Government has obtained a renewal of its $1,000 million line of credit with the I.M.F. which should just about take care of the total annual deficit, if, of course, such support should be necessary.

A Controversy

Announcement of the half-year figures has been enlivened by a crossing of swords between Prof. Nicholas Kaldor, a distinguished economist, and the Chancellor of the Exchequer. Prof. Kaldor began by taking the Government to task for trying to explain everything away in terms of imports of industrial raw materials to sustain the expanding economy. What are the facts? Imports of industrial materials have risen continuously since early last year. In the first half of 1964, their value was 12 per cent (£20 million a month—half the deficit!) more than in the second half of 1963. But a part of this was due to a significant rise in price and the rate of growth of these imports has been slowing down since the beginning of the year.

Imports

On the other hand, imports of finished manufactures increased substantially in the first half of 1964 when they were some 23 per cent (£14 million a month) more than in the previous half-year. Imports of machinery and instruments have continued to rise since the start of the year, but then, so have imports of consumer goods which have shown increases in a wide range of articles. In the second quarter of 1964, consumer goods were 35 per cent up on the year before, including a 44 per cent increase in cars and motor cycles. Others, mainly capital goods showed a 32 per cent rise on the previous year. But this group of finished manufactures (of which only part is capital) accounts for a quarter of the increase in the imports bill.

The more the import figures are analysed the harder it is to find complacent explanations. For instance, while semi-manufactures have risen 32 per cent, imports of iron and steel have risen 58 per cent over the year (comparing still the second quarter of 1964 with the second quarter of 1963). Of course, iron and steel amounts to only one-eighth of the import bill for industrial semis, but it is all too evident in this case that home production is being supplemented by imports simply because it is not sufficiently competitive.

Yet this last aspect was the one which the Chancellor of the Exchequer chose to challenge. He said that Mr. Kaldor was in error in showing alarm at the widening trade gap: this was a phenomenon associated with the beginning of a phase of industrial expansion when industrial materials and capital goods imports had to go up. Unhappily for the Chancellor it now begins to be difficult to see 1964 as the "beginning" of a period of industrial expansion. The production indices have been stationary for several months, imports of goods we should be producing ourselves are rising, consumer goods imports are going up—while, on the other hand, exports have not kept pace with the rate of expansion required of an expanding economy.

Mr. Maudling is generally felt to have had the worst of this exchange, but there can be no satisfaction over this in any quarter, since the problem looks even worse, when even the Chancellor cannot analyse it properly. The Opposition "shadow Chancellor" has easily declared that the answer is an expansion of exports, but has not gone so far as to spell out how this is to be achieved. Lack of competitiveness in exports? Apparently, but how is that to be set right? The answer will no longer be looked for from Ministers, for this long Parliament has ended at last and the country settles down to its general holidays, after which the atmosphe will be steadily heated for the October electic One thing is certain; whoever gets back Westminster in October will be in the unen able position of having to tackle the proble of a really serious imbalance in this country trade.

NEW BODY FOR PROMOTING U.K. EXPORTS

The formation of a new organisation f promoting British exports, following on t decision to dissolve the Western Hemisphere E port Council at the end of March, was announc in the House of Commons recently by Mr. Edwa Heath, Secretary of State for Industry, Trade a Regional Development and President of the Boa of Trade. The tasks of the new organisation w be to initiate, guide and inspire export effort all markets, to advise on the formation of bodi to foster British exports in particular areas of t world, to provide a means of co-ordination b tween such bodies and the country's export effo generally, and to provide the necessary finan and services for this purpose. There will be fi bodies to carry on work in Europe, the Midd East, Canada, the United States, and Lat America.

The sponsors of the British National Expo Council will be the Federation of British Indu tries, the National Association of British Man facturers, the Association of British Chambers Commerce, the Trades Union Congress, and t City Financial Advisory Panel on Exports. S William McFadzean, who has served with suc distinction, and success as Chairman of the E port Council for Europe, has accepted the invit tion to become Chairman of the new Council ar to undertake its formation, in consultation wi the sponsoring bodies and the Board of Trade.

4¾ PER CENT

MAHARASHTRA STATE DEVELOPMENT LOAN, 1976

ISSUE PRICE AT PAR

OPEN ON MONDAY, THE 24TH AUGUST 1964

The loan will be closed as soon as the total amount of Rs. 15 crores has been subscribed and in any case not later than the close of business on the 29th August, 1964.

The applications for the loan will be received at—

(*a*) the offices of the Reserve Bank of India, Bangalore, Bombay (Fort & Byculla), Calcutta, Madras, Nagpur and New Delhi,

(*b*) the branch of the State Bank of India at Patna,

(*c*) the branch of the State Bank of Hyderabad at Hyderabad,

(*d*) the branches of the State Bank of Hyderabad conducting Government treasury work within the State of Maharashtra,

(*e*) the branches of the State Bank of India within the State of Maharashtra except at Bombay and Nagpur and at places covered by item (*d*),

(*f*) the Government Treasuries and Sub-treasuries in the State of Maharashtra at places not covered by items (*d*) and (*e*).

Full particulars can be obtained at any of the offices mentioned above.

BANK MERGERS AND FREE COMPETITION

U.S. SUPREME COURT BACKS JUSTICE DEPARTMENT

BANK mergers have been accepted in India as a means of strengthening small and uneconomic banking units. The Reserve Bank's policy of both voluntary mergers throughout the 'fifties and compulsory mergers since the beginning of the 'sixties has enabled larger and progressive banks to take over units which are substandard or which suffer from a shortage of resources, in order to avoid dangers to their solvency or liquidity. There have even been significant attempts by larger banks to extend their geographical coverage through mergers—the most classic instance being the acquisition of Hind Bank in 1958 and New Citizen Bank in 1962 by the Bank of Baroda. A more recent instance is provided by the Canara Bank which has absorbed the Pandyan Bank, among others. The Reserve Bank has all along encouraged the mergers.

In India, the merger trend has never been considered in the context of competition among the banks, largely because there has undoubtedly been far too many small banks posing a serious threat to the stability of banking and growth of banking habit. It is only lately that the powers-that-be have been talking about concentration of share-ownership and economic power in the hands of a few and entertaining the idea of nationalisation. Even so, they have not cried halt to bank mergers and asked the Reserve Bank of India to reverse its policy. This obviously suggests that they realise that the merger policy has large merits in the Indian context and that its implementation does not in any way reduce the scope for adequate and healthy competition, so essential in the interests of depositors and borrowers alike.

Mergers of even bigger banks have been taking place in many countries of post-war Europe also. Here the object is to render more efficient, economical and diversified service to customers, as well as to take bigger risks than in the pre-war era. Across the Atlantic in the United States, however, the trend towards mergers has evoked considerable opposition.

Two Notable Decisions

As was pointed out in *Commerce* dated 23rd November 1963 (page 864), bankers there have been agitated for the last four years over the hostile attitude of the Justice Department of the Administration, which is charged with the duty to enforce anti-trust laws to bank mergers on the ground that they would impede effective competition. The U.S. Supreme Court decisions in what has come to be known as the Philadelphia merger case (discussed in the aforesaid issue of *Commerce*) and in the latest Lexington merger case have upheld the Department of Justice. They have not only barred completely the way for future bank mergers, but also created a situation in which the Department could challenge the bank mergers that took place even before 1950, when the Clayton Act was passed. These two decisions together may change the entire course of U.S. banking history and reverse the bank merger trend which had gathered much momentum in recent years.

The Sherman Act and the Clayton Act have for years given the U.S. Department of Justice the authority to initiate and institute anti-trust proceedings, but it was not clear whether these Acts applied to bank mergers. In fact for ten years, every one—the Department of Justice, the banking industry, the Congress, the bar and the judiciary—all proceeded on the assumption that these Acts did not affect bank merger. When the Bank Mergers Act of 1960 was being debated in 1960, the Congressional debates and Committee proceedings clearly and repeatedly reflected the understanding that Clayton Act did not apply to bank mergers. The Bank Merger Act defined the procedure for approving bank mergers and prescribed explicitly the authorities for approving the mergers. Thus, mergers of the National banks needed the approval of the Comptroller of Currency and those of the State member-banks required the approval of the Federal Reserve. Similarly, the State non-member insured banks were subject to the Federal Deposit Insurance. The procedure was that the Federal agency responsible for approving mergers must consider several factors affecting bank mergers, namely, the history of the bank, its present conditions, its capital structure, its management, the needs of the economy and of the region. Under the last item, the question of competition between banks in the concerned region should also be considered—by inviting the opinion, but only the opinion, of the Department of Justice.

This arrangement worked smoothly for years, but it was the zealous enthusiasm of the present Comptroller of Currency in approving a large number of bank mergers that seems to have induced the Department of Justice to challenge bank mergers. And it has been able to do so successfully, in spite of the joint efforts and informal co-operation among all the three Federal agencies. In spite of sharp disagreement on various matters, the three agencies have lined up on one side, to evolve a consistent common approach to bank merger applications. Their formal committee is known by the name of Bank Mergers Standards Committee.

The Main Difference

The main difference in the joint approach of these agencies and the approach of the Department of Justice is that, while the former emphasises the *banking* factors and regards the competitive factor as only *one* of the factors affecting the decision on any merger, the latter regards the *competitive* factor as the *fundamental* determinant of merger applications.

The earlier decision of the Supreme Court invalidating the merger between the Philadelphia National Bank and the Girard Trust Corn Exchange Bank—a merger which was originally approved by the Comptroller of Currency and upheld by the District Court—was based upon the Clayton Act, and although the Justice Department had also pleaded the violation of the Sherman Act, no ruling was given on that issue. Bankers in the U.S. were, therefore, eagerly awaiting the Supreme Court's decision on further cases involving the Sherman Act. The Supreme Court has now held that the merger of the First National Bank and Trust Company with the Security Trust Company of Lexington also violates the Sherman Act.

The position as a result of the Philadelphia case was described in our earlier article referred to above. How does the Lexington case alter that position? In the Philadelphia case, both the District Court and the Supreme Court considered the applicability of Clayton Act. The former held that, since a bank merger was a case of *assets* acquisition and not a case of *stocks* acquisition, the Clayton Act did not apply. The Supreme Court conceded both the arguments: if Philadelphia case was different from a *pure assets* acquisition, it was also equally different from a *pure stock* acquisition. But it gave a new interpretation to the law, by holding that the entire range of corporate amalgamations from stock to assets acquisitions was *within* the scope of Clayton Act.

In the Lexington case, the Sherman Act provisions were directly being considered. The Supreme Court has held by a majority opinion that, where the merging companies are major competitive factors in a relevant market, the elimination of significant competition between them constitutes a violation of the Sherman Act. The statistics presented at the hearing clearly showed that the First National and the Security Trust were both big and their merger meant a bank that was bigger still. The new bank, it may be noted here, is larger than all the remaining banks in that area combined together. Prior to the merger, the two banks were *close* competitors in the trust department business. The Supreme Court considered that significant competition will be eliminated by the merger and that elimination of significant competition constituted an unreasonable restraint on trade.

With this final seal of the Lexington decision, the Supreme Court has blocked the future mergers; but it seems to be the objective of the Department of Justice to break up past mergers too. In its action against 1963 merger of the Crocker-Anglo National Bank with the Citizens National Bank, the Justice Department has also challenged the 1956 merger between the Crocker First National Bank of San Francisco with Anglo-Californian National Bank, which produced the Crocker-Anglo. What the bankers now wonder is this: should this 1956 merger break up, can the merger that produced Morgan Guaranty Trust Company survive? Some feel that Justice Department is not likely to stop even there. At the end of Philadelphia decision, it was felt that the anti-trust zeal of the Justice Department may not extend backwards beyond 1950. But the Lexington decision, coupled with an entirely different decision on Du Pont merger with General Motors (which required divestment by the Du Pont of General Motors stock acquired some 30 years ago), has created a distinct possibility that the Department may proceed against mergers or acquisitions accomplished even prior to the passing of the Clayton Act in 1950. In fact, the Assistant Attorney General has said so much. He argued that, though the divestment of assets merged years ago might be troublesome, the difficulties had been exaggerated. It is not necessary, in his view, to trace the original assets for the purpose of segregation: the court may effectively restore the previous competitive situation by creating a new corporation or a company out of the assets of the existing company.

Opinion however is not unanimous on the merger question. Although Senator Patman, Chairman of the House Banking and Currency Committee, has declared that he will oppose all efforts that will now be made to exempt banking from anti-trust laws, Senator Robertson, Chairman of Senate Banking and Currency Committee, has clearly expressed his disapproval of the Supreme Court's decision, which, it may be noted, was not unanimous in the case of both the Philadelphia and the Lexington cases. The dissenting judges differed with the majority opinion not only in the interpretation of the case law, but also pointed out that the consolidations clearly appeared to have been the result of lawful programmes of expansion on the part of the merging banks rather than any invidious scheme to restrain competition and secure monopoly in the local field of banking. They also felt that various banking factors in any particular case might completely outweigh the competitive factors and that in any case competitive factors, however, favourable or unfavourable, were not by themselves the only controlling factors.

There the matter stands now and it remains to be seen, how powerfully and fruitfully the joint committee of Federal agencies will be able to act in allowing bank mergers that are in public interest, even though they might result in some decline in competition.

KERALA FINANCIAL CORPORATION

Unlike in the case of the other State Financial Corporations, the problem of the Kerala Financial Corporation is not that of a shortage of resources but the lack of avenues for employment of funds. As against 48 applications for Rs. 98 lakhs received in 1962-63, only 25 applications for Rs. 25 lakhs were received during the year ended 31st March 1964. The decline is largely due to the difficulty in accepting landed properties as security, as a result of the situation created by the enforcement of Kerala Agrarian Relations Act. With a new Land Reforms Act in force now, the position has eased and the Corporation looks forward with a note of optimism to future working and progress. The Corporation is also making all possible efforts to popularise credit facilities offered by it.

The net profit of the Corporation for the year ended March 1964 shows a nominal increase of Rs. 2,500 to Rs. 5.8 lakhs. It was possible to maintain the profits in spite of the fall in the number of applications for assistance and in spite of adverse circumstances, because the amount disbursed was higher.

In spite of the slight rise in profit, there has been a substantial increase in the subvention required to make up the deficit to meet the guaranteed dividend liability: it rose from Rs. 1.41 lakh for the previous year to Rs. 1.67 lakh for the year under review. The entire increase was, however, the direct result of the new Finance Act which provides for a 7½ per cent tax on dividends declared by companies.

During the eleven years of its existence, the Kerala Financial Corporation earned about Rs. 50 lakhs as net profit, out of which more than Rs. 23 lakhs were provided for taxation. Against this, the subventions drawn from the State Government amount to Rs. 13 lakhs. The awkwardness of the entire arrangement under which the State Financial Corporations pay taxes like any other corporate bodies and then draw subventions from the State Government to meet the guaranteed dividend liability is clearly illustrated by the case of the Kerala Financial Corporation. Moreover, the amount of dividends paid to the State Government and the Reserve Bank of India during these eleven years amounted to almost Rs. 11 lakhs. It is only during the last two years that they have decided to forego their dividends in order to strengthen the reserves of the corporation. The amount foregone so far adds up to Rs. 2,10,000.

The industry-wise classification of loans sanctioned by the Kerala Financial Corporation shows that, of the total loans sanctioned, textiles and food manufacturing industries received 28 per cent each next in importance come mineral products, rubber products and wood work, with 9 per cent, 9 per cent and 8 per cent of the total loans respectively.

I.M.F. AND INTERNATIONAL LIQUIDITY

A PLAN FOR OVERCOMING SOME PROBLEMS RAISED BY GOLD SUBSCRIPTIONS

By S. L. N. Simha

[How can international liquidity be improved? This question has figured prominently in world discussions for some time now. The various suggestions which have emerged from these discussions, together with the findings of the study undertaken by the I.M.F. itself and the "Group of Ten" industrial countries, will come up for a close scrutiny at the forthcoming annual meeting of the I.M.F. due to be held at Tokyo next month. One of the suggestions pertains to a further increase in the quotas of I.M.F. members, the proportion of the increased quota being subscribed in gold. This suggestion has been critically examined by Mr. S. L. N. Simha, an Adviser in the Reserve Bank of India, who served as an Alternate Executive Director for India at the I.M.F. from December 1961 to June 1964, in the course of an interesting article contributed, in his private capacity, to the July 1964 issue of The Banker, *London. Besides examining the issue, Mr. Simha has offered his own plan for dealing with the gold problem.*—ED.]

IT is not yet known what specific proposals for improving international liquidity will emerge from the studies now being conducted by the International Monetary Fund and the "Group of Ten" industrial countries. It is widely anticipated, however, that, when the annual meeting of the Governors of the Fund takes place in September Tokyo, a further general increase in members' quotas (that is, their drawing rights) will be recommended, supplemented by some special increases for particular countries whose importance in world payments has increased over the past few years. It will be recalled that similar action was taken in 1959, following the Fund meeting at New Delhi the previous October. The need for a further substantial increase in quotas is fairly obvious. Quota increases are of great help to all countries, developed and developing—and, indeed, are essential if members' drawing rights are to rise in step with the expansion of world trade. A significant increase in quotas, moreover, would provide adequate resources for the Fund to obviate, by and large, recourse either to any supplementary borrowing arrangements of the type that are now in force or to the sale of gold by the Fund to replenish its holdings of currencies. Certainly, as precautionary measures, such borrowing arrangements and the I.M.F. gold stock have a place. But there are strong arguments for trying to operate the Fund without recourse to them. Immediately, the role of gold in the Fund's operations raises many far-reaching questions that touch upon one of the controversial aspects of the suggestions that quotas should be further increased—the proportion of the increased quotas to be subscribed in gold. This article examines this particular problem and puts forward a proposal for meeting it.

In reviewing the role of gold in the Fund, two conflicting considerations have to be reconciled. One is the necessity of endowing the Fund with sufficient international liquidity—which in this context means gold—to meet its operational requirements adequately and promptly. The other is the evident desire of member countries to keep as much of their gold as possible in their own reserves. It is true that, insofar as a convention is being developed to include the gold tranche of the quota (or more precisely the gold subscription *plus* the net creditor position in the Fund) in the reserves of members, payment of gold to the Fund should not make any material difference to the member's reserves. But, in the aggregate, gold subscriptions could still lead to some decrease in international liquidity to the extent that members have drawings outstanding to the Fund or have to purchase the gold from the reserve-currency countries.

Plainly enough, the larger the quota increases, and the more flexible the supplementary borrowing arrangements, the smaller is the need for the Fund to have gold resources. Moreover, the Fund could also avoid hasty sales of gold for the replenishment of currencies to meet what are certain to be very temporary transactions: it is the writer's impression that the Fund's sales of gold in recent years were not quite necessary. What, then, are the practical ways of achieving this reconciliation of the needs of the Fund and those of its members?

What Escape from Article III?

Under the Fund's Articles of Agreement [Article III, Section 4(*a*)], 25 per cent of a quota increase has to be paid in gold. The Articles also provide that, if, on the date when the member consents to an increase in quota, its monetary reserves are less than its *new* quota, the Fund *may* reduce the proportion of the increase to be paid in gold. This relaxation, it should be emphasised, is discretionary and not mandatory. For instance, when there was a general increase in quotas in 1959, the Fund decided that, in all cases, there must be a 25 per cent payment of gold. Things, of course, have changed a great deal since 1959. The most conspicuous feature of the new situation is the substantial decline in the gold reserves of the United States. The gold holdings of the other reserve-currency country, Britain, have shown hardly any net change. Significantly, perhaps, these two reserve countries might—in view of their heavy short-term liabilities—claim the benefit of gold subscription of less than 25 per cent, in terms of the proviso to Article III, Section 4(*a*). Whether, if the Fund agreed, there would be any meaning at all to a 25 per cent gold payment by the other developed countries, it is unnecessary to discuss here: the point scarcely seems practical politics at the moment. There is little doubt that the majority of the developing countries would be eligible to take advantage of the relaxation of the gold subscription—and deserving of such a concession.

In view of the many uncertainties, it seems highly desirable that other methods of dealing with the gold problem should be explored. One method would be to amend the Articles, providing for either no gold payment or a substantially smaller one than 25 per cent, in any general increase in quotas. Other amendments, however, would also be required, since, under the present arrangements, any holding of a member's currency by the Fund in excess of 75 per cent of its quota is regarded as extension of credit by the Fund to the member and a repurchase obligation is created. Another method would be for the Fund to take the gold subscription due under the present requirements, but to sell it back to the member for purchase of its currency. It is doubtful whether this step would be consistent with the letter and spirit of the Articles of Agreement, for, under the existing provisions, any sale of gold by the Fund to acquire a currency should be predominantly related to the Fund's holdings of that currency. It should be emphasised that Section 2 of Article VII (which provides for sale of gold by the Fund) bears the heading "measures to replenish the Fund's holdings of scarce currencies;" any holding of a member's currency by the Fund above 75 per cent of the quota could hardly be regarded as state of scarcity for that particular currency.

A Plan for Returning the Gold

There is, however, a third way of dealing with the gold problem, and this forms the main theme of this article. Briefly, it proposes the investment of the additional gold subscriptions in securities of the respective member countries, the Fund having the right to get back its gold on maturity of the securities. The pattern for this is the present investment of $800 millions of gold in the U.S. short-term Treasury securities, which, in practice, have been continually renewed on maturity. There seems considerable scope for the use of this technique in any general expansion of the Fund's resources. Without prejudice to the exploration of the various other proposals—especially that for dispensing with gold subscription altogether—this investment device deserves serious consideration. It is assumed that Article III Section 4(*a*) will remain as it is. That is to say, members will have to pay 25 per cent of the increase in quota in gold, except where the Fund exercises its discretionary powers to permit a lower payment; possibly in the case of the less-developed countries, the maximum possible reduction in gold payment, to the point even of zero payment, would be made. Now, if the proposed technique were employed, the whole of the gold subscription as thus determined—or, preferably, a substantial portion (say, 75 per cent) of it—could be invested in Government bonds of the respective member countries. These should be special bonds and might even be called gold bonds or gold certificates; they should carry a uniform, though nominal, rate of interest—say, ¼ per cent—with provision for payment of it in local currency in appropriate cases. Any legal difficulties in the way of the issue of such bonds by member Governments should be removed fairly easily. The essential feature of the bonds is that, any time it wishes, the Fund should have the right to convert a part or the whole of them into actual gold.

Whenever the Fund wished to replenish its holdings of any particular currency by sale of gold (and not by activating any special borrowing arrangements), it would acquire the currency by selling an appropriate amount of the bonds to the country concerned. These would usually be the bonds of the country in question—in which case they would simply be extinguished by payment of the local currency. But if deemed appropriate the Fund could sell the bonds of other countries—in which case the receiving country could either hold them or, through the Fund, in effect redeem them for gold. If the amount of the currency required by the Fund is larger than the gold subscription of the country in question, either the Fund's existing stock of gold would have to be utilised or a call made on other member countries for actual gold payments, there being a corresponding decrease in the amounts of their gold bonds held by the Fund. (The developing countries could be exempted from this call.) To expedite matters, the Fund could first draw on its existing gold stock and replenish it in due course through the call on the gold bonds.

Indeed, it may not be necessary to transfer actual gold to the country whose currency is being acquired by the Fund, over the above what is financed by the gold bonds of that country. As noted earlier, the Fund could transfer to the country part of its holdings of bonds of other countries, which are backed by its own guarantee, as it were—provided the country is willing to accept such bonds. This would result in substantial elimination of gold movements.

A possible objection to the above proposal is that, if countries are not required to pay a gold subscription, they are likely to make exaggerated claims for quota increases. This argument was probably valid when the Fund was being set up. But it has very little validity at the present moment. It is assumed that the quota increases will take the form of a uniform increase of all quotas, suplemented by a few selective additional increases. It is obvious that the selective increases would have to meet with general approval and no country can hope to pitch its claim irresponsibly. At the same time, this arrangement will be of real benefit to the developing countries.

Expanding Liquidity

There seems no reason why the scheme suggested here should require any modification of the policies in respect of drawings in the various tranches of a member's quota. The availability of each tranche is, and should be, governed by the I.M.F.'s assessment of the member's requirements and of the policies it is pursuing. In effect, members will be getting an extra tranche to borrow—which is surely consistent with the basic objective of expanding international liquidity.

It would appear that there is no legal obstacle to the Fund's "investment" of its gold in the manner suggested above. Should there be any dobt, all that is required is a simple amendment, permitting the Executive Board to invest gold in any manner it likes. The amendment could also make suitable provision for eliminating the requirement, if any, that gold must be tendered to a depository before it is returned in exchange for bonds.

The above is only the broadest indication of a technique for overcoming some of the problems raised by gold subscriptions to the I.M.F. Many details have to be worked out. I believe, however, that the scheme has considerable simplicity and provides a fairly satisfactory way out of the difficulties posed by any large gold payment. Undoubtedly, there is need for much more intensive consideration of such arrangements *vis-a-vis* the various other alternatives. The main object of this outline is to stimulate thinking and discussion in this important field that requires the collaborative endeavours of a large number of people and the pooling of a great many ideas.

MORE ON INDIAN LABOUR CONFERENCE

PAYMENT OF PART OF WAGES IN KIND ACCEPTED IN PRINCIPLE

THE twenty-second session of the Indian Labour Conference held at Bangalore on 29th and 30th July was quite notable for the agreement in principle reached on the question of paying a part of the workers' wages in kind. This was the question on which there was an exciting and heated debate, with threats of walk-out by labour representatives. The compromise formula accepted by the Conference provides for payment of a portion of wages in kind, consisting of rice, wheat or wheat substitutes, sugar, pulses, one or two popular varieties of cloth and cooking medium. The Government has agreed to supply to the employers the first three articles at controlled prices for distribution to workers through fair-price shops. On their part, the employers have undertaken not only to ensure such distribution but also to make available to workers textiles, pulses and cooking medium at wholesale prices, the cost of distribution being borne by them.

In the course of discussions on the above issue, it was suggested by the Government spokesmen—the suggestion was widely supported by labour leaders—that employers of industrial establishments should subsidise foodgrains sold through fair-price shops. The acceptance of this suggestion is bound to add further to the production costs of industries which are already high enough. Why should employers be made to bear this additional burden designed to confer benefits on a section constituting a fraction of the population? Naturally, the suggestion was stoutly opposed by Mr. Naval Tata, President of the Employers' Federation of India. Without mincing words, Mr. Tata declared that any subsidy from employers who were already required to give many fringe benefits to workers "is out of the question." Would the Government, he asked, give a similar subsidy to its white-collar employees, and said: "By asking employers to agree to a subsidy, the Government would be creating a privileged class. This is not social justice." Thanks to the convincing arguments put forward by employers' representatives, the Government agreed to ensure supplies of rice, wheat or wheat substitutes and sugar at controlled prices for distribution by employers to workers.

Fair-price Shops

The debate was equally exciting and heated on the issue of fair-price shops. The excitement and heat could have been avoided if only the Government spokesmen and labour leaders had cared to find out the real reasons for the slow progress made in the formation of employer-sponsored fair-price shops and consumer stores. At the Standing Labour Committee meeting in December last, it will be recalled, it had been agreed that 95 per cent of the industrial establishments should be covered by the scheme before 29th February 1964. But, so far, we are told, only 78 per cent of the public sector undertakings and 50 per cent of the private sector enterprises—according to Mr. Naval Tata, the latter figure is much less, being 30 per cent—have implemented the scheme. Mr. D Sanjivayya, Union Labour Minister, threatened that the Government would resort to legislation to ensure the setting up of employer-sponsored fair-price shops and consumer stores in all establishments employing more than 300 persons. This move was widely endorsed by some State Labour Ministers, as well as by all the trade unions represented in the Conference, but was opposed by employers' representatives.

The employers' representatives are not against the scheme as such; only they want that no unit, which is not in a position to open consumer stores or fair-price shops, should be compelled to do so. And they are quite justified in asking the Government to appreciate the real difficulties faced by some units and not to force them to establish fair-price shops, unless, of course, the Government is prepared to help them overcome the difficulties. Some of the points urged by the employer-spokesmen against statutory enforcement are:

1. Unless the prices charged by the wholesale producers or suppliers are controlled, co-operative and fair-price shops which function merely at the distributing end cannot offer much relief to the workers.

2. The existing fair-price shops and consumer stores in factories have not been taken full advantage of by industrial workers. It is, therefore, doubtful whether the need for more such shops has been really felt by workers.

3. The State Governments operate a wide network of their own fair-price shops for general public and, in view of the shortage of essential foodgrains, especially rice, some State Governments are unable to ensure steady supply to the fair-price shops to be set up by the employers.

4. The establishment of consumers' co-operative stores in which the workers will have a direct interest and stake is preferable to the employers' setting up fair-price shops.

Instead of appreciating these pertinent points, the Union Labour Minister thought it fit to hold out the threat of legislative enactment. The Government itself, as Mr. B. M. Chinai stated in the Conference, should take the responsibility for supplying commodities at controlled prices to the employer-sponsored fair-price shops or consumer stores. It is good that, in the case of at least three commodities, the Government has undertaken, as already stated, to make available supplies at controlled prices. The workers, too, must be prompted to avail themselves fully of these facilities, for there are instances of workers in several establishments not making use of these stores.

Bonus Issue

The issue pertaining to bonus also figured prominently in the discussions in the Conference. The trade union leaders, as was only to be expected, unanimously demanded immediate acceptance of the Bonus Commission's recommendations in their entirety. The employer-representatives, however, appealed to the Government not to allow itself to be hustled into taking a decision without examining all aspects of the report. In particular, they opposed the Commission's proposal for a minimum bonus, irrespective of whether or not an enterprise made profits. In the light of the conflicting views, the Conference preferred not to make any specific suggestion. All that it did was to call upon the Government to take a decision on the Bonus Commission's recommendations "quickly."

Voluntary Arbitration

A review of the working of the voluntary arbitration arrangements as made in the Conference revealed a good deal of improvement. There were some difficulties in the beginning, but these have largely been overcome. The approach to this issue of the three parties participating in the Conference, namely, employers,

In Hospitals, Factories, Schools, Public places...

PUT AN END TO THE DANGERS OF

SUDDEN DARKNESS

In hospitals sudden darkness can be a danger to life. Emergency lighting is the obvious safeguard—and that's where Keepalite comes into its own. Keepalite is an automatic emergency lighting system employing lead-acid storage batteries which are automatically triggered into operation by the actual mains failure. Modern methods of control and 'trickle' charging mean that Keepalite equipment has outstandingly long life and requires minimum of maintenance. That's why architects everywhere specify Keepalite as sure inexpensive protection for hospitals, factories, schools, banks and public places.

KEEPALITE

AUTOMATIC EMERGENCY LIGHTING EQUIPMENT

MANCHESTER LETTER

A NEW PLAN FOR TEXTILE INDUSTRY

COTTON BOARD URGES CONTROL OVER IMPORTS

From Our Special Correspondent

MANCHESTER, 28*th July*

A REVOLUTIONARY five-year "convalescence" plan aimed at giving the Lancashire textile industry the chance to achieve complete recovery has been put to the British Government by leaders of the Cotton Board. The key recommendation in a hard-hitting nine-page diagnosis is for the price-tickets on the flood of cheap imported textiles into Britain—so far this year they total more than 400,000,000 yards—to be brought into close alignment with Lancashire's own selling rates. A levy would be imposed on the imported goods "to bring their prices within a fixed percentage of fair domestic prices." The proceeds of the levy would then be returned to the exporting country.

Critics of this novel plan are expected to argue that, in effect, it can only hit the purse of the British shopper who buys imported textiles. But the Cotton Board says the scheme "would undoubtedly solve the cotton industry's main difficulties." It also claims that "very little levy would be payable, because, in practice, the level of prices at which imported goods were offered would rise. Failing such a "radical reform," says the Board, present methods of control must be made more effective—either by the imposition of a "global quota" on imports into Britain or the imposition of a tariff on textiles from the Commonwealth.

In a powerful appeal for Government understanding in helping the industry to restore its lost confidence, the Board says:

"The cotton industry, alone amongst major British industries, has been required to face over the past decade an ever-increasing proportion of cut-price, duty-free imports. Consequently, a catastrophic decline, with enormous erosion of capital and employment, has been unavoidable. It seems certain that a new era of technological advances is opening. Labour-saving techniques are materially affecting the historic balances between capital and labour costs. Both the cotton and synthetic fibre industries are becoming dependent on revolutionary developments in scientific and mechanical techniques. It is especially necessary that reasonable Government support should still be available to the United Kingdom industry, whilst the technical, commercial and financial reorganisation continues."

The document, entitled *The Case for a Viable United Kingdom Cotton Industry,* has been submitted to Mr. Heath, the Minister of Trade.

Progress Report

A five-point programme outlining recent progress in the industry follows. Capital expenditure, it is pointed out, has increased greatly—from £14.2 million in 1958 to £25.5 million in 1961; in subsequent years the sums spent on re-equipment have continued to exceed £20 million. Total spindleage fell by 65 per cent between 1958 and 1963, but yarn production decreased by only 28½ per cent. Mule spindles now represent only 12 per cent of total spinning capacity and automatic looms 37 per cent of the weaving trade.

Shift work has been adopted on 38 per cent of spinning spindles, as against only 5 per cent before the reorganisation scheme. The proportion of looms running shifts has increased from 20 per cent to 39 per cent in the same period. About half the yarn spun on the cotton system and about 60 per cent of the cloth woven is produced on machinery working shifts.

Since the reorganisation scheme, output per head has increased by around 20 per cent on average, despite a shorter working week. The report claims that the most efficient firms are now "within sight" of U.S. levels of productivity.

"The theory so frequently still quoted that cotton textiles are ideally suitable for production in low labour-cost, labour 'surplus' areas, is no longer true. It is urgent that this should be realised by all concerned," says the Board.

During this period of adjustment, the industry, the Board declares, requires control of the volume of goods imported from low-wage countries; control of the pattern of imports from low-wage countries; and a price level reflecting, for the first time for many years, "Western" instead of "Eastern" costs of production. The countervailing levy on imports of cotton textiles from low-wage countries is then put forward as the basis of the case. The proceeds would be returned to the exporting country concerned, the Board suggests, so that the additional earnings would go to the exporter instead of to the Government of the exporting country. Provided the percentage discount were sufficiently small, there could then be a gradual dismantling of quantitative limitations. In passing, the Board comments that such a scheme could easily be combined, if desired, with the establishment of a central buying commission for imports, such as operates in the jute trade. Some significance can be attached to the fact that this proposal is part of the Labour Party's "Plan for Cotton."

A Global Quota

While the Cotton Board contends that such a scheme would undoubtedly solve the industry's main difficulties, it also feels there should be a refinement of the quantitative controls. The only way in which the "ring fence" policy can be made effective is for the existing arrangements to be reinforced by the introduction of a global quota for all those developing countries with whom there is no existing bilateral agreement. The report also calls for the imposition of a tariff on goods from the Commonwealth preference area. The main advantage of this would be to help to some extent in bringing prices of low-cost Commonwealth imports more into line with domestic prices and thereby reducing disruption.

A tariff of five-sixths of the current duty, the Board urges, should be levied on yarns, piece-goods and made-up goods and restrictions on the volume and types of imports should be maintained for a trial period of five to ten years. At the end of that time it is hoped that special quantitative restrictions on yarns and piecegoods would no longer be needed and the general provisions of the G.A.T.T. long-term arrangement, if still in force, would be sufficient protection.

A giant takeover—the biggest-ever—in the Lancashire textile industry. In bids worth more than £36,000,000, Courtaulds, the man-made fibre combine, are seeking control of the two biggest spinning groups in Lancashire—Fine Spinners and Doublers and Lancashire Cotton Corporation.

The news—a well-kept secret—took the British cotton industry by surprise when it broke. Both Fine Spinners and Lancashire Cotton employ thousands of workers in mills throughout Lancashire and in surrounding countries. Fine Spinners operate more than 30 mills in the U.K. and also have six firms in France and a 36,000-acre cotton plantation in Mississippi in the United States. Lancashire Cotton have nearly 40 spinning mills as well as interests in other industries including brick making, woollens and electrical manufacture.

Courtaulds' Offer

Directors of Fine Spinners are recommending acceptance of the Courtaulds' offer for their group—one Courtauld share of £1 plus £6 in cash for every four £1 shares in Fine Spinners. The offer for Lancashire Cotton—one Courtauld share of £1 plus £ 7 in cash for every four Lancashire Cotton shares—is being considered by the group's directors.

Both groups have their headquarters in Manchester. Shareholders who went to Fine Spinners annual meeting in the city were unaware of the developments until Mr. William T. Winterbottom, the Chairman, told them he had an announcement to make. He said: "I am absolutely convinced that the fusion is not only in the interest of the textile industry as a whole but also to the benefit of all those employed."

Mr. Winterbottom said that there was much to be said for larger groupings to combat the industry's problems. He added: "Although we are regarded as a giant-sized group my colleagues and I have come to the conclusion that our ramifications are inadequate in view of the developments which have taken place in our industry since our last meeting."

From the trade unions, Mr. Joe King, General Secretary of the biggest spinning union—the Cardroom Workers—hoped that it would be in the interests of the industry and the people who worked in it. It would mean, he said, the spending of more money on modernisation and re-equipment. But there was a possibility that integration on this giant scale would bring streamlining and possibly the closing down of some efficient mills. Mr. King stated that it was important that, in large-scale financial deals of this kind, the interests of the workers should not be forgotten and that there should be the fullest consultations with the trade unions.

SIGNIFICANT ADVANCE IN U.S. ECONOMY

FISCAL POLICIES ATTUNED TO ENSURE GROWTH

By Douglas Dillon
U.S. SECRETARY OF THE TREASURY

WHEN the Kennedy Administration took office, the great challenge was to find a new way to promote more rapid and steadier economic growth at home, and at the same time restore confidence in the dollar by whittling down and eventually eliminating our balance of payments deficit. The situation that confronted us in 1961—and still continues—ruled out the use of extremely low interest rates. We simply could not permit short-term interest rates to drop to the levels of earlier post-war recessions without courting a massive outflow of short-term capital. In short, the very dangers in our balance of payments situation necessarily limited the freedom of monetary policy and gave it a new challenge—to facilitate investment at home without provoking an outflow of capital abroad.

In the early days of the Administration, therefore, and without hesitation, we decided to employ fiscal policy—and, more specifically, tax policy—to expand the role of the private sector of our economy as the primary force in achieving our national economic goals. We promptly undertook two major moves to improve the climate for business investment—moves that could be instituted without any excessive loss of revenue. They were the Revenue Act of 1962, with its central provision of a 7 per cent investment tax credit, and the administrative liberalisation of depreciation—both landmarks of progress in our drive to spur the modernisation of our capital equipment.

Although these were major achievements, they were merely first steps in our integrated, long-range programme to stimulate the private sector of the economy. The biggest impediment to a more robust private sector still remained—the high individual and corporate income-tax rates, born out of war-time inflation, that continually prevented the economy from reaching and maintaining its full potential. The Revenue Act of 1964 substantially embodies the tax programme we proposed to break the grip of these high tax rates upon our economy. The timing of the overall tax programme has been important in sustaining the present expansion, and deliberately so, but that should not be taken to mean that we have succeeded in developing a new and effective counter-cyclical tool.

There remain, in my opinion, great obstacles to the use of tax policy for purely counter-cyclical purposes. The chief of these obstacles is the fact that, within our constitutional system, a long lag typically intervenes between a request for a change in tax rates and legislative approval. Unless and until some method is worked out—acceptable to the Congress and consistent with its prerogatives—whereby tax rates can be varied without undue delay, the purely counter-cyclical function of tax policy will remain outside our arsenal of economic tools.

It is, of course, far too early to reach any final judgment on the results of this year's $11.5 billion reduction in personal and corporate taxes. We can, however, take a reading of the cumulative effects of our earlier actions, including the 1962 investment credit and depreciation reform. So far as our domestic economy is concerned, the current expansion is now in its 40th month—the longest peacetime expansion in this century except for the half-hearted recovery from the depths of the great depression of the thirties. Gross National Product in real terms has already increased by 17 per cent since the beginning of recovery in March of 1961. This far exceeds the record of the two previous recoveries. And prospects are favourable for continued expansion for many more record-breaking months to come.

Employment Picture

While still too high, the unemployment rate has begun to diminish perceptibly, moving down to 5.1 per cent in May 1964, as compared with the 5.7 per cent average of 1963. More striking has been the decline in the jobless rate for married men, which at 2.6 per cent in May is now lower than at any time since July of 1957—seven years ago.

Recent gains in total employment have been impressive. In the year ending last month, jobs rose by about 2 million to 70.8 million—more than twice as much as the 800,000 gain during the preceding 12-month period. Increased employment and better use of our productive facilities have been accompanied by better-than-average productivity gains, reflected both in higher personal incomes and higher profits. With tax liabilities in the first quarter already reflecting the new reduced corporate tax rates, corporate profits after taxes ran at the rate of $31,100 million—more than twenty per cent higher than in the same quarter of last year and more than sixty per cent higher than in the first quarter of 1961.

At the same time, the recovery has witnessed a large and steady rise in real take-home pay for labour—as evidenced by the fact that, after taxes and adjustment for price increases, the average weekly take-home pay for a wage-earner with three dependents is today ten per cent larger than it was in early 1961.

Price Stability

It is highly significant that all of these economic gains have been accomplished in an environment of price stability. Average wholesale prices are no higher today than they were six years ago. This price stability has been of critical importance to our balance of payments, and is now beginning to pay off in terms of increased competitiveness in our export industries.

Overall, our balance of payments deficit has declined sharply since the middle of last year. Since then, the annual rate of deficit on regular transactions, which averaged more than $3,500 million for the past six years, and last year amounted to $3,300 million has been cut in half. This has enabled us to staunch the heavy drains on our gold stock. As of 31st May 1964, our overall holdings of gold were slightly above those at the end of last July—ten months with no net loss at all, as compared with a loss of $1,700 million in the single year 1960.

Evidence is accumulating that we have "turned the corner" in our balance of payments, which, like the domestic economy, is beginning to show the favourable effects of the more active fiscal and tax policies, complemented by appropriate monetary policies, that have characterised the past three years.

Capital Outlays

These effects are quite apparent in investment spending—the key area in terms of both our domestic growth and our balance of payments. Plant and equipment outlays levelled off and even declined after mid-1962, following the break in stock prices and reflecting widespread business uncertainty. But, by the second quarter of last year, less than a year after the new depreciation rules and the tax credit became effective they were rising strongly and are now running almost one-sixth higher than in the first quarter of 1963. Further sizable increases are in sight through the rest of this year. It seems clear that these successive increases in planned expenditures largely reflect the widening recognition of the new incentives implicit in the recent tax measures—including not only the 1962 measures, but this year's two-stage reduction in corporate tax rates to 48 per cent.

A recent study by George Terborgh of the Machinery and Allied Products Institute emphasises that, in order to have achieved effects upon after-tax returns of capital comparable to those of the 1962 and 1964 measures, it would have been necessary to either:

Cut corporate tax rates from 52 per cent to 34 or 29 per cent, depending upon the assumed proportion of equity to total capital, or to have allowed an initial depreciation of from 53 to 57 per cent of asset cost, or to have reduced the cost of new capital equipment by 16 per cent.

It is hardly surprising that investment activity is responding to incentives of this magnitude—even though it will be some time before the cumulative impact is fully realised—and that investment spending is now spearheading the recovery.

The ready availability of credit has also had a favourable influence on the growing strength of domestic investment, but we have found ways of making this credit available without driving short-term interest rates sharply lower. Instead, with the economy expanding vigorously at home, monetary policy has been able to discharge its full share of the task of defending the dollar. Our short-term rate structure has been brought into better alignment with those prevailing overseas, and our monetary authorities are now in a flexible position, prepared to meet whatever further contingencies may arise in the balance of payments.

Economy No Longer on the Wane

In the relatively short span, therefore, of less than three and one-half years, both American economic policy and practice have taken new and dramatic turns for the better. Our economy is no longer on the wane—but surely and strongly on the rise. And we can now look forward, in all sober confidence, to the continuation of a peacetime economic recovery of greater durability and strength than in any comparable period in this century.

Equally important, the past three and one-half years constitute a significant watershed in the development of American economic policy. For they have borne witness to the emergence, first of all, of a new national determination to use fiscal policy as a dynamic and affirmative agent in fostering economic growth. Those years have also demonstrated, not in theory, but in actual practice, how our different instruments of economic policy—expenditure, tax, debt management and monetary policies—can be tuned in concert toward achieving different, even desperate, economic goals. In short, those years have encompassed perhaps our most significant advance in decades in the task of forging flexible economic policy techniques capable of meeting the needs of our rapidly changing economic scene.

LABOUR

(*Concluded from page 224*)

employees and Government, was almost identical; it may be summed up thus:

Employers: They want voluntary arbitration, provided there is no coercion and necessary conditions are created for it. (Mr. Naval Tata stated that he was persuading the employers to keep away from compulsory adjudication and accept voluntary arbitration.)

Employees: It is a progressive measure to adopt voluntary arbitration, instead of compulsory adjudication.

Government: The principle of voluntary arbitration has been accepted with a view to seeing that the usual bitterness in labour-employer relations is reduced. Mr. Sanjivayya appealed to both sides to co-operate with the Government to see that this principle of voluntary arbitration was fully implemented.)

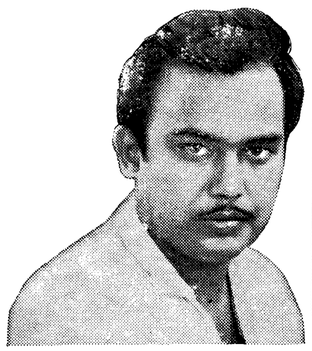
Leave Facility

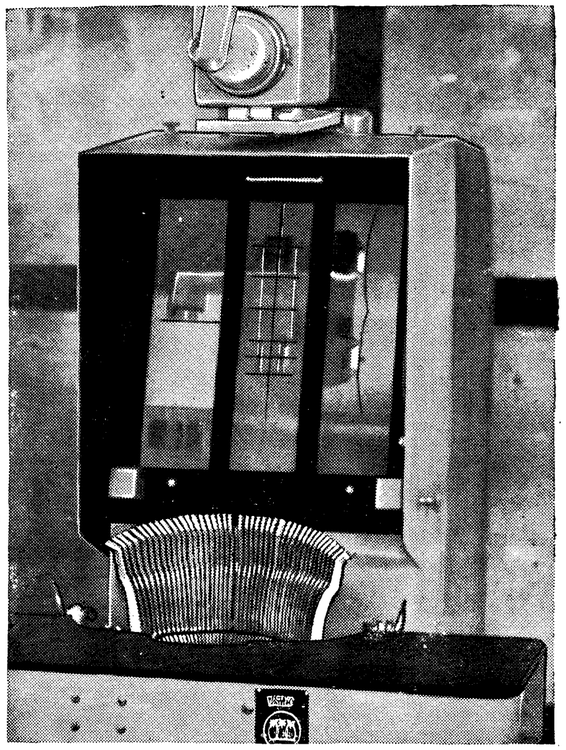
The Conference decided to allow the Punjab Government to legislate for the provision of national and festival holidays, as well as casual and sick leave, for workers in industrial establishments. The decision does not seem to be a sensible one, in that it will, by imposing an additional burden on employers in the Punjab, place them at a disadvantage *vis-a-vis* their counterparts in other States where no such legislation is contemplated. The better thing would have been for the Conference to accept the pertinent suggestion of Mr. Naval Tata that a high-power committee be constituted to fix a national minimum of working days with a view to making uniform leave benefit for workers throughout the country. The Punjab Government can certainly wait till such time as the findings of this Committee are made available. It would be clearly wrong to confer special leave benefits to workers only in one State.

On the recognition of category-wise or department-wise unions in an establishment under the Code of Discipline and the rights of unrecognised union, the Conference did not take any decision. For the consensus of opinion was to the effect that discussion on the subject should be postponed.

Winding up the deliberations, the Union Minister for Labour and Employment made three important announcements. One, the Government has reached a final stage in setting up a wage board for the engineering industry and another for the chemical industry is under consideration. Two, an amendment to the Industrial Disputes Act in order to ensure security of employment is ready; it would be introduced in the next session of Parliament. Three, the Planning Commission and the Government are considering questions relating to giving protection to agricultural labour.

"I check every type of the Typewriter on this machine





"It's the 3-Dimensional TYPE ALIGNING PROJECTOR—simultaneously projecting three images of a type on three adjacent screens. These images reflect three faces of the type (top, side and front) which must conform with pre-drawn markings on the screens. This enables me to check the projected type image for accuracy in type-soldering and bar-alignment. Faults, if any, are immediately corrected and types perfectly positioned to ensure smooth flow and light touch."

Modern precision equipment like the 3-D Type Aligning Projector and Braja Mohan Dan who works on it, are just one team of the multitude of men and machines at the Remington Rand typewriter plant. They are all engaged in a constant endeavour to improve the quality of each tool, die and part that goes into the making of your Remington typewriter.

Over the years people in India have come to expect the standards set by REMINGTON—the highly responsive touch, light positive shift, smooth carriage action, and superior styling and finish—which make them so essential to distinctive correspondence.

BRITAIN'S APPROACH TO CARTELS

WORKING OF MONOPOLIES COMMISSION EXAMINED

By V. S. Swaminathan

BASED on abundant and accessible supplies of cheap coal and steam power, Britain pioneered the Industrial Revolution at a time when rugged individualism was the order of the day, and free trade prevailed. Other nations with vaster and more diversified resources, like Germany in Europe and the U.S.A. across the Atlantic, were not slow to emulate her example. Indeed, when the First World War broke out, Britain was caught on the wrong foot since she leaned heavily on Germany for such strategic items as machine tools, dyestuffs, optical glass and scientific instruments.

Also towards the latter part of the last century the sturdy individualism of an earlier epoch gave place to joint stock enterprise and the family business, which was previously the rule, yielded to limited company operated by salaried managers and owned by a large number of shareholders who were for the most part absentees. Near the end of that century British industrialists, following the lead of the U.S.A. and Germany, began to form big combines like Associated Portland Cement, the Calico Printers Association, Imperial Tobacco and Wall Paper Manufacturers. The biggest of them all—Imperial Chemical Industries (I.C.I.) Ltd.—was born only in 1928.

The First World War gave an impetus to the growth of trade associations aided and abetted by the authorities to fix prices and allocate production quotas. The Great Depression and its aftermath encouraged trade agreements calculated to stabilise prices and reduce redundant productive capacity.

Compared to the United States, the British Monopolies and Restrictive Practices Commission is a mere infant. Here there is no legal presumption that monopoly is harmful. One of the functions of the Monopolies Commission is to determine, when asked by the Board of Trade, whether a particular restraint is in the public interest or not. In the U.K. the Labour Government (like the Congress Government in India) did much to create monopolies in the nationalised industries, bound by no defined principles and outside the scrutiny of the Monopolies Commission. At the same time, some of the leading members of the Conservative Party appeared to defend trade association practices, including fixing of prices by agreement, as contributing to "ordered progress."

Indeed, relations between Government and business in Britain differ markedly from those obtaining in the United States. A section of British opinion believes, rightly or wrongly, that cartels may even be beneficial to the public, for instance, by pooling scientific research, concentrating capital investments and conducting joint publicity campaigns. Some British manufacturers hold that combines enable them to know where they stand, to arrange a steady flow of orders at an assured profit and to plan ahead with a measure of confidence. British trade unions, or at least the majority of them, would seem to sympathise with cartels, arguing that by ensuring attractive prices and profits they gurantee against wage cuts and unemployment. Also, labour leaders naturally find it easier to negotiate with a central body of manufacturers than with several separate units of an industry.

Restrictive Practices

The White Paper on Employment Policy after the Second World War emphatically put to the industrialists that they should seek the reward of enterprise and good management in larger output rather than in higher prices. The growing trend towards cartels and pacts, national and international, by which manufacturers strove to control prices and output, to divide markets and to fix conditions of sale, did not escape the notice of the authorities. The U.K. Government, therefore, sought powers "to inform themselves of the extent and effect of restrictive agreements and of activities of combines, and to take appropriate action to check practices which may bring advantages to sectional producing interests but work to the detriment of the country as a whole." This led to the establishment of the Monopolies and Restrictive Practices Commission by the Labour Government in 1948. Seven years later it was supplemented by the Restrictive Trade Practices Act. The White Paper on monopolies, mergers and restrictive practices, published in March 1964, declares the intention of Government to widen the scope of the definition of restrictive practices so as to bring under its wing "informal," bilateral agreements and "agreements to the like effect" which today escape the scope of the Act.

Initially the Monopolies Commission consisted of ten members with a legally qualified permanent chairman. To begin with, it was entrusted with the task of looking into six trades, that is, electric lamps, dental equipment, electric wires, match making machinery, matches, and drainage goods—a cross-section of the products in which restraint of trade was alleged to be common. Between 1948 and 1956 the Commission prepared in all 18 detailed reports on the supply of a wide range of products by individual industries, trades and single firm monopolies, and one general report on discriminatory practices in industry as a whole.

These reports revealed that restrictive agreements existed in many industries, and in various forms, ranging from secret ones at one extreme and formal written ones at the other. Here are some examples. A 60-Watt lamp for home costs a consumer 1*s.* 4.5*d.* of which 3.5*d.* is purchase tax. But the manufacturing cost of this bulb is stated to be only some 3*d.* The manufacturers not only fix among themselves what they charge to wholesalers and retailers, they also have agreements with dealers regulating the minimum prices at which electric bulbs are sold to the public.

Again, once prices over a wide range of patent medicines or cosmetics have been decided upon producers collectively enforce them. Any retailer is liable to be penalised if he disregards the rigged prices. If he sells a patented drug or tooth paste below the fixed price he may be punished by the cartel in two ways. The manufacturer may cut off his supply of specific articles he has sold too cheaply. Secondly, he may withhold from the "guilty" retailer or wholesaler all other pharmaceuticals marketed by some organisation. This boycott goes by the elegant name of "collective re-sale price maintenance."

Informal Agreements

Informal agreements prevailed between firms under an association, the constitution of which forbade such formal agreements as in the case of British Electrical and Allied Manufacturers' Association (B.E.A.M.A.). In some associations, with no written constitution, the business was transacted by the presidents as, for example, the London Builders' Conference. In the case of the National Association of Master Bakers, the members were advised to accept a recommendation.

The most common type of restrictive agreement was, as noted above, the re-sale price maintenance. This included standard forms of contract and discriminating discounts for prompt payment on large orders. There were also pacts regulating production or sales by means of quotas. There were others to limit entry to a specific trade, or trade in a geographical area, the cases in point being the "tied-house" system in the brewery trade, and the "zoning" system in the retail news agency. There were, too, certain "exclusive dealing" agreements, namely, delimitation of buyers by the sellers, and the practice of discriminatory rates of sale to different buyers. To cut a long story short, price rings control a host of British manufactures, including steel, building materials, textile machinery, electrical equipment, steam turbines, marine engines, non-ferrous metals, etc. A Government Committee reported in 1948 that restrictive practices permeate virtually the entire field of building materials.

Position in Steel Industry

At the moment, the regime under which the largely derationalised steel industry operates in Britain is under critical review from outside. The Restrictive Practices Court has before it one of the main agreements that underpin the present pricing system of U.K. steel. Under it maximum prices are set by the publicly appointed Iron and Steel Board, according to its estimate of what costs and a reasonable return on an "ideal plant" would be; these are then recommended by the industry's conferences as the right price to charge, and in practice steel-makers hardly ever undercut them. Price control is perhaps the strongest influence that the Steel Board exerts on the industry. Its other main power is the obligation upon companies to obtain its approval for major investments. In the denationalisation Act of 1953 it was made the task of the Steel Board to ensure that the supply of the commodity should be "efficient, adequate and economical under competitive conditions." Most steel-makers and the Board maintain that price competition is unsuitable for this industry. *The Economist*, however, adds two criteria: (i) Would they conduce to making the industry adaptable to technological, commercial and economic terms? and (ii) Would they have any chance of being acceptable enough to later Conservative Governments to offer the industry a measure of political stability?

The findings of the Monopoly Commission led to the passing of the Restrictive Trade Practices Act in 1956, which provides for compulsory registration of a wide range of agreements relating to production and sale of goods. It is based on the principle that "restrictive trading agreements are, in general, adverse to public interest because they impede the free play of competition." Circumstances may exist which justify such practices, but this must be demonstrated in each case.

Problems Facing Commission

The problems confronting the Monopolies Commission varied from case to case. They pertained to fixing of prices by Government; exercising a "watching brief" by Government to ensure that prices do not get out of hand; general prices to have a direct relationship to those charged by a monopoly seller to a monopoly buyer; precautionary measures in anticipation of a plausible abuse of the prices by trade associations in future; periodic, but continuing, control by Government over the policy of a single firm monopoly. All these recommendations called for decisions on the part of the Government. In the case of electric lamps, all the findings of the Commission were accepted by the Government and the Electric Lamp Manufacturers' Association agreed to give effect to them. Regarding dental goods industries, it laid bare the existence of exclusive dealing and collective boycott, and recommended the issue of an order by the Government prohibiting these two reprehensible practices, and the Government acted accordingly. The main issue involved in the case of matches and match-making industry was the institution of direct price control by the Government. The system of "level tendering agreement," that is, disclosing and adjusting tenders in London Builders' Conference, was terminated by Government order, and violators of the order were to be excluded from the approved list of Government contractors.

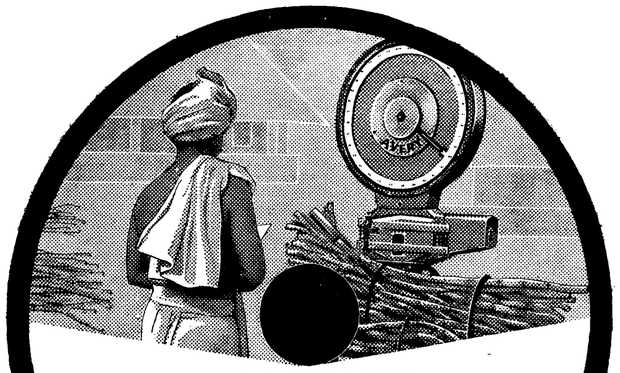
Nowadays the Registrar of Restrictive Trading Agreements compiles and maintains the "register," and institutes proceedings before the Restrictive Practices Court, the machinery of justice consisting of three judges and three or four laymen. The Monopolies Commission still investigates cases of single firm monopolies and any such agreements which may escape the legislative Act.

New proposals contemplate clear demarcation of the functions of the Monopolies Commission and the Registrar of Monopolies. The former would assess the consequences of a monopoly in relation to the public interest. The latter would also investigate proposals for mergers which would result in a monopoly control of at least one-third of the market, or industry, increasing the power of an existing monopoly.

The U.K. Government plans to enact special legislation prohibiting the practice of retail price maintenance except where exemption had been granted by the Restrictive Practices Court. The main object is, of course, to promote more competition throughout the economy. The effect of this legislation would be to make it unlawful for any supplier to fix a minimum retail price, as also to withhold supplies.

The nationalisation of a particular industry only substitutes a public monopoly for a private cartel. It seldom appears to have dawned on the past predominantly Conservative Governments or the post-war Labour Government, that the best way to end restrictive trade practices is to forbid them and penalise their manipulators.

A tariff wall protects the British cartels against foreign competition. These combines carry it further and eliminate much competition on the home market. Independent producers or dealers are black-listed by the cartel if they undercut the ring's selling prices. One result of this is that prices are set at levels acceptable to the least efficient members of the trade. To that extent British cartels keep alive many factories and wholesale and retail businesses which, by any fair test of competency, would long ago have been obliged to close down. Such unduly high prices also hamper exports and impede the country's most pressing economic problem, expansion of sales in the hard currency areas.



AVERY

stands for reliable weighing anytime, anywhere.

Reliable weighing should not be restricted by favourable conditions alone—believe Avery, leading manufacturers of weighing equipment for over 230 years. No matter what the condition—sea level, high altitude, blazing sun or rain—Avery scales are constructed with the finest components and an infinite attention to quality to ensure reliable weighing at all times. And remember, reliable weighing means better profits, more goodwill. Ensure these by using Avery.

ADMINISTRATION OF COMPANIES ACT IN INDIA, U.K. AND U.S.A.

COMPARATIVE STUDY OF ADMINISTRATIVE SET-UPS

By A Special Correspondent

DURING the last six months, a series of administrative reorganisations of the Union Ministries and Departments have taken place. The process is still continuing, though in somewhat a less spectacular manner than it was seen to operate some months ago. In this context, it has become a fashion to suggest new administrative reforms for the administration of various Central laws and subjects; among these discussions, the question of evolving a suitable machinery for the administration of Company Law has also figured very prominently. In fact, the question as to how the administrative machinery for administering the Companies Act should be organised in our country has remained a live issue from the days of the appointment of the Bhabha Committee on Company Law Reform in 1948. Interest in the subject was once again enlivened by the abolition of the erstwhile Department of Company Law Administration in October 1963, and its replacement by a new administrative body, called the Company Law Board, brought into being on 1st February 1964, in the Department of Revenue and Company Law of the Ministry of Finance. This Board is broadly patterned on the lines of the former Central Board of Revenue (now split up into two Boards, namely, the Board of Direct Taxes and the Board of Indirect Taxes).

In the discussions on the form of administrative agency to administer Company Law and to oversee the working of the corporate sector, very frequently references are made to the British Board of Trade and the U.S Securities and Exchange Commission, but a clear picture of these administrative set-ups has not yet been presented to the public in this country. Strangely enough, though the Companies Act in our country has existed for over a hundred years, right up to this day, we have not been able to evolve a suitable and satisfactory administrative machinery for administering it. We have been making experiments while in the U.K. and the U.S.A., the administrative set-ups have been functioning in a stable and perfected form for decades with competence and increasing effectiveness.

Most Formal and Nominal

In our country, for a long long time right upto 1955, the administration of the Companies Act was done in a most formal and nominal way. Firstly, during the days of the British Government, the traditions of *laissez faire* did not require strong administration which might have exercised a close supervision over the working of the joint stock companies. Secondly, after independence, the revision and reform of Company Law took an exceptionally long time during which *status quo* in administrative arrangement was kept and the State Governments, under the authority delegated to them by the Central Government, continued to administer the Act. The Bhabha Committee, which reviewed the working of the then existing administrative arrangements, agreed with the censorial comments of knowledgeable witnesses who appeared before it and said that "the Indian Companies Act was perhaps the most underadministered of the Central Acts relating to trade and industry" in our country. The reasons for the unsatisfactory state of affairs that prevailed then were the absence of a Central administrative machinery and the lack of realisation of full social implications of Company Law by the State Governments to whom the administration of the Companies Act had been delegated by the Central Government. The State Governments, known as Provincial Governments during the British rule, regarded the administration of the Companies Act primarily "as the negative function of preventing the joint-stock companies from contravening its statutory requirements" and employed skeleton staff to exercise a limited measure of control over the companies. The result of this loose administration of law for a prolonged period was a rapid decline in the standards of company management and this process was particularly accelerated under the influence of corrupting pressures generated during the Second World War.

It was to check this trend and to restore the confidence of the public in the corporate institution that the Bhabha Committee recommended the setting up of a strong Central authority as a matter of urgency. The Committee considered two alternatives for organising this authority: (*a*) a Central Department like the one existing in the U.K., known as the Board of Trade (Companies and Insurance Department) and (b) a Central Statutory Authority on the lines of the U.S. Securities and Exchange Commission. On the testimony of a great majority of witnesses, the Committee favoured the latter form of set-up. The principal reason for this choice given by the Committee was that "while a departmental organisation will be simpler to work, a statutory authority will create more confidence and possess more elasticity and initiative." Allaying the fears of official circles, the Committee further said that such a statutory body would not be functioning in isolation from the main currents of economic policy that may be adopted by the Government of the day, as, "once these issues of economic policy have been settled and embodied in legislative or executive decisions, the application of the accepted principles of individual companies, whether in respect of their formation or working, should be the responsibility of a quasi-independent authority which will examine the technical problems involved in as detached a manner as possible and be guided solely in this regard by the general directions given to it in an Act or in a recorded executive decision of Government as a whole." Detailing the functions of the Statutory Authority to be named as "the Corporate Investment and Administration Commission," the Committee advocated that it should also carry on functions such as those relating to capital issue control, regulation of stock exchanges, etc.

The administrative scheme as proposed by the Bhabha Committee seemed to have wide support at the time of the framing of the Companies Bill in 1953, but the Joint Committee of Parliament supported the Government's move to establish a Central Department functioning directly under the Minister-in-charge, instead of a Statutory Commission or Authority. In support of the Government's view, the then Finance Minister, Mr. C. D. Deshmukh, said in Parliament:

"The more I think of it the more I consider that it is a right decision. There are so many powers the exercise of which involves the decision of questions of policy and I cannot readily conceive of any statutory commission which is bound to be autonomous exercising these kinds of power on behalf of Government, because their exercise goes to the root of the economic conditions in the country."

However, while the Government rejected the Committee's main recommendation as to the form of the administrative body, they adopted the other suggestion that subjects such as stock exchanges and capital issue control should be entrusted to the new Central Department. Later on, these subjects became controversial issues and, in the administrative reshuffle effected in 1956, they were taken away from the former Department of Company Law Administration on its transfer from the Ministry of Finance to the former combined Ministry of Commerce and Industry.

Three-tier Machinery

Thus, for the first time in the history of the administration of Company Law in our country, a full-fledged Central secretariat Department was formed in August 1955. It had a three-tier set-up. At the apex was the Central Office—the main secretariat of the Department. It comprised a number of branches dealing with matters relating to investigation, prosecution, liquidation, inter-company loans and investment, licensing and change of names, policy and rules, miscellaneous powers, managerial personnel, research and statistics, housekeeping, etc. The second tier consisted of zonal offices headed by Regional Directors of Companies, and the third one of the field offices in each State and Union Territory headed by the Statutory Officers, called Registrars of Companies. The Registrar of Companies office in the State is a public office where companies are required to file documents and returns. Also in each State, there is the office of the Official Liquidators of Companies dealing with companies under compulsory liquidation or those sent into liquidation by order of the court.

In contrast to the Registrar of Companies Office, the Regional Offices are the creation of the Government outside the scheme of the Act. The Regional Offices, which in the beginning numbered five but later regrouped into four, were charged with responsibilities such as the following:

(*a*) to maintain close contact with the offices of the Registrars of Companies in the region and exercise supervision and control over them on behalf of the Department;

(b) to advise and guide the Registrars on technical and administrative matters;

(*c*) to look after the progress of investigations started by the Department and to pursue prosecutions arising out of investigations and other breaches of the provisions of the Act;

(*d*) to discharge functions of public relations offices and attend to complaints or difficulties put forward by joint-stock companies, particularly the smaller ones having meagre resources to obtain expert advice or guidance; and

(*e*) to report to the Government important events and trends in the region in the sphere of trade and commerce, in general, and particularly on the activities and operations of companies and developments in the capital market.

The regional offices cannot be said to be an altogether original idea, as the Securities and Exchange Commission in the U.S.A. has also got a number of zonal offices for the administration of the Securities Act and other allied legislation in that country. Apart from these, under the provisions of the Companies Act, the Government of India had also set up a high powered commission called the Company Law Advisory Commission. It is headed by a judicial figure and is composed of four other members representing the interests of business, labour, shareholders and an expert from the accounting profession. This Commission advises Government in regard to matters pertaining to managerial personnel.

Change in Nomenclature

The foregoing arrangements continue even today in the original form except that the name of the administrative machinery has been changed from the Department of Company Law Administration to the Board of Company Law Administration. This change in nomenclature occurred in February 1964 in pursuance of the provisions of the Companies Amendment Act, 1963. The provisions of this Amendment Act also envisage that the work relating to the regulation of stock exchanges in particular and other functions like capital issue control, etc., would be once again handed over to the authority administering the Companies Act. The divestment of these functions from the Company Law Administration was severely criticised by the Vivian Bose Commission Report which favoured an integrated administration of laws concerning the corporate sector. As regards converting the Administration into a Board, the main reason given by the official spokesmen was that matters of vital nature affecting the working of corporate sector required careful handling and consideration by a group of officials sitting in a body rather than their disposal by the individual officers at various level without holding a discussion. Further, these officials in the Board would be the experts, whereas, in the Secretariat Department, the administrative seniority normally has the way.

Besides the Board, the Amendment Act of 1963 has introduced a few more novel things in the administrative body. Under the provisions of this Act, an administrative tribunal is to be set up to decide cases of delinquent and 'undesirable' management that may be referred to it in certain circumstances by the Government. In addition, an office of Public Trustee has also been created. The Public Trustee is to be vested with the powers to exercise voting rights attached to shares held by trusts which are created by instruments in writing and which hold shares in excess of certain monetary limits. Thus, in the latest shape, the administrative set-up for the administration of the Companies Act comprises a Company Law Division in the Department of Revenue in the Ministry of Finance, the Company Law Board with regional and State offices under it, an Advisory Commission, a Tribunal, a Public Trustee office and offices of Official Liquidators; the latter are jointly controlled by the Board and the High Courts. From this, it is clear that the administration of Company Law in the present form is quite complex and there is scope for making it simpler, besides evolving effective ways of establishing co-ordination with other Government departments administering laws having some bearing upon the working of the corporate sector. For this purpose, the study of administrative set-ups existing in the U.K. and the U.S.A. would be of great use.

In Britain

In the U.K., the administration of the Companies Act is done by a Government Department called the "Insurance, Companies and Bankruptcy Department" in the Board of Trade which is comparable in a broad sense to the combined Ministries of International Trade and Industry and Ministry of Finance (for certain subjects) in our country. Theoretically, the U.K. Board of Trade is a Committee of the Privy Council having been created in 1786 as a deliberative body, but, over the years, it has in practical administrative sense become a massive ministry which at one time dealt with, besides matters relating to foreign trade, industry, etc., also other subjects which are now handled in the Ministries of Labour, Transport, Fuel and Power, Supply, Materials and Food. Even after the "hiving off" of many a subject, the Board of Trade with its present subjects is at present directly concerned with more than half, judged by value, of the physical product of the national economy, besides a large proportion of the distributive services, more than half of its imports and four-fifths of its exports. The branches of business which are its direct concern engaged the daily work of half of the employed population and a large proportion of the "self-employed." It has to watch, in several ways, the interests of all consumers. In functional terms, the Board's functions include handling of matters pertaining to internal and overseas trade, manufacturing industries except the aircraft and shipbuilding industries, raw materials of industry with such exceptions as coal, oil, iron and steel, building and road-making materials, statutory duties relating to insurance and company law, patents and the distribution of industry.

The Insurance, Companies and Bankruptcy Department is one of the six major constituent departments of the Board of Trade, the other departments being the General Services Division (divided into six sub-divisions such as the Parliamentary Branch, Finance Branch, Enemy Property Branch, Accountant's Division, Establishment Division and Statistics Division), Patents Office and Industrial Property Department, Commercial Relations and Export Department, Industries and Manufactures Department (of this, one division deals with the Monopolies and Restrictive Practices Acts) and Export Credits and Guarantee Department. This Department is concerned with the general administration of the Companies Act, 1948, the Prevention of Fraud (Investments) Act, 1958, including unit trusts, Protection of Depositors Act, 1963, the Registration of Business Names Act, 1916, the Limited Partnership Act, 1907, the Insurance Companies Act, 1958, insurance business and accountancy profession generally at home and overseas, residual work on the U.K. private and business chattel schemes as also the Far Eastern chattel scheme, the Arts Unions Act, 1946, the Newspaper Libel and Registration Act, 1881 and the exemptions under the Moneylenders Act, 1900-27. This Department has three principal branches of which one is the Insurance Branch, the other the Companies Branch and the third the Bankruptcy Branch each of which is headed by an Under Secretary or Assistant Secretary who are in rank equal to the Secretary or Joint Secretary of the Union Government of our country. The Insurance Branch which is headed by an Under Secretary is further sub-divided into two sections one dealing with matters concerning British insurance overseas and the other with insurance in the U.K. and the administration of the Insurance Companies Act, 1958, Business Chattel schemes and the Protection of Depositors Act, 1963. The

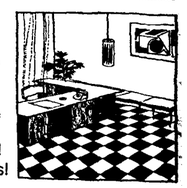
GREATER STYLE
with new
VYNATILE
WONDERFUL PLASTIC TILES FOR FLOORS!

There's nothing like VYNATILE—the unique new floor covering! Strong, flexible and beautiful, VYNATILE does wonders for rooms—looks distinctive on any floor. Ideally suited to offices, shops, restaurants, showrooms, banks, theatres, homes and hospitals!

Choose VYNATILE in 180 cms x 90 cms sheets, in thicknesses of 1.5 mm. or 2 mm. Or ask for it in any economical size. Better still, take it as tiles to fit into your scheme of things!

VYNATILE...better in so many ways!
- So durable. Won't rot, crack, break or scratch!
- Can be used on any surface!
- Superbly finished. In 28 attractive colours and patterns!
- Can be wiped clean in seconds!
- Professionally laid to last for years!



For further details write to:

Vynatile Department, Metro Motors Compound, Harishchandra Goregaonkar Road, Bombay 7.

BI-BI-4

Bankruptcy Branch has very specific responsibility about the bankruptcy matters under the Companies and other Acts. Under this Branch there is an Inspector General who is responsible for the work of the official receivers in Bankruptcy and for supervising and auditing compulsory liquidation of companies. For purposes of handling bankruptcies and compulsory company liquidations, the Inspector General has a headquarters staff which controls over 60 official liquidators all attached to the High Court of Justice and to County Courts throughout the country. The Inspector General is also the Registrar of Deeds of Arrangement.

The third branch of the main Department which deals with matters pertaining to companies functions under the charge of an Assistant Secretary. It is organised under three sections which deal with the Companies Act, 1948, Business Names Act, 1916, Prevention of Fraud (Investments) Act, 1958, Moneylenders Act, and accountancy profession in particular. The administrative arrangement of the Companies Branch is utterly simple and, within it, neither any hierarchy is built nor is the number of staff allowed to swell. Under the branch, there are two Registrars of Companies who head the offices in London and Edinburgh. There is also a Registrar of Business Names who is responsible for the work of registering particulars of business names under the Registration of Business Names Act, 1916. The object of this Act is to secure the disclosure of true identity of persons carrying on businesses under names other than their own. The total number of companies under the surveillance of the Companies Branch in the U.K. is over 750,000, whereas about 30,000 companies are registered every year. The total strength of the branch is of about 400 persons. The whole department of Insurance, Companies and Bankruptcies is manned by not more than 1,200 persons.

Thus, from the above account and a comparison with the administrative set-up as it existed in the past or as it exists today in our country, it would appear that the British administrative set-up is extremely streamlined and compact, it is a part of a Ministry which deals with most of the matters pertaining to trade and industry. The conditions, however, in that country are somewhat different from those obtaining in our country. The network of control over corporate sector is not so elaborate as in our country. Many a matter is regulated by autonomous institutions like the Stock Exchanges and by Advisory Committees like the Capital Issue Control Advisory Committee. In our country, there are Acts which impose numerous kinds of controls and there is centralised direction and control. It is for this reason that there is a multiplicity of administrative authorities which for reasons of administrative pulls are scattered over a number of Ministries. Notwithstanding this, it has to be considered that the volume of work in the U.K. is very appreciably more than that in our country which has only one-twentieth of the companies at work and one-fifth of the companies in liquidation in the U.K. and there is scope for economy in administration.

In the United States

Now coming to the U.S.A., the Company Law, known as the Corporation Law there, is a State subject. There are Corporation Registration Offices in each State. But apart from these, there is the well-known centralised administrative body called the Securities and Exchange Commission which was created under the provisions of the Securities Exchange Act in 1934 to take over the administration of the Securities Act, 1933 formerly administered by the Federal Trade Commission. Subsequently, the Public Utility Holding Company Act, 1935, Trust of Identure Act, 1939. Investment Company Act, 1940 and Investment Advisers Act, 1940 were also entrusted to the Commission. Also by the terms of the Bankruptcy Act, as amended in 1938, the Commission serves under certain circumstances as adviser to the United States District Courts in connection with reorganisation proceedings for debtor corporations. A short description of the objectives of the various federal laws looked after by the Commission would bring out the importance of this body in the American Economic administrative system.

The Securities Act, 1933 has two basic objectives: (a) to provide investors with material financial and other information concerning securities offered for public sale, and (b) to prohibit misrepresentation, deceipt and other fraudulent acts and practices in the sale of securities generally, whether or not required to be registered. Under this law, before the public offering of such securities, a registration statement must be filed with the Commission by the issuer setting forth the required information and the objective of registration is the disclosure of facts upon which investors may appraise the merits of securities and exercise "an informed judgment in determing whether to purchase them." The Securities Exchange Act, 1934, extends the 'disclosure' doctrine for investor's protection to securities listed on national (registered) securities exchanges. Issuers of such securities must file a registration statement both with the exchanges on which the securities are listed and with the Commission, as well as subsequent annual and other periodic reports keeping current the date originally filed. This law also imposes a similar periodic reporting requirement upon companies which file registrations under the Securities Act and whose securities are not listed on the exchanges. The Securities Exchange Act also provides a system for regulating securities trading practices in both the exchange and the over-the-counter markets.

Designed to protect the interests of investors and the public, these provisions seek to curb misrepresentation and deceipt, market manipulation and other fraudulent acts and practices and to establish and maintain just and equitable principles of trade conducive to the maintenance of open, fair and orderly markets. While these various provisions of the law establish the general regulatory pattern, the Commission is responsible for providing rules and regulations for their implementation. The third Act looked after by the Securities and Exchange Commission is the Public Utility Holding Company Act, 1935 which was passed after a comprehensive nine-year study conducted by the Federal Trade Commission and after extensive hearings and debates by both Houses of Congress. This Act seeks to eliminate such abuses as the following:

(i) Inadequate disclosure to investors of the information necessary to appraise the financial position and earning power of the Companies whose securities they purchase;

(ii) issuance of securities against fictitious and unsound values;

(iii) overloading of the operating companies with debt and fixed charges, thus tending to prevent voluntary rate reductions;

(iv) imposition of excessive charges upon operating companies for various services such as management, construction work, and the purchase of supplies and equipment;

(v) the control by holding companies of the accounting practices, dividend and other policies of their operating subsidiaries so as to complicate or obstruct State regulations;

(vi) the control of holding companies and subsidiaries through disproportionately small investment; and

(vii) the extension of holding company systems without relation to the economy of operations or to the integration and co-ordination of related properties.

The law requires that holding company systems register with the Commission and file periodic reports containing detailed data with respect to the organisation, financial structure and operations of system companies. The fourth Act administered by the Commission, namely, Trust Indenture Act, 1939, applies in general to bonus, debentures, notes and similar debt securities offered for public sale which are issued pursuant to trust indentures under which more than $1 million of securities may be outstanding at any one time. The Act requires that the indenture trustee should be free of conflicting interests which might interfere with the faithful exercise of its duties in behalf of the purchasers of the securities. Under the Investment Company Act, 1940 the activities of companies engaged primarily in the business re-investing and trading in securities and whose own securities are held by the investing public, are subject to statutory limitations and to Commission regulation in accordance with prescribed standards deemed necessary to protect the interests of investors and the public. The Investment Advisers Act, 1940 established a pattern of investment advisers which is similar in many respects to Securities Exchange Act provisions governing the conduct of brokers and dealers. Lastly, Chapter X of the Bankruptcy Act provides for Commission's participation as adviser to the courts, in corporate reorganisation proceedings pursuant to Chapter X. The Commission may advise the court with respect to the feasibility and fairness of proposed plans or reorganisation and other matters arising during the course of proceedings.

Three Principle Objectives

The functions of the Securities and Exchange Commission are thus very onerous and require exercise of a nationwide vigilance over the operations of corporations and persons connected therewith by the Commission. The Commission's set-up comprises headquarters in Washington and nine regional offices. The Seventeenth Code of Federal Regulations prescribes the strength of the Commission as of five members not more than three of whom could belong to the same political party. The members are to be appointed by the President, with the advice and consent of the Senate, for five-year terms, term of one member ending each year. The Commission is assisted by a staff which includes lawyers, accountants, engineers, securities analysts and examiners as well as administrative and clerical employees. This organisational structure of the staff is designed to achieve the following three principal objectives:

(a) To secure in the members of the Commission control over policy making;

(b) to create the most effective possible mechanism for enforcing compliance with the Federal securities in laws; and

(c) to provide the greatest possible assistance to public investors and to the regulated industries in achieving compliance with the various Acts.

The Commission has been served by many eminent U.S. public figures, including the father of the late President Kennedy, Mr. Joseph P. Kennedy; its present Chairman is William L. Cary. At the headquarters, the top officers attached to the Commission are the Secretary to the Commission, the Hearing Examiners, the Adviser to the Commission and the Director of Office of Opinion Writing. The Secretary of the Commission has the ultimate responsibility to the Commission for the preparation and maintenance of official records of the Commission actions, the custody of the official seal and the certification and authentication of documents reflecting official Commission actions and for the furnishing of information concerning Commission actions and functions to the press and public. The Adviser to the Commission is responsible for presenting to the Commission an independent viewpoint with respect to problems and matters in the entire field of capital formation under the several statutes administered by the Commission. The Hearing Examiner's job is to preside at public and private hearings and examinations held under the various statutes and in appropriate cases prepare recommended decisions. The Director of the Office of Opinion Writing prepares the opinions and decisions on motions and certifications of questions and rulings by Hearing Examiners in the course of administrative proceedings and this office is also responsible for the preparation of Commission's Annual Report to the Congress. The fifth senior appointment is that of the Executive Director who is chief administrative official of the Commission and wields all such powers as may be delegated by the Commission including the administrative direction and co-ordination of the divisions and offices in the headquarters office and the regional offices in the field. He also serves as the Director of the Division of Administrative Management and responsible for the administration of the Regulation Regarding Conduct of Members and Employees, present and past, both.

Under the administrative charge of the Executive Director and substantive charge of the Chairman, there are six main divisions in the Commission, viz., (a) the General Counsel's Division, (b) the Trading and Exchange Division, (c) Corporation Finance Division, (d) Corporate Regulation Division, (e) Chief Accountants Division, and (f) Administrative Management Division. The General Counsel's office is headed by the General Counsel whose responsibility is to represent the Commission in judicial proceedings in which it might be involved as a party or as *amicus curiæ* to review cases to be referred to the Department of Justice with a recommendation for criminal prosecution, to give interpretations involving novel questions of law, to prepare new legislation entrusted by the Commission and serve as liaison with the Department of Justice etc. The Chief Accountant's Division is responsible for the accounting and auditing matters arising in the administration of the Acts administered by the Commission, particularly with respect to new accounting policy determinations, the form and content of financial statements to be filed with the Commission and the supervision of procedures to be followed in audit or accounting investigations conducted by the Commission. This Office also helps the Counsel in conducting administrative proceedings relating to the disqualification of accountants to practise before the Commission. The Administrative Management Division which is headed by a Director, deals with personnel matters, fiscal matters including preparation of estimates of appropriations and supervision of obligation and expenditure of funds, maintenance of records, public reference services, etc.

Responsibilities

The Corporation Finance Division is assigned the work of administration and enforcement of all matters relating to establishing and requiring adherence to standards of economic and financial reporting with respect to securities traded on exchanges or offered for public sale pursuant to registration or exemptive regulations, establishing and requiring adherence to standards of fair disclosure in the solicitation of proxies for election of directors and other corporate actions, enforcement of the standards set forth in the Trust Indenture Act, 1939 regarding indentures covering debt securities, and enforcing of financial reporting and disclosure provisions applicable to investment companies and reviewing their sales literature. The Trading and Exchange Division is responsible for the administration and enforcement of all matters relating to the regulation of exchanges, national securities associations, brokers, dealers and investment advisers, the institution and conduct of proceedings to revoke or deny the registration of brokers and dealers, the prevention of fraudulent trading practices and market manipulations, supervision of investigation and enforcement activities except as assigned to other operating divisions or offices and for conduct of statistical functions. This Division is also responsible for the institution of injunctive actions arising under the various laws, with the advice of the General Counsel. The Corporate Regulation Division is responsible for the administration and enforcement of all matters arising under the Public Utility Holding Company Act, 1935, the regulatory provisions of the Investment Company Act, 1940 and Commission's responsibilities under Chapter X of the Bankruptcy Act. Each of the above Divisions excepting the Divisions of the General Counsel and Chief Accountant are headed by Directors. The individual operating divisions have the initial responsibility for proposing amendment to existing rules or new rules under the statutory provisions within their jurisdiction.

Each Regional Office has the responsibility in the region for executing the Commission's responsibilities under the various Acts (excepting the Bankruptcy Act) subject to the supervision and direction of the Executive Director, Divisional Directors, the General Counsel and the Chief Accountant within their respective spheres. The Regional Administrator who heads the Regional Office is entrusted with the work of conducting investigation of transactions in securities on national exchanges and registered brokers and dealers including the examination of reports filed under Rule 17A-5 issued pursuant to the Securities Exchange Act, 1934 the examination of proceedings of filings under Regulation A framed under the Securities Act, 1933, the prosecution of injunctive actions in the courts, administrative proceedings before Hearing Examiners, the rendering of assistance to U.S. Attorneys in criminal cases and making of the Commission's facilities more readily available to the public in that region. The New York Regional Administrator, in addition to the above duties, is also responsible for the participation in proceedings under Chapters X and XI of the Bankruptcy Act in the New York and a few other areas. The regional charge of a few other administrators is also wide.

The Securities and Exchange Commission is thus organised in a simple manner in two tiers, one, the headquarters organisation divided into six Divisions and, two, Regional Offices. The Headquarters Organisation, besides having as members who are prominent people taken from the legal and accounting professions or public life, employs highly qualified legal experts and this gives judicial and expert bias to the administration of the Acts governing the corporate sector at the national level in that country. Administrative efficiency combined with expertise is ensured by the appointment of accounting and financial experts to high positions as directors, associate directors of the divisions. Further, prompt service to the public and corporate management and others connected with the promotion of corporations is secured by the decentralisation of administration on regional basis. Lastly, fuller dissemination of information relating to the working of the S.E.C., rules and regulations framed by it and the impact of administration on the corporations is done through a large number of publications brought out by the S.E.C. at frequent intervals. It is a characteristic feature of this body, as is generally true of other American administrative organs, that the objectives in view are secured by giving wide publicity to existing abuses and also to the approach of the administrative agencies towards them: legislation is mooted only after all other ways of checking the abuses have failed.

Conclusion

In conclusion, it may be said that a comparative study of the administrative set-ups existing in the U.K., the U.S.A. and in our country shows that Company Law administration in our country is rather complicated and lacks strength from judicial and legal viewpoints. It is more prone to look into the details of corporate management and thus in the process ignores the positive obligation of raising the standards of corporate management through means other than imposing further stringent controls and punitive measures through legislation. The machinery lacks a system of continuous watch and vigilance over the commanding heights of the corporate sector as also over the vulnerable constituents of that sector. The Administration occasionally gets engaged and entangled with a few companies or business groups which for their doings could as well be given exemplary punishment under other laws of the land. In other words, the present Administration lacks a long-term perspective and objectives. This has been the experience in the past. However, it is to be hoped that the new changes in the administrative machinery, as announced by the Finance Minister, would make the administration of the Companies Act strong, judicious and fair to the corporate sector. Further, the Administration would concentrate its attention to simplify the provisions of law and cut out the requirements of law in regard to filing of many unnecessary and avoidable returns of which use is at present hardly being made by the Government or the public.

INDIA'S ATOMIC ENERGY PROGRAMME

ACHIEVEMENTS OF FIRST DECADE REVIEWED

IN just ten years since August 1954, when the Government of India launched a full-fledged atomic energy programme, this country has acquired the technical competence to become a nuclear power. Thanks to the dynamic, brilliant and farsighted stewardship of Dr. H. J. Bhabha, the Department of Atomic Energy has achieved several notable successes in the pursuit of its allotted tasks of (i) surveying the country for atomic minerals, (ii) working and developing such minerals on an industrial scale, (iii) doing research in the scientific and technical problems connected with the release of atomic energy for peaceful purposes, (iv) training and developing the necessary scientific and technical personnel for this work and (v) fostering fundamental research in nuclear sciences in its own laboratories and in the universities and research institutions. But, notwithstanding these successes, India, like Canada, has proclaimed its non-nuclear status and rejected the idea of nuclear weaponry. In fact, this country has gone even farther than Canada and consistently maintained an anti-nuclear line in international affairs. Although the Department of Atomic Energy aims at complete self-sufficiency in all the related nuclear technologies, it is also wedded to a policy of using atomic energy purely for peaceful purposes. The Department's tenth anniversary this week has provided the occasion for reviewing the progress achieved by it in the pursuit of the twin goals.

Atomic Minerals

First, in the field of atomic minerals development, the relevant division of the Department has been successful in locating large uranium deposits and extensive thorium-rich minerals on the Ranchi Plateau in Bihar State. It is stated that the Ranchi thorium deposits are larger than the Kerala beach deposits and that these two deposits together, estimated at an aggregate of 500,000 tons, represent at least half the known world supply. The division has also located valuable beryl and lithium ores. It is now developing a uranium mine in the Jaduguda area of Bihar State. Work is now in progress there to build a Uranium Ore Mill for treating 1,000 tons of uranium ore per day. The Alwaye Plant of the Travancore Minerals Ltd., in which the Government of India and the State Governments of Kerala and Madras have shares, leaves a residual cake containing thorium and uranium after separation of rare earths chloride from monazite. A plant has been working at Trombay since 1953 to process this residue to obtain thorium nitrate (which is widely used in the gas mantle industry) and uranium fluoride. The latter mineral is further processed at Trombay for obtaining nuclear grade uranium metal.

Research Reactors

Towards the end of 1954 the Department carried out studies of various types of research reactors. In March the next year, it was decided to build a reactor of the pool type, using enriched uranium fuel elements. Work was begun in right earnest in July that year to build at the Trombay Establishment a reactor operating at a maximum power level of 1,000 kw. It may be noted, incidentally, that at the time this decision was taken only two countries in Europe, besides France, the U.K. and the U.S.S.R., had designed and built their own research reactors. The Trombay reactor—the first in Asia—was completed within a year. Christened *Apsara*, it became critical on 4th August 1956 and has since given trouble-free service, with an output of over nine million kilowatt hours so far. The Atomic Energy Establishment at Trombay has thus been a going concern since then.

In 1955 the decision was taken to build a second reactor for engineering experiments, materials testing and radioisotope production. When different reactor types were being considered for this purpose, Canada offered assistance under the Colombo Plan for the design and construction of a reactor similar to their N.R.X. reactor in operation at Chalk River. It was decided to accept this offer on the basis that about half its total cost (more than Rs. seven crores) was to be provided by Canada. Although Canada was responsible for the erection and commissioning of the reactor, the group which actually carried out the intricate job consisted of both Canadian and Indian personnel; the largest number of Canadian staff at any time did not exceed 30, as against the total of engineers and skilled artisans of about 1,200. This Canada-India Reactor reached first criticality in July 1960. Half of its first fuel charge of 190 rods had been fabricated at Trombay and the other half provided by Canada. Complete responsibility for operating and maintaining the reactor (which can be operated at a maximum of 40 M.W.) was taken over from Canada towards the end of November 1960.

The third reactor, *Zerlina*, on the other hand, was designed, engineered and built entirely by Indian personnel. It is a zero-energy reactor and differs from *Apsara* and the Canada-India Reactor in that it is a very low-power reactor, the maximum designed power level being only 100 watts. This reactor, which was erected in less than a year, reached criticality in January 1961. It has proved to be a very valuable experimental tool for the examination of the properties of various types of nuclear fuels.

As heavy water is used as a moderator in C.I.R., *Zerlina* and certain types of power reactors, the Trombay Establishment has co-operated with the Fertiliser Corporation of India in setting up a heavy water plant at Nangal as part of its fertiliser project. The plant, which commenced production in August 1962, has an installed capacity of 14.5 tons of heavy water per annum. The output of this plant, it is stated, will be inadequate to meet the heavy water requirements of the proposed atomic power stations in Rajasthan and Madras States and so India will have to build another plant for the manufacture of about 200 tons of heavy water per annum.

Atomic Fuel

The Department decided in May 1956 to set up a plant for producing reactor grade uranium metal with a view to achieving self-sufficiency in the nuclear field. This plant, which was commissioned by the end of 1958, has been producing nuclear pure ingot of uranium metal from the uranium fluoride obtained from the Thorium Plant. Its initially designed capacity was 30 tons of uranium metal per annum, sufficient for providing the uranium for C.I.R. and *Zerlina* reactors. However, reactor technology has progressed to such an extent that the same plant, with minor additions, can produce enough uranium for feeding the Rajasthan and Madras nuclear power stations with an aggregate capacity of 800 M.W. The Trombay Establishment has also set up a Fuel Element Fabrication Plant. It is noteworthy that this plant, originally set up to fabricate fuel for the Canada-India Reactor, has been so planned as to enable other fuel elements to be made in such shapes and sizes as may be required for experimental purposes or for future research and power reactors.

Plutonium Plant

Trombay scientists and engineers have also successfully designed, built and commissioned a Fuel Element Reprocessing Plant for processing irradiated uranium rods to extract plutonium and other fissionable materials. Commissioned in March 1964, this plant has cost Rs. 3.6 crores. Plutonium, incidentally, is an extremely valuable fissile material and atomic fuel for future reactors. It is of great importance to the long-term power programme, as plutonium reactors can be used to breed uranium 233, also a fissile material, from thorium. India's long-term atomic power programme, it may be noted in this context, is based on the use of thorium in future reactors as the country has the largest reserves of thorium in the world. Plutonium can also be used to improve the utilisation of India's less abundant uranium resources and for the design of small and medium-sized reactors. Hence the significance of the plutonium plant, with its nominal capacity of 30 tons of uranium per annum and its much higher actual capacity.

Radioisotopes

Among the most versatile tools of atomic energy are radioisotopes and radiation sources. The Department has been making these tools available to workers in agriculture, biology, industry, medicine and research all over the country. Today over 250 different types of radioactive products like phosphorus 32, sulphur 35, iodine 131, gold 198, iron 59, chromium 51 and sodium 24, including many special preparations, are readily available from Trombay not only for the domestic market but also markets overseas. Most of the electronic instruments needed by institutions employing radioisotopes and radiation sources, as also by the Establishment, are being produced at Trombay.

Atomic Power

It was in August 1958 that the Planning Commission approved of the inclusion of an atomic power station in the power development programme of the third Plan. The provision in the Plan, it will be recalled, envisaged a 300-M.W. station, costing Rs. 51 crores. However, under the U.S. tender which has been accepted, India will have at Tarapur, 60 miles north of Bombay, a 380-M.W. station for only Rs. 48.5 crores. The U.S. Agency for International Development has lent Rs. 38.10 crores ($80 million) for this station. The likely cost of power from this station has been estimated at 3.01 paise per kw.h., as against 3.69 paise per kw.h. for thermal power in this region. This estimate bears out the Department's stand that nuclear power would be competitive with thermal power in areas far removed from the coalfields. The Tarapur station, now taken up for construction, will be ready early in the fourth Plan period.

The Government has also decided to go ahead with a second nuclear power station, with a generating capacity of 200 M.W. in one reactor, at Rana Pratap Sagar in the State of Rajasthan. This station is to be constructed with Canadian help and collaboration. Already Canada has agreed to loan $37 million (Rs. 16.2 crores) to cover purchases in that country. A noteworthy point here is that, while the Tarapur station is being built under a turn-key contract, the Rajasthan station is to be built by Indian scientists and engineers with Canadian designs. Although the capital cost per kilowatt installed for the Rajasthan station will be somewhat higher than that of the Tarapur station, the cost of electricity from it, we are told, will be less, being as low as 2.6 to 2.7 paise per kw.h. When the proposal for the third power station, to be located at Kalpakkam near Madras, will take concrete shape is not known. But it is said that this Madras station, when taken up for construction, will be engineered and built entirely by Indian scientists and engineers. If that materialises, it will surely be a monument to the remarkable atomic energy development registered so far in India in the pursuit of peaceful objectives.

The U.K. Minister of Transport, Mr. Ernest Marples, told the House of Commons last week that there was no reason why a British nuclear-powered merchant ship should not be operating by 1968. In reply to questions, Mr. Marples said that for some time the Government had been considering ways and means of co-operating with shipbuilders and shipowners to get a nuclear-powered ship built on terms satisfactory to the Government. He also disclosed that recently a shipbuilding company and a shipowning company had jointly approached the Government with the object of building and operating a large merchant vessel powered by a Vulcain-type reactor.

NEW PRODUCTS AND PROCESSES

Stainless Steel Street Lamp Standards

THE first street lamp standards constructed entirely of nickel stainless steel have been installed in Philadelphia. This is a major innovation in street lighting, and will probably set the trend for similar developments in many other cities throughout the world. Standing 30 feet high and incorporating an integral mastarm, the gracefully designed standards have been erected for trial and demonstration purposes. Appropriately, they are equipped with a new type of metallic vapour lamp, the industry's most advanced white light source. The material has traditional advantages—corrosion resistance, adaptability to contemporary design, strength, long life and handsome appearance. As stainless steel resists corrosion, and is not subject to the staining and deterioration in surface finish caused by weathering, the lamp standards require little or no maintenance. This means a substantial reduction in upkeep costs. Such standards offer labour saving and efficient service in trunk-road lighting schemes, while their appearance makes them readily acceptable in residential areas. Their installation is a simple matter for, because of the thin gauge of the stainless steel used, they are light in weight and easily handled.

Machine for Manufacturing Plastic Packages

The "Sterilbox" machine, built by Société Laroche Frères, of France, has been designed specifically for automatic, waste-free manufacture of thermo-hardened plastic containers. The machine is supplied directly by an extruder fed with polystyrene or polyolefin granulates. The granulated plastic is tipped into the hopper of the extruder, and emerges in a strip whose width corresponds to the dimension of the package desired. It then enters the thermo-hardening line, which consists of 16 to 24 moulds mounted on an endless chain. The packages are formed continuously by air pressure and a reciprocating die. A cutting station separates the packages thus formed, which are then fed to the discharge station, while the remains of the strip go to a granulator located above the feeding hopper of the extruder.

Mechanical Suturing Instruments

Soviet surgeons have now 25 different types of mechanical suturing instruments which make reliable, accurate and flawless sutures. The latest achievements in this field are apparatuses for suturing the cornea of the eye, suturing the urinary bladder, and joining the stomach with the œsophagus and intestines. One of the merits of the new apparatuses in their ability to make ideally air-tight sutures. These instruments are expected to enable major surgery to be performed in small hospitals. Mechanical suturing is done in a matter of seconds and cuts to a fraction the time of operation, which is so trying to the patient.

Unique Watch

An electronic watch run by an electric motor has been designed at the Petrodvorets factory near Leningrad in Russia. It vastly differs in design from all other existing mechanisms of this kind. Its miniature case contains semi-conductor-based instruments, condensers, electric magnets and an electrochemical element. The watch is actuated by a tiny storage battery and can operate uninterruptedly for a whole year. The winding key is used only to move the hands.

Computer Aid for Typesetting

An analogue computer which can be used to show quickly exactly how much space an article or any other printed matter will take up when set in type has been developed by Capo Equipment Ltd., Westmoreland Road, London, N.W. 9. If the amount of space available for the article is fixed, the computer can be used to 'decide' the appropriate leading, type size and style to ensure that the article fits exactly. If the printed matter like an advertisement is already in type and has to be changed for a larger or smaller space, the computer shows what changes are necessary. To calculate how much space an article or any piece of copy needs, the computer is first told the number of lines and the average number of letters in a line. It multiplies these to produce the total number of characters. The computer then works out how many lines or what copy depth the article will need, depending on the type, display and leading selected by the operator.

One Driver for Two Tractors

An English farmer, Mr. Colin Shaw of Alvechurch, near Redditch, Worcestershire, has patented an automatic remote control device with which one driver can operate two tractors simultaneously during ploughing or other operations on an arable farm. The two tractors can be of different makes. There are no modifications to the leading tractor, which is driven, and the only extra fitting required for this part of the set-up is an offset hitch of the type used for tandem discs. A telescopic control bar to couple up to the second or "slave" driverless tractor is attached to the hitch on the leading tractor's implement. With only one driver, the two tractors and implements are completely manœuvrable. An added refinement is an automatic switch on the slave tractor to stop the engine in the event of the two tractors becoming separated.

Aircraft Crash Protector

Aircraft passengers of the future may be protected during hard landings or crashes by the cushioning effects of plastic balloons. These balloons would be rapidly inflated to pin the passengers in their seats and keep them from being thrown against the backs of the seats ahead by the impact. The system, called "Air-Stop," has been developed by the Martin Company of Baltimore, Maryland, in the United States in research carried on for the U.S. National Aeronautics and Space Administration (N.A.S.A.). The system has been tested with man-size dummies in simulated airplane crashes. As now envisioned, these bags required only for about ten minutes during launch and landings, will be stored, deflated and folded and kept behind each seat. If a hard landing or crash is anticipated, the bags will be inflated by the pilot with a switch at his control panel. The bags inflate in two sections, one to protect the feet and ankles, and a larger section over the legs, lap and chest of the passenger. The head is protected when, upon impact, it is thrown, together with the upper part of the body, to rest against the back. The bag keeps the passenger from being thrown forward from the seat, and absorbs the shock of sudden deceleration.

Automatic Paint Brush

Thought to be especially useful for painters working on bridges, ships or buildings is a Japanese apparatus which automatically pumps paint from a supply tank to the brush through long, flexible hoses. The painter controls the supply with two push-button valves on the brush, and so can leave the storage tank at ground level. One of the hoses supplies paint to the brush and the other returns unused paint to the tank. Besides helping high-level work, the device is said to make normal painting faster, cleaner and less wasteful. It is supplied by Gray and Campling of Bournemouth, in England.

New Duplicator

No stencils or liquids are required in the Dri-Master, the latest duplicator to be launched by Ellams Duplicator Company, of Walton Road, Watford, Herts. Reproduction is by chemical reaction in the specially treated copy paper used. A master copy is typed or hand drawn and fixed to the drum of the machine. The copy paper is fed in by hand, the handle turned and out come 50 to 150 copies of the material required. The machine is suitable for copying a wide variety of items such as memos, circulars, invoices and address labels.

Water-cooled Jacket

W. A. Bemelman, of Baamburgse, Zuwe 125c, Vinkeveen, The Netherlands, has designed a special type of jacket which, it is stated, will keep steel-makers and others cool as they work in front of hot furnaces. Within the collar of the jacket there is a reservoir of water and over the whole of the surface of the garment there are many hair-like capillaries which connect with the reservoir. Heat from the furnace evaporates the water from the ends of the capillaries and this cools them and the jacket and the wearer. Perspiration can get away because much of the jacket is permeable.

Chronometer

An electronic chronometer of small dimensions and very high precision has been introduced by Ebauches S.A., of Switzerland. It is insensitive to vibration and has been designed as a time base for military and civil use as well as air and sea navigation. It has a built-in power source so that it can be used both for indoor and field operation, independent operation being provided for five days. Further information is available from Swiss Federation of Watch Manufacturers, Windsor House, 83, Kingsway, London, W.C. 2.

Copying Machines

Office copying machines using nuclear energy to react on boron or lithium inks are under development by Moore Business Forms, of 900, Buffalo Avenue, Niagara Falls, New York. Radiation from an element such as plutonium would be used instead of light to reproduce an image. Radiation striking the reactive ink would release high energy particles which in turn affect photosensitive paper. This paper, of the type used in light activated machines, would then be developed to produce the copy. The plutonium would be in the centre of the roller with the master and copy paper passed around it. The system on which Moore holds the patent, is claimed to have the advantage that no outside light source is needed.

Under-water Paint

Dof A.G., of Vaduz, Liechtenstein, says it has developed a paint that can be applied under water. It contains a solvent that dissolves slowly in the water—just as conventional solvents evaporate into the air—allowing a hard film to set. It is heavier than water so that it will not float when the can is immersed. Anti-corrosive agents have been added to the paint, and phosphates so that it will adhere easily to rough surfaces.

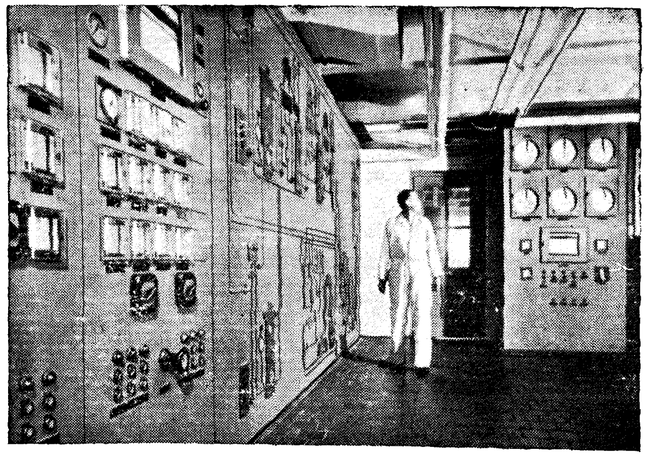
Ideas in Brief

A new low-cost method has been developed by 4D Research and Development Department, Leatherhead, Surrey, England, for turning out concrete products with high-quality surface finishes.

A new high-speed stone-cutting machine is being built in Russia capable of cutting four-to-five-ton granite cubes at high speed. It can also be used for a number of other engineering purposes. Information is available from: Soviet Information Service, 3 Rosary Gardens, London, S.W.7, England.

An attachment for industrial grinding and polishing machines which automatically keeps them supplied with solid abrasive or polishing wax is developed by Johan Gunnar Lundin, Nybohovsbacken 103, Stockholm, Sweden.

A vibration machine, enclosed in the core of moulds when casting reinforced concrete pipes, does not cause displacement of the steel wire reinforcements has been produced by Skanska Cementgjuteriet, Norrlandsgatan 7-9, Stockholm, Sweden.



Look what you get with

HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the tuition-free Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise Instrumentation by Honeywell...and they apply regardless of whether you buy a single instrument, a replacement part or a complete control system.

Sold and serviced in India exclusively by

BLUE STAR

Honeywell

Industrial Process Instruments

PROBLEMS OF PLYWOOD INDUSTRY

RAW MATERIALS SCARCE AND EXPENSIVE

CONCENTRATION of plywood industry in the proximity of tea plantations in this country is not a matter of coincidence but a natural process. Plywood industry began as an ancillary to tea industry which needed suitable containers both for internal distribution and exports of tea. Starting from a mere producer of tea chests, it is indeed remarkable that, within a short span, the industry has made rapid strides, diversifying its production and playing a bigger role in the national economy. The main advantage of plywood as a packaging material is its lightness coupled with strength and elegance. It is also odourless. In view of these advantages, it was but natural that plywood tea chests should usurp other tea-containers from the market. So long as Indian tea industry retains its high place in the world as well as domestic markets, the plywood chest as a container is assured of a good market. But, as mentioned at the outset, the uses of plywood are many and varied now. The main types of plywood that are manufactured today in this country, besides the tea chest variety are: (*a*) commercial plywood which is ordinary non-decorative type for common uses such as partitions, ceiling, furniture, packing, railway coaches and bus bodies; (*b*) decorative plywood with teak, champ, mahagony or walnut facings which find use in high class furniture, panelling, radio cabinet manufacture, etc.; (c) marine plywood, used mainly by shipbuilding industry; and (*d*) flush doors used in all kinds of buildings in replacement of ordinary conventional wooden doors.

Diversification in production and increase in capacity have been accompanied by a marked improvement in quality. The industry has thus justified the protection granted to it for thirteen years from 1947 to 1960. At present,

PRODUCTION OF PLYWOOD
(In million square metres)

States	1961	1962	1963	1964*
Assam	6.81	7.63	9.11	11.00
West Bengal ..	3.89	4.09	4.35	4.70
Kerala	3.29	2.80	4.25	5.00
Mysore	1.24	1.48	2.04	2.70
Uttar Pradesh ..	0.15	0.16	0.18	0.20
Total ..	15.38	16.16	20.93	23.60

* Estimated.

the industry is not only meeting all the indigenous requirements of plywood, thus saving considerable amount of foreign exchange which would otherwise have been expended, but also contributing a sizable amount to the Exchequer. Currently, the value of plywood produced in the country is more than Rs. 8 crores. Its contribution to total excise revenue in 1963-64 was around a crore of rupees.

An idea of the growth of plywood industry can be had from the figures cited in the table accompanying this article. It will be noticed that, during a short period of four years from 1961 to 1964 production has shown an increase of more than 50 per cent from 15.38 million sq. metres in 1961 to 23.60 million sq. metres estimated for the current year, with Assam State providing nearly half of the total output. As against this, the production only a decade back was just over one million sq. metres. In 1963, the output of commercial plywood (10.03 million sq. metres) was a little less than that of tea chest plywood (10.4 million sq. metres). In the current year, however, it is expected to surpass tea chest plywood. This is indicative of new trends in the industry. Judged from the production trends in plywood, there are expectations that the third Plan target of 24.16 million sq. metres pertaining to both commercial and tea chest varieties will be exceeded by at least 1.5 million sq. metres. It is, however, doubtful whether the specific target fixed for tea chest variety will be hit, for the growth of tea production has been lagging behind the goal. The increase in production of plywood has followed a rise in the number of factories. As against 43 recognised units in 1947, the number of factories registered so far is 72 and more factories are in the process of being set up in the Andaman Islands and Bastar (Madhya Pradesh). In addition, there are about 63 small-scale factories in West Bengal, the Punjab, Uttar Pradesh, Mysore and Kerala.

The progress made by the industry has been appreciated by the Deputy Minister for Food and Agriculture, Mr. Shah Nawas Khan inaugurating the second Annual General Meeting of the Federation of Plywood industry at New Delhi a few days ago. Mr. Khan said that the industry had made rapid strides in the production of plywood and other forms of wood products. He expressed the hope that it would be further rationalised. He promised all possible Governmental assistance for the improvement of the industry. Referring to India's international trade in respect of timber and wood products which showed at present an annual adverse balance of about Rs. 20 crores, the Minister underlined the need for replacement of natural forests by plantations of those species which would more economically yield the raw materials for the industry.

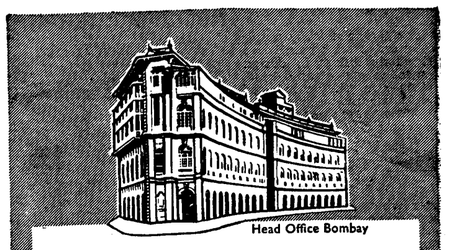
These are, however, measures that can yield results only in the long run and will not solve the existing problems that are handicapping the industry's growth. The first and the most important problem of the industry is that it has to pay for timber, the main raw material accounting for 50 per cent of production costs, a price much higher than the one in foreign countries. This has been described as the main impediment to the growth of industry by the President of the Federation, Mr. A. K. Kader Kutty. According to the Vice-President of the Federation, Mr. G. L. Kedia, while timber for manufacturing plywood is available abroad at Rs. 2.50 per cubic foot, the same quality cannot be had anywhere in this country at a price less than Rs. 5 per cubic foot. Actually, the price of Andaman timber, which feeds the factories in Calcutta area is much higher at Rs. 7.50 per cubic foot. Further, due to shipping difficulties, supply from the Andaman is too inadequate and irregular. This is not all. The coastal shipping lines, which have the monopoly of shipping in the area, are charging Rs. 108.00 per ton as against Rs 60.00 per ton at which foreign ships are prepared to bring Andaman timber. In order to overcome these difficulties, Mr. Kader Kutty wants the Government to permit liberal imports of timber and the use of foreign ships for bringing Andaman timber. It may be noted here that the present timber requirements of plywood industry are placed at 178,000 tons.

Another raw material required by the plywood industry is synthetic resin glue. The present requirements of this material are estimated at 3,500 tons per year which is met partly by indigenous production and partly by imports. By the end of the third Plan, the industry's need of this material is expected to increase to about 5,800 tons. The supply position of resin is also unsatisfactory.

Idle capacity to the extent of 35 per cent is another problem confronting the industry. Inadequate supply of raw materials is not the only cause. The demand for plywood has not kept pace with the growth in capacity. Although production has increased by about 60 per cent during the last eleven years, the production capacity is already very much more than not only the current demand but also the estimated demand in 1965-66—the final year of the third Plan. Whereas the existing capacity for tea chests alone is over 19.5 million sq. metres and that of commercial plywood over 14 million sq. metres, the present demand for tea chests is only 8.8 million sq. metres and that for commercial plywood is 6.5 million sq. metres, the requirements in third Plan being only 11 million sq. metres and 9.3 million sq. metres respectively. As a result, the industry is said to be experiencing keen competition. The position has been aggravated by the imposition of excise duty. The industry's contention is that the prevailing rate of excise duty is pretty heavy completely ignoring the high cost of raw materials and labour. Other points made by it in this connection are that resin itself is subject to an excise duty and substitutes for plywood such as particle boards are assessable to a concessional rate of duty at 5 per cent, as against 10 per cent and 12 per cent on tea chests and other products of plywood industry, respectively.

From what has been stated so far, it should be obvious to any one that the Indian plywood industry cannot compete effectively in world markets. There is a market for tea chests in the other tea producing countries such as Ceylon, Indonesia and East African States. Commercial plywoods are also in good demand in South-East Asia and West Asia. But Indian plywood products, though competitive in terms of quality, are non-competitive in terms of price. According to the study made by a recent delegation on plywood which visited thirteen countries, prices of Indian plywood are generally 40 to 50 per cent higher than the international prices. In order to overcome this handicap, the plywood industry has urged the Government for some relief in income-tax on foreign earnings, besides a minimum subsidy of 35 per cent of the f.o.b. value of exports. Another suggestion made by the industry is that the Government should permit import of plywood machinery for the purpose of diversification of products, as there is a great demand for Indian decorative timber products made of teak, rosewood, walnut, etc.

This picture of Indian plywood industry will remain incomplete without a reference to the Plywood Research Laboratory at Bangalore and the Field Station at Calcutta which are being set up by the plywood industry in co-operation with the Council of Scientific and Industrial Research. The Mysore Government has devoted 17 acres of land for the Research Laboratory which is expected to start functioning in a couple of years. With research and proper publicity demand for commercial plywood can be considerably stimulated in order to solve the problem of unutilised capacity. Research can also help the industry to bring down production costs. Accordingly, the initiative taken by the industry to have its own research outfit is a commendable step.



NEW PUBLICATIONS

Company Directors—A Guide to their Rights, Powers, Functions and Duties. By V. P. Arya. Published for Management Publications by Oxford Book Company, Calcutta. Pages: 161. Price: Rs. 16.

THE success or failure of a company, whatever its size, depends upon the standards of directional behaviour. It cannot stay in business profitably if its directors lack in the essential equipment for the discharge of their directorial duties and functions. The book under review deserves special notice because it aims at describing the rights, powers, functions and duties of directors in a language which is not too technical and in a manner which is not too superficial or too detailed. This book, as its title suggests, is not intended to be a legal text-book. Nevertheless, it will guide the directors in playing an increasingly important part which they are expected to play in the management of a company.

A special feature of the book is the Appendix containing the specimen forms for use by directors in the discharge of their statutory duties.

Elements of Company Law, Third Revised and Enlarged Edition. By Prof. U. V. Desai. Published by Allied Publishers Private Ltd., Bombay 1. Pages: 278. Price: Rs. 10.50.

The popularity of this book is evident from the fact that it is the third and revised edition within a very short time. In its 268 pages it compresses much useful information on the Companies Act, 1956. The book is bound to be useful to students of Law and Commerce, in general, for whom it is primarily intended. It is, however, a pity that it is affected in some parts on account of the principal Act having been amended by the Companies (Amendment) Act 1963. No doubt, the author will issue a supplement to the book so as to make it up-to-date.

Financial Institutions: National and International. Prepared by the Economic Adviser to the Government of Pakistan, Ministry of Finance, Rawalpindi. Pages: 278.

Financial institutions are very much part and parcel of the process of economic development in all countries inasmuch as they oil the wheels of progress by providing long and medium-term loans to industry and agriculture. This publication, prepared by the Economic Adviser, Ministry of Finance, Government of Pakistan, examines in detail the role played by the various financial agencies, national and international, in accelerating the growth process in that country. Some of the agencies discussed in the book, such as the Pakistan Industrial Development Corporation and Agricultural Development Corporation, are not "strictly" financial institutions, but they have been included to give a complete picture of the overall financial operations in the sphere of industry and agriculture. Foreign aid-giving agencies like the International Monetary Fund, World Bank, International Development Association, International Finance Corporation, Export-Import Bank of Japan, and the Commonwealth Development Finance Company Ltd. have been discussed elaborately and their contributions to the process of economic development of the country assessed. The Finance Minister, Mr. M. Shoaib, in his foreword to the book, hopes that the "short account of the activities of the financial institutions would be helpful in appreciating the role played by them."

A Guide to Company Law Procedures. By M. C. Bhandari, 134/1, Mahatma Gandhi Road, Calcutta 7. Pages: 236. Price: Rs. 15.

The purpose of this book is to offer business executives guidance on the procedural formalities of the Companies Act. The author has taken great pains to give as much information as can be compressed in a book of its dimensions. He has attempted to outline topic-wise 115 separate procedures. The topics cover, amongst others, incorporation, conversion, dissolution and amalgamation of companies, alterations and changes in articles, capital issues, appointment of directors, managerial remuneration, lending, borrowing, investments, etc. The book is bound to be of use and benefit to company executives.

Indian Sugar—Annual Number, May 1964. Published by the Indian Sugar Mills Association, India Exchange, Calcutta-1. Pages: 198. Price: Rs. 3.

The above Annual Number marks another milestone in the development of *Indian Sugar* journal. Its main feature is a resume of the proceedings of the 31st Annual General Meeting of the Indian Sugar Mills Association. It also contains a very comprehensive survey of the problems affecting the sugar industry, written by the Association President, Mr. G. M. Modi. There are several authoritative articles, covering a wide range of subjects from cane growing to sugar distribution, from experts and industrialists like D. C. Kothari, V. D. Jhunjhunwala, S. S. Kanoria and S. Jaipuria. The publication carries at the end an up-to-date and extensive statistical section which will come in handy for reference.

Issued by
IMPERIAL CHEMICAL INDUSTRIES (INDIA) PRIVATE LIMITED

METTUR CHEMICAL'S PROGRESS STEADY

DIVIDENDS FULLY COVERED

THE results of the Mettur Chemical and Industrial Corporation Ltd. (Managing Agents: Messrs. Seshasayee Brothers Private Ltd., Mettur Dam R. S.) for the year ended 31st March 1964 reflect, for the first time, the full impact of the expansion from 20 tons a day to 40 tons a day in the capacity of the caustic soda section. The realisation from the sale of a well diversified range of chemical products has advanced by almost 30 per cent from Rs. 201.13 lakhs to Rs. 261.12 lakhs and, with closing stocks of finished goods well maintained around Rs. 6.81 lakhs, the gross profit is higher by Rs. 10.42 lakhs at Rs. 56.94 lakhs. True, the profit-margin (ratio of gross profit to gross sale) has dropped by 1.3 points to 23.8 per cent but this has been due chiefly to a higher incidence of royalty and excise duty amounting to Rs. 12.39 lakhs, as against Rs. 5.32 lakhs, and a further rise in other expenses.

Consequent upon the improvement in gross profit and the decrease of Rs. 0.33 lakh to Rs. 16 lakhs in depreciation, the provision for Managing Agents' commission has gone up to Rs. 2.30 lakhs from Rs. 1.63 lakh for the previous year but that for taxation at Rs. 14.10 lakhs is almost double the amount (Rs. 7.50 lakhs) set aside a year ago. As a result, the net profit is only moderately higher at Rs. 24.54 lakhs, as against Rs. 21.06 lakhs for 1962-63. From this, a slightly larger sum of Rs. 4.62 lakhs, as against Rs. 4.10 lakhs, has been credited to reserves. The appropriation for preference dividend is also higher at Rs. 1.79 lakh as against Rs. 1.56 lakh, because of the increase in this class of capital during the year. The dividend on ordinary shares has been maintained at 12.5 per cent, subject to deduction of tax, but, being payable on an enlarged number of shares, claims Rs. 18.12 lakhs as against Rs. 15.40 lakhs a year ago. Both the ordinary and preference dividends have been fully earned, with the amount carried forward remaining unchanged.

The steady upward trend in sales and profits of the Company that has been in evidence during the past four years is clearly reflected in the following comparative figures:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales realisation	261.12	201.13	150.09	133.89
Other income	2.42	2.68	2.84	2.49
Closing stocks of finished goods	6.81	6.80	5.20	5.78
Raw materials and stores consumed	117.42	88.98	66.53	62.34
Other expenses	89.18	69.91	51.91	46.05
Gross profit	56.94	46.52	33.41	28.36
Managing Agents' remuneration	2.30	1.63	1.63	1.58
Provision for—				
Depreciation	16.00	16.33	12.83	9.47
Taxation	14.10	7.50	2.85	6.60
Net profit	24.54	21.06	16.10	10.71
Withdrawals from reserves	..	..	6.41	2.80
To reserves	4.62	4.10	10.00	3.50
Dividends—				
Preference	1.79	1.56	1.56	1.56
Ordinary	18.12 (12.5%)	15.40 (12.5%)	11.00 (12.5% + B. 1½%)	8.41 (12.5%)
Carry forward	0.12	0.12	0.11	0.16
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	14.26	13.70	15.05	15.25
Low	12.20	11.92	12.03	12.20

It will be recalled that the expansion of the caustic soda unit from 20 tons per day to 40 tons per day was completed during the preceding year and that full rated capacity production was achieved during the second half of that year. With a full year's output forthcoming from the extended plant, production of caustic soda reached an all-time high of 12,700 tons—which is the rated capacity of the plant—and compared favourably with the previous year's figure of 10,380 tons. In consonance with this trend, liquid chlorine production increased substantially beyond the previous year's level. Following the commissioning of a third plant, the bleaching powder unit also showed good results, with production well maintained at approximately 6,900 tons. Output of vegetable oil products and other chemicals continued to be highly satisfactory while that of miscellaneous chemicals actually surpassed the previous year's figures to a considerable extent. The demand for all these products continued to be good and, as transport difficulties were negligible, movement of products remained very brisk throughout the year. The striking feature of the year's performance was the large increase in sales of caustic soda in the lye form. Approximately 60 per cent of the production was sold thus.

The year also witnessed the removal of controls on caustic soda, liquid chlorine, bleaching powder and hydrochloric acid towards the end of 1963, with a view to providing, according to the Government, incentives to producers who would now be assured of a fair realisation for their products. The price control on *vanaspati*, effective from 1st March 1963, was also replaced by a voluntary price regulation formula under which *vanaspati* manufacturers were permitted to sell the product on the basis of raw oil costs *plus* a fixed margin for processing, packing, etc. Soaring prices of groundunt oil due to scarcity of oilseeds are, of course, adversely affecting the production of and the demand for *vanaspati* but the Directors are of the opinion that the situation will improve shortly with the coming in of the new crop.

In their report for the year 1962-63, the Directors had made a reference to the creation of a further 20 tons a day capacity for caustic soda—making 60 tons in all—in the existing factory premises itself by installing 60 additional Hooker cells and auxiliary equipment with a view to achieving expeditiously additional capacity with a comparatively low capital investment. This was done in the year under review and the plant was brought into commission in March 1964. Substantial progress has been made in the setting up of the second factory to produce 60 tons per day of rayon grade caustic soda. The entire land needed for this purpose has been acquired and civil works for factory buildings are well under way. As regards the plans for the manufacture of organic chlorine chemicals, certain delays and difficulties were encountered in concluding collaboration agreements. These difficulties have, however, been overcome and satisfactory arrangements have been concluded for obtaining technical collaboration. It is expected that orders for plant and machinery would be placed abroad very shortly and that the first stage of this scheme would be put on stream by the end of the current financial year.

During the year under review, the Company issued to its existing shareholders 300,000 preference shares and 600,000 ordinary shares, both with a nominal value of Rs. 10 on which only half the amount was collected during the year. This has raised the preference share capital to Rs. 35 lakhs and the ordinary share capital to Rs. 169.79 lakhs. The total paid-up share capital thus stands at Rs. 204.23 lakhs. Reserves and surplus amount to Rs. 42.23 lakhs, raising the total of own funds to Rs. 247.22 lakhs. As against these, outside interest amounts to Rs. 155.07 lakhs, comprising Rs. 82.41 lakhs by way of borrowings and Rs. 72.66 lakhs by way of current liabilities and provisions. On the assets side the gross block stands raised to Rs. 286.96 lakhs following the acquisition of new assets worth Rs. 47.13 lakhs during the year and, on deduction therefrom of the accumulated amount of depreciation, the net block stands at Rs. 163.90 lakhs. Adding to this Rs. 75.58 lakhs as cost of capital work-in-progress, the total net block works out to Rs. 239.48 lakhs. Investments, mostly in shares of Travancore-Cochin Chemicals Ltd., Alwaye are carried in the books at a cost of Rs. 16.58 lakhs while current assets, loans and advances total Rs. 146.23 lakhs.

The Rs. 10 fully paid ordinary shares of the Company are currently quoted on a *cum-div.* basis at Rs. 14.26 and fetch on an *ex-div.* basis a net annual return of 7.6 per cent on fresh investment.

(Concluded from next column)

which have increased from Rs. 117.75 lakhs to Rs. 140.22 lakhs due entirely to the rise in bank borrowings from Rs. 42.75 lakhs to Rs. 65.22 lakhs also include 1969-74 6.5 per cent debentures which are unchanged at Rs. 75 lakhs. Unsecured loans have been lower at Rs. 1.29 lakh as compared with Rs. 9.13 lakhs a year before. The secured bank loans, unsecured borrowings and current liabilities and provisions (including the year's dividend liability) together bring the total short-term indebtedness to Rs. 112.31 lakhs which is covered by current assets, book debts and investments aggregating Rs. 166.27 lakhs. The gross block which has increased during the year from Rs. 278.94 lakhs to Rs. 285.99 lakhs has been written down to Rs. 119.42 lakhs.

Currently quoted at Rs. 135.50 *cum-div.*, the Rs. 50 fully paid shares of the Company offer a net yield of 5.6 per cent per annum.

SIMPLEX EARNS MORE

DIVIDEND CUT PARTLY RESTORED

AN appreciable rise in both sales and gross profits, which more than wipes out the setback suffered in the previous year, has been reported by the Simplex Mills Company Ltd. (Chairman: Mr. S. R. Damani, Bombay), for the year ended 31st March 1964. According to the Directors, the improvement is due to the introduction of fine varieties of cloth which has enabled the Company to achieve a higher profitability. It would be pertinent to note, the Directors add, that, during the year under review, the production programme was extended to the manufacture of superfine varieties including *dhotis*, *saris* and lawns. It is expected that the Company will obtain additional benefits from this change. Meanwhile, the improved results have enabled the Directors to raise the dividend on the Rs. 50 fully paid shares by two points to 18 per cent *per annum*, thus restoring one-third of the six-point cut imposed in the previous year.

Coming to the financial results, net sales (that is, excluding excise, freight, etc.) have risen to a new peak of Rs. 367.10 lakhs from Rs. 289.72 lakhs to which level they had dropped in the previous year from Rs. 342.60 lakhs for the year before that Likewise, gross profit, which had declined from Rs. 54.73 lakhs to Rs. 41.53 lakhs in the previous year, has improved to Rs. 55.65 lakhs during the year under review. Net profit at Rs. 22.26 lakhs is, however, slightly lower as compared with Rs. 22.79 lakhs a year before, because depreciation has claimed Rs. 4.20 lakhs more at Rs. 22.94 lakhs and taxation has taken up Rs. 10.45 lakhs against nothing in the previous year, which was because it was estimated that there would be no assessable income for that year in view of the heavy liability arising from bonus for the years 1957, 1959, 1960 and 1961. Against Rs. 17.04 lakhs in the previous year, Rs. 10.90 lakhs have been provided during the year under review for the payment of bonus for the years 1957 and 1959 to 1962. The dividend, as noted before, is higher and it is to be paid out of dividend reserve to which Rs. 10.89 lakhs have been transferred out of the years's profit. It is pertinent to note here that, whereas, in the previous year, the Directors had to withdraw a net amount of Rs. 3.90 lakhs from reserves and provisions, to pay even the lower dividend, during the year under review the dividend has been raised after carrying a net amount of some Rs. 65,000 to reserves. The carry forward is Rs. 9,856, against Rs. 24,574 brought in.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales, less excise, freight, etc.	367.10	289.72	342.60	358.09

* For 1957 and 1959 to 1962.
† For the years 1957, 1959, 1960 and 1961.
‡ No dividend was paid, but a bonus share of Rs. 50 fully paid was issued for every five shares held.

The Company did not lag behind in meeting the Defence requirements; its supplies of cloth and yarn to Defence formed 5.05 per cent of its total production. The Company will continue to meet future Defence requirements. Exports, which improved as a result of a change in the incentive scheme, are expected to rise further during the current year. Additions to fixed assets during the year amounted to Rs. 7.61 lakhs and orders for machinery outstanding at the close of the year aggregated Rs. 17 lakhs.

The Company's balance sheet shows paid-up capital unchanged at Rs. 60.48 lakhs in Rs. 50 fully paid shares which is backed by Rs. 39.40 lakhs in reserves and surplus, excluding Rs. 10.89 lakhs in dividend reserve required for meeting the year's dividend liability. Secured loans

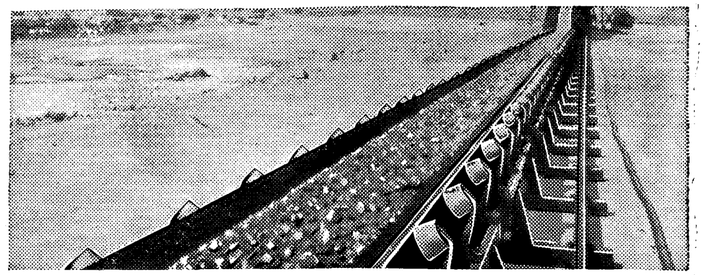
Here are the remarkable features of the

CONVEYOR BELTING WITH A COTTON/NYLON CARCASS

Read about

DUNLOP STARLON



Starlon's cotton/nylon carcass is a major break-through in conveyor belting development in India. These details tell you how Starlon will bring increased pay-offs!

Intensive tests have proved that conveyor belts with a cotton/nylon carcass are far more successful for heavy duty material handling service. Starlon is the result of these tests. It is backed by the world-wide technical know-how and experience of Dunlop and is specially constructed for extra heavy conveyor jobs.

Here's why Starlon means a much more profitable investment!

1. Improved flexibility—better troughing, smaller pulleys.
2. Less horse-power required.
3. Increased flex life.
4. Reduced number of plies—lighter and thinner.
5. Higher impact strength.
6. Greater tear resistance.
7. Better fastener holding properties.
8. Higher belt weft strength.
9. Lower capital cost; lower cost per ton carried.

Starlon Belting, 17240 metres long and 1524 mm wide, will shortly be supplied to the Neyveli Lignite Corporation for their mine expansion scheme. This is the largest single order for conveyor belting and yet another Dunlop achievement.

For complete details on Starlon, contact the nearest Dunlop office or write to:

SYNOPSES OF COMPANY REPORTS

Cochin Malabar Estates Ltd.

(*Managing Agents*: Messrs. Peirce Leslie & Co., Ltd., Calicut.)

Thirty-fourth Annual General Meeting—13th August 1964.

Working Results:

	For the year ended 29th February (In thousand rupees)	
	1964	1963
Sales—rubber	32.29	32.47
,, —bought rubber latex	14.18	35.36
Closing stock—rubber	6.36	5.95
,, —bought rubber latex	.27	1.16
Gross profit	12.75	11.32
To Managing Agents' remuneration	.78	.78
Transfer to depreciation	1.84	1.73
,, ,, provision for taxation	5.57	4.69
Net profit	4.56	4.12
Balance brought forward	.29	.24
Transfer from general reserve	15	Nil
Appropriations:		
To tax deduction for previous year	Nil	51
Transfer to rehabilitation reserve	1.60	25
To preference dividend (taxable)	.8	.8
Proposed dividend (taxable) ordinary	3.23 (12%)	3.23 (12%)
Carry forward	.9	.29

Market value of ordinary shares (in rupees):	1964*	1963	1962
High	6.50	6.45	7.38
Low	6.30	5.60	6.25

* Upto 31st July 1964.

Extracts from the Directors' report: The crop harvested during the year was satisfactory and young rubber areas brought into tapping during the year have shown satisfactory results.

Crops and Costs

Year	*Crop*	*Estate cost of production per kg.*	*All-in cost of production per kg.*	*Average price realised per kg.*
	Kg.	Rs.	Rs.	Rs.
1961-62 ..	11,50,898	2.28	2.76	3.58
1962-63 ..	11,05,303	2.63	3.05	3.48
1963-64 ..	11,32,759	2.41	2.84	3.41

In view of the rehabilitation programme on which the Company has embarked to increase its yields, it is extremely difficult to reduce expenditure by any appreciable amount. The cost of materials and stores continues to increase, and the existing legislations governing the employment of labour places a very heavy burden on the Company.

Future Prospects: The crop for 1964-65 is estimated at 10,88,708 kg., to be produced at an all-in-cost (excluding replanting) of Rs. 2.80 per kg.

Accounts in brief as at 29th February 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	28,04,579	Gross block	60,09,790
Reserves and surplus	19,54,687	—Depreciation	13,97,512

		Current assets	15,15,890
		Cash	6,13,639
	Rs. 67,41,807		Rs. 67,41,807

* Paid-up capital consists of 2,266—7 per cent. cumulative preference shares of Rs. 50 each and 8,97,093 ordinary shares of Rs. 3 each. Of the above 5,38,256 ordinary shares are allotted as fully paid up by way of bonus shares through the capitalisation of reserves.

Samastipur Central Sugar Co., Ltd.

Authorised Controller: Mr. J. P. Goel, New Delhi.)

Registered Office: 1, Netaji Subhas Road, Calcutta.

Forty-fourth Annual General Meeting—26th August 1964.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1963	1962
Sale proceeds	79.99	1,03.80
Closing stock	19.33	46.45
Loss	—10.11*	—1.00
Provision for depreciation	3.51	Nil
To loss on export of sugar	1.54	2.53
,, Items relating to previous year	2	Nil
,, development rebate reserve	Nil	14
Loss brought forward from previous year	8.99	5.50
Total loss	20.66	9.17
Credit adjustment	20†	18†
Final loss carried forward	—20.46	—8.99

Market value of equity shares (Rs. 10 paid up) (in rupees):	1964‡	1963	1962
High	4.50	9.69	10.12
Low	3.50	4.10	8.75

* Loss after providing for depreciation.
† By export sales of sugar in respect of previous year.
‡ Upto 31st July 1964.

Extracts from the Authorised Controller's report: During the year under review, the Factory worked for 78 days as against 154 days in the previous season and crushed 471,822-30 quintals of sugarcane against 9,59,299 quintals in the previous season producing 43,785-39 quintals of sugar against 85,080-81 quintals in the previous season at an average recovery of 9.28 per cent against 8.87 per cent in the previous season. The factory commenced crushing on 13th December, 1962 and closed in the morning of 1st March, 1963. This will show that the period of crushing was short and the quantity of cane crushed was comparatively low. This factor and the incidence of high expenditure have resulted into an abnormal loss as mentioned above. In view of this poor financial position, no provision for taxation or dividend has been made.

After taking over the undertaking it was observed by the Authorised Controller that due to the then financial stringency, the previous Board of Directors (who vacated their offices in terms of the Rule 125-A(4) (a) of The Defence of India Rules, 1962) could not effect payment of either the principal amount or the interest on the loans secured by them from the Government of Bihar, the State Financial Corporation of Bihar, Cane-cess, Cane Price, Cane Societies' Commission, Suppliers' Bills and other liabilities and the Cash Credit limit secured by the Company from the State Bank of India had also been cancelled. However, with a great deal of efforts and co-operation of the employees of the Company and the cane-growers of the area, the factory commenced crushing on 20th January, 1964, producing 32,428-35 quintals of sugar after crushing 325,548 quintals of cane with an average recovery of 9.96 per cent and it is expected that in the next season 1964-65, there would be better results subject to normal conditions of the region.

Accounts in brief as at 30th June 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	11,99,750	Gross block	72,10,543
Reserves	14,04,877	—Depreciation	32,09,585

* Loss after provision for depreciation and development rebate reserve.
† The dividend will not be subject to tax by virtue of Section 84 of the Income-Tax Act, 1961.
‡ Upto 17th July 1964.

Extracts from the Directors' report; Factory Progress: All the plants were in production during the year under review. The manufacture of *Tungsten Carbide* from the ore stage commenced. A new line of production, *Tungsten Carbide Tipped Tools*, also commenced. The indigenously manufactured *Tipped Tools* were marketed in January 1964. Another item in the group of *Tungsten Carbide Products* marketed during the year was *Nibs* for drawing dies. *Nibs* were marketed in March 1964. The production of *Tungsten Carbide Powder* was increased to meet the Company's requirements in full as well as those of other manufacturers of *Tungsten Carbide* products.

Expansion Programme: As a result of discussions with the Government of India authorities, on receipt of their letter inviting the Company to expand the *Tungsten Carbide* production, an application for substantial expansion was lodged with the Government. Simultaneously, applications were lodged with the Government for licences to import machinery and certain balancing equipment to increase the range of *Tungsten Carbide* products. The Government of India have issued a "Letter of Intent" expressing their willingness to issue the necessary industrial licence, subject to the requirement of imported capital equipment being settled to the satisfaction of the Government.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	60,00,000	Gross block	1,43,16,496

Carry forward	63	37

Market value of equity shares (in rupees):	1964‡	1963	1962
High	3.05	3.02	3.00
Low	2.80	2.45	2.50

* Loss after providing for Secretaries' and Treasurers' remuneration and depreciation but without making provision for taxation.
† Loss after taking into account taxation provision of Rs. 22,500.
‡ High and low upto 17th July 1964.

Extracts from the Directors' report: Crop and Costs—A total crop of 158,200 metric tonnes was harvested during the year and delivered to the Coffee Board. This has been valued at Rs. 2.30 per point or Rs. 3.299 per metric tonne. A comparative statement of production and costs for the last three years is given below:—

Year	*Crop (metric tonnes)*	*Estate expenditure per metric tonne*	*All-in-cost per metric tonne*
1961-62	195.281	Rs. 2.742	Rs. 3.044
1962-63	195.508	,, 2.415	,, 2.843
1963-64	158.200	,, 3.244	,, 3.889

A bonus payment of Rs. 13.744 at 5.3 nP per point has been received on 1959-60 crop making the total for the year Rs. 2.29 per point and this is equivalent to Rs. 3.476 per metric tonne.

The 1962-63 season's crop has been revalued at Rs. 2.30 per point being the final figure declared by the Coffee Board for that season and this is equivalent to Rs. 3,416 per metric tonne including the bonus points awarded on the basis of 20 points per tonne on *Arabica Parchment* and 140 points per tonne on *Robusta*.

The 1964-65 crop has been estimated at 175 metric tonnes and the all-in-cost of production at Rs. 3,528 per metric tonne.

Capital Expenditure.—Rs. 21,341 was spent on capital account during the year. Capital expenditure for the year 1964-65 is estimated at Rs. 30,050.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	12,00,000	Gross block	16,67,876

		Current assets	4,15,388
		Investments	6,49,195
		Cash	4,50,076
	Rs. 29,11,329		Rs. 29,11,329

* Paid-up capital consists of 6,00,000 equity shares of Rs. 2 each.

Notices

THE IMPERIAL TOBACCO COMPANY OF INDIA LIMITED

THE DIRECTORS HAVE TODAY DECIDED to recommend to the shareholders at the Annual General Meeting, to be held on 24th September 1964, the payment of a final dividend for the year ended 31st March 1964, of 2½% (subject to tax) which, together with the two interim dividends of 2% (subject to tax), makes a total of 6½% for the year (1963 8%).

The net profit for the year is Rs. 99,25,376 (1963 Rs. 1,80,23,592) after deducting all charges and expenses and after providing for taxation amounting to Rs. 1,87,45,944 (1963 Rs. 2,62,37,010).

The Directors also intend to declare a first interim dividend of 2½% (subject to tax) in respect of the year ending 31st March 1965 (1964 2%).

The Company's business has been adversely affected by taxation measures in each of the last two Budgets and the Directors have considered it prudent to recommend a reduction in the final dividend. Prospects for the current year, however, warrant the declaration of a first interim dividend of 2½%.

The final dividend, if approved, and the interim dividend will be payable on 30th September 1964 to the shareholders whose names appear on the register on 24th September 1964. The share transfer books of the Company will be closed from 5th to 24th September 1964, both days inclusive, and transfers received in order at the office of the Company's Registrars (Jardine Henderson Limited, 4 Clive Row, Calcutta 1) up to 4th September 1964 will be in time to be passed for the payment of the dividends to the transferees.

By Order of the Board

P. J. RICKETTS
Assistant Secretary

VIRGINIA HOUSE,
37, CHOWRINGHEE,
CALCUTTA.
3rd August 1964.

THE MYSORE PAPER MILLS LIMITED

Asiatic Buildings, Kempegowda Road
Post Box No. 570, Gandhi Nagar P.O.
BANGALORE 9

NOTICE

Re: Closing of Share Transfer Books

IN CONNECTION WITH THE TWENTY-ninth Annual General Meeting of the Shareholders of the Company to be held on Wednesday the 30th September 1964, at 2 p.m., in the premises of the Mysore Chamber of Commerce Buildings, Kempegowda Road, Bangalore City, the Share Transfer Books of the Company will be closed from 11th September to 30th September 1964 (both days inclusive).

By Order of the Board,

C. V. RAMACHANDRA RAO,
Secretary.

Dated: 25th July 1964.

NEWS IN BRIEF

EXPORTS of spices from India during the first four months of the current financial year amounted to Rs. 7.1 crores, an increase of Rs. 1.6 crore over the corresponding period last year.

A Soviet seismic survey ship, *Kademik Arkhangelsky*, is now at the Madras port. It will prospect for oil and natural gas under the sea area stretching from Madras to Palk Straits in the South and extending upto the continental shelf.

Thirty co-operative spinning mills at a cost of Rs. 40 crores are expected to be established in Maharashtra by the end of the fourth Plan. So far six co-operative mills have been registered and 19 mills are in the process of being registered.

A committee to study the distributional arrangements of fertilisers is to be constituted by the Union Ministry of Food and Agriculture. The decision to this effect was taken at the meeting of the Planning Commission which was attended by Mr. C. Subramaniam.

The National Coal Development Corporation is reported to be examining proposals for setting up a coal-based industrial complex (which will include several chemical industries) at Ramgarh in Bihar, opening a high temperature carbonisation plant to produce gas for industrial use and exploiting high grade metallurgical coal from depths of 500 to 1,000 metres.

The Central Government is considering a tentative programme envisaging installation of 1,000 improved types of rice mills of three-ton capacity and an equal number of mills of one-ton capacity during the fourth Plan period. It is expected that the bigger mills will together process about 10 to 20 million tons of rice. The one-ton capacity mills are proposed to be set up at less important centres.

An international training centre in food technology, now being set up at the Central Food Technological Research Institute in Bangalore under an agreement between the Government of India and the Food and Agricultural Organisation, is expected to start functioning from the last week of next month. It will provide training programmes in food technology, including a two-year post-graduate diploma course. The F.A.O. will meet the expenses of 12 international trainees and the Indian Government will provide for the training of an equal number of Indians.

The shares of the Industrial Finance Corporation held by the Government of India and the Reserve Bank of India have been transferred to the Industrial Development Bank of India. The shares comprise about 40 per cent of the Rs. 7 crore shares of the I.F.C. The Corporation is also issuing 2,692 additional shares in favour of the Industrial Development Bank so as to enable the Bank to hold 50 per cent of the total share capital of the I.F.C. (which stands now at a little less than Rs. 8.35 crores). The I.F.C. will be co-ordinating its activities more closely with the Bank.

The British Government has offered the Government of India, subject to agreement on terms and conditions, financial assistance for the third stage of the steel works at Durgapur. The third stage will double the capacity provided by the first two stages and bring annual production capacity to a total of three million ingot tons. Construction is expected to begin early in 1966. An extension of the second stage will be put in hand immediately by the construction of a fifth blast furnace and ancillary plant. For that work the Government of India expects to issue tender invitations next week. The foreign exchange costs required for the fifth blast furnace and ancillary plant totalling £7 million will be provided from British aid over the next four years.

The Expert Committee (Chairman: Dr. S. R. Sen, Adviser, Planning Commission) on assessment and evaluation of the intensive agricultural district programme, popularly known as the package programme, in its first report submitted recently has expressed the view that the weakness of co-operatives has proved to be the main limiting factor in the progress of the programme. The progress has not been uniform in all the seven districts in which it was introduced in 1961. The unpreparedness of the Extension Service Agency in terms both of knowledge and equipment, as well as the required strength to undertake the task, is another limiting factor. It is also not possible to create certain basic facilities, such as implements, workshops and soil testing laboratories, organisations for production and distribution of quality seed, and information, units for dissemination of useful information to farmers.

• • • •

From Abroad

The British Treasury has given its consent to the Chrysler Corporation's £12.3 million bid to acquire 30 per cent of the ordinary voting shares in Rootes Motors and a 50 per cent interest in the "A" non-voting ordinary shares.

The U.S. gold reserves have declined by more than $100 million to $15,623 million since the end of April. During the month of June alone, the fall was of the order of $70 million, the largest monthly outflow of gold for almost a year. The total gold loss over the whole of 1963 was $450 million.

The American Institute of Physics feels that, despite the much-publicised 'drain' in the U.S. of British scientific talent, the Americans may still be faced with a severe shortage of scientists by the end of 1970. It is stated that, by 1970, the number of jobs for qualified scientists will be no more than 38,000 as against the estimated 59,300 jobs available.

The Brazilian Coffee Institute has just announced two steps to stabilise domestic and international prices of Brazilian coffee. They are the advancing of purchase from 1964-65 crop by two months and an increase in the purchase price of the previous season s coffee. The Institute has also announced the release from its stocks of 300,000 bags monthly for sale in world markets at 42 U.S. cents per pound.

The automobile factories in Britain produced as many as 1,035,891 cars during the first half of the current calendar year, that is 237,792 more than the corresponding period last year. The total output of cars during the whole of 1963 was 1.6 million. Of the 1,035,891 cars produced, 366,195 were exported, as against the 309,150 cars exported in the preceding half-year and 306,677 in the corresponding period of 1963.

Fire insurance premium rates on commercial and industrial premises in Britain are to go up by an average of 10 to 15 per cent from 1st March 1965, in accordance with the decision taken by the Fire Offices' Committee, which represents tariff companies handling the biggest share of fire insurance business. Household policies, however, will not be affected. Lloyd's underwriters and non-tariff companies are expected to follow suit. The new premium rates replace the temporary flat 15 per cent surcharge imposed last year on commercial and industrial property unprotected by approved sprinkler systems. The fire damage in the U.K. is estimated at £66 million last year and £38.5 million in the first half of 1964. The latter figure represents a rise of 10 per cent as compared with the corresponding period of 1963.

West Germany intends to launch three research satellites by 1969. The Federal budget for 1965 already includes DM4 million as a first allocation for this project. Total cost of the satellites is estimated at DM53.5 million. These satellites are but part of the West German space programme. The Federal Research Ministry has budgeted DM13 million for planning and constructing experimental ground stations. Plans include the building of space-stimulating installations, test-stands for rockets, propulsion units and combustion chambers, the planning and constructing of flight-stimulating equipment, reliability-test stations and location-finding and observation points for satellites. The entire space-research programme will cost an estimated DM74 million.

PERSONAL

MR. J. W. Anson, a Managing Director of Messrs. Mackinnon Mackenzie and Company Private Ltd., has been appointed Chairman of the Company with effect from the 1st of this month, on the retirement of Mr. M. R. Das.

Mr. M. C. Chagla, Union Education Minister, returned this week after visiting the Soviet Union.

Mr. Raghunath Singh, M.P., has been appointed Chairman of the National Shipping Board, *vice* Mr. C. H. Bhabha who resigned recently.

Mr. Nittoor Sreenivasa Rau, Central Vigilance Commissioner, will be in the city from the 8th to 11th inst.

Mr. Viren J. Shah. Chief Executive Mukand Iron and Steel Works Ltd., has been elected the Vice-Chairman of the Company.

Dr. D. N. Wadia has been appointed a part time member of the Oil and Natural Gas Commission for a period of one year with effect from 29th July 1964.

Mr. A. N. Jha, the erstwhile Secretary in the Department of Defence Production, assumed charge as the Secretary to the Union Ministry of Information and Broadcasting on the 3rd inst.

Dr. Gustavo Zakrzewski of Argentina has been appointed Director of the UNESCO's Regional Office for Education in Asia. He succeeds Dr. A. F. M. K. Rahman who died last December.

Mr. Nakul Sen, till recently Chairman and Managing Director of Indian Drugs and Pharmaceuticals Ltd., has taken over charge as Secretary in the Union Ministry of Petroleum and Chemicals.

Mr. R. K. Birla, Chairman of the Indian Woollen Mills' Federation, left on Monday this week for Iran on a week's tour with a view to studying the scope for exporting woollen goods to that country.

Mr. V. Shankar, I.C.S., Secretary to the Union Food and Agriculture Ministry, has returned to New Delhi from Washington where he had gone to negotiate the extension of the period for import of the balance P.L. 480 wheat supplies.

Mr. Humayun Kabir, Union Minister for Petroleum and Chemicals, left New Delhi this week on a four-week tour of Rome, Bucharest, Paris and London in order to explore the possibilities of foreign collaboration in the development of petroleum and petro-chemical industries.

INDIAN GUARANTEE AND GENERAL INSURANCE CO., LTD.

OVERALL CLAIMS COST INCREASES

CHAIRMAN, MR. B. K. KAUL'S SPEECH

PRESIDING over the Forty-second Annual General Meeting of the Indian Guarantee and General Insurance Company Ltd., held at Bombay on Tuesday, 28th July 1964, the Chairman of the Company, Mr. B. K. Kaul, I.C.S., told the shareholders that, though the Company had escaped the effects of deteriorating fire insurance throughout the world, the overall claims cost on this account had increased from 41.1 per cent in 1962 to 45.3 per cent in 1963. He attributed this increase to several factors, particularly increase in all-India fire claims experience, adverse experience in foreign acceptances, rise in motor claims, and the fact that the year 1963 was the first full year in which the impact of statutory cessions received by the Company under the Insurance Amendment Act, 1961 was reflected.

Following is the full text of Mr. Kaul's speech:

GENTLEMEN,

We are meeting under the gloom cast by the passing away of Shri Jawaharlal Nehru, Prime Minister of India since independence. His death has plunged the nation in deep grief. An illustrious fighter for freedom, an outstanding statesman, a world leader, he will always hold a prominent place in the hearts of his countrymen as the architect of a modern India. It is he who gave India a strong and stable Government for seventeen years and strove with all his might to banish poverty from amongst India's millions. The greatness of Jawaharlal Nehru needs no further elaboration and the best tribute we can pay to our departed leader is to work hard and do our duty, as he would have wished us to do.

The report, accounts and balance sheet for the year ended 31st December, 1963 are already in your hands and, with your approval, I propose to take them as read. Before we proceed to consider adoption thereof, I would like to say a few words on some of the points which have a bearing on the working of your Company.

Statutory Cessions

Your Company was reconstituted from 1st January, 1960 as a company transacting reinsurance business only. In April 1961 your Company was approved by the Government of India as an "approved Indian reinsurer" under the provisions of the Insurance Amendment Act 1961, and receives statutory cessions under the provisions of that Act from all general insurance business transacted in India by insurers, both Indian and non-Indian.

In addition to receiving statutory cessions, the Company operates as a reinsurer not only in the Indian market but on an international basis. However, since it started operations in 1960, the results of fire business all throughout the world have been deteriorating steadily. For instance, in the U.K. the claim cost in 1963 amounted to almost £67,000,000 which is 20 per cent higher than 1962 which was the worst year up to then. The highest claims cost recorded till as late as 1958 in the U.K. was only £28,000,000. On the Continent, as well as in Canada and United States of America, the claims cost is also continuously rising.

Reinsurance Business

As we transact reinsurance business only, it is inevitable that we have to bear our share of the adverse claims experience all over the world, but fortunately for a large part of our operations we have escaped this disastrous experience on account of different methods of dealing with our reinsurances and surpluses.

Turning now to the results of the year's working, the Company wrote a total gross premium of Rs. 8,46,46,469 (£6,348,485) as compared to Rs. 6,97,63,358 (£5,232,252) in 1962 and after fulfilling statutory obligations and making other retrocessions, a net premium of Rs. 3,28,63,678 (£2,464,776) as compared to Rs. 2,65,02,946 (£1,987,721) in 1962. The net premium income in 1963 shows a 24 per cent increase over 1962. The net premium income in the fire department increased by Rs. 19,81,347 (£148,601), in the marine department Rs. 21,28,395 (£159,630), and in the miscellaneous insurance department by Rs. 22,50,990 (£168,824).

Claims cost increased to 45.3 per cent from 41.1 per cent in 1962. Commission cost showed a slight increase to 31.9 per cent from 31.8 per cent and expenses of management remained stable at 1.2 per cent. The increase in the overall claims cost is due to several factors, mainly increase in all-India fire claims experience, adverse experience on our foreign acceptances, increase in motor claims, and the fact that the year 1963 was the first full year in which the impact of claims of statutory cessions is reflected. In the fire department, claims cost increased from 29.8 per cent in 1962 to 31.4 per cent which, considering the experience of fire business world-wide, must be considered as very satisfactory, in the marine department the claims cost decreased to 60.1 per cent from 62.4 per cent in 1962 and in the miscellaneous insurance department the claims cost increased from 39.0 per cent in 1962 to 48.4 per cent, giving an overall claims cost of 45.3 per cent, against 41.1 per cent in 1962.

Whilst continuing to maintain reserves in the fire and miscellaneous insurance departments at 50 per cent, I am happy to report that in the marine department we have increased the reserves from 65 per cent to 100 per cent of the net premium income in 1963.

Investments

Our investments as at 31st December, 1963 aggregate to Rs. 2,85,26,453 (£2,139,484) and the depreciation thereon was Rs. 3,61,862 (£27,140). This is adequately covered by the investment reserve. Considering the volume of investments and that the major portion of our investments were made during the second half of 1961 and 1962 when prices were comparatively higher as compared to the prices ruling on 31st December 1963 the depreciation is nominal.

As a result of the year's working, the departmental reserves have increased by Rs. 64,47,114 (£483,534) to Rs. 2,06,42,538 (£1,548,190) in 1963 as compared to Rs. 1,41,95,424 (£1,064,657) in 1962. The funds of the Company stand at Rs. 3,25,31,831 (£2,439,887) in 1963 compared to Rs. 2,47,57,550 (£1,856,816) in 1962 showing an increase of Rs. 77,74,281 (£583,071).

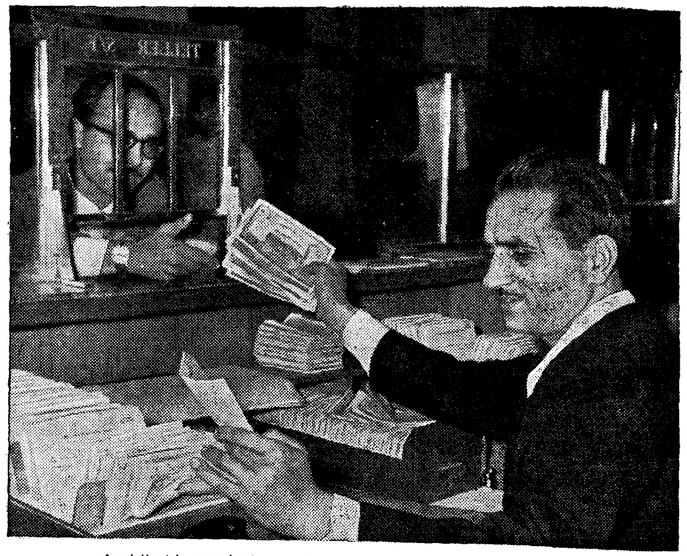
Profits

The gross profit of the Company before making provision for taxation amounted to Rs. 19,45,167 (£145,888) as against Rs. 28,48,755 (£213,657) for the year 1962. The fall in the profit is mainly due to increasing the reserves in the marine department from 65 per cent to 100 per cent of the net premium income besides the adverse experience in the fire and miscellaneous insurance departments. The general reserve has been further augmented by an appropriation of Rs. 3,90,000 (£29,250) and now stands at Rs. 6,50,000 (£48,750).

Your Directors have recommended a dividend at the rate of 6 per cent (subject to deduction of tax at prescribed rates) on the paid-up value of the shares which will absorb a sum of Rs. 6,06,000 (£45,450).

In conclusion I take this opportunity to express my thanks to our business connections both in India and abroad from whom we have received excellent support and co-operation. I would also like to thank the management and the staff of the Company for their loyalty and good work.

Cashed in a Minute!



And that is precisely what we mean. It takes no longer than a minute to cash your cheque at any PNB office with the Teller System.

The streamlined Teller System elliminates tokens, queues, all tedious and unnecessary waiting and delay

PNB was the first bank to have introduced the Teller System as far back as 1954. Today, PNB has 90 branches operating this system and plans to introduce this on-the-spot service in 60 more branches throughout the country.

TREND OF MARKETS

CALL RATE JUMPS UP

(*From Our Own Correspondent*)

BOMBAY, *5th August*

The short-term money market continued to rule distinctly easy till the close of business on Saturday the 1st inst., but developed a stringency on Monday which persisted yesterday and today too. Although the supply of funds was quite plentiful, borrowers found it difficult to obtain it, in view of disorganisation of banking services in the city caused by unrest among clerical and subordinate staff. Consequently, the inter-bank call rate moved up. Fresh money fetched 3 per cent today and renewals 2½ per cent, whereas both were standing at ½ per cent a week before. Calcutta also reported tight money conditions, the call rate there rising again from 4 per cent to 4¾ per cent, with stray transactions put through at 5 per cent.

Despite the emergence of sudden stringency in the money market, the response to the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 4th inst., was quite encouraging. As against the Rs. 2 crores invited, the amount offered was Rs. 4.25 crores; the sum accepted was, of course, only Rs. 2 crores. The average rate of accepted tenders was a shade lower at Rs. 2.393 per cent, as against Rs. 2.399 per cent a week before. The response to Intermediate Treasury Bills, however, was somewhat limited. The Bills actually sold from 29th July to 1st August aggregated Rs. 5.28 crores, as against Rs. 19.06 crores a week before.

There was a rise of Rs. 1.16 crore to Rs. 93.99 crores in India's foreign exchange reserves during the week ended 31st July 1964. The rise was entirely in balances held abroad which went up from Rs. 7.37 crores to Rs. 8.53 crores. The foreign securities held in the Issue Department of the Reserve Bank were unchanged at Rs. 85.46 crores. Loans and advances to scheduled banks increased by Rs. 3.20 crores to Rs. 3.66 crores. Their deposits with the Reserve Bank also increased by Rs. 4.58 crores to Rs. 100.55 crores. Notes in circulation receded by a further Rs. 24.35 crores to Rs. 2,419.41 crores.

The total credit made available by scheduled banks to their clients declined by a further Rs. 8.70 crores to Rs. 1,733.10 crores during the week ended 24th July. At the same time, there was a fresh deposit accretion of Rs. 17.88 crores. Borrowings from the Reserve Bank, as a result, were negligible, being less than Rs. 12 lakhs. Investments increased by Rs. 58.42 crores to Rs. 737.44 crores, while total cash receded by Rs. 6.72 crores to Rs. 156.88 crores.

The notable development of the week in so far as the Gilt-edged market is concerned was the announcement, by thirteen State Governments, of the issue of their new loans for amounts aggregating Rs. 100 crores. All the thirteen loans bear a uniform rate of interest at 4¾ per cent and are redeemable at par after twelve years. The amount (in crores of rupees) of loans and issue price (in rupees), respectively, are given below:

Andhra Pradesh 11: 99.50; Assam 3: 99.50; Bihar 4: 99.50; Gujarat 7: 100.00; Kerala 4: 99.50; Madhya Pradesh 5: 99.50; Madras 14: 99.75; Maharashtra 15: 100.00; Mysore 7: 99.50; Orissa 8: 99.50; Rajasthan 5: 99.50; Uttar Pradesh 10: 99.75 and West Bengal 7: 99.75.

All loans except the Kerala loan will open for subscription on Monday the 24th inst. and close on Saturday the 29th inst. or earlier without notice as soon as subscriptions approximate to the amount of each issue. The Kerala Government's loan will open for subscription on Tuesday the 25th inst. and close on Monday the 31st inst. or earlier without notice as soon as subscriptions approximate to the notified amount. All the State Governments reserve their right to retain subscriptions up to ten per cent in excess of the notified amount. Interest will be paid half-yearly. It will be liable to tax under the Income-tax Act, 1961.

Securities of 4 per cent Bombay State Development Loan, 1964 and 4 per cent Saurashtra State (Local Bodies Development) Loan, 1964 will be accepted *at par* for conversion into the new loan of the Government of Maharashtra. Securities of 3 per cent Madhya Pradesh Loan 1964, Madras Government 4 per cent Loan 1964, 4 per cent Uttar Pradesh Loan 1964 and 4 per cent West Bengal Loan 1964 will also be accepted *at par* for conversion into the new loans of the respective State Governments. Interest on the securities of Bombay State Development Loan, Madras Government Loan, Uttar Pradesh Loan and Bengal Loan tendered for conversion will be paid at the rate of 4 per cent per annum upto 31st July 1964 inclusive and at 4¾ per cent per annum for the period 1st to 23rd August 1964 inclusive. Interest on the securities of Saurashtra Loan and Madhya Pradesh Loan tendered for conversion will be paid at the rate of 4 per cent and 3 per cent upto and inclusive of 23rd August 1964 and 31st August 1964, respectively.

Applicants tendering applications at the offices of the Reserve Bank of India at Bangalore, Bombay (Fort and Byculla), Calcutta, Madras, Nagpur and New Delhi will, in the event of oversubscription to the loan applied for, be given the option of transferring their cash refunds to any of the other State Government loans which may still be open for subscription.

The undertone of the Gilt-edged market this week was steady. 3½ per cent 1968 rose by 15 nP to Rs. 99 and 3½ per cent 1966 Bonds by 10 nP to Rs. 100.10. 3¼ per cent 1969 gained 5 nP to Rs. 98.10. The 6½ per cent 1977 Gold Bonds were fully maintained at Rs. 118.10 at which rate the redemption yield works out to 4.65 per cent. State loans were dull.

In the foreign exchange market, the banks' selling and buying rates for U.S. dollars were unaltered at Rs. 480.00 and Rs. 476.50 per $100, respectively. In New York, the pound sterling eased a little *vis-a-vis* the dollar, the spot rate declining by 0.020 cent to 278.850-278.880 cents and the three months' forward by 0.010 cent to 278.380-278.410 cents.

SILVER FORGES AHEAD

(*From Our Own Correspondent*)

BOMBAY, *5th August*

Both silver and gold staged an impressive rally during the week under review. Silver met with sustained buying support from refiners and upcountry dealers. Arrivals of silver were no doubt quite large, but they failed to have any effect. Gold advanced further on reports of scarcity of supplies due to poor arrivals.

Silver began the week at Rs. 252.50, same as last week, and forged ahead to touch a high of Rs. 261 today. The closing was a shade lower at Rs. 260.50. It was reported that one refiner had cornered 150 bars of raw silver. The daily average arrivals of the metal were higher at 30 bars and the offtake was around 12 bars.

Fourteen-carat gold spurted from Rs. 71 to Rs. 72.25. Primary gold, in unofficial trading, picked up Rs. 3 to Rs. 127 on reports of seizure of contraband gold. Sovereign gained 50 P to Rs. 93.

The international price for gold at the London market went up from $35.07¾ to $35.08¾ owing to good demand for the metal before closing lower at $35.08¾. The sterling price increased by 1d. to 251s. 7d. Both ready and forward silver were unchanged at 112d. and 112¼d., respectively, as also silver in New York at 129.3 cents.

The following table shows the trend of prices during the week under review:

	5-8-64 (closing)	High	Low	29-7-1964 (closing)
SILVER				
Ready (999 fine) ..	Rs. 260.50	Rs. 261.00	Rs. 252.50	Rs. 252.50
GOLD				
Ready (14-carat) ..	72.25	72.25	71.00	71.00
Sovereign ..	93.00*	—	—	92.50*
London—				
Gold ..	251s. 7d.	251s.7½d.	251s.6d.	251s.6¾d.
Silver Ready ..	112d.	—	—	112d.
Silver Forward ..	112¼d.	—	—	112¼d.
New York—				
Silver ..	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

COTTON FUTURES ERRATIC

(*From Our Own Correspondent*)

BOMBAY, *5th August*

Cotton futures during the week under review were characterised by erratic movements. The recovery noticed towards the close of last week was short-lived and the first day itself saw a decline in prices due to the impact of margins imposed by the Forward Markets Commission in order to check unhealthy speculative activity. The range of fluctuations was restricted due to a struggle between bears and bulls. The sagging tendency noticed in the earlier sessions of the week was reversed by hectic short covering during the later sessions, so much so that the futures developed a bullish tendency yesterday. But in their efforts to book profits at the high levels, liquidation by bulls brought the futures down. At the time of writing, however, the prices were rather steady.

The imposition of fresh curbs by the Forward Markets Commission on the maturing Jarilla August contract and the opening of the March 1965 contract were the main highlights of the week. On the first day of the week, namely, 30th July 1964, the Commission imposed a special margin of Rs. 75 per bale on longs whenever the price of August 1964 contract ruled above Rs. 750 and a special margin of Rs. 75 per bale on shorts whenever the prices went below Rs. 725. The Commission stated in its *Communique*, issued on Thursday (30th July), that it had been watching with concern the unduly large open position amounting to about 3,00,000 bales in the August contract. The East India Cotton Association was further directed by the Commission to ask every member to furnish to the Association daily statements showing daily purchases and sales and the long and short position held on his account and on account of every client separately in respect of the maturing August contract.

The Jarilla August contract began the week at Rs. 745, that is, Re. 1.25 lower than the closing rate of the previous week and after retreating to Rs. 737 during the afternoon session of the opening day itself managed to recover to Rs. 746. Thereafter, the trend was irregularly upward and a peak of Rs. 751.50 was touched on Tuesday (4th August). It then fell to close at Rs. 745.75 today, thus showing a net loss of 50 P over the week.

The quantity tendered against the August contract on the first day of delivery, namely, Saturday (1st August) aggregated 6,750 bales consisting mainly of Laxmi "A" and "B" varieties (4,600 bales), other varieties being in small quantities. It may be interesting to note in retrospect that so far in its career the August 1964 contract has moved within quite narrow limits as compared with the previous Jarilla contracts, as will be seen from the following table:

Contract (Jarilla)	(Pre-tender period) Rate (in rupees) High	Low	Range (in rupees)
August 1963 ..	748.0	687.50	60.50
March 1963 ..	784.0	686.50	97.50
May 1964 ..	770.25	718.0	52.50
August 1964 ..	751.50	715.25	36.25

The range within which the currently maturing contract has fluctuated is only Rs. 36.25, which is much less than the average range of fluctuations, namely, Rs. 70.17. If this suggests anything, it is that the quantum of speculations in the said contract has been much less than in its predecessors.

The Forward Markets Commission permitted trading in the 1964-65 season's Indian cotton by allowing dealings in the Jarilla March (1965) contract since Thursday (30th July) subject to following stipulations:

(1) trading shall be subject to a maximum price of Rs. 775 per three quintals upto the commencement of the delivery period, that is, 28th February 1965, and

(2) during the delivery period, that is, March 1965, whenever the prices of the contract rule above Rs. 775 per three quintals, a special margin of Rs. 150 per bale will be payable on the gross long position held by a member on his own account or on account of each of his clients. A free limit of 1,000 bales has, however, been allowed to small operators.

The Jarilla March 1965 contract started its career on 30th July with a backwardation charge of Rs. 15 at Rs. 727 per candy and in the course of first three days' trading, it moved upto Rs. 728.25, though at one time it was taken down to Rs. 724.50. During the subsequent sessions of the week, however, it remained steady at Rs. 727. As the trade attention is concentrated on the maturing August contract, little interest has been evinced in the March contract. The contract closed at Rs. 727, gaining a net of 2 points over the week.

In the Sewri spot market, moderate activity prevailed during the week. The interest by mills was as usual confined to varieties like L147, Co2, Digvijay, Laxmi, 197-3 and Surat. The following are the latest available rates for some popular varieties:

Aurangabad Rs. 905; Malegaon Co2 Rs. 1,300; Jhagadia Rs. 1,185; Amravati Rs. 1,150; Jagraon Rs. 755; Manavdar Hybrid Rs. 1,650; Bijapur Laxmi Rs. 990 spot.

Export registrations of Bengal Deshi have been steadily going up. Though no broadening of foreign interest was visible, prices of new crop of Bengal Deshi continued to rule firm. In the import section, no fresh business in any particular foreign growth was reported. With the excitement over the Egyptian cotton having subsided mill interest is expected to be switched over to Sudan, Pima and East African varieties.

YARNS EASIER

(*From Our Own Correspondent*)

BOMBAY, *5th August*

Easy conditions prevailed in the yarn market during the week under review. Staple fibre yarns drifted downward owing to lack of follow-up support and increased supply from spinners. In sympathy with staple fibre yarns and due to poor demand from local as well as upcountry centres, art silk yarns drifted downward again. Improvement in supplies and a further decline in premium on import licences also imparted easiness. It was stated that those who could not dispose of their licences at attractive rates of premium had themselves imported yarns against these licences. In view of such heavy imports the yarn was said to be available at 140 per cent, that is, at a flat discount of about 20 per cent on the licence premium. Cotton yarns continued to rule dull in the absence of any encouraging development.

Hedge trading in staple fibre yarn is expected to commence by about the 15th of next month. The Yarn Merchants Association and Exchange Ltd., which has obtained the necessary official permission, has just completed the necessary modifications in bye-laws and is seeking proper instruction from the Forward Markets Commission. All the yarn dealers have been informed about the resumption of forward trading in staple fibre yarn.

It is reliably learned that the sale of cotton yarn on sized beam by the composite textile mills will not be allowed to exceed the average deliveries effected in the past three years, namely, 1961, 1962 and 1963. The mills are tending to produce yarn on sized beams, as the prices for these are not regulated, whereas the cone prices are regulated.

Rayon piece goods exports from India suffered a setback during the month of July, the total value of shipments being Rs. 36 lakhs, as against Rs. 56 lakhs in the previous month. The decline is attributed to seasonal slackness in demand.

Among art silk yarns, National Rayon 150D receded by 11 P to Rs. 11.07. 120D shed 4 P to Rs. 11.88. South India Viscose 120D declined by 16 P to Rs. 13.46. Bright Century 75D, however, put on 13 P to Rs. 18.41 on special support.

Staple fibre yarn (2 x 34 French Count) City dropped 11 P to Rs. 9.68. Sitalaxmi slumped by 22 P to Rs. 9.72. Madhav was lower by 5 P to Rs. 9.73.

In the cotton yarn section, 62s Pioneer put on a rupee to Rs. 63. 68s City, however, lost Rs. 2 to Rs. 80. 34s Madura was neglected at Rs. 36.

OILSEEDS DULL

(*From Our Own Correspondent*)

BOMBAY, *5th August*

With the forward section virtually dead, the oilseeds market put on a dull appearance during the week under review. Traders were awaiting the official reaction to the plea of the Bombay Oilseeds Exchange to commence trading in new crop groundnut oil and seeds. The main argument of the Exchange is that the futures market is in no way responsible for the rise in prices and that the reason for the spurt in prices lay elsewhere. The Exchange has also pleaded for the present ceilings to be suitably raised in order that the market may remain active

unlike at present. A memorandum is under preparation. Meanwhile, it is reliably understood that the Forward Markets Commission has permitted trading in new crop cottonseeds January with the ceiling raised from the present level of Rs. 113 to Rs. 118. Both these rates are inclusive of penalties. The new contract will carry a penalty of Rs. 2.50, as against Rs. 2 applicable to the running contract. The weekly limit will continue to be Rs. 3.50 for a rise. The Exchange is to fix up an auspicious hour and trading may start in a day or two.

Although cottonseed has been able to get through and that with a higher ceiling, knowledgeable sources in the market are rather sceptical about the grant of permission for trading in other sections. New Delhi is said to be just not in a mood to take up this question for the time being. At any rate, the question of castor may not come up for consideration before November, but the decision will depend upon the state of the harvest at that time. For linseed, November seems to be the earliest time for consideration, as this is the time of the year when the prospects of the mustard harvest will become available. It is, however, difficult to forecast with any measure of certainty the mind of the Government—any Government for that matter.

Castor September went untraded during most of the week and so were cottonseeds, but, in unofficial dealings, castor was quoted at Rs. 184.25. Spot castor remained firm, with Madras Small at Rs. 40 and Kanpur at Rs. 39. Groundnuts Madras Quality was shaded but well held at Rs. 65.50, Kanpur Bold at Rs. 64.75 and Sangli at Rs. 63. But prices are not the point in groundnuts. The question is whether the Gujarat Government is going to relax its ban or intends to keep it. The oilseeds trade here is worried that the goods booked by rail before the ban was enforced are being held back, even though the rail receipts have already been despatched. Similar complaints are understood to have been made by the trade in some other States too, but the fate of these goods is still hanging in the balance. Meanwhile, private estimates indicate that about four million tins of groundnut oil have accumulated in Saurashtra, in addition to 150,000 tons of seeds. The retail selling price of oil has been fixed at Re. 1.95 a kg., while, for wholesale deals, the price is Rs. 30.25 per tin, inclusive of sales tax. But it is said that oil is currently available there at Rs. 28.50. As compared with the rate prevailing before the ban, the market price is down by about Rs. 12.50 a tin. The position elsewhere is just the opposite. Groundnut oil in Bombay is quoted at Rs. 2,530 per tonne, while, in Delhi, the rate is said to be as high as Rs. 2,750. If the situation goes unrectified, it is feared, many *vanaspati* plants will have to face starvation for want of raw material.

It is said that oilseeds interests, as well as the States which are directly affected by the ban, have taken up the matter with the Gujarat Government, but knowledgeable sources think that the latter may not budge until October or November when the new crop begins to move. A reaction in groundnut oil prices outside Gujarat is ruled out for the time being at any rate, particularly because of reports that the West Bengal Government has raised the selling price of mustard oil to Rs. 4,000 a tonne, as against the earlier price of Rs. 3,225. With the price of mustard oil further up, it is beyond one's imagination how groundnut oil can become cheaper than now. Added to this confusion comes the report that Mysore is contemplating a ban on exports of oil from the State.

There is, however, one silver-lining. Rains this time have been timely and plentiful, and there has been a rise in the acreage under groundnuts. This means that we should be having a larger harvest, but, even then, the chances of a sizable reaction in prices is considered unlikely. An estimated larger consumption may offset greatly the benefit of a larger harvest.

Groundnut extractions have been almost inactive. The ban on the movement of solvent oil from out of Gujarat has much to do with this inactivity. The price of solvent oil in Saurashtra is said to have declined from Rs. 2,600 to Rs. 1,700 a ton during the last fortnight. Further, supplies of expeller cakes have become rather difficult and it is likely that this difficulty will continue for some time, at least until the new crop comes into the market. Offerings of extractions are, therefore, poor, but so is the demand. European countries which account for over 60 per cent of the outgo from here are said to have used up their quotas and, as such, they are not likely to be in the market for quite some time. Based on India's capacity to manufacture about 140,000 tonnes of extractions a month from November onwards, the price trend is likely to be bearish, but the market may take a different turn, if the situation in the Gulf of Tonkin happens to worsen. Then the United States will conserve its supplies of oil, particularly soyabean oil, for defence needs rather than sell it in international markets. Advices from the United Kingdom are currently quiet, with £37-10 quoted for August-September, £36-10 for October-December, £36 for November-January and £35-2-6 for January-February-December.

Linseed September moved in a narrow range during the week, but prices were just below the ceilings. Operators were apparently looking forward to the new crop contract to start and see whether it gives them any chance to trade in. In the spot section, linseed bold was mentioned at the close at Rs. 47.50 and oil at Rs. 20.35, both a shade easy.

The following table shows the closing prices of oilseeds and oils as on 5th August as compared with those of the two previous weeks:

	5-8-1964	29-7-1964	22-7-1964
Groundnuts	Rs.	Rs.	Rs.
Nizam bold	64.50	65.00	64.50
Khandesh quality	65.25	65.75	65.50
Oil ex-mill	25.80	26.25	26.00
Oil Rly. Receipt	25.30	25.80	25.70
Castorseed			
September 1964 contract.. ..	181.50	181.50	181.50
Ready Madras	40.25	40.12	39.00
Ready Kanpur	39.25	39.00	37.75
Oil B.S.S.	18.10	18.60	17.80
Oil commercial	17.45	17.80	17.00
Linseed			
September 1964 contract.. ..	44.78	44.81	44.75
Bold ready	47.50	49.25	47.50
Linseed oil	20.35	21.30	19.90
Cottonseed			
September 1964 contract.. ..	104.00	104.00	104.00

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

KIPS QUIET

(From Our Own Correspondent)

MADRAS, *3rd August*

Arrivals of tanned goods from the tanneries were normal and clearance was moderate. Prices ruled steady. Demand for exports was meagre due to the prevailing August holidays. A few sales were, however, reported in cowhides light weights and mediums lower grade, for exports. There were a few inquiries for light cow calf which was in short supply. Trading in the kip section on the whole was lethargic.

As regards tanned skins, the tempo of the market was also halting. There was patchy demand for 5/6 lbs. and 8/9 lbs. goat skins lower selections while other weights were neglected. It is hoped that a fall in the price levels after the August holidays, to the extent of 5 to 10 per cent would stimulate active trading with the Continent and the U.S.A. Prices of sheep skins ruled quiet, due to poor response to the offers made, by the E.I. Tanners. Raw market remained weak.

The following were the nominal prices per lb. for all-round lots:

Tanned cowhides 8/8½ lbs. average Rs. 2.00 to Rs. 2.06, tanned buffhides 12/14 lbs. average Re. 1.80 to Re. 1.86, tanned buffcalf 1½/2 lbs. average Rs. 2.50 to Rs 2.62.

TIPPY TEAS DEARER

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, *30th July*

A smaller quantity amounting to 600,000 kgs. was offered in tea sale No. 30 held here on the 28th inst. Quality was generally often improved, particularly of teas from the Nilgiris. There was good demand for most descriptions at irregular but often dearer rates, although the plainest types often shaded in price. Highgrowns came to an irregularly dearer market with buyers closely following quality, but the plainer sorts in this category were again barely steady and a similar trend was in evidence in respect of good medium teas. Useful liquoring medium brokens were keenly competed for at slightly higher rates, but the plainer kinds were only about steady; similar fannings elicited good enquiry around last rates. Clean bright low medium brokens also followed an upward tendency, but others generally shaded in price, while fannings were fully firm. Plainest descriptions evoked quite good support, but at lower rates, while black leaf sorts were well supported around last levels. Whole leaf grades, particularly orange pekoes, often eased quite considerably, whereas the useful selection of tippy teas on offer tended dearer. Legg-cut teas came to a lower market. C.T.C., however, were sold well at around last rates except for the plainer sorts.

The quotations (per kg.) were:—

	1964	1963
	Rs.	Rs.
Low mediums	4.00-4.25	4.10-4.35
Mediums	4.20-4.50	4.35-4.60
Good mediums	4.55-5.20	4.65-5.30
Nilgiri B.O.P.	4.50-7.00	4.75-7.20

The average price realised in sale No. 30 was Rs. 4.33 per kilo, as against Rs. 4.36 a week ago and Rs. 4.43 in the corresponding sale last year.

A total of 261,000 kgs. was offered in dust sale No. 30 held today. The market met with fair general demand. Best highgrowns were firm to dearer, but others were generally easier. All mediums received irregular support and prices declined. Clean unorthodox descriptions were firm but fibrous types eased.

The average price realised in dust sale No. 30 was Rs. 4.28 per kilo, as compared with Rs. 4.33 a week ago and Rs. 4.06 in the corresponding sale last year.

Colombo: As much as 7 million lbs. were offered and evoked strong demand, with best liquoring teas irregularly dearer following quality. Useful mediums advanced 5 cents, while lowgrowns ruled fully firm to dearer.

London: *North Indian and other growths*: In Monday's auction, the better liquoring new season's Assams met with good demand, but prices for dooars were generally rather easier.

Ceylon and South Indians: Tuesday's sale encountered quieter demand and prices for all descriptions were generally lower following quality.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire:

"*Sale No.* 31: 576,000 kgs. offered. Good general demand. Low medium and medium brokens fully firm. Fannings barely steady. Good mediums fully firm. Highgrowns dearer with quality. Unorthodox dearer."

FOODGRAINS BUOYANT

(From Our Own Correspondent)

HAPUR, *3rd August*

Buoyant conditions were in evidence in the foodgrains market during the week under review. Wheat and gram reacted a little towards the week-end after touching new high levels earlier. Coarse grains and pulses continued to rule firm on brisk buying support against small arrivals.

Wheat firmed up to touch new high levels at Rs. 77.50 to Rs. 85 per quintal according to quality in the early part of the week on brisk demand in the face of poor supplies. It eased slightly later to Rs. 75 to Rs. 80. Fears of Government intervention and better arrivals influenced the trend. Daily arrivals of wheat averaged 800 to 1,000 maunds in the open market. Sales of imported wheat through fair price shops commenced again after some days' recess and this, too, had a quietening effect on prices. Amidst reports of damage to *kharif* crops in eastern districts and uncertainty of imported wheat supplies, the U.P. Government has taken the drastic step to authorise its district officials to reduce the existing rations of 2 kgs. of wheat per person per week to quantities commensurate with the stocks available.

Firm trend continued in the rice market during the week and prices hardened Rs. 2.50 to Rs. 5 per quintal according to quality on brisk buying enquiries from the consuming areas of east U.P. Stocks here declined to 2,000 quintals. Weekend prices were:—Rice *basmati* superior Rs. 99.13 to Rs. 103.77; *sela* Rs. 96.45 to Rs. 99.13; *mainpuri* Rs. 93.77; *ramajwayan* Rs. 95.11 to Rs. 96.45; *raimunia* Rs. 95.11 to Rs. 96.45; and *gadda* Rs. 92.45 to Rs. 93.77 per quintal.

Gram ruled quiet towards the week-end after being firm earlier as the demand was poor. Local produce was quoted at Rs. 70 and Punjab quality at Rs. 69 per quintal. The prices on the corresponding date last year were much lower at Rs. 42. Both arrivals and stocks were meagre. Barley and *bejhar* attracted good demand from east U.P. and prices improved by Rs. 5 per quintal for each but, towards week-end, prices eased slightly on poor buying. Barley was quoted at Rs. 62.50 to Rs. 63.50 and *bejhar* between Rs. 62.50 to Rs. 64 per quintal. *Juwar* and *guwar* improved on good demand for seed purposes in the face of paucity of stocks. Thanks to sunny weather in the last two days there were chances of early sowing of *kharif* crops of maize, *juwar* and *bajra*. *Methi* and maize prices stayed steady while oats touched new high level. Week-end prices were:—*Gnwar* Rs. 66.98 to Rs. 69.66, *methi* Rs. 57.50 to Rs. 61.50 and oats Rs. 67.50 to Rs. 70 per quintal.

Pulses continued to rule steadier during the week and prices in all sections registered further gains. Peas hardened by Rs. 2 to Rs. 3 per quintal according to quality on better buying enquiry from the consuming areas of Madras and West Bengal. Prices now quoted between Rs. 66.25 to Rs. 67.25 for *dara* quality and between Rs. 67.50 to Rs. 68.50 per quintal for farm quality. Peas *dal* also improved to Rs. 68.50 per quintal. Peas arrivals were small and local stocks declined to 2,300 quintals. *Arhar* advanced by Rs. 2.50 per quintal on good demand in the face of declining stocks position and prices ranged between Rs. 75 to Rs. 80 per quintal. *Urd* and *moong* were stationary at previous levels and were quoted at Rs. 67.50-Rs. 72.50 and Rs. 85.75-Rs. 101.81 per quintal, respectively. *Masoor* ruled firm and advanced by upto Rs. 5 per quintal due to meagre supply position. Other *dals* also ruled firm. Week-end prices here were:—*Arhar dal* Rs. 95 to Rs. 105, *urd dal* Rs. 91.09, *moong dal* Rs. 105, *masoor dal* Rs. 76.50 a quintal.

"GUR" ADVANCES AGAIN

(From Our Own Correspondent)

HAPUR, *3rd August*

Sugar in the open market was steady, as supplies were restricted. Crystal sugar was quoted at Rs. 175 to Rs. 180 per quintal, as against the controlled rates of Rs. 135 to Rs. 140. In the Muzaffarnagar market, sugar firmed up to Rs. 175-Rs. 180 per quintal in private trading, in view of continuing shortage. In the open market, the retail rate of sugar was Re. 1.87 to Rs. 2 per kilogram. Prices in the Kanpur market drifted lower on slack enquiries and week-end prices were Rs. 185-Rs. 190 per quintal. The U.P.-Bihar Joint Sugarcane Board has recommended to the Union Government to fix Rs. 2 per maund as the minimum price of sugarcane. The U.P. is expected to produce 1.4 million tonnes of sugar during the ensuing season, as against 1.1 million tonnes in 1963-64.

Trading in *khandsari* was very much restricted here, as only a part of the stocks frozen by the State Government had been released for sale. Prices in private trading, however, sought higher levels, due to fairly heavy demand. The U.P. Government has announced its new *gur* and *khandsari* policy and, the licensing of units manufacturing these commodities would be restricted. Prices, in the private trading, were Rs. 130-Rs. 160 per quintal. Following the removal of all controls on *gur* by the Union Government, its price flared up by Rs. 6 to Rs. 8 per 40 kilogram on brisk buying support from the consuming States of Gujarat, Rajasthan, M.P., Maharashtra and Punjab. The week's offtake aggregated twenty wagonloads. *Gur* stocks here were around 10,000 quintals and stocks in mofussil markets were estimated at 80,000 quintals. Cane crop prospects were bright all over in west U.P., thanks to the heavy rains in July. The week-end prices (in rupees per 40 kilogram) were:— *gur pansera* 39, *dara* 37.50, *balti* 38 and *shakker* 39 to 41.50.

Buoyant conditions were witnessed in the *gur* and *shakker* market at Muzaffarnagar during the past week, following the removal of ban on inter-State movement. Inquiries were brisk from the deficit areas and, as a result, the prices forged ahead to touch new high levels of the season. *Gur Chaku* dry spurted by Rs. 11 to be quoted at Rs. 44-Rs. 45 per 40 kilogram and wet quality ranged between Rs. 35 to Rs. 36.

TEA DUSTS DECLINE

(From Our Own Correspondent)

CALCUTTA, *4th August*

Tea dusts on offer during the internal sale held last week eased. Arrivals continued in large quantities and, so far, the floods in Assam rivers have not affected movements. Heavy shipments of tea were effected during the week to the United Kingdom. The fact that prices in auctions have not yet reached the same level at this time last year has caused concern. The possibility of a glut in supplies has made buyers to proceed slowly. Tea output in North East India up to the middle of July aggregated 171.85 million lbs., as compared with the 145.89 million lbs. produce in the corresponding period of 1963. Output in this month is expected to raise the percentage still further.

Dusts on offer during last week's internal sale aggregated 20,731 chests, which met with good and general demand. C.T.C. Assam eased by up to 30 nP, the smaller lines meeting with better support. Plain orthodox teas were firm at last levels, while Assam sorts eased. Legg-cut teas met with a good market at around last rates. The quotations per 1 kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.70 to Rs. 7.10; medium Assam C.T.C. dust Rs. 5.80 to Rs. 6.30; medium Assam dust Rs. 4.90 to Rs. 5.70; legg-cut dust Rs. 4.80 to Rs. 5.30; and plain orthodox dust Rs. 4.10 to Rs. 4.50.

HEDGE TRADING IN JUTE GOODS SUSPENDED

(From Our Own Correspondent)

CALCUTTA, *4th August*

With speculative fervour touching a high level, conditions in the jute markets turned excited during the week under review, and both raw jute and jute goods forged ahead. Concerned over the rising trend in the hedge market, the Committee of the East India Jute and Hessian Exchange suspended all operations since the week-end. Earlier, the Vigilance Committee of the Exchange had been asked to keep a watch over the situation and suggest measures to curb excessive speculation. Both the trade and the industry have expressed grave concern over this week's strident rise in the prices of ready goods. That overseas buyers have not followed these rises and placed orders at the high rates only deepens the concern of the industry. There is the genuine apprehension that, if prices failed to move down and steadily quote at reasonable levels, Calcutta goods would lose overseas markets, and substitutes and bulk handling methods would make fresh inroads and that the research now being undertaken in the United States in regard to finding substitutes receive a great impetus. At existing levels of prices, the profit on hessian has shrunk further, and heavy goods can be produced only at a loss. The conspicuous absence of genuine investor-enthusiasm on shares of jute mills demonstrates the apprehension that the profits of mills for the current accounting period would be so markedly lower as to reduce returns. Continued rise in prices of goods would mean a further impetus for the Pakistani goods in overseas markets.

Despite only normal buying by the U.S.A. during the week, buoyant conditions of Caclutta had an effect on the New York burlap market where the spot 40" 7½ oz. hessian gained from 8.75 cents a yard to 8.85 cents and the 10 oz. hessian from 11.55 cents to 11.70 cents. U.S. stockists of burlap possessed at the end of June consumer-requirements for about four months, and that is why U.S. buyers of Calcutta goods have not followed up the rises in Calcutta. In heavy goods, internal buyers restrained from entering into commitments at the rise, as they had not anticipated such an abrupt uptrend. The main cause of the gradually rising trend in prices of raw jute since the beginning of last month has been the poor nature of new crop arrivals. This week's arrivals were no more than 35,000 maunds a day. With mills operating at the maximum capacity, and the proportion of output of hessian and specialities like carpet backing cloth in relation to sacking and miscellaneous goods having increased, mills urgently need to buy selected grades. Mills began this season with lower stocks of fibre, which, including the holdings on account of the Jute Buffer Stock Association, aggregated 3.1 million bales, as against 3.3 million bales at the beginning of the last season. The poor arrivals so far this season have led to apprehensions that the crop may not be even equivalent to the level of the last crop, although the optimistic estimate by the Government of eight million bales has been only reaffirmed despite the uptrend and shortfall in arrivals so far in this season. The drought earlier has delayed harvesting, but the prevelence of good weather in the past six weeks has aided the standing crop. Although new arrivals have not begun in substantial quantities, both the trade and industry share the optimism of the Government in regard to the expectation that the crop would more than meet the requirements of mills and also leave an export surplus.

It is significant that the Jute Bulletin of the Indian Central Jute Committee has estimated that the area sown this year is almost the same as that last year. The quality of the fibre harvested so far has been uniformly good. The yield per acre is believed to have increased. If, therefore, a higher crop is not expected, it is because of some loss in lower Assam valley and north Bengal on account of floods and the loss on account of the month-long drought conditions in the predominantly tossa districts of West Bengal. The good rain in the last six weeks have brought water levels in tanks and canals sufficiently high to allow for good clean retting. The official optimism of a good crop is backed by the additional seasonal factor which allowed sufficient time for cultivators for proper inter-culture. The continued rise in prices of foodgrains and essential commodities since the beginning of this year have forced farmers to quote higher rates for raw jute. In West Bengal, there has already been a demand for official measures to prevent cultivators from sowing jute in traditionally paddy lands. For it is believed that West Bengal has increased jute acreage at the cost of paddy. Another factor for this week's buoyancy in fibre prices is the continued uptrend in Pakistani quotations despite the abolition of the minimum export price of raw jute and the reduction in export duty. The hardening tendency in Pakistani fibre market is attributed to the expectation of lower crop. It is feared that the crop there will not be larger than 5.8 million bales. Export demand is estimated at 4 million bales and Pakistani mills will require about 2.2 million bales. In other words, the carry-over to the next season will be practically nil. According to reports, Thailand, which exports a good portion of its fibre, is also expecting a much lower crop. Already some demand has been shifted from Thailand to Pakistan. All indications are that India will be able to export as much surplus fibre as she would have.

Prices for the new crop increased this week by about Rs. 2 a maund, current quotations being: daissee bottoms Rs. 37.00; Assam bottoms Rs. 35.50; and northern bottoms Rs. 35.00. These prices are now far above the I.J.M.A. minimum levels.

The buoyant conditions that prevailed in goods this week was due not to genuine interest but to keen speculative activities in the hedge market. That the high levels restrained fresh buying activity by shippers was a matter of concern. The rise in fibre prices widened further the loss in manufacture, despite the rise in prices of goods. Shippers hurried to cover against earlier orders lest their losses should increase, and mills had to accept orders for substantial quantities in

both hessian and heavy goods for several positions. As stated, this was on account of covering. The tendency on the part of overseas buyers to place direct orders on mills has become more marked than previously. Now that order books of Pakistani mills are full up to the end of October, overseas support of heavy goods in Calcutta is expected to improve perceptibly. This expectation is all the greater in view of the recent strike in Pakistani mills. On Tuesday last, the impact of the news of the end of the strike in Pakistani mills was greater than on Monday, and ready B. twills eased from Rs. 119.40 to Rs. 118.85. The easiness was aggravated by large-scale selling by some mill groups for forward deliveries. In sympathy, ready hessian 40″ 10 oz. eased to Rs. 45.00. However, on Wednesday last, sentiment was boosted by the buoyancy in fibre prices. The hedge market turned all-liveliness with bouts of speculative enthusiasm. In the spot market, scattered business took place with the U.S.A. and the U.K. B. twills gained from Rs. 120.45 and hessian 40″ 10 oz. to Rs. 45.55. These price levels were maintained on Thursday. On Friday, the U.K. exhibited some interest and business was done; interest on behalf of other countries was paltry, if not nothing. However, activities in the hedge market were so lively as to raise spot B. twills to Rs. 112.40 and hessian 40″ 10 oz. to Rs. 46.40. Over the week-end, the continued buoyancy in the hedge market caused anxiety and the authorities suspended all activities. By this time, ready B. twills had touched a high of Rs. 125.40 and hessian 40″ 10 oz. Rs. 47.50. Despite absence of activities in the hedge market, spot rates continued to advance during yesterday. Speculative buying aided the rise, and overseas buyers did not show any interest. Ready B. twills hardened to Rs. 126.25, and sale was reported in the January-March position at a high rate of Rs. 128. Similarly, business in January-March hessian 40″ 10 oz. was done at the high rate of Rs. 50.

METALS FIRM

(From Our Own Correspondent)

CALCUTTA, *4th August*

With a further rise in prices of utensil copper scrap and electrolytic zinc, firmer conditions were in evidence in the Calcutta metal market during the week under review. This was in tune with the continued buoyancy on the London Metal Exchange, where, during the week under review, both copper and zinc added more gains. The attempts of world producers of copper and zinc to arrest the free-market buoyancy by making direct sales to consumers at prices much lower than the L.M.E. quotations have not yielded results. The cause is that the principal non-ferrous metals have by and large come to stay as very scarce. Efforts have, of course, been made to step up world production, but, unless supplies increase more visibly, the continued buoyancy in world prices cannot be stopped. The principal zinc producing firm in the United Kingdom, the Imperial Smelting Corporation, recently decided to offer to its customers zinc against new sales and unpriced balances of existing contracts at a base price of £125 a ton. This is an attempt to stem the tide of substitution. Producing firms in Australia and Canada have also decided not to sell zinc to the British and European markets at more than £125 a ton.

Despite the price stabilisation moves by producers, spot zinc on the L.M.E. during the week under review rose from £139 to £145 a ton. And rightly, the L.M.E. Chairman stated recently that the price rise could be arrested only if producers were able to meet the extra demand, and that, failing this, consumers would have to look to the L.M.E. to meet their marginal requirements. The Chairman shared the grave concern of the industry at the uptrend, but declared that the L.M.E. should not be blamed for this, as the Exchange was a terminal market which truly reflected the marginal supply and demand conditions.

It is also significant that the uptrend in both lead and zinc continues unabated, despite the decision of the General Services Administration of the U.S.A. to release 75,000 tons of zinc and 50,000 tons of lead from strategic stocks on a shelf-item basis, meaning at pre-determined prices. Although prices are fixed and, therefore, are not to be co-related to prices ruling on dates of release, some conditions are attached to the sales. It is stated that the recognised domestic (U.S.A.) producers of primary slab zinc will be issued 67,500 tons of the 75,000 tons of zinc, on condition that they are re-sell the same within 90 days of issue on an equitable basis to independent allocators of zinc. Prices of issue for the different grades of zinc vary from 13.70 cents a lb. for brass special to 14.50 cents for special high grade. Release prices of lead vary from 12.75 cents a lb. for grades E or K common deliverised lead to 12.85 cents for grade B chemical lead. The distribution of 50,000 tons of lead will be as follows: 5,000 tons each to domestic consumers of primary refined lead and domestic producers of secondary refined lead, 13,500 tons to qualified representatives of foreign producers of primary refined lead and 26,000 tons to recognised domestic producers of primary refined lead. Needless to say, these releases are primarily meant to ease shortages within the United States and that explains the absence of the announcement's impact on the L.M.E. quotations. During the week, spot lead opened on the L.M.E. at £103¾ a ton and closed higher on balance at £105. In Calcutta, zinc and lead were firm at Rs. 343.00 and Rs. 293.00 per 100 kgs., respectively.

The rising trend was also a feature on the L.M.E. in respect of copper quotations. Spot copper wire-bars closed at £328, cathodes at £315 and fire-refined copper at £290 a ton, as against the week's opening rates of £311, £304 and £280, respectively. Rising demand in the face of depleted stocks and reports of loss of production on account of continued strike at El Teniente and Kennecott mines was among factors that pushed up prices. Utensil copper scrap was firm at Rs. 670 per 100 kgs. in Calcutta, despite lower up-country demand on account of the monsoon. Tin gained from Rs. 3.050 per 100 kgs., to Rs. 3.100. The London quotation for spot tin shot up from £1,220 a ton to £1,262½.

DELHI LETTER

(Concluded from page 216)

turn are tied to development of the petrochemical industry. The progress in agriculture cannot simply be projected in terms of input-output ratios, says Mr. Mehta; calculations based on pure equations of input and output are bound to go wrong in agriculture. (It may be noted in passing that there has been a comparative lack of sophistication among the economic and technical experts associated with the Planning Commission in terms of assessing the political and administrative climate.)

To consider one aspect of the efforts needed in agriculture. Major irrigation projects initiated in the first, second and third Plans will give a potential of 44 million acres when completed. At the end of the third Plan, according to Mr. Mehta, these projects may yield a potential of 20 million acres. The aim will be to complete as many of these projects as possible by the end of the fourth Plan. Simultaneously, minor irrigation projects which will yield quick results will have to be taken up. In Mr. Mehta's view, the medium irrigation projects may have to be treated as in the contingent sector, to be taken up if the economy, particularly agriculture, shows a big lift thanks to favourable natural factors. Also in the contingent sector will be the extension of some rural amenities.

Essentially linked to the efforts for capital formation to increase the resources will be the production of what Mr. Mehta calls *incentive goods*. As an example, he cites the pressure to produce toilet goods to beautify milady. (Even among the working class women, the demand for cosmetics is rising, along with the rise in purchasing power and the craving for the little things that make life more attractive—the pleasant smell of face powder and the uplift of the brassieres.) From a strictly rational point of view, it may be said that the inclusion of toilet goods in the Plans of a developing country may not look proper, but some degree of irrationality in meeting consumer demands is inevitable. In the villages, for example, the extension of electric power may be primarily intended to provide more water for irrigation, but it may at the same time lead to a spurt in demand for electric irons, the villager wishing not only to use soap to wash his clothes but also to wear well-creased shirts. In many hearts, the phrase *incentive goods* may echo the wish for the still clusive cheap people's car. But the people's car project is certainly not in Mr. Mehta's mind when he talks of *incentive goods*. To this correspondent Mr. Mehta's conception of *incentive goods* appeared to refer to consumer goods simpler than cars or similar emblems of status. (A sociologist remarks that the controversy over the 'haves' and 'have-nots' in Delhi often appears to be between those who have refrigerators and those who do not have!)

The provision of consumer goods for the farmers will be part of the incentive to produce more agricultural commodities and sell more of the production. While the detailed measures to produce the foodgrains surplus for the urban consumers are a matter to be decided by the executive ministries, Mr. Ashoka Mehta (who studied the problem as chairman of the Food Grains Inquiry Committee) does not subscribe to the view that there is much scope to push or squeeze the farmer. (Even the Stalinists found that pushing the farmer too hard led to a situation in which the peasants go on strike in so far as producing the surplus is concerned. It may be possible to squeeze the traders, but such a policy is unlikely to be very remunerative at present after three lean seasons on the food front. The Delhi Administration made an ass of itself through some raids on godowns last week.)

Mr. Mehta is firmly convinced that the planning process has to become more sophisticated. The annual review of the Plan would perhaps yield a "new five-year Plan" each time, if several sectors are considered flexible. No doubt, there will be some sectors in which certain minimal inflexible efforts will be prescribed and these cannot be tampered with year to year. Many of these will be in the industrial sector and in the infrastructural transport and power sectors.

While the planning for indigenous production of variety of machinery is being pushed through, some of the user Ministries are known to be contemptuous of indigenous efforts. As earlier reported in these columns, one such instance is the attitude of the Irrigation and Power Minister, Dr. K. L. Rao, whose assessment of the capacity of the emerging heavy electrical industry is pessimistic, particularly in terms of quality. This has come up as a celebrated inter-ministerial dispute. The structure of the heavy electrical industry is such that it can take up manufacturing programmes only on the basis of specific orders from the users. Dr. K. L. Rao, as a top technician, has to prescribe the demand as well as the standards. A simple refusal not to make use of home-produced goods because the standards are not yet up to the mark would be a sabotage of the machine-building effort. The margin of difference between the Irrigation and Power Ministry and the people in charge of heavy engineering needs to be reduced by intervention at higher levels. One possible solution being canvassed is the transfer of the heavy electrical industry to the charge of the Irrigation and Power Ministry which will then have the power to impose its standards and control production more effectively. Such a pattern of industrial development exists under the Railway Ministry which itself runs the factories producing locomotives and rolling stock. The stubborn attitude of the Power Ministry is perhaps because it desires such a change in the administration of factories in the public sector producing electrical goods.

Apart from the production of incentive goods to the dynamic elements in society—or those whose purchasing power is increasing—Mr. Ashoka Mehta advocates a determined effort in the field of family planning. Notwithstanding the recent public controversy in which another Planning Commission member, Dr. V. K. R. V. Rao, scoffed at family planning dreams, Mr. Mehta believes that the population increase can be controlled by intensifying the sterilisation campaign. Sterilising women is surgically a more complicated operation and financially a more expensive business than sterilisation of men. Apart from conscientious objections, the Japanese method of abortions is out of question, because facilities for abortion operations without damage to the health of the mother will be impossible in rural areas. The oral pill is too expensive; apart from the recurring cost, the contraceptive methods of population control are speculative. At present it is estimated that there is medical and organisational capacity to sterilise up to a million men a year. The population growth can be brought down to a half the present rate of 2.4 per cent, according to Mr. Mehta, if the sterilisation operations can be increased to a little over 2.5 million a year for the next two decades. Including doctors' fees, compensation for wages lost and other organisational expenses, it is estimated that an operation to sterilise a man will cost between Rs. 30 and Rs 35. An investment of about Rs. 100 crores in the Five-year Plan is what Mr. Ashoka Mehta considers necessary in the family planning field. Mr. Mehta advocates commission to agents who bring men into camp for sterilisation. The commission may be given to individual agents or to *panchayats* who recruit the candidates for sterilisation. The States think a large-scale sterilisation campaign needs this sort of agency commission salesmanship and canvassing, but the Central Health Ministry has a Gandhian abhorrence to such a down-to-earth approach of giving commissions —not to insure life but to ensure no more lives than desired!

The hot, sectoral and perspective controversies over the next Plan have so far been largely within the public sector; the problem of the role for the private sector in the fourth Plan yet remains to be discussed. Indications are that the Planning Commission, particularly its Deputy Chairman, will not make any immediate dogmatic pronouncements on the subject. It is possible that Mr. Ashoka Mehta will have a series of conversations with leading industrialists and groups to assess private sector perspectives.

TREND OF SHARES

BULLS DISAPPOINTED

(From Our Own Correspondent)

BOMBAY, *6th August*

THE hopes raised during the middle of the week that the consolidation process was reaching its end and that the market would emerge from its trading area to resume its upward move were belied when on Thursday shares reacted sharply on bull liquidation and lack of follow-up support.

On balance, the main body showed small to moderate variations over the week, but Thursday's list which was rather significant showed generally sizable losses on a wide front. During the week, some of the leaders did break through their resistance levels and it looked as though they would carry the market on their wings. But this did not happen and the market took a different turn.

Bull operators must have been disappointed with the market's performance on Thursday but none can be blamed for this. The outbreak of hostilities in the Gulf of Tonkin brought Wall Street tumbling down. Some operators were heard to remark on Wednesday that a war elsewhere might help the market here and they were recalling the Korean boom. It is doubtful whether their calculations would work out rightly this time, for a war in which the United States gets itself directly involved might affect its aid programme. India has been one of the largest recipients of this aid and it would be bad for the market if there is going to be any cut or break in U.S. aid. Apart from this the food problem continues to cause anxiety and have statements and good resolutions will not produce food. Added to this is the continued irritation from the Pakistani border, not to speak of threats of strike from labour at home. It is difficult even for the strongest market to ignore these factors. And no bull, howsoever powerful and determined he may be, can carry the trading public with him in face of these factors.

However, steel shares were well held with Tata Ordinary at Rs. 154.25 against Rs. 154 of last week and Indian Iron at Rs. 25.65 against Rs. 25.50. In fact, Indian Iron was in the lead and Tata Steel contented itself with following. Indian Iron was bid up to Rs. 26.05 during the week but at the same time Tata Steel were quoted at Rs. 155.75. Incidentally, the level of Indian Iron was the highest for the year and the corresponding peak for Tata Steel was Rs. 158.50. The statement of Mr. J. R. D. Tata to the shareholders was well received and it was pleasing to note not only the rise in turnover and profits of Tata Iron and Steel but the various measures the Company has on hand to fight rising costs.

The performance of cotton mill shares was rather individualistic and the rise or fall in them was guided mainly by the operators' choice. A point worth noting was the return to popularity of Bombay Dyeing which were bid up to Rs. 60.20 although at the close they had reacted on profit-taking to around Rs. 59.20, as compared with last week's quotation of Rs. 57.80. Svadeshi continued to be in the limelight, being bid up to Rs. 265 before easing at the close to Rs. 258 against Rs. 263 of last week. Standard attracted liquidation and closed five points down at Rs. 624. Kohinoor was steady at Rs. 324.50. At Rs. 622, Century had crossed its resistance level on Tuesday, though persistent liquidation and lack of support brought the quotation at the close to Rs. 610.50 which was just about last week's closing. Among rayons, National was another counter which came in for heavy beating. The closing level was fractionally down on last week at Rs. 362, although at one stage the shares had been bid up to Rs. 367.50. Among others in the group, Gwalior Rayon was a shade better at Rs. 41.50 but Indian Rayon and Baroda were distinctly better at Rs. 60.50 and Rs. 74, respectively. South India Viscose closed the week at Rs. 113, against Rs. 112 last week.

Telco was another notable counter; after being bid up to Rs. 297, it eased on liquidation and scattered bear pressure to Rs. 290.50 at the close, a fraction better than last week. Voltas on the contrary were a shade easy at Rs. 249. Among Motor shares, Hindustan closed quiet at Rs. 17.88, but Premier Auto improved from Rs. 101 of last week to Rs. 103. Alcock attracted support and closed the week at Rs. 279. Among shippings, Scindia rallied on short-covering to Rs. 15.48 while Great Eastern Shipping maintained a subdued tone. Barring Phaltan which were better at Rs. 104, sugar shares were easy due presumably to profit-taking. Belapur was offered lower at Rs. 222 against Rs. 225.50 of last week while Maharashtra lost two points to close the week at Rs. 137.

The bank employees' strike did certainly affect sentiment in bank shares. Of the few that were transacted India was weak at Rs. 102 though United Commercial was steady at Rs. 70.50. But interest in this section was limited. Papers were steady, with West Coast at Rs. 158 and Sirpur at Rs. 11.24. Electricity shares were active and Tata Power was bid up to a new high level of Rs. 1,170 although at the close it was slightly down to Rs. 1,165. A.C.C. caused a flutter by being bid up to Rs. 154.75 but closed at Rs. 154.

Compared with the 8th July levels, the market has a considerably wide gap yet to fill. For example, Tata Ordinary was then quoted at Rs. 156.50 and Indian Iron at Rs. 25.80. Standard has more than 30 points to cover while Dyestuff at Rs. 261.25 has to move up to Rs. 287.50. Hindustan Motor is at Rs. 17.88 against Rs. 18.92 and National Rayon has a loss of 17 points to cover. It must be pointed out, however, that some have crossed the 8th July levels. Notable among these are Svadeshi at Rs. 258 against Rs. 247, Belapur at Rs. 222 against Rs. 215. and Bombay Dyeing at Rs. 59.20 against Rs. 58.50. The general sentiment in the cash list was still hesitant and investors preferred to await developments. However, Gwalior Rayon, Sankey Wheels and Zenith Steel were among those that were in demand. The feeling was that the Government ought to alter its fiscal policy in such a way as to help investment. This point has been stressed in the latest memorandum submitted to the Finance Minister by the stock exchange presidents.

A word about Tata Oil. The market welcomed the Chairman's statement holding out an optimistic outlook. Current results are substantially better and shareholders were satisfied by hopes that the dividend would be maintained, if not increased. The Company's efforts at diversification were also much appreciated. The shares were quoted at Rs. 62.50.

* * * *

In Calcutta, conditions were easier but Birla Jute presented a firm tone, due to a squeeze on bears. Business was confined to speculative counters but the turnover was moderate and the undertone hesitant. Dunlop Rubber was steady but Indian Cable, Indian Aluminium and Kesoram Industries were all quiet. Cotton mill shares were neglected but interests in coals was selective. Howrah, Dalhousie and Ganges were prominent among those jute shares which attracted attention. Tea shares were dull.

* * * *

At the time of writing an easy trend prevails in Madras with business well distributed but at lower levels. Among plantings, Consolidated Coffee and Blue Mountain were both a bit shaded while Periakaramalai held firm. South India Viscose were easy but India Cements continued to maintain a steady tone.

REMINGTON RAND OF INDIA LTD.

Remington Rand of India Ltd. is proposing to accept Indian participation in equity shares. It is expected to come out with a public issue in about six months. The Company, it is said, is now well set to produce more typewriters of improved quality. It has already imported new testing and production equipment. The highly sensitive optical profile grinder is housed in an air-conditioned room and compares machine parts and dies against actual drawing office equipment. Non-specification parts are machined to within the permissible tolerances. The three-dimensional type aligning projector checks type-soldering and alignment of type bars by simultaneously projecting the top, side and front faces on three adjacent screens. Alignment is checked against pre-drawn lines on those lines. Spray painted parts are heat-treated in the hump back oven. The gradual rise in temperature within the oven ensures uniform baking, giving the product a finish which is free from cracking, peeling and corrosion. These modern machines, which are used for the first time at the Remington Rand factory, will help considerably in improving the standard and efficiency of typewriters manufactured in this country.

The Company's factory has a capacity to produce 30,000 typewriters per year. The actual output is currently maintained at an annual rate of 27,000, with an indigenous content of 95.9 per cent which will be raised later to 99.5 per cent. The Company employs in all 3,494 persons and has 31 sales and service stations.

HINDUSTAN ALUMINIUM CORPORATION LTD.

The U.S. Export-Import Bank of Washington has approved a third loan application from the Hindustan Aluminium Corporation Ltd. (Hindalco). The $11-million (Rs. 5.2 crores) loan is repayable over ten years beginning in 1968. The loan will be utilised for financing the U.S. dollar equipment and engineering costs of the expansion programme. The total cost of the programme is put at $30 million (Rs. 14.3 crores). After the completion of the programme, the annual production capacity will be of the order of 48,000 metric tons of aluminium, as compared with the original capacity of 20,000 tons

The Hindustan Aluminium was incorporated in 1958. The Eximp Bank helped in its initial financing by two loans aggregating $18.7 million (Rs. 8.9 crores). The Company is partly owned by Henry J. Kaiser interests in the U.S. and the Birla family interests in India. Approximately half of the outstanding stock is held by individual Indian investors.

BAJAJ ELECTRICALS LTD.

The working results of Bajaj Electricals Ltd. for the year ended 31st March 1964 are slightly better than those for the previous year. Gross profit is higher at Rs. 28.25 lakhs as against Rs. 27.20 lakhs. The improvement in profit is in keeping with the increase in the company's turnover from Rs. 358 lakhs in 1962-63 to Rs. 392 lakhs in 1963-64. Provision for depreciation has been raised from Rs. 2.17 lakhs to Rs. 2.42 lakhs, while that for taxation is reduced from Rs. 14.00 lakhs to Rs. 13.75 lakhs. The net profit is higher at Rs. 10.58 lakhs as against Rs. 10.05 lakhs for 1963. The whole of this amount has been transferred to general reserves from which dividend (subject to tax) on ordinary shares will be paid at Rs. 10 per share, same as last year. The holders of new ordinary shares will get Re. 1.25 per share. The deferred ordinary dividend has been raised from Rs. 4.27 to Rs. 4.53 per share. The total dividend distribution (including preference dividend) will amount to Rs. 6.36 lakhs as against Rs. 5.97 lakhs.

The Indian Aluminium Company has been granted another loan of $900,000 by the Canadian Government to finance purchase of Canadian capital equipment required for the expansion of the Company's bauxite mine and alumina facilities at Loharga (Bihar) and raising the capacity of its smelter at Alupuram in Kerala from 11,000 to 16,000 tons. A loan of $one million was provided in December last.

WEEK'S STOCK EXCHANGE TREND

MR. SHASTRI BACKS REALISM AGAIN

MUCH of what the Government of India has been doing on the economic front during the last few months is analogous to the attempts of a person who started digging a well to quench the thirst of his friend. This may appear to be a rather sweeping statement to some, but the provocation for this statement is the excessive preoccupation with the preparation of the fourth Plan. None can deny that almost 50 per cent of economic news that emanates from New Delhi these days is about the next Plan, so much so that one wonders whether the third Plan has been forgotten, even though it has still a year and a half to go. Members of the Planning Commission and Ministers have been flitting from place to place like butterflies talking about what should be the philosophy, strategy, targets and overall size of the fourth Plan. Almost all the meetings that are held in the Yojana Bhavan nowadays appear to be in connection with the fourth Plan. Hardly any attention is being paid to the third Plan. Advance planning is undoubtedly necessary, but so also is the vigorous implementation of the Plan already launched. It is obvious that, if Ministers and their Secretaries devote a good part of their time to the next Plan, they cannot find adequate time for the current Plan. Similarly, if the Planning Commission is preoccupied with conception of the fourth Plan, it cannot but neglect the task of checking and evaluating the progress so far made and of giving proper directions to the Centre and the States in order to ensure maximum results in the remaining period of the third Plan. All that the Planning Commission and the Union Ministries seem to be doing in this respect is to revise the targets in a downward direction in the light of performance so far. One fails to see the value of this paper exercise in the evening of the Plan, unless the aim is to mislead the public later on by claiming fulfilment of targets.

It must, indeed, be distressing to all those who wish to see that the economic growth of this country takes place in an atmosphere of stability and without too much discomfort for the masses to find that, even while lowering some of the third Plan targets to levels which were considered too low when the current Plan was prepared, our planners persist in their efforts to present a fourth Plan of gigantic size. They may not mind being dubbed as India's twentieth century (second half) Bourbons, but they must realise that they are upsetting the confidence of the public in the value of money and adding to the fear of perpetual inflation. People certainly don't mind being told that "this generation is condemned to hard labour," but they certainly do not relish the prospect of being condemned for another decade of inflation and falling rupee. Such a prospect is engendered by the gigantism that dominates the thinking on the fourth Plan. In any case, our planners' enthusiasm for presenting the country with a record plan is so high that they seem to be completely oblivious of the need for a proper climate of public opinion both within and outside the country for talking about it. This is evident from the fact that the continuing public concern over the steep rise in prices and the oppressive level of cost of living has not deterred them from proposing an investment of Rs. 20,000-22,000 crores under the fourth Plan. Even the hint dropped by Mr. Lal Bahadur Shastri shortly after he became Prime Minister (*vide* the first editorial of *Commerce* dated 27th June 1964) for more realistic planning has gone unheeded, as witness the emphasis of the Working Group on Resources, as recently as on 10th August, on an outlay of Rs. 20,000 crores in the fourth Plan. This Group is credited with the view that "resources should not be allowed to act as a brake on the physical targets that may be found necessary for the fulfilment of the country's objectives" and that, "in the achievement of physical targets, nothing should be regarded as sacrosanct, except India's democratic freedom." This kind of talk, nay, bravado, sounds unrealistic, if not irresponsible, at a time when, to quote Mr. Shastri himself, "the country is facing a situation which looks like developing into a crisis." Surely, democracy in this country is already in danger, thanks to inflation and corruption, not to mention political opportunism. Strikes, *hartals* imposed on the public by threats of *goondaism*, and display of violence even on the floors of Legislatures are all signs of the waning respect for democracy, decency and orderliness. In these circumstances, it would not be too much to suggest that, if the fourth Plan is not to get bogged down as the third has done, Mr. Shastri should carry out a Khrushchevian operation on the Planning Commission. Gentle hints and mild warnings from him will be of no avail.

Meanwhile, Mr. Shastri has done well to direct the attention of the Finance Minister, the Deputy Chairman of the Planning Commission and the Chief Ministers of States to the third Plan by asking them to make a fresh assessment of projects and programmes for which funds are being allocated now or will be allocated next year with a view to effecting substantial economies. Obviously, the Prime Minister has realised that a cut in non-Plan expenditure alone as proposed by the Finance Minister towards the close of June last would not suffice and that some of the Plan expenditure also should be deferred, in order to bring inflation under control. Brief as Mr. Shastri's suggestion is, it is not vague. It is sufficiently clear to indicate the line of action to be taken by those to whom it is addressed. The Prime Minister wants the policies to be geared to meet the immediate requirements of the common man—food, clothing, shelter, medical facilities and employment opportunities. Those projects in the field of heavy industries on which a real start has not been made should be postponed. What is needed, he emphasises, is not the launching of new projects but the expeditious execution of those that have already been taken up, ensuring that the community will get a good return from them. He has further emphasised the desirability of convincing the public that the additional burden they have been carrying during the last few years has brought tangible results to them. He has been frank enough to concede that, so far, the returns have been totally inadequate and not commensurate with the investments made at great sacrifice and with a rising tax burden. This is an encouraging development in the trend of economic thinking in New Delhi and it is to be hoped that Mr. Shastri will take care to see that his advice is expeditiously and diligently implemented. His responsibility does not cease with merely telling his colleagues at the Centre and in the States as to what they should do.

The most convincing proof of the correctness, appropriateness and timeliness of Mr. Shastri's aforesaid suggestions is provided by the reaction of Mr. Bhupesh Gupta, leader of the Communist Party in the Rajya Sabha. He has denounced them as "utterly defeatist and wrong" and has mischievously characterised the Prime Minister's approach as being in line with that "demanded by the Indian big business, the gentlemen of the World Bank and the U.S. Agency for International Development." Mr. Gupta is one of the most clever, as well as able, communists in this country. He realises that, if Mr. Shastri's advice were carried out faithfully and efficiently, India would become safer for democracy. Such a happy prospect does not further the interests of his party and its

ultimate goal. Unfortunately for him, even Mr. Gulzarilal Nanda now realises that Indian communists, whether they are supporters of Russia or China, want the Congress Party to go on making more and more mistakes, so that they can capture power, taking advantage of the chaos caused by such mistakes.

TOWARDS A RATIONAL SUGAR POLICY?

WHEN Mr. Rafi Ahmed Kidwai assumed charge of the Food and Agriculture Ministry at the Centre in May 1952, high hopes were expressed that the sugar industry would be set on a sound and secure footing. Some of the steps initiated by him fully justified these hopes. But, unfortunately, before they could be implemented, Destiny took him away. His successors, Mr. Ajit Prasad Jain, Mr. S. K. Patil and Sardar Swaran Singh failed to summon enough political courage to give effect to the ideas conceived by him. The result is that, even after thirteen years of planning, the country is finding itself in a sorry predicament: existence of large idle capacity in sugar industry, poor output, scarcity of supplies and unduly high level of prices. The situation would not have been so disquieting if, even as late as in the beginning of the 1962-63 season, the Governments (Central and States) had paid heed to the timely and wholesome advice tendered by many who had no axe to grind, including this journal.

Judged against this background, it is, indeed, refreshing to find that Mr. C. Subramaniam, the new Food and Agriculture Minister, is seeking to bring a new approach to the problems of sugar industry. The first thing he has done is to appoint a Commission of Enquiry to look into the variety of problems in the field of sugar. There is, of course, nothing new about these problems. They have been studied over and over again and the solutions to be adopted are clear. But Mr. Subramaniam is essentially a politician and white sugar is a highly political commodity. He apparently wants to safeguard his position by having the findings and suggestions of a Commission before formulating his policies. The setting up of a Commission is thus a political strategy. A great responsibility, therefore, rests on the Commission, headed by Dr. S. R. Sen, Adviser to the Planning Commission, who will be assisted by five competent members: Mr. S. C. Choudhuri (Economic and Statistical Adviser in the Union Ministry of Food and Agriculture), Mr. N. Krishnan (Chief Cost Accounts Officer, Ministry of Finance), Mr. S. C. Gupta (Director, National Sugar Institute, Kanpur), and Dr. Dharma Narain (Institute of Economic Growth, Delhi University); Dr. P. K. Mukherjee, Deputy Economic and Statistical Adviser in the Food and Agriculture Ministry, is the Member-Secretary. The Commission, according to the terms of enquiry, will go into the *entire* cost-price structure of the sugar industry and distribution, as well as the policy regarding licensing of new sugar factories and expansion of existing ones. It has also been specifically asked to concern itself immediately with the determination of the price and distribution system for the next sugar season that formally commences on 1st November; it is required to submit an interim report by the end of this month.

A feature of this new enquiry body is that it consists predominantly of officials. It would therefore, be in the fitness of things to call it a committee of officials. But Mr. Subramaniam has given it the high-sounding designation of a Commission and entrusted to it the privilege of suggesting not only what should be done for the next season but also a policy for long-term. It remains to be seen whether this Commission will have the courage to recommend a rational policy for sugar, for such a policy is bound to tread on many political corns. It does not have even that much of independence which the Tariff Commission has, a body to which Mr. Subramaniam is unaccountably allergic. Be that as it may, Mr. Subramaniam has held out the most welcome assurance that the Government's sugar policy will in future be shaped in accordance with the findings of the Sen Commission. That is something which should strengthen the hands of Dr. Sen and other members of the Commission in tackling the problems entrusted to them realistically and boldly. Inaugurating the twenty-fifth annual general meeting of the Deccan Sugar Factories Association in Bombay last week-end, Mr. Subramaniam said that most of the problems raised by Mr. M. L. Apte in his presidential address would surely be adequately covered by the Commission and that, ultimately, decisions had to be taken based on its report. Most welcome also is the assurance that, in any policy the Government evolves, "there will be an element of positive incentives to efficiency and to higher productivity."

The way in which Mr. Apte surveyed the problems of sugar industry, with particular reference to the Deccan region, was quite impressive. His speech was so long and comprehensive that it could as well serve the purpose of a memorandum to the Sen Commission. No wonder Mr. Subramaniam's reply was brief enough to confirm this impression. An important point that is well known but not unoften overlooked by the powers-that-be, to which Mr. Apte drew attention at the very outset, pertains to cane supplies. Unlike in the majority of sugar producing countries where almost all the cane grown is used for manufacturing a single type of sugar, the cane produced in India is used for manufacturing two types of sugar (*a*) brown sugars (*gur* and *khandsari*) and (*b*) white sugar. The quantity of cane actually consumed by the factories producing white sugar is half of what is consumed by the *gur-khandsari* sector which takes up two-thirds of the total cane harvested in a season. In view of this factor and considering that most of the cane growers themselves are producers of *gur* and *khandsari*, the quantum of cane supplies to sugar mills in any given period of time is naturally influenced to a great extent by the prices commanded by these brown sugars, not to speak of the vagaries of Dame Nature. Moreover, unlike other raw materials such as cotton, jute and oilseeds, sugarcane being a quickly perishable commodity, can neither be imported from abroad nor can it be transported over long distances within the country itself. Again, the sugar factories are rigidly controlled in all directions, whereas the *gur-khandsari* producers are practically free from control. Mr. Apte certainly struck a note of realism when he said: "Availability of cane (to sugar mills) is closely linked to *gur* and *khandsari* price levels; and, hence, to ensure sufficient sugar production, *gur* and *khandsari* prices must be checked at reasonable levels."

One may say, as Mr. Subramaniam, in fact, did, that, because of the widespread dispersal of *gur-khandsari* manufacturing units and the large number of varieties without any quality control, imposition of control on prices is a very difficult problem. There is, of course, a lot of force in this contention. But control on prices need not necessarily mean fixation of wholesale and retail prices for *gur* and *khandsari*. At least some sort of stability in prices can be ensured by proper regulation of cane that goes into their manufacture. Surely, it should not at all be difficult to earmark the supplies of cane grown within the radius of a few miles from sugar mills exclusively for crushing by these mills. No one need fear any possible diversion of land from cane to other agricultural crops as a result of adoption of this policy, since the high minimum prices payable by sugar mills give a more handsome return to the agriculturists than any other crop that can be grown on the same plot of land.

It is necessary to reiterate here the vital point that, as sugar recovery in a factory is well above that obtained in the *gur-khandsari* sector, large-scale diversion of cane supplies from the former to the latter ought to be discouraged. It is not a question of strong pull for *gur* in preference to sugar among large sections of people as Mr. Subramaniam seems to think. (Incidentally, this is an assumption of doubtful validity.) Rather, it is the question of economic utilisation of raw material. If *gur* prices are ruling unduly high, it is not because of the strong consumer preference for *gur* but because of the heavy demand for *gur* for purposes of illicit distillation superimposed on the demand from those who are not able to get enough white sugar.

Availability of adequate cane supplies alone is not sufficient. The sugar mills must also have a reasonable amount of freedom in regard to production, distribution and prices. The views of Mr. Subramaniam on this issue are rather biased and not well balanced. Opposing the thesis of Mr. Apte, he said:

"I am not able to agree with the view that the introduction of controls has invariably stagnated consumption or that decontrol has always encouraged production and consumption. Historically, leaving the need of the country for sugar to be met by the normal operations of the free market has led to what can only be described as exploitation of the consumers. We cannot afford to let either the trade or the producer fatten on the scarcity of any commodity. It has, therefore, become necessary for Government to exercise a *strategic* (italics ours) control over the production and distribution of sugar."

The word 'strategic' in the above quotation is significantly vague. We wish Mr. Subramaniam had spelt out clearly what exactly he meant by strategic control over not only production but also distribution of sugar. In any case, the retiring President of the Deccan Sugar Factories Association was not so unrealistic as to plead for complete decontrol straightaway. All that he wanted was a policy of progressive decontrol of sugar. The specific suggestion which he put forward was this: "Until such time as total decontrol is not possible, some quantities of sugar may be reserved by the Government to meet the minimum domestic requirements of the consumer. (It is not known why Mr. Apte took no account of export commitments.) Remaining quantities should be released for free sale to meet the requirements of industrial consumers like biscuit manufacturers, confectioners and sweetmeat makers." The chief merit claimed for the scheme of partial control is that, while it will make available to consumers at least some quantity of sugar at a reasonable price, higher realisation on free sale will enable the industry to meet the competition offered by *gur* and *khandsari*. Easy availability of sugar in the free market, it is said, will help to bring down *gur* and *khandsari* prices as well. The suggestion seems to be a practicable one and is worth a trial, if the overall cane crop position is fairly satisfactory.

Sugar manufacturers continue to have serious misgivings about the Government's proposal to set up a Marketing Board for sugar. It is only but natural that Mr. Apte should have referred to this move in his speech. He minced no words when he said that such a Board was only an expression of the philosophy of controls and that it implied perpetual controls. Recalling that the sugar industry had been unanimously opposing the establishment of this Board, he observed:

"In support of the Marketing Board, it is argued that it will make sugar available to the consumer throughout the country at a uniform price. We in the industry fail to appreciate the need for a uniform price. No other item of daily consumption in the country is distributed on this basis. Freight advantage is an important consideration while locating the industry and its benefit is shared by the consumer and the industry. Concept of uniform prices, however, denies this benefit to the consumer and the industry, as it can only be achieved through the mechanism of procuring sugar from the factories on cost plus basis and then by pooling of freight. It is well known that there are sugar producing regions in the country that are uneconomic and hence high cost producing. Ironically enough, these regions are also surplus States of sugar and, being located far away from the main consuming centres, these factories suffer a freight disadvantage. These regions can only be subsidised by the low cost producing region through the mechanism of pooling of freight. ... Briefly, uneconomic regions would be subsidised by the economic regions.

"It is stated that, to cover its expenses, the Board will charge some commission. Detailed pattern of distribution yet remains unknown. With our vast population and colossal number of villages involving stupendous number of distribution points, it is unthinkable that the consumer will get his sugar at a uniform price, especially in times of scarcity. Our experience of controls amply supports my belief. In times of surplus, the consumer gets his sugar cheaper than the controlled price anyway. In view of this, we fail to understand the need for such a Board. Experience of other industries like cement fully justifies our fears that, under such controls, production stagnates. I sincerely believe that our planning for plenty can only be achieved by pursuing a policy of productivity and not by following a philosophy of controls."

Mr. Apte deserves to be warmly complimented for having so cogently argued out the case against the creation of any monopolistic State marketing body for sugar. We were once given to understand that the establishment of the Board was a *fait accompli*. We are, however, glad to learn from Mr. Subramaniam that it is not so. For in his speech at the D.S.F.A. meeting, he said that, "while the exact nature and scope of this Board is not yet final, this is also one of the matters which the Commission of Enquiry will examine and advise on." It is now for the Commission to ponder the observations of Mr. Apte. What is lacking in the sugar economy is not a proper distribution mechanism but a vigorous production-oriented programme, a programme that envisages full utilisation of the sugar mills' capacity and improvement in the productivity of cane lands, in terms of both per-acre yield and sucrose-content. If the Sen Commission could spell out the elements of such a programme, it would surely have justified its appointment.

MARKET GOSSIP

Payment Of Wages In Kind

THE decision reached by the Indian Labour Conference at its recent session at Bangalore to pay a part of wages in kind is a retrograde step, the harmful consequences of which cannot be overstated. This is one more example of the way in which our authorities come out with ill-conceived solutions for meeting temporary situations, which owe their origin, in good part, to no less ill-conceived economic policies. Extravagant fiscal and monetary policies have produced an inflationary situation, which has no doubt been aggravated by adverse natural factors affecting agricultural output. The consequences of inflation have to be faced squarely. Of course, every effort should be made to prevent the recurrence of inflation. But what is not good is to resort to expedients of the most doubtful validity and, indeed, of infinite harm to the community and especially, as in the case under consideration, to the working class.

An important aspect of economic growth, modernisation and personal freedom in the economic sphere is the extension of the money economy, that is to say, the shrinkage of barter. Now, we in India seem to be bent upon reversing this trend. The payment of a part of wages in kind is fraught with consequences that will leave a permanent dent in the body politic of the country. It is true that this method was in vogue during the war years and early post-war years in certain parts of the country, as, for instance, in the plantations of North East India. But the situation then was entirely different and, in any case, it was soon abandoned, as neither workers nor employers were happy with it.

The expedient under question will create numerous headaches for the honest employer, as he will have to buy, store and distribute the specified goods. If the employer is dishonest, he can use this arrangement as one more source of profiteering and exploitation. The working class will suffer not merely in respect of price, but in terms of loss of freedom of choice, which is the most precious privilege of a consumer. For an employer cannot afford to have all the varieties of even essential goods that are needed. So workers may find themselves obliged to take things which they do not need and will either have to put up with it or sell these or exchange them for other varieties, incurring a loss in this process. Also, stocks may not be available in time and the workers may be quite inconvenienced. Further, owing to lack of uniformity in the quality of essential things like foodgrains, there may be a premium on the superior varieties. Corruption and black markets will become rampant. Again, the workers' spouse will have no opportunity to participate in shopping. Besides, the articles will have to be carried home from the place of work. The workers may have to queue up in the company's shops. If this time is spent on the company's account, as is inevitable to some extent, it will mean so much less output or additional costs. The maintenance of the fair-price shops will also inflate the employers' establishment charges. There will always be pressures on them to bring new items under the payment-in-kind scheme.

The move may also prove injurious to the interests of labour in other ways. It may, for instance, stand in the way of legitimate increases in emoluments corresponding to increases in productivity. Further freezing of money wages will adversely affect the retirement benefits of workers, since these will correspond to the lower level of money wages. Surely, there will be no fair price facilities for workers who retire.

There is also the additional danger that the proposed arrangement will lull people into a sense of complacency with regard to inflationary pressures. Labour is as much interested in avoiding such pressures as any other section of the community. It is best to fight the evil of inflation by preventing it, rather than by trying to remedy its harmful effects by dubious experiments, which, while being politically attractive for the moment, will injure the whole economy ultimately. What all this means is that the plans for economic development should be properly conceived and efficiently implemented, so that undue inflationary pressures do not arise.

Foodgrains Position In Russia

It is common knowledge that the Soviet Union which used to be an important exporter of foodgrains, particularly to the East European countries, has had to import large quantities of wheat in the 1963-64 crop year from the Western world, particularly from Canada, the U.S. and France, because of extensive crop failures. Till very recently, it used to be regarded in Europe that, in the current crop year (1964-65), too. Russia would be deficit in foodgrains and that it would have to import large quantities again. But the latest advices from Russia suggest that food crops in that country this year are better and that its dependence on foreign supplies would be substantially curtailed. The Soviet Communist Party paper, *Pravda*, has claimed that the country will have sufficient wheat for its requirements this year and that "the U.S.S.R. will entirely meet its needs in cereals by its own production and will substantially build up State stocks."

As usual, Western observers are sceptical of this claim. They argue that, even if Russian wheat and rye production improves this year, it will never be able to regain its position as a major exporter of wheat. This conclusion has been drawn on the basis of estimates of Russian requirements and its ability to grow them.

For considering the production and demand for foodgrains in Russia, wheat and rye, which are interchangeable as bread grains in that country, are better taken together. The average *per capita* consumption of these grains in Russia is estimated to be 440 lbs. per year. On this basis, for a population of 225 million, the requirement is 1,600 million bushels. Since the opening up of new lands, the average annual area in Russia under wheat and rye crops has been about 200 million acres. To cultivate this vast area, another 400 million bushels of grains will be required as seed. In addition, some of the production, placed at 5 per cent, goes as unavoidable wastage. The total requirements for the present population, inclusive of seed and wastage, are estimated at 2,250 million bushels.

Although figures of Russian production are not available, it has been estimated that, under favourable growing conditions, the yield may come to about 2,600 million bushels. However, the virgin lands first put to the plough ten years ago are said to have deteriorated so badly that they are not giving even the normal yield. The weather conditions in the country have also been adverse, resulting in comparatively poor yields. It is, therefore, considered doubtful whether production will reach even the level of the self-sustaining requirements of 2,250 million bushels, let alone a surplus for export.

Mr. J. R. D. Tata On Inflation

Is taxation one of the factors responsible for the current inflationary trends in the Indian economy? The answer to this poser given by some economists is in the negative. Actually, this section is of the view that the effect of the recent heavy taxation has been distinctly anti-inflationary. Here is what Prof. C. N. Vakil, a leading economist of India, said in an article he contributed recently to *The Times of India*:

"... It is possible to argue for or against given tax measures on merit. It is possible to say that a particular taxation measure is heavy in its incidence; *it should not be described as inflationary* (italics ours). Any such tax withdraws the purchasing power to the extent from the taxpayer and reduces his capacity to create effective demand in the market. To that extent, *it works as an anti-inflationary measure* (italic ours). During periods of inflation in the history of all countries, efforts are made to mop up the extra purchasing power in the hands of people by taxation. If this is not done, the effects of the inflation will be more severe and, perhaps, intolerable...."

The logic of Prof. Vakil's thesis is quite valid. Even so, it would be difficult to deny the fact that, in the peculiar conditions obtaining in India, heavy taxation has considerably strengthened the inflationary spiral. Thus, the high level of indirect taxation has contributed largely to cost inflation, as the series of indirect taxes levied by the Central and State Governments even on necessities of life have added to the prices of goods. Since, generally, both industry and trade pass on the bulk, if not all, of the incidence of additional taxation to consumers, the retail prices get inflated to that extent. This, in turn, adds to the cost of industrial raw materials and enhances the cost of living. Then follows a vicious spiral. Those who do not agree with this contention will do well to peruse the observations of Mr. J. R. D. Tata, Chairman of the Tata Iron and Steel Company, made in his latest annual statement circulated to shareholders (the statement is published on pages 276 and 277 of this issue). How steel provides a striking example of the marked deterioration in the country's cost-price structure is vividly described by Mr. Tata thus:

"Whereas until 1955 Indian steel was amongst the cheapest in the world, it has become one of the costliest, although the basic elements which make up the total manufacturing costs have not materially changed in relation to those of other countries. At the end of 1963, the average price of the common categories of steel in India was more than two and a quarter times the 1948 price, one of the largest single elements of increase being in respect of excise duty which increased no less than fifteen times from Rs. 5 to Rs. 75 per ton. Actually, the full incidence of excise duties and other taxes on the final price of steel is much greater than that, as practically every item which goes into the making of steel, including fuel, power, raw materials and stores, is itself subject at one or more stages of production to its own excise duties and other taxes. In addition to the growing burden of direct taxes of one sort or another, freight rates charged by the Indian Railways are today four to five times what they were fifteen years ago."

Rising costs and prices, besides resulting in severe hardship to the common man, cause much damage to the economy and to the long-term plans of development. Increases in costs, as Mr. Tata has said, have already rendered uncompetitive in world markets almost every exportable Indian product, other than tea and jute goods, thus severely restricting the earnings of foreign exchange; they have inflated expenditure under the Plans and this, in turn, has necessitated, apart from further additions to the already "crushing burden of taxation," a further rise in deficit financing, aggravating inflationary pressures and leading to still higher costs and prices, a vicious circle, indeed. Mr. Tata does appreciate the magnitude and complexity of the problems involved and the grievous burden of additional Defence expenditure since last year. Nevertheless, he attributes the deterioration in price structure largely to the policy of forcing the pace of economic development beyond the country's capacity in physical and financial resources. In his characteristic way, he observes:

"The inflationary effect of spending too much too quickly has been aggravated in our case by the fact that so much of the total expenditure has been incurred on unproductive civil administration and on costly long-term projects which can add to the national income only after long gestation periods and which, even when completed, produce little for the consumer. Unfortunately, there seems to be no recognition as yet of the need for a reappraisal of resources and priorities in our planning. From the tentative figures recently announced for the fourth Plan period, it would seem that the remedies for our present ills are thought to lie in still larger plans involving still heavier doses of taxation, deficit financing and foreign borrowings."

Mr. Tata has certainly not made these remarks as a cynic. For he is one of the few in this country whose wisdom and knowledge are unquestionable. In effect, what Mr. Tata has suggested is for the planners and the powers-that-be to have a fresh look at the fiscal and financial policies. Such a look is urgent in all conscience, if the current and subsequent Plans are not to founder on slippery rocks.

Mr. Podar On Inflation And Taxation

To revert to the theme that taxation in this country has been so heavy as to aggravate the inflationary pressure in the country, Mr. Ramnath Podar, Chairman of the Indian Cotton Mills' Federation, also referred briefly to this question in his speech last week and explained as follows:

"It was, perhaps, thought that increased taxation would make goods more costly and thus inhibit demand. Experience has shown that, where consumption is on the subsistence level, the increase in prices resulting from higher taxation does not inhibit demand, but creates pressures for increasing incomes, in an effort to maintain the standard of living. No part of the tax gets absorbed in the price; on the other hand, the price gets inflated by the amount of the tax *plus*, firstly, interest on the additional finance needed and, secondly, additional profit margin to maintain the manufacturer's and trader's real income intact. The primary producers try and obtain higher prices for their produce, so that they may be able to foot the increased bill for their necessities. The wage-earner also tries to obtain higher money income merely to ensure that his real wages do not fall. Meanwhile, Government, which garners bigger revenue, actually collects less in terms of real value and has, therefore, to pump more money in the system to buy the same amount of goods and services they had budgeted or planned to buy! Increased indirect taxation thus becomes a self-defeating measure in economies like ours.

"What is true of indirect taxes is also true, in a different manner, of direct taxes. Direct taxes upto a certain limit are cheerfully borne by the taxpayer. When, however, that limit is crossed and the taxes begin to weigh heavily on incomes, a tendency develops to avoid and evade taxes and this creates unaccounted money in the system. The best place for such money is to get locked in speculative purchases of goods, real estate and such things, which means further pressure on prices. The money, which would normally have gone in productive channels, thus gets diverted into speculative channels.

"The vicious circle which has thus started with reckless additions in the sphere of direct and indirect taxation can be broken only by adequate scaling down of taxes. If such a measure is applied judiciously and with circumspection, it may actually result in strengthening Government's revenues in terms of real value and enable them to make greater investment in the economy with less supply of money.

"Those who somehow identify socialism with higher taxation would consider the suggestion I have just now put forward as blasphemous. I would, however, like to appeal to those who are interested in higher standard of living for the common man and fullest utilisation of all resources in productive channels to give serious thought to the problem that I have posed."

The two views that we have quoted above clearly show that, in practical terms, excessive taxation does generate inflation.

World Bank's Activities

The International Bank for Reconstruction and Development (World Bank) has shown very promising results for the year ended 30th June 1964. The preliminary statement of accounts released this week shows that 1963-64 was an active year for the Bank. Seventeen countries became the new members of the Bank during the year, raising its subscribed capital to $21,186 million. The bulk of these new members was from Africa. As compared with a total of $448.7 million in the previous year, the loans made in 1963-64 amounted to $809.9 million—a rise of over 80 per cent. This brought the total gross commitments of the Bank upto the close of the fiscal year to $7,931.3 million. The disbursements during the fiscal year were, however, lower at $558.9 million, as compared with $620.4 million in 1962-63, bringing the cumulative total to $5,984.4 million.

India topped the list of borrowers from the Bank with loans sanctioned in its favour being $876.1 million—about 11 per cent of the total commitments of the Bank. Other main beneficiaries having loan sanctions of more than $100 million were, in the order of importance, Japan, Mexico, Australia, Colombia, Pakistan, Italy, Brazil, France, the Netherlands, South Africa, Iran, Yugoslavia, Thailand, Finland, Norway

Argentina, Peru, Chile, Venezuela, Congo (Leopoldville) and Austria. Continent-wise, Asia got 34 per cent of the Bank loans, America 26 per cent, Europe 22 per cent, Africa 13 per cent and Australia 5 per cent. Among the purposes for which loans were sanctioned, generation of electric power and transportation had the pride of place, each accounting for one-third of the total commitments upto the close of the fiscal year under review. Industry was the third, with 15 per cent as its share.

The total gross income of the Bank during the year 1963-64 rose to $219.1 million from $203.9 million in the previous year. The rise was mainly due to the higher income from interest which increased from $133.6 million to $145.5 million. The incomes from investments and commissions were also higher by $2.8 million and $1.9 million, respectively. On the expenditure side, whereas the administrative expenses increased by about one million dollars, interest on borrowings, which accounts for over 80 per cent of the total expenses, came down by an almost equivalent amount, so that there was only a minor change in the total expenses, rising from $121.2 million to $121.7 million. The net income thus recorded a rise of about $15 million—from $82.7 million in 1962-63 to $97.5 million in 1963-64. A sum of $33.2 million, which was earned during the year as loan commission, was credited to the Special Reserve, increasing it to $288.1 million. Of the total net earnings of $97.5 million, $47.5 million was transferred to the Supplemental Reserve, making it $605.6 million. The total reserve thus increased from $813.0 million to $893.7 million. The remaining $50 million of the net earnings are being transferred to the Interational Development Association (I.D.A.)—the Bank's affiliate—which provides soft loans. Incidentally, it has been decided that, with effect from 1st July 1964, the treatment as commission of a part of the loan charges, equivalent to one per cent of the disbursed and outstanding portion of loans held by the Bank and its automatic allocation to the Special Reserve, should be discontinued. With minor exceptions, all income from loans in future will be treated as regular income, and the allocations to the Special Reserve, if any, will be decided by the Executive Directors.

A welcome decision taken by the Directors of the Bank is that from 1st July 1964, the annual commitment charge on undisbursed portions of the Bank's loans (including the existing loans) should be reduced by half, from ¾ to ⅜ per cent. This will bring down the cost of borrowings from the Bank to some extent. It may be noted here that, out of the total of net loans effective amounting to $5.905 million as at 30th June last, the undisbursed portion liable to the commitment charge was no less than $1,518 million. Of this total, India's share was $120 million.

British Investments Overseas

It is a well-known fact that Britain was a major supplier of private long-term capital to the overseas countries upto the Second World War. During the war period, however, the country had to sell the major part of its investments, specially those in the dollar area, in order to finance the war requirements. Since then it has been gradually increasing its investment and has now acquired to a very large extent its pre-war position. During 1963, the British companies invested capital worth £223 million in the overseas countries as compared with £209 million in 1962. The total investment, which at the end of 1962 stood at about £3,600 million, thus increased to more than £3,800 million at the end of 1963. If the provision for depreciation is also taken into account, it is seen that the investment was £4,500 million at the end of 1962 and may be well over £4,700 million at the end of 1963. In fact, the totals of net and gross investments must be much more, because these figures do not include investment in oil industry, insurance and banking for which accurate figures are not yet available. An idea of the magnitude of these investments is, however, given by a section of the British Press. The overseas assets of British insurers in the U.S. alone were estimated to be £350 million at the end of 1960. As regards oil, the Bank of England's estimate of the value of foreign assets of oil companies in the overseas countries is £1,100 million. Thus, if the investment in insurance, banking and oil industry are included, the total overseas investment of British private capital will be substantially higher. The figure of £5,600 million (excluding the amounts set aside for depreciation) is unlikely to be far off the mark.

A breakdown is available of the investment total of £3,600 million as at the end of 1962. The amounts invested and the shares of the main host countries in the total investment are as follows:

Country	*Amount in million £s*	*Percentage to total investments*
Canada ...	672	18.7
Australia ...	522	14.5
U.S.A. ...	341	9.5
S. Africa ...	269	7.5
India ...	256	7.1

It will be seen that Canada has been the most important recipient of British private investment. The pattern of investment has, however, been undergoing a change in recent years, with a greater emphasis on Sterling Area—particularly Australia—and Western Europe and less on North America—particularly Canada. Whereas the share of North America has declined from 18 per cent of the total annual investments in 1960 to 9 per cent in 1962, that of overseas Sterling Area has remained almost constant at the level of three-fifths of investment. Western Europe—particularly West Germany and Switzerland—has been more attractive to British investors than even the Sterling Area. The share of this region has risen from 10 per cent (£25 million) of the annual investment in 1960 to as much as 24 per cent (£46 million) in 1962. In the case of India, though the net direct investments stood at £256 million as at the end of 1962, the total comes to £323 million if the provision made for depreciation is included. Most of this amount, which excludes oil and insurance, is in manufacturing industries.

According to the calculations made by the British Board of Trade, the earning of Britain on its private investments overseas in 1963 was 8.7 per cent of their book value (about £3,800 million). This rate was, however, lower than the 10 per cent earned by foreign investors in Britain. As readers are aware, Britain has been not only an exporter of private capital but also an importer. In 1962, foreign private investments amounted to £130 million, of which 73 per cent (£89.5 million) came from the U.S. The total of foreign-owned investments in the U.K. at the end of 1962 was £1,500 million, equal to about 42 per cent of that country's private investments abroad.

PREMIER CABLE CO., LTD.

The Premier Cable Company has just announced details of its public issue. The issue (at par, amounts to Rs. 52 lakhs, divided into 300,000 equity shares of Rs. 10 each and 22,000 redeemable preference shares of Rs. 100 each carrying dividend at 9.3 per cent (taxable); it will open for public subscription on Tuesday the 18th inst., and close on the 28th inst. or earlier but not earlier than the 20th inst. The entire issue has been underwritten by the L.I.C., Kerala State Industrial Development Corporation, Industrial Finance Corporation, I.C.I.C.I., United Commercial Bank Ltd., New India Assurance Co., Ltd. and Messrs. Raja Ram Bahsin and Co. The issue is in addition to the Rs. 18 lakhs (180,000 equity shares) already subscribed for by Directors, promoters and their friends.

The Company is erecting at Karukutty in Kerala a factory with a capacity to manufacture 18 million core yards of P.V.C. cables and 270 miles plastic insulated power cables per annum. The total outlay on the project is put at Rs. 120 lakhs, which is to be met partly from the share capital of Rs. 70 lakhs referred to above and partly from a loan of Rs. 50 lakhs from the Industrial Finance Corporation of India. Details regarding the Company are given elsewhere in this issue (*vide* page 287). It will be seen therefrom that the Company's products are assured of ready demand, that the quality of the products will be high since the Company has secured the technical collaboration of a leading cable manufacturing firm in Europe (Messrs. VEB Kabelwerk Oberspree of East Germany), and that the Company has a competent Board of Directors. Viewed thus, the public issue may be expected to receive good response.

DENMARK LIBERALISES IMPORTS

Denmark has reported to the Executive Secretary, General Agreement on Tariffs and Trade, on the measures taken in implementation of the G.A.T.T. Action Programme for expanding the trade of developing countries. When the Action Programme was adopted by Ministers in May 1963, it was agreed that custom duties on tea and tropical timber should be removed with the least possible delay. The Danish duty on tea, which amounted to 2.70 Danish crowns (*ad valorem* equivalent of 25 per cent), has been eliminated. No Danish duty on tropical timber has existed for several years. Denmark has also reported that, besides the removal of a considerable portion of the remaining Danish import restrictions on twine, cordage, ropes and cables of coconut fibre, electric motors and bicycles, it has liberalised imports of other items, which, although not falling under the Action Programme, have been identified as being of export interest to developing countries. These are bottles, containers of glass etc., plates, sheets and strips of unvulcanised rubber, and flooring materials of agglomerated cork with effect from 1st July 1963, dried vegetables, a considerable number of different varieties of preserved fruits and vegetables, fire hoses of rubber, articles of cork and agglomerated cork apart from flooring material, with effect from 1st January 1964, and mats and certain other articles of unhardened vulcanised rubber and tubings of rubber with effect from 1st July 1964.

(*Concluded from next column*)

ing facilities to deal with a temporary imbalance or with movements of short-term funds. Such is not the position of the developing countries whose possibilities of obtaining international credit continue to be restricted by the hard currency resources of the International Monetary Fund. Yet the two greatest factory areas of the world, the U.S.A. and Western Europe, remain stolidly opposed to an international credit system in which hard currency reserves would play as little a part as the gold stock of any industrialised country does to its internal currency and credit circulation.

But other factors can hold up new output: the U.K. is experiencing an odd example at the moment under the North Sea. Here lie supplies of non-dollar oil on which all the North Sea countries have fastened their eyes. Companies prospecting from the U.K. now need licences to drill: the Government is prepared to issue these on capitalist lines; but the Labour Party is asking the Government to wait: it would like to issue licences on "mixed-economy" lines, going half-shares with the producers once they strike oil. Since the oil companies know the view of the Labour Party, they may have decided to wait—however ready the Government may be to grant licences—till after October and see whether the terms make the venture worth their while!

LONDON LETTER

PRODUCTION TAKES A HOLIDAY

(From Our Own Correspondent)

LONDON, *7th August*

THE Treasury has now come round to the view which business has generally held for some time that things in the production world are not quite what they should be. "In the first half of 1964," says the Treasury's *Bulletin for Industry*, "economic activity has continued to increase. Manufacturing investment has turned upwards and business confidence is high. The trend of unemployment continued downwards (though less fast since the first quarter) and by mid-year pressure of demand for labour was high. It is clear, however, that the pace of expansion has been slowing down this year."

But it is equally clear that the Treasury can't make out what is happening to industrial production, because a high level of activity appears to be coupled with an astonishing uniformity of stagnation. Over the past six months, the production indices have risen, over all manufacturing, no more than 2 per cent. And the whole of this rise had already taken place in the first month of the year! The chemical industries are more progressive than most and show a rise of 4 per cent; the iron and steel industries show a rise of nearly 5 per cent—though metal manufacture as a whole is no more than 2 per cent up; engineering is under 2 per cent up; textiles under 1 per cent; bricks and cement—the basic construction materials—3 per cent up; electrical goods are nearly 4 per cent up; but vehicles and shipbuilding are "stagnant"; some branches of production have actually registered a drop.

There can be only one explanation, that, in the latter part of last year, the pace was pushed too fast to go on increasing and, having achieved a relatively high level of output, industry has been satisfied with turning over at that level. Such an explanation may serve for half a year or so; beyond that time the implication will be that the U.K. is not capable of a sustained rate of growth of as much as 4 per cent.

It is satisfactory to turn to the progress of investment in manufacturing industry. Data on this lags behind that for manufacturing output; but the rise in the last quarter of last year has been continued in the first quarter of this. Not only private but public (largely roads and houses, but also schools and hospitals) investment remains at a strongly rising trend. Total fixed investment rose by 3½ per cent or more in the first quarter and the indicators point to a continued increase.

Investment in stocks rose from a low rate early in 1963 to a high rate at the end of the year; the rate of stockbuilding since then has continued high, but it has not apparently been adding so much to the growth of demand as it did last year. Nevertheless, stockbuilding and fixed investment are about the only components of demand that continue to show strong expansion. Imports of industrial materials and finished manufactures have continued to rise, but even their rate fortunately has fallen back from the high level reached at the beginning of the year.

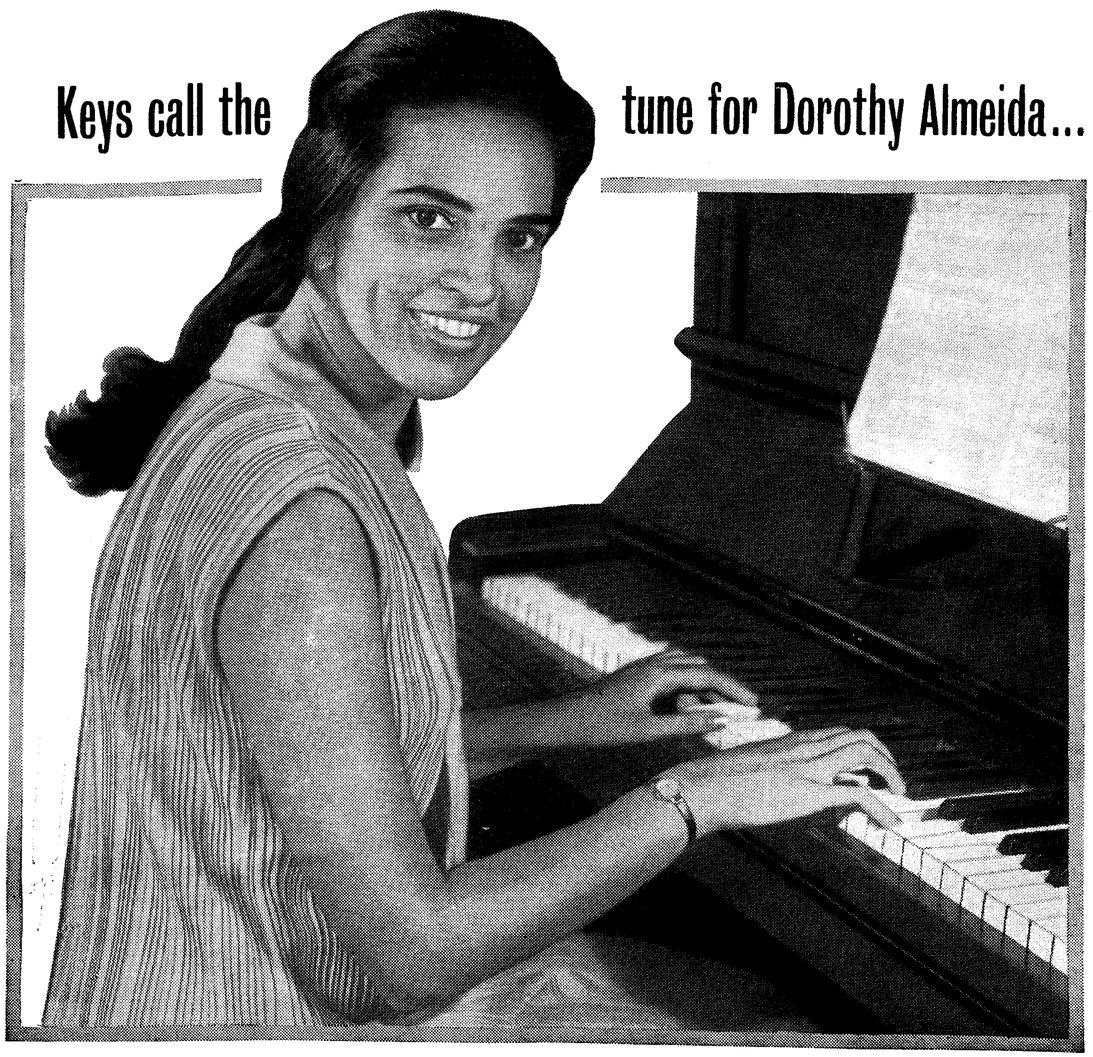
World Picture

How does Britain's position fit into the world picture? Not as well as it should... "World industrial production is expected to increase during 1964 at about the same rate as during 1963; world exports of manufactures are expected to grow only slightly less than in 1963 (a point of great significance to Britain) ... all the main markets for British exports are expected to expand throughout 1964." The world trade in manufactures was about 13 per cent up in 1963 over the level of 1962 and this is the rate of growth which is expected to be maintained. But the main cause is the expansion in the American economy. Of course, the expansion of imports into the U.K. is one facet of this growth in world trade and a similar situation is experienced in Western Europe, in Australia and South Africa and in many of the developing countries. And, in most of these countries, this growth, so welcomed by the exporting countries, is accompanied by a fear of the growing imbalance.

The U.K. is fortunate in having very large first and second line reserves and other borrow-

(*Continued in previous column*)

Keys call the tune for Dorothy Almeida...



She wouldn't put it quite like that herself. She'd say she enjoys playing the piano in the evenings. She'd tell you about the composers she likes, her favourite numbers, her preference for jazz. At work, it's the typewriter keys that call the tune. Here a different touch is needed: brisk, sure, efficient. Whatever the content or the mood—an official letter or a Gershwin blues number—Dorothy Almeida has it at her fingertips!

EFFICIENCY COUPLED WITH PRUDENCE...

...is the keynote to success in her career. Efficiency and prudence meet behind Dorothy Almeida's laughing eyes and gay, infectious smile. Secretary to the Personnel Manager of Burmah-Shell, Bombay, her work is concerned with people. She knows them. Not as functions. As people and individuals. She keeps records about their work and themselves, with care. And there is routine work—correspondence, appointments for the Manager. Her filing is neat, systematic, ready for reference. The Personnel Manager finds his Secretary prompt with intelligent assistance.

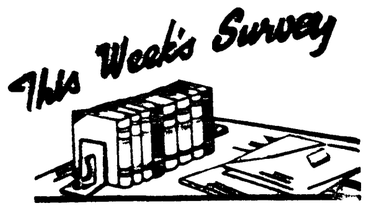
TODAY, AS EVER, PEOPLE LIKE DOROTHY ALMEIDA ARE WORKING FOR YOU

For all her clockwork efficiency, there is nothing mechanical about Dorothy Almeida. Her tall, supple figure moves with grace at table tennis, while swimming, and on the dance floor. It's a full life.

Dorothy Almeida and people like her, at all levels of responsibility are Burmah-Shell. Today, as ever, they are hard at work, working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

BURMAH-SHELL

BURMAH-SHELL are People in the service of the People



CORPORATE MANAGEMENT AND FINANCE

THE two-day conference on promotion of research in corporate management and finance, held at New Delhi last week, was notable for more than one important reason. The conference, which was convened by the Company Law Board (Chief Organiser: Dr. Raj K. Nigam) in co-operation with universities and research institutions, served to highlight the vital role played by research on corporate matters, to assess the vast scope that exists for further work in this field in addition to the marked progress achieved in the past few years, and to focus attention on some of the difficulties faced by research workers. It also sought to emphasise the need for effective application of research to corporate problems, as well as for co-ordinational planning of research. In fact, the conference itself gave a lead in this regard by pleading for the setting up of a permanent autonomous organisation in which the various institutions actively engaged in research might be able to participate. Closely allied to this plea were two suggestions: one, the universities should work on fundamentals, while other institutions should devote attention to applied research; and, two, adequate facilities must be created for training researchers in methodology, etc.

A serious handicap lying in the way of intensified research on corporate matters is paucity of information furnished in the annual accounts of several companies. The present form of preparing balance-sheets and profit and loss account provides for a lot more information than was the case before the first comprehensive amendment to Company Law in 1956. Several of the leading companies have gone out of their way to give more information than is required under the Act; in doing so, they have followed the example set by their confreres in the U.S. and have recognised the need to impress the investors in share markets. Nevertheless, there is no gainsaying the fact that the vast majority of companies, including many in the public sector, are still conservative in disclosing the details of their working. In particular, not much light is generally thrown on the break-up of various items, as, for example, loans, salaries and wages, details regarding production, and data on profit-margins, replacement costs, etc. This was an issue on which there seemed to be consensus of opinion in the conference. Emerging from the discussions was a proposal that the companies should be asked to reveal more information, if not by legal reform, by the various professional bodies.

The corporate sector, like Cæser's wife, should be above suspicion in the eyes of not merely shareholders but the public at large. It will be in the interest of the companies themselves to make their annual accounts a true index of their actual financial operations. But, unlike in the public sector, companies in the private sector have to compete with one another and cannot disclose all their secrets to their competitors. The demand for comprehensive information from joint-stock companies has, therefore, to be reconciled with the need for safeguarding the interests of individual companies. The Government of India, according to the Union Finance Minister, Mr. T. T. Krishnamachari, who addressed the concluding session of the conference, is considering an amendment to the Companies Act to compel companies to provide more exhaustive information about their financial operations; the question of framing the actual requirement in legal terms is, we are told, being actively examined at present. While this move is a right one, the point just made above has also to be borne in mind. Before this particular amendment is finalised, the Government will do well to discuss the issue in detail with the leading chartered accountants and spokesmen of industry.

Private limited companies enjoy special protection in regard to disclosure of information either to the Government or to shareholders. Recalling this protection, the Finance Minister favoured a statutory limit on the scale of operations of these companies. He said: "Either such companies may be obliged to keep within a ceiling of Rs. 20 lakhs or Rs. 25 lakhs of turnover per year, or a suitable formula devised on the basis of capital employed. Operations larger than this limit should be carried on only by public limited companies."

It is true that the private limited companies enjoy a certain amount of secrecy about their operation and financial results. And it is equally true that tolerance of such of those companies as are large does not appear to be in keeping with the greater and greater stress laid on wider diffusion of share ownership. But the question is whether what the Finance Minister favours is the correct solution. The number of private limited companies with an annual turnover of Rs. 20-25 lakhs is fairly large and one wonders whether it would be a practicable proposition to force all of them to convert themselves into public limited companies just for the sake of more detailed information on the corporate sector. If forced, the larger private limited companies may be split into several small companies within the specified limit. Again, several companies may offer for public subscription just a nominal amount of capital, keeping the bulk of it in the hands of directors, friends and relatives. Since private limited companies bear a relatively higher tax burden, the Government, too, may lose some revenue if they are converted into public companies. All these aspects must be examined carefully before the Government takes a firm decision.

NEYVELI POWER STATION

After a protracted delay, the first stage of the thermal power station at Neyveli in Madras has at last been completed. The commissioning of the first stage was formally done on Wednesday the 5th inst. by Mr. P. S. Neporozhni, Soviet Russia's Minister and Chairman of the State Production Committee for Power and Electrification. The power station is unique in several respects. It is, for instance, the single biggest generating station in India, consisting as it does of five turbo-generators with an aggregate capacity of 250,000 kw. The capacity is being raised to 400,000 kw.—construction and assembly work in this connection is in full swing—and it will be raised still further to 600,000 kw. during the fourth Plan. Apart from bigness, the power station is a pioneering venture, in that it generates power on a large scale by using lignite (instead of water or coal or oil) as fuel. The importance of the station lies in the fact that it will ensure additional supply of power to a region which has for long experienced an acute shortage of electric power supply and faced the difficulty and the cost involved in transporting coal from West Bengal and Bihar.

More than all these, the power station is an impressive mark of close Indo-Soviet economic co-operation. Soviet Russia has given a credit of 112.5 million roubles for financing the construction of the power station. This station is one of the thirteen thermal and hydro-power stations with an aggregate capacity of 2,655 MW. now being built in India in collaboration with Soviet Russia. In the course of construction and operation of the first stage of Neyveli power station, several Indian engineers and workers, with whom the Soviet specialists have shared their experience and knowledge, have been trained. In a short period of time, they have, it is claimed, mastered the details of erection and maintenance of big modern power stations equipped with the latest machinery and instruments. Well could Mr. Neporozhni claim that the fruitful results of friendly co-operation between the Soviet and Indian peoples are best seen in the construction of the first stage of the power station.

The Neyveli Lignite Project was first intended to produce thermal power, but advantage has been taken of the marginal excess of lignite over the quantities required for generating power to establish a complex consisting of a fertiliser plant and a briquetting-carbonisation plant. Both these plants are under erection. The fertiliser plant is designed to produce about 154,000 tonnes of urea per annum. Equipment for this plant is being supplied partly by a West German firm and partly by an Italian firm; it is expected to go into production during 1966. The briquetting-carbonisation plant is being put up by a consortium of German firms and the State Electricity Commission of Victoria in Australia; it is expected to commence operation in December 1965. About 386,000 tonnes of carbonised briquettes will be produced for both domestic and industrial uses. The total outlay on the integrated complex, including the residential colony, is put at Rs. 117 crores.

In the course of removal of overburden, excellent china-clay, which is found close to lignite, also becomes available. A clay washing plant capable of producing 6,000 tonnes of washed clay annually has been set up. It is already in regular production. The clay is being used for the production of high-tension and low-tension insulators, sanitaryware, crockery and ceramics of various description. Apart from the main products which will increase the power, fuel and fertiliser resources of the country, there will be a number of useful by-products such as carbolic acid, cresols, fuel oils and char dust from the briquetting-carbonisation plant. Based on these byproducts, further subsidiary industries could be set up. A steel plant based on Salem iron ore and Neyveli lignite is also a possibility. The integrated Neyveli Lignite Project will thus play a vitally important part in fostering the industrial development of the Southern region. No one is pleased so much about the vast potentialities of the project as those who had at one time expressed serious doubts about the economics of the project.

SMALL-SCALE INDUSTRIES

Although the development of small-scale industries in the third Plan period uptill now has not been impressive, the first two Plans witnessed a rapid growth of these industries. There was a substantial increase in the number of units, the volume of production, employment and productivity. A wide variety of new products, requiring highly developed technical skills, was taken up. A brief survey of the growth and problems of these industries will be timely, as it will provide an appropriate background to such decisions as may be taken at the meeting of the Small-scale Industries Board which is being held at New Delhi at the time of writing. According to the studies conducted by the Central Small Industries Organisation, during 1959-61, small-scale industries accounted for the entire production in 14 industries such as clinical thermometers, bifurcated rivets, paper pins and gem clips, measuring tapes and mechanical toys. Ten other industries like fountain pens, rolling shutters, electric irons, metal clad switches, oil pressure stoves, wire netting and wire mesh, etc. had 80 per cent of the installed capacity in the small-scale sector. Similarly, out of 60 products for which figures are available as many as 41 items had more than 40 per cent of the total installed capacity in this sector. To give another indication of the importance of the small-scale sector, no less than 35 per cent of the national production of dyestuffs and almost two-thirds of the production of pesticides in the organised sector come from small-scale industries.

During the first two Plan periods the Government played an important part in encouraging the establishment of small-scale industries. The Small Industries Service Institutes, the National Small Industries Corporation, the Small-scale Industries Board and the Central Small Industries Organisation were all established during this period to assist these industries by way of technical advice, supply of machinery on hire-purchase, finance, sale and establishment of industrial estates. Various schemes for their development were drawn up and further expansion of capacity in the case of many industries was reserved for the small-scale sector. The third Five-year Plan recognised their role and emphasised a co-ordinated development of both the small-scale and large-scale sectors. For this purpose the Plan stressed that, "in each branch of industry, with a view to planned development, it is essential to have a comprehensive view of the requirements of the community, the contribution which small industries can make in relation to large-scale industries and the extent to which the processes and stage of production can be decentralised." An Ancillaries Directorate was set up in the Central Small Industries Organisation and a Standing Committee of the Small-scale Industries Board was assigned the task of continuously reviewing the progress of the development of ancillary units.

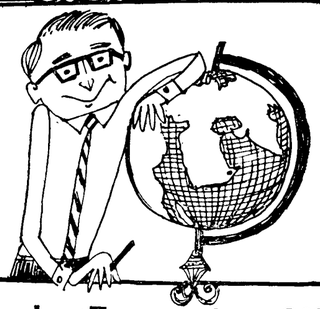
During the last two or three years, however, there has been almost a stagnation in the development of small-scale industries largely due to shortage of production requisites. Thanks to the tight foreign exchange position, imports of components and raw materials were restricted. Even the supplies of domestically produced raw materials like steel, pig iron, coke, etc. became scarce. Expansion of industrial estates was also affected by these shortages as well as by the non-availability of enterprising small entrepreneurs who can make use of the facilities made available by the Government in these estates. In recent months, much noise has been made by politicians and nationalisation of banking has been demanded on the ground that small-scale manufacturers have not been getting adequate credit from commercial banks. But this is not the real bottleneck. The State Bank of India and its subsidiaries in the public sector and commercial banks in the private sector have been doing much useful work. Actually, it is the terms of State Financial Corporations for giving credit to small industries that are very rigid, the emphasis being on security rather than the creditworthiness of the party and the paying capacity of the industry in which he is engaged. It may be noted here that the State Bank of India and its subsidiaries have provided the small-scale sector with cheap credit to the tune of Rs. 35 crores. Recently, the Reserve Bank of India carried out a survey of commercial banks' credit to small industries under its special schemes. It found that, notwithstanding the difficulties encountered by small manufacturers on account of shortage of raw materials, fuel, power and transport and the consequent difficulty in recovering the loans, the assistance rendered by commercial banks has been impressive and that, on the whole, bank credit to small-scale units has been rising at the substantial rate of 25 per cent per annum.

The development of small-scale industries has certain advantages as well as disadvantages. On the positive side is decentralisation. The importance of this factor has been recognised since the very beginning of the programme of development of these industries in this country. In the words of the Karve Committee, set up to draw plans for development of small-scale industries for the Second Five-year Plan, "the pattern of industrial activity that should gradually emerge is that of a group of villages having its natural industrial and urban centre. These small urban centres will be related to big ones; thus a pyramid of industry based on a progressively rural economy will be set up." The gestation period in these industries is also comparatively smaller than that in the case of large-scale industries.

Although these industries have a large employment potential and the investment per employee and per unit of product may also be low, it must not be forgotten that, in many cases, the production per person and the capital-output ratio is considerably lower than that attained in the large-scale sector. Capital being one of the most important factors in the economic development of the country, India cannot afford to have a low capital-output ratio by investing large sums of money in small-scale sector. Then there is the problem of the cost of production and the optimum utilisation of raw materials. The small-scale industries are generally not able to get the maximum out of the raw materials and in many cases the cost of production is also high. India—being short of almost every variety of raw material—can hardly afford this wastage; and in an economy faced with inflation there is a great need for bringing down the cost of production, both for home consumption and exports.

This, however, does not mean that all types of small-scale industries are subject to the limitations mentioned above. There may be some industries in the case of which the capital-output ratio may be equivalent to, or even higher than, that in the large-scale sector. There may be many others the cost of production and quality of which may be competitive and they may be able to capture even the foreign markets, as some of the units in the small-scale sector have already done. It would, therefore, be desirable to undertake a comprehensive study

All banks deal in money
We also deal with PEOPLE



The Foreign Transactions Officer

There's something quite refreshing about our foreign transactions man. All those strange far-away countries he has to deal with. And yet he's very much with you...for prompt courteous service. Is it an overseas remittance you want? Or a letter of credit? Or just valuable trade information? Just leave it to him. It's his job to solve your problem.

Drop in and see him anytime you want. It's almost as refreshing as a trip abroad.

Union Bank Helps People

Union Bank's streamlined methods can help you whether you are interested in Import or Export trade, or have business connections abroad. There are branches in all the important centres in India and correspondents in 72 countries with 22,414 offices. You will benefit from the fast, personalised and comprehensive banking service.

THE UNION BANK OF INDIA LTD.
66/80 Apollo Street, Fort, Bombay. Branches all over India.
Telex contact with countries all over the world.

ECONOMIC FREEDOM
THROUGH
EFFICIENT BANKING SYSTEM

The development and progress of banking in India during post-Independence years is a pointer to the irrefutable fact that an efficient banking system is the *sine qua non* of economic freedom.

Ever since its inception, Canara Bank has worked silently but ceaselessly by inculcating the banking habit in urban as well as rural areas, meeting the demands for development of trade, commerce and industry and helping people to achieve financial security through better financial management.

The earnestness of Canara Bank to make economic freedom a *fait accompli* finds expression in the diverse services offered by Canara Bank to promote 'better living through better banking' and to improve the social and economic conditions of the people and the country.

of the capital-output ratio, cost of production, quality of products—as a matter of fact, of all the economic aspects—of the various industries operated on small scale, in order to evaluate their contribution to the economic growth of the country and determine the scope for them in the fourth Plan. It is only the industries which can be established economically in the small-scale sector that should be chosen for providing all the facilities and encouragement. In view of the limited resources at the country's disposal, such a selective approach will be better than a haphazard growth of small-scale industries in every line of manufacture.

INDO-RUMANIAN CO-OPERATION

Systematic exchange of goods between India and Rumania started with the conclusion of a trade and payments agreement between the two countries a decade back in 1954, before which year only sporadic trading was transacted. Indo-Rumanian economic co-operation got cemented with the visit in 1962 of a Rumanian trade delegation, led by Mr. Gheorghe Gheorghiu-Dej, President of the Rumanian Peoples' Republic State Council, and with the commissioning of the first Indian State refinery at Gauhati that year, in pursuance of an earlier agreement signed at Bucharest in 1958. The outstanding results of this economic co-operation are visible in the petroleum sector. Rumanian experience and expertise have greatly helped India to tap its dormant oil and gas resources. Not only has Rumania designed and erected the Gauhati refinery, but that country has also supplied the requisite installations, equipment and materials. Moreover, many Rumanian drilling rigs for various depths operate at present on India's oilfields.

The visit of the Rumanian trade delegation in 1962, it will be recalled, resulted in a long-term agreement between the two countries. According to this agreement, long-term assistance —technical, economic and scientific—would be forthcoming from Rumania by way of complete industrial installations and technical know-how for the construction of chemical, petro-chemical and cement factories and power stations. Under the agreement, India has also been committed to export iron ore and other products in return. Thanks to this agreement and the inter-governmental management established in 1960, a two-way trade pattern has developed between India and Rumania. This country is thus importing, apart from oil equipment, tractors, road rollers, metal-working machine tools, high voltage electric transformers, diesel engines, electric and water meters, lubricating oils, sodium products, carbon black, dyestuffs, chemicals etc. from Rumania and is exporting to it products such as tea, pepper, coffee, iron ore, ferro-manganese, cotton yarns, jute sacks, vegetable oils, shellac, mica etc.

But, despite all this economic co-operation between India and Rumania during the last decade, the total value of trade between the two countries has of late begun to decline. The total exports to Rumania, which increased from Rs. 2.58 crores in 1961-62 to Rs. 3.38 crores in 1962-63, have declined to Rs. 2.75 crores in 1963-64. Imports from Rumania have also come down from Rs. 3.83 crores in 1961-62 to Rs. 1.85 crore, a decrease of nearly 50 per cent. While, it has undoubtedly been possible for this country to correct the adverse balance with Rumania, which stood at Rs. 1.25 crore in 1961-62, the fact must not be overlooked at the same time that the total volume of trade itself has come down from Rs. 6.41 crores in 1961-62 to Rs. 4.6 crores in 1963-64. It is needless to add that, in the long-term, only an expansion in the two-way trade would ensure better economic co-operation between the two countries.

INDO-CZECH ECONOMIC RELATIONS

Czechoslovakia is one of the countries actively assisting India in its task of economic development. The construction of four important public sector projects, namely, foundry-forge plant and heavy machine plant at Ranchi (Bihar), heavy power equipment plant at Ramachandrapuram (Andhra Pradesh) and high pressure boilers plant at Thiruchirapalli (Madras), started with the help of credit made available by Czechoslovakia under the first economic agreement signed between India and that country in 1959. Under this agreement, India obtained Rs. 23.1 crores from the Czechoslovak Government and Rs. 17 crores from Technoexport of Prague, the Czechoslovak foreign trade corporation. When completed, these projects will go a long way towards strengthening the country's industrial base. The Foundry-forge plant will supply castings and tools at the machine tools plant as well as for the production of machines at the heavy machinery building plant. The heavy power equipment and high pressure boilers plants are expected to strengthen the power base for industrial development.

The second economic agreement signed between India and Czechoslovakia on 11th May last provides for a further credit of Rs. 40 crores to India to finance the purchase of equipment from Czechoslovakia for expanding the aforesaid plants and for constructing a few new projects. The Technoexport has undertaken to tender planning and technical advice, besides making available the services of specialists for the machine tools industry. At present about 200 Indian technicians are being trained in Czechoslovak factories and the number is expected to increase to 700. And about 200 Czechoslovak experts are already helping India in designing, installation and commencement of production; this number is likely to increase to 800.

The beneficial results of closer economic co-operation between the two countries are reflected in the marked expansion of trade. The aggregate value of trade, which was no more than Rs. 13 crores in 1960, touched as high as Rs. 30 crores in 1963. India now occupies the third place in Czechoslovak's foreign trade with non-Socialist countries and Czechoslovakia holds the sixth position in the foreign trade of India. Between 1962-63 and 1963-64, while imports from Czechoslovakia to India have declined from Rs. 19.70 crores to Rs. 17.34 crores, exports to Czechoslovakia have gone up from Rs. 11.1 crores to Rs. 16.2 crores. Exports will be higher still in the coming years, as India will be repaying the credits through the delivery of Indian goods.

In the trade and payments agreement signed in November 1963, when the Czechoslovak Foreign Trade Minister, Mr. Frantisek Hamouz, visited this country, a provision was made for exchange of larger quantities of non-traditional, finished and semi-finished Indian goods. During the last week of March 1964, a purchase mission from Czechoslovakia, led by the Vice-Minister of Internal Trade, visited this country. The mission selected a number of consumer goods for the Czechoslovak market, including all types of socks, fully processed suedes, knitted ready-made woollen wear, wollen and cotton underwear, ladies' shoes, woollen knitting yarns, handkerchiefs, handicrafts, razor blades, etc. Meanwhile, efforts to find out the demand potential in the Czechoslovak markets are also under way. The Czechoslovak Government has made an offer to this country to organise an extensive exhibition of Indian engineering and consumer goods in Czechoslovakia in 1965 and has promised to give this venture wide publicity through newspapers radio and television. The Government of India has already decided to participate in the International Trade Fair at Brno (from 6th to 20th September 1964) along with 300 Indian firms. All this will ensure a faster rate of economic intercourse between India and Czechoslovakia.

4¾ PER CENT

ANDHRA PRADESH STATE DEVELOPMENT LOAN, 1976

ISSUE PRICE Rs. 99·50 PER CENT

OPEN ON THE 24TH AUGUST, 1964

The Loan will be closed without notice as soon as the subscriptions amount to Rs. 11 Crores approximately, and in any case not later than the close of business on the 29th August, 1964.

Applications will be received at—

(a) the offices of the Reserve Bank of India, Bangalore, Bombay (Fort and Byculla), Calcutta, Madras, Nagpur and New Delhi,

(b) the branch of the State Bank of India at Patna,

(c) the branches of the State Bank of Hyderabad and the State Bank of Mysore conducting Government Treasury work in the State of Andhra Pradesh,

(d) the branches of the State Bank of India, in the State of Andhra Pradesh at places not covered by item (c),

(e) the Government Treasuries and Sub-treasuries in the State of Andhra Pradesh at places not covered by items (c) and (d).

FULL PARTICULARS CAN BE OBTAINED

at any of the Offices or Branches mentioned above or at any Treasury or Sub-Treasury in the State of Andhra Pradesh.

ANCESTRAL HOME PUTS ITS HOUSE IN ORDER

By Questor

IT has recently become the fashion for large British companies which run into trouble over profit-margins and realise their need to get rid of superfluous fat to call in the American consultants, McKinseys, to advise them how best to do it. Shell has called them in; so has Imperial Chemical. Now the British Insurance Association is following along the same track. There could be no plainer evidence that the British insurance industry, the progenitor of the insurance business, knows itself to be in difficulties.

It is not the first piece of evidence. The larger insurance companies have been trying (successfully) to cut their costs for ten years past, and, recently, there have been a number of mergers arranged with economies in mind. But the experience of 1963 has encouraged everyone to move faster in this direction. The fourteen largest offices in Britain, whose business has a foreign content, received a premium income of just on $2,500 million last year and made a loss on underwriting of $87 million—their largest since the San Francisco earthquake.

It was possible to pay dividends only because the loss on underwriting was more than covered by investment income. Experience of financing operating losses out of investment income is common in the United States, but no insurance company can be happy to regard it as a normal condition of business. Hence, no doubt, the decision to call in McKinseys.

Last year's losses were only in part the result of exceptional factors, among which the severity of the winter stands out most obviously. The cost of fire damage continued to rise, not only in the U.S. but in Britain. During the past couple of years, it has been half as high again as the average for the preceding two, and it looks like being higher still in 1964. Experience in the accident department, which is dominated by motor business, was only slightly less bad. Only the marine and aviation side continued to be profitable: but claims are increasing here, too, and this side of the business is in any case relatively small. What is worrying the industry is not so much the results of a particular year, even a year like 1963, but the fact that the long-term trend looks distinctly unhealthy.

Continually raising premium rates cannot be the answer. It is being gradually recognised in the industry that the rapid growth of car population and the switch to open-plan factory building both demand a fundamental change in the traditional methods of fixing premiums. The first means that risk ought to be related not only to the type of car and the record of the driver but to the frequency with which it is likely to be used and the type of traffic conditions it is likely to encounter. The second suggests that British business is much less conscious than it ought to be of the fire hazard implicit in modern factory designs and that a sharp discrimination in rates would help to increase both awareness of the hazard and readiness to finance measures likely to reduce it.

This tendency to relate the individual premium more closely to individual circumstances is balanced, however, by a growing realisation that standardisation is the most hopeful approach towards cutting costs, two-thirds of which consist of salaries. The bridge between two apparently contradictory objectives is provided by the computer, which is only just beginning to make an impact on the insurance industry. A greater use of computers will not only make possible a considerable reduction in expensive clerical staff. It will also enable underwriters to make a much more accurate assessment of the real risks inherent in different types of situation and then to quote a variety of standardised rates.

A move in this direction will plainly tend to favour the larger companies, which have most to gain from cutting costs, and to produce still more mergers in the industry. It is also likely to have a gradual effect on life assurance, which at present is growing rapidly in Britain. The two main faults in current life assurance practice, from the point of view of the consumer, are, first, that an extremely conservative view is taken of the risk, so that the policyholder gets large bonuses but only when the Company sees fit to declare them; and, second, that it is still sold largely through professional agents (solicitors, bank managers and so on) who receive a relatively large commission for introducing the business.

As computers replace actuaries, premiums will tend to be more nearly related to the actual risks involved in assurance. And, as the larger companies become more dominant still, they are likely to look for new business less to commissioned agents and more to public advertising. Both their customers and their shareholders, I believe, stand to benefit from these changes.

* * * *

HOW MUCH IN THE KITTY?

Is there good reason for allowing banks exemption from any of the accounting requirements which the law imposes on other public companies? British banks—those which accept deposits—have always been allowed, despite successive Companies Acts, to accumulate inner reserves whose value is not disclosed in their published balance-sheets; their published figures of profit, similarly, are struck after undisclosed transfers to or from these inner reserves. Many people now regard this exemption as anachronistic and made their opinion plain to a committee appointed by the Government several years ago to recommend any changes which might be needed in the present structure of Company Law.

The Committee's report was not exciting. The main financial abuses which originally led to its appointment were dealt with in separate legislation. There were only three issues, apart from the vast mass of technical changes which these committees always recommend, which interested the financial community in general—the case for abolishing non-voting shares, the case for demanding much more information in company accounts, and the case for suspending the accounting exemption allowed to banks. On all three, the Committee came down for leaving things much as they were. But a sizable minority (five out of fourteen) considered that the banks should be allowed exemption only if they could convince the Board of Trade of the merits of their individual case. And the British Government, which recently announced that it intended to hold discussions with the banks before making up its mind on this point, evidently regards the question as still being entirely open.

The traditional argument for allowing the banks exemption is simply that any lack of confidence in their stability might cause depositors at home and abroad to withdraw their funds, so disrupting the banking system as a whole. Banks suffer fluctuations in their income and in the value of their investments from time to time which are large in relation to their profits; and full disclosure of these, it is argued, might prevent them from making adequate provision for the future in good years and shake confidence in their stability in bad ones. A run on the banks is admittedly unlikely in modern conditions, but the majority found it not impossible to imagine: and, therefore, decided to leave well alone.

It is perfectly true, of course, that bank profits are liable to fluctuate a good deal from one year to another and that it is the trend, rather than the results of a particular year, which is important: the dissenting minority would have been quite content if the banks were to publish honest profit figures every three years or so. But the argument about confidence is difficult to swallow. First, British merchant banks have published accurate figures from time to time when applying for a stock exchange quotation without suffering harm, and investment analysts make regular guesses (accurate or not) about the true size of bank profits and reserves. Second, it is exceedingly difficult to imagine circumstances in which there would be a run on one of the large British branch banks—eight years ago some of them admitted in their accounts that their investment reserves were more than exhausted, and their depositors showed no interest whatsoever; if such a run were to develop, the Bank of England would undoubtedly intervene to put things right in good time. Third, it does not flatter the intelligence of depositors to suppose that they repose greater confidence in a bank which conceals its true reserves than in one which has the courage to display them; indeed, it could be argued that the present system is a standing invitation to attract deposits under false pretences.

Banks large enough to be public companies are so closely supervised in Britain that there is little risk of the sort of mismanagement which often led to financial crises in the nineteenth century. Yet exemption from the necessity to disclose full information about profits and assets to the stockholders can lead, as with any company, to a different sort of mismanagement. It leaves the directors free—in the short run, at least—to pursue unadventurous policies and to make an inefficient use of the assets they manage. To take one example, the British branch banks own a great deal of property, much of it in commanding sites: there was even a rumour some years ago that one of the smaller banks (now safely absorbed into a larger) might be the subject of a take-over offer on the grounds that the market price of its stock was much below the value of the underlying property assets. Yet the banks are only now beginning to join wholeheartedly in major schemes of redevelopment. Competition between them ought, in theory, to ensure that assets are efficiently exploited, but outsiders sometimes wonder whether competition is as keen as the bankers themselves claim.

There is a conflict in every banking system between the need to encourage competition and the need to ensure that it does not go so far as to endanger the stability of the financial machine. Banks are strictly supervised in the national interest and are therefore not quite like other companies: this is a factor which the investor has to take into account. There may well be a case for allowing them some liberty to smooth out yearly fluctuations in profits by transfers to and from reserves where it is decided that this is in the national interest. But I do not believe that there is any case for allowing the present sweeping exemption automatically to the 100 odd banks of different kinds which are at present recognised by the Board of Trade in Britain. It would be much better, I think, to make each apply for exemption on its individual merits and to limit the exemption to the publication of a three-yearly or even a five-yearly rather than an annual statement of true profit. I hope that the British Government's decision to regard the question as still open, despite the majority recommendation of the Company Law Committee, will produce some such result as this.

SWEDEN SPENDS KR. 1,500 MILLION A YEAR ON RESEARCH

Sweden spends some Kr. 1,500 million ($300,000,000; or about Rs. 145 crores) a year on research and development. This corresponds to just under 2 per cent of the gross national product and makes her rank tenth, in absolute figures in terms of such expenditure among the world's leading industrial countries, according to *Företage och Forskningen (The Enterprise and Research)*, a publication recently issued by the Swedish Industrial Council for Social Economic Studies.

Out of total research and development spending in Sweden, industry accounts for two-thirds and the Government for the remainder. The Kr. 1,000 million spent by industry includes a couple of per cent for basic research, some 20 per cent for applied research and the remaining three quarters for the development of new products and processes.

An estimated 20,000 people, including some 5,000 holding an academic degree, are engaged in research in the industrial sector, which corresponds to two per cent of total industrial employment.

Of industrial branches, engineering accounts for the largest research spending, with a total of Kr. 602 million in 1959, the latest available breakdown figure. Next follow the chemical industry and the steel and metal industries. The heavy-weight in engineering is the aircraft industry, with Saab as an individual company, holding the lead. A further couple of major companies have research expenditures in excess of Kr. 50 million each.

Of the country's about 20,000 industrial companies, some 10 per cent do their own research. Altogether there are approximately 300 research laboratories within industry proper.

Government-sponsored research is traditionally carried out at institutes of learning such as colleges and universities, but also at other Government institutions and special research institutes. It is co-ordinated by a top-level research committee, twelve research councils and ten academies. A total of about 10,000 people are engaged in Government-sponsored research. The Swedish Government also participates in international programmes, such as research conducted within the framework of U.N.E.S.C.O. and O.E.C.D.

Besides the governmental and industrial activities in this field, research assignments are also placed by Swedish companies with foreign research institutes, with the Swedish nuclear research station at Studsvik, etc. A good deal of research is also conducted by individual researchers, inventors and engineers in their own laboratories and by local bodies such as port authorities and water works.

INTERNATIONAL LIQUIDITY

INCREASE IN I.M.F.'S RESOURCES FAVOURED

ALL the discussions on the adequacy of international liquidity during the last three or four years emphasised the necessity to enquire rather than to act. At the 1963 meeting of the International Moneary Fund (I.M.F.), the Managing Director indicated that the Fund would intensify its studies of international liquidity and related questions. Accordingly, the officials of the Fund made a special study of the problem. At the same time, the ten members of I.M.F. forming the Paris Club* also established a study group to make a thorough examination of the "outlook for the functioning of the international monetary system and of its probable future needs for liquidity." The essential tasks of both these committees during the last year have been to ensure that the central bankers and financial officials fully appreciate the basic points which the various economist-reformers have been making for altering the present international liquidity mechanism. The nineteenth annual report of the International Monetary Fund, published this week, includes, among other things, the principal findings of the Fund's Study Group. Its main finding is that "there is a case for an increase in members' quotas." It does not, however, recommend an increase in the quotas straightaway. Instead, it has proposed an early and detailed examination of the subject, in order to decide on the *size* and *timing* of a general increase, as well as on the need for special increases for individual countries. Even at Tokyo, where the twentieth anniversary of the Bretton Woods Conference is scheduled to take place next month, the emphasis is likely to remain on *preparing* for the reform rather than on the reforms themselves.

Adequacy of Liquidity

The question of adequacy of liquidity has taken a prominent place in recent and current discussions. The concern of the I.M.F. itself over international liquidity is not new: in 1953, a staff paper was published analysing the "adequacy of monetary reserves." In 1958 again, a staff study, entitled "International Reserves and Liquidity," concluded that the resources of the Fund were inadequate and recommended an increase in member nations' general quotas. This recommendation had great weight in the subsequent discussion on Fund quotas which led to the general quota increase in 1959. The ever-growing strains and stresses on the balance of payments position of an increasing number of countries in recent years, the pace and pattern of economic development among the developing countries, and the problems and policies concerned with aid, trade and transfer of resources from the rich to the poor countries, all these have once again raised the question of the qualitative and quantitative adequacy of the international liquidity structure.

In its study of international liquidity, the Fund has given due weight to the views and interests of countries at different stages of economic development and with dissimilar economic and financial institutions. Whatever be the views and interests of the developing countries, the provision of liquidity depends to a very great extent on the policies adopted by the major industrial countries, and the Fund has kept itself informed of the current thinking on these issues among the representatives of these countries. In its analysis, the Fund has not merely confined itself to the question of adequacy—present as well as future—but also outlined the main and major issues involved in the current discussions on liquidity.

International liquidity consists of *all* the resources that are available to the monetary authorities of countries for the purpose of meeting balance of payments deficits. The range of available resources is large and full of variety—from the assets readily available to resources that become available only after extensive negotiations. Assets that are readily or automatically available (*without* any prior conditions that significantly restrict the user's right of access) include at present holding of gold and exchange reserves in freely convertible currencies, gold tranche positions in I.M.F. and, in many instances, bilateral mutual credit or swap arrangements. Most other forms of liquidity are available only on prescribed or negotiated conditions as to use or as to the policies to be pursued by the country using it, though it may be that the degree of restriction may vary from case to case. The latter category even includes a country's capacity to borrow in the money markets of other countries and, in the case of a country with a key currency (as, for instance, the U.K. as the head of the sterling area), the willingness of other countries to accumulate further holdings of its currency. International liquidity thus covers also a wide spectrum of availabilities which are not readily subject to statistical measurement.

*Belgium, Canada, France, Federal Republic of Germany, Italy, Japan, Netherlands, Sweden, U.K., and U.S.A.

Policy Effects

To a large extent, the volume and direction of private international transactions depend upon the lever of international liquidity. It is true that the network of general liquidity and mutual credit arrangements among the members of he Paris Club has discouraged speculative movements on international exchange markets. Even so, the possibility of changes in the policies followed by national Governments, changes dictated by balance of payments considerations and of their unwelcome repercussions on other countries, is still there. Accordingly, any judgment as to the adequacy of a given level of international liquidity must reflect an estimate and an evaluation of the probable policy effects of expanding or contracting such liquidity.

Increase in liquidity, for example, makes it easier for the countries to which it is available for use to follow more liberal policies in regard to trade and capital movements and to follow more expansionary (or less contractionary) financial and monetary policies. If the international liquidity available for bridging *temporary* gaps in the balance of payments were not sufficient, many countries would find it difficult to correct maladjustments in their balance of payments without resort to measures destructive of national or international prosperity: arguing from the other hand, it may be stated that, if the general level of effective demand in the world were to hamper growth and employment, an expansion of international liquidity would be desirable.

Maintaining Balance

The economic policies in almost all countries are determined, guided and influenced by the triple ideal of high employment, economic growth and stable prices. In the international context, this also means that the countries must keep their overall balance of payments in balance *over a period of years.* In the short run, disequilibria one way or the other may be unavoidable or even inevitable, and the precise function of international liquidity is to bridge the gap between the short and the long-term without forcing the affected countries to follow policies that are destructive of national or international prosperity; an adequate supply of liquidity has, therefore, to provide enough *time* to enable the policy adjustments to work themselves out. The relationship between the availability of liquidity and the process of adjustment is clearly implied in the Fund's purposes and functions. Article I(v) says that the Fund is to make its resources available to members, under *adequate safeguards,* in order to provide members with an opportunity to correct maladjustments in their balance of payments, without, however, resorting to measures destructive of national or international prosperity.

Where the I.M.F. has failed is in making a distinction between the problems and needs of the developed and the developing countries. The short-term for the developing countries will have to be considerably longer than for the developed countries, and the adjustments involved will have to be far more fundamental, for the structural changes that may be required in the economy of these countries may take longer than usual to be effective.

Fiscal and Monetary Policies

The Fund has always insisted that fiscal and monetary policies should play an important role in restoring the balance of payments equilibrium, and that international shifts in relative costs, prices and incomes should take place, with their consequent effects on the flow of trade. The Fund, therefore, seems to feel that a proper use of policies should make it possible to correct and reverse balance of payments disequilibria within a reasonably short period without prolonged unemployment or stagnation in developing countries which are largely and frequently in deficit and without undue inflationary pressures on developed surplus countries. An appropriate use of international liquidity is allowed during this period of adjustment. But here the Fund has proceeded without appreciating the problems of both the developed and developing countries. The developing countries may not only find that, in spite of an increasing *volume* of their exports, their foreign exchange earnings are dwindling as a result of worsening terms of trade; they may face limitations in the free use of tied international credits and grants; they may also find that the limitations on the effectiveness of fiscal and monetary policies in the relatively unorganised markets and economics of their countries considerably prolong the period of adjustment required.. On the other hand, the developed countries may not be willing to allow their costs and prices to be affected and may not be willing to reduce or cut tariffs in order to encourage a freer flow of trade. Germany and Italy are the latest examples of countries which have shown their reluctance, in no unmistakable terms, to follow policies which may in fact mean an import of inflation from abroad, thus perpetuating the inflow of funds and mounting surplus. In fact, the I.M.F. has conceded that international adjustment through changes in relative costs and prices in different countries involves more upward adustments in surplus countries than downward adjustments in deficit countries—both of which are difficult to achieve.

Prospective Trends

On the occasion of the last annual general meeting of the I.M.F., it was generally agreed that the supply of international liquidity was adequate. This year's annual report of the Fund, however, points out that the adequacy of general level of liquidity does not necessarily mean that its distribution among countries or the supply of each type of liquidity is equally satisfactory. Moreover, it is necessary to examine, says the Fund, prospective trends in the adequacy of international liquidity. After a detailed study of the factors governing the demand for and the supply of liquidity over the last decade, the I.M.F. has come to the conclusion that, in the next decade, there is likely to be a persistent and substantial growth in the demand for international liquidity.

Discussing the nature of the aditional liquidity required, the Fund refers to the merits and demerits of the bilateral regional arrangements outside the Fund and the multilateral liquidity provided by the Fund. Bilateral credit arrangements between monetary authorities which have been introduced among industrial countries in recent years are useful in several respects, particularly the speed and secrecy with which they can be invoked to deal with speculation. The swap arrangements made by the U.S. Treasury with the European Central Banks and the London Gold Pool with the participation by European and U.S. Central Banks are two excellent illustrations. But the very bilateral character limits the scope and usefulness of the arrangements. The advantages of the multilateral institutional approach is that liquidity is available to countries on a world-wide basis, at appropriate times, and on appropriate terms and conditions. The Fund has, therefore, recommended an examination of the desirability of increases in quotas for expanding operations of the Fund and for providing additional liquidity. The entire problem

HARVEY FABRICS ARE THE FIRST CHOICE OF LEADING CYCLE TYRE MANUFACTURERS

Tough, durable Harvey cotton tyre fabrics provide the sinews for the finest cycle-rickshaw and cycle tyres. That's why they are the first choice of leading tyre producers such as Dunlop, National Rubber Manufacturers, Oriental Rubber Industries and Cosmos India Rubber Works. Harveys' Cotton Cycle Tyre Cord Warp Sheet, Cotton Cycle-Rickshaw Warp Sheet and Cotton Cycle Bead Wrapping Sheet are extensively used by the industry.

Harveys' Madura Mills are today India's largest producers of Industrial fabrics. Through the years they have built up a world-wide reputation for consistently high quality. They have the men, machines and knowhow to produce a wide range of industrial fabrics like Tyre Cords, Belting Ducks, Light and Heavy Canvases and Filter Cloths.

What's more, Harveys can weave industrial fabrics to *your* specifications—however rigid. Recent expansion at Madura Mills, with the installation of up-to-date high speed looms and precision machinery, have further increased Harveys' weaving capacity. They can now meet all your requirements in industrial fabrics... to your complete satisfaction.

Do you know?
The average annual wage of a cotton mill employee is nearly Rs. 2,000.

MANCHESTER LETTER

COURTAULDS ENTERS COTTON INDUSTRY

MOVE TO ACQUIRE THE TWO BIGGEST SPINNING GROUPS OF LANCASHIRE

From Our Special Correspondent

MANCHESTER, *4th August*

CONTROL of the two biggest spinning groups in the Lancashire cotton textile industry now seems likely to pass into the hands of Courtaulds, the man-made fibre combine. Takeover bids for Lancashire Cotton Corporation and Fine Spinners and Doublers—announce on the same day and together worth £37 million —have been accepted by Directors. The Boards of the two Lancashire companies are recommending the offers, and advise shareholders to accept the bids.

From the Manchester traders' viewpoint, the news has been received with mixed feelings. There have only been isolated instances in which the matter has been treated sensibly by the Press and the giant deal has brought with it what many Lancashire cotton men regard as uninformed and unfair criticism.

One writer, observing that at last the entire process, "for good or ill," is now really concentrated in a single planning, thinking, foreseeing hand, quite rightly says that Lancashire has seen this solution to its problems for years. The critics will, of course, immediately reply that the industry should have organised itself through its own endeavours, but, in the modern era, the emphasis undoubtedly rests on finance. This has, in fact, only been available from the built-up reserves of man-made fibre giants during the past 15 months.

In the circumstances, it must be regretted that control is now vested in London. That Courtaulds, indeed, is now the instrument through which this power will be translated into action is something of a paradox. The way in which the pressure has been applied on Lancashire firms smacks very much of the manner in which I.C.I. made its controversial bid for Courtaulds some 2½ years ago.

Almost an Insult

If the offer for Fine Spinners, giving the Directors just three days' grace to consider their verdict, could be described as a whirlwind courtship, the matter of minutes between the handing over of the bid for Lancashire Cotton to their Directors and the public announcement of its contents was far more in the nature of "a shot-gun marriage." In the hope that at least some facts which must be borne in mind in taking a reasonable view of the outlook will eventually permeate to some of those who have been excessively quick to castigate cotton, it is only fair to quote a number of aspects of the situation, however evident they may be to those who are in close touch with the trade itself.

First and foremost, the part which cotton plays in the textile scenes should be reiterated yet again. Whatever the eventual outcome of the forthcoming adjustments, the production of cotton yarn and cloth at the moment still represents approximately two-thirds of the industry compared with one-third accounted for by man-made fibres. It may well be that these proportions will at some future date be reversed, but even the most prejudiced believers in the synthetics admit that such a change will only be accomplished in time—quite probably in a score of years or more.

Reliance on Man-made Fibres

At the same time, anyone who professes a faith in the future of textiles as a whole knows perfectly well that the ability to produce goods with suitable characteristics for individual end-uses must increasingly rely on the man-made fibres whose output and distribution can be more easily adopted to the needs of the moment than agricultural fibres, whose availability has often been jeopardised by the whims of nature.

For many years past, scarcely a firm could be found in Lancashire which did not process man-made fibre goods. Recognition of this fact has come in the merging of trade associations and the general acceptance that no separate industries existed but only one major entity engaged in the output of cotton and man-made fibre materials.

In this connection, it is pertinent to quote part of a survey recently undertaken by a firm of Manchester stockbrokers on the usage of man-made fibres in the cotton industry. By the beginning of the last decade, this report observed, man-made fibres accounted for some 25 per cent of total production of woven cloth. In recent years, the U.K. demand for both cotton and man-made fibre fabrics has remained relatively static, reflecting to some extent the swing to knitted apparel.

Consumption of man-made fibre cloth within the total, it is stated, has in fact declined. At the same time, the rise in the proportion of total cloth production represented by man-made fibres to about a third has been due solely to the fact that the effect of the substantial increase in imports has been confined to the cotton cloth side.

Rayon's Tariff Wall

Those who are excessively critical of the attitude of the cotton leaders in constantly calling for protection seem to assume that suppliers abroad will never take up man-made fibre production on any scale. Already in the first half of the current year, the imports of man-made fibre yarn and thread have risen sharply, while arrivals of foreign man-made fibre cloth have increased from 29 million square yards to 46 million square yards.

Lancashire cotton has stood entirely on its own as a major British industry, completely unprotected for many years from the inroads of foreign competitors, until the recent Government action to license arrivals before new suppliers gained a footing on the home market. In contrast, the rayon products emanating from Courtaulds already account for well over 90 per cent of British consumption. Often completely ignored by those writers who glory in attacking cotton is the fact that rayon is protected by a formidable tariff of 7½*d.* on a basic price of around 17*d.* Inevitably, this gives the fibre a position of great power in the industry and it is scarcely surprising that its growth has been substantial and that its future should seem almost impregnable.

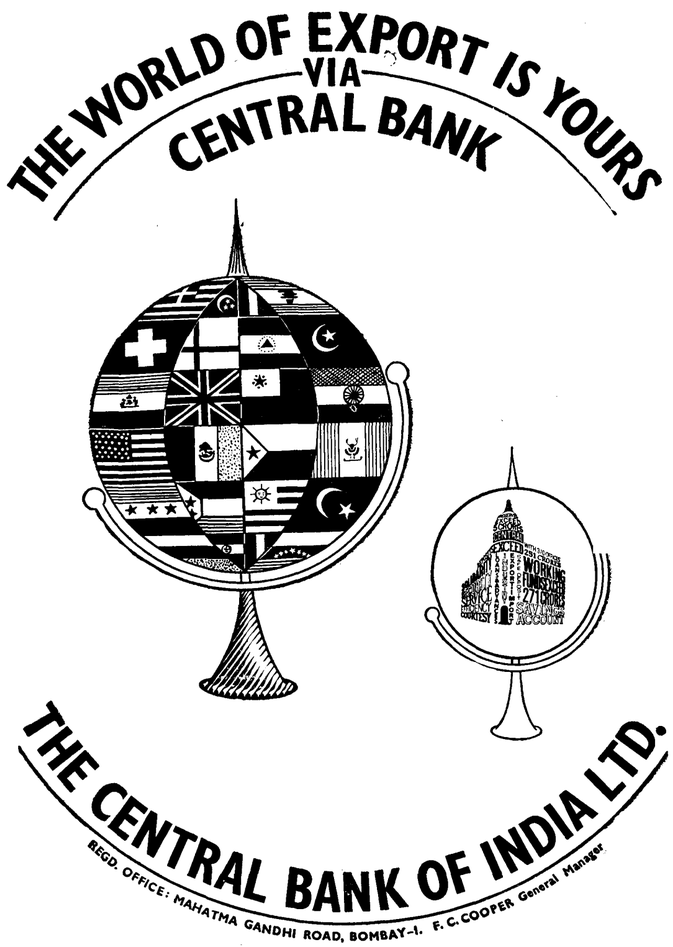
Barlow and Jones Takeover

Another big takeover move in the Lancashire cotton textile industry, followed soon afterwards. English Sewing Cotton, the Manchester-based group, is bidding two-and-half million pounds for the 90-year-old Bolton spinners and manufacturers, Barlow and Jones. The Barlow and Jones Directors are recommending shareholders to accept the offer as "fair and reasonable."

The development came just 72 hours after the £36,000,000-bid by Courtaulds for the two biggest groups in the cotton industry, Fine Spinners and Doublers and Lancashire Cotton Corporation. The 90-year-old Barlow and Jones company has six mills—five in Bolton, one in Dukinfield—and employs more than 1,800 workers. It has spent more than £1,250,000 on modernising its mills under the big cotton streamlining programme. All the mills are geared to two- and three-shift working.

Indian Order

A Yorkshire company has won an order worth £1½ million for the supply of worsted spinning machinery to India. The agreement, announced last week, has been signed by the State Trading Corporation of India and Prince, Smith and Stells, Keighley, a member of the Stone-Platt Industries group. The deal follows a recent contract secured by the same group for the supply of cotton machinery to India.



TEA PRODUCTION AND EXPORTS

REVISED THIRD PLAN TARGETS LIKELY TO BE ACHIEVED FULLY

THE Planning Commission's sub-group on tea, it will be recalled, recently revised downward the third Plan production and export targets for this beverage fixed to be achieved by 1965-66, the former from 900 million lbs. to 830 million lbs. and the latter from 610 million lbs. to 530 million lbs. When the findings of the sub-group were published, a section of tea planters was somewhat doubtful whether even the revised targets could, in fact, be fulfilled. But the actual trend of output and exports in the past few months seem to belie these doubts. Indeed, it looks as though the revised targets will not only be fully reached but actually exceeded. This at any rate is the impression one gets from the deliberations of the eighth annual general meeting of the Tea Association of India held at Calcutta last week. Both Mr. S. R. Daga, who presided over the meeting, and Mr. A. S. Bam (Chairman of the Tea Board), who inaugurated the meeting, painted a rosy picture about the prospects for the tea industry. The industry, Mr. Daga said, would be able to increase production during 1964 to a figure which might justify the revised target and fixing the export target at 530 million lbs. did not mean that the industry would not try to go beyond it; he did, of course, hasten to add that the export performance would depend much on the incentives the industry would get to reduce its production costs so as to sell its tea at competitive prices. While Mr. Daga did not give any estimate of tea exports in 1964, Mr. Bam was quite confident that an export of 510 million lbs. should be possible. As for 1965, Mr. Bam expected exports to reach 530 million lbs. out of a total production of 830 million lbs.

The anticipated production and export performance of tea industry in the current and next year is certainly encouraging against the background of the actual experience of last year. No more than 760 million lbs. of tea were produced in 1963, as against 780 million lbs. in 1962. Exports of tea no doubt registered a rise, but the rise was not appreciable, being 22 million lbs.; the quantity actually shipped was 494 million lbs., as against the 472 million lbs. shipped in 1962. Although India continues to hold the distinction of being the largest exporter of tea in the world, it is fast losing its position of vantage in world markets. Pinpointing this aspect, Mr. Daga said: "Considering the increase in the world tea consumption, we have given way to other producing countries."

Problem of Finance

The growing competition in world tea markets underlines the urgent need for renewed efforts to maximise production, improve quality and reduce costs. In regard to maximisation of output, the Tea Board Chairman felt that, by 1970, a substantial area planted with new bushes would come into bearing and that this additional area, together with a greater application of fertilisers, irrigation and pest control measures, would doubtless lead to a per-acre yield of 1,200 lbs., as against about 1,000 lbs. obtained at present. Mr. Daga's assessment of the position was somewhat different. He was rather doubtful whether production of tea would go up much further by intensive cultivation. For the increase, if any, according to him, would probably be offset by gradual deterioration with the age of total tea area. Recalling that replacements and extensions during the fourth Plan period (1966-71) in respect of 61.2 per cent of the tea gardens of North East India were estimated at 47,000 acres, he held out the assurance that the industry will be able to replant, replace or extend to the extent desired, *given the necessary financial assistance* (Italics ours). Emphasising how important the problem of finance is, Mr. Daga observed:

"Finance has been a chronic problem for the Indian tea industry. The industry needs a very large amount of money for the annual recurring needs on crop hypothecation. Constructing labour houses as required under the P.L. Act, procuring necessary tea garden stores such as coal, cement, fertilisers and iron and steel, purchasing food-grains for subsidised distribution—all these require considerably heavy amount of expenditure. In recent years, after payment of 15 per cent of profit as labour bonus and more than 50 per cent as Central income-tax and State agricultural income-tax and after paying a reasonable dividend, very little is left with the companies to meet the expenditure on capital account or to block larger amount on stores, etc. These have caused some deficits in yearly crop hypothecation account with scheduled banks for some companies. Though such deficits are carried to the next year in liquidation of everything of the previous year, the closing debit balances have been on the increase. Tea companies with such heavy closing debit balances are, therefore, unable to get required finance from the banks. It is necessary that some advance from long-term financing agencies should be provided to the industry so as to meet these deficits."

It is to consider this vital question of finance for the tea industry that the Government of India has recently constituted a high-powered committee (Chairman: Mr. V. V. Chari, Additional Secretary, Ministry of Finance). The Committee is expected to submit its report before the end of October next.

Tax Relief

The findings of the Chari Committee will doubtless reveal that a large number of tea companies cannot afford capital expenditure. For, apart from the fact that depreciation is not allowed on tea bushes, there are the rising costs, mounting liabilities under the Plantations Labour Act and greatly increased taxation. Mr. Daga was certainly voicing the opinion of the industry as a whole when he urged that the cost of replanting, replacements and extension of planting should be allowed as revenue charge for taxation purposes. "This," to quote him, "will be the simplest and best encouragement to replace and extend time-worn tea." Several months have elapsed since Mr. Manubhai Shah first disclosed that the plea was being seriously considered by the Government of India, but no official decision has yet been taken. The State Governments, too, are silent on this issue. Now that a special committee is going into the whole question of tea finance, they may prefer to wait till this Committee submits its report. The Tea Board Chairman was, however, of the view that the State Governments, instead of waiting for the Committee's findings, should themselves take initiative and treat cost of new plantings as a revenue charge for the purpose of agricultural income-tax.

Sympathetic Response

The Tea Board is no doubt offering certain financial facilities to the industry, but they are inadequate. Take, for instance, the scheme of hire purchase of machinery. The scheme, though it gives some latitude to the industry to acquire certain machinery within a limited amount, is said to have two defects: very high rate of interest and procedural delay. Mr. Daga's plea for reducing the rate of interest is unexceptionable, considering that tea production and manufacture are a predominantly agricultural activity. Equally unexceptionable is his plea for including in the scheme a reimbursement clause which would enable the gardener to place their orders for machinery and expedite installation. The clause, according to him, would also make it possible for the gardens to obtain withering machines and oil-firing equipment available from suppliers who are not on the Board's panel and who may be reluctant to be on it because of the terms and conditions. These pleas evoked a sympathetic response from the Chairman of the Tea Board. The Chairman disclosed that a further reduction in the rate of interest was being considered, that the scheme for allowing tea gardens to place order for tea machinery would be considered in detail, and that a fresh scheme

MORE NATIONALS LOOK OUTWARDS

NEW TREND IN WORLD OIL TRADE

THE movement of national or predominantly State-owned oil companies into international operations is not a new thing. Hitherto, however, only State companies of European origin, such as the French B.R.P. and the Italian E.N.I., have gone overseas to look for oil or to build refineries. Now there are signs that national oil companies in the Middle East and India are also moving on to the international scene.

The Kuwait National Petroleum Company, in which the Government has a 60 per cent interest and Kuwaiti shareholders the other 40 per cent, has already a small participation in a refinery under construction in Southern Rhodesia, and has now awarded contracts for the building of a wholly owned 90,000 barrels a day refinery to be situated in Kuwait but to operate almost entirely for export. K.N.P.C. has been investigating outlets for its future products, notably in India. Delegations have been exchanged between the Indian and Kuwaiti authorities who have, however, not announced any firm agreements for future purchases. The possibility has also been mooted that K.N.P.C. might participate in building a refinery in India. The Company has so far no crude of its own, although it has been granted a concession for exploration in Kuwait in which India for its part might seek to participate. Meanwhile, sources of crude are more immediately available to K.N.P.C. The Kuwait Government could sell the company royalty crude and the concessionaires Aminoil and Arabian Oil will probably have increasing quantities for disposal.

More momentous if less advanced at the present time is the proposal for the National Iranian Oil Company to embark on downstream operations outside the country. The Shah has stated that Iran is looking forward to going into the oil markets of the world either on a basis of partnership, or, after market research, through direct investment, and N.I.O.C. has stated that it welcomes assistance from any company in getting direct markets for its oil.

Rich in Crude

N.I.O.C. would have access to ample crude. Not only might it take one-eighth of Consortium production in kind instead of the more profitable cash but it is entitled to crude from the two joint ventures in which there is a fifty per cent N.I.O.C. shareholding. Under the terms of these undertakings N.I.O.C. was to put up half the cost of developing discoveries, as well as reimbursing the foreign partner half the exploration expenses. The State budget does not allocate funds to N.I.O.C. Apart from a profit on internal distribution, the Company's only source of income would seem to be its share of the crude from the joint ventures. So that it may be meeting its obligations under the joint venture agreements by assigning part of this share of crude at some agreed valuation. Nevertheless, all in all, N.I.O.C. can certainly lay its hands on crude for sale abroad.

S.I.R.I.P., the partnership with E.N.I., is already producing at a rate due to reach 27,000 barrels a day this year. N.I.O.C. representatives recently in Italy appear to have explored the possibilities of N.I.O.C. participating with E.N.I. (A.G.I.P.) in Italian or international marketing, or the partners might build a refinery in India. Another idea is for N.I.O.C. to acquire an interest in an independent Italian company engaged in refining or marketing in Italy. Again, I.P.A.C., in which N.I.O.C. shares with Pan American, will begin exporting on 1st September at an initial rate of 100,000 barrels a day to be increased later, and N.I.O.C. might be associated with Pan American in a proposal to build a refinery in India for which I.P.A.C. would supply the crude. Any Indian refinery taking Iranian crude competes to a certain extent with Abadan—but is still preferable from N.I.O.C.'s point of view to an Indian refinery using non-Iranian crude.

Outlets to Offer

For the Indian oil authorities, the boot is clearly on the other foot. They are not going abroad to sell crude but to seek it in return for a promise of outlets. What they have to offer is access to a potentially enormous market, a developing country with a 450 million population, in which the State-owned Indian Oil Company has now about eight per cent of the trade and is extending its operations. I.O.C. has just signed a contract for further supplies of Russian products but price and freight rates were hard-bargained and the Company cannot wish to be dependent on this source.

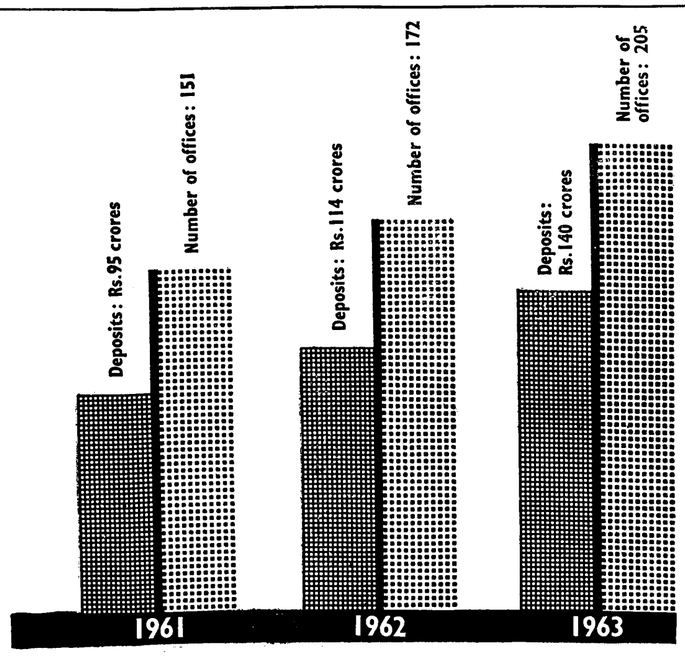
The Indian Government would, therefore, be interested in participating in promising exploration abroad, and has applied to search in Iran. However, not having contributed to the seismic survey of the offshore area, it is not eligible at the present time for a concession on its own but hope to acquire an interest in that of another group. Two potential partners have been mentioned in this connection: Phillips, already building a refinery in India in which the Government has a controlling interest, and E.N.I., carrying out contract drilling and pipeline construction for the Government under a oredit agreement. As indicated above, India is also examining the possibility of participating in the concession of the Kuwait National Petroleum Company as part of collaboration with that outlet-seeking company.

The movement outwards by national agencies is not yet widespread. Nationals of many producing countries in the Middle East, Africa and the Far East are still engaged in learning more about the production side of the oil business, or in entering local refining and distribution, as the Saudi State body Petromin is now doing, or undertaking local exploration, as in Pakistan and Syria. Indonesia's three State oil companies are engaged in exploration, production, refining and local marketing in different parts of the country, on their own or with the help of foreign contractors. Some State companies are embarking on diversification of a rather different kind, not downstream, such as the projected partnership between the Indian Government and Bechtel for refinery construction and general engineering in India. Petromin in Saudi Arabia and a Kuwaiti group have each formed drilling companies with foreign partners to operate in or outside their countries. (A private Lebanese drilling contractor with an American partner has been active for some time.) Latin American national companies are mostly fully occupied at home; moreover, nearly all prohibit the entry of State companies from other countries. There was talk at one time of Petrobras going into exploration abroad but this was critised as entailing speculative expenditure of foreign exchange and came to nothing.

* * * *

Even the efforts which are being made by Kuwait, Iran, India, are still tentative, but they are straws in the wind. They are unlikely ever to supplant world-wide marketing through international companies which offers a flexibility in matching supply and demand impossible to achieve in bilateral arrangements. The Ceylon Petroleum Corporation, relying on Russian imports supplemented by some Rumanian and Egyptian products, has run into difficulties. The Egyptian State oil organisation, though it has made some direct exports, for example to Spain and Greece, finds it on the whole more convenient to contract for its imports with companies which will take Egyptian crude and surplus products off its hands for disposal abroad.

Some two-way deals of particular convenience may be worked out—but any that are will



GROWING STEADILY EVERY YEAR—

THE BANK OF BARODA

Established as a local bank with about 20 employees, the Bank of Baroda is now one of the leading banks in the country, with 205 branches. These are spread all over India and abroad and collectively employ over 5,000 people. Deposits total more than Rs. 140 crores. This dramatic and dynamic growth has been the result of meticulous planning and courteous service. Moreover, the Bank of Baroda has on its Board of Directors, men who are eminent in the industrial and financial world—thereby enhancing the bank's stability and prestige.

BINNY fabrics do not wear a mask
You buy what you see and feel

NO STARCH By tradition Binny fabrics are not starched or given any other form of temporary finish. Every cloth is left literally to speak for itself.

NO OVER-BLEACH Binny fabrics are not over-bleached. Bleaching weakens the fabric and reduces its life. The avoidance of extreme whiteness by over-bleaching is one reason why Binny fabrics have a world-wide reputation for durability.

FAST DYES The use of only the world's fastest dyes and a large experienced staff of highly qualified research chemists—this is the unfailing formula that guarantees the colour fastness of every Binny fabric.

defend it with all your might
—*Jawaharlal Nehru*

Defence does not consist only in military strength. Equally vital is economic strength through rapid development of agriculture, industry and technology. Your job is vital. Help build up defence by discipline and resolute work.

DAG4/F5

PLANNED DEVELOPMENT FOR NATIONAL DEFENCE

be a nuisance to O.P.E.C. in its efforts to bolster prices. For why should the customer make novel arrangements, unless he is to get supplies more advantageously? The seller may thus well get less than he would have done if his oil had been traded through established channels. But some national companies, notably among the richer producers, may be prepared to put up with these disadvantages to gain experience and a footing in the market. They are looking beyond specific deals towards multilateral trading.

Such aspirations were recognised in the concessions awarded to the Japanese for the Neutral Zone, which provided for financial participation in downstream operations. The Kuwait offshore concession provided for Shell to consider any possibilities of further co-operation with the Kuwaiti partner which might develop in the course of time. In the light of recent developments this would presumably include ventures in other phases of the industry. But a small exporter cannot match the integrated companies. The capital investment required for transporting, refining and marketing one barrel of oil a day world-wide is estimated to be about $2,500. Nevertheless, the nationals might reason, one has to start somewhere and it is a fact that more and more companies, including independents of only medium size, are venturing into overseas operations. Nor is it more strange for India to seek rupee oil abroad than for France to seek franc oil or the Japanese yen oil—except that these countries had greater financial and technical resources to play with.

That the national companies should get more international in their outlook is a development which the major companies may have occasion to welcome. In scale, the movement is not likely to damage seriously their own trading as long as their efficiency as distributors remains unparalleled. But they have, in any case, to live with the national companies and this will be easier if these latter have first-hand experience of the expensive realities of the oil industry—an appreciation that money can be lost searching for oil overseas and an insight into the difficulties of selling oil in the hard world.—*By special arrangement with Petroleum Press Service.*

PLANTING

(*Concluded from page 261*)

of Rs. 1 crore under the plantation finance loan plan had received the Union Government's sanction. He also assured the industry that the Government would consider in detail the question of ensuring availability of sufficient land suitable for planting tea. Mr. Daga had earlier referred to this question in his speech.

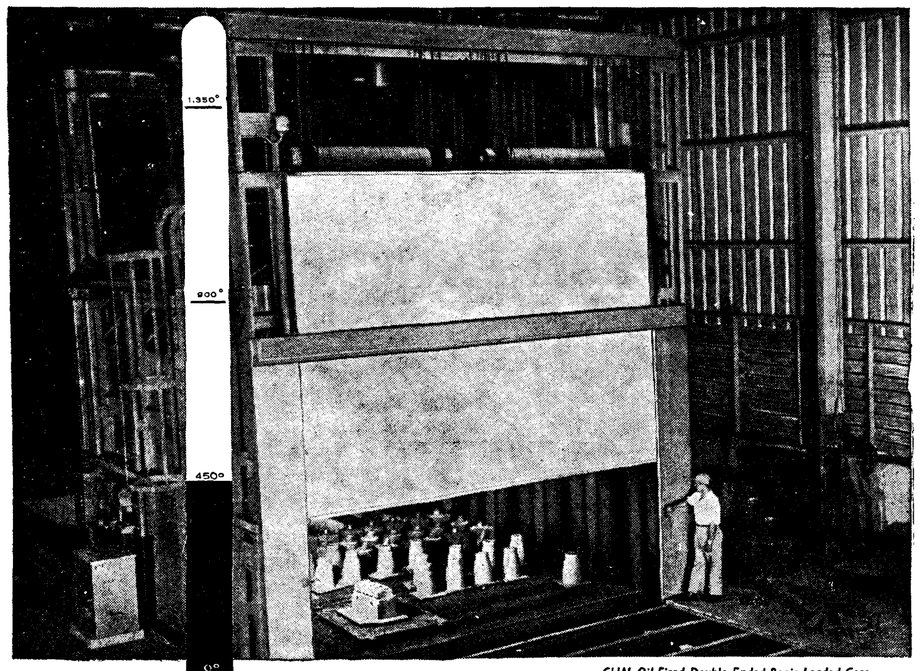
Inasmuch as the terms of references of the Chari Committee include a study of the structure of taxes on tea, Mr. Daga thought it fit to appeal to the Committee to recommend the positive implementation of some suggestion for tax relief made by the industry. In particular, he mentioned the following:

1. In the last Budget, rebate of corporation tax equivalent to 10 per cent of the income-tax *plus* super-tax and 20 per cent on surtax was allowed to the tea industry. But as only 40 per cent of the profits of the industry is taxable to Central income-tax and the balance 60 per cent is taxed as agricultural income by the States, the relief has been reduced to only 4 per cent on income-tax *plus* super-tax and 8 per cent on surtax. To enable the industry to enjoy similar relief as other specified industries, the rate of relief should be increased to 25 per cent on income-tax *plus* super-tax and 50 per cent on surtax.

2. After the abolition of the export duty on tea, the burden of excise duty has been made very heavy. Refund of excise duty on tea, even in part, at the point of export, will be a positive step of giving incentive for export promotion to the major foreign exchange earner of the country. It is, therefore, necessary that the Government should take urgent steps to provide for refund of the excise duty at least on teas exported.

3. The Assam Government should reduce the rates of agricultural income-tax. It may be noted here that, apart from this tax, the State has also increased considerably the rates of land revenue in the Districts of Sibsagar and Kamrup.

These suggestions merit due consideration. And there is considerable force in the contention of Mr. Daga that acceptance of the minimum bonus principle as recommended by the Bonus Commission would have serious repercussions on the future of tea industry. One has to bear in mind the important fact that this is a labour-intensive industry and that it, therefore, deserves to be treated on a different footing as compared with workers employed in purely manufacturing industries.



CHAL Oil Fired Double Ended Bogie Loaded Core Drying Oven installed in a reputed steel foundry in India.

WELLMAN INCANDESCENT LOW TEMPERATURE HEAT TREATMENT OVENS

Wellman Incandescent India Ltd., in collaboration with Controlled Heat and Air Ltd., Smethwick—England, are now manufacturing in India industrial ovens for low temperature heat treatment up to a maximum of 450°C.

These ovens cover the whole CHAL range of products. Ovens for Stoving, Tinprinting, Drying, Metal Heat Treatment, Core Plate Varnishing, Maturing as well as Filtration equipment are available.

Wellman Incandescent are also specialists in Mechanical Handling Equipment and have commenced to manufacture progressively many products which hitherto had to be imported.

NUCLEAR-POWERED MERCHANT SHIPS

U.K. GOVERNMENT PLANNING JOINT PROJECT WITH SOME COMPANIES

THERE are only two nuclear ships in operation in the world today. One is the Russian icebreaker, *The Lenin*, which is really a special case, and the other the American *Savannah*. The latter ship is authoritatively said to have cost £20 million (about Rs. 26.7 crores). It is, however, not known whether it is competitive with other ships carrying cargo or passengers. The economics of nuclear propulsion for merchant ships, therefore, rests on some assumptions as of today. According to the Scientific Editor of *The Financial Times* (London), the first assumption is that nuclear ships should be compared only with ships driven by steam turbines. Here the comparison should only be between the reactor and its heat exchangers of a nuclear ship and the fire and boilers of a conventional ship, for all others in either ship are the same, whatever the driving force.

On this basis, it has been estimated that the capital cost of a suitable reactor and its boilers for a ship of 20,000 shaft horsepower ranges from about £500,000 to £2,000,000, while the equivalent cost for conventional furnace and boilers for a ship of that much horsepower is only about £200,000. On the assumption of a lifetime of 25 years, an interest rate of 6½ per cent per annum and a working year of 315 days, it has been further estimated that the running cost per shaft horsepower per hour is for the more expensive reactor ten times what it is for the conventional one. The respective figures are 0.33*d*. for the nuclear reactor and 0.033*d*. for the conventional furnace and boilers. Even the cheaper nuclear reactor would give a figure of not less than 0.083*d*. But the comparative costs of fuel consumption are estimated at 0.365*d*. per shaft horsepower per hour for the conventional ship and 0.2*d*. for the nuclear ship. When both the components are added together, it is found that the total running cost, in approximate figures, is 0.4*d*. per shaft horsepower per hour for the conventional ship and from 0.53*d*. for the more expensive reactor to 0.28*d*. for the cheaper one. These estimates, based on different assumptions by rival concerns, show that a nuclear ship with a low-priced reactor would be cheaper to run than a conventional one. It has even been estimated by one company (Mitchell Engineering) that the cost per ton of cargo carried would be £0.555 for a conventional ship, £0.536 for the first nuclear tanker and £0.490 for the fifteenth.

Different Hull Shape

But these figures assume the same cost for the hull in all cases. There are, however, several experts who do not believe that nuclear propulsion should be put into any conventional hull. They seem to be right, for the American *Savannah*, for instance, has a structure different from that of the conventional ship. The hull and inner parts of the *Savannah* are reinforced and stiffened. Outside its reactor's containment vessel, there are two collision bulkheads of heavy steel. Inside these there are collision mats—24 inches thick—which consist of a multiple sandwich of red wood and steel plate. The entire structure is such that no ship afloat, going at full speed, could ram the *Savannah* opposite the reactor and get through. Although the experience gained with the *Savannah* may prove some of this built-in safety unnecessary, such safety must be built into any hull utilising nuclear propulsion as a matter of abundant precaution.

Besides this built-in safety, the nuclear ship must also provide itself with suitable devices against the unseen and much-feared radiation. The *Savannah*, for instance, cannot get into any harbour it likes without the permission of the guest country and without some precautions. One such precaution is to slow down the reactor to 15 per cent of its reactivity while in port and to keep tugs ready to tow the ship into open water in the event of a reactor runaway which could lead to fire. As ample instrumental warning of such danger can be provided as in the *Savannah*, the Scientific Editor of *The Financial Times* thinks that there should be no obstacle to an international agreement on the use of ports by nuclear ships. Further, if commercial nuclear ships can also be covered by special insurance for nuclear incidents apart from normal hazards, another difficulty in the way of such ships plying for trade would be removed. Already, in fact, the U.S. Atomic Energy Commission underwrites upto $500 million and indemnifies the victim port or ship. It is also stated that the Commission would underwrite upto $100 million for privately-owned nuclear ships. But, as against this, the International Union of Marine Insurers has quoted a maximum sum of only $15 million for nuclear ships. All in all, therefore, there are several unresolved questions pertaining to running cost, hull shape, nuclear hazards and insurance cover. In view of these uncertainties, nuclear ships cannot be confidently foreseen to be economically competitive at first. But several shipowners in the U.S. and some in the U.K. seem to be optimistic, in the light of reasonable assumptions, that nuclear ships would be economically competitive in the near future.

Practical Advantages

In any case, the practical arguments in favour of nuclear ships are quite strong, and these may well decide the issue of nuclear shipbuilding on a substantial scale. One of these is that at some time in the future the world will run short of conventional fuels—coal and oil—and the only driving force then left for ships will have to come from nuclear fuel or the wind. Another argument is that a nuclear ship can save a lot of space otherwise given up to bunkers for fuel. The other advantages of a nuclear ship are its quick turn-round (because it does not have to be refuelled every time it gets to port) and its independence of length of run. And, from the defence point of view, it has also the advantage that it is independent of refuelling for several years. On a broader view, therefore, nuclear shipbuilding seems to have a future. It is presumably in the light of all these considerations that the U.K. Government has just initiated discussions with three leading British companies (Furness Shipbuilding Company for the hull, Anglo-Norness Shipping Company as the operator and Imperial Chemical Industries as the potential hiring company) on a joint project to build a nuclear-powered merchant ship. According to Mr. Marples, Minister of Transport, if a quick agreement with the companies could be reached for financing and organising the project, there is no reason why a nuclear ship should not be built by 1968. He has also stressed, incidentally, that the future of a nuclear ship reactor would depend on a partnership between the Government and the industries concerned and that, if the latter do not show interest, it would be very difficult for the Government to proceed along in the matter. The outcome of the British Government's negotiations with the relevant companies will be watched with interest.

U.N. SURVEY ON WATER DESALINATION

For quite some time now, the economics of converting saline water into pure water has been under discussion in several countries, notably the U.S., Israel and India. More recently, the United Nations has also studied carefully the possibilities and problems of water desalination in potentially water-short areas in developing countries. The U.N. Survey's findings, which are cautiously optimistic, have just been brought out in a 325-page report entitled "Water Desalination in Developing Countries." The report, prepared by the U.N. Department of Economic and Social Affairs, will come up for consideration at the current session of the Economic and Social Council in Geneva. Based on a survey of 43 developing countries and territories, carried out during 1961 and 1962, the report cites not only the rapid growth in demand for pure water in water-short areas, but also "the increasing pace of development being experienced in some of the water-short areas in the developing countries." Desalination, according to the report, provides an assurance that fresh water will continue to be available in future if it can be economically produced and if water-short areas are within a reasonable distance from the sea or an inland brackish water source.

There appars to be at least 50 water-short areas in which economic feasibility studies are warranted to establish whether or not possibilities exist for the economic utilisation of desalinated water. The U.N. survey urges that there is a strong need to take an inventory of existing brackish water reserves as the installation of desalination plants will become relatively less important if, subsequently, ground water is discovered or water from other areas becomes available. It has focussed attention, in this connection, on the provision of fresh water for non-agricultural uses, as desalinated water has yet to be proved economical for irrigation requiring large quantities of cheap water. But, even in regard to non-agricultural uses, the cost of supplying fresh water from a desalination plant is at present considerably higher than that of water supplied from conventional sources. This is mostly due to higher prices of fuel and electricity, to wider fluctuations in the demand for water and to the shortage of engineers and trained mechanics to deal with any inefficiencies or breakdowns in the plants. Information collected from 61 operating desalination plants, with a total daily capacity of some 77,000 cubic metres (1 cu. metre=264 U.S. gallons), in the areas covered shows that the price of desalinated water ranges from $0.37 per cubic metre (at the plants in Kuwait producing 27,273 cu. metres per day) to $3.02 per cu. metre (at the relatively small plant in Port Etienne, Mauritania producing 115 cu. metres a day).

Incidentally, the present processes of desalination involve either the extraction of fresh water from salty solution by distillation, the widely used process, or the removal of salts from water by electro-dialysis or freezing. Other processes are still in the experimental stage. Considering these factors, the U.N. report recommends (i) that in countries where low-cost energy is available, desalination by electro-dialysis should be given preference and that under other conditions it is advisable to turn to 'freezing' or vapour compression distillation, (ii) that distribution facilities for desalinated water should be taken into account; and (iii) that Governments in developing countries should clearly consider the relationship between desalinated water costs and prices and its possible influences on the efficiency with which the desalinated water is used. The report also draws attention to the problems pertaining to the efficient utilisation of dual-purpose plants, that is, plants producing both fresh water and electricity.

Last but not the least, regarding the possibility of using electricity produced in nuclear power stations for desalination and of producing steam in a nuclear reactor and using such steam for desalination, the report says:

"Nuclear power could be utilised for desalination only if in the modest quantities needed for desalination plants (in underdeveloped areas), such power could be produced at relatively low cost. However, the cost of power generation by a nuclear plant must be compared to that supplied by a conventional plant. At the present time, conventional generating stations are, in all cases, still producing power at lower cost than nuclear plants of equal size in a given location. And it will be appreciated that there are many uncertainties involved in attempting appraisals of future nuclear power costs in comparison with future conventional power costs. A nuclear reactor to produce steam in competition with a conventional boiler is also a technical possibility. At present, there is no basis to assume that a process steam reactor will produce steam at a lower cost than conventional boilers."

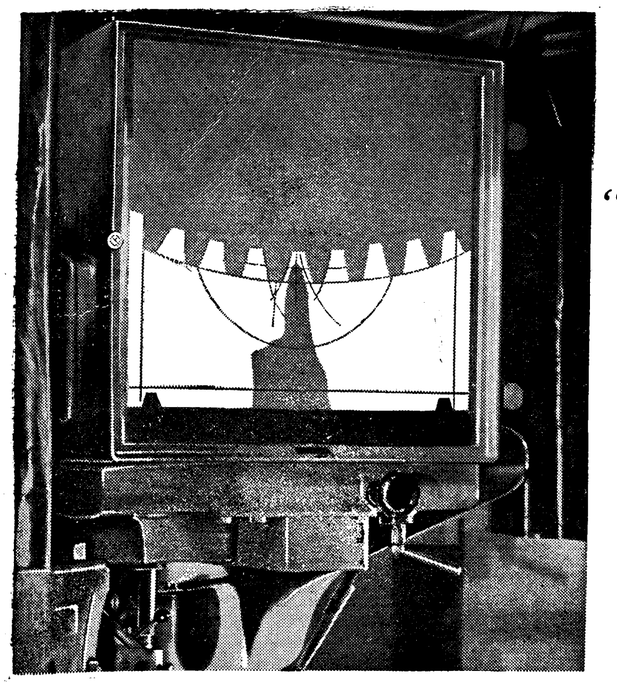
In sum, the U.N. Survey, which has appraised the growing industrial and research efforts being undertaken to expand the types and sizes of desalination plants, has held out the promise of a growing variety of equipment at competitive prices and a continuing decline in equipment cost per unit of output. Hence its hopeful approach to the role of water desalination in assisting water-short areas in developing countries.

EUROPE'S FIRST SLEEPER-BUS

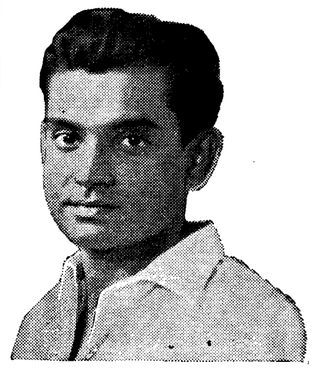
The worst discomfort of a several days' bus trip has been remedied. Any holidaymakers who, so far, avoided lengthy bus journeys, because they were being forced to sit up all the time, can now reach their destination sound asleep, thanks to Europe's first sleeper-bus construction. A large West German motor-vehicle factory will soon be taking this latest development into regular production and has already made its first sales. In a few minutes, the 40 seats of the bus can be changed into 40 comfortable beds. This, by the way, is the first bus construction to accommodate the same number of people either sitting up or lying down. A special air-spring system sees to it that neither will this bus lean sidewards in curves nor "jump" when passing over rough ground. Its 150 h.p. diesel engine is especially quiet-working and the passenger part has, moreover, been noise-insulated. During night trips, thick curtains form compartments, each for two double-beds with four occupants. Each double-bed has its own reading lamp. A separate bed is provided in the rear for the second driver, connected with the driver on duty by interphone. Since this bus can move anywhere independent of hotel accommodation, it has many uses in addition to tourism, e.g. as a hospital bus or troop transporter.

SPECIAL MILK REFRIGERATION AGGREGATE

An Austrian refrigeration and air conditioning equipment manufacturing company is producing new-fashioned milk refrigerating aggregates from high quality material. With these aggregates suitable means for the prevention of milk being ruined or its quality reduced are placed at the disposal of the agriculture and related industries. These special milk refrigeration aggregates are can-milk refrigerators and milk deep-freeze troughs. In the can-milk refrigerators water is cooled down to just about freezing point and circulated in a container. The farmers deliver the milk in cans to collecting centres where they are placed into the cold water and cool down very rapidly. From here the milk is picked up by lorries and taken to the respective dairy. But many dairies are now carting the milk with tank trucks. In this case, the milk is gathered in round or angular milk deep-freeze troughs according to the space conditions and is quickly cooled down to 40° C. (40° F.) which prevents the formation of bacteria thus maintaining the original quality. The floor and the walls of the deep-freeze trough are cooled by circulating cool water or directly by means of a refrigerant. The beautiful shaped and high performance refrigeration aggregates are produced in various sizes.



"This machine ensures accuracy of Typewriter parts up to 1/10,000th of an inch



It's the OPTICAL PROFILE GRINDER, housed in a special airconditioned chamber. Tools, dies and precision parts are machined on it, and *automatically* checked against magnified drawing office specifications — clamped on to a screen. The Grinder projects an image of the same part magnified to the same proportion—upto 50 times. I can see where the part falls short of specifications, and I machine it till its absolutely perfect."

Modern precision equipment like the Optical Profile Grinder and Ujjal Kumar Chatterjee who operates it, are just one team of the multitude of men and machines at the Remington Rand typewriter plant. They are all engaged in a constant endeavour to improve the quality of each tool, die and part that goes into the making of your Remington typewriter.

Over the years people in India have come to expect the standards set by REMINGTON—the highly responsive touch, light positive shift, smooth carriage action, superior styling and finish—which make them so essential to distinctive correspondence.

REMINGTON TYPEWRITERS ARE NOW BETTER THAN EVER—ORDER YOURS TODAY

NEW PRODUCTS AND PROCESSES

Detecting the Fire

A FIRE alarm system incorporating a heat detecting relay which closes its contacts quickly if there is a sudden rise in temperature and so raises the alarm has been patented by Wormald Brothers Industries, of 1, Philip Street, Sydney, Australia. If there is a slow rise in temperature the contacts close when a certain upper temperature is reached. A stop is provided to prevent false alarm being given by unusual weather conditions and the alarm can be set to any rate of rise of temperature or maximum temperature thought appropriate.

Machine Draws Graphs

Drawing machines which can be operated by a typist when preparing engineering reports and graphs save much time. Electro Instruments of 2611, Balboa Avenue, San Diego 12, California, says the machines save engineers from doing this work. All the typist has to do is to press the proper buttons on the machine which then proceeds to draw the graph.

Reduced Exhaust Fumes

A device which is said to burn the unburnt gas in exhaust fumes from internal combustion engines is reported by Auto Union G.m.b.H., of Schrannenstr, 3, Ingolstadt-Donau, Germany. It consists of a tube, which replaces the conventional silencer, containing "catalytic" chemicals which cause any unburnt gases that have escaped combustion in the cylinder head to be substantially burnt. These "clean" gases are then expelled with the rest of the burnt gases, causing only a fraction of the normal air pollution.

Protection Against Dry Rot

A new protection against dry rot and damp, which will have wide application in tropical countries having high humidity, has been developed by Protim Ltd., of London. It is an impervious plastic membrane coated on both sides with a fungicidal solution. The plastic membrane forms a physical barrier against the ingress of damp, and any moisture coming in contact with it is turned into a powerful fungicide. When applied behind skirting boards, door frames or other woodwork in new buildings, the membrane prevents the still-damp plaster from causing the wood to rot.

Automatic Ultrasonic Cleaning Plant

A range of automatic ultrasonic cleaning plant for industry, designed to clean parts in large quantities and at high speed, is being produced by Hall Engineering Ltd., Shrewsbury, Shropshire, England. The standard range of machines will clean ultrasonically all types of material including metals, ceramics, plastics, rubber, glass and man-made fibres. The general exceptions are natural fibres such as cotton, wool and silk, and wood. Soils of all types from oil and swarf to foundry sand and heat scale can be removed in seconds and the process is such that they are removed without damaging the base material.

The machines are designed to operate in production lines. The principle used is the immersion of the soiled component in a cleaning fluid (the chemical formulæ is not being disclosed), which is agitated at a frequency of 20 kc. The agitation results in the pulling apart of the liquid to create the phenomenon known as cavitation. Bubbles thus produced collapse with a velocity of 100,000 g., so producing at the interface of the component and the liquid medium a violent scrubbing action which rapidly scours away all types of soil. The frequency and medium are so designed that the base material is completely unaffected either mechanically or chemically by the process.

Long-lasting Bottles

A new manufacturing technique is claimed to produce bottles which, as well as being more resistant to scratching and chipping, are 25 to 50 per cent stronger than ordinary bottles. The manufacturers, United Glass Ltd., Leicester Square, London, W.C.2, who make four million bottles a day, also claim that the new process results in glass of greater clarity and brilliance. The new process, called titanising, is applied almost at the moment when the red-hot glass is being blown into bottle shape. This chemical treatment alters the composition and physical properties of the surface, giving it hardness and brilliance, and reducing the co-efficient of glass-to-glass friction.

Faster Etching Compound

Increased etching rates and control of undercutting are among the advantages claimed for a new etching compound developed by Lee-Smith Photomechanics Ltd., Lyon Way, Hatfield Road, St. Albans, Hertfordshire, England, for precision work. The compound is basically a very pure grade of anhydrous ferric chloride, with additives. It is these additives that increase the etching speed and enable undercutting of the etch to be closely controlled to produce edges of a specific regular profile. Copper, beryllium copper, brass, aluminium and steel can all be etched. Sheet copper has been etched at rates twice as high as those currently acceptable.

Marine Radar

The first production model of a marine radar system claimed to be the most important advance in radar presentation since the introduction of the cathode ray tube was shown in London recently by Kelvin Huges Ltd. The system is called 'photo-plot' and gets much more out of radar than is possible with conventional t radar information is first displayed in the normal way on a cathode ray tube. The display is then photographed on a special 16 mm. film, processed in a few seconds and projected on to the underside of a translucent screen. The chemicals used for processing the film are blown on to it by compressed air in a pre-arranged sequence.

Suction Dredge

The first dredge equipped with an electronic control device, which will fully replace the dredge operator has been successfully tested at the Czech Shipyards in Prague. This electronic brain operates with an absolute reliability according to a pre-selected work programme which takes into account 1,500 various possibilities, all the manœuvring and working machinery of the dredge. It reacts instantaneously to all changes occurring during its work due to variations in the depth of the water, the shape of the river bed, etc. The output of the dredge SB725 is 725 m³/hour, and is equipped with an automatic control of operation.

Fertiliser from Cotton Waste

Nitrolignin, manufactured from cotton waste by a dry method, is a splendid mineral fertiliser for cotton. It is estimated that Uzbekistan in Soviet Russia will be able to harvest annually an additional 100,000 metric centners of cotton if all waste from the hydrolisis of cotton is used for the manufacture of dry nitrolignin. The production of the new mineral fertiliser has been launched in the Ferghana valley.

Most Modern Steel Plant

A new plant that combines the latest techniques of pneumatic steelmaking continuous casting and universal beam rolling has gone into trial production at the Staffordshire works of Shelton Iron and Steel Co. Ltd., Stoke-on-Trent, England, and will be fully commissioned later this year. Developed at a cost of nearly £20 million to replace two older mills, the new plant is designed to produce a larger variety of sections, joists, columns, beams and rails at a much faster rate. Within four hours, a steel billet weighing several tons can be transformed into a load of steel joists aboard a lorry on its way to a customer. Previously it took between four and seven days. The plant, which uses large quantities of oxygen, produces a "heat" in 1½ hours, compared to 10½ hours in the old type of open-hearth furnace.

Brighter Nickel Coatings

An organic reagent patented by Kemiska Candor A.B., of 10 Storgatan, Stockholm, will produce extra bright nickel deposits on car bumpers and similar components even when added to plating baths in minute amounts. Amounts of not more than one thousandth of a gram per litre of solution will also help keep the other compounds of the bath evenly dispersed, and will give increased ductility to the nickel.

TV Camera Controls Chimney Clouds

In the West German Rhine-Ruhr industrial area, TV cameras have been given extraordinary control tasks. They are watching factory chimneys, or rather the smoke they exhale. By electronic means, the watchful camera-eye makes sure of the most rational combustion possible, at the same time reducing the soot and ash precipitation which, to the neighbourhood, is both a nuisance and a health risk. So far, a yearly load of five million tons of soot and ash—approximately the combined cargo of 75,000 railway wagons—is coming down on the eight million people living in this 5,000 to 6,000 square-kilometre area, and something just has to be done to reduce air-pollution. Numerous industrial plants are being equipped with protective filters, but this is a long and costly procedure and does not obviate optical control by any means. An operator is constantly watching the picture, relayed by the TV cameras to the control board. In the event of excessive smoke generation, an additional alarm system is activated, so that necessary counter-measures can be taken immediately.

Artificial Emeralds

After many years of experiments a chemist in the province of Tyrol has succeeded in upgrading natural beryl by coating it with an emerald layer. Emeralds are known to be very rare, and extremely high prices are charged for fine specimens. For this reason, attempts have long been made to manufacture emeralds—like other precious stones—by synthetic means. Not until after 1945 was a method worked out in the United States—based on research work by the former German LG-FARBEN Concern—to produce emeralds for commercial use. However, like all synthetic products, they have never been able to rid themselves of the odium of being artificial. In the Austrian experiments, by contrast, natural stones are being artificially improved. The significant point is that the emerald layer has the same crystalline structure as the beryl core and is inseparably linked with the latter. Even experts find it difficult to distinguish these stones from genuine emeralds.

3,350 CIMMCO Sakamoto Auto Looms serve the Indian textile industry to produce more and better textiles. It is their proud achievement to enable Indian textile industry to export textiles to the world's most competitive super-markets. And CIMMCO Sakamoto Auto Looms in your factory bring more foreign exchange for you...The fast Reed and loose Reed CIMMCO Sakamoto Auto Looms have fully interchangeable parts. Maintenance cost is low.

FORWARD MARKETS BULLETIN
(Monthly)
Published by Forward Markets Commission
Government of India, Bombay
REGULAR FEATURES
- A 'General Review' presenting an assessment of trading conditions in the futures markets during the month
- Special articles on technical aspect of forward trading
- Extensive information relating to developments in futures markets
- Detailed commodity market reviews
- Comprehensive and up-to-date statistical supplement relating to crop estimates, production and consumption trends, price movements trading against futures contracts, etc.
- About 200 pages in print in crown ¼ size
- Attractive get up

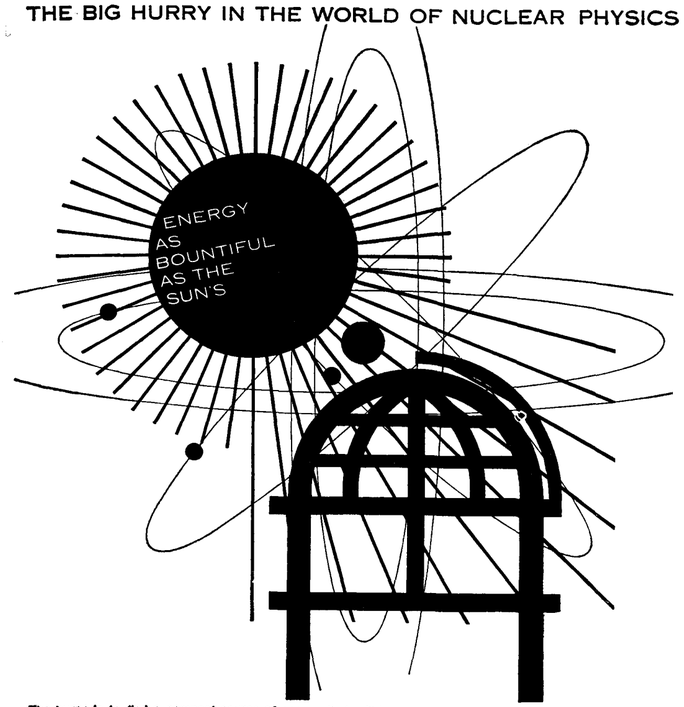
THE BIG HURRY IN THE WORLD OF NUCLEAR PHYSICS



The hurry is to find a compact source of energy that will be as prodigious as the sun and will not exhaust though the world live a million years. ■ Closest to the ideal is Uranium 235, a scant one milligram of which, when fissioned or 'exploded', releases more energy than that obtained by burning millions of tons of coal. This great world of power will keep all of us going, and going well, when the present natural sources such as coal give out. Already atomic power stations are an actuality in many countries including India. ■ Shaping the giant pressure vessels enclosing the reactor cores demands a very specialised knowledge of welding. ■ It is this specialised knowledge and application of industrial gases that Indian Oxygen affords Indian industry.

THE INDIAN IRON AND STEEL COMPANY LIMITED

CHAIRMAN, SIR BIREN MOOKERJEE'S ANNUAL STATEMENT

PARTIAL CONTROL HAS DONE LITTLE TO CURB BLACK MARKET

THE following statement by Sir Biren Mookerjee, Chairman of the Indian Iron and Steel Company Limited, dealing with the Company's working for the year ended 31st March 1964, has been issued to shareholders. The Annual General Meeting of the Company will be held on Tuesday the 8th September 1964, at 3 p.m. at the Registered Office of the Company, 12, Mission Row, Calcutta-1.

Before dealing with the affairs of the Company, I would refer to the national tragedy we have experienced in the death of our late Prime Minister, Pandit Jawaharlal Nehru, on the 27th May 1964 and would give public expression on behalf of the Board of Directors and all members of the Company to our feeling of profound sorrow at the passing of one who played a leading part in the attainment of freedom by our country and who since the achievement of independence, guided in so able a manner on the home and international fronts the destinies of India through the momentous events of the past seventeen years. His memory will remain with us always.

Operations

From the figures given in your Directors' report it will be seen that production of steel during the year under review has again approximated to the rated capacity of the plant. This position barring untoward events it is hoped to maintain, but having reached the plant capacity as it stands under present working conditions no improvement in production of any magnitude can be looked for except to such extent as the introduction of new techniques may render possible. To this end intensive research continues to be carried out by your Company's technical staff into the beneficiation of raw materials, improvement of blast furnace operational conditions and added use of oxygen in the melting shop. I will refer to this matter of research in greater detail at a later stage in this Statement.

Accounts

Those shareholders who are unfamiliar with the provisions of the Income-tax Act and the Companies Act may find difficulty in fully understanding the reasons which have necessitated the raising of the provision for depreciation from Rs. 3,40,18,269 for the previous year to Rs. 4,40,25,006 for the year under review and I should, therefore, perhaps supplement the brief technical explanation given in the report by your Directors.

Section 205 of the Companies Act provides that no dividend shall be paid by a company for any year except out of the profits for that year arrived at after providing for depreciation. Certain alternative bases are then laid down for computation of the provision for depreciation, that chosen by your Company being stated in Section 205(2)(b) as provision "in respect of each item of depreciable asset, for such an amount as is arrived at by dividing 95 per cent of the original cost thereof to the Company by the specified period in respect of such asset." The term "specified period" is then defined in the following words—"specified period in respect of any depreciable asset shall mean the number of years at the end of which at least 95 per cent of the original cost of that asset to the Company will have been provided for by way of depreciation if depreciation were to be calculated in accordance with the provisions of Section 350." Section 350 then provides that depreciation shall be taken at the rate specified for the assets by the Income-tax Act and the rules made thereunder for the time being in force as normal depreciation "including therein extra and multiple shifts allowance."

Referring back to Section 205(2)(b), it will now be appreciated that 95 per cent of the original cost of assets is a definite unvariable amount but that the factor by which this amount is to be divided in order to arrive at the amount of depreciation to be provided, namely the "specified period", is by reason of Section 350 dependent upon the Income-tax rates of depreciation applicable from time to time. If these rates are increased then the more quickly will 95 per cent of the original cost of the assets be covered, the shorter will be the "specified period" by which the 95 per cent of the original cost of the assets has to be divided and the greater in consequence the amount of depreciation that has to be provided against profits. This is the position for the year under review where it has been announced that the income-tax depreciation rates that will be applicable in respect of that year are to be increased by the re-introduction of triple-shift allowance with consequent increase in the depreciation provision made in the profit and loss account.

Dividend

In view of the magnitude of the amount, some comment will no doubt be expected from me regarding the sum of Rs. 5.43 crores set aside to general reserve from the profits of the year in relation to the amount proposed to be distributed as dividend. It is perhaps appropriate that I should therefore list the very heavy loan liabilities outstanding at the 31st March 1964 in respect of the completed expansion schemes together with the finance that has to be found for the further schemes to which reference has been made in your Directors' report. These are:

World Bank loans:		
1953 extensions	Rs.	7.18 crores
1955 extensions	,,	5.31 ,,
Government of India loan	,,	4.61 ,,
Collieries development project	,,	23.19 ,,
Balancing of plant project	,,	16.21 ,,
Total ..	Rs.	56.50 ,,

Following upon completion of the balancing of plant project which, as you are aware, will increase the steel-making capacity of the Burnpur Works by some 300,000 tonnes of crude steel per annum, our plans are that implementation of the second phase of further expansion shall be put in hand and preliminary steps towards this end have already been taken with Government and the World Bank. This second phase of expansion would give added capacity of approximately a further 700,000 tonnes per annum, the two projects together therefore covering the raising of our present capacity by some 1,000,000 tonnes of crude steel per annum. The phasing of this further 1,000,000-tonne expansion into two parts follows our policy that no individual expansion project should be of such magnitude as to impose too great an immediate financial burden on the Company or impair the dividend position to the detriment of the interests of the shareholders but rather that expansion should be gradual, each stage being followed by a period of consolidation before the undertaking of the next. No firm estimate of the cost of the second phase of the further expansion can be made until decision is taken as to what form the end products will take, this being dependent upon the future requirement of the country, but the cost will naturally be of very great magnitude and constitutes therefore a major factor in an appreciation of the financial requirements of the Company.

Additionally, finance has to be found for expenditure on capital account in connection with the modification and improvement of the existing plants, the provision of additional housing and amenities for staff and workers together with the large general capital expenditure that must constantly be incurred in every efficient and expanding organisation. Viewed in this light, the necessity for the ploughing back of profits not only for the year under review but also for the future will, I trust, be clearly apparent.

In compensation in some measure for the restriction of dividend so caused it would normally have been the desire of your Directors to capitalise from time to time by the issue of bonus shares a portion of the reserves of the Company which are already out of all proportion to the share capital. It is a matter of regret to them that such a course is however impracticable under present taxation principles involving, as it would, heavy liability for tax both on the Company and on the shareholders and is, in fact, impossible under the current policy of Government which it is understood is to permit bonus issues solely out of any share premium account.

As possibly of some assistance to the shareholders in the spread of their income, I would however say that I am considering recommending to my Board that for the current and future years an on-account distribution of profits should be made by way of declaration of an interim dividend during the course of the year, the balance of dividend only then being left for declaration in the normal course at the annual general meeting.

Research and Development

The steady deterioration during the last ten years in the quality of the primary raw materials, particularly coking coal and limestone for pig iron production, has presented a serious challenge to the Company's technical staff but thanks to the operational research carried out by them capacity production from our blast furnaces has been achieved and is being maintained. As examples of some of the problems with which we are faced, the ash content of our coking coal currently averages about 19 per cent compared with 16 per cent ten years ago, but what is worse is the wide range between the maximum and minimum ash content at 24 per cent and 14 per cent respectively. Similarly, the effective lime content of the present-day limestone varies between 30 per cent and 45 per cent. The quality of our iron ore too has been adversely affected by increasing demand and mechanisation of the Iron Ore Mines. Nevertheless, these are the raw materials with which our country is endowed and we have to learn, and learn quickly, how to use them to better advantage to enable us to produce iron and steel efficiently, both from a productive and economic point of view.

A large part of the solution lies in raw material preparation which, if we are to avoid merely blindly copying what others have done or are doing, calls for more and more expenditure on operational research. To take a specific case—raw material preparation includes crushing to an optimum maximum size and restricting the minimum size to give an aggregate best acceptable to the process. From this procedure in the case of iron ore, a large quantity of undersize material will accrue to become an expensive discard unless steps are taken to convert it into a useful material.

The most well known, long-standing and orthodox way of doing this is by sintering, a process which has resulted in improved blast furnace practice. We, ourselves, however have never accepted that this expensive process is necessarily the best solution to the problem in relation to Indian iron ore and have consequently refrained from any hasty decision that would commit us to the very heavy capital expenditure involved. That this has been the prudent course is borne out by modern research which has suggested that other forms of agglomeration could be capable of producing better results with Indian iron ore than the sintering process.

Over the past few years your Company has accordingly been carrying out extensive research with its own iron ore in an effort to find the best way of utilising the undersize ore which as a result of crushing and screening is accruing at our Ore Mines. I am happy to say that this research has shown much promise so much so that our own findings involving a combination of direct reduction, magnetic separation and agglomeration have been confirmed on reference by us for test by an independent overseas research organisation. The product obtained in our pilot plant is of high purity and is likely to have in the future a great influence on the operation and efficiency of Indian blast furnaces. Sufficient information has now been obtained to enable the engineers to design the appropriate plant.

We have also investigated the questions of humidity control and fuel injection in relation to the operation of the blast furnaces, the increased use of oxygen in the steelmaking processes and the possibility of future production of such a standard grade of iron as would enable us eventually to eliminate the rather costly and wasteful intermediate Bessemerising process that under present conditions is necessary for purification of the hot metal before charge to the melting shop furnaces. Suitable inclusion towards this ultimate latter end has in consequence been made in the collieries development and balancing of plant schemes.

The utilisation of waste products has also been engaging our attention. For instance, we have been producing for a number of years building bricks and mortar manufactured from waste blast furnace slag.

Import restrictions on engineering spares has forced us into developing manufacturing techniques for which we more often than not are ill-equipped. The recurring expense of importing rolls for our rolling mills, for instance, is a serious drain on the country's foreign exchange resources. Here, although not having been granted a licence to manufacture rolls for the purpose of selling, we have as a result of experiments carried out at our Kulti Foundries and with the help of the British Rollmakers Corporation, been able successfully to manufacture rolls for our 18" mill which have proved to be equal to, if not better than, those imported. For this size of roll we can now support ourselves, saving approximately Rs. 13 lakhs per annum in foreign exchange. The factor limiting our ability to produce rolls in greater numbers and in larger sizes is the capacity of our existing foundry and machine shop at Kulti which we hope to enlarge in course of time so that we may be able to cover also the roll requirements of the merchant mill and sheet bar and billet mill.

Miscellaneous engineering spares previously imported are now regularly being produced by our associated companies within the Martin Burn organisation for consumption at Burnpur resulting in a considerable and recurring foreign exchange saving. We have also been able within this organisation to secure the manufacture to our specifications of items of capital plant for which we had previously to look to foreign suppliers. As examples, these cover such diverse items as hot metal ladles, ingot casting cars, ladle cranes, Bessemer converter shells, hot metal transfer cars and bogies, ground charges, slag ladle carriages, special type discharge wagons, coke quenching cars, acid tanks and acid vats, the total value over the past nine years approximating to some Rs. 50 lakhs.

Kulti Foundries

Modernisation and expansion has been carried out of the non-ferrous foundry and the steel foundry at your Kulti Works and an additional annealing furnace for the latter installed. New machine shops have been attached to these two foundries and the pressure on the main machine shops relieved to this extent.

The order position continues to be satisfactory but output for the current year remains dependent upon adequacy of the supplies of foundry grade pig iron.

During the year loss was suffered by the death of Mr. S. N. Gupta, the Works Deputy General Manager (Commercial) who had charge of Kulti. Mr. R. G. da Costa, a Mechanical Engineer of wide experience has since been appointed and has assumed charge as Deputy General Manager (Kulti).

Decontrol

In my statement last year I indicated that Government were considering decontrol of the distribution and prices of steel and that it had been arranged that the producers should submit joint concrete proposals for the setting up and operating of a joint organisation following upon decontrol and for the prices that should become effective at the date of decontrol. Representatives of the producers met on several occasions at various levels to discuss and work out joint proposals but unanimity was not able to be achieved and ultimately the producers in the private sector were asked to put up their views independently of the public sector. Accordingly, your Company jointly with the Tata Company submitted a memorandum on the 7th November 1963 suggesting the formation of an Iron and Steel Board. The memorandum contained details as to the functions of the proposed Iron and Steel Board together with recommendation regarding the prices to be effective on decontrol. These suggested prices were based on a block of Rs. 1,500 per tonne of saleable steel as being more truly representative of present-day conditions than the figure of Rs. 1,176 per tonne adopted by Government in the last fixation of retention prices. The proposed prices on this basis were about Rs. 35 per tonne higher than the retention prices excluding the assessed increased incidence in respect of freight equalisation.

Matters rested at this stage until unilateral decision was taken by Government regarding the planning of production and control and the pricing and distribution of iron and steel, the principles of which were conveyed to the representatives of your Company and those of the Tata Company who were called to meet the Minister for Steel in Delhi on the 26th February 1964. The salient features of Government's decision were as follows:

(1) Statutory control over the price and distribution of all categories of steel except pig iron, ingot moulds and bottom plates, billets and tin bars, plates, sheets, wide strips, skelp, tin plates, hoops and their respective defectives would be abolished with effect from 1st March 1964.

(2) Indents for categories of iron and steel which continued to be controlled would require to be supported by quota certificates as hitherto.

(3) A Joint Plant Committee would be constituted with an accredited representative from each of the Steel Plants and with the Iron and Steel Controller as its Chairman. A representative of the Railway Board would also be a member of the Joint Plant Committee. This Committee would be entrusted with the task of (*a*) the planning of production both of controlled and decontrolled categories; (*b*) the announcement and listing of prices of the decontrolled categories of steel and (*c*) the administration of the freight equalisation fund for both the controlled and decontrolled categories.

(4) Government would set up a high level steel priority Committee which would determine priority ranking in relation to bulk allocations of steel.

(5) Re-rollers would be virtually made free from all control, as also would stockists and retailers in the case of all decontrolled items.

The decision of Government followed the general recommendation of the Committee appointed by Government in September 1962 on decontrol of steel and popularly known as the Raj Committee.

Simultaneously with the decision of partial decontrol of steel, Government announced increases in the excise duty mainly to compensate the loss of surcharge with the abolition of the equalisation fund with effect from the 1st March 1964. The average rise in the excise duty calculated on your Company's 1963-64 output of steel is about Rs. 18 per tonne. The selling prices for the decontrolled categories announced by the Joint Plant Committee, and the prices directly notified by Government for the controlled categories, include an element of Rs. 62 per tonne on account of freight equalisation to cover the distribution of steel to consumers at all rail head stations throughout India at a uniform price. The system of retention prices has been abolished and the new prices to producers have a differential of Rs. 45 per tonne between the 'tested' and the 'untested' categories, which under the new arrangements is now retained in full by the producers as against Rs. 10 per tonne only under the old system of retention prices.

Owing to force of circumstances the prices announced by the Joint Plant Committee had of necessity to be based on the previous retention prices adjusted for excise duty and additional freight, the effective increase to the producers arising therefore almost wholly from the additional realisation in respect of tested materials. The prices of the decontrolled categories were later revised from the 13th April 1964 in partial compensation of increases in production costs not reflected in the previous retention prices.

The average increase in the case of your Company on the decontrolled categories of steel forming nearly 60 per cent of the total output is of the order of Rs. 30 per tonne on the basis of the product mix and the proportion of 'tested' to 'untested' steel achieved in the year 1963-64. In the case of the controlled categories, the effective increase has been of the order of Rs. 4 per tonne only on account of reduction in the net price of billets and the assumption by Government of an incorrectly high percentage of 'tested' galvanised sheets in working out the prices despite the fact that on protest the price of untested billets was revised upward by Rs. 15 per tonne from 30th May 1964. On the basis of our production for 1963-64 the overall average increase in respect of our total output of controlled and decontrolled categories of steel is approximately Rs. 20 per tonne, effective in successive stages of Rs. 10, Rs. 8 and Rs. 2 per tonne from the 1st March 1964, the 13th April 1964 and the 1st June 1964 respectively.

It is too early yet to assess the adequacy of the revised planning arrangements under the Joint Plant Committee and I would only say at this juncture that the retention of control by Government over certain categories of steel, particularly in the case of sheets, has done little to curb the activities of the black market in the items in short supply.

On the financial side, we have grounds for dissatisfaction inasmuch that the cut imposed by Government on the retention prices recommended by the Tariff Commission for the two years ended the 31st March 1962 and continuing up to the date of revision of prices under the above arrangements together with certain interim increases in production costs have remained uncompensated and that funds to this extent have been denied to the Company which would otherwise have been available against the heavy capital expenditure on staff housing, modernisation and expansion with which we are faced. We are also unaware of the reasons for non-acceptance of the prices put forward to Government under the joint proposals of the Tata Company and ourselves and by reason of the somewhat *ad-hoc* nature of determination of the prices now current are also unaware of any approved basis for future adjustment of these prices in relation to productive capacity, capital block and working costs.

Acknowledgements

In conclusion, I would express on behalf of the Board of Directors our appreciation of the services rendered by the General Manager, Mr. J. McCracken, his executive heads and the entire staff and workers of the Company whose efforts have contributed so largely to the results that have been achieved.

Note: *This does not purport to be a record of the proceedings of the Annual General Meeting.*

AUTOMATIC METAL BOW SAW AND BAND SAWS

The uninterrupted progress in technology and the wish to reduce production costs have led to a steadily progressing automation of machine tool operation. Simple machine tools are increasingly replaced by automatic equipment.

A Vorarlberg manufacturer of machine tools has taken this trend into consideration by developing the mechanical metal saws he has been manufacturing for several decades into automatic machines; his new automatic bow and band saws have found general recognition at home and abroad owing to their high efficiency.

The automatic bow saws are designed for bigger as well as smaller series. The adjustment period being short, the automatic cutting of even small series is economical. The sturdy and at the same time careful design of the machines, together with their high output, guarantees most exact cuts, a further profitable element being the stepless adaptability of the cutting pressure according to the processed material. A switch panel serves to control the operation of the machine which can be either fully automatic or semi-automatic or—if necessary—manual. The Vorarlberg enterprise has moreover taken up production of a new automatic band saw with a high output which can be used with excellent results with a number of materials. Among the main characteristics of this machine are an extremely sturdy two-standard guideway for the saw arm, ground hard-metal guideways for the saw band and a torsion free control of the band. The band is kept stretched only during operation which increases its durability and cutting precision.

The Union Government is said to be considering the import of 150,000 tonnes of foundry grade pig iron every year during the next two to three years in order to meet the increasing demand for pig iron. The necessity for imports, it is said, has arisen because of the shortage caused by the delay in setting up the Bokaro Steel plant and the poor progress in the implementation of licences granted to private sector units. This item has already been included in the Indo-Soviet Trade pact for 1964 and negotiations are being held for the actual import. Meanwhile, the Government has also issued letters of intent for a 200,000-tonne pig iron plant at Ratnagiri (Maharashtra) and a 300,000-tonne plant in Goa. Another scheme for putting up a pig iron plant with a capacity of 300,000 tonnes in Bihar has been approved. In addition, pig iron production in the Bhadravati

BUSINESS NEWS FROM EUROPE

MORE LIBERALISATION BEHIND THE CURTAIN

COMBINED ECONOMY OF SIX STILL STRONG

From Our Special Correspondent

MOVES by a number of East European countries to attract foreign tourists are thought to herald a more flexible policy on private enterprise. Four countries have so far stood out against this trend—Russia itself, East Germany, Rumania and Albania. But in the others moves have taken place along lines pioneered by Poland to introduce much more freedom. Czechoslovakia, for instance, has re-opened a limited sector of public catering to private enterprise. This has meant the introduction of the small man into the hotel trade and laundering. The State, however, regulates prices and maintains general supervision over the whole field of policy. The Polish Government has extended its policy by allowing individuals to go into work which it has been unable to run at a profit. This includes catering and other industries connected with the countryside. And Czechoslovakia has proposed a massive additional distribution of land for private use by members of collectives.

The fields where private enterprise has become most significant are agriculture, transport and the service trades. Private plots already produce a large proportion of the eggs, dairy produce and vegetables needed in Communist countries. It is thought likely that the move towards free enterprise will become more marked throughout East Europe as there is a drive to increase efficiency. But commentators are under no illusions about how far it will eventually go. The Communist States are opposed to private enterprise in almost any shape or form. If it is allowed, it is purely for expediency or to increase economic efficiency. The day is still far off when the "mixed economy" will be allowed or tolerated.

E.E.C.: Underlying Strength

Outlook "good." That forecast, made by the European Economic Community's Commission on the Common Market economy for the rest of the year, is being queried by a number of outside observers who are concerned at the mounting inflation inside the Community. They point to the fact that Italy is still suffering from acute inflation, that Germany has been unable to cure its persistent export surplus, that French foreign trade has deteriorated this year by about 12.5 per cent, and that Holland has experienced a deterioration in the visibles part of her foreign trade.

Most of the criticism of the performance of individual economies has concentrated on Italy and, to a lesser degree, France. Certainly the deterioration of the Italian balance of payments has been serious. During the past two years imports have increased by nearly £1,000 million in annual terms against an increase of £250 million in exports. Nor does there appear to be any seeming ending to the chronic deficit that Italy is now running.

But other countries have their problems too and these have frequently been glossed over, it has been said. The result has been to undermine the economic stability of the Common Market. In the Netherlands, the recent deterioration in the visibles part of external payments has seen the rise in imports in the half year to the end of March running at an annual rate of £160 million more than in the same period two years ago. The French rate in the same six months is now £500 million more than two years ago. Apart from Germany and, to a lesser degree, Belgium, the other four have experienced a turn for the worse in visible trade over the past two years. The important point, however, is that the underlying strength of the German payments position is such that it more than covers the deficits of the rest of the Market. When invisible items are taken into account, the strength of the Six as a whole becomes more pronounced.

In spite of the criticisms, none of the Six, with the exception of Italy, is really under any severe strain at the moment in the external payments field. The forecast by the Commission that further vigorous expansion should continue is, therefore, probably the more accurate judgment.

What has become important for the Six is the rise in exports to non-member countries. In the first quarter of this year, the value of such exports exceeded the level for the corresponding period of last year by 15 per cent. Even allowing for the low level of 1963, consequent upon the severe winter, this is no mean achievement.

Internal demand within the Community also continued to grow briskly, partly owing to the faster increase in gross fixed asset formation. The good weather in the early part of the year gave a welcome stimulus to investment in building and construction.

Expenditure on capital goods was on the whole influenced by the increased propensity to invest, recently seen in several countries, particularly Germany, the Netherlands and Belgium. Even in France it would appear that the previous weakness of growth in private industrial capital investment may have come to an end. Only in Italy has capital investment remained slack.

Danger for the Common Market will arise, if it does at all, in the event of the payments position of the various countries continuing to deteriorate. But there must be, it is thought, some way to go before that situation is reached. So far the deterioration seems to have done little to the basic strength of the combined economy.

Shipbuilding Fears in the Six

The Common Market's national shipbuilding industries are fighting hard to retain the subsidies they get from their Governments. Faced with the outlawing of State aid under the terms of the Rome Treaty, the industries are making it quite clear that, without subsidies, at the moment many would take hard knocks. Like the shipbuilding industry in most of the rest of the Western world, the European industries expanded rapidly in the boom days, following Korea and Suez. Between 1950 and 1958, European yards quadrupled their output. In the last five years, overcapacity has arrived at the same time as increased competition from Asian yards.

In spite of aid, total tonnage launched in the Common Market has fallen from 3.12 million tons in 1958 to 2.39 million tons last year. At the same time its share of the world market has fallen from 33.7 per cent to 28.1 per cent.

Both the Italian and French industries receive direct assistance and the German can raise finance at a lower rate of interest. France has so far attempted to comply with the E.E.C. demand to reduce subsidies by meeting the Commission half way. The Italians were to have abolished their subsidy this year, but there is little prospect that they will.

There is a lot of support for the views of shipbuilding industries that subsidies should be continued. Governments are painfully aware that, if they cancel all financial aid, the industry will take more severe knocks at a time when construction prices are being depressed by competition from Japan and the rest of Asia. It is thought likely, therefore, that the Commission will bide its time in the hope that there may be a wider, more global solution to the problem of surplus productive capacity.

Frozen Food

Consumption of frozen foods is growing steadily in Europe, though there is an enormous gap between the amount eaten here and in the United States. Total consumption in Europe last year is estimated to have been 433,000 metric tons; in America, it was almost ten times as much, at 4.25 million.

Britain accounts for almost half—45.5 per cent—of European annual consumption, with 197,000 tons. Consumption has been rising steadily since frozen foods were first introduced about 15 years ago, though the big growth has been in the last 10 years when it has risen seven-fold. The value of the market in Britain last year is estimated to have been £75 million, an increase of £3 million, of which the retail trade accounted for £62 million and catering the rest. The second largest consumer is West Germany, with 80,000 metric tons, then Sweden, 41,000 tons, the Netherlands, 26,000 tons, and France, 17,000 tons. Italy comes near the bottom of the table, with 8,000 tons.

When one looks at consumption per head there are significant changes. Sweden is clearly the most important country in this respect, with 11.9 lbs. per head a year (as compared with 50.6 lbs. in America). Britain follows, with 8.1 lbs. and then the other Scandinavians, Denmark and Norway, 7.5 lbs. and 6.6 lbs. per head, respectively. The rest of Europe trails away.

In addition to being the third largest consumer of frozen foods Sweden is also one of the Continent's biggest exporters. In 1963 exports amounted to 10,000 metric tons, most of it to Britain. Holland is the major exporter, with 22,000 tons, two-thirds of which are vegetables and the rest fruit, whereas France (34,000 tons) and Austria (5,700 tons) are net importers. Of the French imports only 15,000 metric tons are sold frozen; of the rest, part is re-manufactured and some 13,000 tons last year were thawed and sold as "fresh."

Refrigerators

Although the growth of frozen food sales is frequently associated with home ownership of refrigerators, sales have grown more in Britain, where there are fewer refrigerators as a proportion of total population than on the Continent. The food manufacturers believe that, if more people can be induced to buy refrigerators, they can sell more frozen foods. Last year, refrigerators were owned by under half the homes in eight countries and only in Sweden were there 'fridges in as few as six homes in ten.

In Germany, the most popular frozen foods are poultry, spinach, meat and game, and kale, with fish growing rapidly in popularity. Dutch preferences are similar, with fish fingers and meat croquettes growing in importance. Spinach and cod are important in Belgium and fish in Scandinavia. Frozen-food manufacturers are confident that they will capture a larger share of the convenience-food market from their competitors, principally producers of tinned goods. What both of them fear, however, is the possible emergence of accelerated freeze dried foods. A.F.D. is the system whereby a food is frozen then dried (or dehydrated). The disadvantage of the operation at the moment is that it involves a double process, first refrigeration, then dehydration, which makes it expensive. It also makes foods brittle and a dropped packet can "splinter" a vegetable or meal.

But there are big advantages. A.F.D. needs no expensive equipment in the shops; it can be stored more easily; there is little fear of its going bad in the short run, so it can be kept longer. And it is claimed that A.F.D. preserves taste and texture better than frozen food.

Two firms in Britain are already experimenting with A.F.D. One of them is already in frozen foods in a big way, being the largest supplier in the country and the supplier, through subsidiaries, of half the frozen foods on the Continent.

Development Aid Falls Away

Too few countries are receiving developing aid, which in itself fell in 1962. That is the nub of a United Nations report on aid to the emerging countries. The report shows that there are 52 countries in need of aid. But two-thirds of the long-term aid goes to only 15 of them. And more than a third went to India, Argentina, Puerto Rico, Brazil and Indonesia.

That the Far East should have received the lion's share of the aid is understandable since this is now the centre of the cold war and the Communists are also concentrating their aid in this part of the world.

But many economists feel it is unfortunate that the major donors should be concentrating their aid on those parts of the world where they are seeking to influence economic policies. Much American aid goes to Latin America; almost all French aid goes to the former French colonies in Africa and is often given, or withheld, for political reasons.

Total private and public capital flowing to the developing countries rose from about £2,150 million in 1960 to £2,330 million in 1961 and then fell away to around £2,250 million in 1962, the last year for which figures are available. The decline in private capital flow, which fell from 22 per cent in 1960 to 16 per cent in 1962, has been particularly severe.

It is felt that, unless Governments of the advanced nations guarantee to provide a fixed proportion of their national incomes for aid, the gap between the have and have-not countries will continue to grow.

Gibraltar

Gibraltar is searching for alternative sources of income. This has a double reason: to reduce her dependence on Britain and to maintain her independence of Spain. In the past, much of her income has come from the British military base. This may be less a money spinner in the future, with the rethinking that is going on in British defence policy, especially as Gibraltar's strategic value is now being questioned. At the same time, the desire to lessen dependence on Spain becomes important as that country increases her pressure to incorporate "the rock" into the mainland.

The most obvious alternative income is tourism, most of which has up to now centred on the tourist in transit. A big deficiency is the lack of adequate hotels, but this is being remedied. More facilities for the tourist, such as casinos and restaurants, are also being built. The Government is also developing the entrepot trade. As a shopping centre, Gibraltar leaves a lot to be desired but Japanese and other goods are becoming increasingly evident. Legislation is in the offing to attract foreign capital by making it exempt from much taxation. Although it is too soon to talk of Gibraltar being a tax-free haven, in the same way as Panama, the Bahamas or Liberia, this field could offer scope for the Government. The colony has an acute shortage of water, which is holding up development plans. The Government intends to avoid too heavy a dependence on Spain by setting up special catchment areas.

Trouble Again in Eggs

European trade in eggs, which has been going through some troublesome ups and downs in the past months, now seems to be headed for another "down." The Belgians are particularly concerned by the latest of a series of readjustments to the levies imposed by the Common Market on the import of eggs. A new arrangement that came into force on 1st August deprives the Belgians of most of the differential they previously enjoyed over the Dutch. As a result, Belgium eggs now compete on almost equal terms with the Dutch on the big German market.

The Dutch are concerned because of reports that German traders have released on the market large quantities of foreign eggs bought at low prices and stored for use at a strategic time. Non-Common Market countries have not noticed any improvement in their trade with the E.E.C., since import levies on the third country eggs were reduced last month. Only the German trade appears to be satisfied with present conditions. But even in Germany, importers are complaining at being deprived of a formerly flourishing business in third country eggs. Informed Dutch sources predict a shortage of eggs in the European market late this year following heavy slaughtering of laying flocks in the first months of 1964.

Back to the Land Drive in Czechoslovakia

The Czech Government will offer lavish incentives to get workers back to the land, if proposals put forward by its Agricultural Control Commission are adopted. The proposals are aimed at getting people who drifted to the cities in search of higher wages in the 1950s and early '60s to go back and operate private farms within the framework of the collective (semi-State or co-operative) sector of agriculture.

The Commission's plan is to allot holdings of between 25 and 50 acres, tailor-made to family requirements. These holdings would be available at a nominal rent of about £2 17*s.* a year. Farmers would get about 42 per cent more than the Government controlled price for a substantial proportion of their output and, for three years, income from this source would be tax free. There would also be free holidays for farmers achieving high deliveries. Finally, the Commission emphasises that no farmer will be prosecuted for failing to achieve minimum State delivery requirements. Few of the ex-farmers now working in industry can have for-

gotten that some 27,000 of their number were jailed for varying periods between 1950 and 1954 for failing to deliver enough. Many bought additional produce with their own money and then delivered it back to State buying centres at a discount of as much as 80 per cent.

But behind the current incentive programme is the fact that collective farms, which provide the bulk of Czechoslovakia's food, have been making a loss for some years. Within the collectives, it is normally the private family plots which provide most of the eggs and dairy produce for Czech home consumption.

Dairy and bread production has lately been improving, but as a result of the decline of the collectives there is a shortage of fruit, vegetables and meat. Pork, normally popular, has been in short supply since deliveries from China ceased and, although some Argentine beef is available it is badly distributed. Most of the best fruit goes to West Germany and little is available for domestic consumption.

Subsidies for Smallholders

Over £4 million in subsidies is to be paid to small and medium-scale farmers in **Portugal,** under a plan announced by the Economy Minister Prof. Teixiera Pinto. The subsidies are part of the run-in to an agricultural improvement drive under the 1965-67 Portuguese interim development programme. The low productivity of Portugal's thousands of small farms means that the agricultural sector, which employs nearly 45 per cent of the population, produces less than 25 per cent of the nation's wealth.

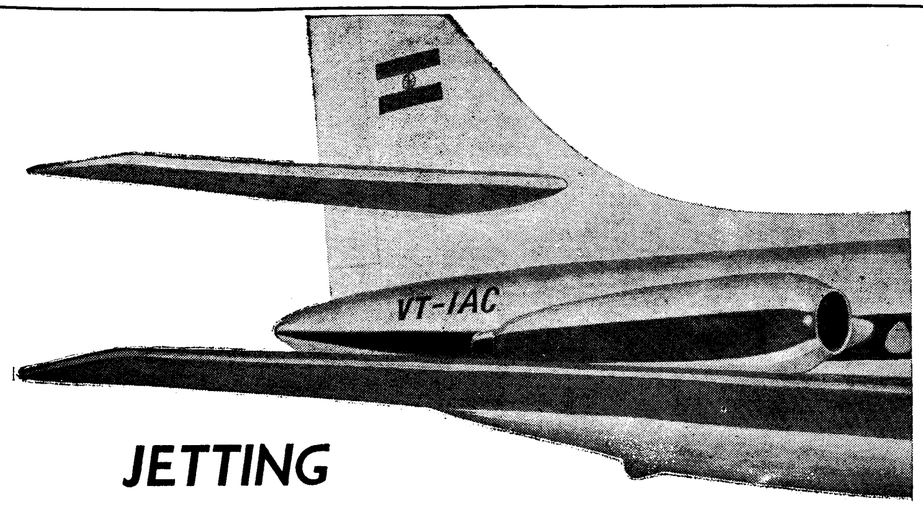
Norway's 700,000-strong agricultural community, agitating for an income rise, is to get less than it demanded—but more than the Government offered. A special arbitration board set up by Parliament decided that the settlement for the two years 1964-65 and 1965-66 should be just about midway between the Farmers Unions' claim and the Government proposal. Under the decision, about £6.25 million will be pumped into agricultural incomes in the first year, and £8.75 million in the second. The settlement is about 40 per cent less than the farmers hoped for, but 40 per cent better than the authorities were prepared to concede. In the first year, 72 per cent of the increase will be accounted for by the authorisation of higher producer prices for agricultural products notably milk and meat, and the rest by budgetary support.

Topical Briefs

European Coal and Steel Community production, imports and stocks of coal are all expected to drop in the third quarter of this year compared with the same period of 1963. Last year, production was 54.2 million metric tons and imports 9.3 million, making a total of 63.5 million tons, in the third quarter. This total was slightly less than requirements, so that stocks were run down by almost a million tons. The estimates are that stocks will rise very slightly (by about 300,000 metric tons) because of a 3.5 million-ton fall in demand and a very small fall in exports. This change is expected to occur in spite of a drop in production (just over 1 million tons) and imports (1.6 million tons). However, stocks are well up for the year as a whole since they increased by more than 4 million metric tons in the first few months of the year.

Europe's Space and Research Organisation (E.S.R.O.) is now rapidly expanding its various supporting branches. At Delft, in Holland, the Organisation's technical centre is taking shape and will eventually employ between 800 and 900 people in planning, developing and building payloads for rockets, satellites and space probes. This is intended to cater either for its own resources or in conjunction with European industry and research centres. A data-analysis centre at Darmstadt is to have a staff of 80 and there is to be a research institute, probably in Italy, also with a staff of about 80, to deal with chemistry and physics problems. Finally a launching site for high-altitude research rockets is to be set up in Sweden, which is also likely to be the home of a series of tracking stations. Eight nations are now affiliated to E.S.R.O.

German economists forecast that their country's export growth will tail off in the remainder of this year. In spite of the levelling off of exports this year, the group of economists thinks that the total amount of exports for the year will exceed last year's total of £5,200 million by as much as 12 per cent. In the first half of the year a growth rate of 15 per cent was reached, which indicates that the upsurge in the second half, if the economists are right, will be around nine per cent. Reason for the decline is that delivery dates have lengthened and the demand from abroad is not as strong as it was. But imports are expected to increase slightly and to be about 10 per cent above 1963's £4,700 million. This would indicate that the trade surplus will increase from £500 million to around £650 million.



JETTING AHEAD WITH EXPERIENCE

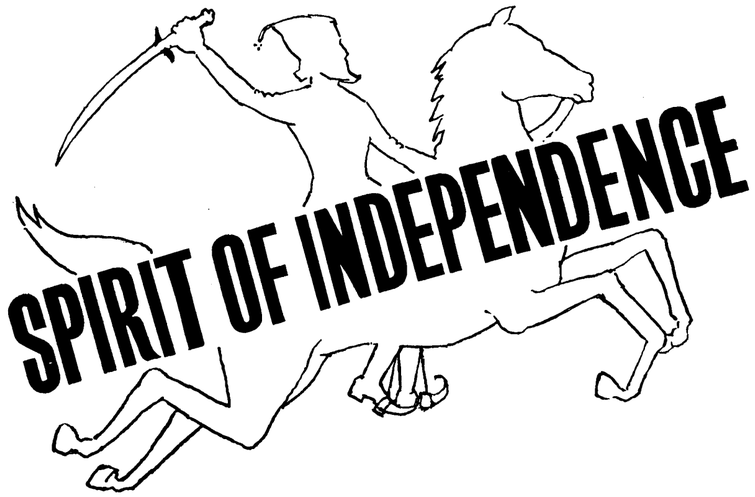
IAC is eleven years old. Graduating from faithful Dakotas through Viscounts and Friendships to fast Caravelles, the airline has earned more than a million hours of flying experience. Linking 70 stations on a 32,000 kilometre network, it offers speedy travel throughout India.

Eleven years of steady growth pointing to a brighter future ahead, IAC owes it to the people of India—for it is not only an airline but a public service as well.

1953-1964

INDIAN AIRLINES

Eleven years old on 1st August



Imbibed with the Spirit of Independence, the birth right of everyone, our Leaders after a long and continuous struggle achieved the Indian Independence on **15th August 1947.**

Anticipating by forty years the advent of Indian Independence, our Promoters, men of vision and goodwill imbibed with the same Spirit of Independence to attain freedom in the world of Banking and Finance made a successful bid and formed the Indian Bank at Madras on **15th August 1907.**

We pay homage to those great men.

THE TATA IRON AND STEEL COMPANY LIMITED

STATEMENT OF THE CHAIRMAN, MR. J. R. D. TATA

THE following statement by Mr. J. R. D. Tata, Chairman of the Tata Iron and Steel Company Limited, dealing with the Company's working for the year ended 31st March 1964, has been issued to the shareholders. The Annual General Meeting of the Company will be held on Thursday, 3rd September 1964, at 4.30 p.m.. at the Birla Matushri Sabhagar, 19, Marine Lines, Bombay 1.

TO THE MEMBERS,

As this review comes to you only a bare two months after the death of Jawaharlal Nehru, it is fitting that it should begin with a tribute to his memory and an expression of our grief at his passing. In every age, a few men are born destined to shape the course of history and it was fortunate for our country that at one of the most critical turning points of its history, one of his heroic stature was there to lead it.

After Gandhiji led us to freedom, Jawaharlal undertook the prodigious task of changing the outlook, beliefs and way of life of hundreds of millions of people steeped in ignorance, poverty and despair; giving them faith in themselves and showing them that with education, hard work, modern ideas and methods and the application of science and industry, they could build a new and better life for themselves and their children. Many years must still pass before Jawaharlal Nehru's dream of a modern industrialised India comes true, but he lived to see the success of the greatest and boldest experiment in parliamentary democracy the world has ever known. If through all the emergencies and crises, which it had to face and surmount over these seventeen years, India has clung so tenaciously to the democratic way of life and remains today a nation of free people, we owe it mainly to him.

The Steel Works and the city of Jamshedpur held a special place in the thoughts of Jawaharlal Nehru for, long before other steel plants were built in the country, they were to him the symbol and the promise of a new India. In 1958, on the occasion of our Golden Jubilee, while dedicating the Jubilee Park, which the Company presented to the citizens of Jamshedpur, he said "I have come here because this great Steel Works and the city of Jamshedpur have become symbolic of the growth of Indian industry ... but the biggest reason of all is to pay homage to the memory of Jamsetji Tata." It is appropriate to recall these words today since this year marks the 125th anniversary of the birth of Jamsetji Tata and the 60th anniversary of his death. Referring to Jamsetji's courage and vision, he said, "It is right that we should honour his memory and remember him as one of the big founders of modern India." The great heart that paid this gracious tribute is now stilled, but, as his biographer has said, "India will remember Jawaharlal as the man who saw the vision big and tried, with all his faith and will, to make it great."

As we mourn the passing of Jawaharlal, our thoughts, sympathy and good wishes turn to the dedicated man who has taken on the heavy burden of leading the country. The unanimous choice of Lal Bahadur Shastri as Prime Minister and the smooth transition to the new regime have given proof of the maturity and soundness of our parliamentary democracy. I am sure that shareholders will join me in assuring Prime Minister Shastri of the full support and co-operation of the Company in whatever way it may be called upon to help in the further development of India's steel industry.

The Year's Results

The Company made satisfactory progress during the year under review and reached the production target of 1.5 million tons of finished steel while the output of steel ignots fell short of the 2 million-ton target only by 5 per cent.

On the financial side, however, the results of the year's operations were somewhat disappointing. Although the profit before taxes was nearly Rs. 2 crores higher than in the previous year, much of the excess was due to the fortuitous addition to revenues of Rs. 85 lakhs written back from excess provisions made in previous years. Discounting this item, the profit was only marginally higher than in the previous year in spite of the substantial increase in sales and the ratio of profit before taxes to sales was 14.2 per cent as against 15.4 per cent in the previous year. The slight deterioration in profit per ton was due, as stated in the Directors' report, to a rise in costs uncompensated by a corresponding increase in retention prices. Increases in prices were sanctioned by Government only from March 1964, although the increases in costs beyond the Company's control which such escalation in prices is intended to cover had taken place much earlier. The delay caused the Company the loss of a substantial amount of revenue and therefore of profit during the year. Furthermore, as stated in the Directors' report, the price increases from March 1964 in categories of steel over which price control has been retained after partial decontrol, were substantially less than expected on the basis of an announcement made by the Minister of Steel in that month.

Shareholders will have noticed the sixfold increase in taxes this year. Whereas in the previous year the bulk of the profit was absorbed, for tax purposes, by arrears of development rebate, there was no similar set-off this year as all such arrears have been fully made up. The provision for taxes would, in fact, have been Rs. 2.70 crores larger but for the higher depreciation allowed under the reducing balance method of calculation adopted by the tax authorities than under the straight line method followed by us. I am sure, you will approve of the Directors' decision to set aside this saving in tax to a deferred taxation reserve for the reasons explained in the Directors' report.

As against the increase of Rs. 6.65 crores in the provisions for taxes, including deferred taxation, as compared to last year, the allocation to the development rebate reserve is as much as Rs. 7.70 crores less than in the previous year. Taking into account all the variations between the two years' allocations and provisions and last year's transfers of Rs. 3.84 crores from reserves, the final balance available for disposal was larger this year by Rs. 3.12 crores.

As you are aware, our general reserves were heavily depleted by transfers to profit during the last few years to compensate for the exceptionally large amounts set aside for special reasons towards additional depreciation and arrears of development rebate. In the interests of the shareholders, it is necessary that we should build up these general reserves again whenever possible after paying reasonable dividends. Your Directors have, therefore, set aside Rs. 2.75 crores to General Reserve No. 1 this year and at the same time were able to recommend an increase of Re. 1 in the dividend on ordinary shares.

Impact of Inflation

A matter of much concern to us as to all engaged in industry has been the continuous increase in costs, year after year, not only in steel but in almost every single product made or grown in India. Although the accelerating rise in the cost of living index during the last year has been principally due to soaring food prices, themselves due to insufficient production combined with a greatly increased purchasing power, the cost of all industrial products, including those which, like steel, do not depend on agricultural raw materials, has continued to rise relentlessly with no sign of abatement in sight.

Steel provides a striking example of the marked deterioration in the country's cost-price structure. Whereas until 1955 Indian steel was amongst the cheapest in the world, it has become one of the costliest although the basic elements which make up the total manufacturing costs have not materially changed in relation to those of other countries. At the end of 1963, the average price of the common categories of steel in India was more than two and a quarter times the 1948 price, one of the largest single elements of increase being in respect of excise duty which increased no less than fifteen times from Rs. 5 to Rs. 75 per ton. Actually the full incidence of excise duties and other taxes on the final price of steel is much greater than that as practically every item which goes into the making of steel, including fuel, power, raw materials and stores, is itself subject at one or more stages of production to its own excise duties and other taxes. In addition to the growing burden of direct taxes of one sort or another, freight rates charged by the Indian railways are today four to five times what they were fifteen years ago.

The damage caused by rising costs to the economy and to the country's long-term plans of development cannot be exaggerated. Not only does the resulting decline in the purchasing power of the rupee cause severe hardship to every family in the country, but increases in costs have a number of other dire consequences. For instance, they have already rendered uncompetitive in world markets almost every exportable Indian product other than tea and jute, thus severely restricting our earnings in foreign exchange; they have inflated expenditure under the country's development plans and this, in turn, has necessitated, apart from further additions to our already crushing burden of taxation, a further rise in deficit financing, aggravating inflationary pressures and leading to still higher costs and prices, a vicious circle indeed.

While appreciating the magnitude and complexity of the problems involved and the grievous burden of additional Defence expenditure since last year, I venture to suggest that the deterioration in our price structure is largely due to our forcing the pace of economic development beyond the country's capacity in physical and financial resources. The inflationary effect of spending too much too quickly has been aggravated in our case by the fact that so much of the total expenditure has been incurred on unproductive civil administration and on costly long-term projects which can add to the national income only after long gestation periods and which, even when completed, produce little for the consumer.

Unfortunately, there seems to be no recognition as yet of the need for a reappraisal of resources and priorities in our planning. From the tentative figures recently announced for the fourth Plan period it would seem that the remedies for our present ills are thought to lie in still larger plans involving still heavier doses of taxation, deficit financing and foreign borrowings.

Special Advance

You will, no doubt, expect me to make some reference in this statement to the recent amendment to the Companies Act empowering Government unilaterally to convert into shares loans advanced by them to joint stock companies, and to the discussions which we and the Indian Iron and Steel Company have been having with Government in regard to the repayment of our respective special advances.

We have viewed the passing of the above amendment with deep concern, not only because of its potentially grave impact on the Company and its shareholders, but also because of the arbitrary and unfair nature of the measure and of its disregard of past undertakings in so far as the two Steel Companies are concerned. The scheme for the special advances of Rs. 10 crores made by Government to each of the two main producers towards the cost of their modernisation and expansion programmes was formulated in consultation with a World Bank Mission in 1952 and, as memories on the subject seem to be short, I feel it necessary to review once again the genesis and history of these advances.

From the end of the war until the mid-fifties, the retention prices allowed by Government to the steel producers were fixed at levels far below import prices, on the unrealistic basis of a gross return of 8 per cent on block, from which had to be provided profit-sharing bonus, Managing Agents' commission and taxes, leaving only about 3½ per cent for dividends and reserves. This price scheme had disastrous consequences for it left virtually nothing in the hands of the industry for rehabilitation and modernisation, leave alone expansion, and made it impossible to attract any fresh capital. As a result, the country had to spend immense amounts in foreign exchange every year on imported steel, which could have been saved if Government had followed a more realistic price policy.

When Government finally accepted the need for modernising and expanding the country's steel industry, we urged that our prices should be raised by Rs. 100 per ton which we undertook to apply exclusively, after taxes, to the modernisation and expansion of the plant. Even with this increase, our average retention price would at that time have been about half the price of imported steel. This modest and perfectly sound proposal was turned down by Government who, instead, decided to increase selling prices without raising retention prices. The funds generated by this increase to the consumer, which would normally and legitimately have accrued to the producers, was taken to an equalisation fund, from which the special advances were made to the two Companies. As I pointed out at that time, this amounted to lending us our own money. This was, in fact, recognised, at least by implication, in the terms of the special advances which made it clear that they were no loans in the ordinary sense, for the advances were to have no fixed maturity date and were to be repaid with interest only if and when a special element was added to the normal retention prices specifically for that purpose. In their 1962 inquiry into the steel industry, the Tariff Commission were specifically asked by Government to recommend a special element in the retention prices towards the future repayment of the advances and interest thereon from July 1958. The Commission recommended Rs. 8 per ton, Government, for reasons of their own which I have not been able to understand to this day, changed their mind and announced in Parliament and elsewhere that they were considering other means of recovering these advances, including their conversion into shares. It was presumably in pursuit of this objective that the extraordinary amendment to the Companies Act mentioned earlier was passed in December 1963. Whether the real purpose was actually to convert the advances into shares or merely to induce the Companies, under the threat of such conversion, to repay them in abrogation of the terms of the agreements between the Government and the Companies, has never been made clear to us. We naturally made strong representations to Government with whom, I am glad to say, discussions have been held and are still continuing towards what I hope will be an equitable and mutually satisfactory solution.

While not relevant to this particular issue, I may mention that we have protested with equal earnestness against another amendment of the Companies Act recently introduced by Government, which is in breach of the spirit if not the letter of the Constitution. Under this amendment, the voting rights attached to shares of joint stock companies held in trust are to pass to a Public Trustee, who incidentally, has still to be appointed by Government. This measure, which has at one stroke disenfranchised every trustee shareholder in the country, except in the case of trusts of less than Rs. 5 lakhs, is an extraordinary piece of legislation which illustrates the present tendency to disregard the rights of individual citizens and a growing readiness to rely on compulsion in enforcing Government's will on the people. Although it is now part of the law of the land, it has not yet been put into actual operation as the appointment of the Public Trustee has still to be notified. I hope, even at this late stage, that some convention or *modus vivendi* will be established whereby, in practice, the voting rights of trustee shareholders will be left undisturbed except when they are abused or where the Public Trustee has grounds to apprehend the misuse of such rights by the trustees.

Further Expansion

In my statement last year, I mentioned the possibility that our Company might be called upon to undertake a further large-scale expansion of capacity at Jamshedpur during the fourth Five-year Plan. Government have, indeed, requested us to undertake such expansion and further progress has been made in the examination of the project. The scheme, as it has now emerged from such a study and from discussions with Government, contemplates the installation of the necessary facilities for making, in the first instance, an additional million tons of ingot steel to be rolled into sheets and strip in a continuous or semi-continuous strip mill.

We expect to appoint a firm of consulting engineers shortly to prepare a detailed project report which should be received in about eight months after their appointment. While only preliminary estimates have been made, the indications are that the cost of this further expansion would be of the order of Rs. 170 crores of which probably a little more than half would be in foreign exchange.

As I hinted last year, the most difficult problem will be that of finance, particularly as this project will be superimposed on a programme already in hand for expanding and modernising our ore mines, building a battery of coke ovens, adding some equipment to SMS 3 and doing a few other things, at the cost of about Rs. 25 crores and on the project for increasing the output of our Jharia collieries by a million tons of washed coal at an estimated cost of about Rs. 30 crores.

There is no need for alarm at the prospect of such large commitments. The recently completed Two Million Ton Programme and the results before you in the form of increased dividends and reserves are an indication of the benefits and added strength which accrue to the Company and its shareholders from expansion resulting in lower costs, better utilisation of total assets and increased productivity. At this early stage, I can only repeat that your Directors will sanction a further expansion only if they are thoroughly satisfied that the project is technically and economically sound and that it can be undertaken on terms wholly fair to the shareholders.

Communal Disturbances

The Directors' report contains a brief factual reference to the tragic events which overtook Jamshedpur in March this year and which, in addition to the loss of valuable life, brought great misery and hardship to thousands of innocent men, women and children. This explosion of communal violence was all the more shocking for having occurred at Jamshedpur which, for over a half century, had established an exemplary record of peace and harmony, maintained unsullied even in the darkest days of 1947.

It is poor consolation to know that the troubles were least pronounced in the Steel Plant and in the areas inhabited by the Steel Company's employees. This was to be expected as a large proportion of our present employees consists of second and third generation citizens of all communities who were born in Jamshedpur, went to school together and form a mature and stable cosmopolitan community. These elements conducive to happy relations between communities are lacking among the newer industries of Jamshedpur, most of whose employees have come from outside the city and, being younger, are more easily swayed by trouble-makers.

The lesson to be learnt from this tragic episode is the need for continuous vigilance and sustained action in the promotion and maintenance of good relations amongst the various communities as well as for a strong civil administration endowed with the necessary authority and the will to take firm and instant action in emergencies. Although the local Government authorities, including the police, no doubt did their best to bring the situation under control, they were at first overwhelmed by the suddenness and magnitude of the events which offered evidence of having been deliberately planned.

One of the possible causes for the situation having gone out of hand for a while is the fact that Jamshedpur, although the second largest city in the State of Bihar and perhaps the most vital industrial centre in the whole country, is still administratively treated as a sub-division of a district, the headquarters of which are in a small neighbouring town. As a result, the law enforcement machinery is inadequate for dealing with serious emergencies. We have, therefore, urged that early consideration be given to the possibility of upgrading Jamshedpur to an administrative status commensurate with its importance to the State and to the country and with the magnitude of the problems and the task of administering it.

As stated in the Directors' report, the Company, along with sister concerns at Jamshedpur, took quick and effective steps to provide relief and rehabilitation to the families of the affected communities. Although not relevant to this review, I think, shareholders may be interested to know that, recognising the similar misery and hardship suffered by thousands of refugee families from across the country's borders, the Steel Company, along with Telco and the Tata Trusts, are planning to undertake a programme of relief at one or more refugee camps in Bihar.

Sir Jehangir Ghandy

It is customary for me to end my annual statement to the shareholders with an expression of thanks to the officers, supervisory staff and workers at Jamshedpur and elsewhere for their contribution during the year to the further progress made by the Company. Now that I am no longer inhibited by his membership of the Managing Agents' firm, I should like to pay a special tribute to my old friend and colleague Sir Jehangir Ghandy, who retired as Director-in-Charge of the Steel Company at the end of the year under review. "Joe" Ghandy, as he has always been known to those who have worked with him, joined the Steel Company as a trainee in 1917, nearly 47 years ago, and left for the U.S.A. eighteen months later for advanced post-graduate studies. He returned to Jamshedpur in 1921, and has been there ever since. From the start, he showed such exceptional ability and drive that it took him only nine years to be put in charge of the whole plant as General Superintendent and another eight years to become the first, as well as the youngest, Indian General Manager. Since 1946, he was in charge of the Company's affairs at Jamshedpur, first as Resident Director of the Managing Agents, and then as Director-in-Charge. To him goes a major share of the credit for the progress and growth of the Company over the last thirty years.

Sir Jehangir Ghandy achieved prominence and countrywide recognition in various fields of national endeavour and was closely associated with many of the country's leading technical institutions; but it is as an outstanding Engineer-Administrator and for his unparalleled services to this Company and to the Indian steel industry as a whole that he will be remembered, and for which we all owe him a deep debt of gratitude.

Although no longer concerned with the day-to-day conduct of the Company's affairs, Sir Jehangir, happily, continues his connection with the Company as a member of its Board, as a Director of Tata Sons and as Chairman of three important enterprises associated with the Steel Company at Jamshedpur. I am sure shareholders will wish to join me in thanking him for all he has done for the Company over these four decades and more, and in wishing him many years of good health and happiness.

The work and responsibilities of Sir Jehangir at Jamshedpur are now shared by two Resident Directors of the Managing Agents, Mr. S. K. Nanavati, in charge of Operations, and Mr. R. S. Pande, in charge of Administration. Mr. Nanavati retired as General Manager of the Company in September last yesar on his joining the Board of the Managing Agents' firm after a brilliant career with the Steel Company covering a period of over 29 years, and was succeeded as General Manager by Mr. G. Kumar.

Mr. Pande had a distinguished record of service with Government prior to joining the Steel Company in 1958 as Director of Personnel. He was appointed Agent in April 1959 and retired from the Company's service on 1st April this year when he joined the Board of Tata Industries.

The Company's operations are safe in the hands of this strong and experienced team backed by a group of able and devoted officers.

J. R. D. TATA,
Chairman.

PRODUCTIVITY IN CEMENT INDUSTRY

FINDINGS OF STUDY GROUP

THE consumption of cement in India—*per capita* as well as per square mile of the area of the country—is very low as compared with the industrially advanced countries in Europe and America. Thus, as against 18 kgs. in India, the *per capita* consumption is as high as 272 kgs. in the U.S., 386 kgs. in Switzerland, 295 kgs. in West Germany, 204 kgs. in France and the U.K. and 191 kgs. in Italy. These figures indicate how far India is lagging behind in cement consumption and consequently in industrial and social development.

Except for a brief spell in 1958-59, the demand for cement has always been far in excess of the availability. This, however, does not mean that the industry has been in a stagnant position and the rise in production has not been fast. Production which stood at 3.2 million tonnes at the beginning of the planned period increased to 5.0 million tonnes in 1956 and 8.2 million tonnes in 1961—a rise of over 250 per cent during the decade. There was a further rise to 8.6 million tonnes in 1962 and 9.4 million tonnes in 1963. But the demand—industrial and road development and housing—has been rising at a much faster pace, resulting in a vast gap between production and requirement. It has been estimated that, by the end of the fourth Plan, the requirement of cement in the country will be somewhere between 20 and 22 million tonnes, that is more than double the present level of production. Some have advocated import of cement as a solution to the problem of shortage. In view of scarcity of foreign exchange, this is not a feasible remedy, except, perhaps, for a short period to meet some unavoidably urgent and strategic requirement. But, basically, it is only through an increase in domestic production that the gap can be met. Indeed, the indigenous cement industry can even develop an export potential if the cost of production can be brought down. This is specially necessary, as cement, being bulk cargo, is costly to import from long distances and most of the African and Asian countries may find it more economical to take their requirements from India rather than from distant countries. If an earnest effort is made to increase the production of cement in India on economic lines, the development of an export market is not beyond the reach of the country.

Plant Improvement

Exports apart, it is necessary to bring down the production cost of cement, a basic raw material, even from the point of view of domestic economy. The aim should, therefore, be not only more production of cement, but more production at a lower cost. It must also be noted that cement industry is a capital-intensive industry. Large sums of money are required to install a cement producing plant, a substantial portion of which will have to be in foreign currency until indigenous capacity for making cement machinery becomes adequate. Whereas it is important to install new plants to increase production, it is all the more necessary to duplicate or even triplicate the already installed plants to get from them the optimum amount of production. A study group constituted by the National Productivity Council to examine the problems of productivity in cement industry has recommended that an initially established plant for producing 600 tonnes of cement a day (that is, 200,000 tonnes per annum) can be economically increased in size to reach a maximum production of 1,800 tonnes per day (that is 600,000 tonnes per annum). This large size has been recommended for two reasons: first, an increase in the capacity of an existing plant can be effected without a proportionate increase in capital investment. Secondly, the cost of production per tonne of cement will come down, as there will be a less than proportionate increase in overheads, labour and establishment costs.

Quite a large number of cement producing plants installed more than a decade ago now require replacement or major repairs. As it is, the production of these plants is only 70 to 80 per cent of their installed capacity, the chief reason, according to the findings of the Study Group of N.P.C., being the frequent breakdowns and stoppage of work. A sizable increase in the production of cement can be brought about, if prompt steps are taken for the rehabilitation of these plants. In addition to the main items of plant and machinery, there are many other mechanical devices which, if introduced in the working of the cement plants, can play an important part in increasing the production of cement and lowering the cost of production. Some of the important equipments the introduction of which can reduce the cost of production are fork lift trucks, skid shovels, cranes, locomotives, bulldozers, etc. The N.P.C.'s Study Group on cement industry has found that the Sikka Cement Works is in urgent need of these equipments and that most of the other plants are also in need of one or other of these equipments.

Machinery Imports

Many of the items of cement producing machinery are now being manufactured in India. As some more factories for producing cement-making machinery are being set up, the supply of indigenous components will improve further. Nevertheless, a substantial quantity of foreign exchange will still be necessary to get the many other items not produced indigenously and required for enlarging and rehabilitating the plants and especially for introducing new mechanical devices. The present allocations of foreign exchange are, according to the Study Group, hardly sufficient to meet the required imports. There is thus an urgent need to increase the import facilities available to the cement industry in order to push up production and reduce cost.

In cement industry, limestone is the most important item of raw materials used. Contrary to earlier assumption that India had a vast, unlimited supply of limestone, the supply prospects are far from satisfactory. Although the already proved limestone reserves are expected to be sufficient to meet the requirements of cement industry till about the fourth Plan period, many of these reserves are not of a very high quality. There are few deposits having 90 per cent $CaCo_3$ and most of the deposits fall in the range of 80 per cent to 85 per cent $CaCo_3$. Five factories are having even still lower quality of limestone, possessing 78.5-79 per cent $CaCo_3$. It may be noted here that, as limestone having a larger percentage of $CaCo_3$ permits the use of larger proportion of clays—a comparatively cheap raw material—the cost of production of cement is lower in such cases. The use of limestone having a lower percentage of $CaCo_3$ will mean the need for more bulk of limestone and less bulk of clays and will push up the cost of production of cement. Unless deposits of better quality limestone are discovered, the factories will have to take resort to flotation for enrichment of limestone. Some factories of A.C.C. have already started this process, having exhausted their deposits of better quality limestone. But the installation of flotation plants requires large capital expenditure and high operational costs are involved which will ultimately fall on the cost of production of cement. A solution suggested by the Study Team is that, so long as deposits of better quality of limestone are not available, other materials like fly ash from thermal power plants, burnt clays and blast furnace slag from steel plants should be used as far as possible. The supply of the last mentioned item will increase gradually with the growth of the steel industry in the country, and it can be used upto 50 per cent of the raw material, depending upon its quality.

The mechanisation of quarrying operations can also go a long way towards reducing the cost of production of cement. Whereas limestone extracted by manual quarrying costs Rs. 4.92 per tonne, the cost under mechanised quarrying method comes to only Rs. 3.41. The difference is mainly due to the lower costs of loading, drilling and overheads in mechanised

FROM HERE TO UNCERTAINTY?

A SCRAP OF PAPER! But it has served its purpose. A new word was learnt. Or, phrase. Or, problem. Or, visual idea. Also the future is bright for this child—but not for that scrap of paper! From here it goes to uncertainty. But till here, there was no uncertainty, because it was born at Dandeli.

The West Coast Paper Mills Ltd. are at Dandeli. Here, paper is made from bamboo and other fine forest materials. For writing. For printing. For packaging. But the process isn't all that simple. It involves a certain amount of chemistry. Certain highly-skilled personnel trained abroad. And, above all, quality control. To make this certain, a special Research and Development Department works round the clock at Dandeli.

quarrying. Mechanisation will also result in reducing the frequent accidents. However, it will require a considerably large amount of capital, a substantial portion of which may be in foreign exchange. The end, however, justifies the means. The Study Group has, therefore, recommended that wherever possible mechanisation should be introduced in the quarries.

Productivity and Employment

One of the arguments often advanced against mechanisation is that it will result in displacement of labour and thus aggravate the problem ot unemployment. In the case of mechanised quarrying, for example, it has been estimated that the manpower required will be only 10 to 15 per cent of that in the manually operated quarries. The Study Group found that in South India, whereas two manually operated quarries are employing 996 and 1,175 men respectively for a daily production of 1,350 and 2,200 tonnes of limestone, the two other almost fully mechanised quarries producing 2,450 and 1,550 tonnes of limestone per day are engaging only 136 and 80 men, respectively. Similarly, whereas 4.47 man-hours are required to produce a tonne of cement in Saurashtra Cement Works, as many as 20 hours are required in some plants as, for instance, Banmore, Khalari and Madras. The reason for this variance is that whereas in the former case, the latest techniques of mechanisation have been adopted, it has not been possible to adopt these techniques in case of the latter, perhaps due to the age of the plant, its design, layout, etc. Although mechanisation may result in temporary displacement of some persons, the benefits of adopting the latest techniques will be substantial and the cost of production will substantially come down through a marked reduction in the man-hours required for producing a tonne of cement. As the wages of workers are progressively increasing, the least that must be done is that any further rise in the wage cost should be halted by reducing the number of people employed in each plant.

The N.P.C.'s Study Group, which consisted of a dozen competent men, is of the view that the machinery employed for cement production in India is in no way inferior to the machinery installed in other countries. Yet it has found that "the productivity of Indian worker as compared with his counterpart in Western countries is depressingly low." It has quoted the following figures in support of its conclusion:

Country	*Man-hours per tonne*
U.S.A.	1.50
Belgium	1.51
Japan	1.75
U.K.	1.82
Germany	2.20
India	10.15

It will be noted that man-hours per tonne of cement produced is 10.15 in India as against only about two in the U.K., the U.S. and Japan. Giving its reasons for this depressing state of affairs, the Study Group says:

"Our workers labour under a peculiar conventional disability. A person doing a particular job will attend to that job alone and to none other even if he has plenty of spare time. Thus an oiler will not do the cleaning, the cleaner will not do the oiling and a machine-man will not do either of these jobs. The principle of the division of labour is thus carried to a ridiculous extreme, with the result that there are many persons unnecessarily hanging around each piece of machinery."

It may be pertinent to recall, in this connection, what Dr. Gunnar Myrdal, an authority on economic development, had said about the productivity of workers in India to members of Parliament some time ago:

"Around every piece of work to be done, there are too many workers hanging around. You are, of course, well aware of the fact that a regular situation in some of the most modern factories in India is that a machine which in Sweden or Germany, the Soviet Union or the United States is serviced by one man or woman, here will need two, three, four or even five men. In spite of low wages, the actual labour cost to the industry then comes up towards or above the levels in richer countries with their higher wages but also higher labour efficiency. Your industry is then not competitive and will lack the strength for expansion."

Summing up its conclusions on this subject, the Study Group itself has this to say:

"Higher productivity might in the short run mean some redundancy, especially in the overstaffed older plants. This can happen in India just as it has sometimes happened in the U.K., under the impact of automation. The very serious unemployment that already exists may make one stop and ask whether productivity at the cost of jobs is really necessary in India. The answer is simple. Economic growth cannot proceed without ploughing back some part of the fruits of past effort, or the accumulation of capital. The greater the accumulation, the faster the rate of growth—at least in an economy as capital-hungry as India's. The quicker the progress, the more jobs there will be, and the total of employment opportunities should in the long run keep well ahead of marginal redundance. This is the lesson of industrial progress not only in the West but also in the different conditions of Japan and Russia."

There can be no two opinions on this conclusion. Only, the authorities in this country do not have the courage to adopt in actual practice the well-known principles underlining the above quotation. Meanwhile, the least that could be done is to accept the Study Group's recommendation that natural wastage of labour in cement factories should not be replaced till the redundant labour is got rid of.

The Study Group has found that working conditions for labour are not uniformly satisfactory in all the cement factories and that productivity is bound to increase if working conditions are improved. On the question of payment of wages by results, the Study Group says that wherever piece-rate payment is in existence, like in the quarries and packing departments, incentive system is also in existence. But, in several cases, the workers do not put in any extra effort and take benefit of the incentive system, because they are afraid that if they give higher production, the company may increase the minimum workload afterwards. Such apprehensions, the Study Group says, should be dispelled from the minds of workers. They should thus be persuaded to take full benefit of the incentive scheme which can considerably increase productivity. In this connection the Study Group observes that the Dalmia Cement (Bharat) has developed an incentive scheme by linking annual bonus with production and that this has helped to increase their output. Other cement factories, in the opinion of the Study Group, may consider adoption of such schemes, if feasible. Social incentives should also be tried along with other incentives.

T.I.S.CO.: HOPE FOR INVESTORS

EXPANSION ONLY IF WHOLLY FAIR TO SHAREHOLDERS

WHEN the Directors of the Tata Iron and Steel Company Ltd. [Managing Agents: Messrs. Tata Industries (Private) Ltd., Bombay] announced an increase of full one point to Rs. 12 in the dividend on the Rs. 75 fully paid ordinary shares for the year ended 31st March 1964, they appeared, to quite a few, to have played to the gallery, especially when the preliminary results released along with the dividend announcement did not fully bear out the increase. The full accounts now on hand also warrant this comment. What is more, no other than the Company's Chairman, Mr. J. R. D. Tata, himself candidly tells the shareholders in his annual statement that "... the Company made satisfactory progress reaching the production target of 1.5 million tons of finished steel with the output of steel ingots falling short of the 2-million-ton target by only 5 per cent ... on the financial side, however, the results were somewhat disappointing . . . much of the excess of Rs. 2 crores in pre-tax profit was due to the fortuitous addition to revenues of Rs. 85 lakhs written back from excess provisions made in previous years."

That, in spite of all this, the Directors have decided to raise the dividend for the second time in two years, third time in four years and fourth time in five years, leads one to infer that they have been increasingly conscious of the shareholders' claim to benefits arising from the 2-million-ton expansion programme, for which they not only provided additional funds but stood, albeit grudgingly, the progressive reduction in dividend in the previous years to as low a level as Rs. 6.80 in 1958-59 in the hope that the expansion programme ahead would bring them their rightful claim. Significantly enough, even after the latest increase, the dividend, after tax, is still lower at Rs. 9.60 as compared with Rs. 10.50 paid in 1953-54 and 1954-55, that is before the expansion programme was launched.

Additional evidence of the Directors' consciousness of the shareholders' claim is evident in Mr. Tata's observation that a further expansion during the fourth Plan envisaging initially a million tons of ingot steel to be rolled into sheets and strip at a cost of Rs. 170 crores of which probably a little more than half will be in foreign exchange will be sanctioned by the Directors "only if they are thoroughly satisfied that the project is technically sound and that it can be undertaken on terms wholly fair to the shareholders." Investors in Tata Steel have every reason to hope for a better deal from the Directors from time to time.

The accompanying table compares the year's results with those for the previous three years. It will be seen from this table that the year's gross profit of Rs. 23.97 crores, which does not include the previous years' excess provisions of Rs. 84.72 lakhs written back to revenues, is marginally higher than the previous year's gross profit of Rs. 22.59 crores, in spite of a rise of nearly Rs. 10 crores from Rs. 88.41 crores to Rs. 98.07 crores in net sales. Further, the ratio of pre-tax profit to sales is actually lower at 14.2 per cent as compared with 15.4 per cent in the previous year. This slight deterioration in profit per ton is attributed to a rise in costs uncompensated by a corresponding increase in retention prices. Increases in prices were sanctioned by the Government only from March 1964, though the increases in costs had taken place much earlier. The delay caused a substantial loss of revenue and profit. Further, the price increases from March 1964 in categories of steel over which price control has been retained after partial decontrol were substantially less than expected on the basis of the announcement made by the Minister for Steel in that month. Finally, the Company booked export orders for 7,400 tonnes of bars and structurals at a loss of Rs. 11 lakhs by way of fulfilling its share of one-third in the year's export target for the three main producers of steel.

The year's depreciation provision of Rs. 7.97 crores has been at the rate of 5 per cent on the gross block in use. During the preceding three years, however, an additional provision for depreciation had been made for bringing up the total provision to the amount of depreciation allowance admissible at income-tax rates. These were the years in which the profits as calculated for tax purposes were insufficient to meet the dividend without recourse to reserves of past taxed profits and these additional provisions were, therefore, made to earn certain tax relief on the dividend paid out. No such additional provision for depreciation has been made this year, as it was not necessary "for the purpose in view." For tax purposes, however, the total provision, including the third-shift allowance, amounts to Rs. 13.94 crores.

Trend of Results at a Glance

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961

* Subject to deduction of tax.
† High and low upto 31st July 1964.

The Company's tax burden for the year is thus about Rs. 2.70 crores less than it would be if calculated on the profits shown in the accounts. But the tax burden in future will become heavier, after the position in regard to depreciation is reversed and the depreciation allowances in the income-tax books become progressively lower than in the Company's books. The Directors have, therefore, created out of the year's profit a deferred taxation reserve of Rs. 2.70 crores, being the deferred tax liability on the difference between the depreciation allowable for income-tax purposes and the provision for depreciation made in the accounts. The amount carried to development rebate reserve is only Rs. one lakh, as against Rs. 8.70 lakhs in the previous year, but the general reserves, depleted in the past few years for paying dividend, have been strengthened with a transfer of Rs. 2.75 crores. For meeting the dividend liability, Rs. 5.25 crores have been taken to dividend reserve.

As noted earlier, the production targets for the year were fulfilled; the percentage increase in pig iron being 2.6, in steel ingots 5.2 and in saleable steel 6.7. The injection of fuel oil into the blast furnaces was extended to the remaining four furnaces during the year. The addition of an eighth furnace in steel melting shop No. 3 in October 1963 coincided with the commissioning of the new tonnage oxygen plant and the increased lancing of oxygen in the furnaces. The output of the medium and light structural mill, which had improved from 145,000 tonnes in 1961-62 to 171,000 tonnes in 1962-63, rose further to 191,000 tonnes during the year under review. Plant modifications for increasing the capacity of skelp mill from 180,000 to 250,000 tonnes are expected to be completed in the current year.

The proposed million ton (second) expansion programme will be worked out in detail by a firm of consulting engineers in about eight months. It will be superimposed on a programme already in hand for expanding and modernising the ore mines, building a battery of coke ovens, adding some equipment to SMS 3 and doing a few other things at a total cost of about Rs. 25 crores, and on the project for increasing the output of the Jharia collieries by a million tons of washed coal at an estimated cost of about Rs. 30 crores. The total outlay on all these plans thus works out to about Rs. 225 crores; half of it will be in foreign exchange. But the Chairman says there is no need for alarm at the prospects of such large commitments. "The recently completed 2-million-ton programme and the results in the form of increased dividends and reserves," he points out, "are an indication of the benefits and added strength which accrue to the Company and its shareholders from expansion resulting in lower costs, better utilisation of total assets and increased productivity." He has assured the shareholders that a further expansion will be sanctioned by the Directors only if the project is technically and economically sound and is undertaken on terms wholly fair to them.

As a result of repayment of Rs. 3.45 crores made during the year against the two World Bank loans, the outstanding liability under the two loans has come down to Rs. 32.84 crores. The total borrowings at the end of the year, apart from the special advance of Rs. 10 crores from the Government, amounted to Rs. 37.27 crores, as against Rs. 44.63 crores a year ago, out of which short-term loans are shown at Rs. 3.43 crores, as against Rs. 7.83 crores. These short-term loans and current liabilities and provisions (including the year's dividend liability) bring the total short-term indebtedness to Rs. 31.43 crores, as against which current assets, book debts and investments aggregate Rs. 59.09 crores. The paid-up capital, including Rs. 11.40 crores in three different types of preference shares, is unchanged at Rs. 38.97 crores and is backed by Rs. 45.01 crores in reserves and surplus, excluding the sum of Rs. 5.25 crores in the dividend reserve for meeting the year's dividend liability. The gross block, which has expanded during the year from Rs. 195.88 crores to Rs. 200.38 crores, has been written down to Rs. 100.15 crores.

The number of shareholders of the Company as at 31st March 1964 was higher at 76,310 as compared with 73,204 a year ago. The majority of shareholders, about 36,000 against 34,149 a year before, held shares up to Rs. 1,000, about 30,000 (against 28,286) held shares up to Rs. 5,000, some 6,000 (against 5,769) had their holdings spread between Rs. 5,001 and Rs. 10,000 and the number of those holding shares worth Rs. 10,001 and over was under 5,900. It will be seen that the shares were widely distributed in a large number of hands. Incidentally, eight years ago, the Company had only 37,519 shareholders.

The net yield on the Rs. 75 fully paid ordinary shares of the Company at their current market value of Rs. 154.50 *cum-div.* works out to 6.6 per cent per annum.

NEW STANDARD COMPLETES 25 YEARS

PROGRESS GOOD—SHAREHOLDERS GET MORE

THE silver jubilee year of the New Standard Engineering Company Ltd. (Managing Director: J. V. Patel, Bombay) which ended on 31st March 1964 has seen further encouraging progress. A considerable increase in the manufacturing activities during the year is reflected in a 31 per cent growth in gross sales (including returns) from Rs. 182.91 lakhs to Rs. 240.29 lakhs which is more than double the 14 per cent rise recorded in the previous year. Gross profit, as a result, has improved to Rs. 26.88 lakhs after having been sticky around Rs. 22 lakhs in the previous year. This improvement, which works out precisely to Rs. 4 lakhs, is reduced to about Rs. 2 lakhs at the level of net profit, amounting to Rs. 11.09 lakhs, as against Rs. 9.31 lakhs a year before, because of slightly higher essential provisions. Nevertheless the shareholders have got one per cent more by way of silver jubilee bonus in addition to the usual dividend of 9 per cent. The net amount carried to reserves (that is, after adjusting withdrawals) is also higher at Rs. 3.29 lakhs as compared with Rs. 2.44 lakhs a year before.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales less returns	234.13	180.26	158.87	119.09

The new foundry project at Goregaon contributed Rs. 85 lakhs to the year's turnover as against its share of Rs. 45 lakhs in the previous year. It will be recalled that the Company was able to proceed in a big way with the Goregaon project after receiving the first instalment of Rs. 20 lakhs out of the sanctioned loan of Rs. 40 lakhs from the I.C.I.C.I. in the previous year. Out of the remaining amount of Rs. 20 lakhs, Rs. 13.70 lakhs have been received and the balance of Rs. 6.30 lakhs has been sanctioned in terms of $132,000 for purchasing one openside planer, which has since been received, and one horizontal borer from the U.K. During the year under review, the Company completed the construction of civil engineering work, the plant and also trenches for support of conveyors for sand handling machinery. However, due to delay in obtaining the licence for the import of capital goods, the scope of the foundry could not be fully enlarged. But some increase and improvement in the foundry capacity is expected after additional machinery is obtained from Cekop, Poland, on deferred payment terms. The necessary guarantee to the extent of Rs. 23 lakhs to secure payment in respect thereof has been furnished by the I.C.I.C.I The import licence has also been obtained and Cekop have despatched the first consignment worth Rs. 18 lakhs.

Among the manufacturing activities, there has been a substantial increase in the designing and manufacture of cranes. The Company has developed manufacturing facilities for 10 and 15 tons cranes and will start delivering these capacities by the end of the current year. There have been increasing enquiries for cranes manufactured by the Company and the orders on hand are approximately worth Rs. 20 lakhs. The manufacture of higher capacity, (upto 20 cwt.) pneumatic power hammers and drop forges, mostly out of indigenous material, has commenced. The D.G.S. & D. has placed a Rs. 12 lakhs order for the hammers. The manufacture of blow room machinery, which improved last year, will be expanded to 24 lines during the current year. A Rs. 12 lakhs order for making 12 disc filters for coal washeries has been obtained and the Company has already delivered three disc filters.

The Company has, in collaboration with the Wheelabrator Corporation, U.S., and Tilghman's Ltd., U.K., promoted a new company called Indabrator Ltd. for manufacturing shot blasting equipment. Production is expected to start by the end of this year. A proposal for making trimming pressed in collaboration with B. & S. Massey Ltd., U.K. has been approved by the Government. The details are expected to be finalised by the end of the current month. The Company's proposal for manufacturing pig iron has been sanctioned by the Government. The Company has also been allowed to make hot blast cupolas in collaboration with Cekop, Poland.

On 12th February 1964, the Directors made the first call of Rs. 25 per share on the 24,961 equity shares of Rs. 100 each issued at a premium of Rs. 20 per share in the previous year. As a result, the paid-up capital, including Rs. 25 lakhs in 9 per cent cumulative redeemable preference shares, has increased from Rs. 78.19 lakhs to Rs. 85.43 lakhs. Reserves and surplus, amounting to Rs. 23.32 lakhs, are a little more than one-fourth of this share capital. Loan capital has gone up from Rs. 81.85 lakhs to Rs. 109.32 lakhs and comprises long-term loans of Rs. 44.75 lakhs and short-term borrowings of Rs. 64.57 lakhs, as against Rs. 30.75 lakhs and Rs. 51.10 lakhs, respectively, in the previous year. In addition to the short-term loans, there are current liabilities and provisions amounting to Rs. 99.72 lakhs, bringing the total indebtedness to Rs. 164.29 lakhs, as against which current assets, book debts and investments aggregate Rs. 208.07 lakhs. The gross block of Rs. 155.97 lakhs (Rs. 140.32 lakhs a year before) has been written down to Rs. 109.72 lakhs.

Currently quoted at Rs. 135.00 *cum-div.*, the Rs. 100 fully paid ordinary shares of the Company offer a net yield of 6.3 per cent per annum.

T.W.A.'S RECORD EARNINGS

The Trans World Airlines' net earnings and revenue for the April-June quarter and half-year of 1964 are all-time records. According to its President, Mr. Charles C. Tillinghast, Jr., the net earnings for the second quarter of this year amounts to $12.17 million (about $1.81 per share), as against $6.45 million (about $0.96 per share) in the corresponding period of last year. The net profit for the six months of 1964 comes to $11.10 million (about $1.65 per share), as against a loss of $3.80 million in the corresponding period of 1963. The Company's financial progress becomes all the more impressive when it is noted that the half-yearly net profit of $11.1 million has been arrived at after wiping out the loss sustained during the same period of 1963.

Operating revenues for the second quarter of this year have gone up by 22.3 per cent to $147.16 million, and total expenses by 7.8 per cent to $122.75 million over the corresponding period in 1963. Domestic operation of the Company, which had resulted in a loss last year, has shown a smart rise this year. The Company has also increased its passenger and cargo traffic during the period. In terms of passenger miles flown, Trans World Airlines has today become the second largest airline in the free world, overtaking both the American Airlines and the Pan American Airways.

NATIONAL RUBBER'S RIGHTS ISSUE OVERSUBSCRIBED

The recent rights issue of the National Rubber Manufacturers Ltd. has been oversubscribed. The total amount of the issue was Rs. 50 lakhs, comprising 500,000 ordinary shares of Rs. 10 each issued at par in the ratio of one new share for every old ordinary share. The allotment of additional shares has been made on a graduated scale in consultation with the Calcutta Stock Exchange authorities. The share certificates for both rights and additional shares will be sent to shareholders and/or allottees on or before 30th September 1964.

(Concluded from next column)

ference shares to Rs. 119.99 lakhs. Bank borrowings of Rs. 166.50 lakhs and the I.F.C.I. loan which has increased during the year from Rs. 82.36 lakhs to Rs. 87.95 lakhs bring the total of secured loans to Rs. 254.45 lakhs. The bank loans and current liabilities and provisions (including the dividend liability) amounting to Rs. 49.96 lakhs raise the total short-term indebtedness to Rs. 216.46 lakhs, which exceeds current assets, book debts and investments aggregating Rs. 189.97 lakhs. The gross block as noted before has expanded by Rs. 281.36 lakhs to Rs. 367.74 lakhs. It has been written down to Rs. 281.37 lakhs and including technical know-how shown at Rs. 305.91 lakhs.

The net yield on the Company's Rs. 50 fully paid ordinary shares at their current market value of Rs. 156.25 *cum-div.* works out to 4 per cent per annum.

POLYCHEM PAYS SAME BUT WITH A 3:7 BONUS ISSUE

TWO PROJECTS COMPLETED

THE most significant thing to note about the working of Polychem Ltd. (Chairman: Mr. Ramdas Kilachand, Bombay) during the year ended 31st March 1964 is the completion of the two projects, namely, styrene monomer plant and alcohol distillery. The reasons are two: one is quite obvious: now that the basic raw material styrene monomer is being manufactured in its plant, the Company is no longer dependent on imports for any of its major raw materials. The other is that it has necessitated larger allocations to depreciation and development rebate from the substantially higher gross profit of Rs. 88.95 lakhs for the year as compared with Rs. 38.70 lakhs for the previous year following a handsome increase in sales (including excise but less rebates) from Rs. 196.83 lakhs to Rs. 269.79 lakhs. Thus, the provision for depreciation has jumped up from a mere Rs. 6.30 lakhs last year to no less than Rs. 56.47 lakhs and that for development rebate reserve from Rs. 2.44 lakhs to Rs. 27.33 lakhs. These large transfers follow the net addition of Rs. 281.36 lakhs to the block account, including Rs. 200.38 lakhs on account of plant and machinery and Rs. 38.78 lakhs on account of buildings and other facilities going with them.

It is commendable that, in the very first year's working of the two new plants, the Company has been able to make these much higher essential provisions. Further, in view of the allowable development rebate, no provision for taxation has been found necessary, except to the extent of Rs. 63,000 by way of dividend tax in respect of the previous year. But all good has also its side-effect which in the case of Polychem is that the profit, after depreciation and development rebate, is a paltry sum of Rs. 4.44 lakhs, not sufficient to cover the preference and ordinary dividends at the previous rates requiring Rs. 11.73 lakhs. In the circumstances, the dividends have been left unchanged and the necessary cover for them has been obtained by writing back excess provisions and withdrawing from reserves a total sum of Rs. 7.24 lakhs.

The shareholders would not have been quite happy at the prospects of realising the same dividend in spite of the very encouraging financial results of their Company. They have, however, been pepped up by the Directors with a proposed three-for-seven bonus share issue by capitalising the share premium account amounting to Rs. 24 lakhs. The improved results during the year are attributed by the Directors to increased production. The growth in gross turnover is 30 per cent and in net sales (that is, after excluding excise and rebate) too it is almost the same. But, according to the Directors, the continuance of the heavy excise duty at the rate of 24 per cent *ad valorem* on all plastic raw materials has made plastics uncompetitive in relation to many of the conventional materials for which they are ideal substitutes.

The following table gives a synoptical view of the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961

Extracts from the Directors' report: *Raisings and Despatches*: Raisings and despatches both improved and were 3,20,083 tonnes and 3,15,956 tonnes respectively as compared with 2,65,945 tonnes and 2,76,844 tonnes in the previous year.

Transport: Although wagon supplies were an improvement on the previous year, stocks increased during this period.

World Bank Loan: Further to the remarks made in the last year's report and accounts under this heading, most of the equipment ordered has now been received in this country, and much of it has been installed or is in course of installation.

Accounts in brief as at 29th February 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	29,97,375	Gross block	57,00,243
Reserves and surplus	17,67,571	—Depreciation	19,62,364

* Loss after providing for depreciation and taxation.
† Upto 5th August 1964.

Extracts from the Directors' report: *Water and Power Supply*: The Maharashtra Industrial Development Corporation completed during this period its temporary water supply scheme at Ambarnath and the Company has been receiving adequate water supply since then. The Maharashtra State Electricity Board has already made available to the Company adequate power for present phase of production.

Building Construction and Erection of Machinery: As was indicated by the Directors in their first annual report to the shareholders, construction of the factory building, was completed by June 1963. Soon thereafter, erection of machinery was also completed.

Production: Trial run of machinery was started on 8th August, 1963 and manufacture of *Air Hoists*, *Electric Hoists* and *Crane Crab* was undertaken. After the prototypes were successfully completed, batch production of these products was started. By the end of the year under report, a turnover of Rs. 4,15,295 was achieved. Since the beginning of the current year the production has gradually increased and is being maintained. During the current year also production of *Air Hoists* and of *Electric Hoists* (*Wire Rope Type*) has been taken up and is progressing quite satisfactorily as also production of E.O.T. *Cranes* against orders received. During the year, the Company also proposes to add to the existing products, production of *Electric Hoists* (*Chain Type*), *Chain Pulley Blocks* and *Belt Conveyers*. The Company's products have been well received in the market.

Finance: To meet additional requirement of funds, the Company has arranged with its Bankers, under the Refinance Scheme of the Government of India by creation of a charge on its fixed assets, a medium term loan (repayable in 7 years) of Rs. 20 lakhs which amount has been drawn in two instalments.

New Industrial Licences: The Company had applied and obtained from the Government of India a licence for substantial expansion of its existing capacity for E.O.T. cranes. The capacity has been increased from 24 to 96 Nos. per annum.

The Company has also obtained from the Government of India under Industries (Development and Regulation) Act, 1951 industrial licences for manufacture of *Guillotine Shearing Machines; Combination Punching, Cropping and Shearing Machines* and *Hydraulic Presses*.

Efforts are being made to negotiate and obtain from reputable foreign parties necessary technical assistance for implementation of the above projects in terms of the licences.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.

† High and low upto 31st July 1964.

Extracts from the Directors' report: The plant continued to work satisfactorily during the year and output of low ash content hard coke was well maintained. A regular maintenance and renovation programme is being followed which, on account of the age of the plant and difficulties in procuring the necessary spares, must inevitably affect the cost of production. The interim wage increase recommended by the Wage Board for the Coal Industry was accepted with effect from 1st March, 1963 and has also contributed to high costs.

For a short period of the year under review it was necessary to carry some stocks of coke owing to a general decrease in demand for hard coke on account of the shortage of pig iron. The high quality of the Company's product did however ensure a speedy return to normal off-take by consumers requiring coke for precision castings for the internal and export markets.

As recorded in the last report of the Directors, the grade of coke produced by the Company was decontrolled with effect from 1st March 1964, and it was therefore possible to pass on to consumers the increases in costs referred to above.

The output from the By-products, Sulphate of Ammonia and Sulphuric Acid plants was maintained at a reasonable level at a reduced cost: the renovated boiler and new water filtration plant, which are being installed, should substantially increase steam generation capacity and hence the efficiency of these old plants.

The management continues to have under investigation plans for diversification and expansion of the Company's operations but no very early results can be expected due to the complex nature of these experiments and investigations.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	12,00,000	Gross block	42,54,256
Reserves and surplus	15,03,889	—Depreciation	37,43,315

		Block in progress	45,936
		Current assets	28,97,184
		Investments	2,06,192
		Cash	5,07,022
	Rs. 41,66,977		Rs. 41,66,977

* Paid-up capital consists of 1,20,000 ordinary shares of Rs. 10 each.

Camphor and Allied Products Ltd.

(*Chairman*: Mr. C. C. Desai, Bombay.)

Third Annual General Meeting—10th September 1964.

Extracts from the Directors' report for the period from 1st April to 31st December 1963:

The working of the Company for the period, after transferring Rs. 11,38,017 to "Expenditure During Construction Account" and after adjusting Rs. 9,285 excess provision of taxation, shows a loss of Rs. 26,890 [after providing Rs. 29,096 (Rs. 20,000 for the year ended 31st March 1963) for managing agents' commission and Rs. 2,500 (Rs. 14,250) for provision for taxation] which is added to the balance of Rs. 65,256 brought forward from the last year's account. The total loss amounting to Rs. 92,146 is carried forward.

As the major construction and erection work was completed by December, 1963, the Directors considered it advisable to change the accounting year from 31st March to 31st December. The accounts presented, therefore, are for a period of nine months ending 31st December, 1963.

The capital cost including the allocation of the pre-operative expenses to be capitalised will be approximately Rs. 1.50 crore. The increase in the capital cost is mainly due to delay in the completion of the project, consequent capitalisation of de-

increased expenditure during construction and general rise in price-level.

The *Camphor* manufactured in the Company's plant has been received well in the market and in view of the arrangements already made for the sale of its entire production, the Company does not envisage any problem with regard to the sales. Barring unforeseen events, the Company can reasonably expect the production of around 350 tons of *Camphor* before 31st December, 1964.

In respect of the Industrial Licence granted by the Government of India for the manufacture of *Formic Acid*, the Company has received two proposals for obtaining "know-how." Which would be more advantageous to the Company, is a matter under the consideration of the Directors. The Company has also submitted an application for the import of the necessary capital goods. With regard to the letter of intent received by the Company for the manufacture of various chemicals based on its by-products, considerable preliminary work has been done in that regard.

Some of the by-products like *Terpene* B, D, G and *Distilled Turpentine*, which are being already manufactured, require efficient and technically knowledgeable marketing.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	59,95,375	Gross block	1,07,87,809
Other liabilities	1,09,00,673	Block in progress	3,58,066
		Expenditure during construction	21,01,717
		Technical 'Know-how'	1,19,053
		Current assets	29,52,028
		Investments	25,000
		Miscellaneous expenditure	3,27,681
		Cash	1,31,247
		P.L. account deficit	92,146
	Rs. 1,68,96,048		Rs. 1,68,96,048

* Paid-up capital consists of 49,995 equity shares of Rs. 100 each and 10,000—9.25 per cent. (free of company's tax) cumulative redeemable preference shares of Rs. 100 each, calls in arrears amount to Rs. 4,250. Amount paid up on shares forfeited is Rs. 125.

Supreme Industries Ltd.

(*Managing Agents*: Messrs. Mody & Co., Bombay.)

Twenty-second Annual General Meeting—22nd August 1964.

Working Results:

Low	75.00	89.00

* Only a sum of Rs. 440.
† A sum of Rs. 746.
‡ Upto 24th July 1964.

Extracts from the Directors' report: During the year under review the working of the Company had been satisfactory considering the numerous difficulties and problems the industry as a whole was facing. The year 1963-64 like the previous year was under the shadow of emergency and the budget of the Government of India was defence oriented with priority for defence requirements. In the last year's report the attention of the shareholders had been drawn to some of the peculiar problems of the industry. The Company had not only to face increase in the price of raw materials but also acute shortage of raw materials.

The Company's *SILPACK* Polyethylene Wide Film Department was forced to remain idle for many months. Though the Directors had deferred the decision for a long time they had to close the department towards the end of the financial year and thus plug the drain on the economy of the Company, though it was a painful decision. The high cost and shortage of raw materials was not confined to extrusion side alone but had also affected the moulding side as well. The judicious use of materials at the disposal of the Company and concentration of all efforts on the moulding side had salutory effects.

The managing agents are making all possible efforts to improve sales of the existing lines, to develop new ones and revive the old line they have for the present suspended. Renewed efforts are being made to step up the sales of paints and adhesives which have good reputation, though the sales so far have not been impressive. The Paints and Adhesive Department has increased the range of manufacture and it has now half a dozen grades each in paints and adhesives for various applications. The Electroplating Department as hitherto has been a valuable adjunct to the industry.

Regarding construction plans of the new factory at Sewree, though the progress made so far is slow, the Company has practically overcome all the objections and difficulties and is now awaiting final approval of the municipal authorities any day and if all goes well the factory will be ready before September next year.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	13,94,300	Gross block	18,94,084
Reserves and surplus	2,89,288	—Depreciation	8,40,811
Other liabilities	8,20,709	Net block	10,53,273
		Block in progress	21,026
		Current assets	12,90,297
		Investments	79,500
		Cash	50,220
	Rs. 25,04,292		Rs. 25,04,292

* Paid-up capital consists of 9,823 equity shares of Rs. 100 each and 4,500 5½ per cent [illegible] shares of Rs. 100 each.

THE ALUMINIUM INDUSTRIES LIMITED

Registered Office:
No. 1, Ceramic Factory Road
Kundara, Kerala State

NOTICE TO SHAREHOLDERS

NOTICE IS HEREBY GIVEN THAT THE Eighteenth Annual General Meeting of the shareholders of the Company will be held at the Registered Office of the Company, No. 1, Ceramic Factory Road, Kundara, on Monday the 28th September 1964, at 3.30 p.m., to transact the following business:—

1. To receive and adopt the Directors' Report and audited Balance Sheet of the Company as at 31st March 1964 and Profit and Loss Account for the year ended 31st March 1964.
2. To declare a dividend.
3. To appoint a Director in the place of Shri S. Narayanaswamy who retires by rotation under Article 102 of the Articles of Association of the Company and who is eligible for re-election.
4. To appoint a Director in the place of Shri K. P. Ramachandran Nair who retires by rotation under Article 102 of the Articles of Association of the Company and who is eligible for re-election.
5. To appoint a Director in the place of Shri N. Sundareswaran who retires by rotation under Article 102 of the Articles of Association of the Company and who is eligible for re-election.
6. To appoint Auditors for the Company for the year 1964-65 and to fix their remuneration. The retiring Auditors, Shri T. Velu Pillai, Alwaye, and Messrs. K. Venkitachalam Aiyer & Co., Trivandrum, are eligible for re-appointment.
7. To consider, and if thought fit, to pass the following resolution as an ordinary resolution:

   "Resolved that consent of the Company be and is hereby accorded for the appointment of Indian Oxygen Limited, Calcutta, as Sole Selling Agents for Aluminium Welding Cables manufactured by the Company for a period of two years with effect from 1st December 1963 for territories in the Union of India and for exports."

8. To consider, and if thought fit to pass the following resolution as a special resolution:

   Resolved that the Articles of Association be amended in the manner following:

   1. The existing Article 92 shall be renumbered as 92(1).
   2. The following shall be added as Article 92(2), viz:

      "92(2). The Industrial Credit and Investment Corporation of India while any mortgage or charge created by the Company in its favour subsists, or any loan or any part of the loan borrowed by the Company is outstanding, may at any time, by notice in writing to the Company appoint one director acceptable to the Company on its Board and may at any time by notice in writing to the Company revoke the appointment of such director and appoint another in his place. Such director shall not be subject to retirement by rotation nor shall he be required to hold qualification shares but he shall be entitled to all fees and expenses ordinarily allowed to the directors."

9. To consider, and if thought fit, to pass the following resolution as an ordinary resolution:

   "Resolved that Messrs. Seshasayee Brothers (Travancore) Private Limited, Kalamassery, be and are hereby reappointed as Managing Agents of the Company for a period of ten years commencing from 15th August 1965, in terms of the draft agreement placed before this meeting and signed by the Chairman for identification subject to the approval with modifications if any by the Central Government, as required by the Companies Act, 1956."

All shareholders are requested to be present in person or by proxy. A member entitled to attend and vote at a meeting is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member.

By Order of the Board,
SESHASAYEE BROTHERS (TRAVANCORE) PRIVATE LTD.,
Managing Agents,
B. V. D. MENON,
Managing Director.

KUNDARA,
27th July 1964.

Note: 1. The Share Transfer Books of the Company will be closed from the 18th to the 28th September 1964 (both days inclusive). The dividend, if sanctioned, will be made payable on or after the 28th September 1964 to those shareholders whose names stand on the Register as on the 28th September 1964.

2. Explanatory statement as required by Section 173 and abstract of the terms of Managing Agency Agreement and the nature of the interest of the Directors under Section 302(3) of the Companies Act 1956 in respect of special business is being posted to the Shareholders along with the notice.

3. The Directors have recommended payment of a final dividend of 90 paise (Ninety paise) per share subject to deduction of tax which together with the interim dividend paid in May 1964 aggregates to 18 per cent dividend for the year.

THE COORLA SPINNING & WEAVING COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE NINETY-SECOND Annual General Meeting of the Company will be held at its Registered Office at Readymoney Mansion, Vir Nariman Road, Fort, Bombay, on Friday the 11th September 1964, at 4-00 p.m. (S.T.), to transact the following business:—

1. To receive and adopt the Directors' Report and the Audited Balance Sheet and Profit and Loss Account for the year ended 31st March 1964.
2. To sanction the declaration of a dividend.
3. To elect a Director in place of Mr. Maneklal Premchand who retires by rotation but being eligible offers himself for re-election and for that purpose to consider and, if thought fit, to pass the following Resolution as a Special Resolution of which Special Notice has been given to the Company and is hereby given pursuant to Sections 261 and 281 of the Companies Act, 1956, as Mr. Maneklal Premchand is a person who is entitled, by virtue of an agreement, to a share of remuneration received by Cowasjee Jehangir & Co. Private Ltd., the Managing Agents of the Company, and as he has completed the age of 75 years:—

   "RESOLVED that pursuant to the provisions of Sections 261 and 281 and any other relevant provisions of the Companies Act, 1956, Mr. Maneklal Premchand who has attained the age of 75 years and who is a person entitled by virtue of an agreement to a share of remuneration received from the Company by Cowasjee Jehangir & Co. Private Ltd., the Managing Agents of the Company, be and he is hereby re-elected a Director of the Company, and that it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the said Act shall not apply to him."

4. To appoint Mr. J. P. Thacker as a Director of the Company and for that purpose to consider and, if thought fit, to pass the following Resolution as a Special Resolution of which Special Notice has been given to the Company and is hereby given pursuant to Section 261 of the Companies Act, 1956, as Mr. J. P. Thacker being a Partner in the firm of Messrs. Mulla & Mulla and Craigie Blunt & Caroe, is an Associate of Messrs. Cowasjee Jehangir & Co. Private Ltd. since Mr. N. R. Mulla, another partner of the said firm, is a Director in the Managing Agency Company:—

   "RESOLVED that Mr. J. P. Thacker, who is an associate of the Managing Agents, Messrs. Cowasjee Jehangir & Co. Private Ltd., be and he is hereby appointed a Director of the Company."

5. To approve of the change in the constitution of the Managing Agency Company, namely, Messrs. Cowasjee Jehangir & Co. Private Ltd., and for that purpose to consider and, if thought fit, to pass the following Resolution:—

   "RESOLVED that the change that has taken place in the constitution of the Managing Agency Company, namely, Messrs. Cowasjee Jehangir & Co. Private Ltd., as a result of change in the ownership of its shares and consequently a change in character of Managing Agency Company, be and the same is hereby approved."

6. To elect a Director in place of Sir Cowasji Jehangir, Bart., who retires by rotation but being eligible offers himself for re-election.
7. To appoint Auditors for the current year and to fix their remuneration.

By Order of the Board of Directors,
COWASJEE JEHANGIR & Co. PRIVATE LTD.,
Managing Agents,
R. P. GOENKA,

BANKING

(*Concluded from page 258*)

is further complicated by the extent to which increased quotas will be payable in gold and by the extent to which the additional quotas will be available conditionally or unconditionally. The issues involved will no doubt be discussed threadbare at the Tokyo meetings of the Fund.

But what is lacking in this approach is the failure to integrate the monetary issues with the issues of trade and payments. It is becoming increasingly clearer every day that the only convincing approach to the problems of international trade is a monetary one, through the creation of a new world liquidity mechanism. This conclusion was challenged by some of the developing countries at the Geneva Conference on Trade and Development and may again be challenged by them at Tokyo. Their contention is that liquidity and reserves are one thing and aid and transfer of real resources from the rich to the poor countries is another. But the essential point is to see that developed countries do not cut their aid or refrain from lowering their tariffs in favour of the developing countries merely on the ground of balance of payments difficulties. Here is where the Fund comes in and an increase in international liquidity will be of some benefit to the developing countries. It remains to be seen to what extent the Fund-Bank meetings at Tokyo will take note of the special requirements of underdeveloped countries and provide for them, so that the Fund, too, can play a more effective and direct role in accelerating the growth of developing countries.

Paris Club's Findings

The findings of the Paris Club's study group, too, underline the need for raising international liquidity. The study group has no doubt reaffirmed the conviction that the present international monetary system based on fixed exchange rates and established price of gold has proved its value as a solid foundation for building the future. And it is also inclined to feel that the available supplies of gold and reserve currencies, supplemented by a broad range of credit facilities, are fully adequate for the present and are likely to be for the immediate future. But it emphasises that the continuing growth of world trade and payments will call for larger international liquidity. The study group does not seem to favour expansion of existing credit facilities and, in its opinion, there is the case for only a "moderate" general increase in I.M.F. member quotas. The more effective solution, according to it, lies in "some new form of reserve asset." The Group has not spelt out clearly what this form should be like. All that it says is that it has been decided to initiate a thorough study of the measures and instruments best suited for achieving the purpose of avoiding major and persistent world imbalances which are not conducive to the smooth functioning of the international monetary system.

EXISTING AND PROPOSED ACTIVITIES OF THE COMPANY

The Company plans to manufacture immediately 18 million core yards of P.V.C. cables and 270 miles of Plastic Insulated Power Cables per annum.

P.V.C. Insulated Power Cables are fast replacing the conventional paper insulated cables throughout the world and in India also.

At present there is a sizable shortage of Power Cables, demand of which is expected to increase still further because of the various power projects under execution. In the Kerala State itself where the factory will be located several power projects like Panniar Pampa, Idukki are under execution.

TECHNICAL COLLABORATION

The Company has entered into a technical collaboration agreement with M/s. VEB Kabelwerl Oberspree of German Democratic Republic (formerly controlled by AEG), who were established 65 years ago and are reputed to be one of the leading cable manufacturers in Europe.

The agreement shall be in force for 10 years. The collaborators shall train 10 Indian personnel in their factories and the Company shall also be entitled to use their Trade Mark and benefit of the improvements made in production techniques by the collaborators. They shall be paid a total sum of Rs. 10,50,000; no royalty is payable.

LOCATION

The factory shall be located at Karukutty in the State of Kerala.

IMPORT OF MACHINERY

The Company has been granted two import licences for import of plant and machinery, worth Rs. 11 lacs from West Germany and Rs. 31·18 lacs from German Democratic Republic. Orders for these have already been placed.

CAPITAL LAYOUT

The capital cost of the project is estimated to be about Rs. 1·20 crores, which shall be met out as below :—

Share capital	Rs.	70 lacs
Loan from Industrial Finance Corp.	Rs.	50 lacs
	Rs.	1·20 crores

MINIMUM SUBSCRIPTION

The minimum subscription on which the Directors will proceed to allotment is shares of the face value of Rs. 52 lacs, being the whole of the present issue.

PROSPECTUS AND APPLICATION FORMS

Application forms along with copies of the prospectus can be had from the Registered Office of the Company and from the Bankers, Underwriters and Brokers, whose names are mentioned above.

APPLICATION FOR SHARES MUST BE FOR MINIMUM 25 EQUITY SHARES OR MULTIPLES THEREOF AND FOR A MINIMUM OF 5 PREFERENCE SHARES OR MULTIPLES THEREOF.

'BEHAR' the dependable name in FIRECLAY & SILICA Refractories

For over 15 years "BEHAR" REFRACTORIES are being used by leading Iron and Steel Works, Cement and Glass Factories, Tea Industries, Sugar and Cotton Mills and other Industries in the country.

NEWS IN BRIEF

THE ban on the movement of wheat and wheat products from the Punjab into Uttar Pradesh has been lifted with effect from the 6th inst.

A high-level technical delegation from Russia is arriving in New Delhi this week-end to discuss with Indian engineers the technical details of the Bokaro steel project.

A notice of a motion to be moved in the Lok Sabha expressing no-confidence in the Union Government has been given by Mr. A. K. Gopalan, the Communist leader. He has charged the Government with failure to tackle the food and price situation.

The Tea Board has launched a random sample survey on the people's consuming habits of tea, coffee and milk. The object of the survey is to collect data in respect of the socio-economic conditions of the people, consumers' buying habits, reasons for the popularity or otherwise of tea as a beverage, and frequency of tea drinking.

The Hyderabad Asbestos Cement Products Ltd. has won a contract for supplying an asbestos cement sheeting plant to Messrs. Johns-Manville International Corporation of the U.S. for their Belgium factory. The plant will be designed specifically for ensuring a very high rate of production of 150 to 200 tons per day.

The Government of India is negotiating with an American firm to erect a pulp and paper machinery factory and five "baby" paper producing factories at a total cost of about Rs. 48 crores in Dehri-on-Sone. The proposed factories will together produce machinery worth Rs. 8 crores annually and 200 tons of newsprint daily.

The Governments of India and Spain are expected to sign an agreement on the development of atomic energy for peaceful purposes. The proposed agreement will provide for exchange of unclassified information, scientists and technical personnel by mutual consent. India has similar arrangement with Sweden, Poland, the Netherlands and the U.A.R.

The Industrial Court of Ahmedabad has granted an interim relief of Rs. 5.25 in dearness allowance for 26 working days to 125,000 textile workers of Ahmedabad. The relief has been granted pending the disposal of the dispute between the Ahmedabad Millowners' Association and the I.N.T.U.C.-led Textile Labour Association over the link-up of the new series of working class cost of living index with the old series for the purpose of paying D.A.

The thermal designs organisation of the Central Water and Power Commission is likely to start functioning in about a month. At present, the Commission is only giving general assistance to designing thermal stations. There are about 30 thermal stations now under construction with an installed capacity of four million kw. and, for their designs, the Government is paying as much as Rs. 6 crores, two-thirds of which represents foreign exchange.

A nine-member expert Committee, with Prof. M. L. Dantwala of Bombay University as Chairman, has been appointed by the Union Government to look into the problems of co-operative marketing. The Committee has been asked to review the present pattern of co-operative marketing of agricultural produce, supply of consumer articles at the village, regional, State and national levels and indicate the role of co-operative marketing in an integrated structure of credit, supplies and processing.

In the month of July 1964, production targets were exceeded in six units of the Durgapur steel works, namely blast furnaces, pig casting machines, steel melting shop, blooming mill, billet mill, and section mill. Two new records were set up in the assembly and despatch of roller-bearing wheel sets. About 1,770 roller-bearing wheel sets were assembled during the month, as against the previous best of 1,543 sets in the previous month, and 1,710 roller-bearing wheel sets were despatched, as against 1,592.

The U.S. Government has authorised four long-term and low-interest loans aggregating $62.3 million (Rs. 29.7 crores) to the Government of India. The four loans are, $50 million for financing import of commodities, $7.2 million for purchase of 25 broad-gauge diesel locomotives $3.1 million for meeting the foreign exchange costs of an additional 89,100-kw. generator to the Sharavathi hydro-electric project in Mysore State, and $2 million for financing the cost of obtaining the consulting services of U.S. firms and individuals for Government and private sector projects.

The Union Ministry of Community Development and Co-operation has selected the States of West Bengal, Orissa, Uttar Pradesh, Andhra Pradesh, Madhya Pradesh, Punjab, Rajasthan, Mysore and Kerala for a critical evaluation of the progress made by some key programmes in the co-operative sector. The evaluation will cover development of co-operatives in areas where intensive cultivation programmes have been launched, progress in the field of marketing and processing, and setting up of consumer stores. It will also cover the assistance received by the co-operatives from the Agricultural Refinance Corporation. The Governments of the States concerned have been asked to undertake a quick review of primary agricultural credit societies.

The Government of India has decided to set up an independent body consisting of a single person to examine the quantum of dearness allowance that should be paid to Central Government employees as compensation for rise in prices. The latest increases in the rates of dearness allowance announced by Government early in May last were calculated to ensure at the minimum of each pay slab up to Rs. 300 roughly 75 per cent neutralisation of the total rise of 20 points in the average price index since 1st July 1959. It has been represented by certain associations of employees that this increase is not adequate. In terms of statements made on behalf of Government in Parliament in August 1960, Government had agreed to 50 per cent neutralisation of the increase in prices and, if necessary, to the appointment of an impartial body to consider what portion, if any, of the other 50 per cent should be neutralised. As employees are not satisfied with the substantially higher increases given from time to time, the Government has decided to appoint an independent person to go into the matter and report quickly. The name of the person appointed will be announced shortly.

The Union Government has given its assent to a collaboration agreement between Clarion, Advertising Services Private Ltd., the largest Indian-owned and managed advertising agency in the country, and McCann-Erickson Corporation, the foremost international advertising agency in the U.S. Under this agreement, a new advertising agency, to be known as Clarion-McCann Advertising Services Private Ltd., will be formed for undertaking export advertising. The Chairman of Clarion Advertising, Sir Dhiren Mitra, told pressmen that, as a result of this arrangement, India would have direct access to reliable worldwide marketing information and facilities so necessary for its export drive, by utilising the 75 offices of McCann-Erickson in 32 countries. This is expected to lead to some saving of foreign exchange, as approximately 50 per cent of the commission earned by the new agency on export advertising will be retained in India. The agreement explicitly provides for the continued management of the new Company by Clarion or its nominees. The American partner in this joint enterprise will hold 49 per cent of shares. Besides the availability of advanced methods developed by McCann Company, the new company will also benefit from McCann-Erickson's regular schooling of personnel, international seminars and loan of personnel for specialised services.

The Union Government has decided to accept the selection of 153 rationalised sections recommended by the *ad hoc* Committee which was constituted in August last year for the selection of the rationalised sections to which rolling would be restricted, which submitted its report in May last after taking into consideration an independent report of the Indian Engineering Association. The recommendations of the Committee have been duly considered. As it will take some time for the existing rolls to wear out and for designs utilising these structural sections to be changed, it has been decided that the change over to the rationalised section will take place from 1st January next year. The main producers are being requested to take all possible steps to ensure that all the rationalised steel sections are made available to consumers in sufficient quantities and in time. The Central and State Government departments have also been requested to modify and base all their designs on these rationalised sections only. All consumers of steel will place indents from 1st January 1965 on the basis of these sections and import of steel sections not included in the rationalised scheme will not be allowed only on the ground that the structures were designed to utilise these other sections. The future pattern of production of structural sections by the main producers will be restricted to the rationalised steel sections only. Special sections, such as crossing sleepers, bearing plate bars, telegraph channels, sheet piling sections, etc., will, however, continue to be rolled to meet specific important demands.

From Abroad

Britain remained as the biggest customer of Australia with purchases worth £255.6 million during the financial year 1693-64. Japan comes next with purchases amounting to £244.6 million.

The International Coffee Organisation Council has set the 1964-65 total world coffee export quota at 47,506,518 bags, 2.67 per cent above the Coffee Agreement's established basic quota of 45,530,183 bags.

The U.S. Export-Import Bank has authorised a $2.5 million credit to Spain. The credit will be re-lent to Spanish concerns for financing moderate-sized purchases of machinery and equipment from the U.S.

The South African Government has created a separate Ministry in charge of Planning. This move is a sequel to the growing importance of joint planning and co-operation in various spheres and the need to secure co-operation between the public and private sectors.

The French Government has agreed to grant Greece Frs. 123-million (£9 million) aid within the framework of the O.E.C.D. Aid to Greece Consortium. The aid consists of Frs. 82 million to untied credits and Frs. 41 million to "tied" credits. Both loans are repayable in 15 years and bears interest at 3.5 per cent.

A national Action Council to promote closer economic ties with Britain has been formed by Australian businessmen. This Council has its counterpart in Britain. A ten-man delegation from Britain is expected to come to Sydney on the 22nd of next month to attend the first meeting of the Action Council.

PERSONAL

MR. Purtej Singh, Chief Engineer of Bhilai Steel Plant, has been appointed a Director of the Hindustan Steel Works Construction Corporation.

Sheikh Yacob Abdul Aziz al Rashid, Kuwait's first Ambassador to India, presented his credentials to the President on Thursday this week.

Mr. M. C. Chagla, Union Minister for Education, will lead the Indian delegation to the third Commonwealth Education Conference to be held at Ottawa from 21st inst. to 4th September next.

Mr. G. D. Kothari and Mr. G. Birla have been elected President and senior Vice-President, respectively, of the Tea Association of India for the year 1964-65. Mr. P. K. Kanoria has been elected the Vice-President.

Mr. Ramnath A. Podar, Mr. G. K. Devarajulu and Mr Madanmohan Mangaldas have been elected Chairman, Deputy Chairman and Vice-Chairman, respectively, of the Indian Cotton Mills' Federation for the year 1964-65.

Dr. A. U. Shaikh has been nominated by the Government of Maharashtra as a full-time member of the Maharashtra State Road Transport Corporation. He has also been appointed the Vice-Chairman of the Corporation.

Mr. S. Bhoothalingam, I.C.S., has been appointed Secretary for Economic Affairs in the Union Ministry of Finance vice Mr. L. K. Jha who has taken over charge as the Secretary to the Prime Minister. He will continue to be in charge of the Department of Co-ordination in the same Ministry.

The Hongkong and Shanghai Banking Corporation is paying £2.1 million (Australian) for a 40 per cent stake in the equity of Mercantile credits, the Sydney-based hire-purchase financing house. The terms are 7s. 6d. for each of 5.6 million 5s. shares to be acquired. The Mercantile's present capital and reserves together amount to £3.22 million and its tangible assets aggregate £22.8 million.

The Government of Pakistan has signed two barter trade agreements with the Hungarian Government. One of the agreements, which is valid for two years, provides for the exchange of goods and commodities upto Rs. 55 lakhs on each side during the next 12 months. The other agreement provides for the import of road-building machinery and construction equipment worth Rs. 9 lakhs in exchange for Pak jute and shoes.

The Australian Federal Treasury, in the new £50 million cash issue, has raised the long-term bond rate to 5 per cent, in a bid to check inflationary trends. This rate represents an increase of 6s. per cent over the yield offered in the previous loan issued in May last and 10s. per cent over the yield of loan offered in February. The main objectives are to drain off a part of the excess liquidity, to encourage saving and to impose a stiffer interest test for capital raising in the share market.

The Government of Bulgaria has given a contract worth £4 million to Simon-Carves of Britain (in association with Imperial Chemical Industries) for the supply of a polythene plant. The plant, with a capacity to produce 24,000 tons of I.C.I.'s versatile plastic material for a wide range of consumer and industrial uses, will be located near Burgas. At least, 90 per cent of the work will be undertaken in Britain and the plant is expected to go into production in 1966.

The first shipments of Algerian natural gas from the Sahara to the U.K., under the U.K. Gas Council's contract with the Algerians for the import of about 70,000 tons a year, are expected to reach Britain sometime next month. Delivery was expected this month, but it has been delayed owing to some problems in the building of a liquefaction plant at Argew in Algeria; the plant will convert natural gas into liquid methane, so that it can be transported by tankers to the U.K. The plant is claimed to be the first of its kind in the world.

Companies, trusts and individuals in Britain are sponsoring some 209 of the 575 young Britons doing voluntary work in countries all over the world this year. Some 15 industrial concerns, according to a spokesman for the Voluntary Service Overseas Organisation are involved, headed by the British-American Tobacco Company and the British Aircraft Corporation, sponsoring five and three volunteers, respectively. Sponsorship required a minimum contribution of £300 for support of the voluntary worker during the year. The biggest supporting trust is the Christian Aid Organisation, which sponsors over 100 volunteers. Others include the Dulverton Trust, the Fort (Dagenham) Trust, and some Livery Companies of the City of London. The volunteers they sponsor go to developing countries all over the world for periods of a year or more to work on a variety of projects. They engage in teaching, agriculture, community development and social welfare. The British Government is contributing this year (1964-65) £270,000 or 50 per cent of the support costs. This will rise to £650,000 or 75 per cent in 1965-66, when it is hoped to increase the number of volunteers to 1,300 from the 800 it is planned to send this year.

TREND OF MARKETS

NEW CEILING RATES FOR DEPOSITS

(From Our Own Correspondent)

BOMBAY, 11th August

The Indian Banks' Association has announced that the requisite support of banks participating in the Inter-Bank Agreement on Deposits has been received for revising the maximum rates of interest on notice money and term deposits. The revised rates, recommended by the Executive Committee, will become effective from Monday the 17th inst. The new rates are as follows:

Period of deposit	*Rate of interest* (Per cent per annum)
For notice money at a withdrawal notice of three days or more ...	3
For term deposits:	
3—30 days	3
31—60 days	3½
61—90 days	3½
Over *Less than*	
91 days 7 months	3¾
7 months 1 year	4
1 year 2 years	4½
2 ,, 3 ,, ...	4½
3 ,, 4 ,, ...	4¾
4 ,, 5 ,, ...	5
5 ,, 6 ,, ...	5½
6 ,, 7 ,, ...	5¾
Over 7 years	6

The provisions A, B and C to Rule IVB of the Agreement will continue to hold valid.

The revised rates are higher than the existing standard rates of interest for notice money and term deposits. The existing rates are given below for the purpose of comparison:

Notice money: 3 per cent; 3 to 30 days (inclusive): 3 per cent; 61 to 90 days (inclusive): 3½ per cent; 91 days and over but less than 12 months: 3¾ per cent; 12 to 24 months: 4 per cent; 24 to 48 months: 4½ per cent; 48 to 60 months: 4¾ per cent; and 60 months and over: 5 per cent.

The short-term money market ruled stringent during the week under review, a rather unusual phenomenon for this time of the slack season. Owing to dislocation of work in banks as a result of employees' agitation for an increase in their salary and curtailment of clearing facilities, the banks which had surplus funds did not wish to lend, while those in need of them could not get their requirements easily. Inter-bank borrowings were, therefore, limited and costlier. The inter-bank call rate for both renewals and fresh money was standing at the high rate of 3¾ per cent, whereas, last week, the former was quoted at 2¾ per cent and the latter at 3 per cent. Calcutta, however, reported slightly better conditions, the call rate receding from 4¾-5 per cent to 4 per cent, with borrowers over.

In view of the tight money conditions, the response to the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 11th inst., was poor. The total amount offered was just equivalent to that invited and also accepted, namely, Rs. 2 crores. The average rate of accepted tenders was slightly higher at Rs. 2.400 per cent per annum, as against Rs. 2.393 per cent.

The Intermediate Treasury Bills also elicited limited support, the Bills actually sold from the 5th to 8th inst. aggregating Rs. 3.53 crores, as against Rs. 5.28 crores a week before and Rs. 19.06 crores two weeks before.

With fresh support lacking, the Gilt-edged market ruled easy during the week under review. 3 per cent 1986 and 4 per cent 1972 declined by 15 paise each to Rs. 63.50 and Rs. 98.85, respectively. 3 per cent 1970-75 shed 5 paise to Rs. 90.20. Among State loans, 4¼ per cent 1974 West Bengal, Madras and Uttar Pradesh eased by 15 paise each to Rs. 99.10. 4¼ per cent 1974 Mysore lost 10 paise to Rs. 99.10 and Orissa 5 paise to Rs. 99.

In the foreign exchange market, the banks' buying rate for U.S. dollars rose by 25 paise to Rs. 476.75 per $100, while their selling rate was unaltered at Rs. 480. In New York, the pound sterling eased vis-a-vis the dollar, the spot rate declining by 0.040 cent to 278.910-278.840 cents and the three months' forward by 0.050 cent to 278.330-278.360 cents.

RECESSION IN BULLION

(From Our Own Correspondent)

BOMBAY, 11th August

A reactionary trend was in evidence in the bullion market during the week under review. Silver, which had keen buyers last week, shed much of its gains in the absence of follow-up enquiries and large arrivals. Dealers, however, felt that this decline was only a connective measure and that silver would pick up very soon. Gold was also quoted lower, thanks to reports suggesting paucity of supplies and moderate support from the South.

Silver began the week at Rs. 260.50, same as last week, and rose initially by 50 paise to Rs. 261 on some support from upcountry dealers. But, following increased arrivals, the metal was subjected to bull liquidation and slumped to Rs. 257.50 to day. The daily average arrivals of silver were 21 bars, while offtake was no more than eight bars.

Fourteen-carat gold declined from Rs. 72.25 to Rs. 71.25, but closed slightly better at Rs. 71.75. Sovereign was quiet at Rs. 93. But primary gold, in unofficial trading, hardened by 50 paise to Rs. 127.50.

The international price for gold in the London market was a shade lower at $35.08. The sterling price, however, moved up by ¾d. to 251s. 7¾d., before closing at 251s. 7¼d. Both ready and forward silver were unchanged at 112d. and 112¼d., respectively, as also silver in New York at 129.3 cents.

Liberal grant of loans at easy rates on interest is envisaged in the comprehensive scheme for rehabilitation of goldsmiths announced recently by the Madhya Pradesh Government. The scheme permits grant of loan exceeding Rs. 5,000 if the borrowing goldsmith can furnish solvent security. The rate of interest charged will be just 3 per cent and even less, in some cases. Even the rule that the guarantor must invest one-third of the capital is waived. The scheme accords priority for eligible goldsmiths in getting alternative employment by relaxing the usual rules regarding age, qualification, etc. It also provides for educational facilities for the children of goldsmiths.

The Surat *Jari* Merchants' Association has urged the Union Finance Minister and the Chairman of the Central Board of Excise and Customs to grant "immediate and complete" relief to the *jari* gilding units from excise regulations. The Association has been "greatly concerned" about the deteriorating situation due to the closure of the gilding units since last month, dislocating the entire industry.

The Punjab Government has decided to raise the loan limit to goldsmiths from Rs. 2,000 to Rs. 5,000.

The following table shows the trend of prices during the week under review:

	11-8-1964 (closing)	High	Low	5-8-64 (closing)
SILVER	Rs.	Rs.	Rs.	Rs.
Ready (999 fine) ..	257.50	261.00	257.50	260.50
GOLD				
Ready (14-carat) ..	71.75	72.00	71.25	72.25
Sovereign ..	93.00*	—	—	93.00*
London—				
Gold ..	251s.7¾d.	251s.7¾d.	251s.6¼d.	251s. 7d.
Silver Ready ..	112d.	—	—	112d.
Silver Forward ..	112¼d.	—	—	112¼d.
New York—				
Silver ..	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

YARNS EASY

(From Our Own Correspondent)

BOMBAY, 11th August

The easy conditions which prevailed in the yarn market last week persisted during the week under review also, as fresh incentives were lacking and offtake was poor. Staple fibre yarns lost further ground, thanks to consumer resistance at higher levels and better supply position. Art silk yarns, too, drifted downward on poor demand from upcountry and local buyers. The rumours of a possible reduction in excise duty on art silk yarns also imparted easiness. Cotton yarns continued to put on a dull appearance due to lack of any fresh developments.

The art silk yarn manufacturers are understood to have made a representation to the Union Government reiterating their plea for a reduction in excise duty on rayon yarns. Such a reduction, it is said, is necessary for stimulating activity in the market.

In art silk yarn section, National Rayon 120D lost 9 paise to Rs. 11.79. South India Viscose 120D declined by 13 paise to Rs. 13.33. Bright Century 75D, however, picked up 55 paise to Rs. 18.96 on special support.

Among staple fibre yarn (2 x 34 French count), City shed 7 paise to Rs. 9.61, Pioneer and Vasantas were easy, the former at Rs. 9.35 and the latter at Rs. 9.02.

In cotton yarns, 52s Pioneer and 68s Finlay were neglected at Rs. 63 and Rs. 96, respectively. But 34s Madura strengthened by Rs. 4 to Rs. 40.50.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	11-8-1964	5-8-1964
Art silk yarn (per kg.)—	Rs.	Rs.
National Rayon 120D	11.79	11.88
Century 75D	18.96	18.41
S. I. Viscose 120D	13.33	13.46
Staple fibre yarn-34 x 2 *French Count* (per kg.)		
Pioneer	9.35	9.39
Premier	9.87	—
City	9.61	9.68
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21.00	21.00
17s Modern	28.50	28.50
27s Gokak	—	33.50
34s Madura	40.50	36.50
52s Pioneer	69.30	69.30
68s Ginlay	105.60	105.60

SPURT IN COTTON FUTURES

(From Our Own Correspondent)

BOMBAY, 12th August

Trading in cotton futures this week was highlighted by a break through of the upper limit of Rs. 750 imposed by the Forward Markets Commission last week to a high of Rs. 764.75. The sudden and sharp rise in cotton futures on the penultimate day of the week under review attracted the punitive provisions laid by the F.M.C. on the currently maturing contract, under which the bulls have to pay a special margin at the rate of Rs. 75 per bale. After moving within narrow ranges during the earlier sessions, the August contract suddenly jumped up and crossed the F.M.C.'s limit of Rs. 750 due to hectic bear covering induced by unfavourable results of survey and appeals and to poor tenders against the contract.

The Jarilla August contract, which had closed at Rs. 745.75 last week, began the week at Rs. 746. It declined to Rs. 742.50 on Friday (7th August), but, on Monday, pierced the limit of Rs. 750 to stand at a high of Rs. 761.50. Bulls were asked to deposit Rs. 75 per bale. On Tuesday, the rate moved up still further to a new high of Rs. 764.75 before closing at Rs. 762, on news that, out of 1,400 bales surveyed, as many as 1,150 had been rejected. Over the week, there has been a net gain of Rs. 16.75. In private deals, the contract was said to have commanded an even higher price of Rs. 767.50. There was no trading on Wednesday owing to the general strike in the City by almost all workers as a protest against the Government's failure to bring down prices.

On the second notice day, namely, Thursday (the 6th inst.), the quantity tendered against the maturing contract aggregated 4,000 bales and, on the third notice day, namely, Monday (the 10th inst.), it was 2,300 bales. This brings the total quantity so far tendered against the August contract to 13,800 bales. The bulk of this, however, has been rejected as unsuitable.

The Jarilla March contract started the week fractionally lower at Rs. 726.25, as against the last week's closing of Rs. 727. It reached a high of Rs. 734.50 today before closing at Rs. 731.75. Thus, this contract has gained a net of only Rs. 4.75 over the week. This relatively modest improvement in the new contract was due to reports of good rains, improving the prospects of a bigger crop in the 1964-65 season.

Trading in the Sewri spot market was of a restricted character. Moderate interest was evinced as usual in select lots of L.147, 197/3 and Digvijay. The following are the rates for some of the popular varieties, the unit being a bale of three quintals:

Gadgag Jaydhar Rs. 1,045; 100 Yaval Rs. 1,061; 100 Khamgaon Rs. 1,015; 100 Nagar Co2 Rs. 1,601; 100 Akote Rs. 955 spot; 100 *Jagadia Rs. 1,175; 400 Ankleshwar* Rs. 1,115 spot; Mangroi Rs. 1,101; and 200 Kim Rs. 1,115 spot.

No significant development was witnessed in the foreign section. There were reports that sales of Egyptian cotton would be resumed soon and that all varieties, except Giza 45, would be offered. The Uganda Lint Marketing Board gave an indication that its official policy would be to reserve 40 per cent of the exportable surplus from the 1964-65 cotton crop for direct sale. The first lots of new crop are expected to be offered by mid-September. Spinners were reported to be evincing keen interest in African cotton.

NEW COTTONSEED CONTRACT

(From Our Own Correspondent)

BOMBAY, 12th August

The only event of importance in a market (oilseeds) which was otherwise devoid of interest was the commencement of trading in the new crop Cottonseeds January contract on Monday the 10th inst. Trading has been allowed subject to a ceiling of Rs. 118, including a penalty of Rs. 2.50. The contract opened at Rs. 98.25, which was the lowest level of the day, and, after being bid up to Rs. 101, reacted to close at Rs. 100 today.

The contract is still far behind the ceiling rate, but informed sources in the market think that, in view of the firm undertone and the factors governing cottonseeds, the January contract should be quoting well around the ceiling before long. The strongest of all factors is the incentive which the manufacturer-*cum*-exporters of decorticated cottonseed cakes enjoy at present. They are entitled to an import licence of one tonne of copra against the export of every 3.5 tonnes of decorticated cottonseed cakes. The import licence is currently fetching Rs. 700 a tonne whereas the average c.i.f. cost of decorticated cottonseed cakes is £32 or Rs. 425 a tonne. In addition to facilities for import of copra, exporters of cottonseed cakes are also given permission to export one ton of copra cake out of every 2.7 tonnes of copra imported by them and further enjoy the benefit of a return of Rs. 214 from the duty paid by them. As though this is insufficient, exporters of copra cake are allowed to import copra equivalent to 75 per cent of the f.o.b. value of cake exported. Advance import licences for copra are also granted in certain cases. On the whole, the margin of profit on exports is put at 100 per cent.

All these incentives have evidently helped in boosting exports of cottonseed cakes and it is said that about 73,000 tonnes have been exported during the year 1963-64, earning Rs. 2.37 crores by way of foreign exchange. Up to the end of July this year, about 39,000 tonnes of cakes and 4,800 tonnes of cottonseed extractions are said to have been shipped from Bombay, besides the 15,000 tonnes shipped from Madras and Marmagao.

In these circumstances, the trend in cottonseed cakes could be anything but bearish. The price of oil had at one stage been bid up to Rs. 2,400, though it is currently placed at Rs. 2,350. Demand by *vanaspati* manufacturers is likely to move up from 5 per cent to 10 per cent. These factors lead market men to forecast that the new contract will move towards its ceiling before long. Knowledgeable sources think a level of Rs. 150 as justifiable for cottonseeds.

The futures section in castor was almost blank again during the week, for no trading was possible within the limit of the present ceiling which bears no relation to the spot market. In unofficial dealings, the September contract continued to be placed around Rs. 184.50 to Rs. 184.75. In the spot section, Madras Small changed hands at Rs. 40.25 and Kanpur Bold at Rs. 39.25. Commercial oil was done at Rs. 17.65. B.S.S. was quoted at Rs. 18.20. Futures trading in linseeds has almost been reduced to a farce with the September contract hovering around Rs. 44.84 which is just a fraction below the ceiling. Linseed Bold spot as firm at Rs. 48.25 and oil at Rs. 20.35.

Meanwhile, disappointment continues over the ban imposed by the Gujarat Government on exports of groundnuts and groundnut oil from the State. A conference convened by the Central Organisation for Oil Industry and Trade during the week in Bombay drew pointed attention to the reported surplus of 1.5 million tins of oil in Gujarat and criticised the State Government's

action in holding up the despatch of oil which had been booked before the ban. The conference thought it wrong to fix the same rates for both crude and refined oil, as this might lead to the closure of many units. Gujarat delegates were understood to have pointed out that, out of the 23 solvent extraction plants, as many as 15 had already closed and a few more were on the point of doing so. The President of the Organisation, Mr. Ratilal M. Gandhi, told the conference that the Organisation had already requested the Union Minister for Food to advise the Gujarat Government to allow the export of those goods for which rail receipts had been obtained and which were despatched before 22nd July. It remains to be seen whether the Centre will advise the Gujarat Government and whether the latter, if advised, will pay heed to it.

Currently, extractions are dull. A total of 695,340 tonnes has been exported from Bombay, Saurashtra and Madras ports since November 1963. About 60,000 tonnes are believed to have been shipped from the ports of Kakinada and Vishakapatnam and 15,000 tonnes from Marmagao and Calcutta. London is easy, though near positions are firm due to lack of offerings. Latest indications are: £38 for August-September, £37-10 for October, £36-12-6 for October-December, £36 for December-January-February and £35-5 for January-February-March.

Exports of HPS from November 1963 up to the end of July were 39,265 tonnes of kernels and 5,657 tonnes of shells. During the same period, exports of groundnut oil from Bombay, Saurashtra and Madras amounted to 74,482 tonnes. Practically nothing noteworthy occurred in the groundnuts section during the week. Prices, however, were well held with Madras Quality in demand at Rs. 65, Nizam Bold at Rs. 63.75 and Kanpur Bold at Rs. 62. Oil ex-mill was done at Rs. 25.70.

The following table shows the closing prices of oilseeds and oils as on 11th August as compared with those of the two previous weeks:

	11-8-1964	5-8-1964	20-7-1964
Groundnuts	Rs.	Rs.	Rs.
Nizam'bold	63.75	64.50	65.00
Khandesh quality	65.50	65.25	65.75
Oil ex-mill	25.70	25.80	26.25
Oil Rly. Receipt	25.15	25.30	25.80
Castorseed			
September 1964 contract.. ..	181.50	181.50	181.50
Ready Madras	40 25	40.25	40.12
Ready Kanpur	39.25	39.25	39.00
Oil B.S.S.	18.20	18.10	18.60
Oil commercial	17.65	17.45	17.80
Linseed			
September 1964 contract.. ..	44.84	44.78	44.81
Bold ready	48 25	47.50	49.25
Linseed oil	20.35	20.35	21.30
Cottonseed			
September 1964 contract.. ..	98.00	104.00	104.00
Jan. 1965_contract	100.00	—	—

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

TEAS IN GOOD DEMAND

(From Our Own Correspondent)

CALCUTTA, *10th August*

Good demand featured last week's export sales when leaf on offer aggregated 48,031 packages. That quality teas are meeting with more attention was indicated in that demand was more general than in the previous weeks. The best Assam C.T.C. teas realised useful prices, and were occasionally dearer. Medium C.T.C teas, although irregular and easier, were absorbed readily; the fannings received less attention than the brokens. Prices of legg-cut teas eased. Plain orthodox teas were firm at around last levels. Bright Assam orthodox teas drew keen attention, and prices rose. In particular, the O.F. teas and B.O.P. teas were in the forefront. Medium Assam and Doars orthodox lots met with good demand at generally lower rates. Although Darjeelings also met with good demand, prices eased in line with the fall in quality. Whole leaf grades realised higher rates, and tippy teas were firm. The quotations per 1 kg. inclusive of excise duty were: best Assam C.T.C. B.P. Rs. 7.20 to Rs. 8.00, best Assam C.T.C. fannings Rs. 7.20 to Rs. 7.80, medium Assam C.T.C. B.P. Rs. 6.20 to Rs. 6.80, medium Assam C.T.C. fannings Rs. 6.20 to Rs. 6.70, clean plain pekoe Rs. 5.20 to Rs. 5.60, plain B.P. Rs. 4.40 to Rs. 4.70, and plain fannings Rs. 4.10 to Rs. 4.30.

The increased tea arrivals from gardens—up to 15th July production in North East India aggregated 77.949 million kgs. as against 66.174 million kgs. in the corresponding period of 1963—explains for rather lukewarm support in internal sales. In the sales held last week, dusts on offer aggregating 27,636 chests met with a reduced demand. Plain orthodox teas recorded a hardening trend, Assams meeting with support at around last levels. Legg-cuts with bright liquors were in good demand, but the rest of this category eased. C.T.C. teas eased up to 50 nP, while good support was accorded to the smallest and brightest teas. The quotations per 1 kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.50 to Rs. 7.00, medium Assam C.T.C. dust Rs. 5.70 to Rs. 6.10, medium Assam C.T.C. dust Rs. 4.90 to Rs. 5.70, legg-cut dusts Rs. 4.80 to Rs. 5.30, and plain orthodox dust Rs. 4.20 to Rs. 4.50.

The need for tea gardens to get relief to enable them with adequate resources having regard to the importance of the Plan target was emphasised by Mr. S. R. Daga, President of the Tea Association of India in his address to the annual meeting of the Association held here on 6th inst. He pointed out that in view of the fact that 60 per cent of the profits of gardens were taxed as agriculture income by the States, the effective relief resulting from the rebates granted in the last budget (10 per cent on income-tax plus super tax and 20 per cent on surtax) stood reduced to 4 per cent and 8 per cent respectively. He urged to raise the rebates to 25 per cent and 50 per cent respectively. He also advocated advances to the industry from long-term financing agencies in view of the industry's inability to secure funds from scheduled banks. Mr. Daga said that if the targets of the third Plan—targets of output and export were recently revised from 900 and 610 million lbs. to 830 and 530 million lbs. respectively—were to be realised, intensive cultivation, replantation of old areas and extension of acreage were necessary. Old bushes may not be replaced as the seeds from grown-up plants have been claimed to yield edible oil, capable of replacing mustard oil. The possibility of West Bengal gardens being requested to retain old bushes has already been hinted at. Against this background and in view of the need in West Bengal to diminish the dependence for mustard oil on other States, Mr. Daga's suggestion to the States, not to requisition lands which were apparently surplus, has been timely.

The trade is happy to note the opinion of Mr. A. S. Bam, Chairman of the Tea Board, in his address to the T.A.I. meeting that the prospects for increased consumption of Indian tea were bright. He referred to the French decision to set up a Tea Council. Although tea exports up to May 1964 were much lower as compared to the corresponding previous figure due to shortfall in early output, offtake for shipments in June were higher by 2 million lbs. Output in North East India is going up. Referring to these figures, Mr. Bam hoped that this year's exports would be substantially higher than last year.

MARGINS ON JUTES

(From Our Own Correspondent)

CALCUTTA, *10th August*

Buoyancy continued unabated in both raw jute and jute goods markets during the week under review, although sellers of fibre were cautious and genuine interest in goods was limited. Since the restrictions imposed by the East India Jute and Hessian Exchange Ltd., including suspension of trading as and when prices rose above prescribed levels, failed to stem speculation in the hedge market, the authorities of the Exchange, in consultation with the Forward Markets Commission, announced special margins on all forward sales. Following this, a reaction set in in the hedge market as holders came under selling pressure. Price levels for suspension of the market were: Rs. 47.50 per 100 yards for hessian and Rs. 123 per 100 bags for sacking for both August and November deliveries, and Rs. 34.25 a maund for Assam bottoms September delivery, with ceilings on daily fluctuations above the closing levels of the previous day being 25 paise, 70 paise and 25 paise, respectively. Special margins imposed from Tuesday last are: Rs. 24 hessian cloth contract whenever the price ruled at or above Rs. 47.50 per 100 yards, Rs. 62 for sacking contracts whenever the price ruled at or above Rs. 123.70 per 100 bags, and Rs. 17 for raw jute contract whenever the price ruled at or above Rs. 34.75 per maund. Announcing margins, the Exchange said:

"The special margins shall be paid on the net outstanding purchases or a ring member on his own account and on the net outstanding purchase of each of his member and non-member clients at the close of each working day in respect of August and November 1964 deliveries of hessian cloth and sacking bags contracts separately—without offsetting the outstanding purchases in one delivery against the outstanding sales in another delivery—and in respect of raw jute contract for September 1964 delivery. The amount of special margins deposited shall be refundable on the liquidation of outstanding purchases and/or on the special margins being not required to be paid on application from ring member concerned."

As stated, the special margins brought down activity in the hedge market, and prices during the week were throughout below the ceilings imposed. Fluctuations were within the ceilings. Thus August and November hessian and B. twills closed at Rs. 47.48 and Rs. 47.50 and Rs. 123.40 and Rs. 123.65, respectively. Earlier, August hessian and B. twills opened at Rs. 46.40 and Rs. 121.35 and this week's lows were Rs. 46 and Rs. 120.90, respectively. September Assam bottoms opened at Rs. 33.60 and rose to Rs. 34.42 which was also the week's high. For a time in the week, spot goods reacted, but soon resumed the upward trend, as fibre prices were maintained at higher levels. The lack of improvement in daily arrivals in view of heavy rains and inundation in several areas of Bihar, Assam and northern Bengal led to apprehensions about the estimate of the crop being in fact realised. If at least a crop of 7 million bales were not realised, prices would harden further. At the enhanced rate of production, mills require about 8 million bales in this season and, considering the carryover of 3.1 million bales, a crop of 7 million bales would more than meet needs. The official estimate of the crop is placed at 7.6 million bales, but, in view of some damage to plants on account of floods, the trade thinks the crop would amount to only 7 million bales. However, considering the expected shortfall in output in Pakistan, prices there are likely to continue moving up, and it is thought that more vigilance is needed at the border to prevent smuggling from India. If Indian fibre crosses the border, a shortage is bound to develop towards the closing months of the season. In view of the upward trend in Pakistan and Thai markets, it stands to reason that the Government of India should permit even now greater imports of cuttings and high-grade fibre. Meanwhile, the buffer stock of 500,000 bales should be released to mills in an attempt to prevent any further rise in prices. The buffer stock should be replenished as and when arrivals increase and prices move down to the I.J.M.A. minimum levels. It is also advisable not to permit exports of even the low-grade fibre until a re-assessment of the supply position is made after a clearer idea of the crop is available.

With low arrivals, sellers of fibre were cautious. The mills no doubt needed to buy in order to cover raw material against sales of goods, but they accorded only meagre support for fear of continued rise in prices. Prices of new crop were: Assam bottoms Rs. 36.00; daissee bottoms Rs. 37.00; and nothern bottoms Rs. 35.00.

Although harvesting and retting have begun seriously, arrivals have so far been much below expectations, due to setback in transport consequent on floods. It is also believed that there has been a tendency to hold back new crop in mofussil areas in expectation of higher prices. The fact that prices of essential commodities to cultivator have risen has naturally led the cultivator to expect a higher price for his fibre. Also, his holding power is believed to have improved following the buoyancy of 1962 in all varieties, including lower grades, and premium obtained for higher grades in 1963.

In goods, steady conditions continued to prevail, although genuine business passing was limited. In view of restrictions, internal buying had shrunk. Overseas buyers restrained support; Australia and the U.S. were among countries that bought. Calcutta's higher trend failed to push up prices in the New York burlap market, where heavy hessian at one time eased to 11.75 cents a yard to recover to the opening rate of 11.90 cents. The 7½ oz. hessian at 9 cents marked a nominal gain of 0.05 cent. By and large, by withholding support, overseas buyers have demonstrated their discontent at the rising trend. Both the trade and industry are, therefore, worried. However, having regard to the rise in fibre prices in both Thailand and Pakistan, the hardening trend in the Indian market should not be considered as not having arisen from the free application of the law of supply and demand. The rise in fibre prices in all the three countries has occurred on account of a genuine apprehension of a shortfall in output, and it is natural that the higher price should adjust demand to supply. Commodity markets throughout the world have been rising since the beginning of this year. Prices of non-ferrous metals on the London Metal Exchange have risen to very high levels as to cause the apprehension of possible substitution by consumers among producers. India has to spend more funds if it desires to maintain imports of industrial raw materials at previous levels. Considering this factor, the possibility of overseas consumers of jute goods being asked to pay a little more for their supplies this year cannot be ruled out as entirely unfair.

Normally, an increase in month-end stocks imparts an easier tone to goods, but this was not so this week. Despite the news of July-end stocks at 135,200 tonnes showing the substantial increase of 8,900 tonnes, jute goods were distinctly firm. Sacking at 52,900 tonnes represented the largest chunk of the increase, that is, 7,700 tonnes. Hessian showed a small increase of 700 tonnes at 45,900 tonnes, while the increase by 1,000 tonnes to 22,400 tonnes in carpet backing cloth showed that the production of this speciality has not yet been adjusted to demand. At 14,000 tonnes, other goods became lighter by 500 tonnes.

On Tuesday last, some business was done in hessian with U.S. buyers, and this was followed by the rise in 40″ 10 oz. hessian from Rs. 46.85 to Rs. 47. Thanks, however, to imposition of special margins, the hedge market came under selling pressure, which business with overseas buyers was absent. Consequently, ready B. twills fell from Rs. 126.25 to Rs. 124.75. On Wednesday, Australia bought 2,000 bales of cornsacks for ready delivery, and the Government also displayed some interest in B. twills. However, these were inadequate stabilisers, and B. twills declined further to Rs. 122.25. In sympathy, hessian 40″ 10 oz. eased to Rs. 46.25. At lower levels, buyers showed interest and, on Thursday, rates gradually picked up. Scattered business with both the U.S. and the U.K. took place. B. twills receovered to Rs 125.25 and hessian 40″ 10 oz. to Rs. 47.50. The announcement of increased stocks led to a reaction again on Friday when B. twills slipped to Rs. 125.25 and hessian 40″ 10 oz. to Rs. 47.30. However, the continued firmness in fibre reversed the easing tendency and, over the week-end, B twills rose to Rs. 127 and hessian 40″ 10 oz. to Rs. 48.15.

* * * *

Since preparing the above report, the Jute Commissioner has agreed to the release of buffer stocks held by the industry in order to offset the slow arrivals of new crop jute. He has also extended the time limit for replenishing the buffer stock from November to February 1965. Talks are also on for introducing maximum jute purchase quotas. These steps were outlined at a meeting of the Indian Jute Mills' Association's General Committee held at Calcutta on Monday this week.

The present market situation came under critical review by the Committee. The unwarranted steep rise in the price of raw jute and the effects of this on the finished goods market were viewed with the greatest concern, bearing in mind that cheapness and stability of price are necessary concomitants of the successful promotion of jute goods sales against substitute materials. Both these prerequisites have been placed in jeopardy by the recent developments in the market.

It was the unanimous view of the Committee that, as far as it was possible at this juncture to make a competent assessment of the availability of raw jute during the current season, there was nothing in the situation justifying the behaviour witnessed in the market during these last few days. While it is agreed that, with production continuing at existing levels, it is likely that some run-down in the carry forward of jute at the end of the season will take place, it is not felt that this will be of such dimensions as to create an actual shortage.

It seems that the present excitement is the result of fears prevalent in Pakistan of the effects of a reduced crop this year in that country, which have caused Pakistan prices to spiral. In the context of India's competitive position *vis-a-vis* Pakistan, it is particularly unfortunate that the Pakistan situation should have been allowed to influence sentiment in India and spark off speculative operations here.

One of the reasons for establishing a jute buffer stock was to meet a situation of this kind, and it is now expedient to tap these reserves. The Jute Commissioner has agreed to the total release of the buffer stocks presently held by the industry and the deferment of the date of their replacement from November to February 1965. This will help to offset the slowness of new crop arrivals due to seasonal factors.

The opportunity which has been lost to the industry to make purchases of fibre from Pakistan at reasonable rates was deplored. It was the view of the Committee that, if the Government of India had acted on the industry's advice to provide at the right time the minimum allocation of foreign exchange necessary for imports, the industry would not now be placed in a position where, because of current price levels in Pakistan, it finds itself unable to operate in that market. The industry has thus been deprived for the time being of a source of supply which in respect of certain high grades and of cuttings is of the very greatest importance.

This situation is a repetition of what has taken place regularly during the past few seasons despite the industry's most earnest representations to the authorities. The Committee of the Association sincerely hopes that, with this most recent example of the results of inaction, the Government will without further delay put the necessary foreign exchange at the disposal of the Jute Commissioner to be utilised in consultation with the industry.

It is felt that, should the price situation in Pakistan continue, it would not be unreasonable to expect the Government of India to subsidise such additional imports from Pakistan as may become necessary in order to ensure that the industry's customers overseas can be assured of obtaining their finished goods at a price which will retain their confidence. The industry is deeply conscious of its obligations of its foreign buyers and of the crucial importance to India of the foreign exchange earnings from exports of jute goods. The Committee of the I.J.M.A. is confident that the steps now being taken will ensure a return to more normal conditions in the market.

METALS FIRM AGAIN

(From Our Own Correspondent)

CALCUTTA, *10th August*

In the background of existing scarcity and a rising commodity market, a firm trend was in evidence in the metal market during the week under review. Earlier in the week, quotations on the London Metal Exchange continued to be higher, but receded subsequently, as more and more zinc producing firms joined the Imperial Smelting Corporation in the latter's price stabilisation move. As India is now able to import non-ferrous metals at much higher rates than previously, imports would be lower. Licences are issued based on value and not on quantity. Therefore, the plea put forward by the Federation of the Indian Chambers of Commerce and Industry to raise the value of licences of actual users and importers, having regard to the steady rise in prices in world markets, is timely. India's imports, restricted by foreign exchange resources, are already much below to meet the growing industrial demands. However, the fact that India's exports are increasing should enable the Government to consider the Federation's suggestion.

On the London Metal Exchange, spot zinc fell from £135¼ a ton to £131¼ this week. The fact, that the high of £147 touched a week ago, has been eroded showed that the producers' decision to make sales to consumers at £125 a ton in an attempt to stem the international tide towards substitution, is yielding the expected results. However, the slow recession is indicative of the tight supply position, and of the improbability of any improvement in supplies in the short-term. Such of the consumers who are unable to get supplies direct from the producers would look to the L.M.E. to meet their demand. According to the Mitsubishi Metal Mining Company, a leading Japanese zinc smelting firm, the L.M.E. quotation would continue to rise for some time. More Australian firms have joined the price stabilisation move.

Earlier in the week, spot copper wire-bars on the L.M.E. touched a new high of £344 a ton, but soon eased to £333 only to close at Rs. 343. Spot cathodes and fire-refined copper were priced at £325 and £298 respectively, but closed higher at £328 and Rs. 302. Spot lead in London rose to £109¼ a ton, and closed lower at £107¾. Spot tin at one time was as high as £1,263 a ton in response to the rising trend in Penang, and the gain in the other metals. The closing level was around £1,257¼. Due to the steady uptrend, world production of tin is rising. The Malaysian Minister of Commerce and Industry stated recently that his country's output in May totalled 5,014 tons, as against 4,768 tons in April. In the beginning of this year, that country had only 726 active mines, but these have now increased to 756. The Minister was hopeful that with the upward price trend, having regard to the economical exploitation of marginal and lower grade mining areas, production would steadily increase.

In Calcutta, prices ruled firm as follows: zinc at Rs. 343.00 per 100 kgs., lead Rs. 293.00, tin Rs. 3,100.00, and utensil copper scrap Rs. 670.00.

BROKEN TEAS DEARER

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, *6th August*

A total of 576,000 kgs. was offered in tea sale No. 31 held here on the 4th inst. Quality generally was well maintained from all districts. Teas from Nilgiris again showed a slight improvement. The market met with a good general demand. Low medium and medium brokens were well supported and prices realised for these were slightly irregular, though, in most cases, they were dearer. Prices for similar fannings, however, could be quoted only barely steady. There was good enquiry for good mediums which were fully firm to dearer. Highgrowns were sold readily with buyers following quality. A number of cases where quality improved realised higher prices. Black leaf brokens were steady, but their fannings evoked good competition and were the strongest feature of the sale. Whole leaf grades encountered better support than last week. Unorthodox descriptions also received good support and were sold at firm to dearer rates. Tippy teas were sold at around last rates.

The quotations (per kg.) were as follows:

	1964	1963
	Rs.	Rs.
Low mediums	4.00-4.25	4.10-4.35
Mediums	4.25-4.60	4.30-4.60
Good mediums	4.55-5.30	4.65-5.30
Nilgiri B.O.P.	4.50-6.75	5.00-7.80

The average price realised in sale No. 31 was Rs. 4.48 per kilo, as compared with Rs. 4.33 a week ago and Rs. 4.49 in the corresponding sale last year.

In dust sale No. 31 held today, 268,000 kgs. were on offer. The market opened to strong general demand which continued throughout the sale. All mediums were well supported and were firm to dearer. Clean black grainy descriptions elicited good competition and were the strongest feature of the sale, sometimes advancing by up to 25 paise. Highgrowns also shared in the general trend of the market and were often dearer. Unorthodox descriptions were sold readily and were fully firm.

The average price realised in dust sale No. 31 was Rs. 4.32 per kilo, as against Rs. 4.28 a week ago and Rs. 3.99 in the corresponding sale last year.

Colombo: There was fair general demand. Western highgrown brokens were easier by 5 to 15 cents. Mediums met with better support and were firm to dearer. Uvas also came to a dearer market, while lowgrowns were slightly lower.

London: No sale was held this week.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"*Sale No.* 32: 656,000 kgs. offered. Fair general demand. Low mediums and mediums about 10 P easier. Good mediums barely steady. Highgrowns brokens dearer, where quality improved. Fannings stronger. Unorthodox fully firm to dearer."

FOODGRAINS SUBDUED

(From Our Own Correspondent)

HAPUR, *10th August*

Quietly subdued trend was witnessed in the foodgrains market during the week. Better *kharif* crop prospects and continued inflow from ports to feed ration shops were the main influencing factors. The Union Government's firm decision to compell hoarders to part with stocks in the near future failing which strong action would be taken against them also depressed the market trend. Some traders, however, felt that, in the coming two months, further difficulty would be faced, as the country would have to depend mostly on imports.

Wheat was subdued during the week and prices declined by Rs. 2.50 to Rs. 5 per quintal according to quality on increased arrivals and better sales of commodity through fair price shops. Average quality was now quoted at Rs. 75 to Rs. 77 and farm produce at Rs. 78 to Rs. 79.25 per quintal, as against Rs. 43 at fair price shops. Arrivals were around 500 maunds daily.

Steadier conditions, however, continued in the rice market and prices rose further by Re. 1.34 to Rs. 2.67 per quintal according to quality on brisk purchases and tight supply position. Local stocks were estimated around 2,000 quintals. A bumper paddy crop was expected this year, because of July's heavy rains. Week-end prices were:—Rice *basmati* superior Rs. 101.81 to Rs. 104.49; *sela* Rs. 99.13 to Rs. 101.81; *mainpuri* Rs. 95.11 to Rs. 96.45; *ramajwayan* Rs. 97.79; *raimunia* Rs. 97.79 and *gadda* Rs. 95.11 per quintal.

After an early advance on east U.P. support, gram eased towards the week-end on slack demand. Local produce was now quoted at Rs. 70 and Punjab quality at Rs. 69 per quintal. Arrivals were poor and stocks were meagre. Barley and *bejhar* also sought lower levels on slack buying enquiries from the consuming areas of east U.P. and prices were Rs. 60 to Rs. 61.25 and Rs. 61 to Rs. 61.25, respectively. Arrivals of both cereals were small. *Juwar* and *guwar*, however, ruled steady, as demand for seed purposes was good and prices were Rs. 64.50 to Rs. 65.50 for *juwar* and Rs. 66.98 to Rs. 68.32 for *guwar*. Because of bright weather in the past few days, prospects for *kharif* crop have considerably improved and large-scale sowings are being done in all the areas. Other coarse grains were listless in limited trading. Week-end prices were:—*Methi* Rs. 57.50 to Rs. 60, maize Rs. 64 to Rs. 66; oats Rs. 67.50 to Rs. 70 per quintal.

The pulses market presented a distinctly firm tone and prices of practically all items advanced to touch new high levels on brisk buying support. Peas hardened early in the week but declined later on slack demand and prices were Rs. 63.75 to Rs. 65 for *dara* quality and Rs. 66.50 to Rs. 67.50 per quintal for farm quality. Arrivals were poor and local stocks ran down to 2,000 quintals. Peas *dal* also advanced to Rs. 70.50 per quintal. *Arhar*, too, improved on good demand in the face of meagre stock position and prices of *arhar dal* sought higher levels. *Arhar* was done at Rs. 75 to Rs. 80 and *arhar dal* at Rs. 105 to Rs. 112.50 per quintal. *Urd* stayed steady, while *moong* rose further, due to poor supply position. *Urd* was quoted at Rs. 67.50 to Rs. 72.50 and *moong* at Rs. 85.74 to Rs. 104.49 per quintal. *Masoor* also ruled firm due to small arrivals. Prices per quintal were:—*Urd dal* Rs. 96.45; *moong dal* Rs. 112.50; *masoor* Rs. 73 to Rs. 85.74; *masoor dal* Rs. 96.45; *gram dal* Rs. 80.50.

SUGAR HARDENS

(From Our Own Correspondent)

HAPUR, *10th August*

Sugar supplies remained scarce during the week, and prices in private trading were quoted at Rs. 175 to Rs. 180 per quintal, as against the controlled prices of Rs. 128 to Rs. 137 per quintal. Cane crop prospects were bright and as no new permits are to be issued in the new *khandsari* and crushers licensing policy, it was gathered that sugar production in the coming (1964-65) season would increase.

Desi khandsari displayed a hardening tendency during the week under review, as demand from local areas and east U.P. centres was encouraging. Prices of superior white stuff recorded a gain of Rs. 7.50 per quintal in unofficial trading. Week-end prices were Rs. 130 to Rs. 167.50 per quintal, against the controlled prices fixed at Rs. 109.83 to Rs. 131.25 per quintal. Sulphur *khandsari* was quoted higher at Rs. 174 per quintal in Kanpur. The district authorities have released only a small part of the commodity for sale out of the stocks freezed some weeks back, and the quality of stocks left was reported to be deteriorating due to the rainy season.

Ready *gur*, after touching new heights of the season, following the removal of restrictions on its movement, reacted during the week, as demand turned slack at the highest levels. Daily arrivals from rural areas were at an average of 300 to 400 maunds out of stocks retained by producers, and the week's offtake aggregating ten wagonloads of local stocks were placed around 10,000 quintals. A bumper cane crop was in sight and, as manufacturing of *gur* by bullock driven *kolhus* need no licensing, it was expected that *gur* production would go up during the coming season. Week-end prices (in rupees per 40 kilogram) were:—*pansera* 36.75 to 37, *kotha* dry 36.37, wet 30, *shakker* 38 to 40.

Ready *gur* and *shakker* was marked down in the Muzaffarnagar market during the week, as demand was dormant from the consuming centres following bulk arrivals at the destinations just after the removal of the inter-State ban on the movement of *gur*. Prices in all sections drifted lower from Rs. 1 to Rs. 3 per 40 kilogram. Cane crop in the belt is reported to be excellent and the new *gur* season is expected to start in early October.

CLEARANCE IN KIPS SLOW

(From Our Own Correspondent)

MADRAS, *10th August*

Export trading in kips and skins was negligible during the week, as most buyers were out of the market, due to the seasonal August holidays. In fact, some buyer advised their suppliers at this end to make no offers till the end of the month. Shipment business was, therefore, poor and patchy in all the sections of the trade.

In the local market, prices ruled steady. Clearance of stocks was slow, and merchants were awaiting the reopening of the market after the holidays.

The next tanned skins Public Auctions in Germany will take place on the 24th of this month and in the U.K. on the 31st instant (not 1st August as reported earlier).

Shipments during the month of July 64 were: 1,856 bales tanned cowhides, 426 cowcalf, 10 buffhides, 280 buffcalf, 454 goat and 292 sheep skins to the U.K.; 2 cowcalf, 3 buffcalf, 843 goat and 447 sheep skins to the Continent; 1 cowcalf, 30 buffs, 45 buffcalf and 272 goat skins to the U.S.A.; 17 goat and 205 sheep skins to Japan. There was also an export of 1,029 cases of pickled and chrome goat shipped to the Continental ports.

Shippers find that, of late, there has been great difficulty to get space periodically for the export of skins and hides to the U.K. and Continental Northern ports.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. I—Interim Dividend. C.R.—Cum. Right. XR.—Ex. Right.

Shares :—If a company has different classes of shares—as for example : 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up' per share.

Accounts :— Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

TREND OF SHARES

FIRM TOWARDS THE CLOSE

(From Our Own Correspondent)

BOMBAY, 13th *August*

THE fears that the nervousness and sharp reaction witnessed on the stock exchange last Thursday (6th August) might well prove the beginning of a reversal of the main trend have failed to hold water. Although during most of this week the market moved irregularly both ways on alternate spells of short-covering and scattered support, the tendency on the last day (13th August) was distinctly buoyant, with most of the leading counters scoring fairly sizable gains.

Last week, sentiment had been disturbed by the developments in the Gulf of Tonkin but shorts hastened to cover when the situation eased considerably. Threat of a general strike—*Bombay Bandh*—had induced the bulls to reduce their commitments but much to their satisfaction the strike passed off without ugly incidents. The situation in Cyprus is none too happy, it is true, but the bulls seemed to have taken the view that, with U.N. efforts at peace, the situation here too might not get out of hand. The go-slow tactics on the part of bank employees did create some apprehension that clearing facilities might get upset, but, by and large, the market was inclined to brush this aside as no more than of nuisance value. The rally on New York Stock Exchange helped sentiment here.

The rise in share values was fairly good. Tata Ordinary, for example, moved up over the week from Rs. 154.25 to Rs. 157.25 but it was Indian Iron that led not only the steels section but the entire market in its spurt on Thursday. On hectic short-covering and renewed fresh support, Indian Iron was bid up on Thursday to Rs. 26.40 which, incidentally, is the highest so far this year. Sentiment here was induced by the statement of I.I.S.Co. Chairman, Sir Biren Mookerjee, that an interim payment might be possible before the annual meeting. The Chairman's reference to the strategy of the Company's expansion plans also added to operators' confidence.

Apart from corporate factors, sentiment was very much induced by the Prime Minister's directive suggesting the postponement of some of the projects in the field of heavy industry and calling for a fresh assessment of schemes and programmes for which funds were to be allocated during the current and next year. Sentiment was also favourably affected by the feeling that the Government was likely to make suitable modifications in the recommendations of the Bonus Commission. These were interpreted by the market as signs of a realistic approach and the market was quick to take notice of them. More than these was the rumour on Thursday that the Government might also announce some relief in taxation.

Under the spell of optimism some of the shares crossed their resistance levels again. These were Century and Telco, not to speak of Indian Iron. Century were bid up to Rs. 625.50 on talk of a higher dividend as well as hopes of a suitable revision in rayon excise duty. It was a new high level again in the current upward trend. Svadeshi continued to be in the limelight, although, at its closing level of Rs. 260, it was much lower than the last week's high of Rs. 265. Bombay Dyeing were well held at Rs. 59.40 against the previous week's level of Rs. 59.20 while Standard improved over the week from Rs. 624.50 to Rs. 636.

An interesting counter was Indian Dyestuff which recorded a rise of five points at Rs. 266.25. Dividend on this scrip has only been maintained and, though there has been a one-for-fourteen right issue at par, the results have not been to the market's satisfaction at all. The 1963-64 results were not encouraging and the Chairman had hinted at the annual meeting that the working until then were no better. Perhaps the market is consoling itself with the idea that the overall position would improve once the expansion plan is put through. It remains to be seen whether the market will be sustained in its calculations. Meanwhile, the present level of Rs. 266.25 is rather far below the current year's high of Rs. 362.50 and the 1963 high of Rs. 460.50.

Telco gave a pleasing performance, touching Rs. 297 again as compared with the last week's closing of Rs. 290.50. Hindustan Motors were also better at Rs. 18.28 against Rs. 17.88 on influential support while Premier Auto was taken up from Rs. 103 to Rs. 104.75. Premier Construction, in the Walchand group, attracted support and were bid up to Rs. 190.50. Sugar shares were dull, with Belapur remaining almost unchanged at Rs. 222 and Phaltan at Rs. 104. Among electrics, Tata Power moved up to Rs. 1,180 but Hydro shaded off a little at Rs. 119.15, while Ahmedabad Electric was fractionally better at Rs. 101.25. Voltas was four points up at Rs 253 and Tata Chemical was fractionally better at Rs. 18.80, as against Rs. 18.72 of last week. A.C.C. was a firm counter at Rs. 156.50, while, among purely rayon counters, Gwalior was a bit quiet at Rs. 41.25 and Baroda Rayon at Rs. 73. South India Viscose were, however, firm at Rs. 115. Among shippings, Scindia improved from Rs. 15.48 to Rs. 15.80, and Great Eastern was fractionally better in sympathy at Rs. 13.76. Larsen and Toubro was firm at Rs. 21.56, mainly on account of the optimistic statement by the Chairman about the Company's prospects.

On the whole, the market has ended the week on a cheerful and buoyant note and this was particularly significant as it had started the week with a load of unhelpful factors. The position is now fairly healthy and the market should be able to forge ahead, provided nothing happens to disturb the favourable factors upon which it is now building its strength.

* * * *

At the time of writing, Calcutta too presents a steady tone, despite the end of account considerations. As in Bombay, sentiment in Indian Iron was helped by the Chairman's encouraging statement while some of the forward scrips which were oversold attracted short-covering. The turnover was fairly good. Birla, among Jutes, was a firm feature and the rise was due to hectic bull support. Among other active counters in this section were Dalhousie, Ganges, New Central and North Brooke. Paper shares were steady, but Orient and Bengal were distinctly firm. Tea shares were dull, while interest in coal shares was selective.

* * * *

Activity in Madras was confined to selected shares. Tea and rubber shares were steady but mill shares continued to be dull. Chemicals were in demand while cements were steady and papers soft. Among banks, Canara evoked some good demand.

The Mitsubishi Heavy Industries Ltd. of Japan has signed a contract for the Japanese company to build two 13,000 G/T cargo liners for Alfred Holt and Co., a British shipping firm. The hull form of the two cargo ships has been designed with a bulbous bow and an open water stern to permit the vessels to be run at economic power output and fuel consumption. The ships will have extensive automation in the engine room and on deck. All hatch covers on all decks will be fully power-operated. All cargo spaces are to be air-conditioned. Individual airconditioned cabins, with private toilet facilities for all officers and men, will be provided. Each of the ships will have a swimming pool. Delivery is scheduled for May 1966 for the first ship and August 1966 for the second ship.

India bought aircraft, aero engines and spare parts valued at £1.64 million from Britain during the first six months of this year. The British Board of Trade has placed the British aircraft industry's exports in June at £6.3 million. Of this amount, India's purchases of aero engines and parts alone accounted for £260,062. Italy was the biggest buyer, making purchases to the value of £489,455, followed by India, the United States (251,261) and West Germany (£237,800). Aviation experts predict that exports of British aeronautical equipment will increase next year when the new generation of jet airliners (notably the BAC 1-11) are delivered to overseas customers.

WEEK'S STOCK EXCHANGE TREN

VOL. CIX. No. 2783 BOMBAY, 22nd AUGUST 1964 PRICE Rs. 2

PRIVATE SECTOR IN CEMENT CAN DO IT

AS cement, like steel, is an indispensable construction material, the chequered growth of this industry in the era of planning has been causing, of late, not a little anxiety all round. Both the Government and the public are understandably anxious, because the overall cement shortage is bound to hold up or slow down construction activity not only in the sector of defence but in all fields of development, including housing, education and public health. All this, of course, may sound platitudinous. But such platitudes, it will be appreciated, have to be repeated *ad nauseam* in the hope that something might be done to improve the fortunes of the cement industry and thereby introduce a more dynamic element into its growth pattern. That this pattern of growth has not been as dynamic as it should have been in recent years is, incidentally, borne out by independent assessments of the situation as well as by those of the industry itself. The Productivity Study Group on Cement Industry, for instance, has just observed that, though the number of factories has increased from 22 to 34 and production by 270 per cent since 1950-51, the demand has outstripped the supply of cement. The industry's own assessment is that the shortfall in the output of an essential commodity like cement results in great dislocation and delay in the execution of important national projects and inflates their overall costs, that it tempts irresponsible and unsocial agencies to indulge freely in adulteration, and that it causes a host of other adverse chain reactions which, in the ultimate reckoning, must be regarded as a national loss (*vide* Mr. Dharamsey Khatau's presidential speech at the third annual general meeting of the Cement Manufacturers' Association held at Bombay on the 14th instant.)

It is Mr. Khatau's review of the industry's progress *todate* that constitutes a telling commentary on its sad plight in the current Plan period. As the public is aware, the capacity target for the industry is 15 million tonnes and production target 13 million tonnes. But the prospect of these targets being reached is bleak. At best, according to Mr. Khatau, actual capacity and production in 1965-66 may come to only 11.5 million tonnes and 11.0 million tonnes, respectively, representing 77 per cent and 85 per cent of the targets. There will thus be big shortfalls to the tune of 3.5 million tonnes in capacity and 2.0 million tonnes in production. The reasons for this disappointing progress are not far to seek. One of them is that the acute foreign exchange difficulties, transport bottlenecks and inadequate supplies of coal in the early years of the current Plan have slowed down the industry's growth. Secondly, the Government's doctrinaire decision to grant licences to newcomers with no experience of cement manufacture has caused a stalemate in the expansion programme of the industry. One has only to recall, in this connection, the grievous tale of how the new licensees failed to set up the licensed plants and how the Government had to cancel several licences. Thirdly, even the cautious recommendations made by the Tariff Commission in regard to the prices payable to cement producers have been watered down by the Government to such an extent that the prices fixed with effect from 1st November 1961 have fallen very much short of the Industry's expectations. How the lack of foresight on the part of the Government in determining the ex-factory prices of cement has arrested the industry's growth will be seen from the following passage in Mr. Khatau's speech:

"The low return fixed by the Government has left little scope for the plough-back of profits in the industry and its expansion. Some of the companies have even been forced to maintain their dividend rates by resorting to the reserves built up previously.... The low returns on cement *scrips have naturally failed to attract investors in* cement company shares. Thus, an all-round malaise has set in mainly due to the unrealistic pricing policies of the Government. In the prices fixed for the industry with effect from 1st November 1961, the Government had made provision for upward adjustment payable to producers if the costs of the industry went up on account of Governmental actions. You are all aware that, between 1st November 1961 and 30th April 1964, *the costs of production have gone up by Rs. 5.92* per tonne and the price adjustment (net) granted by Government over this period amounts to Rs. 3.75 per tonne only. These *ad hoc* adjustments have not been given retrospective effect, with the result that there have been further losses to the industry. The industry's plea for framing an automatic escalation clause for revision of prices from time to time has not been conceded by Government till now."

That the cement industry, with its aggregate capital outlay of about Rs. 115 crores, has not fared as well as it should have is also borne out by the Reserve Bank's analysis of the finances of 1,333 joint-stock companies as of 1962-63. According to this analysis, just published, dividends as percentage of paid-up capital in the cement industry were only 9.3 in 1962-63, as compared with 9.8 and 9.7, respectively, in 1961-62 and 1960-61. It is indeed revealing that, in most industries, such as tea, rubber, sugar, cotton textiles, jute textiles, woollen textiles, iron and steel, electrical machinery, metal products, pharmaceuticals, chemicals, matches and mineral oils, the relevant percentages in 1962-63 were higher, ranging from 9.7 to 16.5. Likewise, in the matter of net capital formation, the cement industry had a rate of only 7.0 per cent in 1962-63, as compared with 4.6 per cent and 9.3 per cent. respectively, in 1961-62 and 1960-61, while most other industries had higher rates. With its gross profits—these are exclusive of interest charges and managing agents' commission—representing 11.4 per cent of capital employed and its profits (after tax) representing just 9.4 per cent of net worth in 1962-63, the highly capital-intensive cement industry can hardly be in a position to plough back profits in expansion at the present level of return allowed to it by the Government. But that such expansion is urgently called for need hardly be overemphasised.

It is in this context that the industry's recent representations to the Government for a better deal may be deemed quite timely and necessary. An increase in the development rebate from the present 20 per cent to 40 per cent, a more rational basis for the grant of production incentive, a higher price for additional production achieved by the expansion of existing plants or the setting up of new plants and a realistic retention price for cement—these are the elements of a better deal expected by the industry. But the Government has agreed so far to grant only one measure of relief by way of a higher price (Rs. 77.75 per tonne) for production coming out of expansions of the present plants and out of new plants. If the other measures of relief were also conceded, it would be possible for the industry to expand rapidly. And it would any day be cheaper and more economical to encourage the present units in the private sector to expand capacity and step up production than to establish new units in the public sector which at present has two units—one in Mysore and the other in Uttar Pradesh. As the industry in the private sector has achieved a high level of production performance, representing 95 per cent of its installed capacity (9.4 million tonnes), trained and nurtured a corps of technical personnel and built up some experience in prospecting limestone deposits, it would be more prudent and economical in the long run to improve the investment climate and facilitate the growth of new ventures and accelerate the expansion of existing units in the private sector itself.

The production target of 23 million tonnes, currently canvassed for the fourth Plan, would seem to buttress the case for establishing a number of units in the public sector. But, if it is realised that this is an over-ambitious target in relation to the third Plan's likely maximum achievement of 11 million tonnes per annum, a more realistic target may come to be laid down ultimately. One has only to recall, in this connection, that the second Plan originally laid down a target of 13 million tonnes, later reduced it to 11 million tonnes and finally achieved a production level of 7.8 million tonnes only. If even the comparatively realistic target of 13 million tonnes under the third Plan is beyond reach, it is because of the defects in the Government's policy. If these defects are promptly removed and if a realistic target is decided upon for the fourth Plan, such a target would be well within the capacity of the private sector itself to achieve.

FOURTH PLAN EXPORT TARGET

THE export target for the fourth Plan has now been more or less decided. It is, perhaps, the first among the fourth Plan targets to be determined in consultation with the private sector, as well as with the Ministry concerned. This is only as it should be, because foreign exchange plays a prominent part in the implementation of the Plans and, for the coming Plan, India would be well advised to depend on its exports for the major portion of foreign exchange requirements. Again, it is only right that the spokesmen of private sector should be taken into confidence in this matter, for the great bulk of exports is being handled by that sector. It was, indeed, thoughtful of Mr. Manubhai Shah, Union Minister for Commerce, to have asked the Board of Trade to meet this week and express its views on this important subject. After much deliberation, the Board of Trade has endorsed the figure of Rs. 5,100 crores as the aggregate export target for the next Five-year Plan. This decision, incidentally, should put an end to the controversy that has been silently going on between the experts of the Planning Commission and those of the Commerce Ministry on the export target. It would appear that, while the former were contending that Rs. 5,400 crores should be the minimum, the latter were of the view that anything more than Rs. 4,700-4,800 crores would be extremely difficult and unrealistic. The officials of the Ministries pertaining to agriculture, industries and [illegible] affairs were also [illegible]

ed with the opinion that the expectations of the Planning Commission were too high, reflecting inadequate appreciation of the practical problems. Mr. Manubhai Shah himself was not in favour of a very high export target. In an article contributed to the Independence Day supplements of newspapers last week-end, he struck a note of caution in choosing the export target and crisply remarked: "It would be unfortunate, if a larger export effort, following from a large Plan, is made the subject of fancy and wishes rather than of facts and hard work towards modest practical targets." The target that has now been approved, namely, Rs. 5,100 crores, itself appears to be substantially higher than the figure the Commerce Ministry had in mind, thereby representing a compromise between the ideas of the Ministry and the Planning Commission.

Yearly breakdown of the aggregate target for the five-year period of the coming Plan is not available at the time of writing, except that the Board of Trade has regarded Rs. 1,100 crores as a realisable target in the last year of the Plan, that is, 1970-1971. This compares with Rs. 1,200-1,300 crores which the Planning Commission is reported to have had in view and Rs. 1,065 crores advocated by both the Committee of Economic Secretaries and the Commerce Ministry. More pertinent, however, would be to compare the Board of Trade's target figure of Rs. 1,100 crores with the actual performance and the target of the third Plan. For the final year of the third Plan, the target is Rs. 840 crores, that is, Rs. 200 crores above the exports of Rs. 640 crores in 1960-61, the last year of the second Plan. Exports in 1963-64 were of the order of Rs. 798 crores, a spectacular increase of Rs. 130 crores over those in the previous year. Even making allowance for the fortuitous factors that enabled India to register such a striking increase, it would be reasonable to assume that the third Plan aggregate export target of Rs. 3,700-3,800 crores would be more than realised and that actual exports in 1965-66 would at least be Rs. 850 crores, if not Rs. 875 crores, provided there is no slackening in the efforts for sustaining the high level of tempo and no serious setbacks to either the world economy or the domestic economy. On these assumptions, the target chosen for the fourth Plan means an increase of Rs. 250 crores in the annual level of exports over the five-year period, or a progressive increase of Rs. 50-60 crores every year. Is this a feasible proposition? Two years ago, one would have shook one's head and said "no". But, today, considering the increase achieved last year and the promising prospect of third Plan export target being hit, one may be inclined to say that it is not beyond the realms of possibility.

The target favoured by the Board of Trade, however, implies sustained hard work in many directions. It also calls for the continuation of the vigorous export promotion measures and scheme of assistance adopted last year, with prompt adjustments and refinements to suit the changes in circumstances. The Plan itself should be so drawn up as to facilitate a high level of exports. It has now been realised from experience that there is still good scope for stepping up India's traditional exports (jute manufactures, tea, textiles, minerals, and vegetable oils) if they are competitive in price and quality alike. No efforts should be spared to increase their production at economic prices. The Government's policies should be so readjusted as to enable the country to enjoy the benefits of economies of scale in production and marketing. Considerations of ideology should be tempered by practical wisdom. Investments in agriculture and mining must be stepped up in order to secure larger production. Transport (including shipping) and port facilities should be expanded. Each sector of the economy and every industry must be encouraged to study and state its needs for making an effective contribution to the export drive. The powers-that-be should examine them patiently and dispassionately, without bringing in their ideological predilections, and try to meet such of those needs as are not inimical to the country's larger interests. If this is done, the competitive capacity of many industrial goods and raw materials can be greatly improved.

Some Ministers and members of Planning Commission have been stressing restraint on domestic consumption in order to find enough exportable surpluses. This policy has serious limitations; it is already in force in the case of most commodities, with unpleasant consequences to price stability and cost of living. It can, therefore, be relied upon only to a limited extent. The policy of starving domestic consumers and penalising them, in order to find adequate supplies for exports, may have some chance of success under a dictatorship, but it will be self-defeating under a democratic set-up, where people are not accustomed to self-discipline and where political agitators behave like free-booters in exploiting the discontentment among the people caused by the strains and stresses of rapid economic development. In such a situation, it is only through more and still more production that the surpluses required for export purposes should be found. This is not an unrealistic solution, for the scope for it is large, especially in the agricultural sector.

RESERVE BANK ON PRICE SITUATION

So much has been spoken and written about the critical price situation in the past few months that one need not be surprised if the Reserve Bank of India has not said anything new on the subject in its latest Annual Report on Currency and Finance (for the year 1963-64) released this week. But one is certainly surprised to find that the appraisal of the price situation as made by the Reserve Bank is not sufficiently forthright. Not only is the analysis of the factors responsible for the inflationary pressures in the economy somewhat loose and incoherent, but no attempt has been made to indicate the solutions to the problem of combating the strong and persistent pressure on the price level. Although quite a detailed reference has been made to the price policy, the Reserve Bank has merely listed the series of steps taken by it and the Government of India to counter the inflationary pressures; it has not made any comments on the adequacy or otherwise of these steps, much less indicated the future course of action. By virtue of the unique position the Reserve Bank occupies as the central bank of the country in charge of monetary and credit affairs and as the economic adviser to the Central Government, two roles which it is supposed to play as an autonomous and independent body, it ought to be more explicit and forthright in its views especially on a burning topic as that pertaining to prices. May be, the nature and the scope of the Report on Currency and Finance are different from those of the annual report of the Central Board of Directors. Even so, the authors of the Report should have made at least a searching analysis, if not a critical review, of the problem of rising prices, a problem that is agitating everybody's mind. It is, however, to be hoped that what is lacking in this Report will be amply made good in the annual report of the Directors of the Bank.

From this criticism one must not conclude that the Report is not without some value on the issue in question. Indeed, it is notable for the wealth of statistical data giving a clear idea of the magnitude of the recent trends in prices and highlighting the basic cause of the deterioration in the price situation. Barring 1955-56, in no other year after the commencement of Five-year Plans in 1951 was the increase in prices so steep as that witnessed in 1963-64, the actual increase being over nine per cent; in the previous year (1962-63), the increase was no more than 3.7 per cent, while, in 1961-62, there was actually a drop of 3.7 per cent. Inasmuch as the Report covers only up to the end of March 1964, the review of prices is an understatement of the position as of today, inasmuch as the price situation has deteriorated considerably since the beginning of the current financial year. Thus, between 28th March and 1st August this year, the all-India wholesale price index (base: 1952-53=100) has gone up by a greater extent than was the case in the whole of 1963-64: a rise of nearly 15 points, as against 12 points or a total rise of 27 points since the end of 1962-63, which is almost equivalent to the increase of 27.4 points between the base year 1952-53 and March 1963.

What is the basic cause of the deterioration in the price situation? The answer given to the poser in the Report is unexceptionable. The accentuation of inflationary pressures, as it has been rightly pointed out, is basically the outcome of the widening gap between aggregate demand and supply. While the substantially larger outlays on defence and development, higher levels of industrial activity, increase in incomes and employment, as well as growth of population and urbanisation have all tended to swell demand, agricultural production, which exercises a crucial influence on the general price level, has suffered a visible setback, the decline being particularly conspicuous under food articles which account for 50 to 60 per cent of the total household expenditure. The demand-supply imbalance has been aggravated by a phenomenal rise in money supply. Indeed, at present, too much money seems to be chasing too few goods. The Reserve Bank has been fair enough not to play down this fact, as witness this quotation from the Currency Report:

"Money supply, which broadly represents the monetary demand in this (organised) sector (of the economy), expanded at a distinctly faster rate (in 1963-64) than in the previous year, the increase being Rs. 439 crores or 13.3 per cent, as compared to Rs. 264 crores or 8.7 per cent during 1962-63. The expansion in money supply more than kept pace with the growth in aggregate output, thus inevitably giving an upward thrust to the price level. A striking feature of the monetary situation this year was the increase in money supply in the slack season also."

The Reserve Bank has also been candid enough to concede that the major factor stimulating expansion in money supply continues to be the net bank credit to Government, representing the combined lending of the Reserve Bank and the rest of the banking system. The Reserve Bank's net credit to the Government sector—that is, deficit financing—has been moving up year after year. During the three years of the third Plan (1961-62, 1962-63, and 1963-64), the total of this credit has risen by as much as Rs. 561 crores; a further addition of Rs. 177 crores has taken place in the first quarter of the current year, as compared with Rs. 111 crores in the corresponding period of the previous year.

The impact of the increase in money supply would not have been so severe if only the Central and State Governments had taken care (*a*) to ensure that their high level of investments were matched by savings or by results in terms of increased production, (*b*) to reduce non-Plan outlay as much as possible, and (*c*) to effect economies in developmental expenditure. One wishes the Reserve Bank had thrown some light on these most important causes of the price problem. Indeed, it has sought to justify the tax measures of the Centre (besides the increases in railway freights and fares and post and telegraph charges) as being anti-inflationary in effect. In doing so, the Reserve Bank has apparently ignored the cost inflation that has resulted from the high level of direct and indirect taxation (especially on industrial raw materials) and the pressure on retail prices exerted by the series of taxes on a wide range of commodities.

It is somewhat strange that the Reserve Bank has argued that the incidence of changes in the excise and customs proposed in the last Budget is diffused over a number of commodities which are mostly outside the common man's budget. It is equally strange that the Bank has wholeheartedly endorsed the budget for 1964-65 by glibly saying that the Government has refrained from making any major increase in indirect taxes that may tend to push up commodity prices perceptibly. For the question is not whether the last budget in particular has added to inflationary pressures to any significant extent but whether it was designed to reduce the pressures that were already there, thanks to the impact of heavy doses of taxation resorted to by the Central and State Governments in the earlier years, more especially "the unprecedented increase in taxation"—to borrow the phrase from the Report—introduced in the 1963-64 Budget.

How the heavy load of taxation has aggravated the inflationary pressures was shown at some length in our Market Gossip columns only last week, so that it is unnecessary to dilate on it again now. Suffice it to say that an adequate scaling down of taxes is necessary to give a real boost to production (especially of consumers goods) which will go a long way towards reducing the supply-demand imbalance.

Considering that the price situation is a complex of varied and complicated factors, any qualitative change in the inflationary situation, as Mr. C. Subramaniam, Union Minister for Food and Agriculture, aptly stated at a seminar on food and prices in New Delhi early this week, calls for integrated measures which transcend the conventional wisdom of credit and other regulations. It is gratifying to hear from Mr. Subramaniam that he proposes to bring about a rationalisation of the food price mechanism. But such rationalisation of food price mechanism alone will not be of much avail, unless measures are taken to augment foodgrains production and unless a bold bid is made to avoid excessive deficit financing, to redetermine priorities to advance projects yielding immediate results, and to cut down non-developmental and unproductive expenditure to the barest minimum. The Prime Minister, Mr. Lal Bahadur Shastri, we are glad to note, has expressed his determination to tackle the price situation with vigour. In this task, he deserves the unstinted support from his colleagues at the Centre and in the States, as well as from the Opposition leaders and the business community.

MARKET GOSSIP

Stock Exchanges In Good Cheer

The Stock Exchanges are in a cheerful mood and the recently begun upward trend is still gathering momentum. Gains have been handsome in regard to only certain popular speculative counters, while the vast majority of scrips, including a good number of first class equities, have scarcely moved up. Among the speculative counters, steels have taken the lead. This is not surprising, for they had remained unduly depressed for an unduly long time. Both the steel companies have stepped up their dividends and their financial strength is perceptibly improving, having attained production upto their full rated capacity. In other words, the burdens of development under the second Plan which had been acting as a drag on the dividend-paying capacity of these companies have begun to shrink in size. There is no threat of nationalisation either direct or indirect. In fact, the Government does not intend to exercise its recently acquired power to convert the loans given to them into equities and wants them to expand their capacity further. That apart, purely on the basis of merits, even at current levels the steel shares are not overpriced.

It would surely be too early to say that the rise in equities in recent days has been too much or too rapid. If first class counters in the cash list have not yet received the attention they deserve, it is because genuine investors have yet to get over the shocks of depression. Many of them have suffered heavy losses, especially in new scrips. Further, the rising cost of living has eaten into their margin of savings and a part of their incomes has to be set aside for paying the Annuity Deposit. If nothing untoward happens, the bullish fervour may gradually spread over a wider list of counters.

Debacle In Cotton

After many many years, the futures section of the Bombay cotton market is faced with the failure of a few speculators to pay the difference due from them on the clearance day; the amount involved is placed at Rs. 10 lakhs. Consequently, trading in Jarilla August Contract has come to a standstill, even though it still has a few days of life. This debacle is the result of overtrading by a few adventurous speculators of inadequate means and brains. It is inconceivable that anyone should go short by several thousand bales and keep the position open almost right up to the end of the Contract's career, when prices in the spot market have all along been ruling firm at the ceiling level. Although the current cotton season is ending with a comfortable carry-over, thanks to a record crop of six million bales (of 400 lbs. each), the supply of good cotton has become scarce and the quantity available for being tendered against the Contract is limited. That this would be so would have been obvious to any speculator who had any connection with the cotton market and had cared to study the statistical position of the commodity. Obviously, the bears who are now caught must either be ignorant or reckless gamblers, caring very little for their reputation. The bulls who were all out to get their pound of flesh cannot be blamed, if they still insist on doing so. No one need be sorry for this mess in the East Indian Cotton Association, though the Board of the Association could have averted it in good time had it the desire and will to do so. The Forward Markets Commission has done well in remaining calm, resisting the temptation to rush in with more restrictive measures. For the tussle between the bulls and bears has been well within the rules and limits already prescribed by it. Had it come forward with any further steps, it would have meant taking sides with the bears now in distress and deservingly so. Now it remains for the Income-tax Commissioner to collect his share in full from the bulls who have had a windfall. He must make sure that they do not outwit him by hiding their profits.

World Coffee Agreement

Just before the International Coffee Council began its fifth meeting at London on 28th July, some had expressed serious doubts about the Council being able to reach agreement on the issue of export quotas for the coffee year commencing from 1st October next. These doubts have proved correct. The meeting, which was to have ended on the 7th of this month, went on till Wednesday the 19th inst., when it adjourned to meet again after sometime, without reaching any agreement on either the overall basic quota or on the quotas for individual member-countries. For so divergent and conflicting were the views of the consumer and producer groups of countries. The former wanted the overall quota to be fixed anywhere between 47 million bags and 49 million bags, while the latter favoured a lower quota: 45 to 47 million bags. Informal talks are currently going on among the delegates and a further conference is expected to be held next month.

Despite the deadlock on the quota issue, the recent session of the Coffee Council was not without any significance. The Council, before adjourning, took two important decisions, besides approving the administrative budget amounting to $700,000. One of them was the sanctioning of a $5.3-million programme for promoting world coffee consumption during the year 1964-65; the programme will be financed from out of a cess (at the rate of 15 cents per bag) on coffee exported from member-countries of the Agreement. The other was the approval of rules governing deduction of export excesses over authorised exports. Accordingly, any excess over authorised annual exports during the three previous quarters of the same coffee year which is not compensated by a corresponding quantity in the fourth quarter will be treated as a quarterly excess of the last quarter of the coffee year 1963-64 and be deducted in equal parts from the authorised exports for the quarters January-March and April-June of the coffee year 1964-65. In case such exports exceed 50 per cent of the authorised exports under quota in any of these quarters, the balance will be deducted from the authorised exports under quota for the July-September quarter of 1964-65.

In the context of quota restrictions and the move to stimulate consumption, the world coffee market is currently ruling distinctly firm. Uganda Robusta grade coffee is now quoted in London at £14-2 per cwt. This rate, though it is lower than the high of £16-18 touched a few weeks ago, is well below the £9-9 prevailing at this time last year. In view of the high prices abroad, Indian coffee interests are hoping to earn more from exports. The earnings would be larger still if the country's plea for a more liberal export quota were conceded by the Coffee Council.

Tea In Madras

The move of the Madras Government to give some tax relief to tea industry is, indeed, commendable. Addressing the eleventh annual conference of the Association of Planters of Madras at Coonoor last week, Mr. R. Venkataraman, the State's Minister for Industries, disclosed that the Madras Government was considering the question of granting some relief for tea under the agricultural income-tax. He did not indicate what exactly this relief would be. It is, however, presumed that the Government would allow, as suggested by the Centre, replanting expenditure as a legitimate charge on the profit assessable for agricultural income-tax. While the Minister was silent on the plea of the Association's Chairman, Mr. M. R. M. Punja, for allowing depreciation allowance for field assets in the form of tea, coffee and rubber, he held out the welcome assurance that the Government would give planters exemption from electricity consumption tax during periods of power cut or when the Government asks the industry to use its own generators.

Madras has once again given the lead; it was Madras which first granted the depreciation element in the case of rubber. And the Governments of other States will do well to follow this lead.

Capital Goods Industries

It is well known that the cost of production of capital goods in India is very high as compared with that in the industrially developed countries. The cost is high in both the public and private sectors. Although consumer goods industries are not free from this defect, the high cost of capital goods has more severe and sustained repercussions, as it affects, to a very large extent, the cost of production of consumer goods. With the introduction of science and technology to our agricultural system, and the use of fertilisers and improved farm implements, even the cost of production of agricultural commodities depends to some extent on the cost of production of industrial goods. The high cost of production of one commodity thus chases that of others, resulting in a vicious circle that does not easily lend itself to be cut effectively.

In order to curb inflation in the economy, it is necessary to bring down the cost of production of not only consumer goods, but also capital goods like steel, machinery and chemicals, as this reduction will automatically affect the cost of production of consumer goods. The magnitude of the problem will be clear from the latest finding of an official working group that the cost of most capital goods manufactured in India is higher by as much as 40 per cent as compared with the landed cost of the same categories of items, besides being comparatively inferior in quality. The high cost of capital goods in the country is the result of a number of factors. Though it cannot be denied that most of the capital goods industries in India are in their infancy, it is also true that production has not been able to reach the optimum level in the case of many plants. One reason may be the shortage of raw materials. Another reason may be the Indianisation of technical services. As the indigenous technical expertise is not of the same calibre as in the Western countries, the replacement of foreign experts has, in many cases, adversely affected the productivity of the plants and the quality of products. The lack of introduction of modern industrial practices in many plants is a third reason for the high cost of production.

It is gratifying to learn that the Government is now considering the problems faced by the capital goods industries in reducing the cost of production. It is reported to have decided to constitute a panel of experts to suggest measures for introducing modern industrial practices in the capital goods industries in the public sector with a view to reducing cost of production. It is also said to be examining the question of facilitating the flow of foreign experts without any inhibitions.

INTEREST IN MORE INTEREST

By Questor

The resources of British banks have been growing more *slowly* for some years past than those of other deposit-taking institutions like finance houses and building societies. The reason is not far to seek: the latter offer much more attractive rates of interest. About two-thirds of all bank deposits are current accounts, on which no interest at all is paid. The rate on the remaining third is fixed by agreement at 2 per cent under Bank Rate and stands at present at 3 per cent. By contrast, *Local authorities offer 4½ per cent*, finance houses a fraction over 5 per cent, and building societies the equivalent of nearly 6 per cent.

It is some time now since the Governor of the Bank of England shocked the bankers assembled at a banquet to celebrate the 400th anniversary of one of the big ten by suggesting that they were not doing all they could to meet the needs of the twentieth century and that it might be a good idea if they tried to win deposits from competing institutions by offering higher rates. The shock was due not only to the unexpectedness of this onslaught and the occasion on which it was delivered but to the fact that the rigidity of the present structure of bank interest rates had been assumed to suit the convenience of the monetary authorities. When it wore off, however, bankers—to whom the idea of competition was not altogether novel—began to consider the new proposal.

The first reaction was that higher rates would serve no useful purpose. The level of bank deposits, it was argued, was a simple function of the amount of liquidity the *monetary authorities chose* to create; higher rates could not increase it. The argument, however, was soon carried a stage further. If the banks raised their deposit rates, two results might be expected to follow. In the first place, they would probably win deposits from competing institutions. Even if this did not increase the total level of bank deposits directly, it would certainly reduce the velocity of monetary circulation and perhaps force the monetary authorities to create more credit. In the second place, they would probably attract funds at present invested in Government securities, notably through the National Savings movement. The Government would be forced to make good this loss by borrowing in other directions—in particular, by issuing Treasury Bills to the banks themselves and so increasing their credit base.

Once thinking had reached this stage, the banks became more reconciled to the idea of competition. There would be no point, of course, in paying interest on current accounts, which are presumably maintained at the minimum level compatible with convenience, or in increasing the rate on small deposit accounts. But it might well be possible to win back business from competing institutions by offering higher rates on large deposits guaranteed for a certain time. Most of the bank chairmen gave the possibility an approving mention in their annual statements.

At this point, however, the Treasury stepped forcefully in. The Bank of England is nationalised and is formally subordinate to the Treasury, but it enjoys a good deal of independence in practice, and it is by no means the case that the two institutions always see eye to eye. On this occasion, the Treasury decided that higher bank deposit rates would mean, first, that monetary management of the economy would become more complicated and, second, that loan rates to industry would be bound to rise simultaneously. There may be a case for this in the abstract, since bank finance is relatively cheap and many firms depend on it who could perfectly well raise permanent capital in the market. But it did not seem a good idea to officials, who, at that time, were trying to stimulate the rate of growth of the economy and, in particular, to encourage an upswing in industrial investment.

The banks, however, annoyed by this Treasury ban on a step which had taken them so much time and trouble to decide on, are now eager to experiment in this new field. And since the British economy is now at a stage where it may soon need mild restriction rather than further stimulus, the case for giving them their head has become rather stronger. In the meantime, some of them may well attempt to do by the back-door what they are still discouraged from doing by the front. They already have substantial investments in the leading finance houses, some of which are completely controlled by banks, and are, therefore, able to do part of their business at the higher deposit and lending rates which these institutions customarily quote.

They now seem to be hiving off another part of their business. At the end of last year, the Midland formed the Midland and International Bank with the participation of three foreign banks. The Westminster has recently increased the capital of Westminster Foreign. Barclays has now formed Barclays Export Finance Company with an issued capital of £ one million. This financial services it offers to exports are not markedly different from those which Barclays itself already offers and will continue to offer. But it will also take deposits of over £50,000 at fixed terms of three, six and twelve months at whatever the market rate happens to be. It would not be surprising, if Barclays were to push export financing business into its new and flexible subsidiary, just as it tends to push certain other business in the direction of its associated finance house.

DELHI LETTER

CONTROLLING POPULATION GROWTH

PLANS FOR A "CRASH PROGRAMME"

From Our Special Correspondent

NEW DELHI, 18th August

NOTWITHSTANDING the controversy in public between the Deputy Chairman of the Planning Commission and a Commission member, Dr. V. K. R. V. Rao, programmes are being processed with the idea of intensifying the campaign for sterilisations, particularly of males, so as to bring about a reduction in the population growth. In the decade 1911 to 1921 there was no growth in the Indian population. In the thirty years to 1951 the population grew 44 per cent and in the decade of the fifties the population explosion reached the rate of 22 per cent. It is now believed that the increase during the decade of the sixties will be at least 24 per cent. According to experts, India is now in the second demographic stage. In the first stage in which the country remained until 1921, the birth and death rates more or less neutralised each other. The progressive reduction in the death rate from about 44 in the beginning of this century to about 20 per thousand of the population in the decade of the fifties has caused the population to increase at a high rate. According to the Indian Parliamentary and Scientific Committee, which has just published a report on population control and family planning, the death rate has already shown a fall to about 18 per thousand of the population without any similar fall in the birth rate. It is in the third stage of the demographic cycle that there is a steady fall in the birth rate. According to the Parliamentary and Scientific Committee, there is a time lag between the fall of the death rate and the fall in the birth rate; in Western countries this process has taken a century or a century and a half.

The biggest immediate problem from this increase in the population growth rate is in the provision of foodgrains. The Committee's report contains an amusing paragraph which reads: "It can be reasonably expected that in the next twenty-five to thirty years, through great effort, it may be possible to produce at the most 94 million tons (of foodgrains) a year. This would be just enough to feed 450 million a year. It appears that the population has already exceeded this limit though the total food production is lagging far behind." (The Chairman of the Parliamentary and Scientific Committee is Mr. Lal Bahadur Shastri.)

No. of Sterilisation Operations

Year	Males	Females	Total
1956	2,879	5,526	8,405
1957	3,760	10,797	14,557
1958	10,676	17,853	28,529
1959	16,630	23,607	40,237
1960	37,373	25,157	62,530
1961	60,196	37,405	97,601
1962	96,418	33,096	129,514

The Committee says that, if a list of priorities for the family planning programme is drawn up, more money should be spent on propaganda and education. The Committee proceeds to argue that the role of medical personnel will be subservient to those of social and behavioural scientists for years to come. According to it, "family planning is not a medical problem; but it is essentially a social and psychological problem."

The Committee discusses the various contraceptive methods and points out that, although the licensed capacity for rubber contraceptives was 93 million, production in 1963 was only two and a half lakh pieces. At present, the licensed capacity has increased to more than 180 million pieces a year, according to the Family Planning Directorate in New Delhi. It is estimated that the demand for rubber contraceptives may be as high as 180 million pieces this year and more than 500 million pieces by 1966. The Government is understood to be considering the question of entering the contraceptive manufacture business in a big way since there appears to be a disinclination on the part of private manufacturers to increase production. One party which was granted a licence recently surrendered the licence. The private sector's reluctance is probably due to the fact that in this country the rubber and other contraceptive appliances may have to be distributed free or at nominal charges if there is to be any widespread use of contraceptives. In the face of rising prices, the people are likely to consider the amounts spent on purchasing contraceptives as a domestic budget item on which economy could be practised, as Mr. Asoka Mehta pointed out to this correspondent some days ago.

Mr. Asoka Mehta is forcefully advocating the popularisation of sterilisation operations for men, but the Parliamentary Committee says: "To effect a fifty per cent reduction in ten years (which should be the target if the population is to be stabilised at an optimum level of 600 million,) nearly two million operations per year or six thousand operations per day have to be performed. Even with the maximum intensification of efforts and providing the facilities for operation it is difficult to visualise the figures reaching beyond two lakhs a year." Yojana Bhavan planners, however, think that it will be possible to popularise vasectomy as the only sure method of population control. The Parliamentary Committee's emphasis is on non-clinical methods because it proceeds on the premise that family planning is primarily a social problem. The Committee says. (1) High priority should be given to the production of mass communication media and rapid methods of dissemination of information and education. (2) Far more resources, and probably the bulk of them, should be put into non-clinical systems of education and distribution of contraceptives. Normal retail channels should be maximised by education and subsidisation of shopkeepers, druggists, doctors, midwives, welfare organisations in large factories and offices. . . (3) Indigenous production of contraceptives should receive high priority. Since there does not seem to be any particular enthusiasm in the private sector, the question of their manufacture in the public sector should receive serious attention.

Public expenditure on family planning schemes has hitherto been lagging behind the allocations under the Five-year Plans. In the first Plan the outlay proposed was Rs. 65 lakhs and the public expenditure was only Rs. 19 lakhs and in the second Plan the outlay proposed was Rs. 550 lakhs and the expenditure Rs. 300 lakhs. The outlay in the third Plan is Rs. 2,700 lakhs but the total expenditure in the first three years has been less than Rs. 900 lakhs, leaving two-thirds of the third Plan outlay available for expenditure in the last two years of the current Plan.

At the end of the second Plan, the number of family planning clinics was 2,136—1,379 in the rural areas and 757 in urban areas. The clinics have now got a new name, family welfare planning centres or Parivar Kalyan Niyojan Kendras. As on 31st March 1964, the number of such centres was 10,948, of which 9,244 were in the rural areas and 1,704 were in the urban areas. The rapid statistical increase is probably due to redefinition of the scope of the centres; now institutions distributing contraceptives are also included in the listing. The third Plan target, however, refers to 8,200 clinics—6,100 in the rural areas and 2,100 in the urban areas. The Health Ministry thinks that this target will be achieved by the end of the third Plan. In 1956 the number of sterilisation operations recorded by Government institutions was 8,136; of these the number of operations on males was 2,879 or, in other words, the females undergoing sterilisation operations totalled two-thirds of the total undergoing operations. By 1959 the number of sterilisation operations increased to more than 40,000 but the number of females undergoing sterilisation still was higher than the males. This trend was reversed in 1960 where more males than females underwent sterilisation. In 1962 the operations crossed the one-lakh mark; the number of males going in for voluntary sterilisation was more than 96,000. Up to March 1964, the total number of sterilisation operations conducted by Government institutions was more than 550,000. The goal of the family planning programme now is to accelerate the trend of birth control measures so as to halve the rate of population growth and to spread the practice of family planning to ninety per cent of the married couples. Several State Governments have now accepted the need for a "crash programme" in sterilisation.

The Union Government has already decided to offer various forms of financial assistance to the States. These include: (1) Strengthening of staff of teaching medical institutions for training of doctors in the techniques of sterilisation operations; (2) Strengthening of hospitals up to taluk level for which the Centre will spend up to about Rs. 10,000; (3) Payment of Rs. 100 per day to surgeons for doing a minimum of ten sterilisations of men in camps organised by the State Governments; (4) Rs. 100 a day for surgeons who do a minimum of five sterilisation operations a day on women; (5) Special casual leave of up to six days for Central Government employees undergoing sterilisation operations. Some State Governments are already paying people undergoing sterilisation operations Rs. 10 to Rs. 30 to compensate for the loss of wages.

Plan Outlay on Family Planning
(In lakhs of rupees)

	Outlay	Expenditure
First Plan	65	19
Second Plan	550	300
Third Plan	27,00	..
1961-62	..	242
1962-63	..	314
1963-64	..	327
1964-65	..	883
Fourth Plan (suggested) ..	101,00	..

For the fourth Plan, experts at Yojana Bhavan recommend an outlay of Rs. 101 crores for family planning programmes. (See also Delhi Letter in *Commerce* dated 8th August 1964, on page 216).

F.I.C.C.I. ON MONOPOLIES

FOR some time now, the Monopolies Enquiry Commission has been receiving memoranda from commercial organisations on its terms of reference. The latest memorandum is the one submitted by the Federation of Indian Chambers of Commerce and Industry. In this memorandum is to be found a painstaking analysis of the structural and organisational aspects of Indian industry. It emerges from the Federation's analysis that "there is little scope for any concentration of economic power in a few hands or for the exercise of monopoly control over the supply of any commodity." Moreover, according to the Federation, it would not be *relevant* to speak about the existence of monopoly and concentration of economic power, for the various legal and administrative regulations, together with the overall controls imposed by planning, "have limited the freedom of individual enterprise and made it conform to the standards set by the Government." This general approach, which takes into account the pervasiveness of legislation and administrative regulations that limit the growth, form, ownership, control, etc. of private industries, has been amplified by the Federation as follows:

"There are certain peculiar features which apply almost invariably to all industries in India and which make it impossible for any firm or group of firms to achieve monopoly power so as to regulate prices, production, distribution or investment. The extent of these regulatory measures is so comprehensive and their application so unmistakable that development of industry in all forms and at all levels has been just what Government had planned or desired. When the State has such effective powers, it would be idle to talk about monopoly or concentration of economic power in private hands."

Specifically addressing itself to the question whether under the prevailing conditions it would be possible to secure a monopoly position in any industry, the Federation has sought to establish "that, taken all in all, the sellers in India cannot be deemed to have that unrestrained power which can be described either as monopoly or concentration of power." The stages by which this conclusion has been reached constitute the core of the Federation's memorandum. The starting point of the Federation's analysis is the working hypothesis "that monopoly ceases to be effective when the supply controlled by the largest seller is less than one-third of the total supply in the market." This hypothesis, which has been adopted in the U.K., is further based on the assumption that the particular commodity does not have any near-substitute. Applying the hypothesis to the following estimates made by the National Council of Applied Economic Research, the F.I.C.C.I. memorandum argues that, in most industries, the proportion of output controlled by the largest firm or the largest group of firms is less than one-third and that, therefore, it cannot provide any effective basis for monopoly power:

Industry	*Year*	*Percentage share of topmost unit/group/in total production/ capacity*
Cotton textiles	1958	4.1
Sugar	1958-59	2.4
Coal	1959	11.1
Caustic soda	1958	14.8
Matches	1960	60.0
Jute textiles	1958	12.3
Ceramics	1957	17.3
Paints and varnishes ..	1957	11.4
Hydrogenated oils ..	1958	14.0
Superphosphate	1958	14.8
Soap	1957	30.8
Cement	1960	45.0
Bicycles	1959	20.2
Paper and paper board ..	1958	23.5

It will be seen from the above figures that there are at least some industries where the output controlled by the largest firm or the largest group of firms is more than one-third. But the Federation has hastened to add that this does not mean that these are monopolies, for they do not have the freedom to charge any price, adopt any process of manufacture, regulate the level of investment and growth, etc; this freedom is purposively curtailed by the general policy framework. The capacity to retain monopoly power is eliminated by the opportunity available under the Industries (Development and Regulation) Act for the entry of competitors. Further, a situation cannot be identified as monopoly, if it is not associated with the power to influence prices, supply or cost. As prices are controlled by the Government in several industries (namely, steel, pig-iron, sugar, zinc, cement, fertilisers, coal, paper and newsprint, cotton and woollen textiles, *vanaspati*, petroleum and petroleum products, drugs, etc.), there can be no question of any effective monopoly *per se* in such industries. The Federation has also highlighted the fact that Indian industry has registered rapid growth in all fields of production in the last decade, thanks to the operation of competitive forces. Such growth would not have been possible in monopoly conditions, for it is a matter of general observation that an industry with a monopolistic organisation is apt to grow at a smaller rate than it does under competition. All these are no doubt powerful arguments. If they also happen to be borne out by the Commission's specific enquiries, it will be very good indeed.

The Federation's memorandum is notable for the attention it has focussed on the need for reducing the present pervasive restrictions so as to stimulate greater effort in the industrial sector. Some of these restrictions already amount to interference by external authority with the internal management of companies and render the economic power of entrepreneurs ineffective. As they generally stand in the way of monopolistic control and concentration, the Federation has taken the stand that no further regulations are called for. Of course, it has recognised that the number of producers in certain industries is not large. But this situation, in its opinion, merely reflects the state of development in accordance with the licensing policy and Plan targets; it does not reflect the existence of monopolistic or restrictive practices. Further development is bound to bring in more producers, thanks to the assertion of the forces of individual enterprise, and thereby put an end to the present temporary scarcity in some fields. It is the emphatic view of the Federation that any additional restrictions on the present system would only curb effort and postpone development itself. As the Union Finance Minister himself said in his Budget speech on 29th February 1964, the question is how to achieve this objective—the objective of preventing any concentration of economic power or the growth of monopolies—"consistently with our concern to see that genuine and desirable development is not stifled." The Monopolies Commission may be expected to show the way in the light of its objective enquiries.

A CHRONICALLY IRRATIONAL ATTITUDE

The stubborn refusal of the Maharashtra Government to concede the Bombay Gas Company's just plea for a moderate increase in gas price is deplorable. Equally deplorable is the move of the Government to take over the Company itself. It is true that the gas produced by the Company constitutes an important source of fuel to a large number of homes (18,000 in all), hotels, hospitals and industrial establishments, besides being used extensively for street lighting, in the city of Bombay. But one should not be completely blind, as the Government of Maharashtra has all along been, to the realities of the situation. The array of facts and figures cited by Mr. N. K. Jalan, Chairman of the Company, in his speech at the annual meeting of the Company held in Bombay on Tuesday this week, will clearly bring out the irrational attitude of the State Government towards the Company. The price of gas has continued to be pegged at the 1949 level of Rs. 3.94 per thousand cubic feet, despite the marked rise in the production costs of the Company, following the all-round increases in coal prices, enhanced freight charges, heavier wage bill and higher interest charges. The Company consumes on an average as much as 110,000 tons of coal every year. Should not the price of any commodity be adequate enough to cover cost increases, provide a moderate return on capital employed, and ensure a reasonable surplus for expansion and development? The Government of India has recognised this important fact. When the control prices of several goods (iron and steel, cement, coal and sugar, to mention a few) have been revised upward, one fails to understand why the Maharashtra Government has not cared to raise the price of gas suitably.

The price of gas continues to be pegged at the uneconomic level of Rs. 3.94 per thousand cubic feet, while the price of liquid petroleum gas sold by Burmah-Shell and Esso is as high as Rs. 16. The price is also well below the Rs. 7 at which the Oriental Gas Company of Calcutta (this Company was taken over by the West Bengal Government in 1960) is supplying gas in Calcutta. That the Bombay Gas Company's plea for a suitable increase in price is fully justified has been, we understand, amply borne out by the findings of the Directorate of Government Commercial Audit which examines the accounts of the Company year after year. When the Government of Maharashtra appointed a Gas Advisory Committee in February 1963, it was thought that the Government might have been convinced of a strong *prima facie* case for an increase in gas price. But, for some unknown reason, the Government has not cared to release the Committee's report, much less to act upon it, although nearly a year has elapsed since the report was submitted. The Committee is believed to have recommended a higher price for gas, and it is regrettable that this recommendation has been kept in cold storage. It is all the more regrettable because the recommendations of the Committee, according to our understanding, are mandatory.

Caught as it has been between a highly uneconomic price (fixed fifteen years ago), on the one side, and cost inflation, on the other, the Bombay Gas Company has been incurring heavy losses. The working results of the Company for the year 1963 show a loss of Rs. 10.31 lakhs. This much loss on a turnover of about Rs. 110 lakhs is certainly quite heavy. Moreover, it may be noted here that, out of the annual turnover of the Company, only half represents the income from gas, the other half being derived from the sale of by-products (soft coke, tar, creosote oil, ammonia and naphthalene).

In the context of the proposed move to nationalise the Company, it looks as though the continued refusal of the Maharashtra Government to sanction an increase in the selling price of gas is a deliberately planned action to deprive the shareholders of the Company adequate compensation and to take over the entire show for a song. This is surely unethical and unbecoming of any democratic government. The best way to disabuse this impression is to drop the move to nationalise or municipalise the Company. It must be noted here that the Company is not unwilling to expand its activities by making fresh investments, if it is assured of a reasonable return. Indeed, it claims to have taken great pains and spent large amounts of money in order to expand and develop. The quality of its service is also said to compare favourably with that of other public utility concerns. What justification is there then for the State Government to take over this Company? Surely, the Government's hands are not idle. It has plenty of other things to do and its resources can be more fruitfully employed than in taking over an existing undertaking.

JUTE GOODS EXPORTS

It is not so much the growing popularity of paper, polyethylene and other packaging materials and bulk handling methods as the keen competition from the Pakistan jute industry that is now causing utmost concern to jute millowners and shippers in India. Indeed, indications are that competition offered by Pakistan jute mills will be keener still in the coming years, especially in respect of sacking goods. The jute industry in Pakistan is now said to be operating at a level of 325,000 tons annually, representing about 25 per cent of India's production, and there exist plans which envisage a further 20 per cent increase in production over the next eighteen months and a much greater increase over the subsequent three or four years. The four distinct advantages enjoyed by the Pakistan jute industry are (*a*) completely modern machinery and equipment, (*b*) availability of superior quality raw jute at an economic cost, (*c*) larger yield of raw jute per acre, and (*d*) direct export subsidy.

Pakistan has, of course, every right to resort to any reasonable step to make its jute goods highly competitive in world markets. But the grant of a permanent export subsidy in the form of bonus voucher scheme certainly contravenes the G.A.T.T. fair trade regulations. If the Government of India has resisted from conceding the plea of the Indian jute industry for a similar subsidy, it is apparently because it does not want to be placed in the same invidious position. At the same time, it recognises the need for offsetting the advantage enjoyed by the Pakistan jute industry over the Indian industry. The Government has been considering for some time the question of granting assistance for export without infringing the G.A.T.T. regulations. One of the proposals mooted in this connection relates to the grant of a subsidy on sacking exports made at prices competitive with those from Pakistan, the subsidy being paid from out of a fund raised by a cess on the domestic sales of jute goods.

It is felt that, if the aforesaid scheme were operated by the industry, the Government could absolve itself of the responsibility for giving a permanent export subsidy. But who will bear the cost of this arrangement? Apparently, the domestic consumer. In that case, the inflationary pressures within the country will be aggravated further which in turn will add to the cost of production of the jute mills themselves in course of time. In short, this is a self-defeating measure. It may not yield any sustained tangible results. It is possible that, in order to counteract the advantage of this scheme to Indian jute mills, Pakistan may come out with an even more liberal scheme of export assistance. In any case, the adoption of measures and countermeasures of doubtful economic value by India and Pakistan is not a sensible approach. It simply means one underdeveloped country cutting the throat of another, the net gainers being the developed countries which can certainly afford to pay reasonably better prices. The need for avoiding such unhealthy competition was very forcefully stressed in just one sentence by Mr. D. Duncan-Smith, the retiring Chairman of the Calcutta Jute Fabrics Shippers Association, when he addressed the annual meeting of the Association at Calcutta last week. He said:

"I sincerely hope that, ultimately, the two countries can reach a form of working agreement in both raw materials and finished goods, so as to avoid chronic over-capacity and, in the end, bankruptcy in both camps. ..."

This is certainly a sound suggestion, but it is highly doubtful whether Pakistan will really co-operate with India in this respect. Any invitation by India will be interpreted by Pakistan as stemming from weakness. Even so, the Indian Jute Mills Association (I.J.M.A.) may sound its counterpart in Pakistan. Till then, however, every effort must be made by this country to improve the competitive capacity of Indian jute goods abroad. Simultaneously, the assistance of G.A.T.T. must be sought again for preventing Pakistan from infringing continuously rules of international trade to which it is a party. Mr. Duncan-Smith wanted the Government of India to assist the industry in meeting the "State-subsidised competition" from Pakistan. Echoing this plea, the I.J.M.A. Secretary, in the course of a statement issued to the Press, observes: "A boldly conceived plan of assistance to the industry is what is required to achieve this desired objective (of not losing its position as the major supplier of jute goods), but time is fast running out. If the confidence of the Indian industry in its future is not to be irreparably damaged, Government must come to the industry's aid, so that a concerted effort can be made to win back lost markets and to ensure that India obtains a fair share of any rising world demand."

Neither Mr. Duncan-Smith nor the I.J.M.A. Secretary spelt out clearly the type of assistance which the Government should provide. By way of general remarks, however, Mr. Duncan-Smith did indicate certain lines on which improvements could be effected. In particular, he stressed the importance of maintaining high quality standards and stability of prices. He went to the extent of saying that some sort of stability must be achieved, even if it meant control on maximum prices for export; minimum prices were already being enforced. Mr. Duncan-Smith also stressed the need for removing two main obstacles to the rapid settlement of overseas buyers' claims. One is the somewhat cumbersome arbitration

By N. Pattabhi Raman

NEW YORK, 15*th August*

IT is believed here that, in the fourth Five-year Plan, the target for foreign private investments in India would be set at $1,500 million, or $300 million a year. This would represent a five-fold increase in expectations, considering that the Third Plan target is $300 million for the five-year period.

The escalating expectations underscore the realisation on the part of the Government of India that foreign, Government-to-Government aid cannot be expected to keep up with the anticipated increase in foreign exchange requirements during the fourth and fifth Plans and that, substantially, larger foreign investments would be required to narrow or close the foreign exchange gap. Finance Minister T. T. Krishnamachari has publicly acknowledged this position in seeking to improve the climate in India for foreign investments.

Placed against these hopes, recent data indicating a rise in U.S. business investments abroad should appear heartening. A survey conducted this month by the publishing firm of McGraw-Hill reveals that U.S. manufacturing and petroleum companies expect to spend $4.5 billion on their overseas activities this year—a 14 per cent increase over last year and the biggest annual increase since 1957. Actually, manufacturing companies plan to spend 21 per cent more than last year.

Part of a Trend

The rising outflow of American investment capital is part of a trend. U.S. companies have now invested some $35 billion in plants and equipment in other countries. Two-thirds of this investment was made in the last ten years. In 1963, more American companiees (745) participated in new foreign activities than in the previous two years. They established 718 new activities (new facilities, expansion of existing facilities or licensing arrangements) last year, as compared with 584 in 1962 and 560 in 1961. These figures are available from a study made by Booz, Allen and Hamilton, a Chicago firm of management consultants.

The McGraw-Hill survey further indicates that, both for 1965 and 1966, U.S. companies are planning to spend in excess of $4.6 billion on overseas activities.

The projections for 1964 to 1966 may be somewhat surprising, considering that the domestic economy is shaping excellently, but the factors underlying the rising outflow are not difficult to locate. Apparently, more and more companies in America are coming to the conclusion that the biggest markets of the future are overseas, not here at home. They seem to feel that the U.S. market, though huge, is relatively saturated and that new products are the only major key to growth. Sales data of U.S. companies with multinational operations clearly show that their sales overseas are growing much faster than their sales in the U.S. The McGraw-Hill survey indicates that U.S. manufacturing companies expect a 11 per cent increase this year (to $36 billion) in sales from overseas plants, as against an anticipated 6 per cent rise in U.S. sales.

Profitability

Profitability, too, it seems, is better abroad than at home; returns on capital even in some of the so-called socialistic societies top what can be obtained in the citadel of capitalism. Many companies admit to a percentage return twice as high overseas as in the U.S., the contributing factors presumably being less competition and lower labour costs. Sixty-five per cent of the companies polled by McGraw-Hill stated that profit-margins abroad were as good (23 per cent) or better (42 per cent) than at home.

Also, the cash position of U.S. companies is excellent this year, despite a projected 12 per cent increase in domestic capital spending and hence they are able to festoon the globe with doller bills.

If U.S. companies are stepping up their foreign investments, one might say that it augurs well for India. But to determine to what degree it really does so, one must look into the directions of the flow of American private capital. The governing principle in this regard was well stated recently by Augustus C. Long, Board Chairman and Chief Executive Officer of Texaco, when he said: "Private enterprise is free enterprise. It is free to go where it is needed, where it is wanted, and where it will be treated fairly. If the economic climate is poor, private enterprise will look elsewhere."

Statistics developed by Booz, Allen and Hamilton indicate that, during the 42-month period ended 31st December 1963, U.S. companies chose Western Europe as the site of half of the more than 4,000 new foreign activities undertaken by them. They selected countries in the Western Hemisphere (Canada and the Latin American republics) for 26 per cent of their new activities, scattering the balance of their activities in Asia, Oceania and Africa. Between 1961 and 1963, new activities sited in Western Europe declined from 52 per cent to 49 per cent of all foreign activities newly undertaken by U.S. companies; correspondingly, there was a small gain in activities in the Western Hemisphere countries (24 per cent to 27 per cent) as well as in Asia (16 per cent to 17 per cent).

India's Share

These data do not show any significant shift in the geographical distribution of U.S. foreign investments; however, they reveal a promising, though very small, increase in the number of activities in Asia. In 1963, U.S. companies participated in 206 new activities in Asia, as compared with 176 in 1962 and 189 in 1961. Japan was the site of 123, 99 and 107 of these activities, while India accounted, respectively, for 30, 31 and 28 activities.

Against this background, can India hope to increase the flow of foreign investments to the extend desired? The answer to this question lies in the womb of the future, as it does also in the hands of the Indian Government.

The Government of India has, in recent months, initiated several measures designed to lure larger foreign investments and make their entry less cumbersome. These have received the appreciation of the U.S. business community. At the end of the April talks in New Delhi with Indian Government Ministers and officials, Mr. J. Roy Galloway, Chairman of the top-drawer U.S. Businessmen's Delegation that came to India at the invitation of the Indian Investment Centre, said:

"In the light of the significant strides which the Indian economy has already made in recent years, with the political and financial stability which has stemmed from democratic institutions and good government, with the vast potential market which India's large and industrious population represents, India should offer an outstanding opportunity for business enterprise. We are hopeful that, as a result of this conference, the investment climate will continue to improve and that increased private foreign investment will be able to assist India in achieving its economic goals."

Mr. Galloway's statement indicated that U.S. businessmen, at least the members of the Delegation, expect the Government to take additional steps to improve the climate for foreign investments. Perhaps, India cannot grant all the concessions and conditions that foreign investors seek, but it is clear that, in order to attract a significantly larger volume of foreign investments than is coming in today, continuous efforts will have to be made to enhance India's attractiveness as a competitive site. If the past is prologue, it is difficult to be sanguine about the future.

Advice from a Friend

In this context, I had a discussion this week with a leading authority on economic development, a man who does not see thinks simply in black and white but is sensitive to the entire spectrum of ideas and possibilities, a man who is fully aware of Indian conditions and plans and what is more a staunch friend of India. What he said is relevant to this discussion and accordingly I *parapharse* his remarks below:

"I will not go into the virtues of capitalism or socialism. But I will say India cannot afford socialism. The Indian Government's semi-socialistic policies slow down the rate of development. The Government's leaders and senior officials seem to look on private enterprise with suspicion; instead, they should place greater reliance on it if the economy is to make adequate progress.

"Foreign investors can make a substantial contribution to the growth of the Indian economy. India, with its huge population, has one of the biggest potential markets. If I were in business, I would want to be there. But it is so difficult to get in. All these controls that India has, they only deter progress. Controls should be considered only in terms of an emergency, not as permanent measures.

"The Government should concern itself less and less with industrial investments. It shouldn't be committing its resources in industry, in oil, for example. It should concentrate on agriculture which is not making sufficient progress. If it insists that foreign companies should take it as partner in industrial enterprises, foreign investments will continue to lag behind expectations and needs. Businessmen do not want to join the Government; they much prefer to take Indian businessmen as partners.

"As I have told you before, India must give private enterprise a much larger role. If it does, growth will be much faster."

British bankers are going out on more international ventures. Last week, Rea Brothers have taken on a 25 per cent share in the Dutch banking firm Amsterdamse Crediet Maatschappij in company with Contrad Hinrich Donner of Hamburg which is taking the same stake. At the same time, Westminster Foreign, which recently announced a new link with Spain's Banco de Vizcaya, has raised its capital from just over £1 million to £3 million. The most notable move of all in recent weeks, however, was the co-ordination of interests in the Caribbean by Barclays D.C.O. and the Bank of London and Montreal, which was originally owned, in equal shares, by the Bank of London and South America and the Bank of Montreal.

DEPOSITS ARE ACCEPTED BY

MAHARASHTRA STATE FINANCIAL CORPORATION

at the rates of interest as under:—

(*a*) 12 months and over but less than 24 months 4¼% per annum.
(*b*) 24 months and over but less than 48 months 4½% per annum.
(*c*) 48 months and over but less than 60 months 4¾% per annum.
(*d*) 60 months and over 5¼% per annum.

The minimum amount accepted is Rs. 5,000/-

THE GOVERNMENT OF MAHARASHTRA has GUARANTEED the deposits as to the repayment of principal and payment of interest at the rates specified above.

TRUSTS can, therefore, deposit their funds.

Further details can be obtained from the office of the Corporation.

Managing Director.

LONDON LETTER

THE MILLS OF MONEY

MINISTERS OF TEN IGNORE THE NEEDS OF DEVELOPING NATIONS

From Our Own Correspondent

LONDON, 14*th August*

AMONG the international credit arrangements which have grown up almost unnoticed in the past few years has been one going under the umbrella title of General Arrangements to Borrow. This is an organisation of the main financial powers of the "Western world"—Britain, France, Germany, Belgium, Netherlands, Italy, Sweden, Canada and Japan. Britain is strictly slightly apart from the others (known as the "Eight") as it is a reserve currency nation. In the same category is the U.S.A. joined with Britain in the Arrangements. In addition to these ten is Switzerland which co-operates with the other countries but is not directly associated.

These ten countries, *plus* Switzerland, have gradually devised formulæ to supplement the credit assistance given by the I.M.F. to countries in temporary credit trouble—countries, that is, that are members of the club of ten. As a result, behind the national reserves of these ten countries (which through Britain embrace the whole sterling area) stands not only the I.M.F. but also the resources of the ten, mobilised through interbank arrangements—hence the title of the club.

Less than a year ago, the participating countries decided to set up a form of Committee of Ministers and Governors to examine the adequacy of world credit arrangements. This was naturally done in association with the I.M.F. and at the same time the officials of the I.M.F. were asked to make a parallel study. Both studies are to be considered at the meeting of the International Monetary Fund in the autumn of this year. Meanwhile, the Ministers have issued their report. Looking at the monetary uses of gold, the Ministers formally make the statement "... we do not believe that the flow of new gold into official reserves can be relied on in fact to meet fully the liquidity needs of the future." This is an auspicious beginning!

It is recognised that domestic reserves backing the currency should be available for international settlements—thus the logic is established that gold should play no part in domestic currency, that domestic currency and credit should lose "conventional relationships" with gold. But, in the international sphere, the Ministers confirm the enthronement of gold and their concern is to make gold available for its international role.

The Bank for International Settlements is now having a new lease of life in the Arrangements to Borrow—thanks to being in Switzerland. It is becoming the centre or forum for the balancing of surpluses and deficits on international account. Such arrangements are *ad hoc*, but it is intended that, first of all, by a complete exchange of balance of payments information and next by actually making balance swaps, the B.I.S. should work more than ever before as a central bank for central banks. No such thought is spelled out in the report of Ministers, but the functions are stated and recommended . . . "a basis for multilateral surveillance of the various elements of liquidity creation, with a view to avoiding excesses or shortages in the means of financing existing or anticipated surpluses and deficits in the balance of payments, and to discuss measures appropriate for each country in accordance with the general economic outlook." All this to be done in co-ordination with the O.E.C.D. (Organisation for Economic Co-operation and Development).

Next the Ministers address themselves to the question of creating a new form of reserve asset to supplement the stocks of gold already declared to be inadequate. But at this point imagination deserts the Ministers or may be they have not been fully briefed. The world has two problems moneywise—not one. First is the problem of short-term credit facilities and the machinery for coping with hot money movements and temporary imbalances. These are on the way to being very well provided for. But the other need is for more credit to be made available for the developing countries, now held back because it implies balance of payments problems for the lender. The Ministers show themselves quite unaware of this problem. They say: "in view of the adequacy of the supplies of gold, etc., in the present and near future, there is no immediate need to reach a decision as to the introduction of a new type of reserve asset. Such studies can, therefore, be pursued without undue haste. . . . But . . . such studies are timely. . . ." So the Ministers have established a study group on the creation of reserve assets to report in about a year! Such is the pace of progress. But, perhaps, the officials of the I.M.F. will, in their report, show more understanding of the urgency of this great problem. Why must domestic credit get along without a gold prop but international credit must be limited by gold stocks? Clearly the Ministers of these ten countries do not see this limitation as cramping international exchanges on the present basis. They do not see that the present basis may be quite inadequate for the needs of the developing countries.

B.O.A.C. TRANSATLANTIC TRAFFIC UP

British Overseas Airways Corporation's transatlantic traffic rose rapidly—by 32 per cent—in the early summer months this year as compared with the same period in 1963. The Corporation has announced that 145,925 passengers were carried between Britain and North America from April to July, as compared with 110,390 passengers during the same four-month period last year. For September, the forward bookings from Britain to the United States are 55.5 per cent up on the same month last year, and for October 61.9 per cent up.

CORPORATE SECTOR'S NET PROFIT SUFFERS AGAIN

DEPENDENCE ON BORROWINGS INCREASES

THE profitability of Indian joint-stock companies declined further in 1962-63 as compared with the previous year, which had witnessed a setback over the year 1960-61. Although there was an improvement in the rate of growth of the value of industrial output from 7.8 per cent in 1961-62 to 10.1 per cent in 1962-63—mainly due to the declaration of emergency in October 1962 and the resultant better utilisation of installed capacity—and the sales, total income and gross and pre-tax profits, all recorded a higher rate of growth, the net profit declined for the second year in succession due to higher taxation. Consequently, both the rate of dividend and the rate of shareholders' equity came down by about 10 per cent. These conclusions are derived from the Reserve Bank of India's excellent study of 1,333 public limited non-financial non-governmental companies having a paid-up capital of more than Rs. 5 lakhs each and covering 89 per cent of the total paid-up capital of all such companies at work as at the end of March 1961. The coverage is comprehensive in the case of most of the industries, though it is comparatively less extensive in the case of plantations, especially rubber plantations, in that the companies selected cover only 54 per cent of the total paid-up capital in the industry. The study is based on the accounts of the companies closed during the period 1st July 1962-30th June 1963.

At the outset, we give below a summary of the growth and working of the 1,333 companies during the years 1961-62 and 1962-63:

Table A: Growth and Working of the Company Sector

(Percentage rate of growth)

	1961-62	1962-63
Paid-up capital *plus* reserves	7.9	6.7
Total gross assets	10.1	9.9
Total net assets	9.3	9.3
Sales	9.7	10.5
Total income	9.6	10.0
Gross profit	8.1	10.2
Profit before tax	7.6	9.9
Taxation provision	21.6	28.5
Profit after tax	—1.2	—4.3
Dividends	3.5	—4.5
Profits retained	—8.3	—4.0

The most outstanding point that emerges from the above data is the stagnation in the growth of joint-stock companies. The provision for taxation, which had increased by 21.6 per cent in 1961-62 as compared with the previous year, recorded a still higher increase of 28.5 per cent in 1962-63. Thus, during the two years under reference, the taxation provision increased by as much as 56.2 per cent. The higher tax provision in 1962-63 was mainly due to the introduction of Super Profits Tax in the budget for the fiscal year 1963-64. The result was that, though the profits before tax had increased at a faster rate—indicating the efficiency in the private sector companies as compared with that in the public sector companies most of which have been running at a loss—the profits after tax which had declined by 1.2 per cent in 1961-62, declined at a faster rate by 4.3 per cent in 1962-63. Due to this decline in profits after tax, both the amount distributed as dividend and that retained by the companies came down, having severe repercussions on the growth of paid-up capital and reserves, as is evident from the table. Due to the fall in the retained profits and the unfavourable impact of higher taxes and lower dividends on capital markets, the companies had to depend in a large measure on external resources. Due to a decline in the dividends, the importance of the role of fresh issues came down considerably and borrowings increased at a fast rate. Whereas fresh capital issues declined from Rs. 37.20 crores in 1961-62 to Rs. 28.84 crores in 1962-63, borrowings increased from Rs. 66.23 crores to Rs. 96.05 crores. Of these borrowings, those from banks alone rose from Rs 50.60 crores to Rs. 67.15 crores. It is not suggested that the growth in dependence on external sources of finance was entirely due to the defects in fiscal policy, for, to some extent, it reflects the expansion in industrial activity. But there is no denying the fact that, if the fiscal policy had not been severely harsh and punitive, the corporate sector would have been able to raise more capital on its own and to plough back a larger amount of its improved gross profit.

Income and Expenditure

The total income of the 1,333 companies recorded an improvement in the rate of growth—from 9.6 per cent in 1961-62 to 10.0 per cent in 1962-63. The sales also recorded a higher growth rate from 9.7 per cent to 10.5 per cent. The growth would have been still better if there was an improvement in the supply of raw materials, especially cotton, sugarcane and iron and steel. Groupwise, agricultural and allied activities carried on a commercial scale, recorded a recovery in 1962-63 from stagnation in the previous year. Whereas, during 1961-62, there was only a marginal increase in the income of tea plantations, and there was a decline in the incomes of coffee and rubber plantations, during 1962-63, all the three plantations recorded a good increase in income and the total income of agricultural and allied activities, which had increased by only 1.1 per cent in 1961-62, jumped up by 9.4 per cent in 1962-63. Mining and quarrying also showed better return from 5.9 per cent to 10.0 per cent; coal mining from 6.8 per cent to 10.4 per cent. The growth of income of processing and manufacturing industries, however, declined from 10.8 per cent to 10.1 per cent. But in this group, the performance of metals, chemicals and products thereof was remarkable and the income increased from 10.5 per cent to 14.0 per cent (iron and steel 5.9 to 10.3, transport equipment 4.7 to 10.9 and machinery unchanged at 18.8). It was the foodstuffs, textiles, leather and products thereof that suffered a fall, the growth in their income falling from 10.9 per cent to 7.8 per cent. The worst sufferer was the sugar industry, the income of which grew by only 1.4 per cent as compared to 17.4 per cent in the previous year. There was also a decline in the rate of growth of income of cotton textiles and jute textiles, the former from 10.3 per cent to 8.2 per cent and the latter from 7.7 per cent to 7.2 per cent. As regards other processing and manufacturing industries not covered by the two sub-groups, cement industry had a higher growth in its income (from 11.7 per cent to 13.4 per cent). However, the growth in income declined from 14.9 per cent to 10.1 per cent in rubber and rubber manufactures and 11.1 per cent to 10.7 per cent in paper and paper products. Mineral oil industry continued to remain a sick child and the income which grew by only 5.3 per cent in 1961-62 recorded a mere 2.0 per cent growth in 1962-63.

The growth in the income of industries other than processing and manufacturing, was 9.3 per cent against only 3.6 per cent in 1961-62. It was 17.2 per cent in construction and 14.8 per cent in electric generation and supply. The income in shipping, which had remained practically unaltered in 1961-62, rose by 8.5 per cent in 1962-63. And trading, which had increased its income by only 3.9 per cent in 1961-62, recorded a more respectable growth of 8.6 per cent in 1962-63. It will be seen that the popular notion of very high profits in trade is not correct, not in the organised sector at any rate. The growth in income of trading companies was considerably lower than that in other sectors both in 1961-62 and 1962-63. The above figures indicate the commendable performance of the private sector companies, in spite of various limitations such as shortage of raw materials and foreign exchange.

On the expenditure side, the major items are raw materials consumed, salaries, wages and bonus and excise duty and cess. The value of raw materials consumed which increased by 6.7 per cent in 1961-62, rose by 7.2 per cent in 1962-63. This was mainly due to higher growth of industrial production in 1962-63, though the rise in prices of raw materials also played some part. Salaries, wages and bonus, which increased by 7.5 per cent in 1961-62 as compared with those in 1960-61, rose further by 8.5 per cent in 1962-63. Thus, in two years, the increase was over 16 per cent. Though the rise in employment was there, a considerable portion of this rise was the result of additions to the rates of wages and salaries.

Effect of Indirect Taxes

It was the excise duty and cess payable by manufacturers that recorded perhaps an unprecedented rise during 1962-63. The inflation was as much as 30.7 per cent over the previous year, on top of a rise of 12.9 per cent in 1961-62. Thus, during the two years, excise duty and cess paid increased by about 50 per cent. As a part of the total income, excise duty and cess increased from 5.6 per cent in 1960-61 to 5.8 per cent in 1961-62 and 6.8 per cent in 1962-63. But these figures hide the fact that, in some industries the share of excise duties and cesses in the total income was very much higher. Thus, the charge was as high as 56.0 per cent of the total income of match industry, 39.3 per cent of tobacco industry, 24.1 per cent of mineral oil, 19.3 per cent of cement, 17.7 per cent of rubber and rubber manufactures, 15.7 per cent of sugar, 14.2 per cent of paper and paper products and 12.0 per cent of silk and rayon textiles. An important point that emerges from this analysis is that, to a substantial extent, the increase in the total income of the corporate sector reflects the growth in the burden of indirect taxation. Incidentally, the corporate sector's role as tax collector also accounts for the rise in its borrowings, inasmuch as excise duties and cesses have to be paid even before the sale proceeds flow into the companies' bill.

Before we proceed with a further analysis of the Reserve Bank's study of the corporate sector's financial results, it is necessary to add here that the Bank's conception of gross profit is different from that followed by this journal. The Bank has arrived at the gross profit after providing for all expenses, except interest charges and managing agents' commission, and for depreciation. Profit before tax is computed by deducting from the gross profit interest and managing agents' commission. Profit after tax is what it literally means, that is, that which belongs to shareholders.

Profits and Their Allocation

As the growth in total income was better in 1962-63 and the growth in expenses remained almost unaltered, the gross profit, which had increased by 8.1 per cent in 1961-62, rose further by 10.2 per cent in 1962-63. As percentage of sales and total capital employed, it remained almost the same at about 10 per cent, though the position varied widely from industry to industry, as shown in Table C. Of the total gross profit, interest charges accounted for 15.6 per cent in 1962-63, as against 15.2 per cent in 1961-62—due to the large borrowings at higher rates of interest—and managing agents' remuneration for 4.2 per cent which was lower than 4.4 per cent in 1961-62. The profits before tax remained at almost the constant level of 80 per cent of the gross profits, though, in 1962-63, the increase in these profits was 9.9 per cent as compared to 1961-62 when they rose by 7.6 per cent.

So far we have seen that the growth of industrial production was greater and the increase in sales, income, gross profits and profits before tax was faster. These are all favourable factors, indicating that the development of the industrial sector was faster in 1962-63. But one single factor that changed the entire position and had wide repercussions, was taxation. As may be seen from Table B, tax provision as percentage of profit before tax rose sharply from 38.3 in 1960-61 to 43.3 in 1961-62 and still further to 50.6 in 1962-63. It was highest on sugar industry and rose sharply from 50.5 per cent of the pre-tax profit in 1961-62 to 72.2 per cent in 1962-63. Of the total of 28 industries covered by the Bank's study, the burden varied between 60 and 70 per cent on five industries, namely, tea plantations, electric machinery, apparatus, appliances etc., foundries and engineering workshops, 'other chemical products' and mineral oils and between 50 and 60 per cent on ten other industries. Thus, out of a total of 28 industries, as many as 16 industries paid more than half of their pre-tax profits by way of taxation. The result was a reduction in profit after tax by Rs. 1.53 crore in 1961-62 and Rs. 5.67 crores in 1962-63 or by 1.2 per cent and 4.3 per cent, respectively. The return on shareholders' equity (that is, profit after tax as percentage of net worth) came down from 10.9 per cent in 1960-61 to 10.0 per cent in 1961-62 and 9.0 per cent in 1962-63, as is shown in Table C. Next to shipping, sugar industry was in the worst position with a return as low as 3.5 per cent. Some of the industries, notably jute textiles, silk and rayon textiles, woollen textiles, iron and steel, machinery, chemicals and pharmaceuticals, and matches, were, however, in a relatively better position with a return of over 10 per cent, though the return in the case of many of even these industries was lower as compared with that for the previous year.

Of the total decline of Rs. 5.67 crores in profits after tax in 1962-63, the decline in the amount of dividends was Rs. 3.75 crores and in retained profits Rs. 1.92 crore. Whereas the amount distributed as dividend had increased by 3.5 per cent in 1961-62, the decline in 1962-63 was 4.5 per cent. Thus, the loss in 1962-63 was more than the gain in 1961-62, and the situation was even worse than that in 1960-61. The position of retained profits was still worse. The retained profits had declined both in 1961-62 and 1962-63, by 8.3 per cent and 4.0 per cent, respectively. Though there was a great need for preserving the profits for reinvestment, the corporate sector could not have possibly pruned the dividends further, as such action would have demoralised the shareholders and the stock exchanges. Thus, as is shown by Table B, of the total amount of profit after tax, the percentage share of dividends and retained profits remained in 1962-63 at almost the same level as in 1961-62. But, though the profit after tax had declined, the paid-up capital and net worth of the companies had increased, so that, in spite of the fact that dividend as percentage of the profit after tax remained unchanged, as percentage to paid-up capital and net worth of the company, it came down sharply both in 1961-62 and 1962-63. The dividends paid works out to an average of 5.7 per cent on net worth. This is one of the lowest in the world and quite inadequate for an undeveloped economy like that of India. No wonder the industrial sector is not able to attract enough risk capital and the pace of industrialisation is in turn far behind what it should be, having regard to the need for more goods and employment.

During 1962-63, gross assets increased by Rs. 354.9 crores, as against a rise of Rs. 325.3 crores in 1961-62. The rate of growth was, however, lower at 9.9 per cent, as against 10.1 per cent. The gross assets can be divided into internal resources and external resources. The growth of owned resources, comprising paid-up capital (including capitalised reserves), reserves and surplus and provisions, declined from Rs. 217.3 crores to Rs. 202.4 crores, i.e. from 66.8 per cent of the total increase in gross assets to 57.0 per cent. Though the development rebate reserve, depreciation provision and taxation provision had to be increased of necessity, the addition to all the other types of reserves and surplus and provisions came down. The increase in paid-up capital through capitalisation of reserves was much larger at Rs. 12.90 crores in 1962-63 against Rs. 6.20 crores in 1961-62, obviously because of the sensible concessions which Mr. Morarji Desai had given in the tax on bonus shares. This welcome change in the fiscal policy has unfortunately been reversed by his successor, Mr. T. T. Krishnamachari, so that the trend to issue bonus shares has suffered a serious setback since March last.

In view of the slower growth of owned resources, the external resources became more important. Thus, of the total increase in gross assets, whereas the external resources of funds had accounted for 33.2 per cent in 1961-62, the percentage increased to 43.0 in 1962-63. It was still higher in some of the industries. As there was poor response from the market, the fresh capital issues declined from Rs. 37.2 crores in 1961-62 to Rs. 28.8 crores in 1962-63, that is from 11.4 per cent of the increase in gross assets to 8.1 per cent. Borrowings, on the other hand, rose at a faster rate, the rise being Rs. 66.2 crores in 1961-62 and Rs. 96.0 crores in 1962-63 (bank borrowings Rs. 50.6 crores and Rs. 67.1 crores, respectively). As a part of the total increase in gross assets, the rise was from 20.4 per cent to 27.1 per cent.

The gross fixed assets increased by a larger amount of Rs. 196.1 crores in 1962-63, as against Rs. 185.4 crores in 1961-62, but the rate of growth was lower from 10.1 per cent to 9.7 per cent. As the major portion of the increase in gross fixed assets was accounted for by depreciation provision, the rate of net fixed assets formation declined from 8.3 per cent to 8.0 per cent. The rate, however, varied widely from industry to industry, as will be seen from Table D.

The Reserve Bank's study throws up data in ample measure to substantiate the contention that, to a very large extent, the Government is responsible for the stagnation in the industrial sector. The industrial policy of the Government, which is supposed to be meant for industrial development, is actually working as a drag on economy of the country. The basic principle for industrial development is that the internal sources of the companies should be as large as possible and should at least be sufficient to meet the requirements for gross fixed assets. But in India, the trend is just the other way round because of a defective fiscal policy. More than half of the profits before tax are taken up by the Government by way of taxation, as a result of which both the dividend (amount and rate) and the growth in reserves have not been adequate to sustain the interest of investors in industrial shares. The Unit Trust and the L.I.C. may, through their open market operations, sustain the tempo of stock exchanges for a while, but they cannot solve the problems posed by an inadequate supply of risk capital fully and satisfactorily.

Table B: Capital Formation Rates, Industry-wise, 1961-62 and 1962-63

(Per cent per annum)

Industry	No. of companies	Gross fixed assets formation		Net fixed assets formation		Inventory accumulation		Gross capital formation		Net capital formation	
		1961-62	1962-63	1961-62	1962-63	1961-62	1962-63	1961-62	1962-63	1961-62	1962-63

TEXTILE MACHINERY INDUSTRY

EXPANSION AND MODERNISATION ALIKE NEEDED

By A Special Correspondent

THE textile machinery industry of India is less than fifteen years old, although its mainstay, the cotton mill industry, came into existence more than a century ago. There is good reason for the former's late arrival. Till the outbreak of the last war, the Indian cotton mill industry had few opportunities to consolidate its position. The Indian market was flooded with imported textiles. Many mills were forced to work multiple shifts and subject their machinery to extreme wear and tear in an attempt to reduce their working costs so that their products could successfully compete with foreign cloth. In spite of such efforts, a large section of the industry could not earn sufficient profits even to cover the depreciation allowances to which the mills were entitled and the large amounts required for interest on borrowed money.

Perspective

The Indian textile producers, who were thus forced to fight a rearguard action, could not be expected to venture into the uncharted realm of machinery manufacture, involving considerable capital investment and technical knowledge. Other entrepreneurs were no less chary of assuming such a responsibility. Apart from considerations of finance, textile machinery production demands advanced technical skill which the millowners and others were in no position to import and pay for. How the machinery manufacturer has to cater to a bewildering variety of specifications is best illustrated by the fact that the types of ring frames produced are so numerous that it is almost impossible to count them! It is because the variety in the textile machines is so large that, in spite of the great forward steps taken to improve their quality, world producers of this equipment have not yet fully succeeded in standardising their products.

Another equally important reason that discouraged the development of textile machinery industry as a major enterprise in the country was the cheapness and the plentiful supply of textile machines of all kinds from abroad. In the 'thirties, British manufacturers waged a ruthless price-war among themselves which sent machinery prices tumbling down by 42½ per cent. For instance, in 1932-33, a card was sold at £90 and a ring frame at £180. It was only on the eve of the last war that machinery prices rose again, as a result of the British producers abandoning their ruinous competition, so that a card was sold at £200 and a ring frame at £450.

The Indian cotton mill industry opened a new chapter in its chequered career with the outbreak of the last war. The enormous calls upon its productive capacity greatly helped it to recover from the many infirmities that had long oppressed it and to take stock of its new position. The war, however, created new problems for the industry. In the drive for higher output, the plant and machinery, the bulk of which had already become old, were worked without rest or respite. It was not possible to carry out renewals and replacements on the required scale, partly because machinery prices had risen to abnormal levels and partly because imports were most difficult. In fact, there was a world-wide dearth of textile machinery due to the manufacturing countries like the United Kingdom and Japan diverting their productive capacity to the manufacture of military hardware. The Indian cotton mill industry, which had by now greatly widened its productive activities, was not prepared to accept the situation with resignation. It was impossible for it to consolidate its gains if it were to depend helplessly as before on distant countries to meet its requirements of capital equipment.

Factories to produce textile machinery were accordingly set up in the country during the war years, but inevitably the venture had all the limitations of a pioneering enterprise. They started manufacturing some quantities of spinning frames and rings, looms and parts besides other accessories such as wire healds, pickers, bobbins, fluted and tin rollers. The end of the war, however, saw many more firms entering the field, Texmaco and Textools being notable among them. These were commendable ventures, but it was felt that, owing to the vastness of the requirements of the mill industry, the textile millowners themselves should assume major responsibility for the production of capital goods required by them. The prospects for a wider demand for cloth were considered extremely good.

Initial Step

It became increasingly evident to the millowners that strenuous efforts would be needed to establish the textile machinery industry in a big way if the mills were to be assured of a regular supply of their productive equipment. At the instance of the late Sir Ardeshir Dalal, the then Central Member for Planning and Development, a conference of millowners was held in December 1945 when the question of setting up an all-India organisation for undertaking such a project was considered. The conference came to the conclusion that the new industry should be started and controlled by a body of millowners and not be left to the initiative of individuals. In the following year, a delegation of millowners went to Britain and made arrangements with a leading firm of textile machinery manufacturers in that country for the establishment of a factory in India. It is thus that the National Machinery Manufacturers Ltd., whose factory is situated at Kalwa, near Bombay, came into existence. The President of the Indian Union, the late Dr. Rajendra Prasad, inaugurated the factory on 25th February 1952 and praised the Indian industrialists for their drive and enterprise.

Production of textile machinery in the country is on the increase. Imports of many items and parts are banned to provide a sense of security to the domestic producer and to enable him to expand his activities with confidence. On the recommendation of the Tariff Commission in 1949, statutory shelter was given to spinning ring frames, spindles, spinning rings and plain looms. Subsequent investigations by this body led to a wider range of items being brought within the scope of protection.

Protection

In its report of 1963, the Commission recommended that the industry should be given protection for a period of three years ending 31st December 1966 in respect of complete ring frame. Similar shelter was suggested for protected components, namely, spindles, spinning rings and fluted rollers. The Commission also recommended continuance of protection to automatic looms beyond 31st December 1963 for a period of three years. In the case of all these items, the prevailing rate of duty of 10 per cent *ad valorem*, exclusive of surcharge, was recommended.

The following table shows the various items of spinning equipment produced in India:

	Carding engines	Drawing frames	Speed frames	Ring frames*	Reeling machines	Doubling frames
1955	649	44	28	863	607	..
1956	726	24	29	1,110	1,158	..
1957	1,023	34	33	1,364	1,965	..
1958	1,148	9	28	877	804	..
1959	763	41	16	1,077	435	..
1960	1,075	47	45	1,127	50	156
1961	1,308	75	70	1,340	14	113
1962	1,498	91	45	1,571	136	114
1963	1,690	52	96	1,990	419	80

* Each ring frame consists of about 400 spindles.

The production of looms in the country is shown below:

Year	Looms			Automatic looms imported
	Plain	Automatic	Total	
1955	2,787	70	2,857	1,067
1956	2,873	161	3,034	139
1957	2,868	316	3,184	915
1958	3,187	36	3,223	848
1959	4,231	356	4,587	159
1960	5,177	374	5,551	649
1961	7,534	67	7,601	1,943
1962	5,360	496	5,856	1,747
1963	1,802	3,382	5,184	1,411

The scope for expansion of textile machinery production in India greatly depends upon the prospects for cloth and yarn offtake both for domestic consumption and for export. The third Five-year Plan has provided for a moderate increase in mill production, namely, from the present level of 5,000 million yards of cloth a year to 5,800 million yards. On the basis of the anticipated *per capita* consumption of cloth and exports by the end of the third and fourth Plan periods, the annual requirements of different items of spinning and weaving machinery, both for expansion and for replacement, are as shown below:

Item of machinery	Annual requirements for expansion and replacement	
	Third Plan	Fourth Plan
Blowroom lines	42	58
Carding engines	1,230	2,040
Comber sets	21	41
Draw frames	108	158
Speed frames	304	431
Ring frames	1,325	1,840
Winding machines—		
(a) High speed	33	24
(b) Fully automatic	16	23
Warping machines—		
(a) High speed	22	23
(b) Fully automatic	16	23
Sizing machines	38	49
Plain looms	1,650	1,225
Automatic looms	4,700	3,250
Total value of the above items in rupees (lakhs)	1,449,450	2,130,125

It is evident from the series of statistics presented here that, while indigenous production of textile machinery is making good progress, the magnitude of machinery requirements of textile industry is very much higher than domestic supplies. The mill industry has made an estimate of its own in the case of some of the important items of textile machinery that will be required from 1964. According to this study, the mill sector should have 16 lakh spindles annually both for purposes of rehabilitation and expansion, while the output of spindles in the country is 8 lakhs a year.

Demand Position

Similarly, the mills need 1,000 carding engines a year to replace the existing ones and another 3,300 *per annum*, if the plan to increase the spindleage materialises. India produces about 1,700 carding engines a year and should, therefore, be prepared to make good a deficit of 2,500 of them each year.

The position relating to the supply of looms also calls for an appreciable improvement. It is estimated that, as many as 7,000 looms will have to be earmarked annually for purposes of rehabilitation. If the expansion of weaving capacity materialises on the scale envisaged, the industry must have 41,000 looms. Assuming that half the quantity of these looms will be installed in the current year and in 1965, the annual loom requirements of the mills will be 17,000, that is, 7,000 for rehabilitation and 10,000 for expansion. The current rate of production inside the country is 3,500 automatic looms and 2,500 plain looms.

There will also be a shortfall in other items of machinery, including blow room lines and speed frames. The textile industry has consistently held that indigenous producers of textile machinery should be given every encouragement to increase their output so that the gap between domestic output and the requirements of the mills may be narrowed. Towards this end, it has advocated that the Indian textile machinery manufacturers should be allotted foreign exchange on a generous scale. It has also suggested that long-term loans should be sanctioned to them to facilitate their concluding collaboration agreements with foreign manufacturers for the production of textile machinery on a bigger scale inside the country. They should also be helped to import pig iron and components on the required scale. At the same time, suitable steps should be taken to ensure that machinery production in the country is in accordance with the latest technological developments abroad.

Commendable Efforts

The textile machinery manufacturers themselves are making strenuous efforts to expand and diversify their output. A number of new items, namely, blowroom lines, draw frames, speed frames, high-speed winding and warping machines, wet processing machinery, including winches, cloth printing machines, automatic jiggers, hot-air stenters, mercerising machines, singeing machines, continuous dyeing plant, pneumatic mangles, open width bleaching plant and polymerising machines are now being manufactured in the country. Indigenous capacity has also been created for the production of ring frame components such as top arm drafting parts, ball bearing top rollers, ball bearing jockey pulleys, roller bearing inserts, etc. Foreign collaboration has been secured for enlarging the production of automatic looms and sizing machines.

Even so, the country will have to wait for many years before it can reach the much-coveted goal of self-sufficiency in textile machinery, as the growth of this industry is not rapid enough. During the second Plan period, 1956-61, India produced textile equipment valued at Rs. 42 crores which accounted for about 46 per cent of the assessed demand in terms of value. Imports have thus become inevitable. The following table shows the value of the textile machinery imported over a period of years:

Year	Rs. (crores)
1957	18.94
1958	10.31
1959	9.05
1960	13.81
1961	20.36
1962	21.68
1963	22.00

Imports of items like ring frames, spindles, spinning rings and fluted rollers are in negligible quantities, while large sums of money are being spent on importing blow-room machinery, drawing frames, winding machinery and automatic looms. The following table shows the import of some of the major items of cotton textile machinery in the year 1st April 1963 to 31st March 1964:

Type	Quantity in Nos.	Value in lakhs of Rs.
Cotton waste spinning machinery	25	13
Dyeing machinery	41	15
Finishing machinery	10	17
Printing machinery	8	5
Sizing machinery	22	41
Blowroom machinery	81	109
Carding machinery	37	18
Combing machinery	94	62
Twisting machinery	28	28
Drawing frames	362	142
Intermediate frames	9	4
Ring frames	59	28
Roving frames	23	26
Warping machinery	22	19
Winding machinery	222	107
Automatic looms	1,279	127
Plain looms	8	3

(*Source:* Department of Commercial Intelligence and Statistics, Government of India.)

The main sources of textile machinery supply to India are Britain, the United States of America, West Germany, Japan and Czechoslovakia.

The third Plan provides for textile machinery production valued at Rs. 20 crores a year. Considering the enormous machinery requirements of the textile mills, the target is undoubtedly a modest one. The following table shows the value of indigenous production in the period 1957-63:

Year	Rs. (crores)
1957	9.25
1958	7.65
1959	8.84
1960	11.08
1961	12.94
1962	15.40
1963	18.52

It is estimated that production will rise to Rs. 36 crores in 1966.

Raw Materials

The industry is, however, confronted with serious difficulties in reaching higher levels of production. With the existence of unutilised capacity, we are witness to the strange spectacle of darkness at noon. The reason for this paradox is the inadequate and uncertain supply of the raw materials required by the industry. The main raw materials for textile machinery production are pig iron of superior grades, steel items like bright drawn sections and free cutting varieties and coke.

Machinery producers are greatly handicapped due to the deterioration in the supply position pertaining to most of these items. They fear that the quality and prices of their own products will be exposed to adverse criticism on this account. The textile machinery industry has undoubtedly a good case for asking that imports of essential components and raw materials required by it should be liberalised by making a generous allocation of foreign exchange for this purpose.

It is only when the textile machinery industry is freed from such worries will it be able to increase its output to the required scale, to improve the quality of its products and to deliver them to the mills more promptly and at attractive prices. It will also be in a better position to adopt the continually improving techniques of machinery fabrication. As in the production of other industrial equipment, revolutionary changes are taking place in the manufacture of textile machinery, the aim being to reduce the number of processes in the production of cloth and yarn and to improve their quality.

New Invention

Inexorable economic forces are driving the textile industry towards automation, with the result that the production of conventional types of machinery may before long go into disuse. The C.A.S. (continuous automated spinning) system developed in Japan is designed to shorten the conventional six to nine operational stages to two. In America, a new experimental cotton spinning machine, developed by the engineers of the U.S. Department of Agriculture, may well lead to early automation in the cotton spinning mills.

To conclude, the textile machinery industry in India is still in a developing stage, but the scope for its products is very wide indeed. Its aim should be not only to increase the volume of its output but also to improve the quality of its manufactures. By doing so, it will not only be able to cater to domestic requirements but also be in a position to export sizable quantities to the textile producing countries, especially in Asia and Africa. In order to keep itself up-to-date, the industry should be permitted to import the latest machines with a view to manufacturing similar ones in the country itself. If necessary, collaboration with foreign firms and experts should be sought on a bigger scale than at present. Self-sufficiency in textile equipment is one of the urgent necessities of the country.

TEXTILES IN A DIVIDED EUROPE

In one of the recent issues of the *Textile Mercury International* (Manchester), Mr. Mario Ludwig, Director of the International Federation of Cotton and Allied Textile Industries in Zürich, takes a new look at the textile industry in a divided Europe. He reviews the structural evolution in the world's textile industries, which resulted in a decline in the productive capacities of the Western nations and a corresponding increase in the textile mill capacity of developing countries, mainly in Asia, Africa and Latin America. Mr. Ludwig then points out that, as a result of the division of Western Europe into the "Six" and the "Seven," the textile industries are handicapped further still. In the E.E.C. area, the textile industries are relatively homogeneous and composed of four large and fairly similar markets; Benelux, France, Germany and Italy. They always had intensive foreign trade in textile goods among themselves. In the E.F.T.A., on the other hand, the textile industries form an extremely heterogeneous group. They are composed of one very large producer and consumer, i.e. the United Kingdom, and six small, multifarious markets scattered all over Europe, each with its own small cotton textile industry. These smaller E.F.T.A. countries have, in their foreign trade in textile goods, always been orientated towards E.E.C. countries.

Mr. Ludwig recalls that the textile industry of Western Europe has been the first industry ever to advocate all-European market integration. Since this is not likely to happen soon on the political level, it is understandable that the industry should now seek ways and means as to how this could be achieved at least for the textile sector. Two major conditions would have to be fulfilled: (1) Harmonisation of E.F.T.A. tariffs on textile goods with the common external tariff of the E.E.C., and (2) adoption of a common foreign trade policy towards third countries. Mr. Ludwig believes that both are within the realm of possibilities. As far as the harmonisation of tariffs is concerned, he points out that current textile tariffs in E.F.T.A. countries—with a few exceptions—do not differ substantially from the common external tariff of the E.E.C. With regard to the co-ordinated foreign trade policy, he recalls that already the Western European textile industries receive special treatment under the G.A.T.T. Long-term Arrangement on International Trade in Cotton Textiles. If this need for special textile policies, specifically designed for the benefit of the highly industrialised importing countries on one side and the developing exporting countries on the other, has been officially acknowledged by such a world-wide inter-governmental body as the G.A.T.T., then—Mr. Ludwig feels—it should not be too difficult to arrive at a co-ordinated foreign trade policy on textiles between the E.E.C. and the E.F.T.A. He suggests that perhaps the special Committee for Textiles of the O.E.C.D. might provide the appropriate institutional framework to achieve this.

SECOND WAGE BOARD FOR COTTON TEXTILE INDUSTRY

The Government of India has announced the setting up of a second Wage Board for the cotton textile industry to consider the question of a further revision of the wage structure in the industry. While making its recommendations, the Wage Board has been asked to keep in view the recommendations of the first Wage Board for the cotton textile industry and Government decisions thereon; the principles of fair wages as set forth in the report of the Committee on Fair Wages; the needs of the industry in a developing economy (including the need for maintaining and promoting exports); the various elements of labour costs (excepting bonus) apart from wages; the requirements of social justice; the need for adjusting wage differentials in such a manner as to provide incentive to workers for advancing their skill; and the desirability of extending the system of payment by results. In applying the system of payment by results, the Board is required to bear in mind the need for fixing a minimum (fall-back wage) and also safeguarding against overwork and undue speed. Further, the Wage Board shall consider the demands for the introduction of a gratuity scheme on an industry-wise basis.

The composition of the Board shall be as follows:—

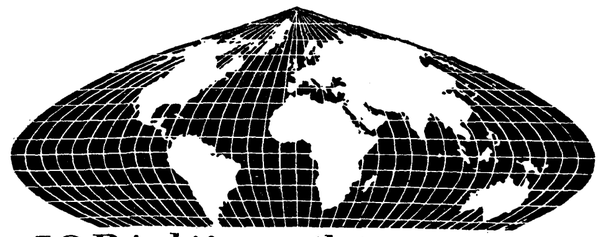
Chairman: Mr. K. Bhimasankaram, Retired Judge, High Court, Andhra Pradesh; *independent members*: Mr. Tulsidas S. Jadhav, member, Lok Sabha, and Prof. M. B. Desai; *employers' representatives*: Mr. D. C. Kothari and Mr. Surottam P. Hutheesing; *workers' representatives*: Mr. G. Ramanujam and Mr. A. N. Buch.

The headquarters of the Board will be located at Hyderabad. The correspondence intended for the Board shall be addressed to the Chairman, Second Central Wage Board for the Cotton Textile Industry, c/o the Secretary to the Government of Andhra Pradesh, Home (Labour-II) Department, Hyderabad.

ANNUAL REPORT OF MILLOWNERS' ASSOCIATION, BOMBAY

The Committee of the Millowners' Association, Bombay, in its annual report for the year 1963, describes the various regulations affecting the cotton textile mills throughout the country. The Committee points out that a mere permission to industries to step up their productive capacity cannot raise the level of production. What is more urgently needed, according to it, is action to bridge the widening gulf between costs and prices. It, therefore, urges a revision of cloth and yarn prices.

The report contains a resume of the proceedings of the last annual general meeting and incorporates the full text of the latest budget speech of the Union Finance Minister. The comprehensive statistical section included at the end gives, among other things, details regarding the progress of the cotton mill industry, consumption of raw cotton, production, import, export and *per capita* availability of cloth in the country and the prevailing rates of excise duty on cloth.



I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers —Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

MANCHESTER LETTER

FOREIGN TRADE IN TEXTILES

EXPORTS DECLINE, IMPORTS RISE AGAIN

From Our Special Correspondent

MANCHESTER, 11*th August*

IN June, exports of cotton cloth from Britain were at their lowest level for many years at 14,586,000 square yards, while corresponding arrivals from abroad were 70,366,000 square yards. At the end of six months, shippers had sent 102,877,000 square yards of cotton cloth abroad, earning £15,360,884, while imports had reached 414,723,000 yards at a cost of £34,386,622.

Arrivals during the half-year were only about 6 million square yards short of the previous peak in 1961 and were over 80 million yards more than in the same period last year. At the same time, the comparable shipments of man-made fibre cloth were 44,687,000 square yards and imports were 46,278,000 square yards.

The following table illustrates the current situation, with corresponding figures for selected years since the post-war export peak:

(Cloth in thousand sq. yards and yarn in thousand lbs.)

	Cotton cloth		*Rayon, etc. cloth*		*Cotton yarn*	
	Exports	*Imports*	*Exports*	*Imports*	*Exports*	*Imports*
1949 ..	903,578	345,800	180,708	51,800	82,061	1,960
1953 ..	709,905	98,640	176,826	44,400	41,920	3,360
1958 ..	384,078	386,763	84,404	47,171	26,797	14,637
1959 ..	347,687	557,145	63,725	37,764	22,921	21,512
1960 ..	337,090	727,707	54,355	58,419	21,113	38,648
1961 ..	286,632	731,011	48,884	69,739	14,451	43,737
1962 ..	235,210	575,021	54,969	66,485	21,902*	31,910*
1963 ..	222,262	695,208	80,319	63,446	20,605	36,244
1963—						
1st half	113,965	332,586	38,827	28,894	10,941	19,219
1964—						
1st half	102,877	414,723	44,687	46,278	11,092	21,461

* Including thread from 1962 onwards.

While the above table still reflects the same discouraging picture which has for so long affected the British industry, the one bright spot remains the man-made fibre yarn sector. Shipments in the first half of the current year increased by a further 8 million lbs. to 48,177,000 lbs., nearly twice as much as was exported in the corresponding period of 1961. Arrivals of man-made fibre yarn and thread admittedly nearly doubled at 13,476,000 lbs. as against 7,121,000 lbs., but it is as well to remember that there are some encouraging aspects of the situation.

The major rise in imports has again been in the quantity of cotton grey cloth arriving in this country. This has soared from 254,440,000 yards to 327,738,000 yards. Leading suppliers during the six months were India (136,002,000 yards, as against 94,618,000 yards); Hong Kong (38,236,000 yards, as against 45,736,000 yards); Pakistan (32,679,000 yards, as against 35,976,000 yards) and China (29,669,000 yards, as against 18,937,000 yards). Larger quantities were taken from Canada, the Irish Republic and Yugoslavia.

Arrivals of finished fabrics were nearly 9 million yards higher in the first half of 1963 at 86,985,000 yards. Most of these goods came from Belgium (15,096,000 yards), India (13,645,000 yards) and Hong Kong (12,524,000 yards).

Cotton cloth exports continued to decline in volume. The major markets were South Africa (12,157,000 yards); the Irish Republic (10,406,000 yards); and Australia (9,399,000 yards). Among other countries absorbing modest quantities from Britain were New Zealand (7,276,000 yards); Nigeria (7,189,000 yards) and Rhodesia and Nyasaland (6,294,000 yards).

No Holiday Let-up

Yet another week of pronounced activity in the takeover field affecting textile companies has brought a new rush of negotiations and actual bids, and it seems self-evident that the traditional holiday month of August is not going to interfere with the expansionist plans of the groups which are the mainspring of this mood. In particular, focus at the moment is the weaving section. Following the substantial purchases made in spinning, it is felt that those who aspire to being fully vertical are somewhat short of an appropriate number of looms to absorb the rest of their capacity. The likelihood of John Grey Ltd., Burnley, being absorbed for this reason has been confirmed by an official indication that talks are going on with a prospective bidder.

In the meantime, steps taken to protect contacts and outlets by some of the smaller units in the industry reflect the anxiety which is undoubtedly being felt by customers and producers alike. Mergers within this field, or at least a series of financial arrangements to safeguard the future flow of supplies, may well provide an offshoot to the direct takeovers which have lately concerned the more substantial companies in the trade.

Re-equipment Schemes

Although the first flush of comment created by the bids for the spinning combines has died down, the outlook for the industry has still been the subject of widespread debate. Much has been made during the past week or two of the financial aid provided by the Government to carry out the reorganisation scheme and, in particular, the re-equipment grants.

Again, the industry has been blamed for not scrapping enough machinery or installing sufficient new plant. In general terms, some of these arguments can be justified, but it should be remembered that individual companies still retained the right to decide how far they should venture into these schemes—there was no compulsion.

In fact, very large sums of money have been expended on modernising the mills and the critics would do well to spend a few hours seeing the best that Lancashire can now offer, which is more than comparable with its competitors abroad. The efficient, far-seeing executives who have nursed these plans into fruition, and who still have a number of useful cards up their sleeve, will be only too ready to show what has been accomplished so far.

In view of the comparisons which are constantly being drawn between the consumption of the natural and man-made fibres, it is interesting to note that the supplies of raw cotton imported into this country during the past season were the highest for the last four years. Arrivals of nearly 1,300,000 bales were 180,000 bales more than in the previous 12 months and as compared with 1,450,000 bales in the 1959-60 season.

Although there is obviously a distinct correlation between the state of the trade in the industry and the purchases of the raw material, the maintenance of imports at more than 1,000,000 bales seems to indicate that cotton is by no means the back-number which some people suggest. Certainly two years ago, when arrivals were at their lowest ebb for a long time back, it looked as if the writing was on the wall, but, in the subsequent seasons, additional quantities have been shipped to this country each year.

One of the major changes over the past season has been the marked revival in purchases of cotton from the United States, despite the very complicated circumstances ruling in America, arising from the legislative changes relating to the crop which were under consideration. It is a far cry indeed from the 1956-57 season when the United States Government adopted an aggressive selling policy to dispose of their huge accumulation of stocks, and Britain imported just over 1,000,000 bales of American cotton out of total arrivals of 1,690,000 bales.

In contrast to the fluctuating shipments from the United States, the imports of Turkish cotton have shown a steady increase with the exception of the 1960-61 season, and now represent the second largest source of supply. Purchases from Iran have also moved upwards, and cotton grown in Pakistan has found a ready market in Britain this year, reaching the highest level for many seasons past.

Actual forwardings of cotton to the mills during the past season were rather smaller than might have been anticipated in view of the arrivals. The gap between the two was in fact 86,000 bales, as compared with only 8,000 bales in the previous season.

GOVERNMENT OF UTTAR PRADESH

FINANCE DEPARTMENT

Dated Lucknow, August 4, 1964

PRESS NOTE

4¾ Per Cent

Uttar Pradesh State Development Loan, 1976

The Government of Uttar Pradesh are floating a loan of Rs. 10 crores in order to finance development schemes particularly those relating to electricity, irrigation and industries. The loan will open for subscriptions on August 24, 1964 and will close on August 29, 1964, unless closed earlier. The main terms of the loan are that the issue price will be Rs. 99.75 for every Rs. 100 of the loan applied for; the loan will have a currency of 12 years from August 24, 1964, and will be repaid at par on August 24, 1976; the loan will carry interest at the rate of 4¾ per cent per annum from August 24, 1964 payable half-yearly on February 24 and August 24, the payments being subject to tax under the Income Tax Act, 1961. Subscriptions for the loan can be made in the form of cash or cheque or securities of 4 per cent Uttar Pradesh Loan, 1964 and will be received at the branches of the State Bank of India in Uttar Pradesh, the Government treasuries and sub-treasuries in the State of Uttar Pradesh where there is no branch of the State Bank of India, the offices of the Reserve Bank of India at Bombay, Calcutta, New Delhi, Madras, Nagpur and Bangalore, the branch of the State Bank of India at Patna and the branch of the State Bank of Hyderabad at Hyderabad.

Full details of the terms of the loan are contained in Finance Department notification No. BI—3054/X—88-64, dated August 4, 1964, copies of which, along with the application form, are obtainable at the receiving offices mentioned above.

2. Financial position of the Government of Uttar Pradesh:—

Revenue position—During the years 1959-60 to 1962-63, the Revenue receipts and expenditure were as follows:—

(Figures in lakhs of rupees)

	Revenue Receipts	Revenue expenditure	Surplus (+)
1959-60	12,955	12,816	+139
1960-61	14,835	14,431	+404
1961-62	15,399	15,111	+288
1962-63	19,000	18,867	+133

The Accounts for 1963-64 have not yet been finally closed, but the indications are that the year might close with a revenue surplus of about Rs. 10 crores.

Balances in the Reserve Funds—The balances at the credit of the various Reserve Funds at the end of 1963-64 were Rs. 65.40 crores of which a sum of Rs. 54.84 crores is invested in Government securities.

Debt position—The total debt of the Government of Uttar Pradesh as on March 31, 1964 was about Rs. 406.59 crores consisting of Rs. 331.63 crores as loans received from the Government of India, Rs. 64.75 crores on account of open market loans, Rs. 9.31 crores representing loans from the Agricultural Credit Fund of the Reserve Bank of India and from the Life Insurance Corporation of India, etc., and a sum of Rs. 90 lakhs in respect of issue of U. P. E. E. Act Bonds. There are Sinking Funds for the public loans (both Liquidation and Depreciation) and the balance at the credit of these Funds which amounted to Rs. 27.40 crores on March 31, 1964 is invested mostly in Government of India securities. A sum of Rs. 16.83 crores—mostly invested—is also available in the Sinking Fund built up for the amortisation of loans obtained from the Government of India which are repayable in lump sum. Besides the above debt of Rs. 406.59 crores, the State Government also issued Zamindari Abolition Compensation Bonds and Rehabilitation Grant Bonds, the outstanding balance of which on March 31, 1964 amounted to Rs. 81.40 crores.

Assets of the Government—Against the outstanding debt of Rs. 406.59 crores there are assets in the shape of the Ganga, Yamuna and Sarda Canals, various other canals and the State Tube-wells, Government Cement Factory, Government Precision Instruments Factory, Government Bus Services and Rihand Electricity Scheme, in which a total sum of about Rs. 321.44 crores has been invested. Another asset is the balance due to Uttar Pradesh Government on account of loans and advances made amounting to about Rs. 194.31 crores. Besides these, there are a large number of buildings and roads for which no separate capital accounts are maintained.

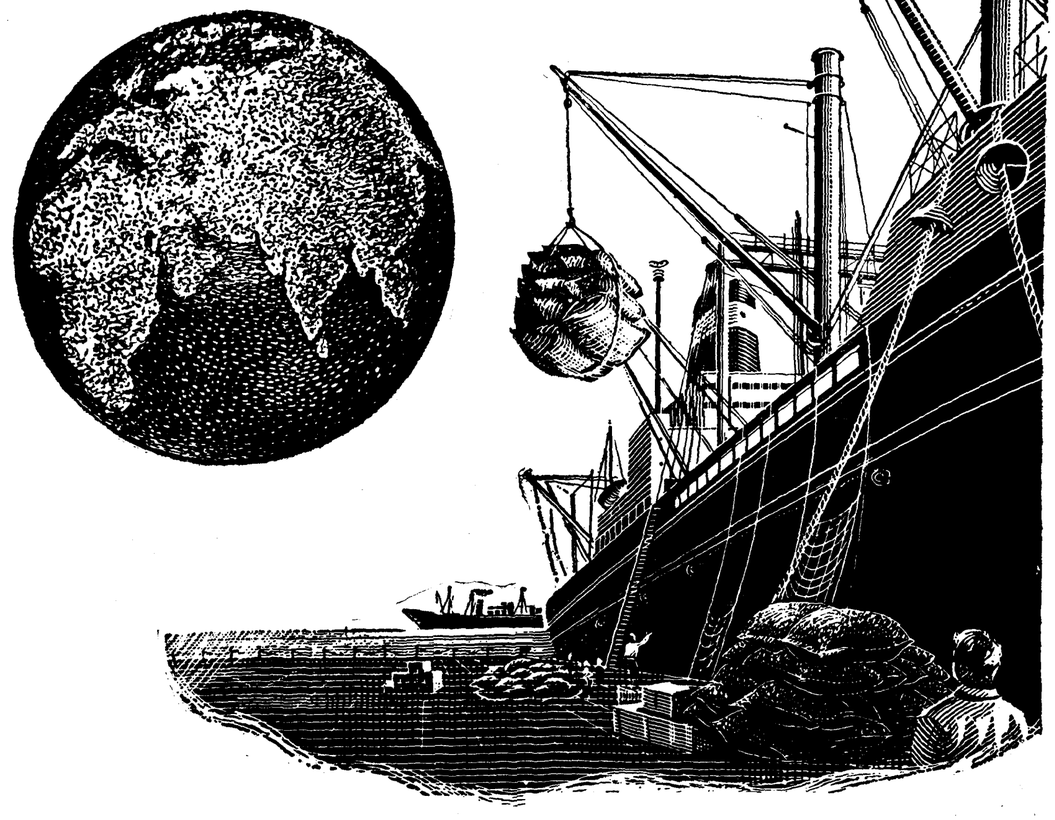
THE E.I.D.-PARRY GROUP
1964

FOREIGN EXCHANGE AND PARRYS



FOREIGN EXCHANGE*— the most important factor in the country's economy today—is also the most important factor in the E.I.D.—Parry Group's plans for brighter and better tomorrows.

The production of fertilisers provides a good example of the E.I.D.—Parry Group's contribution towards increased food production and towards conserving foreign exchange by reducing the volume of fertiliser imports. In 1963/64 the Government have set aside no less than Rs. 40 crores for the import of fertilisers to meet the deficiency between indigenous production and total demand. During the same period the E.I.D.—Parry Group will produce and distribute about 250,000 tons of fertilisers, which figure will be further increased by expansion programmes during the Third Plan period.

Other manufactures of this Group of nine companies of substance include sugar, confectionery, sanitaryware, acids, chemicals, carbonic acid gas and industrial and potable alcohol.

THE E.I.D.—PARRY GROUP, MADRAS

* *The Foreign Exchange Bill for the Third Five-Year Plan is more than Rs. 1,900 crores.*

COAL CONSUMPTION IN INDIA

LARGER USE OF LOWER GRADES MUST BE ENCOURAGED

IN any industry, the level of production alone is not important. Equally important is the proper pattern of production. If the production pattern is not proper, there is bound to be imbalance in the demand for, and the supply of, a product. This simple truth, it is somewhat unfortunate, does not seem to have been recognised by New Delhi. How else is one to explain the recent decision of the Union Ministry of Steel and Mines to earmark the additional non-coking coal requirements of nine million tonnes in the remaining period of the third Plan exclusively to higher grades of coal upto grade one?

Apart from the limited deposits of superior grade coal, the Government should not ignore certain vital considerations. Some of these considerations have been well brought out by the Indian Colliery Owners' Association in a memorandum recently submitted to the Minister for Steel and Mines. The Association has drawn attention, for instance, to the fact that, in due recognition of the necessity for larger consumption of lower grade coal supplies backed by large reserves, boilers in various industries have been designed for using lower grade coals. Further, mention is made of the economics of lower grade coal for brick-burning purposes. It is claimed that such coal can be used easily without any loss in efficiency. Mention is also made of the urgent demand, already existing in the countryside, for lower grades of coal to meet the needs of domestic consumption in the shape of soft coke. Recalling, in this connection, the incalculable harm being done to the economy as a whole by the use of cow dung, fire wood and vegetable wastes as fuel by villagers as highlighted in a research study, the Association says: "Any lapse on our part resulting in the failure to check the wasteful use of our available manures by replacing them with soft coke, in which our country abounds, would be unpardonable." Dr. P. S. Lokanathan, Director-General of the National Council of Applied Economic Research, in his foreword to the interesting report on *Domestic Fuels in India* published by the Council in 1959, said that, "if the amount of dung burnt in India is used as manure, production of foodgrains can be increased by about nine million tons every year, which means that the loss in terms of fertilisers is roughly equivalent to burning 12 Sindries every year."

Stocks Heavy

In 1962, it may be noted here, the production of lower grades coal (IIIA and B) did not exceed ten per cent of the total output and coal was considered to be in acute shortage. The collieries producing such lower grades readily responded to the call for stepping up production, and the supply position improved greatly thereafter. The position today is, however, different. Explaining the position, the Association observes:

"This section of the coal industry (representing producers of lower grades), after having achieved the required production, finds itself facing a peculiar predicament arising from the so-called glut in the production of lower grades. This has assumed a proportion of serious threat not only to the economy but the very existence of the majority of the producers of lower grade coals. The pithead stocks lying at the collieries are the greatest cause of distress, besides various other liabilities and commitments hanging like Damocle's sword. In an all-out effort to respond most zealously to the nation's call for higher production, the industry made costly preparations like sinking new pits, constructing railway sidings, installing new machinery and plants necessary for increased production and thereby got involved in various financial commitments coming out of which, in the existing circumstances, seemed well-nigh impossible. The pithead stocks held by the lower grade coal producers are 2,808 million tonnes at the end of February 1964."

In this connection, the Association rightly stresses the supreme importance of conserving higher grade coals. Out of the estimated total deposits of 51,312 million tons of coal upto the depth of 4,000 feet, selected grades, we are told, form no more than two per cent and the medium coking and non-coking grades (grades I and II) account for seven per cent, whereas the so-called inferior grades constitute as much as 91 per cent. While the reserves of selected grades are thus small, the rate at which they are being consumed is pretty high. Out of the total consumption, these grades alone account for as much as 26 per cent, the share of medium and lower grades being 62 per cent and 2 per cent, respectively. This pattern of consumption certainly underlines, as the Association says, the necessity for a thorough recasting of the schedule of gradewise allocations for various industries and changing the very pattern of consumption on realistic basis in the light of the proved reserves. There have been numerous studies and examinations of the position of reserves in our country by various Committees appointed by the Government to ascertain the need to curtail production and consumption of coal of certain varieties and to encourage the utilisation of those grades the reserves of which are plentiful. All these studies have warned against consumption of higher grade coals for purposes where the lower grades could very well meet the demand.

Coal for Brick-burning

Pointing to another instance of the imbalance in coal consumption and resources, the Association observes:

"In a rising economy, the necessity of housing and building construction is great. Requirements of fuel for brick-burning as corollary to this part of the national programme cannot be ignored. While coals of lower grades can easily be used without any loss in efficiency for brick-burning purpose, Grade I coal was allowed to be used to the extent of 31.5 per cent of total supplies of coal under 'BRK' category during the year 1963 alone. The position has further worsened by the supply of washery middlings under priority class BRK—a regrettable fact which came to the notice of the Association in 1961 whereupon the matter was duly taken up with the Deputy Coal Controller (Distribution) and such movements had to be stopped. But the despatches of washery middlings began again for the second time during 1963 and the Association made telegraphic protests to the Coal Controller and sought the help of the Ministry of Mines and Fuel. Although this practice hit the lower grade coal producers hard, no final action seems to have been taken at Government level."

Transport Problem

A larger and wider use of lower grades coal in industries, brick-burning and for domestic purposes presupposes the availability of adequate transport facilities. The Colliery Owners Association is quite aware of this fact, as witness its plea for a speedy revision in the overall system of transport. Severely criticising the way in which the Railways are handling coal transport, it observes:

"Railways are the principal carriers of coal and coke and their irreconcilable attitude imposing restrictions of various kinds on the movement of coal/coke under the plea of rationalisation, even when wagons are available in plenty, still persists. It really does not stand to reason how unflinching restrictions under the name and style of rationalisation are considered expedient now. Substantial demands for these coal/coke are going unsatisfied for years together, while pithead stocks of these grades are mounting in the collieries. With the onset of relaxation of distribution of soft coke and coals of Grade II and below with effect from 1st July 1964, the hardships on account of heavy demurrage imposed upon collieries on the basis of programmes prepared by the Coal Controller prior to the measure of present decontrol set in have suddenly registered a steep rise. While collieries are ignorant of the wagons arriving at their sidings under the Coal Controller's programmes, Railways continue to honour such programmes and the demurrage charges go on mounting for no fault on the part of the collieries."

The Government of India will do well to ponder the aforesaid observations and rationalise the production-consumption pattern of the different grades of coal. When the various expert studies have clearly revealed that the reserves of metallurgical coal are extremely limited, prudence demands that these reserves should be conserved for the use of expanding iron and steel industry. Such conservation can be easily ensured, if proper steps are taken to encourage larger and larger use of lower grade coal.

trust only genuine spare parts

No problems ! No worries
Problems always arise if you neglect your Jeep.
It works hard and long for you and may at times need certain replacements.
Factory approved spare parts guarantee a new life and maintain the excellent performance with minimum upkeep. Rely with confidence on genuine spare parts —only with them will you get complete satisfaction.

U.K.'S ECONOMIC EXPANSION SLACKENS

NOT AN UNWELCOME CORRECTIVE TO EARLIER RAPID GROWTH

By W. T. C. King
EDITOR OF "THE BANKER"

LONDON, *4th August*

THERE is now no doubt that Britain's rate of economic expansion, after rising sharply in 1963, has this year slackened significantly—as, indeed, it needed to do, if risk of a recurrence of excessive strains on productive resources was to be avoided. The rapid expansion last year, it may be recalled, was largely in response to a series of Governmental measures designed to boost demand, with the object of enabling the economy to take up the slack in utilisation of productive capacity, a slack that had accumulated in the aftermath of the abrupt disinflationary check administered in mid-1961. Precisely because the economy was last year meeting the increased demands upon it largely by a fuller utilisation of existing productive resources, total output could grow much more rapidly than would be possible when resources were fully employed, for then the safely sustainable rate of growth of output could not exceed the rate at which productive capacity was itself growing.

For this reason, the degree of stimulation applied in 1962 and 1963 was almost bound to prove excessive in the conditions of 1964, as the economy came closer to the practical limits of full employment. Accordingly, official tactics for the regulation of aggregate demand changed direction: at the end-February last, the Bank Rate was raised from 4 to 5 per cent, and six weeks later the Budget provided for increase in taxation to the extent of £100,000,000—measures that were intended to slow down the prospective rate of growth of demand to bring it into line with the maximum rate at which it was assumed that output could grow without any "overheating" of the productive mechanism.

Most unofficial commentators, as I recorded in this correspondence *at the time*, were indeed of opinion that the Chancellor's measures might not prove sufficient for this purpose. Now, however, although it is still too soon to gauge the full effects of the Budget, it appears that the economy has been slowing down more decidedly than had been expected—by the critics, if not also by the authorities. The statistical evidence, unfortunately, is not adequate to sustain any precise quantitative assessment, not at any rate over so short a period, owing in part to the difficulties of seasonal smoothing. But, if all the available pointers are considered together, they seem to show fairly conclusively not only that a material slackening has been taking place but that it started before the Budget.

National Income

The quarterly estimates of national income and expenditure issued at end-July show that, in the first quarter of this year, the gross domestic product, valued at constant prices, was 1½ per cent above the average for the two preceding quarters, equivalent to an annual rate of increase of 4 per cent, whereas that average for the second half of 1963 had been as much as 6 per cent above the low figure recorded for the first quarter of 1963 (when there was distortion of the smoothing estimates owing to the abnormally severe winter) and fully 5 per cent above the fourth quarter of 1962. (The averaging of the last two quarters of 1963 for purposes of comparison is considered necessary since the two alternative bases of estimation—on income data or on expenditure data—gave sharply divergent figures for the latter quarter, but the two sets of figures came into line again in the first quarter of this year, suggesting that the difference may have been largely due to discrepancies in timing.)

The impression of slackening emerges even more strikingly from the official index of industrial production, which covers approximately one-half of national output as a whole. The latest available index relates to the month of May, too soon to register any perceptible effects from the Budget. Yet that index, at 126 (1958=100), now shows no increase since January, after downward revisions of provisional estimates.

The index now figures at 126 for five successive months. Hence, even if three-monthly averages are taken as a guide (to avoid the distortions to which single month's estimates are prone), the latest three-month period shows an advance of less than 1 per cent per annum of the preceding three months, compared with 3¼ per cent per annum registered a month earlier (for the period February-April compared with November-January), and rates up to 10 per cent a year in the latter part of 1963. The index for manufacturing industry alone is, moreover, now shown as having actually dipped in March and April to 127, as compared with 128 in February, and to have merely regained this setback in May. On the three-month comparison, this index likewise indicates a rate of growth of under one per cent a year for the latest period.

F.B.I.'s Survey

Other evidence suggests that these indices of industrial production may be overstating the extent of the change in the pace of the economy. There are signs that business activity went on increasing in some measure not only through the period in which the production index had stabilised, from January to May, but also more recently.

This impression emerged in particular from the latest of the surveys of industrial trends conducted by the Federation of British Industries (F.B.I.). Of the industrialists responding to the questionnaire in June, 60 per cent reported a rise in output over the preceding four months, whilst only 7 per cent reported a fall, and those expecting output to go on rising in the next four months far exceeded those expecting a fall. In the course of a parliamentary debate at end-July, the Chancellor of the Exchequer, after referring to the slackening in the rate of growth, went on to say: "If one looks at the returns from industry, goes to the F.B.I. or talks to people in industry and business who know the facts and prospects, one learns the expansion is continuing, but continuing at a healthy rate."

As yet, it is not easy to match this evidence of deceleration of output with detailed evidence from the side of demand, but there certainly appears to have been a marked slackening in the most important sector of demand. The seasonally smoothed index of the value of retail sales dipped by one point in March, from its January-February peak of 112 (1961=100), rose to a new peak of 113 in April and held that in May. But this climb was wholly attributable to price changes. The index of volume dropped two points in May, to 104, as compared with the peak of 107 in January last, and the average for the latest three months, at 15, is below that for the first quarter of the year, and at the same level as that recorded for both the third and fourth quarters of 1963.

There also seems to have been some flattening of demands financed by hire-purchase. The level of outstanding debt on hire-purchase contracts first surpassed £1,000 million in April last, and then jumped to £1,024 million in May, the increase in both those months being larger than in the corresponding period of 1963. But the rate of growth of new hire-purchase business, by comparison with the higher levels established last autumn, is regarded as not much more than seasonal, and in household goods the May total actually showed a small drop on the year.

Consumers' expenditure as a whole, as measured by the quarterly national income and expenditure series, showed only a very slow growth, at constant prices, both in the first quarter of this year and in the fourth quarter of 1963: the rise in both those periods was at the rate of about 2 per cent per annum.

Investment of Capital Rising Fast

The fastest rising sector of demand early this year was, indeed, that of investment capital. Fixed investment, valued at constant prices, was fully 3½ per cent greater in the first quarter than in the preceding quarter, and 6 per cent above the average for the second half of 1963. The increase, as expected, was most marked in the public sector (up by 8½ per cent by comparison with the second half of last year), but private sector investment still reached its highest point since the all-time peak was touched in the third quarter of 1961. Investment in manufacturing industry which now accounts for about one-fifth of total investment, rose by 6½ per cent, as compared with the second half of 1963. Stock-building was also running at a high level in the first quarter of this year; the actual estimates suggest some reduction from the peak rate recorded for the fourth quarter of 1963.

Little statistical evidence is yet available of the course of investment in the second quarter of the year, but the general impression is that the rise has continued, and in the private sector may even have accelerated. The rate of placings of new orders in the heavy engineering industries up to May and in machine tools up to April suggests that there are good prospects of sustained expansion through the second half of this year at least.

Employment Still High

The trends in the labour market also imply that the general level of activity has continued to rise, if more slowly, up to mid-June. Unemployment was falling more than seasonally: in the three months to that date. The true rate of decline in the number of adult workers "wholly" unemployed was probably rather more than 7,500 a month. Only in the four weeks to mid-July was the fall less than seasonal—by 12,153, compared with a "normal" decrease of about 15,000. That was a welcome portent, for the total of all workers unemployed had been reduced by June to only 1.4 per cent of the labour force, with the ratio in districts of most intense demand for labour down to only 0.8 and even 0.7 per cent in July.

In spite of these low ratios—and in spite of the fact that notified vacancies remaining unfilled now exceed the total of unemployed—there have been comparatively few reports of severe shortages of labour. In June, the F.B.I. enquiry still showed industrialists, surprisingly, putting scarcity of orders above scarcity of labour as the factor most likely to limit their output in the ensuing four months. The labour supply, it should be noted, is now receiving its seasonal injection from school-leavers: the unemployment ratio normally reaches its lowest point of the year in July.

The Achilles' Heel

If the pressure on the labour market is, indeed, passing its point of maximum intensity, it is to be hoped that there may be some corresponding easing in the pressure for wage increases. These have been outrunning the long-run sustainable average rate, and the gap has lately seemed likely to widen. The tendency for incomes to outpace production and productivity is, indeed, the Achilles' heel of Britain's economy. Thanks to the drive for public education in the facts of economic life, this is a truth that is now widely recognised, but the remedy still proves elusive.

MECHANISATION OF SUGARCANE PRODUCTION

World sugarcane experts, who attended a four-day conference in England last week, studied one of agriculture's oldest problems—full mechanisation of cane production.

Delegates from more than 20 sugarcane producing countries attended the conference, which was being held at the Massey-Ferguson School of Farm Mechanisation near Coventry. Mr. J. W. Beith, Managing Director of Massey-Ferguson (Export) Ltd., said that he believed it was the first cane conference designed to deal on a global scale with all aspects—from ploughing and planting right through to delivery of cane at the factory.

Reviewing the current situation in the industry, Mr. Arthur Chapman Barnes, the conference chairman, said sugar was vitally important in the world's food economy. An average man's annual intake was equivalent to 1,000,000 calories. At present, this amount was produced by approximately one-tenth of an acre of sugarcane—compared to wheat flour which required seven times as much acreage, milk 20 times and beef 100 times as much land to raise the cattle. He said that world sugarcane production had risen from 18,255,000 tons in 1939-40 to 28,702,000 tons in 1962-63. "Despite this remarkable rise," he added, "the world market has reflected shortages by the spectacular fluctuation in prices, from the low figure of £19 15s. per ton in January 1962 to an all-time high of £105 in November 1963. It is a production position which calls for corrective measures. With other factors involved, the result is that the sugar industry has entered another phase of active expansion which requires more agricultural machinery and the application of efficient methods at all stages of production."

The situation at the present time, Mr. Barnes said, indicated a reduction of world stocks of sugar to a level which was inadequate. World demand for sugar was expected to be 21,000,000 tons more in 1980, requiring an additional area of 8,000,000 to 10,000,000 acres. He concluded: "Here, then, is a group of factors which constitutes a challenge of great magnitude to the commercial interests of many countries which must be resolutely met by determined action, especially by manufacturers of agricultural machinery on the one hand and by the sugar plantations on the other. It is clear that the future developments and continuing prosperity of the cane-sugar industry are heavily dependent on the complete mechanisation of the work concerned with the production of sugarcane in constantly increasing quantities."

SOUTH MADRAS ELECTRIC SUPPLY CORPORATION LTD.

CHAIRMAN, MR. K. A. P. VISVANATHAN, HINTS AT FURTHER EXPANSION

SPEAKING at the Twenty-fourth Annual General Meeting of the South Madras Electric Supply Corporation Limited, held at Tennur, Tiruchirapalli, on 14th August 1964, the Chairman of the Company, Mr. K. A. P. Visvanathan, told the shareholders that the progress of the Company last year was satisfactory. He revealed that the Company had decided to invest about Rs. 25-30 lakhs over the next 7-8 years on expansion projects. He observed that, for a brief spell from June to July 1964, the power supply position had been very unsatisfactory and that, following the Government's belated decisions to cope with the delay in the arrival of the south-west monsoon, considerable harassment was caused to the rural and urban consumers of domestic power. He, however, expressed satisfaction over the abundant supply of water in the reservoirs for the coming summer months.

The following is an extract from the Chairman's speech:

Please allow me to welcome you all to this twenty-fourth annual general meeting of the Company.

We are gathered here today under the gloom cast by the demise of our beloved Mr. Jawaharlal Nehru. As one of the architects of our freedom and then as our Prime Minister, from the time the country reached its independent status, he worked hard for improving the economic status of the ordinary individual and for conferring equality to all people. He succeeded in his objectives in no small measure. May we deserve his efforts and sacrifices and continue to work in his footsteps, to achieve his objectives and ideals.

Mr. Shastri

We are fortunate in having in Mr. Lal Bahadur Shastri a worthy successor to Nehruji. He has been acclaimed, the world over, as one who would follow Nehruji's footsteps, most sincerely and effectively. I am sure that in his efforts to bring economic happiness at home and world peace and amity all over, he will have the sincere co-operation and goodwill of every citizen of India.

Last year, the balance sheet and accounts of the Company could not be published on account of the prohibition imposed on the publication of such documents under the Defence of India Rules in 1963. I am glad to state that this prohibition has however been relaxed and hence the accounts of this year have been published. I believe you will share with us the gratification that our Company's affairs progressed very satisfactorily. Though the restrictions imposed under the Emergency have been relaxed, I would like to repeat my assurance to the Government, on behalf of all of you, that this Company's resources and services will always be available to the Government in any emergency.

Satisfactory Progress

Now, reverting to the specific affairs of the Company. As I said earlier, the progress all round has been satisfactory. Expansion in both rural and urban areas has been up to the usual budgeted schedules. In spite of our having given up large blocks of the area to the Electricity Board for development, demand for extension in the retained area, for both agricultural and domestic services, continues to be heavy.

The Company has decided to invest between 20 to 25 lakhs of rupees every year on such expansion projects, so that over the next seven to eight years we can cover the entire area entrusted to us, with electricity services.

We had an almost calamitous power position this year, from the beginning of June to the end of July. Due to late decisions taken by the Government on the imposition of restrictions, the mode of power regulation was very unsatisfactory and caused untold harassment to the rural and urban consumers of domestic power. I would request the officials of the Electricity Board to recognise the fact that the hydro-electric generation in this State is subject to vagaries of monsoon and, therefore, to take more timely and rational steps in regulating power supply to avoid such unpleasant situations.

I am however glad to say that the abundant, though late, rains are reported to have filled up the Kundah and Pykara reservoirs and that Mettur, Periar and Papanasam lakes are also receiving a full measure of water supply. This position, I am told, will ensure that, in the coming summer months, we will not be subjected to any anxiety on account of power restrictions.

Increased Dividends

The effect of this one month's power restrictions (that is, June-July 1964) will probably be reflected to some extent in the next year's account. This year, however, as you would have observed from the balance sheet, we have done very well with power sales at over 120 lakhs of rupees and with over 76,000 consumers. With the continually increasing demand for power, I believe this rate of growth will be kept up. Your Directors have recommended the payment of increased dividends on equities at 11 per cent for this year which, I hope, will be accepted by you. I also hope the same progress will continue in future.

To achieve this level of expansion and growth, the staff of the Company have contributed their best. I am sure they will every time strive to give their best for the consumers whom they serve.

This leads me to the Managing Agents, Messrs. Seshasayee Brothers (Private) Limited whose managing agency will end by 1st April 1965 and whose request for renewal of their managing agency has been commended to you by the Directors. Seshasayees need no further recommendation to you from me. Apart from the exemplary way in which they have managed the affairs of this Company, their contribution to industrial expansion in South India is well known to you. I heartily commend their continuance as Managing Agents as per their request. I am sure you will all wholeheartedly support this proposition.

I now move that the Directors' report, Auditors' report and the balance sheet as on 31st March 1964 and the profit and loss account for the year ended 31st March 1964 be approved and adopted.

Note:—*This does not purport to be the record of the proceedings of the 24th Annual General Meeting of the Company.*

4¾ PER CENT

MAHARASHTRA STATE DEVELOPMENT LOAN, 1976

ISSUE PRICE AT PAR

OPEN ON MONDAY, THE 24TH AUGUST 1964

The loan will be closed as soon as the total amount of Rs. 15 crores has been subscribed and in any case not later than the close of business on the 29th August, 1964.

The applications for the loan will be received at:—

(*a*) the offices of the Reserve Bank of India, Bangalore, Bombay (Fort and Byculla), Calcutta, Madras, Nagpur and New Delhi,

(*b*) the branch of the State Bank of India at Patna,

(*c*) the branch of the State Bank of Hyderabad at Hyderabad,

(*d*) the branches of the State Bank of Hyderabad conducting Government treasury work within the State of Maharashtra,

(*e*) the branches of the State Bank of India within the State of Maharashtra except at Bombay and Nagpur and at places covered by item (*d*),

(*f*) the Government treasuries and sub-treasuries in the State of Maharashtra at places not covered by items (*d*) and (*e*).

Full particulars can be obtained at any of the offices mentioned above.

IMPORTANCE OF AGRICULTURAL EXPORTS TO ECONOMIC DEVELOPMENT

Dr. Baidyanath Misra, M.A., A.M., Ph.D.

THE degree of unfavourableness in foreign trade is increasing in India in recent years. The imbalance in foreign trade was mild during the period of the first Plan when the tempo of development was slow to begin with. With the increase in the rate of industrialisation, the need for imports is rising and, therefore, the economy is facing greater adverse foreign balance. This process is likely to continue till the economy is in a position to generate sufficient internal resources for development, and to produce necessary capital goods and technical know-how which are necessary for transforming the economy from a traditional or transitional to an industrial one. Imbalance in foreign trade at the present stage seems, therefore, inevitable. As a matter of fact, if there is an attempt to increase the rate of growth, there will be greater unfavourableness in foreign balance. The economy will have to choose between slow progress and less unfavourable balance of trade or rapid progress and greater unfavourable balance of trade. The choice at the present stage seems to be in favour of the latter.

This does not, however, mean that there should not be any attempt to correct the imbalance in foreign trade. It is often said that unfavourableness in foreign trade is desirable for inducing rapid growth in an underdeveloped country. Harrod's equation of growth for an open economy, GwCr=S—B (where Gw stands for the warranted rate of growth, Cr for the required capital co-efficient, S for the fraction of income saved and B for the foreign balance) implies that, if Cr and S remain constant, the value of Gw varies inversely as B, or in other words, the warranted rate of growth of an economy falls as its foreign balance increases. It follows from this that a positive foreign balance is necessary for a developed economy where the saving propensity is so high that the warranted rate of growth exceeds the natural rate of growth and where a reduction in the warranted growth is called for in the interest of full employment. On the other hand, in the case of a developing economy where the saving propensity is low and the warranted rate of growth lags behind the natural rate, there is need to maintain, so it is argued, a negative foreign balance to develop the economy.

Multiplier Effects

The important defect in this argument is that a deficit in foreign trade balance may translate itself into a higher volume of consumption and prevent the growth of the economy. In fact, the fundamental role of foreign trade in the process of capital formation is whether the proportion of capital goods has increased as a result of foreign trade. If an underdeveloped country could not transform consumer goods into capital goods through foreign trade, the multiplier effects of unfavourable balance of trade cannot generate a process of growth and the physical transformation functions of foreign trade is always a difficult process.

It means that mere unfavourableness in foreign trade cannot generate growth. Further, even though it does, a developing country cannot afford to put up with a growing deficit for all the time to come. The ability to import will ultimately depend upon the capacity to export. Export promotion, therefore, remains crucial for all developing countries, as they are heavily dependent on imports of machinery, heavy equipments and other essential goods that are strategic to lifting the levels of productive investment for accelerated economic growth.

If exports are crucial for economic development, what kind of commodities should the underdeveloped countries export in order to earn foreign exchanges? There is no doubt that underdeveloped countries should diversify their exports and seek out for themselves the dynamic industrial commodities with rising demand trends and with higher income and price elasticities. Due to excessive dependence on primary commodities, the external balance of less developed countries was considerably accentuated by a steady deterioration in the terms of trade. The average price of goods exported by these countries in 1960 was about the same as in 1950, while the average price of their imports was significantly higher, resulting in the decline of the terms of trade by 9 per cent. As a consequence, the share of the underdeveloped countries in total world trade which was already low at one-third shrunk to one-fifth. The industrially developed countries and the centrally planned economies increased their respective share of world trade. The poor export performance of the underdeveloped countries in 1950's is also explained by low income elasticity of demand for food stuffs and high propensity to economise and substitute in the case of raw materials. For example, in the decade of 1950's, the volume of exports from the less developed countries rose at an annual rate of 3.6 per cent, as against 6.9 per cent of increase for the developed private enterprise countries and 10.7 per cent for the centrally planned economies. On the other-hand, under the momentum of plans of economic development, the volume of imports of the less developed countries rose at an annual rate of 4.6 per cent which was significantly in excess of the 3.6 per cent annual expansion in the volume of exports. The income elasticity of demand for imports from underdeveloped countries is presented in the following table:

Income Elasticity of Imports of the Industrially Advanced Countries from the Developing Countries

Commodity group	*Income elasticity*
Foodstuffs	0.76
Agricultural raw materials and ores	0.60
Fuels	2.87
Manufactured goods	1.24

(Source: *World Economic Survey* 1962.)

This means that underdeveloped countries should change the basic structure of their economy and thus transform the pattern of their trade so as to secure new opportunities in international trade. The fundamental factor for improving balance in trade is, therefore, creating a new type of economy which is different from the existing one. This does not seem to be an easy process. In the initial stage of development, improvement in trade balance could, therefore, be obtained only by increasing the exports of traditional commodities. There are three immediate reasons for this. First, these primary commodities account for well over four-fifths of the exports of less developed countries. In case of India, agricultural commodities form about 50 per cent of the total exports of the country. These are too important for India to be neglected. India should try to hold on to the present share of world exports for these traditional commodities. Our past neglect for traditional exports has reduced our share of world trade. For example, in jute manufactures, our share of world exports fell from 97 per cent in 1948-50 to about 76 per cent in 1958-60; in tea our share fell from about 50 per cent to 43 per cent over the same period; before the war, India normally supplied 45-50 per cent of world exports (excluding China) of groundnuts and groundnut oil (in terms of oil equivalent); but in 1958-60, India's share had fallen to 3 per cent. During 1948-50, both India and Japan accounted for about 11 per cent each of world exports of cotton textiles each; in 1958-60 Japan had managed to raise her share to about 18 per cent while India's fell to about 10 per cent. It is estimated that, if India's relative share of world exports of her principal traditional exports in 1958-60 had been the same as in 1948-50, the country's export earnings would have been higher by about Rs. 90-100 crores a year than they actually were. This clearly shows that export promotion of traditional commodities is too important to be neglected.

Deterrent Factors

Secondly, at this stage of our economy, we may not be able to increase the export of our new manufactures to a substantial extent due to growing emphasis on import substitution in other underdeveloped countries and the reluctance of the Western countries to be liberal in reducing their tariff barriers. Each and every underdeveloped country is trying to industrialise and get the advantages of economic growth. This is a deterrent factor to foreign trade promotion of manufactured commodities for any particular underdeveloped country. There is, again, the tariff policies of Western countries. In spite of their divergent levels, the customs tariffs of Western European Countries have three common features. First, they are low for primary commodities not competing directly with domestic production. Secondly, with some exceptions, tariffs increase at each stage from crudes to processed materials and from processed materials to finished products. Thirdly, there is a tendency for tariff rates to increase more in the transition from crude to processed materials than in that from processed materials to finished products. These features clearly indicate that the tariff structures of the West European countries have been so designed as to offer protection to their domestic manufacturing industries. It is, therefore, doubtful whether underdeveloped countries can hope to increase their exports of manufacturd goods, unless the Western Countries are persuaded to bring down their trade barriers substantially.

Finally, export surplus is crucially dependent on the trends in internal production. For example, export drive can be effective only if the economy responds to incentives thereby establishing and increasing exportable surplus at short notice so as to take advantage of increased foreign demand. It is quite possible that agricultural productivity could be increased by introducing various simple technological innovations within the frame work of existing labour-intensive methods of production and with a minimum capital investment. There is an existence of technical base in the agricultural sector and farm output and productivity could be exploited by techniques that rely mainly on the use of resources that have low opportunity cost. This is the greatest advantage of agricultural exports for promoting economic development in the country.

Land reform will be the subject of a three-year study by Professor M. L. Dantwala of the University of Bombay. The project will be financed by a grant of Rs. 236,500 from U.S.-owned rupees generated by the Food-for-Peace Programme in India. It calls for an evaluation of the impact of land reform in the Western region of India, on the structure of land holdings and farm production potential. Involved will be the principal social and economic issues, a study of the impact on responses of farmers in regard to long-term investment and adoption of improved farming techniques, and to evolve an appropriate methodology for land reform research.

Announcement

This is not a Prospectus but only an announcement of the proposed issue of capital, persons interested may obtain copies of the Prospectus from the Company's Registered Office, Bankers, Brokers and Underwriters

THE MYSORE ELECTRO CHEMICAL WORKS LIMITED

(INCORPORATED AS A PUBLIC LIMITED COMPANY UNDER THE MYSORE COMPANIES ACT, 1938)

Registered Office : Rajajinagar, Industrial Suburb, Yeshwantpur, Bangalore-22. *Postal Address:* P.B. No. 1022, Malleswaram, Bangalore-3.

Collaborators : M/s. ACCUMULATORENFABRIK SONNENSCHEIN G.m.b.H., West Germany. M/s. SEMPERIT, Vienna, Austria.

EXISTING AND PROPOSED ACTIVITIES OF THE COMPANY

The Company is already manufacturing various types of Storage Batteries for Motor Cars, Trucks, Forklifts, Motor Cycles, and Scooters and for Defence Services etc. under the name and style of " MEC " Batteries.

The quality of the Batteries manufactured has satisfied rigorous consumer standards and has been approved by the Indian Standards Institution.

By reason of the considerable increase in the demand for Storage Batteries in various fields including Defence and Communication requirements of the country, the Company has launched a programme of expansion of its present capacity to manufacture various types of batteries. Apart from the manufacture of the Automobile Batteries, Traction Batteries, Heavy Duty Batteries, Aircraft Batteries, Stationary Batteries etc., the Company will also be taking up the manufacture of specialized batteries for Electronic Flashes, Transistorised and Electronic Equipments and Wireless Sets.

With the completion of the expansion scheme the Company will also be self-sufficient with regard to the requirements of Hard Rubber Containers and Lead Oxide which are now being procured from other sources.

The expansion and development of Road Transport, Railways, Telegraph and Telephone Systems and Electronic Equipments in our country under the Five-year Plans has enlarged the demand for Storage Batteries of various sizes and descriptions. The requirements of the Defence Department have also increased considerably. The prospects for export of batteries are also very bright. As such the Directors of the Company have every hope that under the present arrangements made for the expansion of the factory with West German collaboration the Company will be able to earn sufficient profits in a short time and pay reasonable dividends to the shareholders early.

LOCATION OF THE FACTORY

The factory is situated in the fast developing area of the Industrial Suburb of Rajajinagar, Yeshwantpur, Bangalore. The Company has necessary land in possession for the proposed expansion.

SHARE CAPITAL

AUTHORISED CAPITAL:

	Rs. P.
1. 10,000—9.3% Redeemable Cumulative Preference Shares of Rs. 100 each	10,00,000.00
2. 3,65,671 Equity Shares of Rs. 10 each	36,56,710.00
3. 68,658 " A " class Equity Shares of Rs. 5 each ..	3,43,290.00
Rs.	50,00,000.00

ISSUED AND SUBSCRIBED CAPITAL:

	Rs. P.
1,00,000 Equity Shares of Rs. 10 each	10,00,000.00

PAID-UP CAPITAL:

68,658 Equity Shares of Rs. 10 each reduced to Rs. 5 each	3,43,290.00

PRESENT ISSUE:

(i) 2,00,000 Equity Shares of Rs. 10 each	20,00,000.00
(ii) 5,000—9.3% Cumulative Preference Shares of Rs. 100 each (Subject to Tax)	5,00,000.00
Rs.	25,00,000.00

Out of the present issue, the 5,000—9.3% Redeemable Cumulative Preference Shares of Rs. 100 each are set apart for allotment in favour of Messrs. Accumulatorenfabrik Sonnenschein G.m.b.H. of West Germany, the Technical Collaborators of the Company.

1,00,000 Equity Shares of Rs. 10 each will be allotted to the Directors and their friends.

THE BALANCE NOW OFFERED AT PAR FOR PUBLIC SUBSCRIPTION:

1,00,000 EQUITY SHARES OF Rs. 10 EACH.

TERMS OF PAYMENT

On application—Rs. 5 per share. On allotment—Rs. 5 per share.

THE EQUITY SHARES HEREIN OFFERED FOR PUBLIC SUBSCRIPTION ARE FULLY UNDERWRITTEN BY INDUSTRIAL FINANCE CORPORATION OF INDIA, NEW DELHI.

APPLICATIONS

Copies of the application forms and Prospectus can be obtained from the Registered Office of the Company or from the Brokers, Bankers and Underwriters listed herein.

LOAN CAPITAL

The Mysore State Finance Corporation has been pleased to sanction a loan of Rs. 14.30 lacs to meet a part of the Capital requirements of the expansion project of the Company.

TECHNICAL COLLABORATION

The Company is already having Collaboration arrangements with Messrs. Accumulatorenfabrik Sonnenschein G.m.b.H., West Germany, for both technical collaboration and participation in the Company's Share Capital. Messrs. Accumulatorenfabrik Sonnenschein G.m.b.H. are a leading firm of Battery Manufacturers in West Germany for more than 50 years and have considerable experience in the manufacture of various types of Lead Acid Storage Batteries and Accumulators of special types—such as those used in Electronic Flashes, Transistorised and Electronic Equipments, Wireless Sets etc. They now operate two large Factories in West Germany. They enjoy a very strong domestic market and export their products to more than 100 countries.

They have agreed to subscribe for the full issue of Preference Capital, partly by supply of machinery and partly in cash.

Further, the Company has also received Government of India's sanction for entering into an agreement with Messrs. Semperit, Austria for technical collaboration to manufacture Hard Rubber Containers for batteries. Messrs. Semperit are well-known Manufacturers of Tyres and Battery Containers, in Europe.

NEW PRODUCTS AND PROCESSES

Shatter-proof Mirror

A VERY lightweight, virtually unbreakable mirror has been manufactured by Ward Brooke and Co., High Wycombe, Bucks. The basic material is polyester film, only 0.0005 inch thick. It is coated on one side with a vacuum-deposited film of aluminium and mounted with the metal so that the reflecting surface is protected from damage. The thinness of the material prevents condensation, since the surface instantly assumes the temperature of the impinging moist air. A crisp image with no sign of distortion or chromatic aberration is given. The material weighs about one-fifth as much as comparable glass mirrors.

Easy Threading of Conductors

Inserting cables through twisting or angled protective tubing, often a nightmarish job, has been neatly solved by the German firm, W. Hegler. All plastic reinforced conduit made by the Company has a draw-wire already fitted, so that even thick cables can easily be pulled through from one end. Each reel of conduit has about three feet of spare draw-wire at each end, so that lengths can be cut off without losing the draw-wire.

Discovering Counterfeit Notes

A way of examining bank notes so that even the most cleverly produced counterfeit ones are detected has been patented by the Automatic Canteen Co. 1430, Merchandise Mart., Chicago, U.S.A. Notes of the same denomination are mounted in a machine which directs a light on to one side of them as they pass through. The light passes through the paper in a certain fixed pattern for a genuine banknote, but in a slightly different pattern for a counterfeit note. Counterfeit notes are automatically rejected. The Company says the machine can be adapted for the separation of cheques, stubs, tickets and other partly transparent plastic or paper items.

Polishing Lenses

High precision and high output are the main claims made for a Belgian machine for grinding down and polishing lenses for spectacles and other optical equipment. The machine is used for operations subsequent to the initial 'roughing' process, and produces surfaces accurate to 0.01 to 0.02 of a micron (micron is one millionth of a metre). Grinding down of a 50 to 51 mm. diameter lens is stated to take three minutes and polishing five minutes. It is being manufactured by Optibel, 150-160, Rue Jolly, Brussels, Belgium.

Automatic Tin and Jar Filler

Gunther and Walker of Pfaffikon, Switzerland, has developed a fully automatic machine for filling tins, jars and other rigid containers with free-flowing products in powder, granular or crystal form. A similar machine is available for small tablets. It can be set to give an accurate filling of any weight between 0 and 2 lbs. to within plus or minus 1 or 2 grammes, depending on the character of the product. It can be linked to a main storage silo and supplied as a complete installation. Containers of various sizes and capacities can be filled by the same machine, and containers of differing diameter, or totally different design can be accommodated by use of spare sets of conveyor parts. The firm is represented in the U.K. by the Central Engineering Co., Colquhoun House, 27-37, Broadwick Street, London, W. 1.

Tyre Pressure Gauge

Gauges permanently mounted in hub caps are available in the U.S. for lorry owners wishing to keep constant watch on tyre pressures. Supplied by the Berg Manufacturing Co., 333, East Touhy Avenue, Des Plaines, Illinois, the devices can also be used to equalise pressures between the tyres on twin wheels.

Water-resistant Leather

An emulsion that is claimed to give tanned leather outstanding water-resistant properties while keeping it soft and supple and dry to the touch, has been formulated by Farbenfabriken Bayer A.G., of Leverkusen-Bayerwerk, Germany. The leather is soaked in the solution for about 72 hours and then taken out, hung up to dry and dressed in the usual way. Rubber can be vulcanised to it without any difficulty.

Dismountable Steel Cupboards

A dismountable steel cupboard, suitable for use in factories, hospitals, workshops, stores, offices, etc., is being marketed by A. H. Korthof N.V., Postbus 5162, Amsterdam (Holland). The cupboard consists of two, three or five sections, each with a door. Ventilation slits have been pressed into the doors at the top and bottom. The rear wall is flat, so that the cupboards are particularly suitable for making separating walls to, say, partition off a changing or washing area in the corner of a large room or hall.

The cupboards can also be supplied with a sloping top and mesh doors, and with or without legs. In the latter case they are placed directly on the floor. Extras, such as special locks, can be supplied on request. As the cupboards are dismountable, they require little storage space. For despatch purposes, a special packaging was designed for the cupboards, resulting in a considerable saving in freight costs.

Saving Time on Road Works

Developed by a British firm is an adhesive agent, which if dissolved in hot bitumen or tar considerably cuts the time taken for these binders to adhere to wet road surfaces and chippings. The secret behind the additive is that while it is soluble in organic solvents it is quite insoluble in water. Another advantage is that inclusion of the additive protects the road surface against the stripping which may occur later as a result of gradual moisture absorption in the aggregate, or because of the action of frost. The additive, "Stearine Amine," is an organic crystalline product which melts at 120°F.

Spool for Winding Thread

For winding thread, wire and other materials, Gebrs. Franken Rondcartonnage N.V. Willem Fenengastraat 13, Amsterdam-O., (Holland) has brought out a spool consisting of two plastic flanges and a cardboard tube. Each plastic flange is provided with a shank ribbed with barbed hooks. The spool is assembled by pressing a plastic flange with its shank into one end of the fibre cylinder. The barbs on the shank ensure that the flange is very securely anchored in the fibre tube and that rotation is out of the question. The spool can be made of various widths by selecting tubes of different lengths. Advantages of this spool are that the smooth surface of the plastic flanges eliminates thread rupture or damage to the material to be wound. Furthermore, the tube fits so snugly up against the tube that there is no opening or groove between the two parts in which the thread could stick. The flanges do not wobble during winding; they are accurately centred and are exactly at right angles to the tubes. Since the flanges are flat the spools can be stood on end without wobbling. In addition, the plastic flanges can be made in a variety of colours and printed with letters, embossed or engraved. As the spool consists of three separate components that occupy very little space, this new product works out very cheap in both storage and transport.

Process for Fertiliser Manufacture

A process, developed by the Scottish Agricultural Industries Ltd., reduces to a single stage the production of agricultural fertilisers in hard, dry, spherical granules of uniform size. Each granule, a complete and balanced plant food in itself, is built up layer upon layer, rather like onion skins, in two revolving drums of a recycling system, and the chemical energy liberated as heat during the process is used to evaporate all the water present. The interaction of sulphuric, nitric and phosphoric acids with ammonia produces the constituents of the granules, and potassium salts are added to form a complete synthetic fertiliser.

The uniformity of the granules' shape and size makes for an even pattern of distribution, and since they contain less inert matter they are more concentrated. The fertiliser is available in two forms—one with a high potash content and the other with a high nitrogen content.

Colour Prints

A Swiss industrial firm in Basle has found a new process for obtaining colour prints from diapositives. The colours do not fade and are perfect in tone. This new process renders it feasible to market non-fade prints vastly superior to the ephemeral ones produced by the traditional methods of reproduction.

Plug and Socket

A new type of plug and socket for electrical connections, which has recently been developed by a Swiss firm, can carry currents exceeding 10 amperes. The smallest model of the plug, 2.3 mm. in diameter, suffices for a load of 25 amperes. One that is 35 mm. in diameter can carry 1,000 amperes, and certain of the 100 mm. models are intended for currents of 4,000 amperes.

Hypodermic Syringe

A new hypodermic syringe made entirely of glass with a removable tip has been evolved by a Swiss firm. Its chief advantage lies in its robustness. Also, in case of damage, only the cylinder, which is quite cheap, need be replaced, for tip and cylinder are separate. Up till now, it had been the practice to solder a metal tip to the cylinder. Finally, the new syringe is easy to clean. As there are no soldered joints, the risk of contamination is reduced.

Top-loading Balance

A Swiss factory has made new top-loading balance. This balance has a range from 0 to 120 grammes, and an accuracy of ± 3 milligrammes. It thus, fills the gap between the existing top-loading balances and the ordinary analytical balances. It is simple and very rapid to operate. Moreover, a special viewing device allows the operator to keep the moving scale under continuous observation. This does away with the tiresome pauses that were necessary up till now when measuring out the substance to the weighed.

Table Clock

A table clock showing the time all over the world in a new way has just been placed on the market by a Le Locle watch factory. The clock is round 12 inches long and 7 inches high. Its face, showing local time, is superposed on twenty-four spindle-shaped sections of the globe. An aperture at the base of each spindle gives, for that part of the world, the time corresponding to the local time shown on the clock face.

NIMAR TEXTILES LIMITED—*(Continued)*

MANAGING AGENTS

M/s. NAV AGENCY PRIVATE LIMITED, Sylvester Building, 1st Floor, 20, Old Custom House Road, Bombay-1.

UNDERWRITERS

1. INDUSTRIAL FINANCE CORPORATION OF INDIA, Reserve Bank Building, Parliament Street, New Delhi-1.
2. LIFE INSURANCE CORPORATION OF INDIA, "Jeevan Kendra," Jamshedji Tata Road, Bombay-1.
3. THE INDUSTRIAL CREDIT & INVESTMENT CORPORATION OF INDIA LIMITED, 163, Backbay Reclamation, Bombay-1.
4. MADHYA PRADESH FINANCIAL CORPORATION, Shiv Vilas Palace, Indore-2.
5. THE ORIENTAL FIRE & GENERAL INSURANCE CO. LTD., Oriental Buildings, Mahatma Gandhi Road, Bombay-1.
6. DEVKARAN NANJEE BANKING CO. LTD., 17, Horniman Circle, Bombay-1.
7. SHRI L. K. PANDAY, Kilachand Building, 45/47, Apollo Street, Bombay-1.

BANKERS TO THE ISSUE

1. STATE BANK OF INDIA,
Apollo Street, Bombay-1,
and at their Main Branch Offices at Ahmedabad, Bangalore, Baroda, Bhopal, Calcutta, Delhi, Gwalior, Hyderabad, Indore, Jabalpur, Kanpur, Khandwa, Madras, Nagpur, New Delhi, Poona, Rajkot and Surat.
2. DEVKARAN NANJEE BANKING CO. LTD.,
17, Horniman Circle, Bombay-1,
and at their Main Branch Offices at Ahmedabad, Bangalore, Baroda, Bhavnagar, Bhopal, Calcutta, Delhi, Hyderabad, Madras, Nagpur, New Delhi, Poona, Rajkot and Surat.
3. THE BANK OF INDIA LIMITED,
Mahatma Gandhi Road, Bombay-1,
and at their Main Branch Offices at Ahmedabad, Bangalore, Baroda, Bhavnagar, Bhopal, Calcutta, Delhi, Gwalior, Hyderabad, Indore, Jabalpur, Kanpur, Madras, Nagpur, New Delhi, Poona, Rajkot and Surat.
4. THE CENTRAL BANK OF INDIA LIMITED,
Mahatma Gandhi Road, Bombay-1,
and at their Main Branch Offices at Ahmedabad, Bangalore, Baroda, Bhopal, Calcutta, Delhi, Gwalior, Hyderabad, Indore, Jabalpur, Kanpur, Madras, Nagpur, New Delhi, Poona, Rajkot and Surat.

BROKERS

Bombay

8. M/s. P. ROY & COMPANY, 3/8, M. M. Road, Jn. Panchkuin Road, New Delhi-1.
9. M/s. HARBANS SINGH MEHTA & CO., 33, Regal Building, Parliament Street, New Delhi-1.
10. M/s. RAJ PAUL CHADHA & CO., Delite Cinema Building, Asaf Ali Road, New Delhi.

APPLICATION FOR SHARES

Application forms alongwith copies of the Prospectus can be had from the Registered Office of the Company or from the Underwriters, Bankers, Brokers, named hereinbefore.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF THE BANKING HOURS ON FRIDAY, THE 28TH DAY OF AUGUST 1964 AND WILL CLOSE AT THE CLOSE OF THE BANKING HOURS ON THURSDAY, THE 10TH DAY OF SEPTEMBER, 1964, OR EARLIER AT THE DISCRETION OF THE DIRECTORS BUT NOT EARLIER THAN THE CLOSE OF THE BANKING HOURS ON TUESDAY, THE 1ST DAY OF SEPTEMBER, 1964.

BRITISH AIRCRAFT INDUSTRY AT THE CROSSROADS

PROBABLE FUTURE TRENDS

By Our Civil Aviation Correspondent

THE Farnborough Air Show, now a biennial function, is a time-honoured fixture in the aeronautical calendar. This year's show, to be held, as is customary, in September, will be as entertaining and as interesting, no doubt, as ever. For the hosts, however, and particularly for the major manufacturers of aircraft, it will be, one imagines, an occasion for some anxiety. To imply that the British aircraft industry is approaching those allegorical 'crossroads' so beloved of journalism is, perhaps, to over-dramatise the situation. Nevertheless, the turn of events over the past two years has been none too favourable.

Take the case of the VC-10, for example. A few short months ago, and accompanied by an almost unprecedented fanfare of publicity, this new, second generation, long-haul jet was launched by B.O.A.C. on its U.K./Africa routes. The aircraft, by all accounts, is doing extremely well. Passengers have reacted favourably to its exceptionally quiet, roomy, and comfortable cabin. Operationally, the aircraft has proved to be singularly free from "teething troubles" and is achieving a high daily utilisation. An excellent start, one would surmise—yet most, if not all, of the high potential value of a successful debut has been dissipated by an unfortunate domestic storm centred round B.O.A.C. and the Super VC-10.

The story of this particular controversy is now fairly widely known. To recapitulate, B.O.A.C.—to whose specifications the aircraft was designed—placed an initial order for 12 VC-10s and 30 Super VC-10s. That was two years ago. However, B.O.A.C.'s recently appointed Chairman, whose brief, apparently, is to make the Corporation pay, has come to the conclusion that not only did his predecessor in office order too many Super VC-10s but that, as compared with the Boeing 707, the Super VC-10 will be uneconomical to operate. In accordance with those conclusions, he expressed an intention to cancel the entire order and to purchase, in lieu, an additional seven Boeing 707s.

In the interests of the British aircraft industry, the Chairman's plan was set aside. B.O.A.C. is to take 17 of the 30 Super VC-10s ordered. Politically speaking, that was probably as good a solution as any other. From the industry's point of view, however, it is little short of disastrous. How very unfortunate, too, that the whole episode was staged, as it were, *in coram populo*. The fact is, of course, that, even if the Super VC-10 is marginally less economical than later versions of the Boeing 707, it has compensatory features. In the long run, these may well offset its higher break-even load factor. It would be less than realistic to suppose, however, that these events have enhanced the aircraft's value in the eyes of foreign operators.

Most unfortunate of all, perhaps, is the timing of this purely domestic controversy. It comes at a time when not the VC-10 alone but other British second generation jets are engaged in a world market where opposition has seldom been so formidable or competition so ruthless. There is the B.A.C. One Eleven, for instance, a short-medium haul jet built by the same firm as the VC-10. The One Eleven was the first jet in this particular field and achieved considerable initial success—including sales in the American domestic market. It has, in fact, netted 64 sales to date. Latterly, however, its prospects have somewhat faded. It is faced with intense competition not only from the Boeing 737, the most recent entry in the field, but also from the Douglas DC-9. This latter aircraft, incidentally, has just secured a large and important order from T.W.A.

Another British venture is the De Havilland "Trident." This aircraft was more or less designed to the specifications of British European Airways and is now in operation with that Corporation. To date total orders for the Trident amount to only 32—a figure obviously very far removed from the number which De Havillands must sell to recover the development costs. The Trident's most formidable rival is the Boeing 727 which, backed, of course, by the large American domestic market, has already received in excess of 140 orders. To make matters still more difficult, Sud Aviation has embarked on the Galion, an improved version of the famous Caravelle. This aircraft also comes into direct competition with the Trident.

The British engine manufacturers—represented by such world-famous firms as Rolls Royce and Bristol-Siddeley—are in a somewhat different category and, as yet, have little to fear from world competition. It is the aircraft industry *per se*—and that includes the many scores of firms who manufacture aircraft systems, components, and accessories—which, to use a common idiom, is "out on a limb." The two British air corporations and a few independent air companies cannot absorb a tenth of the aircraft industry's products. Yet, in order to secure initial orders of any size, British aircraft have often to be designed to the specifications of one or other of the two Corporations. This is to have the worst of both worlds. Such aircraft are not necessarily the most suitable for the world market, yet it is in the world market that they must sell.

There are those who see in this increasingly difficult situation the looming of crisis and the necessity for fundamental changes in the composition and policies of the aircraft industry. In their view, if the United States is not eventually entirely to monopolise the aircraft market, the time has come for the British industry to regroup and to concentrate on fewer projects backed by greater resources. They advocate, too, co-operation, rather than competition, with the growing aircraft industries of Western Europe. There are no lack of indications that the latter policy may be quite actively pursued. Most obvious, of course, is the Anglo-French Concord, involving major units of the British and French industries. In addition, there is collaboration on space projects and several joint ventures in respect of military aircraft are mooted.

And so, back to Farnborough. This is the shop-window of the aircraft industry—and the primary objective of a shop-window is to sell the goods. There will be many thousands of overseas visitors, including top representatives of air forces and airlines from all parts of the world. It will be a colourful occasion, but, as never before perhaps, with the accent firmly on commerce. Success this year will be judged not on the size of the attendance, not on the brilliance of the military flying, not even on the vagaries of the fickle British weather, but solely on the size of the order books obtained.

BRITISH ENGINES FOR GERMAN VERTICAL TAKE-OFF PLANES

Rolls-Royce are to supply the turbojet engines for a second West German experimental vertical take-off and landing (VTOL) aircraft. This follows collaboration between the British firm and the German aero-engine firm M.A.N. Turbomotoren in producing the engines for the first West German experimental VTOL aircraft, the V.J. 101-C/X1, which achieved transonic speeds for the first time during tests recently. A spokesman for Rolls-Royce said that the second aircraft, to be known as the V.J. 101-C/X2, would have the same RB145 engines as the first aircraft, but that they would be equipped for reheat. He said that it was hoped by this means to achieve higher supersonic speeds.

Two of the 65 BAC 1-11 short-haul jet airliners now on order will go to executive users, according to its manufacturers, the British Aircraft Corporation. One of the aircraft is for a "large industrial undertaking in the United States," and the other is for the German chain-store company Helmut Horten. The 1-11, which is fitted with two rear-mounted Rolls-Royce Spey jet engines, cruises at about 540 m.p.h.

The K.C.P. Limited of Madras, which has entered into an agreement with the Industrial Development Corporation of Orissa Ltd. for the supply and erection of a 1,200-ton-per-day cement plant at Bargarh in Sambalpur district, has made very good progress in the manufacture and despatch of the major part of the machinery for the project. Roughly two-thirds of the machinery and equipment are of indigenous origin, the balance being imported from France. About 1,100 tons of imported machinery and equipment landed in Madras harbour this week. The fabrication of the remaining indigenous machinery is going on in full swing in the workshops of the K.C.P. Ltd. in Madras. The cement factory at Bargarh is expected to go into production by the end of 1965

ECONOMICS OF BIG IRRIGATION PROJECTS

SOME POINTS ANSWERED

Mr. S. Ramayya, a retired Accountant General, who had contributed a series of three articles on the subject, writes:

"MR. R. A. Deshpande from Bangalore has raised certain points on my articles on the "Economics of Big Irrigation Projects" (*vide* page 153, *Commerce* dated 25th July 1964). I am replying to them below. At the outset I may mention that the three articles published in *Commerce* of 28th September 1963, 20th June 1964 and 27th June 1964, respectively, have to be read together, since there is an undercurrent of basic ideas running through all of them.

"Mr. Deshpande starts agreeing with me that major projects of over Rs. 10 crores should be taken over by the Centre. If my article in *Commerce* of 28th September 1963 is perused, it will be clear that the argument hinges on the fact of the very poor additional national output by such huge investments and that States will be hard put to find enough of additional revenues to pay for both maintenance and the interest charges on the loans mainly got from the Centre. The question arises whether it is worthwhile even for the Centre to start such projects in future. The trend of recent thinking in the Centre, as seen from recent news in the papers (*vide* the *Hindu*, dated 19th July 1964) is to discourage huge projects and encourage more and more only medium types, the same idea which I have been stressing.

"The second point raised is that a Rs. 150-crore project cannot be a purely irrigation project, but a multipurpose one with a combination of hydro-electric production and/or flood protection. I can assure the correspondent that I have taken the figures from an actual case with which I was intimately associated till recently. It is a huge irrigation project with some idea of possible generation of power in a so-called second stage. As conceived at present, its objective is only irrigation and its cost will be easily of the order of Rs. 150 crores. The benefit from flood protection, being not appreciable, will not affect the fundamental figures.

"If a particular project of Rs. 150 crores includes a hydro-electric scheme, we should proceed in a different manner. This is a case of joint cost and we first allocate separately the cost of investment in irrigation and then the cost of investment in hydro-electricity by the usual principles in such cases. Then, we can proceed to evaluate the result by aggregating the public sector outlay and the private sector investment in each case and comparing output and judge. As I have argued in the articles, the power project may evoke greater private sector investment and it may be very paying from the national point of view. The irrigation side may not be worthwhile. We can then combine both and see the result and then compare it with a purely power project, say, a thermal one. Anyhow I am here confining myself to a simple actual case of an irrigation project only.

"Mr. Deshpande wants to put a figure of Rs. 80 crores as net national output with a possible two crops. The intention of this project, if I remember aright, is only one main crop, that is, paddy. Leaving aside this question of fact based on water storage and crop planning, a little refined calculation, even on the basis of a double crop, will not show much of a difference from my Rs. 50 crores. The Rs. 50 crores, I took as a good approximation, on a gross output in 2 million acres, with half ton per acre, on a single crop of paddy with Rs. 500 per ton, based on existing price levels, and with existing techniques of production. *The net national output* naturally excludes the raw materials used in production like seeds, manure and fertilisers outside farmyard product and the depreciation on the investment of the peasant. This depreciation is easily Rs. 500 per annum on five acres, or Rs. 100 per acre. Consequently from the gross Rs. 50 crores, Rs. 20 crores intermediate product (2 million×100) should be deducted for these items, leaving a net output of Rs. 30 crores only.

"The other point is that we are not bringing virgin land under cultivation. Already in the region (as elsewhere in India), the 2 million acres are cultivated in some sort of way, with rain water, small tanks rivulets, etc., and they must be producing at least Rs. 10 crores net. *Since we are considering additional net output on the new investments only* and even taking the figure of Rs. 30 crores of Mr. Deshpande for the second crop, *the net national output for the investment will not exceed Rs. 50 crores*, i.e., the new Rs. 30 crores production *plus* the extra (30-10), i.e. Rs. 20 crores—50 crores.

"Mr. Deshpande puts the cost of permanent investment by the peasantry at Rs. 200 to Rs. 250 an acre. I am afraid this is rather on the low side. I have seen the region and large portions are full of rock and are very uneven. We should not forget the other factors. If a peasant and his family and possibly an odd labourer now and then with a five-acre holding is going to start cultivation with new irrigation water, he has to invest in lots of other things also. Five acres require at least two pairs of bullocks and one or two carts. He has to purchase better ploughs and implements. Greater investment in housing for himself and his labourer, if any, may be necessary with additional farmyard space. These will easily cost over Rs. 2,500. The other work of bundling, levelling, etc., may cost, even according to Mr. Deshpande, Rs. 1,250 for five acres, in all Rs. 3,750. On a conservative estimate, I had put it at only Rs. 750, while some technical officers have told me that it might easily go up to

(*Continued on page 337*)

TRENDS IN WORLD GOLD PRODUCTION AND DISTRIBUTION

SHARE OF NON-MONETARY USES STILL HIGH

FOR the tenth successive year, world production of gold, excluding the output in the U.S.S.R., Communist China and other countries of the Red bloc, increased in 1963. The rise was of the order of 4.6 per cent, bringing the total to 38.9 million ounces, the highest annual figure touched so far. At the U.S. price of $35 per fine ounce, the value of gold produced in 1963 works out to $1,360 million, as compared with $1,300 million, in 1962, $1,215 million in 1961 and $1,178 million in 1960. These figures have been taken from the annual report of the International Monetary Fund (I.M.F.) for 1964, which, as usual, provides a comprehensive picture of gold production, distribution, reserves and trend of prices.

South Africa again led the gold producing countries in 1963 with its output of 27.4 million ounces, equivalent in value to $961 million. Representing about 70.6 per cent of world production, South Africa's production in 1963 was the highest on record so far. While output in Ghana increased by $1 million, in Japan, Mexico, and Southern Rhodesia, the increase was much smaller. In Canada, the United States, Australia and Columbia, the downward trend in gold production witnessed in the last few years, continued in the year under review also. In Canada, the second largest gold-producing country (excluding U.S.S.R.) in the world, the output in 1963 was no more than $139 million, as compared with $162 million in 1960. During the same period it fell from $55 million to $53 million in the U.S. and from $38 million to $36 million in Australia. In India, too, the production decreased by $0.9 million to $4.8 million as compared with 1962. The table below shows the trend of production in the principal countries over the years 1940-1963:

Table I: *Value of World Gold Production** (In millions of U.S. dollars at U.S. $35 a fine ounce)

	1940	1959	1960	1961	1962	1963
South Africa	492	702	748	803	892	961
Canada	186	157	162	155	145	139
United States	170	57	59	55	55	53
Australia	57	38	38	38	38	36
Ghana	31	32	31	29	31	32
S. Rhodesia	29	20	20	20	19	20
Philippines	39	14	14	15	16	13
Japan	30	11	12	13	15	15
Columbia	32	14	15	14	14	11
Mexico	31	11	11	9	8	8
Congo (Leopoldville) ..	20	12	11	8	7	7
Others†	157	59	57	56	61	65
Total† ..	1,264	1,127	1,178	1,215	1,300	1,360

Source: International Monetary Fund, *International Financial Statistics*.
* Excluding the output of Sino-Soviet area.
† These figures include estimates for data not available.

It will be seen from the table above that gold production has more than doubled in South Africa since 1945. This growth is significant, because there has been no increase in the world price of gold which has remained pegged at the U.S. official price of $35 per fine ounce and the South African Government has been demanding an increase in this price on the ground that it is uneconomical and unremunerative. The main reasons for this expansion is the opening of new mines with rich reserves and adoption of new techniques of mining. Unlike some of the other producing countries, as, for instance, Canada, and Australia, the South African Government has not been providing any subsidy to its producers. It was only in April this year that it decided to assist some of its marginal mines by granting them unsecured loans. This financial assistance, which has the cocurrence of the Fund, is to be confined only for one year. Will the upward trend in gold production in South Africa continue in the coming years? By way of an answer to this poser, the I.M.F. report draws attention to the view of Transvaal and Orange Free State Chamber of Mines that the country would reach its peak output in 1964 or 1965 and that, thereafter, production might level off for a few years, and subsequently decline because of the closing down of the older and marginal mines, which cannot employ the new techniques used in conjunction with concentrated mining.

On the position of gold in Russia, the I.M.F. review has this to say:

"During the period under review, bad harvests forced the U.S.S.R. into the market as a buyer of wheat. These purchases, principally from Australia, Canada, France, the Federal Republic of Germany, and the United States, are understood to have led to the sale of gold in order to provide the foreign exchange to effect payment. For this reason, Russian gold production, reserves, and sales have been a subject of considerable interest in the gold markets. It is estimated that in 1963 the U.S.S.R. sold gold approximating to $550 million, compared with sales of only $215 million in 1962. Recent estimates of Russian production have varied between $150 million and $400 million per annum and those of Russian gold reserves between $1,950 million and $7,000 million. In any event, it is felt that the drain on the gold reserves of the U.S.S.R., resulting from the wheat purchases will be significant, and there is some evidence of a desire by the Russian authorities to diversify their sales of gold. Banking facilities have been opened by them in Beirut. On the other hand, the Soviet authorities have announced a drive for increased gold output and a reduction in costs of production."

Drawing attention to the growing concern among gold producers over the falling production and rising costs, the I.M.F. report remarks:

"The introduction of new mining techniques and discoveries of higher-grade ore have helped to maintain and even increase output in certain areas. However, a few governments have found it necessary to provide financial assistance to the industry, which in some cases has taken the form of direct subsidies."

Gold Holdings

The I.M.F.'s survey of the gold holdings held by the monetary authorities of the world shows that they have increased by as much as $855 million in 1963, as compared with $325 million in 1962 and $600 million in 1961. The holdings of the Communist bloc nations are not included in these figures, but those of the I.M.F. the Bank for International Settlements, and the European Fund have been taken into account. On this basis, world monetary reserves at the end of 1963 stood at $42.3 billion. The amount of gold newly available to the Western countries last year is placed at $1,910 million, and that which has gone into private hands, industries and the arts at $1,055 million, about $135 million less than in 1962. It has been estimated that, over the post-war years, approximately $15,000 million worth of gold has been diverted from official holdings to other uses. This continuous addition to private gold hoards is attributed to "political and economic uncertainties." The following table indicates the position of world gold reserves, as well as the sources of changes in the years 1961-63:

Table II: *World Gold Reserves*
(In millions of U.S. dollars)

	1961	1962	1963
Production	1,215	1,300	1,360
Soviet sales	325	215	550
Total available ..	1,540	1,515	1,910
Consumption in industry, arts and private hoarding	—940	—1,190	—1,055
Total added to world monetary gold stock*	600	325	855
I.M.F. gold transactions :			
Subscriptions	—72	—24	—46
Sales to countries	500	..	..
Repayments	—66	—94	—71
B.I.S. and E.P.U./E. F. gold transactions	—135	165	238
Total added to countries' monetary stock*† ..	830	375	975

Sources: International Monetary Fund: *Internal Financial Institutions*.
* Excluding stocks held by countries in the Sino-Soviet area.
† Totals do not equal the sums of the items because of rounding.

It is true that not all the gold that has gone into non-monetary uses represents hoarding in the form of bullion and jewellery, because a part of it includes the metal that has gone into industrial applications and arts. But there is no gainsaying the fact that the bulk of this total constitutes private hoarding.

Gold Markets and Prices

A brief review of the trend of gold markets and prices during 1963 may be given. The Federal Reserve Bank of New York, as the fiscal agent for the U.S. Treasury, sold $391.7 million of gold to foreign countries and international institutions at the official rate of $35.0875 per fine ounce. In addition, about $69 million gold was sold inside the country for industrial, professional and artistic uses. The total decline in the U.S. gold stock amounted to $461 million, as compared with $889.9 million in 1962. The U.S. sales to foreign countries in 1963 included $517.7 million to France, $130 million to Spain and $82.1 million to Austria. In the same year, America purchased gold from the United Kingdom ($329.3 million, resulting mainly from the operations of the Gold Pool), Brazil ($72.2 million) and Philippines ($24.7 million). As a result of these operations, the amount of gold held under earmark by the Federal Reserve Banks for accounts of foreign central banks, Governments and international institutions rose by $253 million, to a total of $13 billion (that is $13,000 million).

The dollar price for gold during the Fund's fiscal year May 1963 to April 1964 at the London market fluctuated within the narrow range of about 5.5/16 cents, as compared with 13½ cents in 1962. The price touched a high of $35.11-3/16 per fine ounce in August 1963 due to the uneasiness about the strenght of the dollar and consequent hoarding. Sales of Soviet gold to effect payments for wheat imports brought the price as low as $35.05⅛ per fine ounce in March 1964. At the same time, the sterling price of gold moved between a minimum of 250s. 4½d. and a maximum 251s. The latter price was the highest level reached since the Cuban crisis in October 1962. In 1963, Britain imported some 34.3 million ounces of bullion, equivalent to $1,200.5 million, and exported about 19 million ounces, equivalent to $664.5 million. Thus, the net addition to Britain's stocks of gold was $536 million, as against $179.1 million in 1962.

Other Markets

In markets where gold is bought and sold against local currencies, prices were relatively stable. These markets, because of their special characteristics and intermediary exchange rate fluctuations, have been found to be different from the London pattern. The following table will give one an idea of the changes in gold price in the main markets of the type described here:

Table III: *Prices in Various World Markets*
(In U.S. dollars a fine ounce, a day's dollar rate)

	Bar Gold		Sovereign	
	End of April 1963	End of April 1964	End of April 1963	End of April 1964
Beirut	35.00	35.32	40.64	41.55
Bombay	76.34*	74.05†	..	..
Brussels	35.20	35.16	41.63	41.08
Hongkong	38.55	38.09	..	..
Milan	35.33	35.44	42.09	42.15
Paris	35.23	35.20	41.52	41.35

* Average for week ended May 10.
† Average for week ended April 24. The figure was obtained by conversion from quotations for 14-carat gold.

Commenting on the Bombay bullion market, the Fund's review says:

".... dealings were restricted following the introduction by the Government of India of a variety of regulations, the immediate objective of which was to reduce smuggling, but which were also expected, in the long run, to help the authorities to mobilise the existing private hoards of gold. The regulations have had the effect of reducing the demand for gold. There is some evidence that the volume of smuggling of gold has declined, and the price of gold, which had been rising steadily in recent years, was markedly lower in 1963 and the early part of 1964 than it had been just before the adoption of the gold control measures."

In the markets for gold coins, prices for the sovereign and the napoleon rose in general over the period, although at the end of April 1964 they were rather below the highest levels recorded during the year. In Milan, this increase in price was due in part to increased political uncertainty and doubts as to the economic future, which early in March 1964 led to rumours of a devaluation of the lira. Early in April, stocks on the Milan exchange sank to their lowest point for four years, as selling revealed investors' lack of confidence in the economic situation. This uncertainty led to an increased demand and higher prices for gold coins.

Silver

The I.M.F.'s review makes a brief reference to silver also. According to it, the wide interest in the price of silver and the activity of the last two years subsided after 9th September 1963, when the price of the metal rose to 129.3 cents, slightly above the price at which it becomes profitable to call upon the U.S. Treasury to redeem silver certificates. In response to this increase in price, the U.S. authorities took action, and the Congress enacted a law repealing the Silver Purchase Acts of 1934, 1939 and 1946. The 1963 Act authorises the Federal Reserve Banks to issue Federal Reserve notes in denominations of $1 and $2; this will enable Treasury silver certificates to be retired over a period of time. Following its enactment, purchases and sales of silver bullion in the United States were freed from legislative restriction for the first time for 30 years. The way was thus opened for trading in silver futures, which was resumed on the New York Commodity Exchange on 12th June 1963 for the first time since 9th August 1934. Under these new market conditions, the highest price reached in 1963 was 131.35 cents an ounce on 5th July, for delivery of silver in June 1964. The U.S. Treasury holds nearly 1,500 million ounces of silver, which will become available for coinage and other uses as Federal Reserve notes gradually replace silver certificates in the low denominations.

INDIA IN THE WORLD OF AGRICULTURE

A COMPARATIVE PICTURE OF PRODUCTIVITY

By A Special Correspondent

WHERE does India stand in the world of agriculture? A study of this question is of considerable importance when our food situation has reached a critical situation. From time to time, economists and others, both in India and abroad, had warned the Government against complacency but the warnings were not taken seriously. The result is we are once again confronted with scarcity and high prices, and imports on a massive scale have become necessary. Mr. Chester Bowles has revealed that 15 per cent of the wheat and 20 per cent of the rice grown in the U.S.A. are now coming to India. There is, of course, nothing wrong in importing food from other countries, provided we, on our part, have done everything to improve productivity and increase the output. This, however, has not been done.

Six years ago, four eminent industrialists—Mr. B. M. Birla, Mr. C. H. Bhabha, Mr. Tulsidas Kilachand and the late Sir B. P. Singh Roy—prepared a scheme for achieving self-sufficiency in agriculture. Briefly, their proposals aimed at the improvement of increasing the yield per acre substantially by using methods of intensive cultivation over 100 million acres of irrigated land in ten years. The then existing land under all crops was about 350 million acres. The industrialists estimated that, if we could increase the yield in ten years in 100 million acres by about one-third of a ton per acre, we would be able to raise food production by about 50 per cent in the next ten years. They pointed out that the total land under various crops in the United States was not very much more than what we had in India. But the yield from land in the U.S. was many times higher than in India because of improved methods of agriculture, large-scale farming, supply of better seeds and fertilisers.

INDIA AND WORLD

Yield per acre of certain Agricultural Commodities

Puerto Rico ..	68,339	India	2.6
U.S.A.	46,915	Pakistan	3.8

Specific Suggestions

Some specific suggestions made by the industrialists included the following: creation of a unified central organisation to deal with food as well as other allied activities closely linked with agricultural production; more emphasis on minor irrigation schemes; intensive use of nitrogenous, phosphatic and potash fertilisers; provision for the production of one million tractors in ten years; adequate banking facilities in rural areas, and a vigorous programme of family planning involving free distribution of contraceptives worth Rs. 25 crores every year. The capital cost of the scheme was placed at Rs. 1,305 crores, of which the foreign exchange component was Rs. 350 crores. The return in terms of increased yield from 100 million acres at the end of the tenth year was estimated at an additional output of 33 million tons valued at about Rs. 1,320 crores. It was expected that, as a result of this plan, it would be even possible to produce two crops instead of one in many parts of the country.

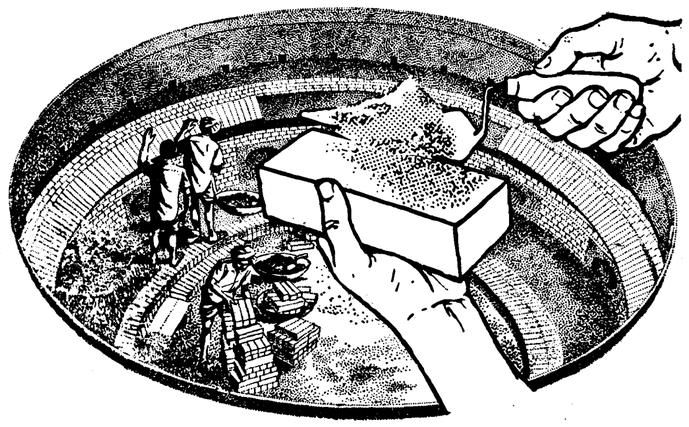
There was, of course, nothing very original in these suggestions but it was significant that the captains of our industry had taken a lively interest in agricultural problems and forcefully pleaded for the efficient administration of the most important sector of our economy.

Mr. B. M. Birla and his colleagues submitted their above plan in 1958. Five years later, the Federation of Indian Chambers of Commerce and Industry set up an Agriculture Sub-committee, with Mr. S. S. Kanoria as Chairman. This Sub-committee also produced a valuable and interesting report. It did not contain any novel suggestion, but the data it released on various aspects of agriculture served to focus attention on many weak spots of agriculture. The report pointed out, for instance, that, while in India about 71 per cent of the population were dependent on agriculture for occupation and livelihood, the corresponding figures in other countries were much less—12 per cent for the U.S., 13 per cent for Australia, 16 per cent for New Zealand, 19 per cent for Netherlands, 23 per cent for Denmark, 26 per cent for France and 40 per cent for Japan. But the income from agriculture accounted for less than one half of the total national income in India. Indian agriculture, according to the report, was, by and large, poorly mechanised, the number of tractors in use at the end of the second Plan being about 35,000. On the other hand, the number of tractors in use in other countries was: U.S. 48 lakhs, West Germany 8.5 lakhs, France 6 lakhs, U.K. 4 lakhs, Canada 4 lakhs, Italy 2.5 lakhs and Denmark 1 lakh.

There has never been any dearth of suggestions for improving agricultural production in India; and if today, despite over a decade of planning, the food problem continues to be difficult, it is almost solely due to inefficiency and lack of effective co-ordination on the part of the different agencies dealing with agriculture. Frequent changes at the Food Ministry in the Centre and the indifference of most Chief Ministers of States to agricultural development have in no small measure contributed to the present crisis. The uncertainty created by land reforms is another important factor responsible for the muddle. It is not adequately realised that the policy of putting a limit on land holdings will adversely affect productivity, because it is not conducive to the adoption of modern techniques of cultivation. Large farms not only can produce more but also provide more wages and other amenities to labour.

An analysis of the yield per acre in India as compared with other countries, given in the table below, glaringly brings out the vast scope for improvement in agriculture. Not only in rice but in every other crop—wheat, cotton, sugarcane, tobacco and jute—our yield is very much lower than what it is in other countries. It may not be possible to raise our productivity to the level of the U.S., Japan or elsewhere but certainly it should be possible, by the adoption of suitable methods, to bring about a substantial increase in the yield per acre. It is to be hoped that the ease with which we have been able to import food from abroad will not lull the Government into complacency and that serious and systematic attention will be given to the vital task of agricultural development.

The accompanying table compares the yield per acre of some agricultural commodities in India with those in other countries.



ACCOSET-50

—ACC High Temperature Refractory Cement —

for strong firebrick linings and joints

Composed of finely ground plastic clays, high alumina burnt refractory materials and special chemicals, **ACCOSET-50** gives good bonding strength and high heat resistance. Once it is dried and burnt **ACCOSET-50** becomes one with the bricks.

YOU CAN USE ACCOSET-50 ■ for jointing, repairing and patching ■ for bonding and laying firebricks of any shape ■ for protective wash for furnace walls and floors ■ for monolithic and rammed linings, gunning etc.

Technical literature sent free on request

INDIAN COPPER CORPORATION LIMITED

SHORTAGE OF GOOD QUALITY COAL HINDERS PRODUCTION

CHAIRMAN, MR. S. C. GLADSTONE OUTLINES EXPANSION PLANS

PRESIDING over the Annual General Meeting of the Indian Copper Corporation Limited, held at Calcutta, on the 12th inst., the Chairman of the Company, Mr. S. C. Gladstone, told the shareholders that the shortage of good quality coal had been chiefly responsible for the reduction in the Company's output. He said that scarcity of foreign exchange, coupled with inadequate supply of blister copper, especially in the U.S., had an adverse effect on the Company inasmuch as the new electrolytic refinery was based on the import of blister copper. Mr. Gladstone outlined the expansion plans the Company had taken in hand and disclosed that the Company had been granted an industrial licence for expansion of copper production, as well as for the production of sulphuric acid as a by-product of the electrolytic plant. The financial results for 1963, the Chairman said, were satisfactory, despite the mounting costs on account of higher wages and deeper mining operations.

The following is the text of Mr. Gladstone's speech:

GENTLEMEN,

The report of your Directors and the accounts for the year ended 31st December 1963 have been in your hands for several weeks. Fortunately, the restrictions imposed in 1963 by the Government of India under the Defence of India Rules, which prohibited the publication of the accounts, have now been relaxed.

This is the first time that I have had the privilege of addressing you, but, before I begin my review, I should like to pay tribute to the late Prime Minister, Pandit Nehru. After leading the freedom movement for many years, he became the first Prime Minister of independent India in August 1947 and for 17 years never spared himself in the service of the country. He will undoubtedly go down in history as one of India's greatest men.

Your Chairman last year, Mr. J. W. Easson, who left India on retirement in March this year, has been connected with the Company for 29 years and has been your Chairman for the last two years. I am sure that you would all like to join me in wishing him a happy retirement, which has been so well earned.

I will now give you a general review of the affairs of your Company during 1963.

General Review

During the first nine months of last year, there was ample copper to meet world demands and the price remained steady at about £234 per ton. In the last quarter of that year, demand began to overtake supply, but it was not until the new year that prices began to rise. In spite of increased production and sales, the price on the London Metal Exchange, which had been steady since June 1961, rose to around £300 per ton where it has since remained.

At the present time, production capacity probably just about balances the world demand and, but for industrial disputes, the price could be expected to recede to between £240 and £250.

The shortage of copper, especially in the U.S.A., has had a most unfortunate effect on your Company, inasmuch as the new electrolytic refinery is based on the import of blister copper. It was originally intended to import blister copper from Africa, but, as a result of the foreign exchange shortage, the Government of India have only been able to allow us a licence to import from the U.S.A. and, at the present time, blister copper is not available from this source.

Working Review

The production of copper in 1963 was 9,582 metric tonnes, a small decrease of 199 tonnes compared to the previous year, due to a number of factors such as the deterioration in the quality of coal and operating conditions.

In the middle of 1962, as a result of the acute shortage of good quality coal, the Coal Controller reduced our quota of Selected 'A' coal by 50 per cent and substituted coal of inferior quality for the balance of our requirements. Inevitably, this has had a significant effect on the efficiency of your smelter.

Your Company's rolling mill produced 9,376 tonnes of brass sheets and circles during 1963 and for this imported zinc is required. Import licences for zinc are now based on value and are financed by U.S. aid and thus the high price of this metal in world markets, and particularly in the U.S.A., has resulted in a substantial reduction in the tonnage that can be purchased. The Government of India have also imposed restrictions on the sale of brass and copper sheets to the utensil industry, our traditional and principal consumers. The effect of these restrictions began to be felt in the second half of 1963 and the burden this year will be heavier.

Mining exploration at your Surda and Patharghora mines continued, but a serious breakdown of the main compressor restricted development work at the main mine at Mosaboni. In spite of the most energetic efforts, it took eight months to obtain an import licence and procure spare parts for this machine, during which time all available compressed air was used to maintain production and development was at a standstill. In spite of this, our reserves increased by over 2,000 tonnes, which is satisfactory, and I am pleased to say that the compressor was put back into operation in January 1964.

Electric supplies were adequate throughout the year, but pig iron and coke for the foundry and cement were in very short supply. Thanks to a better supply of wagons, despatches showed some improvement, resulting in a decrease in the stock of finished products.

The financial results of your Company for 1963 were satisfactory, considering the rise in prices in the wake of the Emergency. Labour costs and the expenses of mining at greater depths continue to mount; nevertheless, the successful results reflect credit on all concerned.

During the year under review, labour relations were generally good and a dispute over the payment of profit-sharing bonus was settled in conciliation proceedings. Towards the end of the year, however, the Unions submitted fresh demands for very substantial increases in wages, which cannot be justified. I regret to report that, while negotiations were in progress, the Works Union recently called a three-day protest strike to bring pressure to bear in support of their demands. Negotiations are still in progress.

Kyanite

Exports of kyanite fell from 27,686 tonnes in 1962 to 18,797 tonnes, due to competition from synthetics and poor market conditions. The recession in the steel industry abroad in 1962 led to a reduced demand for kyanite in the following year. At the same time, there was a big improvement in the supply of railway wagons to carry the ore from your mines to the docks, which encouraged your customers to reduce their stocks. This has led to a temporary fall in exports, but I am happy to say that, up to the end of July, over 13,000 tonnes had been exported and, by the end of this month, the figure will approach 17,000 tonnes.

Electrolytic Plant

When your Directors' report was written in May this year, it was predicted that the new refinery would be completed in September this year, but I regret to report that there have been further serious delays since that date.

There have been many delays in the construction schedule, chiefly due to a shortage of essential materials such as cement, roofing sheets and steel and the failure of most suppliers of indigenous plant to keep to promised delivery dates. Much of this can be traced to the Emergency created by the Chinese invasion in November 1962. There has also been pilferage in the Calcutta docks. All this is completely outside our control and, although everything is being done to speed the work on the final stages of the plant, it is anticipated that production will not commence before the new year. This will, of course, depend on the supply of blister copper to which I have referred earlier.

Your Company has also been licensed to produce 260 tonnes of nickel sulphate, which will be a by-product of the electrolytic plant. Foreign exchange has been arranged and the final details of technical know-how are now being negotiated. It is hoped to start production in the first quarter of 1966.

Expansion Plans

Your Company has been granted an industrial licence to expand production of copper and to produce sulphuric acid as a by-product and negotiations for foreign exchange loans are far advanced. The present smelter is now over 30 years old and has for some time been operating at well above its designed capacity. No plant can be expected to remain at peak efficiency after so many years' service. It will, therefore, be necessary to install a new smelter of larger capacity and of a type that will allow the recovery of waste gases in the form of sulphuric acid.

At Surda, new equipment is required to allow for development in depth and also a concentration plant. Additional grinding plant is required at your works and a new crushing plant at your Mosaboni mine to deal with the increased capacity. It is expected that, after this new equipment has been installed, production of copper will rise to 12,130 tonnes during the first year of operation of the new smelter and to 12,950 tonnes during the second year. Sulphuric acid will be produced at the rate of 100 tonnes a day.

The total cost of this plant will be £2,875,000, which, it is planned, will be financed by bank overdrafts, foreign loans and debenture issue.

Accounts

The profit for the year before providing for taxation, depreciation and reserves amounts to £1,384,875, as compared with a profit in 1962 of £1,351,771. Income-tax and super-tax on profits, however, amounted to no less than £821,855, partly because of the bonus issue in 1963 and the new tax on dividends. Your Directors have decided to place £170,000 to depreciation and £98,000 to general reserve. £26,597 is allotted to development rebate reserve and £21,694 to provision for kyanite decretal amount.

There is a balance available of £247,299 and your Directors are recommending that the same amount as last year, i.e. £246,834, equivalent to a dividend of 12 per cent, subject to tax, on the new capital of the Company should be distributed, leaving a balance of £465 to be carried forward.

Staff

It remains for me to thank the General Manager, Mr. N. A. B. Hill, and the staff and workers, both at the mines and the works. I am sure that you would all wish me to thank them for their exertions on your behalf which have led to yet another successful year.

THE BOMBAY GAS COMPANY LTD.

RISE IN GAS PRICE LONG OVERDUE STILL UNJUSTLY DENIED

CHAIRMAN, MR. N. K. JALAN, DEPRECATES NATIONALISATION MOVE

HOW the Bombay Gas Company Limited had been denied the legal and equitable right to an increased gas price was highlighted by Mr. N. K. Jalan, Chairman of the Company, at the Annual General Meeting of the Company held at Bombay on Tuesday, 18th August 1964. Mr. Jalan declared that it was difficult to understand the reasons or the motives weighing with the Government of Maharashtra in taking no action on, or in going slow in dealing with, the Company's well-proven case for an adequate increase in the price of gas. He characterised as ill-founded and unsound the Government's view that a rise in gas price would hit consumers hard and provoke resistance. He deprecated the talks of nationalisation or municipalisation of the Company and stated that the move was ill-conceived and ill-timed. After recalling the "great pains" taken by the management to nurture the Company for the last eighteen years and the "substantial contribution" made by the Company to the national economy, he hoped that the Government would give the Company that justice and fair deal to which it was clearly and definitely entitled.

The following is the full text of Mr. Jalan's speech:

GENTLEMEN,

I have pleasure in welcoming you to the annual general meeting and to present to you the balance sheet and the annual accounts, together with your Directors' report, for the year ended 31st December 1963. These have been in your hands for some time now and, with your permission, we may take them as read.

Company Incurs Substantial Losses

You would have found that the accounts for the year 1963 reveal a very poor and disappointing financial result of the working of the Company, entailing a very heavy and abnormal loss of Rs. 10.31 lakhs, as compared with a loss of Rs. 1.92 lakh for 1962. The principal factors responsible for this further substantial increase in the Company's loss to the tune of some Rs. 8.39 lakhs were (*a*) increase in cost of coal and freight charges by Rs. 3.37 lakhs, (*b*) Emergency Risk Insurance, being Rs. 1.53 lakhs, as against nil in 1962, (c) interest on overdraft, etc., and (*d*) other general increases and incidence of annual increase in total staff and labour payments, etc. Your Directors regret that, owing to this extremely unsatisfactory financial result of the operation of the Company, no dividend can be paid to the stockholders for the year under review, this being the second consecutive year for which the Company has been unable to declare a dividend. We need hardly point out that this is bound to produce further unfavourable reaction on the already depressed investment market of the country.

The current year's (i.e., 1964) working is going to be affected still more adversely on account of substantial increases in cost under several items. Thus, the increase in railway freight/surcharge from 1st April 1964, and increase in cost of coal from 5th June 1964, together with the full impact of the rise in the cost of coal sanctioned earlier in 1963, are estimated to cost an additional amount of Rs. 4.52 lakhs. Secondly, as per the Lakdawala Committee's recommendations regarding increases in the dearness allowance of workers and staff and as sanctioned by the Maharashtra Government with effect from 1st January 1964, the annual salaries and wages expenditure would increase by Rs. 2.10 lakhs. Thirdly, the projected minimum bonus as per the recommendations of the Central Bonus Commission, which are currently under the active consideration of the Government of India, when applied to the existing level of wages and salaries, without taking into consideration the effect of time-scale increment as per Awards, etc., would add a further amount of Rs. 1.54 lakh to the total expenditure. Fourthly, time-scale increment of wages and salaries would cost Rs. 95,000 per year. These items, together with the increased impact of certain other statutory increases in the course of 1963, fully operative in 1964, increases in municipal rates/taxes, etc., would account for an increased expenditure of over Rs. 10 lakhs in 1964 above that of 1963. On this basis, the total loss from the Company's operations in the current year (1964) would come to the alarming figure of well over Rs. 20 lakhs.

The paid-up capital of the Company is Rs. 40 lakhs and there is a reserve of Rs. 12.61 lakhs, out of which Rs. 9.50 lakhs have already been eaten up on account of the heavy loss incurred during 1963. With the currently running rate of loss of Rs. 20 lakhs per annum, by the end of the present year, practically the whole of the reserves and fully one-half of the paid-up capital of the Company would have gone. It would be easily appreciated that, with its capital and reserves drastically depleted to the extent of Rs. 30 lakhs, or by almost 60 per cent of the total, it will just not be possible for the Company to carry on any longer.

The accounts of the Company are also independently audited every year by the Government Auditors. According to the reports of the Deputy Director of Government Commercial Audit, the Company had incurred deficits in what is considered to be reasonable return in 1959, 1960, 1961 and 1962, the deficit for 1962 having been as high as 162 per cent. And on the basis of the financial results of the Company's working in 1963, the percentage of deficit, according to the methods adopted by the Director of Government Commercial Audit, would be 5.3 times as high, i.e., 860 per cent of the reasonable return. In this connection, it may be pointed out that, for purposes of calculating reasonable return for 1961 and 1962, the Deputy Director of Government Commercial Audit, under instructions from the Government, arbitrarily and drastically reduced the capital base of the Company from that used for the immediately preceding two years, i.e., 1959 and 1960. Thus, whereas the capital base used for 1959 was £875,396 (Rs. 1.17 crore), the capital base used for 1961 was taken at only £269,213 (i.e., Rs. 35.90 lakhs), which meant an unjustifiable reduction in the capital employed by about 70 per cent. Again, whereas, in the earlier two years of 1959 and 1960, the rate of return on capital was taken at 8.9 per cent, the rate taken for 1961 and 1962 was 7.5 per cent On this account, whereas the amount of reasonable return for 1959 was estimated at £77,910 (i.e., Rs. 10.30 lakhs), the corresponding figure of reasonable return for 1962 was only £21,302 (i.e., Rs. 2.84 lakhs). Had the capital base and the rate of return thereon for 1962 been calculated under the same principles and methods as had been applied for the years 1959 and 1960, the figure of deficit for 1962 would have become much higher than what it is shown to be.

Prima Facie Case for Increase of Gas Price

These recurring and rapidly mounting shortfalls in what the Deputy Director of Government Commercial Audit has determined to be reasonable return on the capital employed by the Company for four successive years, 1959 to 1962, at long last convinced the Government that there was a strong *prima facie* case for an increase in the price of gas and a high-power Gas Advisory Committee was appointed, on 16th February 1963, to go into the question of a reasonable price for gas. At the instance of the Committee, experts of the Finance Department of the Government carried out a thorough examination of the accounts of the Company and confirmed that the current rate for gas was clearly and definitely uneconomic in the sense of not even covering the bare costs of production and distribution of gas, with the result that the Company was running at a loss. Subsequently, in August 1963, the Advisory Committee held detailed discussion with the Company's representatives and, apparently, the Committee also was convinced that there was a clear and strong case for an increase in the price of gas.

Appointment of Gas Advisory Committee

The Committee would have submitted its findings and recommendations to the Government by 31st October 1963, being the date of expiry of its term of office, i.e., after eight and a half months from the date of its appointment. As indicated in the earlier paragraphs, due to continuous rises in the costs of production and distribution of gas, the Company's financial condition was fast deteriorating and the Company made urgent representations to Government for an early sanction of a reasonable rise in the price of gas. And, full five months after the submission of the Advisory Committee's report, the Government wrote a letter to the Company on 31st March 1964, in which the Government asked for a "binding undertaking" to implement an expansion programme in the event of a reasonable increase in gas price. In reply to this letter, the Company solemnly reaffirmed the undertaking that had been already given in the course of its several representations, to implement a programme of expansion designed to give 15,000 to 20,000 new gas connections within a period of three to four years, in the event of an early and adequate rise in the price of gas.

Consumers Enthusiastic for New Gas Connections with Moderate Increase of Price—Company takes Preliminary Steps

In the light of the foregoing developments, the Company had been led to anticipate a rise in the price of gas. And it proceeded to circularise some 3,000 applicants for gas connections on its waiting list to the effect that, if they were still interested in receiving gas connections, the Company would survey their premises and prepare and furnish estimates of costs of fittings, labour, etc. The Company received an immediate and enthusiastic response from over 1,500 would-be consumers, and several hundred citizens got their premises surveyed and promptly deposited the estimateed costs of fittings, etc. In the circulars issued to the applicants for new gas connections, it had been clearly pointed out that these essential preliminaries were being carried out to facilitate the immediate installation of gas connections without allowing any loss of time, in the event of an increase in gas price being sanctioned by Government. The very fact that over 1,500 applicants for new gas connections eagerly responded to the Company's circular by requesting the Company to survey their premises while a majority of them promptly deposited with the Company the estimated costs of fittings, etc., would go to show very clearly that the members of the public were ready and willing to pay an adequately increased price for gas to receive new gas connections. Information regarding these important preliminary steps for giving new gas connections, was duly communicated to the Government.

Government's Mysterious Silence on the Gas Advisory Committee's Report

The Government having appointed, under Section 5 of the Bombay Gas Supply Act, 1939, a Gas Advisory Committee to go into the question of a fair and reasonable price for gas, and the said Committee having duly submitted its recommendations to the Government in this behalf, we are advised that the Government were required, under Section 6 of the same Act, to make rules prescribing, in accordance with the recommendations of the Advisory Committee, the limits of prices which the Company may charge. It is a matter of great regret and surprise that, even eighteen months after the date of the appointment of the Advisory Committee and over nine months after the receipt of the Committee's Report in this behalf, and in spite of our repeated representations pointing out the financial difficulties through which the Company had been passing, the Government has not yet seen fit to sanction the gas price increase to which the Company is specifically entitled in law and equity.

Established Principles of Price Fixation

In the matter of price control, it is a well-recognised principle or convention that control prices of commodities and services should cover (*a*) all indisputable cost increases, (*b*) a moderate return on the capital employed, and (c) reasonable surplus for reserves. In a number of important cases, such control prices sometimes include also a substantial element intended to contribute partially towards the cost of expansion. This principle has been honoured in India over a wide field of price control, more or less continuously, ever since control was instituted during the Second World War. It has also been honoured by and large in all the advanced and developing countries. In India, in accordance with this principle, practically all control prices, such as those of iron and steel, cement, coal and sugar, have gone up several times. Thus, for instance, in the case of a basic commodity like steel, the control price of which had been fixed at Rs. 393 per ton from 1st February 1956, was raised to Rs. 474.59 per ton, i.e., by Rs. 81.59 or 21 per cent with effect from 31st March 1960, and again to Rs. 522.50 per ton, i.e., increased by Rs. 47.91 or 10 per cent, with effect from September 1962, the total increase within the period of 6½ years being 31 per cent. With effect from 29th February 1964, several items of steel, viz., structurals, light bars, heavy bars, rails, blooms and hoe-bars were decontrolled and the authority for the the fixation of their prices was given to the Joint Plant Committee comprising the Iron and Steel Controller and representatives of all the steel producers in the public and private sectors. Immediately, the prices of most categories were raised, the increase in the case of untested rails being from Rs. 655 to Rs. 710 per tonne or 8.4 per cent and tested rails from Rs. 694 to Rs. 755 per tonne or 8.8 per cent. With effect from 1st March 1964, the prices of several categories of iron and steel, such as pig iron grade I, ingot mould 1 tonne and below, billet, tin bars, skelp, black sheet, G.C. sheet, plates, R.R. strips, C.R. sheets, cotton bailing hoops and jute bailing hoops, which are still under control, were also raised. Thus, for example, the price of pig iron grade I was raised from Rs. 246 to Rs. 282 per tonne or by about 15 per cent, ingot mould, 1 tonne and below, from Rs. 148 to Rs. 223 per tonne or 50.7 per cent. The price of untested tin bars was raised from Rs. 473 to Rs. 547 per tonne or by 16 per cent and tested tin bars from Rs. 503 to Rs. 592 per tonne or by 17 per cent. (The above prices are inclusive of excise duties.)

As regards coal, the cost of coking coal, inclusive of freight, as supplied to the Bombay Gas Company, was increased from Rs. 47.36 per tonne in 1957 to Rs. 56.73 per tonne in 1961, to Rs. 59.67 in 1962, to Rs. 63.31 in 1963, and to Rs. 68.13 in the early part of 1964, the total increase during the last seven years being Rs. 20.77 per tonne or 43.86 per cent. In Bombay itself, the Tata Hydro Electric Company raised the rate for electricity by levying a surcharge of 10.5 per cent from 1st July 1962, and again by 26.4 per cent with effect from 1st May 1963, on account of increase in the cost of coal, freight, etc. It may also be noted that, in the same city of Bombay, the municipal assessment of cotton mills was raised on the basis of quinquennial valuation from Rs. 3 in 1933 to Rs. 7 in 1958 per 100 sq. ft. of processing block, i.e., by 133 per cent in 25 years; and from Rs. 2 in 1933 to Rs. 6 in 1958 per 100 sq. ft. of non-processing block, i.e., by 200 per cent in a period of 25 years. It may be mentioned that the increased rates of 1958 were imposed in spite of general public protest. The Maharashtra State Electricity Board itself, after the take-over of the Poona Electric Supply Company, raised the rate for electricity in Poona per unit from 13 nP to 31 nP, i.e., by 138 per cent, on account of rise in cost.

Oriental Gas Company

The Oriental Gas Company of Calcutta, which was taken over by Government in 1960, has recently increased the effective price for gas by approximately 35 per cent in an indirect manner on the plea of improvement in quality. It is pertinent to mention that this Company had already before raised the rate for town's gas from Rs. 4 per '000 cubic feet in 1945 to Rs. 5.75 per '000 cubic feet in 1948, i.e., by 43.75 per cent. Thus, in the case of the Oriental Gas Company, the increase in the price of gas over a period of 19 years has been about 95 per cent. Incidentally, it may be mentioned that the nationalisation of the Oriental Gas Company of Calcutta, instead of improving the quality of service and reducing the price for gas, has, on the contrary, led to a substantial increase in the price of gas on the one hand and serious deterioration in the quality of service to the consumers on the other, and, consequently, there has been much public criticism and resentment at the arbitrary manner in which the increased charges for gas are billed. The B.E.S.T. undertaking of the Bombay Municipality, with effect from 21st April 1963, has raised the minimum bus fare from 7 nP to 10 nP, i.e., by 43 per cent. It is also reported that the same undertaking is presently contemplating further increases in bus fare. During the last six years (1958-64), in the city of Calcutta, the bus and tram fares have been raised twice, first in 1958 on the recommendation of a Commission of Inquiry and then recently, with effect from 29th April 1964, on account of rise in the cost of maintenance and service, and the public of Calcutta have accepted these two rises without any protest whatever. On this latest occasion, the lowest tram fare in Calcutta was raised from 6 nP to 7 nP per ticket, i.e., by 17 per cent. Likewise, Delhi Transport Undertaking is reported to have also recently increased the bus fares by 50 to 80 per cent. It may also be mentioned that the Bombay Municipality, within a period of eight years, from 1948 to 1956, has raised water charges per '000 gallons from Re. 1 to Re. 1.50, i.e., by 50 per cent. It will be noted that these are very essential commodities and services affecting the pockets of even the poorest working class people.

Consumers Do Not Grudge Reasonable Increase in Gas Price

The claim of the Bombay Gas Company to an adequate increase in the price of gas is based on the well-recognised economic principle or convention mentioned above. It is, also, as explained earlier, based specifically on the Company's legal right under the Bombay Gas Supply Act, which is the obverse of its legal obligation under that Act to supply gas at such control price as may be fixed by Government from time to time in accordance with the recommendations of the Gas Advisory Committee. Such being the case, it is difficult to understand the reasons or the motives which may be weighing with the Government in taking no action, or, at any rate, in going slow in dealing with, the Company's well-proven case for an adequate increase in the price of gas. The spokesmen of the Government have sometimes suggested that the consumers of gas, by and large, being lower middle-class people, a rise in the price of gas would hit them hard and provoke resistance. Such a view would be altogether ill-founded and unsound, for, by far the largest number of consumers of town's gas reside in such aristocratic localities as Malabar Hill, Marine Drive, Cumballa Hill, Cuffe Parade, Fort, etc., or are flourishing business units in different parts of the city. At a time when even the poorest classes are under compulsion to bear the heavy burden of rising prices of essential commodities and services like electricity and transport, it is most unreasonable to hold that a moderate increase in the current price of gas, which, by the way, was fixed as long ago as in 1949 and which, incidentally, is somewhat lower than what it had been in 1926, would inflict an excessive burden on the rich and prosperous individuals who are privileged to live in those expensive areas and who have enjoyed the advantage of subsidised gas price over the years. That there is no substance at all in this view regarding the burden of an increase in gas price on the consumers would be crystal-clear from the fact that, according to available information, there are at the present time in the city of Bombay itself over 104,000 consumers of liquid petroleum gas with the trade names of 'Burshane' and 'Mobilflame,' with another 64,000 consumers of this bottled gas being located in other parts of Maharashtra and certain parts of Gujarat (i.e., old Bombay State), who readily buy this liquid petroleum gas at nearly 4 times the price of town's gas. It is altogether anomalous, unjust and inequitable to hold that a moderate increase in the present town's gas price of Rs. 3.94 per unit consumed by some 18,000 rich and prosperous consumers including modern, luxurious hotels and big industrial units, would be an excessive burden to them while in the very same city of Bombay hundreds of thousands of consumers, many of them being in the middle-income brackets, are eagerly and spontaneously buying and consuming liquid petroleum gas at a higher price of around Rs. 16 per unit, without causing any complaint or unfavourable comments in any quarters including the general public and the Government. In this connection, it is interesting to note that at the present time Esso Oil Company is reported to be enlisting 2,000 new consumers every month in the Bombay City itself and that, in the city of Calcutta where the supply of Burshane was started on 1st July 1964, the registration of new consumers of this bottled gas is proceeding at the rate of 400-500 per day. In this connection, it would be quite proper and pertinent to raise the question whether it was not a patently and grossly discriminating policy on the part of the Government to peg down, most rigorously and inflexibly, the control price of town's gas to Rs. 3.94 per '000 cubic feet over a period of almost two decades despite enormous increases in all important costs and prices during the time, while, at the same time, freely allowing two oil companies to sell a substitute for piped town's gas, namely, liquid petroleum gas, at almost four times the price of town's gas, namely, Rs. 16 or more per equivalent unit in terms of thermal power to over 168,000 consumers of middle-income bracket groups in the self-same city of Bombay and in certain contiguous areas of Maharashtra and Gujarat the unjust discrimination being in effect applied against the Bombay Gas Company, which has been rendering a good service to the city of Bombay, continuously for almost two decades, by supplying piped gas, the most convenient form of fuel, at a rate which is by far the cheapest rate in any part of the world including the most advanced countries of modern times. It may also be pertinently askcd whether it is not extremely anomalous and paradoxical that, whereas the rate for electricity in Greater Bombay has been increased by 37.1 per cent in the course of only two years, which certainly hit hard many millions of consumers of lower-income groups, the Government of Maharashtra is found to show such excessive solicitude for the 18,000 consumers of town's gas belonging to the upper-income bracket groups, that they appear to have firmly resolved that not even a moderate increase be granted in the price of town's gas however justifiable it might be in law and equity and by considerations of indisputable and well-proven increases in the costs of production and distribution of gas.

Company Has Made Substantial Expansion of Supply

The present management carried out substantial expansion of production and increased gas supply by 64 per cent from 988,242,300 c.ft. in 1946 to 1,613,887,000 c.ft. in 1963. New gas connections came to 3,430, out of which 2,500 were given in 1957-58, in response to an assurance informally given by the then Ministers concerned to the effect that, if the Company carried out expansion and gave new gas connections, the Government would favourably consider the question of an increase in the price of gas. The Company, in good faith, carried out this substantial expansion programme. In this connection, it may also be pointed out that, had the average consumption of gas per consumer remained unchanged at the level of 1946, the expanded gas supply would have sufficed to add some 9,000 new gas connections to the 14,831 in existence at 1946. However, while the Company invested a considerable amount on this occasion to give new gas connections and thus fulfil its part of the informal understanding, the Government gave no price increase whatsoever. This was also an important instance of unfair and inequitable treatment received by the Company at the hands of the Government.

We invested in 1946 a very large amount of money to acquire the assets of the Bombay Gas Company, from its foreign owners. This fact was admitted by the First Gas Advisory Committee headed by Sir Navroji J. Wadia, a retired Judge of the Bombay High Court. Since then, the Company has put back into the undertaking some Rs. 70 lakhs of which [illegible]

General Manager

Rs. 17.31 lakhs were spent as lately as in 1962 and 1963 to provide some ancillary facilities, such as complete re-sheeting of a gas-holder, setting up an elevated purifier box and enlarging the gas mains at important places, etc., with a view to facilitating the flow of larger gas supplies proposed to be immediately undertaken by the Company. In this case also, the Company put back into the undertaking these large sums in perfect good faith in the intentions of the Government to give a fair deal to the Company. And we are shocked to learn that Government now propose to forsake all considerations of justice and fair play in dealing with the Company.

The Company's fixed assets, recently revalued by the well-known surveyors Messrs. Ibcon (P) Ltd., in the light of present-day market prices of such assets and after providing for full depreciation stand at Rs. 3.19 crores as at 31st December 1963.

Company's Dividend Policy Has Been Conservative

It is sometimes held against the Company that it had distributed high dividends in the past. The actual facts are as under:

Average annual dividend during 1947-52—7.12 per cent.

Average annual dividend during 1953-56—12.50 per cent.

Average annual dividend during 1957-62—3.52 per cent.

1962—Substantial loss and no dividend.

1963—Much heavier losses and no dividend.

The above percentages of dividends are on the basis of the paid-up capital of Rs. 40 lakhs as shown in the Company's books. Actually, however, the present management had paid, as mentioned above, a much larger amount in acquiring the valuable assets of the undertaking from the foreign stock-holders. This high acquisition price was based on the then ruling market price of the stock of the Company. In relation to the cost of acquisition of the assets of the Company, the dividends would be as follows:

Average annual dividend during 1947-52—2.49 per cent.

Average annual dividend during 1953-56—4.38 per cent.

Average annual dividend during 1957-62—1.23 per cent.

And it is obvious that these effective dividend rates were much too low by any standard and these figures would completely demolish the wrong impression that the Company had indulged in paying excessively high dividends for certain years in the past.

With an Economic Price for Gas, the Company Will Readily Improve Workers' Remuneration and Amenities

One of the direct and devastating effects of the continuance of an uneconomic price for a prolonged period has been that the Company's finances are so crippled that it had not been possible for the Company to bring about any upward wage revision, or to give any bonus to its employees, for the past several years. Today, there is acute unrest among the workers, and great dissatisfaction among the members of the staff on this account, which is an extremely unfavourable trend even in normal times, and more so at the present juncture. The workers have preferred a claim for the payment of bonus for the year 1962, and their "Charter of demands" claiming several benefits, is pending before the Conciliator. Similarly, the Company's Staff Association has put in a claim for upward revision of salaries, and for other benefits. If these claims are allowed, it would be an unbearably heavy burden on the present slender resources of the Company. In this connection, it would be pertinent to point out that the Government's directive to industrial units to pay higher dearness allowance to employees pursuant to the recommendations of the Lakadawalla Committee has also imposed a very heavy financial burden on the Company to the tune of over Rs. 2 lakhs per year. The issue of a notice in this behalf by the Company notifying to the employees its intention to discontinue paying the readjusted dearness allowance caused considerable unrest among the employees, who waited in deputation on the Labour and Industries Ministers, and in consequence the Government have referred the matter for adjudication to an Industrial Tribunal. The Government has been stoutly advocating industrial peace and better understanding between management and labour, and very rightly so. An adequate increase in gas price, and a consequent improvement in its financial position, would enable the Company to consider favourably the claims of the employees for better terms during the present times of economic stress and mounting costs of living.

Ill-conceived and Ill-timed Nationalisation or Municipalisation Talk—The Prime Minister's Grave Warning and Wise Advice Regarding Priorities

In response to a very recent personal representation to the Government, earnestly pleading for an immediate and adequate rise in the price of town's gas, we were informally given to understand that Government were presently considering the question of nationalising or municipalising the Bombay Gas Company. The question of nationalisation or municipalisation is a question of high policy. It may, however, be pointed out that, according to the Industrial Policy Resolution dated 30th April 1956, carbonisation of coal is included in Schedule B. In the said resolution, it is mentioned that, while, with a view to accelerating their future development, the State will increasingly establish new undertakings in the industries in Schedule B, at the same time, private enterprise will also have the opportunity to develop in this field, either on its own or with the State participation. It can be reasonably argued that, since there is already a well-established, experienced and efficient private sector unit of gas industry in the Bombay City, it is entitled to be allowed to continue to render its service to the Bombay City under suitable economic conditions. This point of view derives special support from the fact that the Union Government, in accordance with the Industrial Policy Resolution cited above, has recently given a licence for the installation of a coke oven plant in the Maharashtra State in the private sector, the licensee being Messrs. Shanta Bros. Private Ltd. Town's gas, however, is relatively low in the scale of priorities for nationalisation with a view to carrying through rapid expansion and providing for substantially wider availability. There are several other items which have much higher priority from the point of view of social welfare-*cum*-economic development, such as adequate supply of drinking water in the towns and villages, road transport, electricity, slum clearance, working and middle-class housing and State-wide health services with hospitals—all of which would involve development on a colossal scale, entailing huge capital outlays and employment of large numbers of top level administrative personnel. When these high-priority items have been taken care of, say, within a period of four or five years, it would then be appropriate time for Government to review the question of taking over relatively low-priority items like town's gas. It would be pertinent to point out that many of the huge capital-intensive enterprises in the public sector, according to the findings of the Estimates and Public Accounts Committees of Parliament, have failed to show any conspicuous success in respect of planning, programming, executing and financing. On the contrary, there have been far too many cases of lack of proper programming and phasing and of absence of efficient operation, with the result that there has been colossal wastage of money, material and manpower, and the return on the huge investments has been extremely poor and disappointing, being, for instance, as low as 2.5 per cent, in 1962-63, even after ignoring the huge losses sustained by Hindustan Steel Ltd. In this connection, we do hope that all parties, concerned with the economic progress and social welfare of the country, will give serious heed to the wise advice and timely warning that has been recently given by our beloved Prime Minister, Shri Lal Bahadur Shastri, regarding the imperative need of applying stricter standards of priorities in our development plans and programmes. In the undoubtedly grave situation of a developing crisis which the country faces, the Prime Minister rightly says, "It is imperative that Government policies in the immediate future should be geared to meeting the requirements of the common man...." The Prime Minister goes on to say, "What is needed at the present time is not the launching of new projects but ensuring that those already in execution are completed expeditiously, giving a good return to the community." The Prime Minister, also wisely points out that "the people should feel that the additional burden they carried during the last few years has brought tangible results to them. So far such returns have been totally inadequate and not commensurate with investments made at great sacrifice and with a rising tax burden."

The proposal for the municipalisation of the Bombay Gas Company was mooted long ago. But, by requiring the Company to undertake an expansion programme, by setting up a Gas Advisory Committee, by demanding a "binding undertaking" from the Company, and by allowing the Company to proceed with important preliminary steps for giving new gas connections, the Government had clearly indicated that the question of municipalisation had been put off by a few years and that, in the meantime, the Bombay Gas Company would be allowed to continue and that, as clearly implied by the very fact of the appointment of a Gas Advisory Committee, the Company would be given a rise in the gas price if recommended by the Advisory Committee.

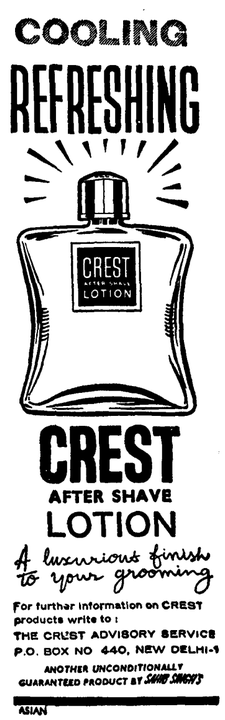
We have taken great pains to nurture the Company for the last eighteen years. We invested very large amounts in acquiring the former British-owned Company and in developing it over all these years. We have effected all-round improvement in its efficiency. The quality of its service would compare very favourably with that of any other public utility concern in this country, including even the largest Electric Supply Undertakings in Bombay, Calcutta and elsewhere. By taking over the Company at a huge capital expenditure, we have saved year after year, over this long period, substantial amounts of foreign exchange which would have been otherwise remitted abroad by way of transfer of profits. We have also completely Indianised the managerial and technical staff, thereby also saving considerable amounts of foreign exchange. And we still hope that, in consideration of these substantial contributions to the national economy, Government would give us that justice and fair deal to which we are clearly and definitely entitled.

Plant and Machinery

During the year, we have added plant, machinery and equipment worth Rs. 2.50 lakhs, including one additional Holmes Commersville station meter having a capacity of 6 million cu. ft. per day, one Sternette compressor unit for oil refrigeration and one 100 kw. Germanium rectified set.

Appreciation

Before I conclude, I would like to express our warmest appreciation to the workers, the staff and officers for their whole-hearted co-operation and specially to Shri S. Chowdhary, your General Manager and Secretary, and Shri A. S. Rao, your Deputy General Manager, for their invaluable services.



PRODUCTION AND USE OF FERTILISERS

SUPPLY LOW—CONSUMPTION ILL-BALANCED

FERTILISERS play the role of a catalyst in the economic development of a predominently agricultural economy such as India. The failure on the food front, in particular, and the shortfalls in agricultural production, in general, both of which have presently created chaos and confusion in this country's economy, serve to highlight the importance of fertilisers once again. Modern scientific agriculture presupposes sufficient and diligent use of fertilisers without which seeds, implements and labour cannot yield optimum results. It is not a mere chance but the outcome of definite planning and hard work that all the industrially advanced countries such as the U.S., France and West Germany have sound agricultural sectors. It has been estimated that one unit of plant food can grow ten times extra quantity of grains. With the use of fertilisers, some of the Indian farmers have also experienced increases of about eightfold in their outputs. But such instances are rare exceptions rather than a general rule. By and large, expansion in the use of fertilisers has been poor, as compared with the need for it. This point has been well brought out by the Fertiliser Association of India in some of its recent publications. In the latest issue of its periodical, *The Fertiliser News*, the Association very aptly remarks:

"But food production cannot increase markedly when only about 5-10 per cent of our farmers use fertilisers; when our per-acre use of fertiliser of 2.5 lb. is the lowest in the world; when our yields per acre are among the poorest in the world; when the fertiliser distribution and the flow of rural credit are monopolies of co-operatives, regardless of efficiency, performance and coverage; when fertiliser distribution margins offer little incentive to salesmanship, and when propaganda measures to educate the farmer on advantages of fertilisers are halting."

Further, in its *Annual Review* of 1963-64, providing a wealth of data on consumption and production of fertilisers in this country, the Association provides a vivid picture of the lags in this sphere. According to the *Review*, though there has been progress in fertiliser production and consumption, such has been slow and consistently below the targets laid down for the third Plan period, except in 1961-62 when the production of nitrogen very nearly hit the target.

Production of Nitrogen

Table I shows the trend of production of nitrogen (N) and phosphoric acid (P_2O_5), the only fertilisers made in this country since 1960-61. Nitrogen, it may be noted here, is produced in the form of ammonium sulphate, calcium ammonium nitrate, urea, ammonium sulphate nitrate, ammonium chloride, Chilean natural nitrate of soda, ammonium phosphate sulphate and nitro-sulphate. In all these forms, the output of nitrogen increased from 111,987 metric tonnes in 1960-61 to 194,194 metric tonnes in 1962-63 and is estimated to have touched 239,275 metric tonnes in 1963-64, an increase of about 114 per cent over 1960-61. Impressive though this improvement appears to be, it must be noted that this achievement was only 78.5 per cent of the target for 1963-64, the shortfall being 65,500 tonnes. The gap that remains to be filled in the remaining two years of the current plan is much bigger, as the target is as high as 812,000 metric tonnes. At the current rate of growth in production, the actual production in 1965-66 will fall far short of this target. Be that as it may, such increase as there has been in production since 1960-61, is due partly to the commencement of production by the new factories at Nangal (Punjab) in 1960-61 and Rourkela (Orissa) in 1962-63, and partly to the expansion of the Sindri factory and Fertilisers and Chemicals Travancore Ltd. (F.A.C.T.). The beginning made in the production of a complex fertiliser at Ennore (Madras) also made a modest contribution to the total.

Table I: *Production of Fertilisers in India*
(In metric tonnes)

Plant food	1963-64*	1962-63	1961-62	1960-61
Nitrogen (N)	239,275 (66.3)	194,194 (68.7)	154,326 (70.2)	111,987 (67.6)
Phosphoric Acid (P_2O_5)	121,840 (33.7)	88,301 (31.3)	65,360 (29.8)	53,722 (32.4)
Total (N+P_2O_5)	361,115 (100.0)	282,495 (100.0)	219,686 (100.0)	165,709 (100.0)

Note:—Figures in brackets represent percentage to the total.
* Estimated.

A region-wise picture of progress shows that, till 1960-61, production of nitrogen was mainly confined to five States—Kerala, Mysore, Punjab, Uttar Pradesh and Bihar, with the last mentioned State contributing more than 70 per cent of the total production. By 1963-64, its share had, however, come down to about 38 per cent, because of the growth of factories in the other States.

Phosphoric Acid

Production of phosphatic fertilisers, in the form of superphosphate, ammonium phosphate sulphate and nitro-phosphate, is, however, in almost all parts of the country. The Southern region accounts for nearly half of the production and the Western region for about one-quarter. The rest of the production is shared by the northern and eastern regions. Upto 1960-61, the production of superphosphate was confined to the States of Andhra Pradesh, Kerala, Madras, Mysore, Gujarat, Maharashtra, Delhi, Bihar and West Bengal. In the subsequent three years, superphosphates factories in Madhya Pradesh, Uttar Pradesh and Assam also went into production. The only States not producing superphosphate are Jammu and Kashmir, Himachal Pradesh, the Punjab, Rajasthan and Orissa. It will be seen from Table I that production of phosphates, in terms of phosphoric acid, showed an increase from 53,722 metric tonnes in 1960-61 to 88,301 metric tonnes in 1962-63 and still further to 121,840 metric tonnes (estimated) in 1963-64, the net gain during the period being 127 per cent. Even so, it falls far short of the target for 1963-64 by 106,800 tonnes, the achievement being only a little over 53 per cent. From the level attained in the third year of the third Plan, the Plan target of 406,400 tonnes seems to be a far cry. All regions have shared in the increase in the production of phosphoric acid, but more particularly in the northern and eastern regions, due to the completion of new superphosphate factories at Unnao in Uttar Pradesh and Chandrapur in Assam.

Trend of Consumption

The quantum and pattern of consumption of fertilisers in India are indicated in Table II. It will be seen that consumption of nitrogen increased by about 41 per cent from 231,817 metric tonnes in 1960-61 to 327,774 metric tonnes in 1962-63 and still further to around 440,000 metric tonnes (estimated) in 1963-64. As compared with the base year, the net increase during the year under review was about 90 per cent. The share of nitrogen in the total consumption of plant foods is about 71 per cent. A region-wise analysis of consumption of nitrogen does not indicate any particular pattern which is more or less dependent on the availability of nitrogen under the Central Fertiliser Pool formed to regulate the distribution of all available supplies. The southern region accounts for about half of the total consumption of this variety, the intake of the northern, western and eastern regions being 21, 17 and 12 per cent respectively. The important individual States consuming nitrogenous fertilisers are Andhra Pradesh, Madras, Uttar Pradesh, Maharashtra and the Punjab. These States together consumed nearly 65 per cent of the total nitrogen consumed in the whole of India in 1962-63. The average consumption of nitrogen per acre of cultivated land is 1.72 lb. in India. It is the highest in Andhra Pradesh (5.07 lbs.), followed by Madras (5.06 lbs.), Kerala (3.25 lbs.) and the Punjab (2.31 lbs.). The other States, consuming more than a pound are Delhi, Uttar Pradesh, Mysore, West Bengal, Bihar, Gujarat and Maharashtra. The third Plan envisages the consumption of nitrogen to go up to 1,016,000 metric tonnes, but, by the end of the third year, it was only 440,000 tonnes, that is, well below 50 per cent of the target. It will be observed from the data given here that the States in the South are more fertiliser-minded than the others. But the Association is of the view that, "given a free market," the pattern of consumption may be different.

Table II: *Consumption of Fertilisers in India*
(In metric tonnes)

Plant food	1963-64*	1962-63	1961-62	1960-61
Nitrogen (N)	439,800 (70.2)	327,774 (71.4)	307,077 (76.5)	231,817 (72.5)
Phosphoric Acid (P_2O_5)	130,580 (20.8)	91,159 (19.9)	63,580 (15.9)	53,804 (17.1)
Potash (K_2O)	56,500 (9.0)	39,940 (8.7)	30,443 (7.6)	29,583 (9.4)
Total (N+P_2O_5+K_2O)	626,970 (100.0)	458,873 (100.0)	401,100 (100.0)	315,204 (100.0)

Note:—Figures in brackets denote the proportion of each plant food consumed to the total.
* Estimated.

Consumption of phosphoric acid (P_2O_5), in the form of phosphatic and complex fertilisers, showed a marked improvement in 1962-63 as against the two previous years. Whereas in 1961-62, it stood at 63,580 metric tonnes as against 53,804 metric tonnes in 1960-61, it increased to 91,159 metric tonnes during 1962-63, showing an increase of about 43 per cent. There was a further increase of 43 per cent in 1963-64 taking the total to 130,580 metric tonnes. Nevertheless, it does not look as though the third Plan target of 406,400 metric tonnes is likely to be hit in 1965-66. The consumption pattern for phosphoric acid is determined by the free-play of the market forces of demand and supply. All the regions have shown an increase in consumption of this plant food during the last four years. As in the case of nitrogenous fertilisers, so also in the case of phosphatic fertilisers, the Southern States had the lead in consumption. Thus, a little less than half of the entire quantity of phosphate consumed in the country during 1962-63 was in the South, the western, eastern and northern regions consuming 26, 12 and 9 per cent respectively. Nearly 26 per cent of the all-India consumption in 1962-63 was in one State, namely, Andhra Pradesh, as against 28 per cent in the previous year. This State is followed by Madras, Mysore, Gujarat, Maharashtra and West Bengal which taken together account for about 46 per cent of the total consumption of phosphoric acid. About 17 per cent of total consumption is accounted by Kerala, Madhya Pradesh, Punjab, Uttar Pradesh and Bihar and about 4 per cent by Rajasthan, Jammu and Kashmir, Assam, Orissa and Union territories. The remaining 7 per cent is used in the mixtures prepared by the superphosphate manufacturers. On the whole, consumption of phosphoric acid has been steadily increasing. The per-acre figure for the whole country is 0.43 lb. It is highest in Andhra Pradesh (1.55 lb.), followed by Madras (1.09 lb.), Kerala (0.76 lb.), West Bengal (0.76 lb.), Gujarat and Maharashtra (0.57 lb.) and Mysore (0.49 lb.). Other States have a per-acre consumption of below 0.30 lb.

Potash

Potash is another chemically produced plant food. Its importance will be clear from the following quotation from the annual report of the Fertiliser Association of India:

"Consumption of this fertiliser is more or less confined to a few States in India. They are Kerala, Madras, Mysore, Maharashtra, Bihar and West Bengal which account for about 90 per cent of the fertiliser consumed in India. This is rather a sorry state of affairs considering that as the can and phosphoric acid is increased, the existing deficiency of other plant nutrients, viz. nitrogen sumption of potash will increase further and soils will be depleted of potash. Unless potash deficiency is restored in the beginning itself, it will require much more effort to correct potash deficiency at a later stage. Every effort should, therefore, be made to increase the consumption of potash in the country."

Production of potash in India is very negligible at present and whatever little is consumed (for actual figures see Table II) is met mostly out of imports.

Although consumption of potash in the form of muriate and sulphate in 1963-64 at 56,500 tonnes was 93 per cent more than in 1960-61, it was only a little more than one-fourth of the target of 203,300 tonnes assumed in the third Plan for 1965-66. In the case of this type of fertiliser, too, the southern region has been leading. It consumed nearly 75 per cent of the total quantity available, though with the gradual increase in consumption in other regions, the share of southern region will go down in the coming years.

Table III: *Import of Fertilisers*
(In metric tonnes)

Plant food	1963-64	1962-63	1961-62	1960-61
Nitrogenous	717,783 (24.65)	796,505 (24.56)	342,505 (10.45)	314,930 (9.70)
Phosphatic	27,965 (1.01)	16,779 (0.65)	1,376 (0.05)	2,654 (0.05)
Potassic	75,083 (1.82)	81,158 (2.04)	53,465 (1.40)	33,957 (0.92)
Total	820,831 (27.48)	894,442 (27.25)	397,346 (11.90)	351,541 (10.67)

Note:—Figures in brackets denote value of import in crores of rupees.

Consumption of fertilisers in India is grossly inadequate. Even in the South which ap-

(*Continued on page 339*)

L. & T. MAKES STRIKING PROGRESS

DIVIDEND RAISED—RIGHTS ISSUE ON WAY

A SIXTY-TWO per cent rise in production, a 40 per cent increase in sales and a 67 per cent improvement in gross profit amply justify the conclusion: the progress is striking. And this is precisely what Larsen and Toubro Ltd. [Managing Agents: Messrs. L. & T. (Management) (Private) Ltd., Bombay] has achieved during the year ended 31st March 1964. Sales have spurted from Rs. 582.38 lakhs to a new record of Rs. 820.74 lakhs, the increase having accrued very largely from higher sales of own products. Together with servicing, etc., the total turnover shows, however, limited growth from Rs. 740.74 lakhs to Rs. 859.02 lakhs, because against Rs. 121.80 lakhs charged for completed contracts in the previous year, there is no corresponding figure for the year under review as the current two large contracts—the instrumentation of the Barauni refineries and the mechanical and electrical erection and instrumentation of the thermal power station at Korba—are still in progress. Profit shows a greater rise than sales, because, apart from the higher proceeds of own product sales, there has also been a reduction in production cost during the year.

Provision for taxation, including Rs. 1.45 lakh on account of the year's equity dividend, Rs. 4.90 lakhs for sur-tax and Rs. 1.50 lakh for prior years, amounts to Rs. 50.50 lakhs, as against Rs. 24.40 lakhs in the previous year. The substitution of S.P.T. by sur-tax has to some extent reduced the tax liability, but the burden on the Company and its subsidiaries is still heavy and hampers their ability to expand. Net profit, as a result, is higher by only Rs. 15.18 lakhs at Rs. 42.31 lakhs. The transfer to reserves has been doubled from Rs. 8.30 lakhs to Rs. 16.54 lakhs. At the same time, the dividend on the 10-rupee ordinary shares has been slightly raised by one point to 15 per cent per annum, subject to tax. Since this dividend covers a full year's distribution on the 550,000 shares allotted and fully paid up in August 1962, the total cost of dividend has increased from Rs. 19.25 lakhs to Rs. 24.75 lakhs. The equity and preference dividends absorb Rs. 25.72 lakhs and are to be paid out of dividend reserve to which a sum equal to this total liability has been transferred from the year's profit. If the tax on distribution of dividend on equity shares is continued, the current year's tax liability will increase by Rs. 1.86 lakh which is more than one per cent of the equity capital.

The salient features of the Company's progress in the past four years are presented in the table below:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales, servicing charges, etc.	859.02	740.74	571.40	351.08
Other income	49.40	34.17	25.89	19.48
Work-in-progress	69.98	39.59	134.60	100.57
Materials, trading goods and stores consumed	541.05	385.86	333.12	190.38
Salaries, wages and benefits	150.08	120.28	144.94	84.31
Other expenses	130.21	103.52	94.13	68.96

Low	20.12 X.R.	20.52	20.48 X.R.	33.75	25.75

Mr. H. Holck-Larsen, Chairman of the Company, informs the shareholders that expansion in the Company's activities between 1960-61 and 1963-64 has necessitated a doubling of the equity capital from Rs. 80 lakhs to Rs. 165 lakhs and led to an almost threefold rise in production, sales and profit, before tax. The forecast of production and sales for the following three years, he notes, also shows an encouraging picture. A comprehensive three-year plan for financing expansion covering an increase in the capacity at Powai, additional facilities for sales and servicing of Caterpillar equipment and improvement and expansion of the Madras workshop envisages issue of additional shares, arranging further medium and long-term loans and securing adequate banking facilities. To begin with, it is proposed to issue 660,000 equity shares of Rs. 10 each for cash at a premium of Rs. 2 per share (in the proportion of two for five), which would bring an amount of Rs. 79.20 lakhs. From the State Bank additional cash credit facilities were obtained during the year and medium and long-term loans are expected to be arranged in future. Mr. Larsen writes: "From the progress of the past, I see the promise of the future.... I feel confident of our future growth and strength." The Directors say in their report that they are reasonably hopeful of maintaining the dividend for the current year on the increased capital.

All manufacturing units at Powai, it is claimed, operated during the year with increased efficiency. Now they have reached or exceeded their production targets. The manufacturing activities here have been organised into two major units—general workshop and switchgear factory. The general workshop was fully occupied with the fabrication and assembly of plant and equipment for the chemical, pharmaceutical and food processing industries. The switchgear factory increased the production of switchgear, motor starters, control and instrument panels and kerbside petrol dispensing and metering pumps. Production of switchgear equipment exceeded the target and the factory requires a further expansion to meet the increasing demand. The general workshop also assists the contracting division to undertake 'turn-key' jobs—from design and fabrication—to complete erection and commissioning of plant and equipment. The contract from M.P. State Electricity Board for the mechanical and electrical erection and instrumentation of the 200 M.W. thermal power station extension at Korba, valued at Rs. 140 lakhs, and the contract for instrumentation of the Barauni refineries, valued at Rs. 31 lakhs, are progressing satisfactorily. Some smaller contracts of this type are also in progress.

As for the subsidiary companies, it is proposed, because of the tax disadvantage, either to merge one subsidiary with another or to merge all of them with the Company at a favourable time. Their progress during their completed years has been satisfactory.

From the wholly-owned Alu Capsules Ltd., which manufactures, in addition to bottle capsules from aluminium foil, press tools, jigs, fixtures, plastic bakelite moulds and dies for pressure die castings in collaboration with Interfonda Ltd., Switzerland, the Company received Rs. 3.27 lakhs as selling agency commission and Rs. 75,000 as dividend on the paid-up capital of Rs. 7.50 lakhs.

Taking advantage of the clause contained in the Finance Act 1964 for exemption from the provision of the Income Tax Act requiring compulsory distribution of dividends, the 51 per cent-owned Christensen-Longyear (India) Ltd., manufacturing drilling equipment and diamond drill bits in collaboration with E. J. Longyear Company, U.S., and Christensen Diamond Products Company, U.S., respectively, declared no dividend but paid the Company Rs. 6.57 lakhs as sole selling agents' commission. Between them, the collaborators hold the balance 49 per cent shares.

In order to conserve resources, the wholly-owned subsidiary, Engineering Construction Corporation Ltd., which showed a substantial increase in civil engineering and contracting business during the year ended 30th September 1963, declared no dividend and in May 1964 doubled its paid-up capital to Rs. 10 lakhs. It is extending its operations by collaborating with reputable foreign companies for large civil engineering works.

The India Crown Cork Company Ltd.'s production and sales increased during the year and the Company earned Rs. 3 lakhs as selling agency commission and Rs. 58,500 as dividend on the paid-up capital of Rs. 5.85 lakhs entirely owned by it. In its operations, this subsidiary is handicapped by inadequate supply of tinplates.

The progress of associate companies also continues to be up to expectations and there is a steady increase in the Company's income by way of selling agency commission and dividends.

Audco India Ltd., the 50-50 joint venture with Serck Ltd. of the U.K., paid Rs. 1.45 lakh as commission and Rs. 15,000 by way of dividend from tax-empt profit. It has plans in hand to widen the range of products which are lubricated taper plug valves for different industries.

Eutectic Welding Alloys of India Ltd., formed in collaboration with Castopar Societe De Participations Et D' Etudes Castolin S.A., Lausanne, Switzerland, for manufacturing low temperature welding alloys and fluxes for gas and arc welding, is expected to start production, delayed by the non-receipt of import licence, by the end of this year.

The Government has approved of the Tractor Engineers Ltd.'s collaboration agreement with the American Caterpillar Tractor Company, for obtaining know-how, specifications and designs for manufacturing parts for Caterpillar tractors. For increasing production from additional plant and machinery its factory is to be shifted from Sion to a new location in Powai.

From Tractor and Equipment Corporation Ltd., supplying Caterpillar and allied machines and their parts to Government bodies, the Company received Rs. 4.39 lakhs by way of dividend and commission on sales.

Strikes and riots at Rourkela between January and April 1964 caused a temporary but severe setback to the gradual increase in production of Utkal Machinery Ltd. During the year, it was entrusted with the manufacture of a major portion of components for blast furnace No. IV for the Rourkela steel works. The Company earned from it Rs. 1.24 lakh as selling agency commission which in future will rise with the anticipated increase in sales but the dividend may not come by for some years.

The parent Company's paid-up capital, including Rs. 15 lakhs in two types of preference shares, amounts to Rs. 180 lakhs and is backed by reserves and surplus (excluding dividend reserve of Rs. 25.72 lakhs) aggregating Rs. 112.40 lakhs. As against this, the gross block of Rs. 234.04 lakhs (Rs. 192.60 lakhs a year before) has been written down to Rs. 156.85 lakhs and, together with capital work-in-progress, the net block is shown at Rs. 171.60 lakhs. Current assets, loans and advances are shown at Rs. 666.79 lakhs and investments at Rs. 127.88 lakhs and together they exceed the total indebtedness, including borrowings of Rs. 315.46 lakhs, by Rs. 120.80 lakhs. Out of the total investments, Rs. 127.73 lakhs are in subsidiaries and associate companies. These, together with loans and advances to the subsidiary and associate companies bring the Company's total investment in their fixed assets to Rs. 234.04 lakhs.

Currently quoted at over 100 per cent premium at Rs. 21.68 *cum-div.*, the Rs. 10 fully paid ordinary shares of the Company offer a net yield of 5.8 per cent per annum.

PARSONS-I.B.I. PRIVATE LTD.

The Indo-Berolina Industries (Private) Ltd. of Bombay, a well-known engineering house in the chemical field which supplies chemical plant and equipment, has launched, in collaboration with the world-renowned Ralph M. Parsons Company of the U.S.A., a new engineering and construction company, known as the Parsons-I.B.I. Private Ltd. This was disclosed by Mr. D. T. Javeri, Executive Director of the Company, at a Press conference in Bombay on Friday last week. The Government of India has already given its approval and the new company is expected to be registered shortly with a capital of Rs. 10 lakhs, of which half will be contributed by the American firm.

The new company proposes to offer to the Government and private industrialists in this country a wide range of services on petroleum refineries and processing units, petro-chemical plants, chemical plants, off-site facilities, power generation and material handling systems, metallurgy and ore processing engineering, etc. The services cover economic feasibility surveys of proposed projects, arrangements for obtaining the best know-how for the projects, designing and engineering of projects, procurement of the best equipment on global basis, maximum fabrication of equipments indigenously, construction of the entire plant on a turn-key basis, and start-up and commissioning of plant to give the guaranteed output in terms of quality and quantity based on stipulated consumption of raw materials and other off-site facilities.

BOTANIUM RETURNS CAPITAL

It will be recalled that, in an extraordinary general meeting of the Botanium Ltd., held on the 10th January 1964, it was decided by the members to reduce the paid-up capital by returning to shareholders Rs. 4 out of Rs. 5 paid-up on shares with a face value of Rs. 10 each. This followed the decision of the Company not to proceed, for the time being, with the project for establishing a titanium dioxide plant. But this reduction of capital did not affect the 300,000 fully paid-up equity shares allotted to Laporte Industries Ltd., London in lieu of the "know-how" of manufacturing process acquired by the Indian Company from that company. The "know-how" and technical collaboration agreements, entered into between the Botanium Limited and the London firm, would continue to stay for a further period of five years, when they will expire, if it is finally decided by the Company not to proceed with the project.

In their report to the shareholders covering the year ended 31st March 1964, the directors of the Company say that the scheme for reduction of capital was approved by the High Court in April last and that the work of repaying Rs. 4 per share to the shareholders has now been practically completed.

BATALA ENGINEERING CO., LTD.

The Batala Engineering Company Ltd. (a subsidiary of the Mukand Iron and Steel Works Ltd.), which manufactures machine tools, proposes to expand and diversify its activities. The total cost of the expansion projects is put at Rs. 162 lakhs. In order to meet a part of the funds required, the Company is entering the capital market shortly with a public issue of Rs. 7.39 lakhs; the list for subscription will open on the 28th inst. The Company is setting up a factory at Balabgarh near Delhi to manufacture open side hydraulic planers and geared-head lathes. Its application for import of equipment worth Rs. 39.36 lakhs (subject to availability of foreign exchange loan of Rs. 22.05 lakhs) has been approved in principle by the Central Government.

ANGLO-INDIA JUTE MILLS

PROFIT-MARGIN RECEDES

IN common with most jute companies, the Anglo-India Jute Mills Company Ltd. (Managing Agents: Messrs. Duncan Brothers and Co. Ltd., Calcutta) has suffered a sharp setback in its fortunes during the year ended 31st March 1964. The gross turnover has decreased by no less than Rs. 86.00 lakhs to Rs. 782.52 lakhs and, although the closing stocks of gunnies have been marked up from Rs. 33.29 lakhs to Rs. 42.81 lakhs, the gross profit has dropped by about a third from Rs. 97.85 lakhs to Rs. 66.03 lakhs. The profit margin (ratio of gross profit to gross sale) is, therefore, lower at 8.4 per cent, as against 11.3 per cent for the preceding year. What has brought about this reduction is, of course, the increase in the cost of labour, following the implementation of the Wage Board award, as well as rise in the cost of power and other materials. Consequent on the decrease in gross profit and also because of the rise in the provision for depreciation (from Rs. 15.13 lakhs to Rs. 23.47 lakhs), the provision for Managing Agents' commission has declined from Rs. 8.14 lakhs to Rs. 3.90 lakhs and that for taxation is as low as Rs. 17.13 lakhs, as against Rs. 38.14 lakhs the year before. Thanks to these sizable reductions in essential provisions, the net profit is lower at Rs. 18.53 lakhs, as against Rs. 35.44 lakhs. Out of this, a sum of Rs. 8.15 lakhs (as against Rs. 27.74 lakhs for 1962-63) has been credited to reserves and a further Rs. 3.64 lakhs has been earmarked for the payment of preference dividend. The ordinary dividend has been maintained at 12 per cent, subject to deduction of tax, but, since it is payable on an enlarged number of shares following the one-for-five bonus issue in the preceding year, the actual amount claimed is higher at Rs. 7.09 lakhs, as against Rs. 5.90 lakhs previously. The carry forward is naturally lower at Rs. 55,893, as against the Rs. 90,773 brought in.

The working results of the Company for each of the past four years are set forth in the following comparative table:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961

The Company's balance-sheet as at 31st March 1964 shows that its paid-up share capital aggregates Rs. 99.05 lakhs, of which Rs. 40.00 lakhs are in preference shares of Rs. 100 each and Rs. 59.05 lakhs in ordinary shares of Rs. 100 each, including the 9,842 shares issued during the year as bonus shares in the proportion of one for every five held. With the backing of Rs. 115.86 lakhs in reserves, this makes Rs. 214.91 lakhs as the shareholders' funds. As against these, borrowings aggregate Rs. 175.52 lakhs and current liabilities another Rs. 191.10 lakhs, so that the outside interest totals Rs. 366.62 lakhs. This is more than fully covered, on the assets side, by the total of current assets and loans and advances which, as at the date of the balance-sheets, stands at Rs. 369.47 lakhs. Investments are carried in the books at a cost of Rs. 70.29 lakhs, comprising Rs. 2.70 lakhs in Government securities, Rs. 32.08 lakhs in shares of Isaac Holdens Ltd.—now Woolcambas of India Ltd.—and the balance in unquoted shares of a subsidiary. Additions to fixed assets during the year aggregated Rs. 32.77 lakhs, including Rs. 1.56 lakh as the cost of capital work-in-progress transferred on completion and this has raised the block account to Rs. 373.88 lakhs. On deducting therefrom Rs. 233.71 lakhs as the depreciation earned to-date, the net block amounts to Rs. 141.77 lakhs, inclusive of Rs. 1.60 lakh as the value of capital work-in-progress at the end of the year.

The Company's subsidiary, Landale and Clark Ltd., had another successful year's trading and earned a profit of Rs. 8.67 lakhs before providing for taxation. One year's preference dividend was proposed to be paid. The results of Isaac Holdens (India) Ltd., in which the Company has substantial interest, were satisfactory during the year ended 31st December 1963 and a maiden dividend of 5 per cent was received.

Commenting on the prospects for the Indian jute industry, the Directors observe that, although internal demand is improving, the challenge to our export markets for sacking continues to grow on account of the rapid development of jute industries in other consuming countries. They make special reference to the rapid expansion of Pakistan's capacity for the production of sacking and its ability to produce goods at comparative cheaper cost. They further state that, while demand for good quality carpet backing continues to exist, production in India appears at present to be more than adequate to meet current overseas requirements. As for prospects for the current year they inform that, at present levels of prices, trading margins are disappointing and prospects must, therefore, be viewed with extreme caution. The forecast for the season's crop is satisfactory. Export prospects for sacking continues to be a matter of concern, but local demand is expected to maintain itself at encouraging level. Offtake of hessian will continue to be governed primarily by the level of American consumption, which has not been encouraging of late. But with no recession in the American economy and with the growing support of Argentine and Russian markets, a steady demand is expected.

The present quotation for the Rs. 100 paid shares of the Company is Rs. 167 *cum-div.* On an *ex-div.* price, the net yield works out to 6.1 per cent per annum.

(*Concluded from next column*)

quotas set by the Jute Commissioner caused acute embarrassment to the mills. Results for the current year indicate ever-increasing competition, with the result that the margin of profit which can be earned in both hessian and sacking still continues to diminish. Fortunately, there are indications that more countries are beginning to take an interest in Indian jute goods and it is hoped that the strenuous efforts being made by the Government and the Indian Jute Mills Association will result in the creation of new markets, particularly for sacking, to replace those already lost. The Directors, however, are of the opinion that, unless positive steps are taken to offset the large price advantage enjoyed by our overseas competitors, it will be difficult to retain such markets and to prevent further erosion of the established ones.

Some additions were made during the year to machinery installed and extensive repairs were also carried out to both plant and buildings. The sewing capacity of the factory is being increased and an application has been made for licences to import further preparatory machinery. Orders have also been placed for additional spinning frames to increase the capacity for non-standard items. Arrangements are in hand for the constructions of extra godowns to accommodate the increased stocks of jute that must now be held.

The paid-up share capital of the Company continues to stand at Rs. 91.88 lakhs, of which Rs. 26.25 lakhs are in two classes of preferences shares of Rs. 100 each and the balance is in equity shares of Rs. 10 each fully paid up. Reserves have risen to Rs. 51.91 lakhs from Rs. 46.01 lakhs a year ago. Own funds thus total Rs. 143.79 lakhs, as against which the outside interest is only Rs. 105.84 lakhs. This comprises Rs. 29.74 lakhs as loans and Rs. 76.10 lakhs as current liabilities and provisions. On the asset side, current assets and loans and advances aggregate Rs. 164.93 lakhs, while investments, including partnership capital of Rs. 15.08 lakhs, are shown in the balance-sheet at a cost of Rs. 21.89 lakhs. As a result of additions worth Rs. 2.30 lakhs made during the year, the block account stands raised to Rs. 233.65 lakhs and, on deduction of Rs. 170.88 lakhs as the depreciation earned to date, yields a net block of Rs. 62.77 lakhs. Machinery awaiting installation is valued at Rs. 4,578.

The Rs. 10 paid ordinary shares of the Company are currently quoted at Rs. 16 *ex-div.* and fetch a net annual return of 6.2 per cent on a fresh investment.

HOWRAH JUTE'S PROFIT LOWER

BUT DIVIDEND RAISED

THE working results of the Howrah Mills Company Ltd. (Managing Agents: Messrs. Jardine Henderson Ltd., Calcutta) for the year ended 31st March 1964 are heartening, though they reflect the impact of the further increase of Rs. 30 per ton in costs of production due to the award of the Wage Board for the jute industry, which became operative from 1st July 1963, the implementation of the schemes to ensure a higher standard of quality of finished products, and the increases in lighterage rates and charges for electricity. With production and demand well maintained and a sizable drop in the value of closing stocks, realisation from the sale of products has advanced by over 13 per cent from Rs. 350.74 lakhs to Rs. 396.82 lakhs, but the gross profit has declined by as much as Rs. 15.69 lakhs to Rs. 53.54 lakhs. The ratio of gross sales to turnover (profit margin) has thus dropped by 5.7 points to 14 per cent and this is mainly because staff expenses have risen rather sharply from Rs. 73.98 lakhs to Rs. 89.44 lakhs—for reasons already stated—and other expenses are also up from Rs. 41.98 lakhs to Rs. 45.16 lakhs.

The lower gross profit, accompanied by a higher provision of Rs. 9.29 lakhs (as against Rs. 7.84 lakhs) for depreciation, has, as a matter of course, necessitated a lower provision of Rs. 3.65 lakhs (as against Rs. 4.05 lakhs) for the commission payable to Managing Agents. The provision for taxation at Rs. 24.62 lakhs is likewise lower by Rs. 5.38 lakhs than that a year ago. Although the essential provisions thus aggregate Rs. 37.56 lakhs, as against Rs. 41.89 lakhs previously, they form a much higher proportion—70 per cent, as against 60.5 per cent—of the gross profit and the resulting net profit, therefore, shows a decrease of Rs. 11.36 lakhs to Rs. 15.98 lakhs. Strengthening this by Rs. 3.51 lakhs (Rs. 1.01 lakh) withdrawn from reserves and past provisions, the Directors have credited the reserves with Rs. 8.90 lakhs (Rs. 3.39 lakhs) and have also set aside Rs. 2.39 lakhs for the payment of preference dividend. The ordinary dividend has been stepped up by 2.5 points to 12.5 per cent subject to deduction of tax. This claims Rs. 8.20 lakhs, as against Rs. 6.56 lakhs a year ago.

The following comparative table presents synoptically the changes in the fortunes of the Company during the past four years:

(In lakhs of rupees)

	For the year ended 31st March

* Including Rs. 2.39 lakhs for the year ended 31st March 1962.

During the year under review, production by the industry was maintained at the maximum and the Company continued to operate as many loans as possible having regard to the ancillary machinery installed.

Raw jute supplies were adequate, although quality continued to deteriorate. Prices were maintained at the operational minima imposed by the Government and the resources of the Company were stretched to the utmost to provide fineness and storing space for the stock while it was obliged to hold. In addition to their regular purchases, the Buffer Stock Association continued to operate with consequent increase in the demand on the mills for storage space. As stated earlier, greater emphasis was placed on quality control and on pre-shipment inspection of goods. The Directors state that, while results were achieved, it was here that the declining quality of raw jute supplies became most apparent and the large quantities of jute fit only for sacking production which the industry was obliged to buy to fulfil the

High	5.25	5.28
Low	5.10	5.00

Extracts from the Directors' report: *Crop, Cost and Prices*: A rubber crop of 2,21,220 kgs. was harvested at an estate cost of 205.41 nP per kg. against 2,15,817 kgs. at an estate cost of 196.81 nP per kg. for the previous year. The actual crop harvested till 30th June 1964 is 63,003 kgs. against 62.334 kgs. for the same period last year.

The tea crop harvested was 17,555 kgs. at an estate cost of 381.09 nP per kg. against 20,667 kgs. at an estate cost of 325.17 nP per kg. for the previous year. It was mentioned in the previous report that tea crops were on the decrease because the tea area was being replaced by rubber. The process has since been completed and the tea bushes are being abandoned from next month onwards.

The net average prices realised were 306.59 per kg. for rubber and 397.64 nP per kg. for tea against 322.13 nP per kg. for rubber and 354.80 nP per kg. for tea for the previous year. The demand for latex was not good during the year and hence the lower sales price.

The maximum controlled price for No. 1 sheet remained at Rs. 162.60 per 50 kgs. exclusive of sales tax till 16th December 1963 when prices were decontrolled, but from 19th December 1963 floor prices were fixed which is Rs. 161.50 per 50 kgs.

Minor Products: The Company's cocoanuts and peper have been a good source of income this year enabling it to maintain the profits inspite of increase in cost and decrease in sale proceeds of rubber. The income from this source is expected to show further improvement in further years.

The estimates for the current year are for a crop of 2,05,000 kgs. of rubber at an estate cost of 229.25 nP per kg.

Accounts in brief as at 29th February 1964 are as under:—

§ Upto 7th August 1964.

Extracts from the Directors' report: The Directors regret that, after a period of continued profits aggregating to over Rs. 27 lakhs gross in the previous three years, which enabled the Company not only to wipe off all the previous arrears and deficits but also declare token dividends for the years 1961 and 1962, the results of the year under report are negative and the dividends have to be passed over. The main reason was that the work of installing the bulk of the new machinery under the N.I.D.C. Scheme, commencing trial runs and placing the machinery into working order led to considerable dislocation of work in the first half of 1963. Furthermore, owing to reduction in the actual users' quota for superfine cotton, the number of spindles operating on superfine yarn had to be reduced during the year under report from about fifty per cent to twenty-five per cent of the total spindles. Moreover, the prices of superfine yarn were reduced in February 1963 under the Voluntary Price Control Scheme.

The prices of cloth during the year under report remained unchanged, and pegged at unrealistic levels under the Voluntary Price Control Scheme which has been in force since 9th September 1960 and which provided for stamping of prices at rates determined on the basis of rates prevailing in August 1959. The Scheme intended as a stop-gap measure has been continued for nearly four years. The most important lacuna in the Scheme has been that it ignored the cost factor and involved linking to old sorts while fixing prices of "new" sorts of cloth. The shareholders are aware that a large percentage of the cloth produced by the Mills in 1959 consisted of grey goods. However, under the Voluntary Price Control Scheme, the new processed varieties of cloth introduced in the last two years have been assigned meagre price differentials for processing.

The N.I.D.C. Scheme, which is now almost fully implemented, has resulted in the transformation of the Mills from an obsolete unit into a modern unit. A new American whitin blow room line replacing two old lines is now operating entirely on coarse and medium cottons used in cloth, and the teething troubles in this blow room line have been completely overcome. Practically the entire production of coarse and medium yarn meant for warp purposes in the weaving shed is now spun on new N.M.M. double driven large package ringframes which comprise nearly thirty per cent of the total spindleage of 46,000. Of the remaining spindles, about half have already been renovated and modernised under the N.I.D.C. Scheme. Materials are being received for converting a further 11,000 spindles leaving a balance of only 6,000 spindles to be modernised or replaced.

Accounts in brief as at 31st December 1963 are as under:—

Extracts from the Directors' report: There was no tariff revision during the year. 2,135 new consumers were connected to the mains bringing the total number to 36,201.

Sales: The following table indicates the development of sales of energy since the year 1961-62.

Kilowatt hours sold for the year ended 31st March	Public and private lighting and fans	Motive power and domestic purposes	Total	% increase on previous year
1962	10,471,223	47,945,575	58,416,798	2.14
1963	11,047,655	50,076,980	61,124,635	4.63
1964	12,278,087	57,394,998	69,673,085	13.98

The restrictions on the supply and use of electricity imposed by the Government of Gujarat in March 1961, continued to operate throughout the year under review.

Gujarat Electricity Board:—The Company continued to purchase bulk supplies of power from the Board's thermal station at Utran, which were supplemented from time to time by the Company's Diesel Plant.

The Company's maximum demand on the Board during the year under review, was 13,565 kw. and kilowatt hours purchased were 73,340,000, kilowatt hours self-generated were 3,540,000.

The maximum simultaneous peak load on the Company's system as a whole was 16,700 kw., as against 15,850 kw. during the previous year.

The Company's transmission and distribution systems were maintained in good order and gave trouble-free service. To relieve some of the overloaded distributors and to cater for new demands, several extensions and reinforcements were carried out. At the close of the year, there were 133.368 km. of underground and 89.594 km. of overhead mains. Five new substations were added to the system.

Extracts from the Chairman's review: Despite restrictions and the acute power shortage which prevailed in the South Gujarat area, the Company has had a successful year in 1963-64. The sale of energy was 13.98 per cent higher than the units sold in the previous year. This rate of growth is well above the annual rate of growth recorded during the last seven years. This growth, in spite of overall shortage, has been due to better utilisation of available plant capacity. Such utilisation has been made possible by the judicious use, and good maintenance, of the Company's diesel plant, which, although over 20 years old, is continuing to give reliable and efficient service.

To meet the growing demand, the Company proposes to install a Third Receiving Station with a capacity of 15,000 KVA. The land for this purpose has been purchased and appropriate action is being initiated for the purchase of plant and equipment. Steps are also being taken to lay additional distribution cables and to lay out substations to serve the additional load visualised. The capital required for this expansion is proposed to be financed by Bank borrowings.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.

TREND OF MARKETS

MARGIN ON FOODGRAINS CREDIT RAISED

(*From Our Own Correspondent*)

BOMBAY, 19*th August*

The enhanced ceiling rates for deposits, announced by the Indian Banks Association, have come into effect from Monday the 17th inst. The revised rates (details were given in our last report) are applicable to exchange banks and Indian scheduled banks in category one as specified in the Inter-bank Agreement on Deposits, that is, banks with deposits of Rs. 50 crores or more. Banks in category two (with deposits between Rs. 25 crores and Rs. 50 crores) are permitted to pay ¼ per cent more and banks in category three (with deposits between Rs. 10 crores and Rs. 25 crores) ½ per cent more than the standard rates. The agreement, it may be noted here, does not cover banks with deposits of less than Rs. 10 crores.

Yesterday (Tuesday the 18th inst.), the Reserve Bank of India announced further tightening of control on bank advances against foodgrains, in view of the sharp rise in prices of foodgrains and with a view to checking further possible speculative hoarding of stocks with the help of bank advance. Thus, under the new directive issued to banks, the minimum margins required to be maintained by banks on advances against the security of these foodgrains have been raised from 35 per cent to 50 per cent with immediate effect and those on advances against warehouse receipts covering foodgrains from 35 to 40 per cent. Further, the ceiling limits in respect of advances against "other foodgrains" (that is, other than paddy and rice and wheat) have been reduced and the banks are now required to maintain, during each two-month period commencing from September-October 1964, an average aggregate level of credit against the security of "other foodgrains" which shall not exceed 90 per cent of such level of credit actually maintained in the corresponding two-month period of 1962. Earlier, these ceiling limits had been fixed at 100 per cent of the 1962 level.

The above directive does not seem to have had any significant effect on the short-term money market. Conditions in the market have improved greatly. The supply of money available is quite large and borrowers are obtaining their requirements easily. Interest rates, as a result, have tended to decline. Fresh money is quoted at ¼ per cent and renewals at ¾ per cent, whereas, last week, both were done at ½ per cent. Calcutta is also ruling easy, the call rate standing now at ¾ per cent, as against 4 per cent last week.

Thanks to the comfortable conditions in the money market, the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 18th inst., evoked very encouraging response. The total amount offered (Rs. 4 crores) was exactly double that invited and also accepted. The average rate of accepted tenders was unchanged at Rs. 2.400 per cent per annum. The Intermediate Treasury Bills, too, elicited very good support; the Bills actually sold from the 12th to 14th inst. aggregated Rs. 855.75 lakhs, as against Rs. 353.25 lakhs a week before and Rs. 527.50 lakhs two weeks before.

India's foreign exchange reserves improved by Rs. 27 lakhs to Rs. 94.26 crores during the week ended 14th August. The improvement was entirely in balances held abroad which rose from Rs. 8.53 crores to Rs. 8.80 crores. The foreign securities held in the Issue Department of the Reserve Bank were unaltered at Rs. 85.46 crores. Deposits of scheduled banks with the Reserve Bank went up by Rs. 12.91 crores to Rs. 113.46 crores, while loans and advances obtained by them declined by Rs. 1.77 crore to Rs. 1.89 crore. Notes in circulation recorded a rise of Rs. 33.55 crores, the total being Rs. 2,452.97 crores.

A rise of Rs. 7.03 crores to Rs. 1,736.91 crores in the total credit made available by scheduled banks to their clients occurred during the week ended 7th August. At the same time, there was an increase of Rs. 7.55 crores to Rs. 2,637.91 crores in deposits. Even so, borrowings from the Reserve Bank rose by Rs. 2.03 crores to Rs. 4.03 crores. Investments improved by Rs. 2.85 crores to Rs. 764.21 crores and total cash by Rs. 1.71 crore to Rs. 160.28 crores.

The Gilt-edged market ruled quiet with business on a reduced scale. Values of practically all Central and State loans were unchanged. 3 per cent 1986 encountered selling and declined by 20 P to Rs. 63.30. 4 per cent 1969 eased by 10 P to Rs. 99.80.

In the foreign market, the banks' buying and selling rates for U.S. dollars rose by 50 paise each to Rs. 477.25 and Rs. 480.50 per $100, respectively. In New York, the pound sterling eased again vis-a-vis the dollar, the spot rate declining by 0.220 cent to 278.590-278.620 cents and the three months' forward by 0.110 cent to 278.220-278.250 cents.

BULLION ERRATIC

(*From Our Own Correspondent*)

BOMBAY, 17*th August*

Both silver and gold moved rather erratically during the week under review. Silver, which was marked down last week, picked up some strength on upcountry support, but failed to sustain the same later owing to increased arrivals. Reports of larger inflow of gold depressed the otherwise steady demand for the yellow metal. Dealers, however, felt that this decline was only temporary and that it would move up gradually.

Silver opened the week on a weaker tone at Rs. 256, as against the previous close of Rs. 257.50, but firm enquiries from upcountry centres helped it to advance to Rs. 259. Subsequently, however, it receded and closed at Rs. 257.50, same as last week. The daily average arrivals of silver were 28 bars, while offtake was only 9 bars.

Fourteen-carat gold began at Rs. 71.75, same as last week, and steadily firmed up to Rs. 72.75 on good demand in the earlier sessions. But following reports of better arrivals, gold declined to finish at Rs. 72.25. Primary gold, in unofficial trading, was quoted higher by 50 paise at Rs. 128. Sovereign put on 50 paise to Rs. 93.50.

The international price for gold in the London market was marked lower at $35.07¼. The sterling price, however, gained 1¼d. to 251s. 9d. Both ready and forward silver were unchanged at 112d. and 112¼d., respectively, as also silver in New York at 129.3 cents.

The Union Government has widened the powers vested in Central Excise officers for purposes of seizure and confiscation of gold articles, manufactured in contravention of the sub-rule (2) of Rule 126-B of the Defence of India Rules, by amending these rules. Liquid gold below nine carats in purity will henceforward be covered by this rule. The officers are further empowered to seize and confiscate any article of gold, irrespective of its caratage, manufactured in contravention of the rules.

The following table shows the trend of prices during the week under review:

	19-8-64 (closing)	High	Low	11-8-1964 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER				
Ready (996 fine)	257.50	259.00	256.00	257.50
GOLD				
Ready (14-carat)	72.25	72.75	71.75	71.75
Sovereign	93.50*	—	—	93.00*
London—				
Gold	251s. 9d.	251s.9d.	251s.6¾d.	251s.7¾d.
Silver Ready	112d.	—	—	112d.
Silver Forward	112¼d.	—	—	112¼d.
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

ART SILK YARNS DECLINE

(*From Our Own Correspondent*)

BOMBAY, 19*th August*

Art silk yarns continued to rule easy during the week under review, while staple fibre yarns were firm and cotton yarns steady. The easiness of art silk yarns was due to pressure of sales by spinners and poor offtake. Consumers were said to be only buying the minimum they required. Even the rise in import licence premium from 163 per cent to 175 per cent and rumours of increase in incentives against exports of finished rayon fabrics failed to have any effect. Staple fibre yarns tended to look up following good demand from Surat side.

The Union Ministry of Commerce has informed the General Secretary of the Andhra Pradesh Handloom Weavers' Congress that the Government of India has initiated steps to increase production of superfine counts yarn in hanks in the next few months. It has also stated that 65 per cent of the hank—yarn of superfine counts will be drawn for supplies under the all-India yarn distribution scheme to the handloom industry; the composite and spinning mills have been directed to pack 25 and 50 per cent respectively, of their monthly average packing during the period April-September in each of the superfine counts. The plea to subsidise yarn used by handloom sector has been rejected by the Ministry. In its opinion, it is not possible to augment substantially the supply of high count yarn to meet the increasing demand, particularly as this type of yarn is being produced from imported cotton involving extra expenditure of foreign exchange.

The Art Silk Yarn Distribution Committee, which was set up by the Central Government in 1961 under the Development Council for Art Silk Industry to distribute art silk yarn equitably, has been wound up with effect from Monday this week. The last meeting of the Committee was held in Bombay on Monday. Addressing the meeting, Mr. S. M. Mehta, member of the Committee said that the residual work of the allotment of yarn distribution under the special export promotion scheme would be transferred to the Silk and Rayon Textile Export Promotion Council. The Committee, during its short tenure of three years, had distributed as much as 63.4 million kg. of indigenous yarn out of the total production of 87.0 million kg.

It is understood that the manufacturers of art silk yarn have reached an understanding to the effect that they should not sell at prices lower than those fixed now. The prices fixed per lb. are: first quality bright cone rayon yarn 150D Rs. 4.97 (Rs. 10.82 per kg.); 120D Rs. 5.35 (Rs. 11.77); 75D Rs. 8.56 (Rs. 18.83); dull cone 120D Rs. 6.12 (Rs. 13.46). This move is justified as being necessary to prevent a possible competition among manufacturers and to stop further erosion in the prices of yarns in the open market. Market circles, however, are doubtful about the success of the scheme; since the prices of a few varieties of yarn actually ruling in the market are below the fixed prices.

Imports of art silk yarns into Bombay during the month of July amounted to 456,000 kg. and synthetic yarn to 661,000 kg. W. Germany was the leading supplier of art silk yarn with 288,000 kg. followed by Italy with 84,301 kg. and the U.K. with 44,143 kg. Exports of cotton yarn during the month under review amounted to 290,000 kgs.

Among art silk yarn National Rayon 120D fell by 9 P to Rs. 11.79. South India 120D eased by 13 P to Rs. 13.20. Bright Century 75D shed 6 P to Rs. 18.90. National Rayon 150D was neglected at Rs. 11.07.

In the staple fibre yarn (2 x 34 French count) Section, Vasanta put on 20 P to Rs. 9.22. Sitalaxmi picked up 2 P to Rs. 9.66. Sriram gained 14 P to Rs. 9.35. Pioneer was firm at Rs. 9.35. City, however, receded by 13 P to Rs. 9.48.

Cotton yarns 34 Madura improved by 50 P to Rs. 41. 68s City and Modern were fully steady at Rs. 80 and Rs. 110, respectively. 42s Tuticorin, however, lost 25 P to Rs. 42.50.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	19-8-1964	11-8-1964
Art silk yarn (per kg.)—	Rs.	Rs.
National Rayon 120D	11.70	11.79
Century 75D	18.90	18.98
S. I. Viscose 120D	13.20	13.33
Staple fibre yarn-34 ×2 *French Count* (per kg.)		
Pioneer	9.35	9.35
Premier	9.83	9.87
City	9.48	9.61
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21.00	21.00
17s Modern	28.50	28.50
27s Sasoon	37.00	37.00
34s Madura	41.00	40.50
52s Pioneer	69.30	69.30
68s Finlay	105.60	105.60

OILSEEDS RECEDE

(*From Our Own Correspondent*)

BOMBAY, 19*th August*

Interest in oilseeds has shifted to new crop trading and indications so far point to a comparatively easier trend. Against the current crop groundnuts Khandesh and Karad Bold ready, which are quoted at Rs. 65 and Rs. 62, respectively, transactions have been reported in new crop groundnuts (15th October R/R) at Rs. 48.50 per 50 kg. for Khandesh quality, the quotation for whole October and early November is only Rs. 47. December-January Karad Bold is mentioned at Rs. 44.75, as against the spot price of Rs. 62. Groundnut oil spot is quoted at present around Rs. 2,500 per tonne, while September delivery is mentioned at Rs. 2,375, October at Rs. 2,000 and November at Rs. 1,800, deals in December are said to have been put through at as low as Rs. 1,750 with sellers over. Even the spot market was easy during the week.

Sentiment in new crop groundnuts is apparently induced by optimistic estimates of a crop of 3.6 million to 3.8 million tonnes. Further, exports of groundnut oil from the country are banned. In these circumstances, the tendency for the market will be for a decline in prices and knowledgeable circles say that they will not be surprised if, after the new crop begins to move in the market sometime in November-December, the price of oil declines even to the Rs. 1,500 level. A forecast for so long ahead is, however, difficult, but, looking to the trend in new crop groundnuts and the factors influencing the commodity, the market is likely to remain easy in the months to come. The one factor which may help the market revive is the high prices fetched by mustard oil and, if the trend in mustard oil continues to be firm, it is possible that groundnut oil prices may look up.

It is presumably the weakness in new crop groundnuts that has induced an easy trend in cottonseeds, apart from satisfactory cotton reports. The January 1965 contract has been unable to maintain its levels and declined from the week's highest level of Rs. 101 to Rs. 94.75 on Wednesday. The September contract eased in sympathy to Rs. 90.50. Knowledgeable sources again assert that no visible damage has been done to the long-term outlook for the new contract, but they also say that cottonseeds cannot keep their head high so long as groundnuts lie low. Cottonseeds, they say, could only be sold at a discount of Rs. 100 to Rs. 150 a tonne on groundnuts.

Groundnut extractions have been dull and the market is quiet on overseas advices. Reports from the United Kingdom indicate a price of £37-10 for August-September, £37 for October, £36 for October-November-December, £35-15 for November-December-January and £34-15 for January-February-March with sellers eager and buyers hesitant. East European countries are said to be out of the market at present and they are not likely to come in at least until two months. New crop groundnut extractions were reported on offer at Rs. 370 a tonne for December-January, but buyers were said to be hesitant. The spot quotation at Bombay, however, is Rs. 415, indicating a steady tone.

Castor futures is virtually untraded with the quotation at Rs. 181.50 nominal, but, in unofficial dealings, the trend has been easy. The September contract was mentioned at Rs. 184.75 early in the week with a fairly good volume of business put through, but, later, the contract drifted downwards and, at the time of writing, it was mentioned at Rs. 182.25-182.50. Sentiment was also induced by talk that the present ceiling of Rs. 181.50 valid up to the end of this month would be extended until the close of the contract. In the spot section, Madras Small was easy at Rs. 39.25, as against Rs. 40.25 at the beginning of the week, Bihar Bold at Rs. 38.25, as against Rs. 39.25, Commercial oil at Rs. 17.40, as against Rs. 17.65 and B.S.S at Rs. 18, as against Rs. 18.15. Shippers do not see much prospect for India selling castor oil in overseas markets, in view of the stiff competition from Brazil following the systematic devaluation of its currency. Linseeds futures continued to be dull and price movements did not have much of a meaning in a contract which is consistently quoted just under the permissible

ceiling. The closing rate on Wednesday was Rs. 44.69. In the spot section, linseed oil was easy at Rs. 20 and linseed bold shaded at Rs. 47.50.

This week was a short one with a holiday besides Sunday. The trade is now eagerly looking forward to permission for trading in new crop seeds and, although at one time it was supposed that the Government would think twice before granting permission, the easy trend in the new crop seeds might induce it to relax its attitude. In fact, some market men are so confident that they expect forward deals to start in the course of the next few days. The question is whether the Government would raise the ceilings which have become unrealistic in the case of the running contracts. There is, however, a strong feeling that trading should be freed from ceilings and that prices should be allowed to find their natural levels. But ceilings might lose their meaning if the market were to take a downward turn and the long-term outlook remains bearish. The removal of the ban on exports from Gujarat of solvent extracted groundnut oil and the permission granted for the free movement of *vanaspati* was welcomed. Stocks of raw groundnut oil in Gujarat are said to be around four million tins, while there are said to be about 150,000 tonnes of groundnut kernels. Estimates for the new crop are 1.5 million tonnes of kernels, as against the 950,000 tonnes produced in 1963-64. The trade has been looking forward to the removal of the ban on other items of seeds and oils, but it is doubtful whether the Gujarat Government will alter its policy for the rest of the current year

The following table shows the closing prices of oilseeds and oils as on 19th August as compared with those of the two previous weeks:

	19-8-1964	11-8-1964	5-8-1964
Groundnuts	Rs.	Rs.	Rs.
Nisam bold	63.00	63.75	64.50
Khandesh quality	64.50	65.50	65.25
Oil ex-mill	25.00	25.70	25.80
Oil Rly. Receipt	25.00	25.15	25.30
Castorseed			
September 1964 contract.. ..	181.50	181.50	181.50
Ready Madras	39 25	40 25	40.25
Ready Kanpur	38 25	39 25	39.25
Oil B.S.S.	18 00	18.20	18.10
Oil commercial	17.40	17.65	17.45
Linseed			
September 1964 contract.. ..	44.60	44.84	44.78
Bold ready	47.50	48.25	47.50
Linseed oil	20.00	20.35	20.35
Cottonseed			
September 1964 contract.. ..	90 50	98.00	104.00
January 1965 contract	94.75	100.00	—

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

KIPS EASY

(From Our Own Correspondent)

MADRAS, 17*th August*

Arrivals of kips from the tanneries were of moderate volume and clearance was small. Prices ruled weak. Export business was small and selective, with emphasis on fifths selection in cowhides and fourths in cowcalf skins, at one to two pence below the last prices made. Buffcalf was not in demand, from the usual European or American ports. The holiday mood seems still to persist; and trading has been very halting and slow.

In the skins section also, export business was at a low ebb. There were enquiries for goat 8/9 lbs. and fifths in 5½/6 lbs., but as tanners have been in a well sold position, business booked was small. In the sheep skins section, trading was patchy in middle class tannages and the call for prime and semiprime sheep was not pronounced. Buyers seem to await lower prices to commence economical purchases. Several tanners from South India will be visiting some countries in Europe and U.S.A. next month to augment their export business; it remains to be seen how far their objective will be achieved.

Prices in the raw skins markets ruled shade quiet, as the quality of arrivals was poor.

STRONG DEMAND FOR TEA

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, 13*th August*

A total of 655,000 kgs. was offered in tea sale No. 32 held here on Tuesday the 11th inst. Nilgiri quality was useful, but from other districts it was barely maintained. The market evoked strong general demand for all liquoring teas, especially fannings, but, for the plainer types, it was not so strong as seen in previous weeks. Best highgrowns were sold well at dearer rates. Their fannings were particularly in strong demand and appreciated by up to 40 paise in value. Medium descriptions, meeting only a fair demand, shed a few paise. Their brokens were generally weaker than equivalent fannings. Black leaf B.O.Ps suitable for the Middle East were easier, but selected black fannings were strong and were sold at dearer rates. Orange pekoes were sold well at dearer rates, but flowery pekoes came to a lower market. Unorthodox descriptions were sold well at firm to dearer rates. Tippy teas declined in value.

The quotations (per kg.) were:

	1964	1963
	Rs.	Rs.
Low mediums	4.00-4.20	4.00-4.20
Mediums	4.20-4.50	4.20-4.50
Good mediums	4.55-5.20	4.60-5.40
Nilgiri B.O.P.	4.75-7.00	5.20-9.00

The average price realised in sale No. 32 was Rs. 4.39 per kilo. as against Rs. 4.48 a week ago and Rs. 4.51 in the corresponding sale last year.

In dust sale No. 32 held today, 324,000 kgs. were offered. The market met with strong general demand. Highgrowns were well supported and appreciated in value, sometimes by up to 50 paise. There was good enquiry for all medium sorts and prices were fully firm on last rates. Black leaf types were strong and dearer. Clean unorthodox descriptions advanced in prices, but others were a little irregular and sometimes easier.

The average price realised in dust sale No. 32 was Rs. 4.41 per kilo, as against Rs. 4.32 a week ago and Rs. 3.94 in the corresponding sale last year.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire:

"*Sale No.* 33: 688,000 kgs. offered. Useful demand. Plain and low mediums unchanged. Mediums and good mediums about steady. Highgrowns dearer, with improved quality, particularly fannings. C.T.S. strong and dearer."

TEAS IRREGULAR

(From Our Own Correspondent)

CALCUTTA, 18*th August*

An irregular trend and a fall in prices of certain varieties featured the export sale last week, when leaf on offer aggregated 57,822 packages. The sale opened on a hesitant note. Although good demand was in evidence subsequently, it was less general than the previous week. Whole leaf grades were a strong feature, and prices were fully firm. Darjeelings were readily absorbed. Orthodox teas were firm, but B.O.P. teas and other tippy kinds were below invoices. Selected fannings recorded a small gain, and the plainer teas realised valuations. C.T.C. teas met with fair support and B.P. teas were steadier than fannings, with the best sorts fetching useful prices. The quotations per kg. inclusive of excise duty were: best Assam C.T.C. B.P. Rs. 7.00 to Rs. 8.00; best Assam C.T.C. fanning Rs. 7.00 to Rs. 7.80; medium Assam C.T.C. B.P. Rs. 6.10 to Rs. 6.70; Assam C.T.C. fannings Rs. 6.00 to Rs. 6.50; clean plain pekoe Rs. 5.20 to Rs. 5.60; plain B.P. Rs. 4.40 to Rs. 4.70; and plain fannings Rs. 4.10 to Rs. 4.40.

Dusts on offer during last week's internal sale aggregating 31,580 chests met with limited demand and prices with a few exceptions were lower. All C.T.C. teas eased by about 40 P., while legg-cut teas were shown good attention. Plain orthodox teas were firm, while medium Assams were irregular. The quotation per kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.30 to Rs. 6.60; medium Assam C.T.C. dust Rs. 5.50 to Rs. 5.90; medium Assam dust Rs. 4.90 to Rs. 5.70; legg-cut dust Rs. 4.90 to Rs. 5.30; and plain orthodox dust Rs. 4.20 to Rs. 4.50.

Tea output in North East India this year is expected to be 600 million lbs. Up to the end of July production was 226.57 million lbs. as against 195.63 million lbs. in the corresponding period in 1963. However, output in South India is lagging behind last year's level. The industry in North East India has been unusually affected by floods in this year, and some loss of production is feared on account of limited plucking. Weather reports for July refer to heavy rains in tea districts due to which transport has been affected. That explained why tea arrivals in this week failed to come up to earlier expectations despite increased crop.

Demand was again irregular during yesterday's export sale when leaf on offer was 66,066 packages. Prices of orthodox B.O.P. teas and O.F. teas gave way in line with quality, while Assam brokens and fannings were sought at firm rates. Plainer sorts were quiet. Good support was accorded to the best C.T.C. teas, while the rest of this category recorded an irregular trend. Legg-cut teas met with support at lower rates. Whole leaf grades were absorbed at lower rates, with little support being accorded to the higher priced teas. Darjeelings were taken at about last rates. The quotations per kg. inclusive of excise duty were: best Assam C.T.C. fannings Rs. 6.80 to Rs. 7.80; medium Assam C.T.C. fannings Rs. 5.80 to Rs. 6.50; best Assam C.T.C. B.P. Rs. 6.80 to Rs. 7.80; medium Assam C.T.C. B.P. Rs. 5.90 to Rs. 6.50 clean plain pekoe Rs. 5.10 to Rs. 5.50; plain B.P. Rs. 4.25 to Rs. 4.50; and plain fannings Rs. 4.10 to Rs. 4.30.

METALS BUOYANT

(From Our Own Correspondent)

CALCUTTA, 18*th August*

In line with the buoyancy in world markets, prices in the metal market moved up during the week under review. The steady rise in the quotations for copper on the London Metal Exchange has been so alarming that a break is not foreseen without clear indications of a fall in demand, on substitution. Although world output is rising, the gap between demand and supply is difficult to be bridged in the short term. The news that despite the withdrawal of all Soviet technical help, Red China has embarked on a plan of doubling aluminium output by 1970 is significant. Many other countries having rich reserves of bauxite are likely to show greater attention to aluminium. India has also stepped up its aluminium output, and the setting up of more smelters is envisaged in the next Plan.

The sharp uptrend in prices of non-ferrous metals is hitting hard the industries depending on these metals. India, which is dependent on imports to meet most of her requirements of nonferrous metals, is finding it difficult to maintain her imports at earlier levels. The acute world shortage has led to wide disparity between L.M.E. quotations and the producers' prices to consumers. According to a report from Japan, prices in the Japanese markets are far above ex-mill rates. The Mutsui Mining and Smelting Company stated that the acute shortage in world markets and the buoyancy in prices were forcing Japanese smelters and refineries to raise their prices. It is noted that Japan has desired to link the prices of zinc ores and concentrates imports with the producers' price of £125 a ton. At present, the L.M.E. quotation for zinc is considered as the base to determine the prices of zinc ores and concentrates. However, since the Imperial Smelting Corporation has fixed the price at £125 a ton for direct sale to consumers, and several other zinc smelters have followed this, Japan is feeling the need for revision of prices of ores imports. India, which is exporting ores to Japan, should be concerned with Japan's argument. It was reported that the Mitsubishi Metal Mining Company raised its price for lead ingots by 5,000 yen to 106,000 yen per long tonne for shipment as from 1st August. The Mutsui Mining and Smelting Company raised its ex-mill price for zinc by 5,000 yen to 137,000 yen per long tonne.

On the London Metal Exchange during the week under review, spot zinc opened at £132 a ton, and moved within narrow limits to close at £131. The fact that the quotation did not rise, unlike other metals, showed that the producers' action in arresting the uptrend was having effect. The liberal decision of the Imperial Smelting Corporation to release 875 tons of zinc to the market despite its own heavy commitments to consumers, expresses the Corporation's anxiety to do all it can to stem the uptrend. In Calcutta, the acute shortage explained the rise in the price to Rs. 352.00 per 100 kgs. Utensil copper scrap gained from Rs. 670.00 to Rs. 675.00 and tin from Rs. 3,100 to Rs. 3,150 per 100 kgs. Lead was maintained firm at Rs. 295.00.

Spot copper wire-bars on the L.M.E. rose from Rs. 352½ a ton to £379 as a result of excessive demands and the sharp uptrend in New York futures. However, the gain was partially lost to £367 as the week progressed. Spot cathodes and spot firerefined copper closed higher on balance at £347½ and £305 a ton respectively after opening at £336 and £305, and forging ahead to £355 and £315. Although warehouse stocks in London improved, the buoyancy in prices of metals explained the rise in spot tin from £1,262½ a ton to £1,284. The closure was, however, around £1,272. Spot lead on the L.M.E. rose sharply from £112 to £115½ a ton.

RAW JUTE FIRMS UP AGAIN

(From Our Own Correspondent)

CALCUTTA, 18*th August*

Although trading in the jute goods hedge market was active during the week under review, prices were below the ceilings imposed and thus the question of payment of special margins was not involved. However, speculators accorded much attention to the spot market, and they booked business with mills in all the principal constructions up to March deliveries at very high prices. Although fibre arrivals increased to about 70,000 maunds a day, prices continued to go up. In an attempt to hold the price line, the Jute Commissioner has decided to release the buffer stocks which would be replaced only in February next. As a further measure, the question of issuing maximum purchase quotas is also being considered. The fact that genuine overseas buying of goods at the higher prices continued to be restricted has caused anxiety to the industry. The Indian Jute Mills Association is shortly sending a delegation to the Government of India in an attempt to impress upon the latter the need for assistance to industry. India's exports of sacking goods fell significantly in 1963-64, with biggest losses being recorded in Africa and Western Europe. This was due to keen competition from Pakistan mills, which, it should be noted, increased exports to Africa in the eleven months to May last to 38,620 tonnes from 12,600 tonnes in the corresponding previous period. Although consumption of heavy goods in Australia has been rising, Indian exports had been falling. In respect of hessian, however, Indian exports in 1963-64 showed a sharp increase; in particular, shipments to the U.S.A., the U.S.S.R., the Argentina and Canada increased impressively. There has, however, been evidence lately that, in hessian, too, the Pakistan mills are attempting to under-cut Indian quotations and although Pakistan output of hessian and specialities like carpet backing cloth is insignificant at present, plans are afoot to step-up production of these also. According to Mr. Duncan-Smith, Chairman of the Calcutta Jute Fabrics Shippers' Association, who addressed the annual meeting of the Association last week here, it was the failure of the grain crop in the U.S.S.R. and other East European countries that led to increased purchases of wheat from Canada, the U.S.A. and Australia and thus to the use of more gunny bags.

In July, output of goods in Indian mills amounted 117,700 tonnes, a rise of 10,700 tonnes over June. Hessian increased by 4,800 tonnes to 49,100 tonnes, sacking by 5,200 tonnes to 46,400 tonnes, carpet backing by 300 tonnes to 8,200 tonnes and miscellaneous goods by 400 tonnes to 14,000 tonnes. At the end of June, stocks of goods were 126,300 tonnes and at the end of July these had increased to 135,200 tonnes. In other words, the total availability in the month was 244,000 tonnes and demand was only in the order of 108,800 tonnes, much less than output. This statistical position, coupled with the poor purchases made by overseas buyers so far in this month, is causing grave anxiety to the industry and, considering the heavy stocks of fibre with mills, the buffer stocks and satisfactory crop estimates of the crop, trade as well as official, there is no justification whatsoever for the steep rise in prices. The Indian Jute Mills Association considers the rise as wholly unwarranted and attributes the same to speculative operations in Calcutta arising from fears of reduced Pakistan crop and the rise in prices in that country. Although mills are in need of buying the selected grades, they are purchasing only in niggardly quantities, but speculation is so rife that prices are steadily rising. Prices of goods have also risen, but the consumer-resistance is reducing turnover in goods also. Referring to the recent request of mills to provide adequate foreign exchange to step up imports of fibre from Pakistan, the I.J.M.A. has said that, had only this request been accepted by Government, the industry would have been provided with an opportunity to make purchases from Pakistan at reasonable prices. It is to be hoped that, without further delay, the industry's request would be heeded, so that it can make purchases even now. For all indications are that the up-trend in Pakistan fibre prices would continue.

Despite increased arrivals and meagre support from mills, fibre prices rose as follows: Assam bottoms from Rs. 39.00 to Rs. 41.00 a maund, Daisee bottoms from Rs. 41.00 to Rs. 43.00, and northern bottoms from Rs. 38.00 to Rs. 40.00. If only conditions on the road had been better, arrivals should have increased further, but heavy rains slowed down fibre movements from harvesting areas. With the decision of the Buffer Stock Association to release its entire holdings to mills, mills would continue to accord less support to new crop, but, if arrivals got into the hands of speculative holders, that would mean the continuance of the up-trend at least for some time to come.

Meagre support was accorded to the goods market by overseas buyers. Only little business was done in hessian with U.S. buyers. The U.K. also booked some business. The continued uptrend in Calcutta forced up prices in the New York burlap market, where hessian 40" 10 oz. rose from 12.20 cents a yard to 12.40 cents, and the 7½ oz. from 9.25 cents to 9.40 cents. The fluctuations in the hedge market were within the ceilings fixed earlier. In the ready goods market, B. twills rose from Rs. 130.00 to Rs. 131.25 on Tuesday last following some business with Government. On the other hand, ready hessian fell from Rs. 48.50 to Rs. 48.15. Some business was done with overseas buyers of hessian on Wednesday when the 40" 10 oz. hessian hardened to Rs. 48.75. Government continued to buy B. twills and the price jumped to Rs. 133.00. On Thursday, the East India Jute and Hessian Exchange announced the imposition of heavy margins payable on transactions in raw jute at or over Rs. 37.50 per maund, 40" 10 oz. hessian over Rs. 52 and B. twills Rs. 138. Ready B. twills on Thursday had risen to Rs. 136.50 to ease to Rs. 133.75 on Friday. Hessian 40" 10 oz. also gave way to Rs. 48.75 after rising to Rs. 50.00. Yesterday, although prices remained steady, the news that U.S. burlap consumption in July had fallen and that stocks at the end of the month had risen made speculators cautious. Some interest was in evidence on behalf of U.K. buyers. Hessian 40" 10 oz. was better at Rs. 48.85 and B. twills to Rs. 134.50. The fact that new crop arrivals have tended lately to increase this week and that mills are resisting the higher levels should lead to sobriety in the fibre market, and this, before long, should take down prices of goods to levels that would attract buying by foreign interests against replenishment.

COTTON FUTURES IN TROUBLE

(From Our Own Correspondent)

BOMBAY, 19*th August*

Meagre tenders on the fourth and fifth notice days (13th and 17th August) and unfavourable survey, appeal and super-appeal results lifted cotton futures to still higher levels, bringing about a payment crisis. The squeeze on the bears was so hard and the difference payable was so large that the bears have not been able to meet their commitments. Business in August contract, therefore, came to a standstill on Wednesday. Efforts are being made, at the time of writing, to settle the issue through private negotiations.

Except on the first day of the week when the August contract was subdued due to some squaring up operations, the trend of futures was upwards.

The August contract, which had closed at Rs. 762 per three quintals or 660 lbs. last week, opened the week a shade higher at Rs. 762.50 and, after declining to Rs. 761 on the same day, jumped up to cross Rs. 770 on Monday, the 17th instant, on brisk bear covering and fresh bull buying. A high of Rs. 773 was touched on that day. There was a further rise to Rs. 774.75 on Tuesday and today no business was reported officially in the ring, though unofficially the contract was quoted at Rs. 780.

On the fourth notice day (13th inst.), the tenders issued amounted to only 1,800 bales. Out of the fresh tenders, 800 bales were rejected in survey. On appeals in respect of 2,950 bales till that date, 2,000 bales were rejected. In superappeals in respect of 2,200 bales, 550 bales were rejected. Further tenders to the tune of 6,200 bales were issued on the fifth notice day (17th inst.), which brings the total number of bales tendered till date to 21,050. Appeals in respect of 1,800 bales were conducted, of which 950 bales were rejected. As many as 1,700 bales were rejected in the super-appeals conducted for 2,650 bales. The August contract matures on 25th August 1964. While only two notice days (20th and 24th August) are left, the transactions that are still outstanding are reported to be quite large.

Jarilla March contract did not receive much attention from the operators. This contract moved within a narrow range. Reports of excessive rains in Punjab and Gujarat and in some parts of Maharashtra imparted a little strength to the distant contract, which moved up from Rs. 731.75 at the beginning of the week to a high of Rs. 734.25, before closing at Rs. 732.50. Thus, it gained a net of Re. 1.75 points over the week.

Some mill buying was witnessed in the spot market at Sewri, characterised by enquiries for popular varieties like Digvijay, L.147, 197/3 and Laxmi. The rates in respect of certain varieties per candy of 784 lbs. are as follows:

Hubli Laxmi Rs. 1,080; Bagalkot Co2 uncertified Rs. 1,100; Bijapur new Rs. 1,115; Bardoli Rs. 1,230; Manavdar high breed Rs. 1,771; Baramati Laxmi Rs. 1,550; Anjangaon Rs. 1,190; 45 Malegaon Rs. 970 and Jagadia Digvijay RL Rs. 1,185.

In foreign cottons, mill interests was focussed on new crop African, Sudanese and Pima varieties. About Egyptian cotton, it was understood that the shipment period allowed for the import under the recent global quota of 214,000 bales, would be extended upto 31st March, 1965, if so desired by spinners in India.

Export business remained dull. Bengal *Deshi* remained neglected, following the reduction of export duty on this cotton by Pakistan from July last. There were unconfirmed reports that the export duty here also would be reduced from Rs. 25 per bale to Rs. 12.50 per bale very shortly. The new Bengal *Deshi* crop is estimated by the trade around 550,000 bales. Although the December delivery contract of this variety has been steady around Rs. 737-738, foreign interest in this cotton is generally lacking, while shippers are waiting to see what the Government of India will do in regard to export duty.

FOODGRAINS QUIET

(From Our Own Correspondent)

HAPUR, 17*th August*

Foodgrain prices ruled quiet during the week on selling pressure by stockists. Timely rains earlier this week, brightened kharif crop prospects and stockists were reported anxious to sell fearing Government intervention. Demand from east U.P. was also slack following arrivals of new maize there. Sales of imported wheat through ration shops are being continued, but at times supplies fall short of distribution.

Wheat prices were subdued in early part of the week but, improved slightly at the week-end on good consumers support in face of meagre supply position. Average quality was quoted between Rs. 75 to Rs. 77 and farm produce between Rs. 77.50 to Rs. 81.50 per quintal as against Rs. 43 per quintal at fair-price shops. Daily arrivals averaged 500 maunds a day but stocks in open market were reported as negligible. Firm trend continued to prevail in the rice market and prices touched an all time high level on brisk buying inquiries from east U.P. districts. Prices hardened by Rs. 2.50 to Rs. 4 per quintal, according to quality. Stocks with trade were estimated around 2,000 quintals. Prospects of standing paddy crop were reported better due to beneficial rains. Week-end prices were:—Rice *basmati* superior Rs. 104.49 to Rs. 109.85, *selaj* Rs. 101.81 to Rs. 103.77, *mainpuri* Rs. 96.45, *ramajwayan* Rs. 97.79, *raimunia* Rs. 97.79 and *gadda* Rs. 96.45 per quintal.

Gram prices were subdued on lack of support and prices eased by Re. 1 per quintal and were quoted at Rs. 70.50 for local produce and Rs. 69.50 per quintal for Punjab quality. Both arrivals and stocks, however, were nominal. Barley and *bejhar* prices also drifted lower on poor buying support, and prices ranged between Rs. 61.25 to Rs. 62.50 for barley and between Rs. 61.25 to Rs. 62.50 per quintal for *bejhar*. *Juwar* and *guwar* also moved down as demand for sowings was poor. Prices were quoted between Rs. 64 to Rs. 65 and Rs. 66.08 to Rs. 68 per quintal respectively. Oats and coarse grains prices however were listless in limited trading. Prices in week-end were:—Maize Rs. 62.50 to Rs. 65, *methi* Rs. 57.50 to Rs. 60 and oats Rs. 67.50 to Rs. 70 per quintal.

Steadier conditions continued to prevail in the pulses market and prices registered further gains in all the sections touching new high levels on good buying support in face of dwindling stocks position. Peas prices were steady, while peas *dal* prices hardened on good east U.P. and Madras support. Peas *dara* was quoted between Rs. 65 to Rs. 66 and farm quality between Rs. 66.50 to Rs. 67.50 per quintal. *Arhar* and its *dal* prices also sought higher *levels* as stocks with trade were negligible in face of good demand. *Arhar* prices ranged between Rs. 75 to Rs. 80 per quintal.

SUGAR RISES FURTHER

(From Our Own Correspondent)

HAPUR, 17 *August*

Sugar registered further gains in the open market during the week, due to revival of festival demand and restricted supply position. The prices, in unofficial trading, were quoted at Rs. 180 to Rs. 185 per quintal, as against the controlled price of Rs. 133 to Rs. 140.

Brisk buying support locally and from east U.P. due to tight supply position of crystal sugar accounted for the appreciable gains in *khandsari* in the open market. *Khandsari* was quoted at Rs. 130 to Rs. 170 per quintal and superior sulphur quality upto Rs. 175 in the open market.

The U.P. Government's notification fixing the prices of frozen *khandsari* stocks at Rs. 106 to Rs. 109 and later at Rs. 127 per quintal, which was challenged by *khandsari* traders, was upheld by the Allahabad High Court. Sale of *khandsari* at these prices commenced during the week, and it was reported that 20,000 tons of *khandsari* were given to Madhya Pradesh in exchange for wheat. With a good cane crop in sight and prevailing high prices of the commodity, *khandsari* production was expected to rise in the coming season.

After early easiness, *gur* recorded a steadier trend during the week, on brisk buying support from the consuming areas of Gujarat, Bihar, Saurashtra and Punjab against tight stocks position. The week's offtake aggregated twenty-five wagons mostly to Gujarat and local stocks were now estimated around 4,000 quintals. New *gur* production would commence by the end of September. *Shakker* also advanced by Re. 1.50 per 40 kilogram, in sympathy with *gur*. Stocks however were very small. Week-end prices (in 40 kilogram) were:— *Gur pansera* superior Rs. 37 to Rs. 37.25, average 36.25, *dara* Rs. 35.50 to Rs. 35.75, *kotha* selected Rs. 36.50, dry-wet Rs. 32 to Rs. 33, wet Rs. 29 to Rs. 29.50 and *shakker* Rs. 38 to Rs. 40.50.

ENGINEERING

(*Concluded from page* 324)

Rs. 1,000 an acre in that area.

"It is not clear what Mr. Deshpande means when he speaks of a development in the area and propensity of the people. There will naturally be some increase in income for sometime but neither will it be very high nor will it last long. These points I have explained in some detail in my articles. If there is going to be better communications and housing, somebody has to invest. A prosperous peasantry with high income and capable of paying more taxes can induce such investment. But that is not possible according to my calculations. Nor will industrialists come and invest there, since primary production by subsistence farmers will not provide a big market, except probably for a few rice mills.

"There is no 'balanced' industrial and agricultural sector anywhere in the world. In underdeveloped countries, over 50 per cent of the national income may be generated in the agricultural sector and 70 to 80 per cent of the working population may be engaged therein. In advanced countries, 20 to 30 per cent only of national income will come from agricultural production, with 10 to 30 per cent of labour working there. In high-income countries, the proportion of income spent on food will be low, as compared with the underdeveloped countries with a low *per capita* income. Advanced countries may also depend on food imports, as, for example, Great Britain. During war-time, which is exceptional, other arrangements were and are possible.

"Developmental strategy has to be applied carefully with an eye on resource position and existing conditions. With 70 to 80 per cent of people on subsistence agriculture, with scarce capital resources and enormous disguised unemployment in the rural sector, the obvious remedy is to draw off the excess population towards capital formation and industries. Luckily, foreign aid is not unavailable for such purposes and this is the correct strategy for India. Naturally, with higher capital per head in industry and better land-man ratio in the rural sector consequent on such movement, productivity and *per capita* income will go up slowly. This will help planners to get more savings, further investment and so on in a compound interest fashion. Ragnar Nurske, Arthur Lewis and hosts of other modern economists are now of this view for underdeveloped countries with overpopulation. They stress more on industrialisation and less on heavy investments in agriculture, though nobody denies that better seeds, crop rotation, more fertilisers, better implements and minor irrigation on low-cost investment will improve agriculture to some extent which is very necessary in view of growth of population.

"The principles underlying and the actual capital-output formula of Mr. Deshpande are not clear. Even according to his formula, the rate of return on capital cost of irrigation will be very much below 5 per cent if worked out with actual data, once it is recognised that cost of land after the introduction of irrigation will be at least four to five times the cost of land before irrigation. If the first "x" is Rs. 5,000, the second "x" will be at least Rs. 20,000 or Rs. 25,000.

"The formula misses the essential idea behind capital-output ratio. The concept of capital-output ratio in modern economics is based on an empirical deduction observed over a series of years in advanced countries. It applies to fixed capital like machinery, etc., excluding land, invested in a year and the correlated net addition to the national income. The average of all sectors usually yields a ratio of 3, that is, if Rs. 100 are invested marginally, Rs. 33 are the additional net income. It is generally used in developmental calculations like our Five-year Plans. It may not be a perfect tool but a very useful tool. There are other methods also like the input-output ratio, and cost-benefit ratio. By any of these methods, it will be found that, as compared with industrial investment, investment in large irrigation projects is not very good from all points of view in the present context of India."

SURVEY

(*Concluded from page* 307)

clause in the existing Indian contracts which were worded years ago when some overseas buyers were not entirely familiar with the technicalities of jute manufacture. The other pertains to the delays in financial settlement. Even after financial settlement is reached, there is, it is said, a serious delay in obtaining Reserve Bank's permission for remitting the amount in question to overseas buyers. Surely, it should not at all be difficult for the Reserve Bank to avoid this delay by streamlining its existing procedures, in order to create goodwill among the overseas buyers of Indian jute goods.

It is somewhat disquieting to hear from Mr. Duncan-Smith that the shippers continue to experience much difficulty as regards excise duty. The procedure by which shippers have to take out bonds and produce AR 4 forms to obtain exemption from excise duty entails considerable extra work and expense, quite apart from the additional work and staff required by the Customs and Excise Departments. Since four-fifths of the jute goods produced are exported, could not, one would ask, some simplified scheme be evolved to reduce the expense

Notices

JARDINE HENDERSON LIMITED

NOTICE IS HEREBY GIVEN THAT THE eighteenth annual general meeting of the members of the above-named Company will be held at the registered office of the Company, No. 4, Clive Row, Calcutta 1, on Tuesday, the 29th day of September, 1964 at 11-15 a.m. for the following purposes :—

1) To receive and consider the Audited Accounts for the year ended 31st March, 1964, the Balance Sheet as at that date and the Reports of the Board of Directors and Auditors thereon.

2) To confirm the dividends already paid on the Preference Shares and to declare a dividend on the Ordinary Shares of the Company.

3) (*a*) To appoint a Director in place of Mr. D. Fordwood who retires at the forthcoming annual general meeting.

(*b*) To appoint a Director in place of Mr. I. F. Marriss who retires at the forthcoming annual general meeting.

(*c*) (*As special business*) To appoint a Director in place of Sir Asoka K. Roy who retires by rotation at the forthcoming annual general meeting and in this connection to consider and if thought fit to pass the following resolution of which special notice as required by Section 281 of the Companies Act 1956 has been received by the Company viz. :—

"That in accordance with the provisions of Section 281 of the Companies Act, 1956, Sir Asoka K. Roy who has attained the age of 78 years and who retires from the Board at this time be and is hereby re-appointed a Director of the Company whose period of office will be liable to determination by retirement of Directors by rotation and it is hereby specifically declared that the age limit of the Directors prescribed by Section 280 of the said Act shall not apply to him and that he be remunerated by way of a fee of Rs. 600 for each meeting of the Board attended subject to a maximum in the aggregate of Rs. 6,000 per annum."

4) To appoint Auditors and to fix their remuneration.

Notice is also given that the Share Transfer Books of the Company will be closed from 16th September to 29th September, 1964, both days inclusive.

A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself on a poll and a proxy need not be a member of the Company.

By Order of the Board,
JARDINE HENDERSON, LIMITED,
(Sd.) C. EVANS,
Secretary.

4, CLIVE ROW,
CALCUTTA-1.
13th August, 1964.

Note: 1. The dividend if approved will be payable on and after 23rd October, 1964 to those members whose names are registered in the books of the Company on 29th September, 1964.

2. The explanatory statement required to be annexed to the notice convening the general meeting pursuant to the provisions of Section 173 of the Companies Act 1956 is being forwarded to the members.

THE PULLANGODE RUBBER AND PRODUCE COMPANY LIMITED

(*Incorporated in India*)

NOTICE IS HEREBY GIVEN THAT THE Twenty-first Annual General Meeting of the Shareholders will be held at 11.30 a.m. on Monday, the 21st September 1964, at the Registered Office of the Company at Calvetty, Fort Cochin, to transact the following business :—

1. To receive and adopt the audited Balance Sheet and Accounts for the year ended 31st March, 1964, and the Reports of the Directors and Auditors.
2. To declare a Dividend.
3. To elect a Director.

Note: Mr. R. Sundram Iyer, the retiring Director, is now 77 years of age. Special Notice has been received and is given of the following resolution :—

"RESOLVED that Mr. R. Sundram Iyer, who has attained the age of 77 years, and who retires by rotation, be and is hereby reappointed a Director of this Company, and it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the Companies Act, 1956, shall not apply to him."

4. To appoint Auditors.
5. To consider, and if thought fit, to pass the following resolution as a Special Resolution :—

"RESOLVED that the following Article be substituted in place of Article 50 of the Articles of Association of this Company :—

'On a show of hands, every shareholder present in person shall have one vote; and on a poll, every shareholder present in person or by proxy or by attorney shall have one vote for every ordinary share and five votes for every preference share held by him.'

The relative explanatory statement under Section 173 of the Companies Act, 1956, in respect of the special business under items 3 and 5 above is being posted to all members.

The transfer books and register of members of the Company will remain closed from 8th September 1964 to 21st September 1964 (both days inclusive).

Any shareholder unable to attend personally is entitled to appoint any person (whether a member or not) as his proxy to attend and vote instead of himself, subject to the provisions of Section 176 of the Companies Act, 1956. Such proxy should reach the Registered Office of the Company at least 48 hours before the time fixed for the meeting.

(By Order of the Board),
THE PULLANGODE RUBBER & PRODUCE CO. LTD.,
Per Pro. ASPINWALL & CO. LTD.,
V. P. THOMAS,
Managing Agents.

FORT COCHIN,
17th August, 1964.

Note: The dividend, if declared, will be paid on or after the 12th October 1964 to those shareholders whose names appear in the Company's books on the 21st September 1964 or to their Mandatees.

AGRICULTURAL REFINANCE CORPORATION

THE COORLA SPG. AND WVG. COMPANY LIMITED

CORRIGENDUM

IN NOTICE DATED 7TH AUGUST 1964 RE: Annual General Meeting to be held at 4 p.m. on 11th September 1964 (which appeared in *Commerce* issue of 15th August 1964) the name of the Director of Cowasjee Jehangir & Co. Pvt. Ltd. signing the Notice should read: "G. P. Goenka" and not "R. P. Goenka."

COMMERCE AND INDUSTRY

(*Concluded from page* 331)

pears to be more fertiliser-conscious, the total consumption of plant food is only 5.73 lb. per acre (that is, 6.42 kg. per hectare). How low this intake is will be evident if one compares it with 240 lbs. per acre or (270 kg. per hectare) consumed in Japan, a land of small farmers. Again, consumption is not only low, but it is also ill-balanced. Emphasising this point, the Fertiliser Association of India says:

"The phosphoric acid consumed is nearly one-fourth of the nitrogen and potash consumption is one-eighth of the nitrogen consumption, that is the ratio of N : P_2O_5 : K_2O consumption is nearly 8 : 2 : 1. The consumption of P_2O_5 is about 70 per cent of the nitrogen consumption in Pondicherry and Gujarat, about 50 and 60 per cent of the nitrogen consumption in Assam and West Bengal respectively and between 30 and 40 per cent of the nitrogen consumption in Andhra Pradesh, Mysore, Maharashtra, Goa, Rajasthan, Himachal Pradesh and Orissa. In all other States, the ratio of N : P_2O_5 is below the all-India ratio. In Kerala, the potash consumption exceeds nitrogen consumption, while in Assam and West Bengal it is 65 and 37 per cent of the nitrogen consumption respectively and in Madras and Mysore it is about 25 per cent of the nitrogen consumption. In all the other States, the ratio of N : K_2O is substantially ill-balanced.

Defective Distribution

Apart from inadequate supply of fertilisers in India, the distribution of what is produced and imported, also leaves much to be desired. The distribution set-up is devoid of any advisory mechanism or soil testing techniques in order to guide the farmers who are reluctant to shed old beliefs and embark on newer methods of cultivation. Added to this are the high prices of the fertilisers in this country. Indeed, fertiliser prices in India are said to be the highest in the world. In a recent seminar on the use of fertilisers in Maharashtra held at Bombay, certain problems were highlighted. Although the conference was regional in character, it was national in spirit because the problems are more or less the same in all the regions. The Maharashtra Government gives a subsidy of Rs. 20 per ton on mixtures, superphosphate and nitrophosphate but it is much less than the 33 per cent and 50 per cent subsidies that Ceylon and Thailand give to their paddy growers. The excessive profits made by the co-operatives, through which supplies are regulated, are quite unjustified. It has been observed from the experience of the F.A.C.T. in Kerala that there is definite scope for improvement in the set-up for distribution. The latest decision of the Government of India to appoint a technical experts committee to examine the existing arrangements for the marketing, distribution and promotion of the use of fertilisers for agricultural purposes with the object of evolving a suitable distribution and promotional agency for fertilisers in the fourth Plan period is, therefore, a timely and appropriate step.

TREND OF SHARES

BULLS IN GOOD FORM

(From Our Own Correspondent)

BOMBAY, *20th August*

THE trend of share markets during the week under review was unquestionably bullish. The market maintained a buoyant tone throughout and, in hectic sessions of heavy short-covering and renewed bull support, most of the leading counters crossed their resistance points to establish new high levels in the current upward trend. It looked certain that the market had completed its stage of secondary reaction and resumed its major upward move.

Sentiment in the market was induced mainly by the feeling that Prime Minister Shastri has initiated a policy of realism both in the domestic and external spheres. Efforts at reducing expenditure and the proposal to soft pedal some of the heavy industry undertakings together with the measures to tackle the food situation made a great impression on the market. Further, there were rumours of a supplementary budget sometime next month and the markets seemed to have taken for granted that this budget would be a budget for relief and not one for taxation. Sentiment was further induced by the renewed efforts on the part of the Prime Minister to solve the Kashmir problem and, knowing Mr. Shastri as the markets do, the impression was strong that the solution this time would be peaceful and lasting. At least this was the general feeling on the stock exchanges.

Almost all the speculative counters were active and business was well distributed. Profit-taking trimmed part of the gains late on Thursday but yet the improvement on balance was sizable. Tata Steel, for example, have moved up from Rs. 157.25 to Rs. 162, Indian Iron from Rs. 26.40 to Rs. 27.55, Century from Rs. 625.50 to Rs. 636.50, Standard from Rs. 636 to Rs. 654, National Rayon from Rs. 376.50 to Rs. 384.50 and Telco from Rs. 296 to Rs. 305.50. These levels, however, are well below the highest touched during the week, though some of them in kerb dealings. The highest touched by Tata Steel during the week was Rs. 163.25 but the support level had been around Rs. 153. Indian Iron touched Rs. 27.85 on Thursday, piercing the historic 1962 high of Rs. 27.75. In fact, steel shares led the rise with operators enthused by reports of satisfactory arrangements with the Government in respect of repayment of loans by which no interest would be charged henceforth. Equally in the lead with steels were National Rayon and Century touching in Thursday's session Rs. 386.50 and Rs. 639, respectively, compared with their 8th July levels of Rs. 379 and Rs. 612. Support to these shares was based on hopes of a reduction in the excise duty on rayon but this had been talked about in the market for quite some time. It is difficult to say whether there is anything else in it and if so informed sources which have been bidding up the shares should know better. Textile shares generally followed the lead of Century, with Standard moving up to Rs. 654 against last week's level of Rs. 636 and the 8th July level of Rs. 655. Svadeshi which had spurted into activity a few weeks ago was comparatively calm, although, in sympathy with the general market trend, the quotation moved up by three points to Rs. 263 at the close. There was nothing much doing in Bombay Dyeing which were slightly better at Rs. 59.55. In the cash section of textile shares Dawn shot up into the limelight on rumours of a higher dividend although at the close they were a shade lower at Rs. 169 as compared with the week's high of Rs. 170.

A fillip to sentiment came from reports that the Unit Trust had been receiving encouraging response from small and middle income investors. The fact that the first sale was made at a premium of 3.5 per cent contributed in no small measure to the enthusiasm on the part of operators to bull the market. It was said that electricity shares came in for particular consideration from the Unit Trust, with the result that these shares maintained a firm tone. Among these, Tata Power was the most conspicuous and were taken up to Rs. 1,195 against Rs. 1,180 of last week. The rise in these shares has been to the tune of 40 points over the last few weeks. Similarly, Surat Electricity was bid up from Rs. 110.50 to Rs. 113 while Bombay Suburban gained two points to be quoted at Rs. 112. Sentiment in electricity shares was also helped by talk that, following an amendment to the Electricity Act, the rate of return would be increased from the present 2 per cent over the Bank Rate to 3 per cent. This will put up the yield on these shares and perhaps the market has begun to adjust itself to the new yields. Activity generally in the cash section was not commensurate with the buoyancy in the forward section but it was significant that sellers were hard to find. However, West Coast Paper attracted support on informed buying, closing the week better at Rs. 166 while Indian Copper was supported on talk of expansion. Gwalior Rayon, Chemicals and Fibres and B.I.C. were notable among cash scrips, although the rise in Gwalior Rayon was but fractional. Among other rayon shares, Indian Rayon and Baroda Rayon were both shaded at Rs. 59.20 and Rs. 72.50 respectively. South India Viscose was slightly better at Rs. 116. B.I.C. improved from Rs. 10.12 to Rs. 10.24. Cement shares were better with A.C.C. at Rs. 158.50 and Digvijay at Rs. 178.25. Premier Auto ruled better at Rs. 105. Construction was steady.

Another notable counter was Telco, bid up to Rs. 308 on hopes of a reduction in the premium to be collected on the forthcoming right shares. At the close, however, the shares had ceased on profit-taking to Rs. 305.50 against last week's quotation of Rs. 296. Hindustan Motors were also firm having touched Rs. 18.92. Voltas was six points up at Rs. 259, while among Chemicals Tata was firm at Rs. 19.04 and Dyestuff at Rs. 275 against the previous week's Rs. 266.25. There was nothing much doing in bank and insurance shares. Larsen and Toubro continued to attract demand.

Technical analysts point out that, while it is clear that the reaction has ended and the market has resumed its major uptrend, current levels are yet far behind the pre-Budget highs. The working of the market has to be watched and it is likely that there will be intermediate corrections but the overall pattern is bullish. That cash shares have not been participating in the measure they ought to in the rise is a point worth taking into account but a bull market always begins with the active counters in the forward list.

* * * *

At the time of writing, near boom conditions are reported on Lyons Range, with sentiment induced mainly by the firmness in Bombay. There, too, Indian Iron has been in the lead. Interest in the share market broadened as there is now little scope for speculation in commodities. A notable counter in Calcutta has been Midnapore Zamindary which was bid up on talk of diversification of its activities and possible entry into the industrial sphere. Inquiry for engineering and paper shares was selective. Dunlop Rubber and Indian Copper attracted good attention.

* * * *

Madras was comparatively mild, with activity in the forward section confined to a few selected shares. Plantations maintained a steady trend but mill shares were dull. Among banks, Canara and Indian Overseas were in demand but electricity shares were overlooked. Sugars were moderately active with interest noted in Deccan and E.I.D. The undertone of the market was, however, firm.

GLASS CARBOYS AND PRESSEDWARES LTD.

The public issue of Glass Carboys and Pressedwares Ltd. opened for subscription on Thursday this week. The issue, the whole of which has been underwritten among others by the L.I.C. and the I.F.C. of India, amounts to Rs. 17.5 lakhs, comprising Rs. 12.5 lakhs in equity shares of Rs. 10 each and Rs. 5 lakhs in 9.5 per cent redeemable cumulative preference shares of Rs. 10 each. The Company is putting up a factory in the Maharashtra Government's Industrial Estate near Thana (Bombay) for the manufacture of glass carboys and pressedwares, domes for mercury vapour lamps, glass tiles, etc. The Company has been licensed to manufacture 4,200 tons of glass carboys and pressedwares per year. The actual output planned, however, is only 3,600 tons per annum, on the basis of 80 per cent capacity.

The Directorate of Mineral Industries, Government of India, has estimated the demand for glass carboys to be around 10,000 tons per annum, so that the Company seems to be assured of a good market. At present, the demand for this product is being met primarily through imports. The total outlay on the project is estimated at Rs. 45.46 lakhs, of which Rs. 25.56 lakhs are proposed to be met by way of loans and the balance of Rs. 25 lakhs from the share capital. Of the share capital, the promoters—the House of Jhunjhunwalas—and directors, their associates and friends, have already subscribed to Rs. 7.5 lakhs of equity capital, and the balance of Rs. 17.5 lakhs represents the public issue.

The firm has secured Rs. 10 lakhs as a long-term loan from the Maharashtra State Financial Corporation, Rs. 5.5 lakhs in foreign exchange loan from the I.C.I.C.I. for the import of machinery from the U.K., U.S.A. and W. Germany, Rs. 4.5 lakhs as banks borrowings and Rs. 0.56 lakh as unsecured loan from promoters. The Company has no proposal to have foreign collaboration.

The Board of Directors of the Company is headed by Mr. Ramjilal Jhunjhunwala and consists of Mr. Bhagawati Prasad Jhunjhunwala (Managing Director), Mr. R. B. Rungta, Mr. N. R. Ruia, Mr. M. V. Meghji and Mr. Madhaw L. Apte.

NIMAR TEXTILES TO ENTER CAPITAL MARKET

The Nimar Textiles Limited is entering the capital market on the 28th inst. with a public issue of Rs. 42 lakhs, comprising Rs. 28 lakhs in equity shares and Rs. 14 lakhs in 9.5 per cent cumulative redeemable preference shares, both of Rs. 100 each. This amount is in addition to the Rs. 28 lakhs out of the paid-up capital of Rs. 70 lakhs which the promoters Directors and their friends have agreed to take up. The entire public issue has been underwritten by the Life Insurance Corporation of India, Industrial Finance Corporation, Industrial Credit and Investment Corporation, Madhya Pradesh Financial Corporation, Oriental and General and Fire Insurance Company Limited, Devkaran Nanjee Banking Company Ltd., and Mr. L. K. Pandey, share broker. The authorised capital of the Company is Rs. 3 crores.

The Company is setting up a new textile mill of 25,000 spindles at Khandwa in Madhya Pradesh. The project is expected to cost Rs. 197.49 lakhs which will be financed through capital issue, loans and advances. The total cost of machinery is estimated at Rs. 1.09 crore, of which machinery worth Rs. 85 lakhs will be indigenous, the rest being imported from the U.S.A. and other countries. The mill is scheduled to go into production by June 1965 and achieve full production by the end of next year.

MYSORE ELECTRO CHEMICAL WORKS LTD.

The public issue of the Mysore Electro Chemical Works Ltd., which manufactures various types of storage batteries for motor-cars, scooters, trucks and motor cycles, opened for public subscription on Monday this week. The issue consisted of Rs. 10 lakhs divided into 100,000 equity shares of Rs. 10 each. The Company is expanding its present capacity to produce different kinds of batteries and proposing to manufacture specialised batteries for electronic flashes, transistorised and electronic equipments and wireless sets. The Company has secured a loan of Rs. 14.30 lakhs from the Mysore State Finance Corporation. The Union Government has permitted the Company to enter into technical collaboration with Messrs. Semperit of Austria.

VISION LACKING AMONG INSURERS

FEAR and hope underline the speech of Mr. P. A. Advani, delivered this week at the thirty-sixth annual general meeting of the Indian Insurance Companies' Association, Bombay, in his capacity as the outgoing Chairman. Neither was new. The Life Insurance Corporation (L.I.C.) entered the field of general insurance business on 1st April 1964. It is, therefore, nearly five months since the insurers in both the private and public sectors have been living with the giant L.I.C. and their co-existence has so far been quite peaceful. Contrary to earlier fears, the L.I.C. has been playing the game by observing the tariff rates and by not indulging in any unfair competition, even though the L.I.C. had chosen to be a non-tariff insurer right at the beginning itself, ignoring the pleas of tariff companies in the private sector. Nevertheless, one senses a lurking fear in Mr. Advani's speech that this peaceful co-existence might not last long. This is implied in his renewed request, on behalf of the insurers in the private sector, to the authorities of the L.I.C. and their boss (the Union Finance Ministry) to accept the tariff rates as the norm to be charged by them. "The tariff rates," he says, "are fixed on a basis to provide a reasonable margin of profit to a well-managed medium-size insurer." So the L.I.C., the largest of all insurers in the country, should be happy enough to observe them. That is the logic of Mr. Advani's reasoning. In fact, he goes further and says: "An immense insurance potential exists in the country and it is only through the collective efforts of both the public and private sectors that such a task could be achieved successfully." The sum and substance of his thesis is that competition for business through a cut in tariffs is unnecessary.

There is nothing new in this trend. It has been reiterated by the private sector time and again. This is understandable, for competition from or with an all-powerful State undertaking is not a pleasant prospect. But will the L.I.C. oblige the private sector companies? At the moment, it has an open mind. It is observing the tariff rates, but it has unequivocally reserved its freedom to quote competitive rates on the basis of its experience. Its Chairman, Mr. B. K. Kaul, told the Press early this year that, in due course, the L.I.C. would evolve its own rating structure and schedule on sound and scientific lines in the light of its underwriting experience. The expression "in due course" is a vague one. It may mean a year, or five years or ten years. But, as revision will be determined by the experience of L.I.C. and not that of other companies, it is a safe guess that the companies in the private sector have a fairly long breathing time, for, if the revision is to be on sound and scientific lines as Mr. Kaul has said, it cannot be done on the basis of the experience of a year or two.

It may not, however, be politically possible for the L.I.C. to give an undertaking of the type repeatedly suggested by the spokesmen of the private sector, for the Government has taken a firm decision that the L.I.C. should operate as a non-tariff insurer. Indeed, political circumstances may compel the L.I.C. to quote competitive rates. Its failure to do so would mean a confirmation of the contention that the country as a whole had nothing to gain by ushering the L.I.C. into the sphere of general insurance. This journal feels that it is impolitic for general insurers in the private sector to persist in their plea for assurances and actions which the L.I.C. cannot comply with. The L.I.C.'s entry into their field as a competitor has saved them from nationalisation. If the cry for nationalisation is to be effectively silenced, it is far better to allow the L.I.C. to play the role assigned to it than to try to neutralise it by bringing the Corporation into the tariff net, Code of Conduct and so on.

As just mentioned by us, the insurers in the private sector have a fairly long time at their disposal to put their house in order, so that they may be strong and sound enough to face all healthy and fair competition that may be forthcoming from the L.I.C. They should discard their fears and misgivings, as well as their tendency to live on futile hopes, and brace themselves up to the refreshing cold wind of competition. Mr. Advani's speech, however, suggests that they are still far from this realisation. It is high time they did so and took vigorous steps to group themselves into companies of large size, so that they may enjoy the economies of scale and offer better service to their customers at a lower cost. It is true that, in recent years, there has been a steady fall in the number of insurers, from 184 (91 domestic and 93 foreign) in 1958 to 142 (76 domestic and 66 foreign) in 1963. Even so, there are far too many insurers, having regard to the size of the market and the volume of business. One may say that this suggestion has been put forward so often and for so long a time that it has become a trite. The fact that it has failed to evoke any response from those to whom it has been addressed may even warrant the inference that it is not feasible. But what is the alternative?

If the aforesaid suggestion has fallen on deaf ears, it is because of the strong individualistic character of Indian business houses and their failure to realise that it is their weaknesses that open the door to State trading. The Code of Conduct and similar props only serve to cover inefficiency and other defects in general insurance. If they are removed, there will be a strong impetus among the insurers to undertake the type of reform that has been advocated by us for long. Unfortunately, the Government itself has been reluctant to take the initiative. On the contrary, it has been extending its blessings to every one of these props. The Controller of Insurance has neither the status nor the drive of the Reserve Bank which has taken a number of steps to weed out the sub-standard units in the banking sector. It would be no exaggeration to say that at present the Government gives one the impression of being more interested in letting the private sector insurers fall in the estimation of the public through their own folly than in reforming them. In the larger interests of the private sector as a whole, therefore, a body like the Federation of Indian Chambers of Commerce and Industry should take the initiative in this respect before it is too late. It is needless to add that the hands of private sector will be steadily weakened, if the scope for it in the various spheres of the business world is progressively reduced through the extension of the public sector.

There is no lack of evidence to show that the Government is keen on getting hold of the major share of the general insurance market for itself. Apart from asking the L.I.C. to enter this field, it has also been endeavouring to direct the general insurance business to flow into the Insurance Companies' Association Pool, in which two public sector companies alone have the major share, as much as 75 per cent. Its *modus operandi* for this purpose is simple. Industrialists in the private sector are dependent upon the Government for many things. Finance is one of them. Getting contracts for civil engineering and supply of machinery is another. It is stated by the Insurance Companies' Association that quasi-Government organisations such as the Coffee Board, Tea Board, National Small Industries Corporation and the Hindustan Steel have been influencing the borrowers and suppliers to place their insurance with the Pool and not with insurers of their choice. Those who defy this pressure are exposed to the risk of incurring the displeasure of these quasi-Government bodies. The Association, according to Mr. Advani, has been representing to the Government that it is wrong in principle to issue such instructions, as they militate against the very spirit of the concept of mixed economy accepted by all (except the Communists, of course) as a matter of policy. But this representation has so far gone in vain. The authorities' silence over this matter is in keeping with its tactics, deplorable as they are. The Association's contention will, however, derive greater strength, if it can clearly establish that the private sector insurers are not giving away too much to their foreign counterparts by way of reinsurance and thereby putting the country to unnecessary loss of foreign exchange.

Another standing complaint of insurers in the private sector against the Government, which was voiced by Mr. Advani in his speech, pertains to the limit on expenses prescribed for insurers under Section 40(c) of the Insurance Act 1938 and Rule 17E of the Insurance Rules. These limits were fixed as far back as 1950. The Association's contention is that the limits have now ceased to be realistic, as they are disproportionately low as compared with the present-day costs of operations. Mr. Advani

drove home this point by giving a few telling facts. Since 1950, salaries (including dearness allowance) of staff, which account for nearly two-thirds of expenses, have gone up, and so also the cost of postage, telegrams, travelling, paper and stationery. "It would be safe to say," according to Mr. Advani, "that, during the last 12 years, the cost of insurer in servicing Rs. 100 premium has increased by at least 30 per cent, if not more." Here is a typical example of rigidity in Government controls. The consequent hardship is aggravated by the refusal of Income-tax authorities to allow as expenditure for tax purposes anything which is in excess of the aforesaid limits on expenses. In other words, any expenditure in excess of the prescribed limits, even if it is *bona fide* and wholly and exclusively for the purpose of normal business, has to come out of taxed profit. It is true that, since 1950, the insurance companies' turnover has gone up and unhealthy competition has been kept under check through such voluntary arrangements as the Code of Conduct and Administrative Machinery, with the result that their margin of profit must have gone up. Even so, the rise in operational costs has been steep enough to justify the insurers' demand for an upward revision of the expenses limits. It is justified further by the cantankerous attitude of the Income-tax authorities and by the imperative need of insurers to expand their business by entering new fields.

F.I.C.C.I. AGRICULTURAL CONFERENCE

THE very fact that, while India's population has increased by about 20 per cent over the last eight years, foodgrains production has gone up by just 18 per cent during the same period should serve to underline the precarious balance between food and population. In fact, the situation is more serious than these figures would seem to suggest, for, if account is taken of the acceleration in money incomes and the income-elasticity of demand for finer foodgrains in particular between 1956 and 1964, only a 30 per cent increase in production could have comfortably balanced supply and effective demand at the mid-1964 level of population (476 million, as compared with 397 million in mid-1956). Even imports at the current annual level of five million tonnes have not been quite sufficient to keep supply and demand in reasonable balance. Thanks to a residual gap of probably up to three million tonnes in supplies—according to the Union Food Minister, this is not less than five million tonnes—non-producing consumers in urban and rural areas alike have been forced to pay higher prices for foodgrains in the last few months. The scarcity has been aggravated by the continued talk of scarcity, as it has led to hoarding at all levels—producers, traders and consumers. It is in this situation of scarcity and consequent high prices that newspapers, political parties and trade unions have taken, in recent weeks, a feverish interest in the agricultural problem. That the Federation of Indian Chambers of Commerce and Industry has convened a full-fledged conference on agricultural development and economic progress this week (28th and 29th August) at New Delhi is also quite timely and appropriate, for it reflects the anxiety of the business community over the slow progress in agriculture and of the consequent constraint on the pace of industrial growth.

The Federation's conference, which is being attended by representatives of its constituents and by invitees from the relevant Union Ministries, Planning Commission, F.A.O., Ford Foundation, U.S.A.I.D., Rockefeller Foundation, Bharat Krishak Samaj, Indian Council of Agricultural Research and agricultural universities and colleges, is a significant development at the non-official level. As several experts and persons with practical knowledge are participating in it, the conference provides a forum for exchange of ideas and experiences between agriculturists and agricultural organisations, on the one side, and businessmen, on the other. Although the agricultural problems and their possible solutions are broadly known, these certainly require objective analysis and re-assessment at the national level at the present time when the fourth Plan is under formulation. The conclusions of the three conference committees—one on agricultural policy and land reforms, another on agricultural production and the third on distribution and pricing—and the deliberations in general will, however, be known only next week. Without appearing to anticipate them, it should be possible, in the meantime, to deal with some significant observations made, as also issues posed, in the background paper distributed to participants and in the address of Mr. S. L. Kirloskar, Vice-President of the Federation.

The Federation's background paper may be considered first. The authors of this paper have taken great pains in marshalling facts and figures (mostly from official sources), presenting them objectively and posing appropriate issues for consideration at the conference. It is noted at the outset that, even after 13 years of planning, agricultural self-sufficiency is as distant as ever, for, although agricultural production in general has increased by more than 40 per cent since 1950-51, large quantities of foodgrains, raw cotton and vegetable oils have still to be imported. Again, although the output of commercial crops has increased at a slightly higher rate than the output of foodgrains during the period and the per-acre yield of foodgrains has risen from 466 lbs. in 1950-51 to 613 lbs. in 1962-63, agricultural productivity in general continues to be much smaller, by international standards, in respect of almost all important commodities. At the same time, it is becoming increasingly difficult to extend cultivation to marginal lands, that is, cultural wastes which agregate some 45 million acres in the entire country. The difficulty, in this connection, is that the investment required for bringing such lands under cultivation will be out of all proportion to their possible productivity. As it is a question of basic strategy here, the Federation has done well to pose this question: "Is it profitable to invest more in land already under cultivation and increase its productivity, or is it more profitable to invest in bringing more land under the plough?" What the answer is should be obvious. Still, to clinch it, it would be apposite to recall some observations made by Mr. Chester Bowles, U.S. Ambassador to India, at the inauguration of the Mysore University of Agricultural Sciences last week. These are to the effect that, in a country like India, where agricultural yields are among the lowest in the world, improved technology can increase the output of some fields by as much as ten times, that expansion of areas under cultivation is no longer possible on a major scale and that future reliance must be on rapidly increasing yields per acre.

Another issue involving basic strategy has been posed by the Federation. This pertains to the manner in which the area under cultivation is to be utilised to produce foodgrains, on the one hand, and commercial crops, on the other. The factual position, in this connection, is that, since 1950-51, the area under foodgrain crops has decreased slightly from 84 per cent of total area under cultivation to 82 per cent and that under commercial crops has increased correspondingly from 16 per cent to 18 per cent. Whether in the context of current and prospective trends pertaining to population, industrial production and exports, the relative area under commercial crops would have to be increased or decreased is the question. One may well argue, in this connection, that, as the Federation itself has recognised in minor irrigation the advantages of a shorter gestation period and a higher rate of return, extension of well-irrigation for intensive garden-type cultivation of commercial crops would not only obviate the need for extending the area under such crops but even facilitate some marginal reduction in that area in the interest of greater food production. While it would be interesting to await the findings of the conference, the manner in which the authors of the background paper have posed the relevant issues is not without some significance. This is what they say:

> "In this context, the problem to be considered is whether the present crop pattern is economic, taking into consideration the pressures of different demands from the public, industry and exports. *The evaluation cannot be based merely on short-term considerations* (italics ours). It must relate to the long-term view about the evolving structure of the economy, of which agriculture constitutes a part. The major shifts in the pattern of production cannot be achieved with speed. The balance between different types of crops is a consequence of a multitude of factors whose influence—direct and indirect—is spread over a long period of time. If a definite shift in the crop pattern has to be achieved, it is necessary to take early measures, so that, in future years, the pattern of demand may not be out of alignment with the pattern of production."

The various issues relating to prices and pricing, too, figure prominently in Mr. Kirloskar's address as in the background paper. The point made by Mr. Kirloskar is that it is necessary to understand the nature of the price rise so as to judge whether it is a reflection of some temporary factors, whether it originates from more primary sources or in the course of distribution, and whether it can be corrected by setting up new agencies or requires a new national food policy—even a new economic policy. As has been rightly pointed out by Mr. Kirloskar, prices cannot be stabilised without the necessary supplies coming on the market in the wake of larger production. The supreme question, therefore, is how production and productivity can be increased over the next five or six years. It is in this context that the issues posed by the Federation in regard to price and distribution controls, physical factors (like irrigation, fertilisers, improved seeds, plant protection, credit facilities and other agricultural requisites) and organisational factors like land reform, land management, extension service, co-operation and agricultural administration are eminently relevant.

NATIONAL INCOME AND POPULATION

"LIKE a thief in the night, population growth can rob us of all that we achieve, day after day, in economic growth." The author of this impressive description of a problem of serious magnitude confronting India is Mr. Asoka Mehta, Deputy Chairman of the Planning Commission. One must not, of course, exaggerate the population problem by attributing all our economic ills to it. But it must be unreservedly accepted that, if excessive population growth is not held in check, the efforts to raise the living standards of the people will not be of *much* avail. In other words, a high rate of increase in population neutralises greatly the benefits of economic development. This precisely is what has happened during the thirteen years following the commencement of Five-year Plans. Thus, while the aggregate national income of India (at 1948-49 prices) went up by 18.4 per cent in the first Plan period and 21.4 per cent in the second Plan period, *per capita* income rose by only 8.2 per cent and 9.8 per cent, respectively. Over the first three years of the third Plan, as against an increase of 9.5 per cent in national income, *per capita* income improved by a bare 2.4 per cent. The relatively slower rate of rise in *per capita* income has been due to leaping population growth. The rate (annual) of population growth, which was no more than 1.86 per cent in the first Plan period, spurted to 2.18 per cent in the second Plan period and further to 2.27 per cent in the first three years of the third Plan.

Taking the year 1963-64 alone, however, it is, indeed, gratifying to find from the "quick" estimates prepared by the Central Statistical Organisation that, in spite of the persistent rise in population, the increase in *per capita* income (at 1948-49 prices) was more appreciable than in the first two years of the third Plan; the actual increase in 1963-64 was Rs. 5.70, as against the negligible rise of 40 paise in 1962-63 and Re. 1.10 in 1961-62. This was not because of any sudden and sharp fall in the population growth rate but because of an improvement in some sectors of the economy and the consequent increase in national income. The "real" rise in the aggregate national income in 1963-64 was 4.3 per cent, as compared with 2.4 per cent and 2.6 per cent in the two previous years, respectively. The growth rate would not have been as high as it is but for the significant contribution to production made by factory and mining establishments which together accounted for a rise of as much as 9.1 per cent. This rise, incidentally, is to be attributed in large measure to the impetus provided by the Emergency following Chinese aggression in October-November 1962. Equally significant was the contribution made by communications (+8.7 per cent), railways (+7.8 per cent), organised banking and insurance (+7.9 per cent), and other commerce and transport (+4.4 per cent). These increases more than offset the poor progress in the agricultural sector which, as is well known, accounts for over a third—37 per cent to be precise—of the aggregate national product. The overall rise in this sector during 1963-64 was just 1.5 per cent. These figures underline the supreme importance of stepping up the production of both foodgrains and commercial crops. While higher foodgrains output is of vital importance to feed the growing population, higher output of commercial crops is necessary to ensure expansion of industrial production.

The total net rise (in real terms) in national income over the first three years of the third Plan (1961-62, 1962-63 and 1963-64) thus comes to 9.3 per cent, giving an average annual growth rate of 3.1 per cent which is well below the growth rate of 5-6 per cent envisaged for the third Plan period as a whole. It is a moot point whether the lag would be made good in the remaining two years of the Plan. The prospect would certainly have been higher if only the planners and the powers-that-be had accorded right priorities to quick-yielding projects in agriculture and industry. In particular, agriculture has not received the due attention it deserves in the implementation of development plans. The blame for the lag in agricultural production rests squarely with the State Governments which have so far failed to import into it a missionary fervour.

Higher production (agricultural and industrial), better transport facilities, improvement in communications, etc., though they are all urgent in all conscience, will simply not yield any sustained increase in living standards, unless the present phenomenal growth of population is checked effectively. Despite all the loud talk of population control all these years, the progress achieved has been little, as witness the higher rate of population growth referred to already. Finance is definitely not in the way of implementing the family planning schemes successfully. What has been lacking is the firm and right approach to the whole problem. It is, therefore, highly encouraging to learn from Prof. M. S. Thacker, a Member of the Planning Commission, who spoke at a meeting of the Central Family Planning Board in Bombay on Tuesday this week, that the Planning Commission would give the highest priority to family planning. The Commission, it is believed, has already decided to earmark Rs. 100 crores for family planning programme in the fourth Plan, as against the Rs. 27 crores provided in the third Plan, Rs. 5.50 crores in the second Plan and Rs. 65 lakhs in the first Plan.

Several economists and population experts in India as well as abroad have put forward in recent months a series of measures designed to check population growth. These measures

GROWTH AT A GLANCE

Year	Population (millions)	National income at 1948-49 prices (Rs. crores)	*Per capita* income at 1948-49 prices (Rs.)
1950-51	358	8,850	247.50
1955-56	391	10,480	267.80
Percentage variation (1955-56 over 1950-51)	+9.3	+58.4	+8.2
1960-61	434	12,730	293.20
Percentage variation (1960-61 over 1955-56)	+10.9	+21.4	+9.8
1961-62	444	13,060	294.30
1962-63	454	13,370	294.70
1963-64	464	13,940	300.40
Percentage variation (1963-64 over 1960-61)	+6.8	+9.5	+2.4

were considered by the Central Family Planning Board. At the end of discussions, the Board commended for acceptance certain valuable suggestions. They are:

1. The Central Government should undertake the production of all types of contraceptives as expeditiously as possible.

2. Sterilisation operations and other methods of contraception should be propagated and carried out soon after a couple has had their third child. The honorarium of Rs. 100 for 10 operations in one day offered to private surgeons may be continued. The approved organisations and vasectomy units may be allowed a payment of Rs. 10 per case for drugs and transport to meet their expenditure. The Centre should give 100 per cent assistance to State Governments for providing additional beds for sterilisation cases in hospitals.

3. The all-India organisations of employers and workers may consider the proposal to restrict maternity benefits in industrial establishments to a maximum of three confinements.

4. The age of marriage of girls must be raised to 18 years. (This plea stems from the belief that the fertility of girls within the age group 14-18 is generally very high).

These suggestions and the move of the Board to set up a committee to study the question of liberalising Abortion Law as a measure of family planning are quite sensible. We would only like to add that manufacture of contraceptives should not be a monopoly of the Government and that manufacturers in the private sector—there are already some—should also be given all possible encouragement. But one should not ignore the vital point that family planning is a complicated and delicate problem touching, as it does, human emotions. It may, therefore, be difficult to treat the family planning programme as a "crash programme" and implement it on a war footing. In any case, such a programme has to be preceded by proper, intensive education of the masses. The move of the Family Planning Board to appoint regional leaders to advise and guide district education leaders and intensify their activities is certainly a step in the right direction

MARKET GOSSIP

World Sugar

THE chances of India selling abroad sugar at attractive prices and without a loss have receded once again, at any rate for the time being. For the world sugar markets are currently depressed and indications are that they will continue to be so for some time to come. Sugar in London is now quoted (c.i.f.) at £38¼ (Rs. 513) per ton, as against as high as £91¼ (Rs. 1,220) early this year. The setback in prices has followed persistent selling pressure induced by fears of heavy selling by East European beet sugar producers, as well as by Argentina and Brazil. Thanks to beneficial rains throughout Europe, the sugar beet crop is expected to be a bumper one in the coming season (beginning on Tuesday, 1st September). World sugar stocks at present are no doubt much lower than those a year or two before. Even so, the possibility of a further fall in prices is not discounted. Whether or not such a fall will come about, sugar producers the world over are somewhat inclined to feel that "sugar has returned to more traditional levels after the excitement of the past eighteen months when it was twice above £100 a ton."

An event of some importance to the world sugar markets is the South African decision to terminate, with effect from 1st January next, its five-year agreement entered into with Britain, under which it has been selling Britain about 168,000 short tons of sugar annually since 1962 at a fixed price; this agreement was concluded in 1961 when South Africa ceased to be a member of the Commonwealth. Thereafter, South African sugar will be sold freely in the U.K. on the basis of the world market price and the British refiners will no longer need Government permission to import South African sugar. These refiners are currently importing (annually) more than half a million tons in excess of the sugar purchased under the Commonwealth Agreement. With the latest decision of South Africa, the sugar industry of Britain, it is said, will be made much more vulnerable to fluctuations in the world market than at present.

Note Of Cheer On Food

The Food Minister, Mr. C. Subramaniam, this week exhibits a face of cheer and confidence because he believes that the worst phase is over in the food situation in the short-term. His confidence is based partly on reports of good *kharif* crop prospects. He says that the scare created by various sections—the trade, political parties and newspapers—has been as much responsible for the atmosphere of crisis as the facts of the food shortage themselves. He does not absolve Government spokesmen of some responsibility in adding to the scare. Mr. Subramaniam pointed out, in an informal conversation, that even surplus States had tried to hold on to stocks and the deficit States exaggerated their demands, but he now thinks the process of unloading stocks has begun. Even in the worst affected area, West Bengal, the arrivals of grain into the markets have increased. The autumn crop in Bengal promises to be a bumper harvest, but, in Kerala, the other major critical area in the rice-eating region, fair-price shops had alleviated the sufferings to some extent. The Kerala crop is not good but Mr. Subramaniam thinks that the size of the problem in Kerala is not huge because the total population is not large.

The situation is still delicate in Maharashtra and Gujarat which have to depend on releases from the Central reserves until the zonal system can be ended. Mr. Subramaniam admits that the zonal system, which was intended to isolate the pockets of scarcity, has misfired by extending the problem of prices. The distortion in prices in the scarcity pockets has been reflected in areas of plenty also, with farmers holding on to grain as long as possible.

In fact, the zonal system added an edge to the crisis atmosphere. Mr. Subramaniam is clear in his mind that he will have to work his way to bring the zonal system to an end, but this cannot be done in the middle of the season, but only after the big wheat harvests are reaped early next year.

In the past eighteen months, according to Mr. Subramaniam, the wholesale food price index rose 22 per cent, against 27 per cent in the preceding ten years. Mr. Subramaniam does not believe that food prices can be pushed down very much. Stability rather than depression of prices, is his long-term aim. To an extent, Mr. Subramaniam believes in the thesis that recent food price increases have helped partly to make up the lag in prices of farmers' produce, as compared to increase in prices of non-agricultural commodities. Production and availability of more foodgrains alone cannot bring the prices of foodstuffs down, and Mr. Subramaniam explains that a fall in food prices will depend on the general economic situation.

As he has said several times since he took over the Food and Agriculture Ministry, the crux of the long-term problem is to ensure remunerative prices for the farmer. At present, the Food Minister estimates that the farmer gets around 60 to 65 per cent of the price paid by the consumer for foodstuffs. If the profit margin of the trader can be brought down, the farmer will get more, even if the consumer is not asked to pay more for his grain. In the transitional stage, perhaps, according to Mr. Subramaniam, some urban consumers may have to be supplied grain at subsidised prices. Without higher income for the farmer, Mr. Subramaniam thinks there will not be substantial improvement in agricultural production. He thinks it will be possible to reduce the margins for traders by reducing the number of multiple transactions between the producer and the consumer. To quote Mr. Subramaniam: "I do not consider a low price level as an indication of prosperity. Stabilisation of prices is important; a steady price level rather than periodic fluctuations."

A system of remunerative prices for the producer and a fair price for the consumer is better, in the Minister's opinion, than wholesale rationing. As for the operations of the State food trading corporation, the Food Minister gives the impression that he will feel his way through, rather than take precipitate action. The power for the corporation to take over stocks from wholesalers at prices notified in advance, the Minister thinks, will in itself act as a factor contributing to food price stability.

Foodgrains Target And Production Requisites

A production target of 120 million tons of foodgrains for the Fourth Plan is being talked about. The achievement of this target, based more on needs than on feasibility, will largely depend on the production and supply to the agricultural sector of items like credit, fertilisers and cement which are the basic requisites for the agricultural development in the country. Mr. Shriman Narayan, Member for Agriculture in the Planning Commission, who visited the States as the leader of the Central Agricultural Teams during May and June this year, has stressed the importance of this factor to the Government of India.

Expressing his disappointment about the shortage of cement for agricultural development projects like minor irrigation schemes, he said, "It is extremely painful to find that considerable quantities of cement are being used in both private and public sectors for constructing luxurious buildings when such agricultural programmes as minor and medium irrigation are suffering for want of cement supplies. These anomalies must be eliminated with a sense of emergency if we are really serious about stepping up agricultural output to check inflationary trends." He has estimated that at least six million tons of cement will be required for the agricultural sector to achieve the said target of foodgrains production. In order to assure the availability of this quantity for agricultural sector, he has recommended that general cement quotas for the States may be reduced, as the States give low priority to agricultural schemes in the matter of allocation, and separate quotas may be fixed for the allocation of cement for the agricultural sector. But it must be emphasised that, though the distribution system is important and the needs of agriculture must be given a high priority, Mr. Narayan's suggestion will be of no use even if it is accepted, if vigorous and effective steps are not taken to increase the production of cement in the country. As against the production of about 9 million tons in 1963, the target for cement production by the end of the fourth Plan period is contemplated at 24 million tons. Will Mr. Narayan support realistic policies designed to achieve such a high level of production for cement?

The position of fertilisers is also almost similar. Against the target of one million tons, the fertiliser production by the end of the third Plan is expected to be no more than 400,000 tons. Fertiliser plants take about five to six years to go into full production. This means that, in order to achieve the contemplated target of 2.2 million tons of fertilisers by the end of the fourth Plan period, plans for the installation of the new plants should be started immediately. If proper attention is not given to this aspect, Mr. Narayan feels that the production by the end of the fourth Plan may be only 1.2 million tons and, according to him, this factor alone would be sufficient to keep down the achievement of the food target of 120 million tons by 10 million tons. He has, therefore, stressed the need for much greater earnestness than has been evident so far in setting up fertiliser plants.

Planning for agriculture does not simply mean the laying down of targets for agricultural production. It is an intricate process involving the production of many other commodities, the production of which may, in turn, depend on many other factors. Unless a complete and integrated study is made of these factors according to the input-output analysis, the achievement of agricultural targets will be doubtful.

Raising Copper Production

India continues to spend quite a bit of its precious exchange on imports of copper. The actual imports during the financial year ended March 1964 amounted to over Rs. 27 crores, the quantity involved being about 108,000 metric tons (copper, alloys and scrap). Such heavy imports are necessitated by the yawning gap that exists between requirements and production. The estimated total demand at present is of the order of 140,000 tons per annum, whereas actual output is currently maintained at an annual rate of no more than 10,000 tons; production was around 8,700-9,600 tons in the past four years (from 1960 to 1963). The only producer of copper in India has all along been the Indian Copper Corporation.

The need to reduce heavy dependence on imports of copper and thus to save a large part of foreign exchange expenditure was recognised by the Planning Commission several years ago. The second Plan accorded a high priority to the 12,000-ton copper smelter at Khetri in Rajasthan. But no progress was made in implementing this public sector project and it was carried over to the third Plan. It is a pity that, although nearly three and a half years have elapsed since the

it was before. Many major issues are yet to be settled and none knows when the project will fructify. The project itself has undergone many changes and it is still being drawn and redrawn.

This is a glaring instance of faulty and defective planning. And it is also an instance of the way in which the public sector handles the projects *vis-a-vis* the private sector. *Meanwhile*, the Union Ministry of Steel and Mines is said to be preparing new plans to meet the demand for copper during the fourth Plan period—expected to go up from 140,000 tons at present to 250,000 tons in 1970-71. *The Ministry, it is reported*, has already initiated preliminary work on four copper projects with an aggregate capacity to produce about 58,000 tons annually. The total outlay is put at Rs. 39 crores. Details of the projects are:

Location	*Production capacity* (in metric tons)	*Estimated outlay* (Rs. crores)
Rekha road-Sideshwar blocks in the Singhbum District of Bihar ..	15,000	20
Kolihan near Khetri deposits in Rajasthan*	10,000	10
Guntur in Andhra Pradesh	2,000-3,000	1
Location not decided†	30,000	8

* The project is expected to materialise by the middle of the fourth Plan.

† This will be a smelter based on imported concentrates.

The successful implementation of the aforesaid projects and the expansion of the Indian Copper's capacity from 8,000 tons to 19,000 tons will depend greatly on the availability of copper ore. Since imports of ore concentrates entail foreign exchange spending, the need for augmenting production of copper ore, which has gone up only slightly from about 448,000 metric tons in 1960 to 474,000 tons in 1963, is imperative. Both the Indian Bureau of Mines and the Geological Survey of India should, therefore, intensify the search for copper deposits for giving this task a high priority. They should, if need be, import a sufficient number of foreign technicians.

Spurious Co-operative Societies

Inaugurating the Conference of Presidents and Secretaries of the State Co-operative Unions last week, Mr. S. K Dey, Union Minister for Community Development and Co-operation, announced the setting up of a committee, under the chairmanship of Mr. Ram Niwas Mirdha, Speaker of the Rajasthan Legislative Assembly, to go into the question of spurious co-operative societies, to make a probe into vested interests in the co-operative movement and to recommend measures to make the movement self-reliant. He said that, for the co-operative movement to be successful in this country, the co-operative societies should be self-reliant, depending on their own resources, instead of on governmental assistance. This means that co-operative societies should never run at a loss, but earn sufficient profits to pay a reasonable dividend to its shareholders and to build up resources. In other words, they should be run on business lines.

Before going into the details of the purpose of the Committee, a word must be said about its constitution. It is rather strange that the Speaker of a Legislative Assembly should have been nominated as Chairman of the Committee. According to democratic conventions, the moment somebody is elected as the Speaker of a legislative body, he rises above the controversy of party politics and ceases to be politically controversial. If such a person is the head of a committee, the recommendations of which may create a controversy between the various political parties, he will undermine the prestige of the *portfolio* which he holds. The need for avoiding such a situation is all the more greater in the context of the growing lack of confidence in the Chair, as is evident from the recent episodes in some of the States. Obviously, for the Government of India, it is one thing to proclaim from the housetops its adherence to the principles of democracy, and quite another to observe these principles in actual practice.

This political aspect apart, let us see what has been the extent of the spurious nature of co-operative movement and what are the factors responsible for it. It may be appropriate to reproduce here some data released by the Reserve Bank of India regarding the working of co-operative societies. Although the latest figures available pertain to only 1961-62, they do give a good idea of the deplorable conditions of working of co-operative societies and the spurious element in the movement. At the end of 1961-62, there were 341,841 co-operative societies in the country, of which about two-thirds were agricultural credit societies. Whereas about one-fifth of the agricultural credit societies were inoperative, another one-third were found to be working unsatisfactorily. In the case of consumers' co-operative societies, whereas a third were having no earnings, another one-third were running at a loss.

The question of questions is this: How was it possible for spurious elements to enter the co-operative movement, in spite of the so-called vigilant eye of the co-operative departments? The V. L. Mehta Committee recommended in its report that the optimum coverage of a co-operative society should be about 3,000 persons or 600 families. But, in India, a large number of co-operative societies are of very small size. Did the co-operative departments verify the size of these societies before they were authorised to function in the co-operative field? Secondly, as stressed by Mr. S. K. Dey, the Minister for Co-operatives, whose responsibility for the sad plight of the co-operative movement cannot be denied, a successful co-operative society should be self-reliant, depending on its own resources instead of on governmental aid. Did the co-operative departments ascertain the element of self-reliance before sanctioning a large number of agricultural credit societies or did they feel that the primary function of such a society is to sanction loans and their recovery is only of secondary importance? And thirdly, as has been recognised by every co-operator, the basic principle for the success of a co-operative movement is that it must not only be voluntary, inspired by the people themselves, but they must also be responsible for its management and efficient working. Did the co-operative departments verify the existence of these elements before sanctioning a co-operative society, and did they ascertain that the right type of leadership, which is so essential for a voluntary movement, was available to run the societies?

The fact of the matter is that the powers-that-be themselves encouraged the spurious elements to get into the co-operative movement by relaxing the fundamental conditions for recognising a co-operative society and by offering all sorts of concessions denied to self-employed businessmen and agriculturists. To enlarge this point a little further, the size of many of the co-operative societies in this country is very small, so small that they are not economically viable. The movement is inspired and propped up by the Government. In many parts of India, it is given a political colour which tends to keep out honest, decent and selfless workers. Further, the Government interferes in the day-to-day working of societies. It provides fiscal temptations to the people to start a co-operative society. Those who are not willing to work hard for their livelihood and are in the good books of the authorities, start a co-operative society and gain not only political importance but also monetary benefits. But it is human nature for anyone to try and take advantage of the opportunities which come his way. To blame these people for the failure of the co-operative movement and to call the societies floated by these people as spurious is to ignore the basic causes that led to the coming into existence of these societies.

It is high time the Government realised that, howsoever it may support a co-operative society, if the people do not take any direct interest in it, it can never be a success. What is required is that, instead of thrusting the co-operative movement on the people and providing fiscal temptations to them to join it, the Government should try to inculcate the co-operative spirit in the people, so that, gradually, the voluntary character of the movement may be strengthened. Naturally, it will take some time to inculcate this spirit, but it must not be forgotten that a successful co-operative movement cannot be developed in a matter of few years. It is not suggested that no incentives at all should be given to the co-operative movement. Only, they should be subject to a sense of proportion and provided only after making sure that the societies concerned are really genuine. This calls for an efficient and honest administrative machinery. If the attitude and character of Governments are not above reproach, the co-operative movement will be full of blemishes.

The recent directive of the Prime Minister to start a large number of consumer co-operative societies should be considered in the light of these facts. The Ministry-in-charge of Co-operation at the Centre feels that, unless it has an active role in the processing of agricultural goods, the consumer co-operative societies are not likely to succeed. It wants that, to start with, the rice mills in the private sector should be transferred to the co-operative sector. This approach seems to have been inspired by the success of the movement in the processing of sugarcane and some of the agricultural commodities in Maharashtra. But a factor which played an important part in the success of the movement in this State has been the availability of inspired and well-informed leadership which most of the other States cannot boast of. The suggestion, however, ignores the incapacity of the co-operative sector, in general, to handle the huge task of rice milling all over the country. Past experience shows that a remedy of this type will *not solve the food problem*. The chances are that scarcity may become more acute and magnified when all the three groups of processors, that is, individual millers, co-operative societies and the Government which also proposes to enter the field, compete with one another to get the maximum share in the common pool of production. Moreover, the co-operative societies will require large amounts of funds as aid from the Government to run the rice mills. In view of the chronic scarcity of funds with the Government, such a step is not advisable. The basic need for solving the food problem is a rise in production and it would be better for the Government to utilise its scare resources for providing more irrigation facilities, better seeds, fertilisers and improved varieties of tools than to invest in co-operative societies.

Terylene In Britain

Encouraged by the growing world demand for Terylene, the Imperial Chemical Industries Ltd. of Britain proposes to augment the production capacity of its Terylene plant by 25 per cent, that is, from 80 million lbs. to 100 million lbs. per year. The plans for expansion were announced in London last week. Details regarding capital outlay involved in expansion and date of completion have not been given. It is, however, stated that the expansion will add several million pounds to the £60 million which the I.C.I. has already invested in Terylene since it was first produced nine years ago (in 1955). The new project will help boost production of staple fibre used in blends with wool and cotton, as well as tow, by making use of the continuous polymerisation process developed recently by the I.C.I.'s Fibres Division and a U.S. firm.

Sir Isaac Newton held that gravity is a force, whereas Einstein regarded it as a property of space, which he believed was curved. But they had one thing in common. Both the Law of Gravitation and the Theory of Relativity were put down on papers for the consumption of knowledge-hungry world.

The world's first paper was made by the wasp for nesting purposes. The Egyptians manufactured Paper by cutting strips from the stem of the Papyrus plant-moistening them and laying them flat.

In modern India, J. K. Paper Mills produce all quality high grade writing and printing paper.

"CUPPACHA?"

Besides adopting the Indian word for tea, the U.K. in the month of March 1964 alone, also took Rs. 1.04 crores worth of tea. The rest of the world took Rs. 4.89 crores worth. A year's export of tea will earn enough foreign exchange to finance a project twice as large as the nuclear power plant at Tarapur. That's how important tea exports are—how important exports are to India.

The demand for Indian goods is growing everywhere. We know. We are practically everywhere ourselves. We can provide you with expert banking assistance where it counts: on the spot. Around the world.

TWO COMMITTEES FOR JUTE TEXTILES

THE Government ofo India has announced this week the setting up of two special bodies for the jute industry. One of them is the Jute Textiles Consultative Board and the other is the Jute Export Promotion Advisory Committee. The terms of reference of the former are quite broad and comprehensive, covering as they do the entire gamut of jute industry, while those of the latter are restricted to the export trade only. Thus, the Consultative Board has been entrusted with the task of advising the Government on the steps to be taken to develop the jute industry in all its aspects—production, distribution and exports of jute goods, import and export of raw jute, procurement of raw materials, machinery and accessories required by the industry, and matters relating to research. The functions assigned to the Export Promotion Advisory Committee are: to act as a channel of communication between the Union Government and the jute industry; to make recommendations regarding the best means and methods of expanding jute goods exports to traditional and non-traditional areas; to promote interest among manufacturers in the expansion of overseas sales; to advise the Government on measures of export assistance (including the formulation and implementation of export promotion schemes); to effect co-ordination in the matter of jute goods exports for the entire range; to enforce quality control in co-operation with the industry and shippers; and to render any other assistance to exporters as may be considered necessary. This Committee is empowered to appoint sub-committees and panels of experts to deal with special problems.

Since the terms of reference of the Consultative Board are very comprehensive and considering that its advice will greatly influence the shaping of jute textile policy, the decision of the Government to make it a high-powered body is only as it should be. The Board will be presided over by the Union Minister for Commerce, Mr. Manubhai Shah himself. The other members include Mr. S. V. Ramaswamy (Deputy Minister for Commerce) who will be the Vice-Chairman, the Secretary and Additional Secretary to the Ministry, a nominee of the Food and Agriculture Ministry, Jute Commissioner (Member-Secretary), Chairman and three representatives of the Indian Jute Mills Association, a representative of the Calcutta Jute Fabrics Shippers Association, and a representative of labour in the jute industry. The Export Advisory Committee will be headed by the Jute Commissioner and consist of the Joint Secretary to the Union Ministry of Commerce, four members representing the I.J.M.A., and Chairman and a representative of the Jute Fabrics Shippers Association.

The appointment of the two above-mentioned bodies, as well as the constitution of the Central Committee for Jute Development announced early last month, signifies the recognition, by the Government, of the imperative need for ensuring speedy and healthy development of the jute industry. The recognition is to be widely welcomed in the context of keen competition from Pakistan, not to speak of the growing popularity of alternative packaging materials and bulk handling methods. Unless energetic action to counter this competition, not by means of special subsidies or some other counter-measures but through improvement in the competitive capacity of Indian goods, is initiated in the near future, the jute industry will not be able to fulfil the fourth Plan targets (tentative) assigned to it. The targets fixed to be achieved by 1970-71 are 1.70 million tons for production and Rs. 180 crores for exports, as against 1.23 million tons and Rs. 157 crores, respectively, in 1963-64 (third year of the third Plan). Viewed thus, a heavy responsibility is cast on the Consultative Board, the Export Promotion Committee and the Central Committee for Jute Development. The findings of these special bodies, one hopes, will form the basis for the formulation and implementation of a rational policy for jute industry in the coming years.

Inasmuch as the jute industry is an export industry—almost three-fifths of its production is sold abroad—and raw jute accounts for well over half of the industry's production costs, India's ability to compete in the world markets for jute goods will naturally depend on the adequate availability of quality fibre at a reasonable price. This aspect was pinpointed by both Mr. A. D. Ogilvie, President of the Associated Chambers of Commerce, and Mr. R. H. Morrison, Chairman of the I.J.M.A., during the discussions at the recent meeting of the Board of Trade. As Mr. Morrison rightly remarked, the Government should ensure the conditions necessary for securing higher productivity from jute lands, in terms of not only yield but also quality. Such higher productivity will obviate the need for inflating raw jute prices.

PLANS FOR PETROLEUM INDUSTRY

India's imports of crude oil and petroleum products crossed the Rs. 100-crore mark in the fiscal year 1963-64. They amounted to Rs. 104 crores, to be precise, as compared with Rs. 88 crores in 1962-63. This rising import bill, which, incidentally, is a consequence as much of the delay in constructing the public-sector refineries as of the Government's disinclination to permit the three private-sector refineries to expand further, constitutes a big drain on the country's slender foreign exchange resources. An annual saving of at least Rs. 25 crores in foreign exchange could have been effected by now, if, instead of importing Rs. 58 crores worth of petroleum products, the Government had allowed private refinery expansion so as to process an additional Rs. 33-crore worth of crude. It is not too late even now to do the right thing. but the Government seems to be in no mood to learn the right lesson from its past mistake. For, how else can one explain the reported proposal of the Union Ministry of Petroleum and Chemicals to authorise expansion of private refining capacity by an aggregate of up to 2.5 million tons *only in the last year of the fourth Plan or in the first year of the fifth Plan*?

The Ministry's tentative programme for the development of petroleum industry in the fourth Plan period, incidentally, envisages the creation of an additional refining capacity of 12 million tons so as to take the country's total refining capacity to 30 million tons per annum in accordance with the official demand projections upto 1971 for motor spirit, kerosene, high-speed diesel oil and other products. This is on the basis that the combined capacity of the four private refineries, the public-sector refinery at Gauhati, and the three public-sector refineries under construction at Koyali (Gujarat), Barauni (Bihar) and Cochin (Kerala) would come to 18 million tons. Of the proposed additional capacity of 12 million tons. three new State-owned refineries—one each at Madras, Haldia and Kandla—will, we are told, account for a total of 7.5 million tons, further expansion of Gujarat and Cochin refineries for upto 2 million tons and expansion of three private refineries, namely, Burmah-Shell, Esso and Caltex, for up to 2.5 million tons. On paper all this planning seems to be quite in order. But the snag is that, even as the third Plan is not going to achieve the public sector refinery target, the fourth Plan, too, may end with a substantial shortfall in its public-sector target of 9.5 million tons, thereby involving a larger cumulative shortfall on account of both the Plans.

What is worse, if the private refineries are not going to be allowed to expand before the last year of the fourth Plan or the first year of the fifth Plan, the actual aggregate capacity in both the public and private sectors will be very much less than the 30 million tons envisaged for 1970-71. In any case, what guarantee is there that the expansion prospects of the three private refineries would not be adversely affected by a possible later stand that two public-sector refineries in Gujarat and two such refineries on the East Coast would be sufficient in the context of demand in their respective areas? Such an element of uncertainty in the matter of private refinery expansion will certainly not be in the interests of the country's oil economy. In fact, the Government's stubborn refusal to date to countenance this expansion is already having its detrimental effects all round. As an entirely new refinery would involve a much higher capital cost than the equivalent expansion of an existing refinery, there is a compelling case for permitting private refinery expansion here and now. The case derives added strength from the consideration that the foreign exchange cost of such expansion could be entirely met by the refineries themselves. Now that the third Plan's public-sector refinery projects are being delayed, it would be prudent and farsighted to do now itself what is proposed to be done in 1970 or 1971 under possibly more depressing circumstances.

PACKAGE PROGRAMME IN LUDHIANA

During the last three years of intensive Agricultural District Programme, popularly known as the Package Programme, there has been a significant increase in the area, yield and production of wheat and groundnuts in Ludhiana District of Punjab. The table below shows the progress that has been made:

	1960-61	1963-64
Wheat :		
Production (lakh maunds)	45.41	76.39
Yield per acre (maunds)	16.90	23.70
Gross value of production (Rs. crores).	7.28	12.60
Groundnuts :		
Production (lakh maunds)	6.75	15.21
Yield per acre (maunds)	10.09	14.30
Gross value of production (Rs. crores).	1.54	3.56

Note :—One maund=37.32 kgs. or 82.28 lbs.

It will be observed from the figures quoted above that production of wheat rose by 68 per cent during the three years, against the contemplated increase of 50 to 60 per cent during the entire five-year period of the operation of the Programme. The rise in yield per acre was over 40 per cent and in the gross value of wheat production as much as 73 per cent. As regards groundnuts, the growth was still better. Whereas production increased at a remarkable rate of 125 per cent, yield per acre improved by 42 per cent and the gross value of production by 131 per cent. In spite of the fact that two of the three crop years were unfavourable to wheat crop, the cumulative economic gain from these two crops during the last three years has been Rs. 12.50 crores, which is over 30 times the expenditure of Rs. 40 lakhs, excluding loans, incurred on the Package Programme in the district.

The rise in production noted above is attributed to the preparation and implementation of farm plans, larger consumption of fertilisers and adoption of the method of producing two food crops from the same field during the year. The intake of fertilisers increased from 5,590 tonnes in 1960-61 to 24,000 tonnes in 1963-64. The use of superphosphates, which play an important part in raising wheat production, increased from a mere 360 tonnes to 6,000 tonnes. The farmers have adopted the rotation of hybrid maize followed by wheat and thus grow two food crops in the same field. As maize has to be fertilised heavily, the residual manure which becomes available in the field after the harvesting of crop, is taken advantage of by wheat crop.

The importance of what has been stated above cannot be exaggerated. In the context of continuing shortage of food and raw materials and the failure of Government's agricultural policy to increase production in the country, there are a few factors which the planners must note before laying down the plans for agricultural development for the fourth Plan period. It will be seen from the figures above that money, though important, does not play the conclusive part in raising agricultural production. This may be seen from the fact that, with an expenditure (excluding loans) of Rs. 40 lakhs only by the Government on the Programme, it was possible to raise the production of wheat and groundnuts substantially and that, during the short period of three years, the yield increased by over 40 per cent. It may be noted that India's food deficiency is only marginal and even with a lower increase in yield per acre than the one experienced in Ludhiana, the country can become self-sufficient and may even be able to export a considerable quantity of food. What is important to gain this objective is that individual attention should be given to each farm or at least to each farming village and the farming requisites should be supplied to the farmer in adequate quantities and at proper time. Even more important is that the farmer should be made aware of what these improved farm practices can do, namely, larger production, more money and better living standard. He should be made conscious of his capability to raise production and the defeatist attitude that has been so dominant in the country these days should give way to optimism. This change in outlook is possible only when the Government itself displays the production-raising demonstrations in every village and on the field of the farmer under conditions almost similar to those which are prevalent in the villages and under the limitations which the farmers have to face. A few demonstrations here and there, away from the field of the farmer and under conditions not identical with those in the villages, create a suspicion in the mind of the cultivator and are not conducive to success.

The top-heavy planning under which ambitious targets are laid down by the planners while sitting in the air-conditioned rooms of the Sachivalayas—both for expenditure and production—is not going to solve the food problem. There is an urgent need to bring planning to the village level, so that it may be possible to give adequate attention to requirements of every village to raise production.

U.S. ATOMS-FOR-PEACE PROGRAMME

Two developments of significance to the Atoms-for-peace programme have taken place of late in the United States. One of these pertains to the basic revisions in the 1954 Atomic Energy Act, approved by the U.S. Congress last week. The purpose of such revisions is to give American industry the right to own fissionable materials and make it easier for other nations to obtain U.S. fuel for atomic power stations. Under the 1954 Act, it will be recalled in this connection, American domestic operators of nuclear reactors had to lease fuel from the Atomic Energy Commission and other nations had to negotiate specific barter arrangements with the A.E.C. each time they wanted enriched uranium to re-fuel power reactors. Thanks to the present amendments, American operators will have the right to buy nuclear fuels outright and own them, while foreign nations will have a longer-term support of U.S. fuel for power reactors through a continuing uranium-enrichment service within the A.E.C. As many private enterprises in the U.S. and some 30 foreign nations depend on the A.E.C. for nuclear fuel supplies for research or power reactors, the latest changes in the basic U.S. Atomic Energy Law are bound to give a fillip to the Atoms-for-peace programme throughout the world.

The other significant development is the successful testing of Experimental Breeder Reactor II (E.B.R.-II) which has just generated its first electricity—8,000 kilowatts—at the A.E.C.'s Idaho Falls station. It is said that this particular type of reactor is the forerunner of commercial atomic stations that will produce more fuel than they burn. E.B.R.-II thus represents another milestone in the longer-term programme to get cheap, plentiful electricity with the aid of the atom. This facility is expected to furnish the technology and engineering know-how to build a prototype breeder power station in 1968. Experience with the prototype, according to the A.E.C., should lead to the construction of a full-scale commercial breeder station for supplying plentiful and inexpensive electricity by 1980. E.B.R.-II, incidentally, differs in three important respects from other experimental and commercial atomic power stations, numbering 14, which now supply more than one million kilowatts of electricity in the U.S. Firstly, it uses no moderator, such as water, to slow down the fission reaction within the core. This unrestrained chain reaction produces an enormous build-up of neutron particles that must be contained within the core while they are put to useful work. Secondly, the fuel core in E.B.R.-II is surrounded by a blanket of Uranium-238 which, in its natural state, is not burnable as fuel. Neutrons are permitted to bombard this Uranium-238, transforming it chemically to plutonium which is burnable (fissionable) as fuel. And, thirdly, the breeder uses liquid sodium, instead of water, to remove heat from the core. This heat is piped off to make power as in conventional thermal plants, that is, by feeding it through turbo-generators.

Although the U.S. is already producing economic atomic power in high-cost regions in the north-east and on the west coast and the six larger private units under construction or consideration in that country for an aggregate capacity of 2.5 million kilowatts are confidently expected to be competitive over their lifetime with conventional electric plants *anywhere*, the goal of cheap and unlimited atomic electricity is yet far away. The attainment of this goal has to await the ultimate in reactors, the breeder like the E.B.R.-II, which is now only in the experimental stage—a stage that is expected to continue up to 1968 when a prototype breeder power station is scheduled to be built. But, as has been indicated already, both the United States and the world have a long way to go before they can produce cheap electricity on a large scale with the aid of breeder reactors. The first full-fledged breeder station itself is expected to be in operation only after sixteen years from now.

EXPORT PROMOTION

On the basis of the Rs. 5,100-crore export target (at the currently ruling prices, we presume) fixed for the fourth Plan, the average annual value of exports during the five years from 1966-67 to 1970-71 will be of the order of Rs. 1,020 crores. Although this figure is markedly higher than the actual exports of Rs. 798 crores in 1963-64 and the average annual exports of about Rs. 716 crores in the first three years of the current Plan, it is not difficult of achievement, provided sustained efforts are made from now alone to improve the competitive capacity of Indian goods in world markets. What these efforts are were impressively highlighted by Mr. Murarji J. Vaidya, the Founder-President of the Indian Council of Foreign Trade, when he addressed the eleventh annual general meeting of the Council in Bombay last week-end. The programme of planning for export promotion which Mr. Vaidya commended for acceptance once again is based on the following five measures:

(*a*) Greater attention to the expansion of our agricultural products;

(*b*) greater utilisation of existing indigenous industrial capacity for capital goods;

(*c*) fuller utilisation of our productive capacity for consumer goods and durable goods;

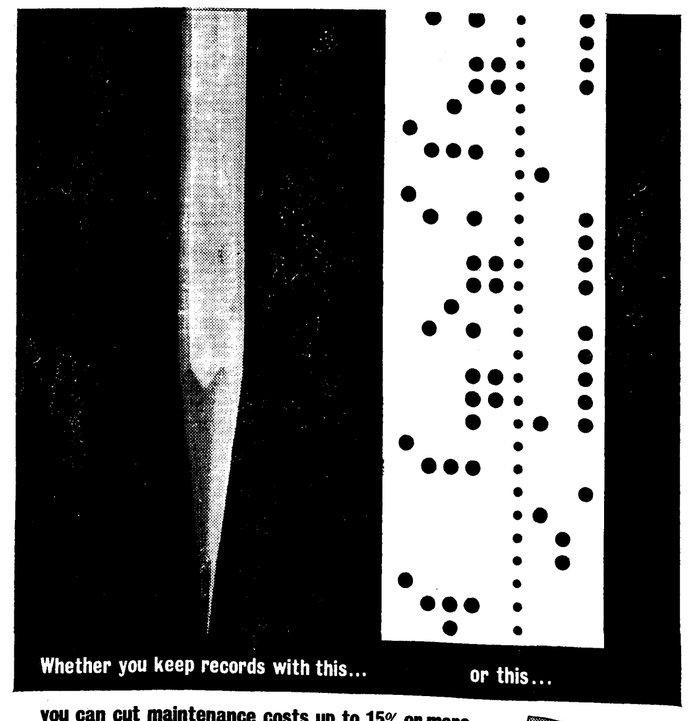
(*d*) judicious and balanced reduction of our imports by resorting to a greater degree of processing in the country and importing the same goods required by our industries and importers so far but which have not undergone the same extent of processing abroad; and

(*e*) a scheme of automatic export incentives in the place of the present integrated system of export incentives.

The first three suggestions are unexceptionable. But the fourth suggestion is somewhat vague and confused. One wonders how exactly the implementation of this suggestion will help step up exports. As for export incentives (and indirect benefits), Mr. Vaidya himself admitted that these could only be viewed as temporary measures, for, "ultimately, it will be our ability to reduce our cost of production that will ensure the continuous expansion of our export trade." Needless to say that such a reduction in cost can be brought about only by increased production (industrial and agricultural), a cut in the overall burden of taxation and steps to check the rising trend of prices, especially of industrial raw materials. Appropriately enough, Mr. Vaidya cited the example of countries like Japan which have counteracted inflationary pressures by greater productivity and increased output through the adoption of improved machinery and processes.

TEXTILES COMMITTEE

A 30-member Textiles Committee, with Mr. R. G. Saraiya as Chairman, has been set up by the Union Government "to carry out the purposes of the Textiles Committee Act, 1963." The Committee is a corporate body vested with large statutory powers to ensure the quality of all textiles, whether made wholly or partly of cotton, wool, silk, art silk or fibre. Generally it will ensure standard qualities of textiles for internal markets and export purposes, undertake, assist and encourage scientific, technological and economic research in the textile industry, promote exports of textiles and machinery and carry out propaganda for that purpose. It will specify the type of quality control or inspection and inspection of textiles at any stage of manufacture.

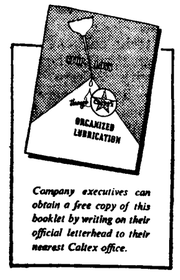


you can cut maintenance costs up to 15% or more with Caltex "Stop Loss" Programme

Here's one plan for reducing major overhead costs that puts no premium on your record-keeping methods.

Whether you use a clerk or a computer, you can count on a Caltex "Stop Loss" Programme for substantial savings in maintenance expense... savings that can reduce costs up to 15% or more.

The key to this plant management plan for cost control is our exclusive Lubrication Control System. This flexible blueprint for economy helps slash costs in the primary areas of production and maintenance. It eliminates the high price that companies pay for unnecessary shutdowns. It extends machine life, reduces maintenance time and labour costs, and increases unit output.



Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex office.

DELHI LETTER

NEW DIMENSIONS OF DISCORD

PRIDE AND PREJUDICE OVER TECHNICIANS

From Our Special Correspondent

NEW DELHI, 25*th August*

IN the issue of *Commerce* dated 9th May 1964, this correspondent commented as follows on the Soviet aid offer for the Bokaro project:

"On May Day, the Steel Minister made the dramatic announcement that the Russians would *underwrite* the Bokaro plant and *adopt the Bhilai style*.... Despite all the tall talk, the going has been hard on Bokaro in trying to go it alone. The task of co-ordinating construction, with equipment to be ordered from numerous firms all over the world, would have been immense. The experience in Rourkela has been bitter enough. ... The Bhilai style for Bokaro means that the Russians will tackle the one-and-a-half-million-tonne stage on a *turnkey basis*.... The Russians certainly will be agreeable to making use of more indigenously fabricated equipment, particularly since the largest supplier of such equipment will be the heavy engineering plant established with Soviet technical and financial assistance."

To put it in a nutshell, the general principles governing the Soviet attitudes towards helping the construction of the Bokaro plant have undergone no change, whatever the imaginative interpretations made or the expectations unfolded by Indian technical experts inside and outside the Steel Ministry since May. The change of the Minister in charge of the Steel Ministry in itself has not meant fundamental changes in attitudes, because, phraseology of public statements apart, the basic policies in relation to Soviet or other aid are influenced by detailed discussions among various Cabinet Ministers and not subject entirely to the personal whims of one Minister or the other. It is true that the Finance Minister, Mr. T. T. Krishnamachari, has held views on the Bokaro project which have been at variance on occasions with those held by the former Steel Minister. It is also possible that the recent somewhat sensational disclosures about Soviet Demands (later denied officially) may have been inspired by those who have shared some of Mr. Krishnamachari's views on heavy projects.

A colourful description of the difficulties in Bokaro project negotiations would be to say that they relate to pride and prejudice—national pride over the expected capability of Indian technicians and prejudice on the part of foreign experts over the limitations of Indian technicians' capacities. Bhilai was created as a Soviet aid image; the ambition, which was shared by Mr. C. Subramaniam, was that Bokaro should essentially produce an Indian image with the Russians or someone else acting as the midwives. The Soviet thinking is naturally that the new steel baby should exihibit distinct Russian parentage. The Russians need not be blamed for wishing to ensure that the Bokaro baby is not delivered as a sick infant like Rourkela was. The Russians have not gone out of the way to decry the value of the work done hitherto on Bokaro planning by Dastur and Company; at the same time, the Russians obviously do not think that Indian designers' capacity has matured enough to handle the basic aspects of the Bokaro plant. The Russians want to be the final arbiters on the stage-by-stage decisions on how far Indian technicians are to be associated with the Bokaro project and at what levels. The premise that the man who issues the cheque calls, the tune need not necessarily be branded as purely capitalist. It is foolhardy to accuse the Russians of being stubborn; they are being realistic.

It is now clear that the Soviet assessment of Indian technical capabilities is not very different from that of the Americans who were connected with Bokaro investigations. Incidentally, the Russians are understood to have had discussions with an Austrian firm which makes the equipment for the L D process which is to be adopted at Bokaro. The Hindustan Steel Limited holds the Indian licence for the use of the L D process in the country. Although there is to be a separate organisation for the Bokaro project and there may be other tie-ups for other steel plants, Hindustan Steel will be in the picture as far as the L D process is concerned.

Supersonic Issues

As the Russian experts and the Indian counterparts hammer out a solution for the differences on administrative and technical control over the Bokaro project, the Defence Minister, Mr. Y. B. Chavan, will be engaged in another series of discussions of crucial importance. It is now two years since the Russians agreed in principle to help the Indian Air Force equip itself with supersonic striking power. Here, again, the essential factor is the judgment of the Russians or other foreign aiders on the Indian technical capabilities in venturing into large-scale aircraft manufacture. And here, again, the Western powers. from the very beginning, have adopted a policy which puts a damper on Indian ambitions to build up her capacity to strike in the air. While refusing to supply the type of sophisticated fighter-bomber aircraft which the Indian defence forces are keen to have, the West has at the same time carried on a quiet campaign to persuade India to withdraw from the deal with the Soviet Union to make MIG fighter planes in the country. India could, perhaps, afford to go slow with the MIG project if the United States made a firm promise to supply modern planes.

Recent reports from the United States about the possibility of Western collaboration for an engine for the Bangalore-made HF-24 has been coupled with suggestions that it would be unnecessary for India to go ahead with the MIG project. HF-24 was originally designed to be flown with a British-designed engine. The collapse of the arrangement with Bristols had nothing to do with political considerations; it was a question of India being reluctant to invest the amounts needed for the development of a suitable engine when other parties originally interested in the engine dropped out. Soviet engines were thought of as an alternative to the British engine but the use of Soviet equipment would have meant radically redesigning the engine frame of HF-24. British and American experts, who, recently visited India to study the problem of the engine for HF-24, have naturally reported that they could build an engine for the aircraft. Rolls Royce already has arrangements to help engine manufacture at the Bangalore factory of Hindustan Aircraft Limited. There is no reason why the Indian Defence Ministry should not pursue a *commercial* deal with Rolls Royce to design new equipment to power the Bangalore-designed plane.

The question of tying up the Bangalore project with the MIG venture comes up, because the Defence Ministry thinks in terms of semi-governmental aid for the aero-engine. The problem will be simplified once the Government takes a decision to enter into a commercial contract with a British or French firm which can design the engine.

The Shastri Style

Mr. Nehru's method of operations often consisted of direct conversations with a Secretary or Minister to arrive at decisions. The other Ministers were often ignorant of the reasons for the decisions and sometimes did not even know that certain important decisions had been taken. From the record of actions so far, Mr. Lal Bahadur Shastri appears to think in terms of allowing for greater interplay of forces among the various Ministries. He has at the same time made it clear that he will not hesitate to lay down the law when he thinks there is need. His directive to his colleagues that there should be immediate attention paid to economies in public expenditure is a straightforward and direct approach and he is not willing to enter into a debate at this stage on the perspectives of the fourth Plan. He refused to enter into a discussion of dogma raised in the letter written by the communist M.P., Mr. Bhupesh Gupta. Mr. Shastri has touched on the basic premises he has in mind, and says in his reply to Mr. Gupta: "It is *not* my view that there is a contradiction between the setting up of heavy industries and the promotion of well-being of the masses. But, clearly, there has to be some kind of a balance between outlays on heavy industries and outlays on measures which bring immediate benefit to the common man." Mr. Shastri is clear in his mind that sufficient attention has not so far been paid to the creation of such a balance. He explains that "the development of heavy industries is not to be assessed in terms of foundation-stones laid but in terms of output derived." Some of the laborious formulations hitherto done at Yojana Bhavan are no doubt being blown off by the new wind.

LONDON LETTER

THE CHANCELLOR IS PUZZLED

(From Our Own Correspondent)

LONDON, 22*nd August*

"TRADE Gap narrows" screamed the evening paper headlines in unison this mid-week and the hot and holiday-making Britons relaxed in the satisfaction that all was well after all, their standard of living was secure and the Conservatives were not such bad chaps and maybe ought to get back into Government again. When is the rude awakening going to come? The Chancellor has helped already in one of the frankest television interviews ever given to the British public. Only one more set of trade figures can be given to the country before it goes to the polls and there is no doubt that many a fervent prayer will be uttered that it may be good.

The good news about the trade gap was that from the near-record adverse figure of £62 million in June, it had narrowed down to the grim figure of £39 million. But, for the whole first quarter, the adverse balance was £36 million per month; for the second quarter it was £45 million; for the first half-year, it was £40 million per month and for July it was £39 million per month! It will have to improve a good deal more than £1 million per month before the complacent holiday-maker can be sure his standard of living won't be cut.

It is now possible to make an assessment of the balance of payments for the year to date: against imports of £2,448 million for the first half-year, exports and re-exports were only £2,206 million, giving an adverse balance of £242 million. Against this, invisibles produced about £85 million (the average of 1963), so that the final adverse balance on current account was £157 million. For the seven months including July, it can be estimated at £180 million and for the year as a whole on present trends it would be £300 million.

Outflow of Long-term Capital

Allowance must be made for the outflow of long-term capital: for the first half of this year, it is estimated at £150 million and the National Institute Economic Review forecasts £100 million for the second half-year. However, there are the imponderables which over the years work out as favourable and may be allowed for as £60 million positive to set against the capital outflow. (Actually for the first half-year these imponderables were exceptionally favourable which helps to account for the fact there has been no trade pressure on sterling, but, in the second half-year, they could easily be adverse as they were in 1963.)

So to the current adverse balance estimated at £300 million for 1964 must be added £190 million on capital account, giving a total adverse sum of £490 million. Up to now, support for this monetary outflow has been found from the rise in overseas sterling area balances.

What of the future? The National Institute Economic Review assumes that the visible balance will not continue to stay intractable as the upsurge in imports dies down. Even so, it estimates a deficit on current account for the first half of 1965 of £200—£250 million *less* invisibles say £100 million—thus net £125 million. But, with the allowance for long-term capital, this would become £200 million adverse for the half-year and maybe £400 million adverse at the most for the full year or, perhaps, only £300 million, making the most optimistic assumptions all round.

Adverse balances totalling £800-£900 million over two years are supportable with enough central bank assistance, but, clearly, there is no future in such vast overspending, even if £300 million or so represents investment. Naturally, the Chancellor is being asked what he thinks about it all. And this is when he has admitted that he is puzzled and does not know why our exports are lagging so far behind. For such improvement as there was in the July trade figures did not come from better exports but from worse exports coupled with a heavier drop in the import bill. Industry is confident, says Mr. Maudling; orders are flowing in. Why then aren't the figures better? Can it be that exports are just not competitive enough?

Whatever the reason, Mr. Maudling will not admit a crisis. He will not (to his credit) cut back demand—maybe the thought of the coming election has to do with this. No, he just couldn't make out what was wrong. He was asked about import controls and he made the staggering answer that he had no doctrinal objection to such if they could be shown to do the job. Mr. Wilson who has even less doctrinal objection to import controls can plead that he could make them do the job even better than Mr. Maudling could. If he thinks he can undercut Labour criticism by such an admission, he may find that he has launched a boomerang.

Output is holding up at a 4 per cent rate and the malaise with the economy on the surface is only in the export field. But, of course, this reflects something deeper. Mr. Maudling says he must have an incomes policy. The electorate may consider whether he or Mr. Wilson may be better able to achieve it. Competitiveness is going to be the watchword, but, before long, some Government is going to have to turn the word into reality!

TECHNOLOGY TAKES BRITAIN INTO EUROPE

By Questor

THE European Community is at bottom a political grouping, and it was mainly because of General de Gaulle's doubts about Britain's political loyalties that the Brussels negotiations finally broke down. But the purely economic arguments in favour of British entry, which were widely canvassed among businessmen at the time, are obviously valid. Europe can succeed in standing up to U.S. competition under conditions of reasonably free trade only if it creates a home market large enough to offer similar advantages of scale to the highly-capitalised manufacturer.

This is most plainly true in fields which involve advanced technology, particularly where the technology is of a kind more or less Government-subsidised as in the U.S. by the requirements of the defence programme. Britain has run up several times recently against the impossibility of standing up alone in such fields against U.S. competition.

First, there is the case of computers. The British computer industry was over-supplied with different models and is now rationalising iteself, but it will still find it difficult to hold out against I.B.M. I.B.M. is in an almost uniquely strong position, perhaps, but no European country wants to be dependent for expertise in this rapidly-growing sector entirely on America—General de Gaulle, it will be recalled, made a big fuss before he allowed General Electric to take an interest in Machines Bull.

Then there is the case of nuclear reactors. Lacking domestic resources either of oil or of really cheap coal, Britain has been building nuclear power stations to supply electricity for some years past and is now planning to build a new generator whose costs, it is hoped, will be competitive with those of fossil fuels. Britain has a promising reactor type, developed at considerable expense by the Atomic Energy Authority and working well, a development of the type which is already operating successfully.

But the situation has been complicated at the last moment by the fact that U.S. firms, anxious to establish themselves in the British market, are offering to supply a different type of reactor at a capital cost much reduced by proposed standardisation and mass production. So far as nuclear-powered ships are concerned, again, where the prospect of competing with oil is much more distant, there is a choice between continuing with an Anglo-Belgian reactor or buying a much less advanced but cheaper U.S. type.

Aircraft are another case in point. Britain has just had a major political row over the orders placed by the national airline, B.O.A.C., for British-built VC-10s. These orders were necessary if the British aircraft industry was to continue producing a long-range jet, and the VC-10 is a first-class piece of engineering. But the Boeing 707 is now so firmly established that the VC-10 will get few export orders and B.O.A.C. may well be entitled to demand a subsidy of some kind for operating it.

Again, the projected cost of the Concord supersonic jet airliner has already risen sharply and there is a risk that the world's airlines may not want it to fill the gap between the next generation of subsonic jets and any more advanced supersonic model the U.S. eventually decides to produce with Government help. It is a gamble which may come off, but it would be a very big gamble for one country to take alone.

In an entirely free world market, there is no doubt that the competitive advantage of the U.S. would be overwhelming and that smaller industrialised countries, however competent their own technologists, would find it cheaper to import the products of advanced technology and high capital investment. In their own interest, however, they cannot allow this to happen: they must build up their own advanced industries, just as the newly-developing countries must build up simpler manufacturing industries of their own.

Protection may be part of the answer, but it cannot be the main part. If Britain cannot maintain a large independent aircraft, nuclear or computer industry without strain, nor can the other European countries. The obvious answer is European co-operation, and the beginnings are already obvious. France and Britain are working together on the Concord, Belgium and Britain on a nuclear reactor for ships; there are strong rumours of a link-up between British and German industry on computers.

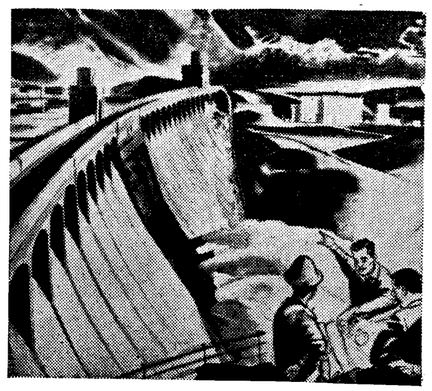
The same tendencies are making themselves felt in the world of banking. U.S. banks have been expanding steadily into Europe. At the same time, however, European banks have been steadily formalising the informal links which have existed between them for generations past and creating syndicates to transact business larger than any one of them would care to undertake alone. More recently, they have actually been acquiring stock interests in one another.

Moves of this sort are inevitable, if European financial institutions are to overcome the disadvantage inherent in the larger resources of their U.S. counterparts and in the fact that Britain, the only European country with financial markets as developed as those of the U.S., is forced into regular balance of payments difficulties by the inadequate size of her gold reserve.

The encouraging fact about the technological links is that they are being forged in the face of the political differences which kept Britain out of the European Community and of the rising trade barrier created by the common tariff. The financial links are more encouraging still: they are based more on traditional associations than on the fact that Europe is temporarily split into a Six, a Seven, and an outer fringe. They are so obviously in the common interest of the businessmen involved in them that they may yet help to break down political barriers and create a united Europe, able and willing to deal on equal terms with the U.S.

The South Arabian Federation proposes to change the name of its currency from East African shilling to dinar by April next, according to the Federal Finance Minister. The dinar will be worth 20 East African shillings (£1 sterling) being backed heavily by sterling convertible at a fixed rate. The proposed "South Arabian Currency Authority" will have about 85 to 90 per cent of its currency reserve in sterling and British Government securities and the remainder in sterling securities issued by the Aden State Government. Bahrain also proposes to introduce a new currency, the dinar, in the middle of 1965, which too will be convertible at par with sterling.

DEVELOPMENTS IN THE EAST



With the improving living standards in the East comes the prospect of trade expansion and of increasing opportunities for profitable marketing. The world-wide facilities of three great banking organizations, merged into a single comprehensive service, are at your disposal with up-to-date information and expert advice on all aspects of finance and trade in these areas.

TRUCE BETWEEN BANKERS AND BANKMEN

SOME LESSONS OF THE DISPUTE

FOR the first time in fifteen years, the bankers—both the State Bank of India and the other commercial banks in the private sector—have come to a mutual settlement with their employees, thus opening a new era of common understanding and mutual trust. Ever since Independence, the bankers have relied almost exclusively upon industrial tribunals to give awards which proved to be extravagantly expensive (not only in their impact, but also in their formulation), infinitely time-consuming, and thoroughly unsatisfying to both the parties. If the Sen tribunal's award was declared void and inoperative on technical grounds, the Sastry award met no better fate: in fact, the fate of the Sastry award was obvious from the experience of its short-lived predecessor—the Divatia tribunal—which was dissolved even before it had started its work. The detailed and exhaustive Sastry award was altered by the Labour Appellate tribunal, in order to give larger benefits to the employees of banks. The Labour Appellate tribunal decision was again modified by the Government which felt that it was inexpedient on public grounds to give effect to it. The wave of discontentment among bank employees again forced the Government to appoint a commission to enquire, ascertain, review and recommend an appropriate course of action that will ensure an equitable treatment to bank employees, consistent with the capacity of the various classes of banks and of the various units to pay. Mr. Justice Rajadhyaksha died soon after he undertook this assignment, and it fell to the lot of Mr. Justice Gajendragadkar to carry out the job.

The whole process from Divatia to Gajendragadkar took almost four years and the Government thought it worthwhile to give effect to the Sastry award as altered and modified, for a period of five years upto the end of March 1959 by an Act of the legislature. Meanwhile, the considerable expansion of banking industry and growing dissatisfaction of employees with the conditions of service had served to inflate the expectations of the bank employees, expectations which remain unfulfilled. The dissatisfaction of the employees led to further unrest, because the cost of living was rising and the purchasing power of money was declining as a result of the mounting strains and stresses generated by the tempo of the second Plan.

Bankers' Attitude

In 1959, the various unions of bank employees, led by the All-India Bank Employees' Association, served notices of termination of Sastry award and submitted fresh charters of demands on behalf of the employees. The Desai tribunal was constituted in 1960 and took more than two years to produce the Desai award which was liked neither by the employers nor by the employees. The employees were fully vociferous in expressing their dissatisfaction, but the employers must have found, inspite of their declared feelings, that any revision of Desai award would be even worse for them: not only did they accept the Desai award, but requested its extensions—the first such extension was granted in July 1963 and the second in July 1964. In the aftermath of the Chinese invasion, the first extension was easily available, but the second extension was very reluctantly granted by the Government, in the face of mounting discontent among the employees. The bankers felt that the time, effort and expenditure that had gone behind the Desai award would not be worth it, if the award were to expire within a year or two. But their real feelings and fears were that another award or a settlement would involve additional burdens which they might not be *able* or *willing* to bear in the face of the revised liquidity requirements coming into force from the next month. The Desai award, they were able to take in their stride, and were willing and eager to perpetuate it as long as possible—preferably for a period of up to five years.

The employees had presented their case against the Desai award on various grounds—largely upon what they described as anomalies, defects, inadequacies, etc. They never got a hearing from the employers, presumably because the bankers were able to convince the Government that the alleged anomalies, etc., had been fully and exhaustively considered by the Desai tribunal before arriving at the final decision. It was, however, the failure of the third Plan to hold the price line that ultimately torpedoed the Desai award. It must be remembered that it was the steep increase in prices five years ago that had enabled the employees to convince the Government of the need for reviewing the modified Sastry award. In the same manner, the current trend of mounting prices has forced the Government to persuade the bankers to consider the genuine grievances of bank employees even if that meant going beyond the Desai award. For two years, the bankers shielded themselves under the Desai award, but in the face of an unprecedented agitation and pressure from the Government, they could not do so any longer and had to face the realities of the situation.

Two Results

The protracted negotiations held in Delhi for over a week has brought two results: first, an *ad hoc* relief for the bank employees and, secondly, a bipartite machinery for negotiating a new long-term settlement. In the bargain, the bankers have obtained a promise of lasting peace and harmonious relations. A temporary rise in the dearness allowance equivalent to 6 per cent of the basic salary for clerks and 8 per cent of the basic salary for the subordinates (to remain effective till the expiry of the Desai award, or till the 1960-based cost of living index is published or till a long-term settlement is arrived at, whichever is earlier) is well below the original demand of the bank employees for a 20 to 25 per cent rise in the total emoluments. Immediate abolition of area IV by class A banks alone, involving a 10 per cent rise in the emoluments of staff stationed in such areas is also much below the expectations of a large number of area IV employees serving in smaller and medium-sized banks. The settlement between the bankers and the bankmen is not, therefore, notable for what it has granted: it is more important for the changed *mood* that it reflects among both the parties. As this issue of *Commerce* goes to press, the negotiations are being continued in an effort to arrive at a mutually agreed long-term settlement on various 'anomalies' perpetuated by the Desai award. Given the mood of Delhi settlement and a genuine desire amongst bankers and bankmen to arrive at a settlement that is fair to both, the chances of a successful emergence of a bipartite agreement are bright.

The latest phase of the dispute, however, holds out a few lessons for the future of industrial relations in our country and shows clearly how not to handle industrial relations. The bankers, unwilling right from the beginning to talk with the bankmen, needed an impressive demonstration of their employees' strength before being pursuaded to negotiate: but even when they were unwilling to talk, they were equally unwilling to be firm and wanted the Reserve Bank or the Government to face the music. It was only after it became clear that neither the Bank nor the Government was willing to do so, that bankers came into their own and were able to achieve a mutually satisfactory agreement. It must, however, be said to the credit of the Union Government that it did its best to reconcile the two parties and helped them to come to the present understanding.

Lack of Firmness

The bankmen claim that but for the agitation they raised, the bankers would never have listened to them: the agitation itself was novel in more ways than one. It was variously described as 'go-slow tactics' or 'work-to-rule movement' etc., but, in effect, it caused considerable disruption of banking activity and raised a number of problems of mass indiscipline and of security of banking operations. It may be argued, for the sake of argument, that employees had discovered a unique form of agitation which, while paralysing banking activities in a worse manner than an outright strike would have done, had the advantage of not cutting into their pay packets. It must be mentioned here that neither the bankers nor the Government ever challenged the employees by pointing out that they cannot agitate during the currency of an award or when the Government was already moving to bring the bankers and bankmen together. Quite apart from the question of justice or otherwise of their demands, no groups of employees can be allowed to labour under the impression that they can get away with rank indiscipline and unedifying demonstrations. After all, the Government did ask them as early as mid-1963 to prepare lists of their demands or of what they considered anomalies; if they took as long as a year or so for preparing the lists, it was their own fault. Having taken such a long time to frame their demands, they were not justified in starting an agitation even before giving the bankers a chance to consider the lists ultimately prepared by them. The truth seems to be that the workers wanted to test the Government's reaction to their agitation and, when they found that the Government was indifferent towards what was going on in the banking industry and lukewarm towards the bankers' point of view, they intensified their agitation in order to get a quick settlement. The bankers, on their part were timid and did not have the courage to take any disciplinary action.

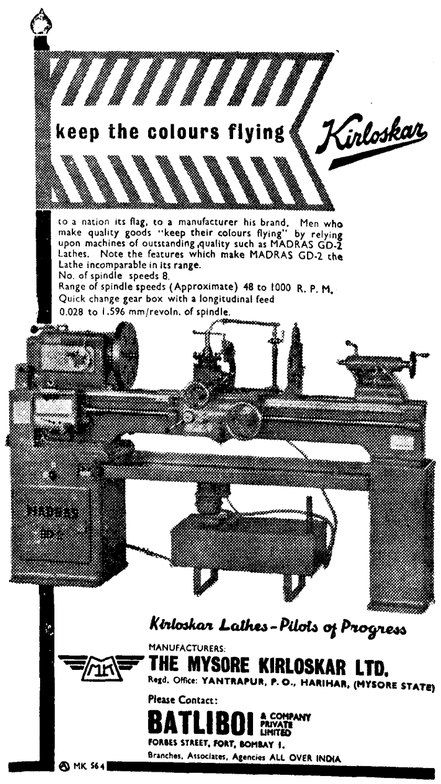
The Government on its part was completely at sixes and sevens and vacillating. The initial mistake of the Government was to give a handle to the employees' organisations by telling them in effect that, though the Desai award was extended for another year, it was no longer sacrosanct. The second mistake was its failure to tell the employees that by indiscipline or unruly behaviour they cannot intimidate the bankers. The third mistake was the failure to realise that the problem the bankers faced was not unique in any way and that, if bank employees got any substantial relief, the agitation was bound to spread to other spheres of work, business and trade. Yet another mistake was the irresponsible statements reported to have been made by some of the Ministers and officials on the banking situation: if it was the Government's intention to "force" the bankers to concede all "reasonable" demands by taking "legal measures," it could have done so without so much fuss; if the Government had only looked up the machinery for enforcing industrial peace rather than showing its helplessness, the public would have been spared much inconvenience.

State Bank of India

Some bankers say that the State Bank of India had played a clever game by announcing some concessions to its staff on the eve of the negotiations between the bankers and the bankmen. Does a public sector organisation, they ask, have no responsibility or consideration for the delicate negotiations that were to begin in Delhi? But one fails to understand as to why the State Bank of India should always be expected to support the bankers in the private sector.

One's reading of the whole situation would, however, be wrong, if one were to attribute the present interim gains of employees merely to the State Bank's cleverness, or the Government's indifference, or the bankers' helplessness. The steep increase in the cost of living during the past fifteen months has only partly and inadequately been compensated by linking the dearness allowance to the cost of living index, and there is clear justice

(*Continued on page 381*)



STANDARDS OF DIRECTORIAL BEHAVIOUR

HIGH DEGREE OF RECTITUDE AND ACTIVE INTEREST ESSENTIAL

By F. R. Ginwalla

IN modern industry, elasticity and adaptability to changing conditions are of supreme importance. Company directors have become so much immersed in their old habits that they are inclined to overlook the need for a change and even resist it. Most of our company directors show their inability or unwillingness to learn, to think and see, in a totally new fashion, the current thought and feeling. It is important, in the interest of our industrial dynamics, that the appreciation of the thought that every profession needs a certain purity of spirit must grow quickly, and become more broadbased than it has been hitherto. The highest standards of conduct in enterprise will determine the pace and direction of the country's march to prosperity. It is time company directors realised that, when they all pull together in the same direction, the country will be able to reach its goal of economic progress and social justice. And it is time they realised that no enterprise is insulated against the state of the country's economic health.

I can say without overstatement that the constant stream of criticism against the directorial behaviour indicates that some of the company directors elude the attempts to wean them away from the care-free and slipshod ways of an earlier epoch. I must beg the reader to excuse me for using this expression, for I do not find a better one.

My object in writing this article is to emphasise the wisdom or usefulness of re-thinking which has to be made by the weaker sections of company managements. Such re-thinking must be made by every sector and sections of the total community, by labour as well as capital, scientists, engineers, economists, researchers, business educators, politicians, lawyers, judges, social workers, and others scattered over the vast country. It is only when we reorganise our role in the society and when we all pull together in the same direction, will we be able to reach our goal of economic progress and social justice. We must expect to live the orderly ways we have invented, continually conscious of the fact that things change with the passage of time.

Peculiar Feature

Standards of conduct for any profession are formulated first through the behaviour of individuals in that profession. They are in fact the consolidation of a long-established practice which is eventually enforceable by regulations. A directorship is in that stage of professionalism where there is no official recognition of standards of behaviour other than in the strongly legal or narrow sense of the regulatory provisions of the Company Law.

I wish to stress that the success or failure of any corporate organisation largely depends upon the standards of directorial behaviour that are followed.

I do not dislike corporate enterprise, for I could not live without devoting all my hours to it. Everything I write or speak in connection with the corporate enterprise is to see that the system survives the pressure of change. There is a danger to the corporate sector, as a result of boards of directors being composed of individuals having major investment blocks in the share capital of the company, or of persons who are close relations and friends lacking in essential equipment for the discharge of directorial duties and functions. Then there is the danger to the country's economy resulting from the directors misusing their position of trust as trustees of the Company's money and property, misapplying the company's funds and committing breaches of trust, making corrupt profits or receiving a secret commission, making overseas trips for businesses unconnected with the company, and evading taxes and duties.

Today, when widespread, deep and rapid changes are taking place in the social and economic frame of our nation, and when still other changes seem necessary to provide more to the country in terms of higher production and better quality of goods at reasonable prices, to the people in terms of better living, to workers in terms of higher wages, and to shareholders in terms of higher return on their investments, some changes are necessary in the concept of the standards of directorial behaviour.

What is a Board?

A board of directors is essentially a collection of individuals of experience, judgment, imagination, initiative, decision, courage, integrity, and human understanding with collective responsibilities to the company's shareholders, employees, creditors, customers and consumers. Every director is in a position of trust. He is trusted by the shareholders, employees, company's creditors, and fellow-directors. And he is trusted by the nation for the country's industrial development and productivity. His responsibilities are not merely those defined in the legal text-books.

The causes for the failure of some business enterprises can be traced to the lack of initiative for the proper planning in the composition of the board of directors. It is pertinent to observe that the existing conservative tendency towards the composition of the board of directors hinders the achievement of the objectives of the company. The board of a company is like any other organisation. It must progress and grow on healthy lines. It cannot be permitted to stagnate or remain static. It is an essential fabric in the structure of the economic life of the country.

It is time to penetrate deeper and see dispassionately what is wrong with the pattern and shape of the existing boards in the country and make conscious and deliberate efforts with vigour and vitality for planning and developing a really effective board. The need for initiative to expose conservatism to new dimensions and directions can hardly be stressed. The principle that it is the board as a whole which takes decisions and not the individual directors must gain wider recognition.

No company, whatever its size, can stay in business profitably if its board is composed of directors who indulge in the belief that their responsibilities begin and end in the board room. There are instances when directors of the highest position, some of them even very eminent lawyers, have never queried the propriety of what is going on. The presence of "yes men" on the board is more often than not a rule in this country. This is due to directors distributing favours to their relatives and friends or the chairman adopting a technique to have a board which consists merely of directors nodding their heads in consent to his preconceived ideas on the items on the agenda.

A word of caution must be said against the prevalent trend in this country to bring on the board retired high Government officials, or politicians or ex-rulers chiefly with a view to making the company and the board look more strong and influential. Let it be said that both the person, who merely lends his name to a company in exchange for a fee, and the company which borrows it, are making a grave mistake in their understanding of the director's responsibilities and his obligations to the society.

Chairman

There is one particular remark I wish to make against the prevalent practice of appointing an individual as a chairman who holds a large number of chairmanships. The propriety of such a practice is considered by different people from different angles suited to their own inclination or experience. I concede that there is a distinct advantage where one individual holds chairmanships in companies having a direct link, because he may be able to maintain a uniform policy for all the companies. But I feel very dubious about the wisdom or usefulness of the practise of appointing an individual as a chairman who holds a large number of chairmanships in companies having no direct link with one another. He keeps switching on from one company to another at a moment's notice. He has hardly any time to get to know about the company's activity or even to throw a cursory glance on the financial statements and progress reports. Such a chairman is far more unlikely to serve the companies effectively as the head of the business. From an economic point of view also this practice is undesirable, because it tends to encourage concentration of economic power in the hands of a few individuals. The Companies Act prohibits the appointment of an individual as a managing director of more than two companies. There should be some regulatory provision in respect of chairmanship also.

Of late, many companies have been set up as joint ventures in collaboration with foreign companies. The Government, generally prefers that foreign investment should not be more than 49 per cent. It has, however, been pragmatic and there are many cases where the majority participation of foreign capital has been allowed. A cursory analysis of some of the companies where the foreign collaborators have large share-holdings will reveal that, in some cases, the foreign collaborators have developed a tendency to interfere in matters which are strictly the province of the board or feel that they have a right to dictate to the board, as if the board was a rubber-stamping body for them and their nominee directors. These tendencies must be closely watched and guarded against.

There is no provision in the Company Law to meet situations arising out of large stock-holdings of foreign counterparts. Here remedial action is urgently needed. The Government would do well in the wider national interest to examine the position and take the right action so as to ensure that all types of collaborations fit into the framework of the social and economic pattern of the country.

Outside Blood

Many companies in the U.S., the U.K. and other advanced countries consider it desirable to include on their boards individuals who have special knowledge and skill. Outsiders with such a background are invited to join the board, because it is increasingly recognised that their contribution to the board's wisdom would come from their specialised knowledge and that their wider experience would enable them to take a more detached view than would be possible for a whole-time or an executive director. It is a wise practice to have an outside director so as to make the board more effective. In this country, one rarely comes across a company which follows this practice. Perhaps the conservative tendency hinders the introduction of anything fundamentally new.

The appointment to the board of senior executives from the management would help the board to take sound decisions. I disagree with the view that a man so appointed would not recognise that his responsibilities as an executive of the company were quite different from his responsibilities in the board room. There is no real danger, if he keeps his two identities separate.

To believe that there are only a few persons in our country who are capable of handling affairs is to indulge in a dangerous illusion. There are many who are adequately equipped for positions of administration and leadership. The absence of law governing interlocking of relations among corporate directorates has created a barrier against bringing new men, new energies, new spirit of initiative and new blood into the management of business enterprises. Our task, therefore, is to open the field of industrial development and organisation to scores of men who are obliged to serve when their abilities entitle them to direct. Let it not be thought that I am implying that men alone are proficient in business careers, for women, too, have come a long way in a short time.

Retirement Age

The Companies Act provides for the retirement of directors on attaining the age of 65. The age limit was imposed in order to open out opportunities for the utilisation of the services of younger men with requisite training and experience in the management of companies. This objective has not been fulfilled. Hardly any director over 65 has ever retired. On the contrary, by continuing to retain their seats on the board even after attaining the age of 65, these old people stand in the way of more active men being appointed on the board. It is a common feature in this country that the directors in general consider themselves immune to the age of retirement. There are many cases where directors, by reason of their age, are unable to take any active interest in the management of the companies concerned. There must be some prohibition against the superannuated directors seeking approval of the shareholders for their reappointment again and again. This will immensely hearten the young men coming up in life and enrich the business community's

EMPLOYMENT IN INSURANCE BUSINESS

SETBACK IN THE GENERAL SECTOR

INSURANCE has gradually come to acquire an important place in the employment market in the country. At the end of March 1963 the regular employment in insurance business (based on the data published by the Life Insurance Corporation and the estimates of employment in non-life insurance business made by the Central Statistical Organisation, New Delhi) stood at 66,400, which was higher by about 15,000 as compared with the position as of March 1959. There has thus been a rise of 30 per cent in four years or an average annual rise of about 7 per cent. In addition to this, there were many more people employed in the insurance field, working on commission basis. No information on the number of such people is available.

Life Insurance Corporation

The Life Insurance Corporation (L.I.C.) accounts for about three-fourths of the total regular employment in the insurance business. Table I shows the regular employment in the Corporation since 1959, category-wise. It will be seen from the table that Supervisory and Clerical workers constitute about two-thirds of the total staff of the Corporation. But their share is gradually coming down and the rising trend which prevailed upto 1960, has been reversed. The position of Subordinate Staff is also almost similar. However, the ratio of Class I Officers and Development Officers is rising gradually.

The salary bill of the Corporation has risen at a fast rate, particularly since 1961. Though the employment has also increased, the salary bill has jumped up at a much faster rate. As compared to 1959, whereas the employment in March 1963 was higher by 29 per cent, the gross salary bill was bigger by 56 per cent. The figures indicate a considerable rise in the scales of salaries in the Corporation. Table II shows the rise in gross salary bill and the changes in average gross salary per employee, categorywise.

It may be seen from the table that the gross salary per employee increased by 21 per cent during this period. The rise was about 40 per cent in the case of Subordinate Staff and over 23 per cent for Supervisory and Clerical Staff. However, in case of Development Officers, there was practically no change and that of Class I Officers declined by about 5 per cent. No wonder the Development Officers all over India have been vociferously agitating for an increase in their salaries. Considering that there has been a steep rise in price and cost of living, their clamour is quite understandable.

Non-life Insurance

The July issue of the *Monthly Abstract of Statistics* gives some data about the employment position in non-life insurance. These data, however, give only a rough idea, as the results have been arrived at by the Central Statistical Organisation from the returns submitted by only 43 per cent of the working companies. At the end of 1961, there were 155 non-life insurance companies. Of these four Indian and four foreign companies ceased working in 1962 and one new foreign company came into existence in India. Thus, at the end of 1962, there were 148 non-life insurance companies working in the country. As against 93 companies which had sent their employment returns for March 1962, 105 companies sent such returns for March 1963. Thus more companies had responded than in the previous year. The method used by the Central Statistical Organisation for determining the employment in 148 companies and its conclusions are better put in its own words:

"Of the 105 companies which have sent in returns of employment as on 31st March 1963, it is found that 64 companies had also submitted returns on 31st March 1962. In this identical set of 64 companies, the employment has decreased from 8,820 on 31st March, 1962 to 8,553 on 31st March 1963, indicating a fall of 3.0 per cent. The eight companies which ceased to function in 1962 did not submit any returns even for 31st March 1962. As the total net premium of these eight companies put together was almost nil during the year 1961, the total employment in these companies as on 31st March, 1962 might also have been very negligible Applying, therefore, the observed decrease-rate of 3.0 per cent to the estimate of total employment as on 31st March 1962, the total employment in the 148 companies which continued to function in 1962-63 is estimated at 18,320 as on 31st March 1963, as against 18,890 in the previous year."

The method of estimation is not foolproof inasmuch as it is not necessary that the employment behaviour of 64 companies put together was also followed by the remaining 84 companies, especially so when the 64 companies were not selected by any scientific system of sample selection. Still, in the absence of any other reliable data, the C.S.O. estimates give a rough indication of employment in the non-life insurance companies.

There has been a slight change in the trend of employment in non-life insurance as compared with that of life insurance. Thus, whereas in 1962-63 there was an increase in the number of workers employed by the L.I.C., there was a fall in the non-life sector, after continuously rising upto 1961-62. As compared with 16,200 in 1958-59 the employment stood at 18,890 in 1961-62—a rise of 17 per cent in three years or an average annual rise of over 5 per cent. In 1962-63, however, it declined by 3 per cent to 18,320. The decline has been mainly in the number of Field Officers as is shown in the table in the first column.

The average number of salaried Field Officers employed by a company declined sharply during the year and the share of this category in the total employment came down from 20.2 per cent in 1961-62 to 14.5 per cent in 1962-63. In view of the general rise in the non-life insurance business, the only reason for this decline may have been the understanding among the majority of general insurers accounting for the bulk of the business in the country not to indulge in cut-throat competition and to follow a code of conduct in this respect.

ACCIDENT INSURANCE IN W. GERMANY

In the world's industrialised countries, half the workers are today using techniques unknown half a century ago. New ways in industry mean new dangers to life and limb—and consequently new responsibilities in on-the-job safety and accident insurance.

In the Federal Republic of Germany, the 80 years old industrial-safety and accident-insurance system has been re-shaped to help it cope with the new working conditions of the present day. It was on 6th July 1884, that a pace-setting law in this field was promulgated, under Chancellor Bismarck. It drew world-wide attention and is still considered a landmark in employee-welfare legislation. On this foundation, a modern accident-insurance programme was erected last year and came into effect on 1st July 1963.

Measured in per-worker cost to employers, the new German accident-insurance law is record-breaking. One of the many aspects of the high cost is the schedule of benefit payments. These are figured according to the worker's last full year of income; and the top annual income as a base for reckoning benefits has been quadrupled, to a ceiling of 36,000 DM. Moreover, a new concept of "dynamic benefits" is designed to make accident-insurance payments rise by law as wages and salaries rise. One such boost of 8.7 per cent was granted on 1st January 1964, and another increase of 6.1 per cent is planned for 1st January, 1965. Measured in comprehensiveness, the new insurance law provides workers and their dependents, at expense of the employers, with previously unequalled coverage. Benefits in most categories are higher. There are new categories of beneficiaries. And, as before, work-connected accidents are broadly defined to include not only mishaps on the job but also illnesses traceable to a worker's occupation and traffic accidents on the way to and from work.

Measured by its job-safety provisions, the law is particularly ambitious. Here too, most of the broad new responsibilities devolve on the employer. It has been estimated that 80 per cent of industrial accidents have "human" origins; that is, they are accidents from oversight or carelessness, and could be foreseen and therefore prevented. An emphasis on accident prevention therefore receives unprecedented stress under the new law. One notable provision is the role of safety or accident-prevention officer within a firm. Under the new law, some 180,000 German enterprises require an army of around 400,000 accident-prevention officers. All get extensive special training at employers' expense.

BETTER DIET FOR WORKING MAN

The average calorie requirement for a young Indian male industrial worker is 2,800 per day. A woman industrial worker requires a daily minimum of 2,150 calories. Children in the age group of 0-5 require 1,230 calories and those in the age group of 6-14, 2,000 calories per head, per day.

These are the findings of a sub-committee of the National Nutrition Advisory Committee which recently conducted a survey of nutritional requirements of industrial workers. The Committee has recommended possible improvements in the diet schedule of workers to make it more balanced. It has suggested that a part of the calories may be obtained from green leafy vegetables, which are a cheap but good source of vitamin A and Calcium, in which the working class diets are very deficient. It is of the view that most of the nutritional deficiencies found in the diets of workers can be removed by increasing the in-take of green leafy vegetables. For expectant and nursing mothers, the Committee recommends an extra thousand calories daily.

Another sub-committee, a working group on Food Hygiene, set up by the Nutrition Advisory Committee has recommended minimum standards of hygiene and cleanliness to be observed in cook-houses, hotels and restaurants. Among other things, it recommends hot oven treatment for drying and sterilisation of crockery and plates used in all eating places.

Employment Pattern in Non-life Insurance Companies

MANCHESTER LETTER

COTTON INDUSTRY AFTER THE MERGERS

PROFIT-MARGINS POOR—RETURN ON CAPITAL LOW

From Our Special Correspondent

MANCHESTER, 18*th August*

IF the first six months of the current year can be taken as a criterion, earnings from British textile machinery shipments during 1964 will again establish new records. The half-year ended with exports valued at £36,523,757, an improvement of over £3,000,000 as compared with the corresponding period in either 1963 or 1962. By volume, however, textile plant sent abroad was smaller than in 1962, being 807,853 cwt., as against 834,194 cwt. Shipments in June this year were decidedly lower than in the same month of 1962, although the aggregate for the first half of last year was exceeded by some 12,000 cwt.

The major change in destinations of British textile plant exported during the first half of 1964 was in shipments to Pakistan. These amounted to 106,525 cwt., as against 64,770 cwt. in the same period last year. Significantly, although India only took 69,886 cwt., as against 91,591 cwt., the value of these shipments at £2,779,151 exceeded comparable earnings from trade with Pakistan by £150,000. Shipments to the Soviet Union by volume were up from 36,777 cwt. to 46,318 cwt., but the value of this business increased from £1,742,791 to £3,371,961.

Few Major Changes

Most of the other countries in the long list of those buying textile machinery from Britain showed no decided change in 1964 as compared with last year, but trade with Poland dipped substantially from 15,479 cwt. to only 1,447 cwt., while purchases by South Africa fell from 65,124 cwt. to 34,651 cwt. By value, however, South African takings only declined from £1,784,509 to £1,585,427.

Shipments to Egypt by volume improved from 25,411 cwt. to 35,100 cwt. and their value was nearly doubled at £1,367,897. Western Germany also absorbed more plant at 24,596 cwt., as against 18,929 cwt. and exports to Japan were doubled at 26,748 cwt. In contrast, trade with Peru slumped from 21,507 cwt. to 2,871 cwt.

Mergers and Margins

As the dust begins to settle after the startling takeover events of the past few weeks, the British cotton trade is still trying to take stock of the situation and, although views may vary—sometimes very substantially so—the outlook gradually becomes a little clearer. One aspect of the outcome of a more closely integrated industry concerns the always controversial issue of prices. Spinners and weavers have long complained about the inadequacy of their margins; when trade has been patchy, the level of selling rates has invariably been described as poor and even in good times the return has rarely satisfied producers—although buyers have often argued this particular point.

Independent scrutineers of the industry's balance sheets have frequently suggested that the return on capital employed was below the average usually anticipated by comparable trades. When judged in relationship with the present high cost of machinery, there is certainly justification for believing that profitability in the past has been low by other standards.

Price Leadership Plan

Since the spinning and doubling sections were forced to abandon their price regulation schemes more than five years ago, after the adverse judgment passed on them by the Restrictive Practices Court, a number of alternative systems which might not displease the authorities have been considered as replacements. None, so far, has been able to secure recognition.

Attempts to establish a form of price leadership have been the most heavily canvassed ideas, and some degree of success has been achieved during periods when the time has been propitious for such schemes to gain adherents. On other occasions, it has proved an unworkable arrangement through the inability of the sponsors to secure overwhelming support for the principle.

It could now be that, in the new circumstances ruling in the industry, those who have such enormous control over so large a part of the total productive capacity will be able to exercise their power to stabilise and virtually direct prices. Already questions are being asked as to how the man-made fibre producers will treat their spinning subsidiaries when it comes to providing supplies—and the same queries can be raised over the equally vital factor of price.

Need for Stability

Concentration of power in a few hands—the natural result of the recent spate of mergers in textiles—gives those in whom it is invested opportunities for using their authority for good or ill. Monopolistic methods often antagonise the world at large, let alone those who suffer from their ill-effects, but, in the circumstances, it seems that the now even larger textile giants will act with restraint, if only because of the watchfull eye which future Governments will keep on their activities.

It is far too early yet to give any definite opinion as to how the latest developments will basically affect the price of yarn and cloth. Concessions could conceivably be offered to users of particular man-made fibres, but far more likely is a determined effort on the part of both producers and spinners to establish a realistic level of margins, aimed at covering inescapable costs and overheads on a much more sensible scale than in the past.

While this would again benefit the major groups, the independent and smaller companies would scarcely suffer, provided they avoided the temptation to enter another suicidal price war. Such policies, so often adopted in the past, and generally with dire results, are a heritage which Lancashire traders could well obliterate from their minds. If the move towards gigantic combines on a vertical structure does no more than eliminate senseless price-cutting, it will have given the industry a real tonic.

At Harrogate in 1961

Delving into the past may be regarded in some quarters as a futile pastime, but looking through old files can sometimes unearth documents which have a very direct bearing on current circumstances. In the light of the structural changes which are proceeding in the trade, therefore, the comments made at the Cotton Board conference three years ago by Mr. D. R. B. Mynors, a Director of Courtaulds, take on an added significance.

Dealing with the relationship of the man-made fibres industry to the cotton industry, Mr. Mynors pointed out that he was the first director of a man-made fibres producing company to address the cotton trade's annual gathering at Harrogate. His statistics are now, of course, outdated, but it is worth remarking that, even in 1960, man-made fibres accounted for 17 per cent of the total fibres used by spinners, while man-made fibre and mixture cloths represented one-third of the output.

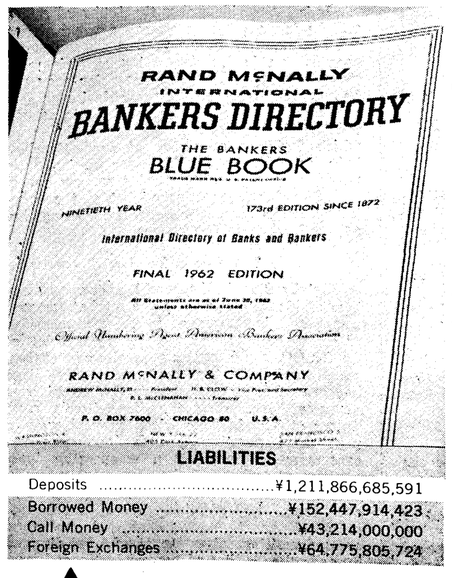
Many of the statements made at that time were well-established facts, such as the extent of the big promotional activities carried out by the man-made fibre producers. In 1960, they spent about £2,000,000 on press and television advertising alone, apart from other forms of promotion and customer and consumer services.

This expenditure, Mr. Mynors declared, was important because it helped to extend the market for textiles as a whole in the battle for the consumer's pound and also augmented the fashion-conciousness of the average woman. The benefits of this promotion spilt over into the field of natural fibres as well as man-made products.

Cotton's Inheritance

Competition from Far Eastern countries, he added, had had a much more severe effect on the producers of the older man-made fibres than many people realised. In this connection, Mr. Mynors was by no means as critical about the cotton industry as many of its detractors are. "Generations of experience are part of your inheritance," he told the conference, "and to this you can add the benefits of continual research and an ever expanding choice of materials."

In concentrating on the newer developments provided by the man-made fibres, the textile processing industry would be better able to survive the inevitable disruption caused by competition in plain cotton goods from Far Eastern countries and emergent colonial territories with lower wage levels. Lancashire, he forecast, would not only use a greater proportion of man-made fibres in the future, but would tend to concentrate on them still more as a means of exploiting its technical inheritance in an age when simpler techniques were known all over the world.



A GREAT BANK?

How do you judge the world's great banks? Deposits are one way. The Mitsubishi Bank's deposits of well over one billion yen* tell part of the story. For the rest, speak to the world bankers who respect Mitsubishi and the business leaders who prefer to deal with it. The Mitsubishi Bank can make your dealing with Japan easier and faster.

INTERNATIONAL COTTON SITUATION

NEED FOR FINDING NEW END-USES IMPERATIVE

CONTINUED erosion of markets due to intensified competition from man-made fibres is the most serious problem facing cotton growers the world over at present. Although the cyclical downswing in cotton consumption, which began in the 1960-61 season and gathered momentum in the subsequent two seasons, has been arrested, as is evident from the expansion and improvement in cotton textile activity in many countries, cotton's position is constantly deteriorating *vis-a-vis* man-made fibres. The share of cotton in the aggregate fibre consumption in 1963 was no more than 63 per cent, as against 65 per cent in 1962 and over 70 per cent in 1958. The *per capita* mill consumption of cotton in the same year was lower at 21.6 lbs., as against 22.5 lbs. in 1962. Thanks to the reduction in consumption following the ever-increasing use of competing fibres, the volume of world cotton trade suffered a distinct setback during the three seasons (1960-61, 1961-62 and 1962-63). During the season that ended on 31st July last, that is 1963-64, the trend of consumption was no doubt upward, but the estimated actual consumption of 48.1 million bales was less than the peak of 48.3 million bales consumed in 1959-60. Since, however, the quantity consumed was below the record available supply of 73 million bales, the current season began on the 1st of this month with a heavier carry-over stock of 24.7 million bales, as against 23.2 million bales a year before and 19.8 million bales two years before. In other words, there has been an addition of as much as five million bales to the world stocks in the past two seasons. The bulk of the world surplus is in the U.S. which, as is well known, is the world's biggest producer of cotton.

The substantial rise in world cotton stocks is, indeed, a matter of concern not merely to the U.S. but to the other countries as well. At the 23rd plenary meeting of the International Cotton Advisory Committee held at Frankfurt a few weeks ago, it will be recalled, serious concern was expressed over the declining trend in world cotton consumption and mounting cotton surpluses during a period of steady

WORLD COTTON SITUATION

growth in the total fibre market. Although the main purpose of the meeting was to consider ways and means of developing a world-wide programme of promotion and research through international co-operation, the general discussions centred largely on the three important aspects bearing on world consumption of cotton. They were: (1) The return to a situation of imbalance between production and consumption with its implications for near-term future; (2) the question of an international price level which is both remunerative to producers and competitive with other fibres; and (3) recognition that cotton consumption has failed to expand in recent years when the total fibre market has been growing, and the need to stimulate consumption.

Special Causes

The deliberations at the meeting and the events that have taken place since then have made it clear that, in addition to the general causes of imbalance in world cotton economy like over-production and under-consumption, there are special reasons which have checked the rising trend of consumption, resulting in an aggravation of the imbalance. In the U.S., for instance, the competitive position of raw cotton has been adversely affected by the dual price system. Further, even though cotton consumption in certain countries continues to increase, the rate of increase in some cases has been held down because of difficulties in assuring adequate supplies of cotton, caused by insufficient domestic production and the inability to supplement domestic supplies by imports due to lack of foreign exchange. As regards the effects of excess production, the U.S. has been able to mitigate these by a regulation of its cotton policy and it is expected that this stability of prices will continue under the new legislation in that country. Most of the producing countries, however, have a feeling that the price stability has been at too low a level, in view of the unavoidable increase in production costs, while many consumers emphasise the importance of the price factor in competitive position of cotton against other fibres, particularly rayon and staple fibre.

It will be worthwhile to recall here the observations of the Committee on the social and economic implications of the present cotton situation. The Committee said:

"It should never be forgotten that cotton provides a livelihood for countless millions of people throughout the world. There is a vital need to improve living standards of cotton farmers by ensuring that cotton prices are at a level that will offer adequate remuneration and contribute an increase in national income. In many primary producing countries, cotton is a prime source of foreign exchange and, in some, cotton and cotton textiles are an integral part of their long-term plans for economic development. Increased export earnings by these countries are in the interest of industrialised countries as well, for the developing countries are important outlets for manufactured products."

Future Prospects

Notwithstanding the huge world stocks of cotton and the growing use of man-made fibres, there does not seem to be any cause for despondency as to the future of raw cotton. Striking a note of optimism the Committee made the following observation at its last meeting:

"With an expanding world population, most of it ill-clad, it would be ironical to accept that there is too much cotton. In the long run, the problem is rather one of under-consumption than over-production. Existing capacity is sufficient to accommodate an increase in cotton textiles production and this situation has been intensified by the natural desire of the developing countries to establish and expand domestic textile industries. In the industrial countries, competition is intense and manufacturing margins are low relative to other industries. To remedy this situation, cotton textile industries are undertaking expanding programmes or rationalisation and plant modernisation. Although capacity in the highly organised man-made fibre industry continues to increase rapidly, with a heavily financed programme of research and advertising, consumption uptil now has kept pace with output. These fibres are having a material impact on the market for raw cotton, either by direct substitution or by the increasing use of blended fabrics."

It is thus evident that the future of cotton will be influenced largely by the trend of cotton consumption. In the present circumstances, consumption in the developing countries continues to expand, but this expansion may not be sufficient to offset the probable increase in production. There are then policies in certain industrialised countries, including the U.S., which facilitate expansion of synthetic fibre industry. If these developments persist, there would be a continuing surplus of raw cotton and, in order to ensure equilibrium, the countries may be forced to resort to the negative approach of curtailing output.

The Cotton Problem

Briefly stated, the world cotton problem is twofold: Expansion in the market for raw cotton and improvement in the remuneration of cotton farmers. At the plenary meeting of the I.C.A.C., the delegates generally agreed that, on a world basis, the efforts along these lines had been far from adequate and that this was a matter demanding the Committee's most urgent attention. The Committee did well to urge the imperative need for producers and consumers to formulate a co-operative programme of technological and market research and promotion. As was rightly pointed out then, in addition to a more co-ordinated effort in the field of promotion and advertising, attention should be directed towards the finding of new end-uses and new outlets for cotton products. The statement that research and promotion would be applied to cotton, in general, and to those specific projects where the potential for expanding consumption is the greatest and where the competition from the man-made fibres is the most intense, is reassuring. It is only through research aimed at achieving higher yields, improved fibre quality and more efficient farming that the remuneration of farmers can be increased. No one need, of course, deny the validity of the Committee's contention that, if an acceptable programme on cotton research and promotion could be put into operation, this would stimulate the demand for cotton by improving cotton's competitive position in the world fibre market.

Extra Long-staple

Of special importance to the world cotton situation is the supply position in respect of extra long-staple cotton (E.L.S.). It was not surprising that this issue was chosen for a separate discussion at a preliminary meeting of the Committee held prior to the 23rd plenary session. The review made at the meeting reveals that a reduced carryover and a much smaller crop have resulted in a marked contraction in total supply of E.L.S. cotton in the 1963-64 season. The opening stocks were somewhat lower than a year earlier, though higher than in most recent seasons. However, production was at its lowest level since 1957-58. The small world production was attributed primarily to the greatly reduced crop in the Sudan and decline in production in the U.A.R. The fall in world production would have been steeper still, but for the new peak output in the U.S. and Peru. "The main explanation for the decline in the world production," to quote the Committee, "is the significant reduction in average yields per acre, for total acreage was about unchanged last year." Demand, it is said, was very strong, encouraged by a relatively favourable price situation at the beginning of the season and exports were expected to be maintained at about the last season's near-record level. However, due to insufficient production, this level of export could only be achieved by reducing stocks to the lowest level in many years.

For the 1964-65 season, it has been assessed that supplies will be smaller than in 1963-64. Reports about a smaller crop of extra long-stable cotton in the Sudan have led to a substantial rise in prices of this variety and the consuming countries have expressed the fear that, if the present level of prices persists, there may be a substitution of long-staple upland cotton, more particularly synthetics, in many traditional uses of E.L.S. In order to alleviate the situation in regard to E.L.S., the U.S. has been requested to dispose of its remaining stocks of imported Egyptian cotton within the next few months.

It may be noted with satisfaction that most of the world's E.L.S. cotton is produced in developing countries, where the need for foreign exchange earnings is the greatest and where remunerative prices to growers are necessary to improve the standard of living. This situation imparts bargaining strength of the producing countries in their discussions with the advanced countries. As the International Cotton Advisory Committee has emphasised, the interests of producing and consuming nations will be best served by efforts to expand markets for this variety.

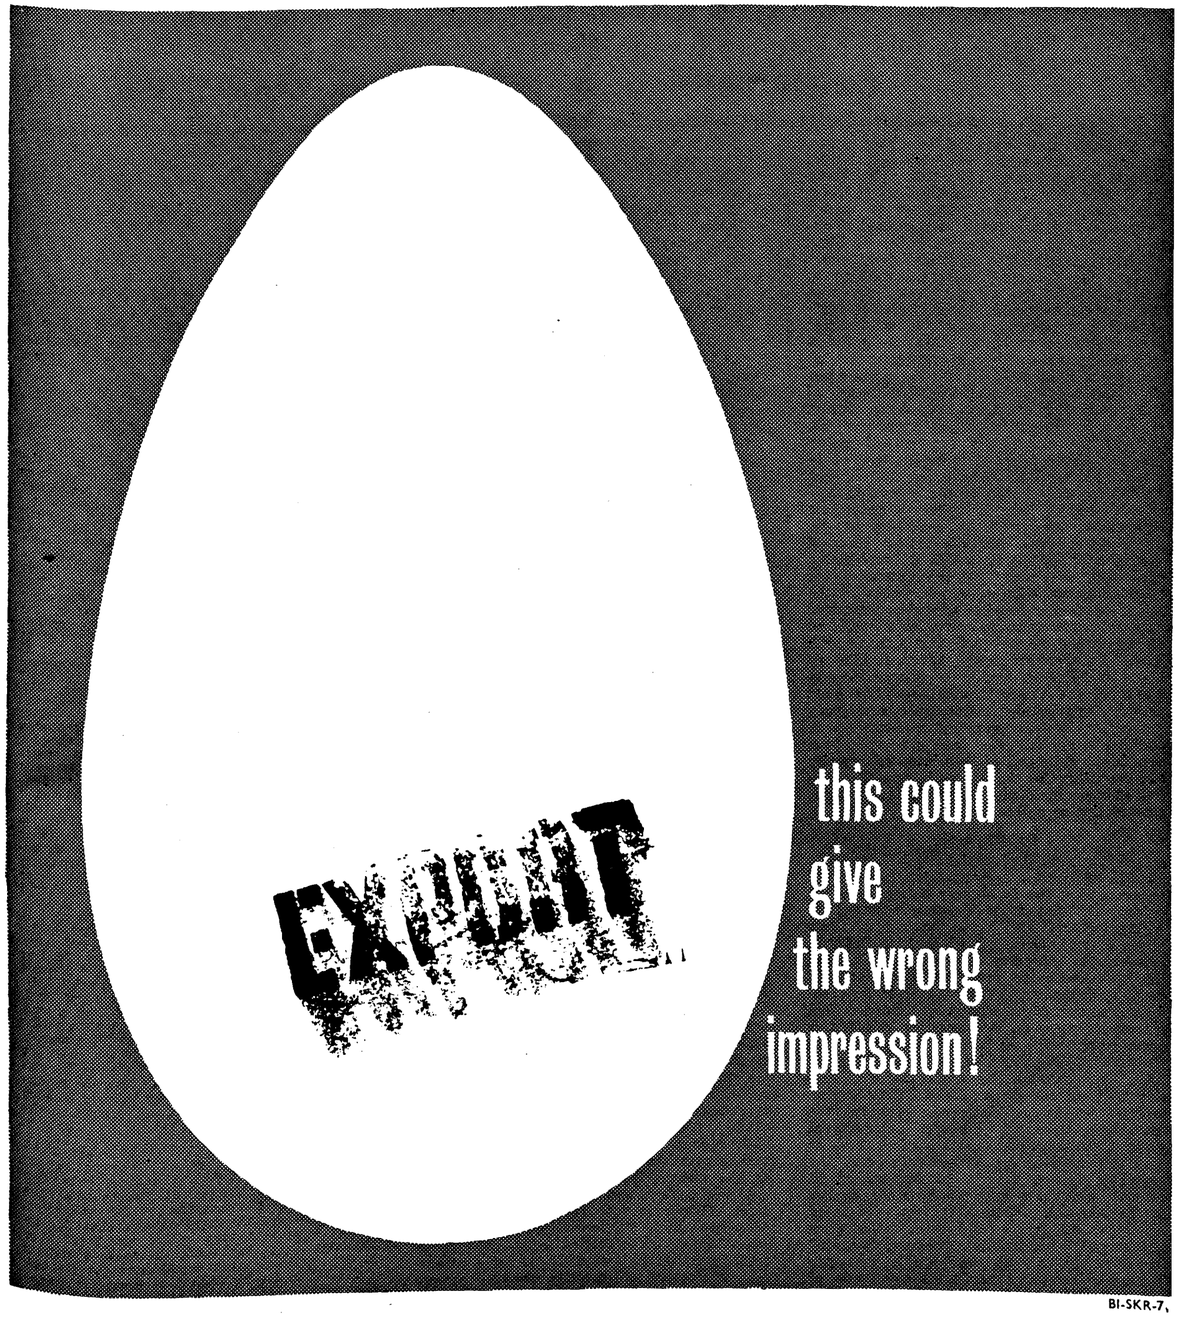
COTTON IN THE U.S.

The supply of cotton in the U.S. during the 1964 season is expected to equal demand. The U.S. Department of Agriculture has forecast output at 14,785,000 bales (of 500 lbs. each), which compares with the actual output of 15,327,000 bales last year. According to Merrill Lynch, demand this year may just absorb the output.

It was hoped in the U.S. that legislation passed earlier in 1964 would cut the existing large surplus by paying farmers to reduce their acreage by a third. Unfortunately, the legislation was passed after the growing season had begun. However, domestic consumption in the U.S. is estimated at 9.6 million bales, an increase of 1.1 million over 1963, though exports should fall by 400,000 bales, to 5.2 million due to better crops elsewhere in the world.

Cotton textile production was up in most countries in the first quarter of 1964, with the greatest increase in India, Pakistan, the U.S. and Japan. This increase in output has ended the three-year decline from 1960. In the U.S., in particular, the industry is in better shape following legislation which enables the mills to buy U.S. cotton at world market prices. This has led to new plant outlays and offers some hope that the enormous U.S. cotton surplus may be gradually absorbed.

The Textile Commissioner has permitted mills to purchase Indian cotton for the 1964-65 cotton season fully equal to the total consumption of Indian cotton during the previous season 1963-64. Every mill is required to complete its purchases of the entire quantity of Indian cotton so allowed as early as possible and, in any case, not later than 31st July 1965. This general permission is subjected to the condition that, in case any mill has used Cambodia 'A' and/or 'B' cotton any time during the last three cotton years ending on 31st August 1964, it should, during the season 1964-65, purchase at least a quantity equivalent to 7½ per cent of the annual consumption of Indian cotton in 1963-64 season of Cambodia 'A' and/or 'B' cotton.



STAMPING IT CLEARLY IS IMPORTANT

When you export Rayon and Synthetic fabrics, it is worth remembering that details matter. Blots, smudges and shabby stampings can create a wrong impression about you and your goods.

Remember—clear and accurate stampings mean a clear gain in goodwill.

Your reputation abroad rests on:
- Attractive presentation
- Strong and seaworthy packing
- Supplies as per samples
- Shipments in time

Build your exports on a long-term basis

SECOND ALL-INDIA POWER SURVEY

WILL OVERALL SITUATION BE MORE SATISFACTORY?

THE Central Electricity Authority has just published the second All-India Power Survey (price: Rs. 5) which was carried out by the Electric Power Survey Committee (Chairman: Mr. K. P. S. Nair, Vice-Chairman, Central Water and Power Commission). The survey report, it is claimed, is the result of combined thinking on the part of representatives of State Electricity Boards and private electricity undertakings. Its principal findings pertaining to load growth in the country from 1961-62 to 1967-68 are presented in Table I. The all-India data in this table represent the arithmetical sums of the regional data. A rather satisfactory finding is the estimated aggregate installed capacity of 10,924 M.W. in 1965-66—a figure not very much below the third Plan target of 11,270 M.W. for commercial operation during the year in the public utilities sector covering both State-owned and company-owned undertakings. If this is going to be the position in respect of *installed capacity* (defined by the Committee as the sum of the maximum continuous ratings of all installed generating equipment), the aggregate *capability* of the power systems will naturally be less, being of the order of 9,434 M.W. in 1965-66. Incidentally, *capability*, as defined by the Committee, is "the maximum kilowatt output ability of the power systems at the time of system peak load with all power sources available with no allowance for outages, and (for systems with hydel installations) with sufficient kilowatt hours available to supply the energy requirements of the system"; this *capability* must provide for scheduled maintenance, emergency outage and system operating requirements in addition to the estimated load and any unforeseen load. Estimates of both *installed capacity* and *capability* for the four years from 1964-65 to 1967-68 cover the plants already installed, under construction or authorised.

Load Forecast

As for *peak load*, which is the maximum simultaneous ultimate customer demand that occurs during the fiscal year as measured by actual deliveries at bulk power sources and which includes line losses but not auxiliary power requirements, it will be 8,052 M.W. in 1965-66. The difference between *capability* and this peak load is the *gross margin* which should be of sufficient magnitude to provide for scheduled maintenance, emergency outages and system operating requirements; in 1965-66, this *gross margin* will be 1,382 M.W. representing 17 per cent. It is not clear whether this *gross margin* accounts for the *surplus* of 10,285 million kw.h. of energy in 1965-66. This *surplus*, incidentally, is the difference between "the total energy that can be produced under normal water conditions for hydel stations and at normal availability for thermal units" and "the aggregate of the energy consumption of all ultimate consumers, as measured at the busbar of the generating stations." It may be noted here that the forecast regarding "energy requirement" is not strictly a "demand forecast," for it refers only to the possible aggregate "energy consumption" at the estimated level of actual power deliveries for ultimate consumption. Th real *demand* for power may be much greater, but, then, there is no forecast of such demand in the Committee's survey. The impression produced by the figures in Table I, however, is that the overall power situation in the country will be increasingly safe because of an increasing difference between "energy available" and "energy required." But this may not actually be the case, if there happens to be substantial *unsatisfied* demand over and above the level of energy consumption estimated by the Committee under the head "energy required."

Region-wise Estimates

The region-wise picture is to be found in Table II which gives the estimates under all the relevant heads (namely, installed capacity, capability, peak load, gross margin, energy available and energy required) for 1965-66 and 1967-68. The northern region in this table covers Jammu and Kashmir, Punjab, Rajasthan, Uttar Pradesh, Delhi and Himachal Pradesh; the western region Gujarat, Madhya Pradesh and Maharashtra; the southern region Andhra Pradesh, Kerala, Madras and Mysore; the eastern region Bihar, Orissa and West Bengal; and the north-eastern region Assam, Nagaland, Manipur, N.E.F.A. and Tripura. As regional grids are yet to be established, the regional data in the table represent only the arithmetical sums of the data for each State. When a regional grid comes into operation in each region, the annual power survey will take account of any diversity between peaks on the systems that will then be operated as a closely co-ordinated group within the power zone. Thanks to such co-ordinated operation, there will be a substantial saving in capital expenditure and operating costs and higher peak loads can be met with the same capability on account of diversity between system peaks. There is no indication in the report as to when the proposed regional grids will become a reality. As regional electricity boards have now been formed for all the regions, the proposed formation of regional grids, one hopes, will not be long delayed.

In the non-utilities sector, covering self-generating industrial establishments (that is, auto producers), the estimated aggregate installed capacity in 1965-66 will be only 1,126 M.W., as compared with the third Plan target of 1,420 M.W. The estimated load demand on such non-utility power stations in that year will be 694 M.W.

The Committee's report has also highlighted the fact that the annual load factor has been 61 per cent to 63 per cent in the last three years and it will not be less than 60 per cent in the coming years. This country, incidentally, compares very favourably in this respect with the United Kingdom where the load factor is below 50 per cent. It shows that the generating plants in India are being used more fully than in the U.K.

Statewise Picture of* Per Capita *Power Consumption

MAGNET WIRES INDUSTRY

The magnet wires industry is of very recent origin. The wires produced are mainly used in the manufacture of various electrical equipment, such as electric motors, transformers, switchgear, fan chokes and other electrical appliances and in telecommunication equipment. It has grown from a small production stage of 250 tons in 1950 to the level of 7,900 tons in 1963. The present rated capacity of the industry is estimated at 8,000 tons per annum, as against the licensed capacity of 13,000 tons and the third Plan target of 20,000 tons. But the industry is unable to expand production further because it has been experiencing of late some difficulties, such as inadequate supply quotas of copper (its principal raw material), delay in issuance of import licenses and irregularity of ship arrivals. These difficulties were pin-pointed by Mr D. C. Chinai, Vice-Chairman of the Magnet Wires and Cable Manufacturers' Association, at a Press conference in Bombay this week.

The Government issues raw material quotas on the basis of the performance of the industry. According to Mr. Chinai, it so happens that sometimes the industry could not reach the targeted level of production owing to some peculiar difficulties. The consequent lower production during the relevant policy period is taken as the basis for raw material quotas and the units are, therefore, forced to buy additional copper at a higher price from the open market. Mr. Chinai's suggestion is that the quota should not be reduced simply because a particular unit could not make full use of it, but that the unit in question should be granted "at least sufficient copper to produce to its rated capacity from the very first year it goes into production." As for the delay in issuance of quotas and the delayed arrivals of ships, his suggestion is that either the State Trading Corporation or the Association must be allowed to maintain a buffer stock of raw materials. Mr. Chinai has also taken the sensible stand that, instead of allowing small units of 60 tons a year to come up, the Government should encourage the existing units to expand capacity to the economic level of about 2,000 to 2,400 tons per year per unit. This will obviously save some foreign exchange, for it is well known that the foreign exchange required to start a new industry is much more than the foreign exchange required to expand an existing unit.

Mr. Chinai's complaint that the system of requiring the industry to sell its scrap at the present fixed rate to a fixed customer is not fair seems to call for sympathetic examination. His three alternative suggestions, in this connection, are that the Government (i) should allow the industry to sell its scrap in the open market, or (ii) revise the present fixed rates so as to conform to the prevailing international prices, or (iii) ask the S.T.C. to lift the scrap in exchange for scalped electrolytic wire bars. In view of the raw material difficulties faced by the industry, the third suggestion deserves to be pursued.

PROTECTION TO ALUMINIUM INDUSTRY

The Indian Non-Ferrous Metals Manufacturers' Association, Calcutta, in its reply to the Tariff Commission's questionnaire on the subject of extension of protection to the aluminium industry beyond 31st December 1964, has pleaded for such extension on several grounds. Firstly, the performance of the industry fully justifies the protection given to it so far. Secondly, the Association has estimated the demand for aluminium by the end of the fourth Plan at around 260,000 tonnes, as against the current demand of 80,000-90,000 tonnes. Hence a rapid expansion of the industry is needed. Thirdly, the high cost of production in India, as compared with that in foreign countries, is mostly due to factors beyond the control of the industry. The most important of these factors are:—(a) the high price of electric power; (b) the high price of raw materials, particularly caustic soda and calcined petroleum coke; and (c) high unit capital costs on account of import duties, small scale of operation, greater expenditure on colony and welfare facilities and greater investment in imported spare parts. The Association, therefore, strongly favours continuance of protection to the aluminium industry till 1970.

NEW PRODUCTS AND PROCESSES

Tougher Emulsion Paint

AFTER considerable development research, Pinchin Johnson and Associates, 93-97, New Cavendish Street, London, W.1. has produced an emulsion paint of great toughness and covering power, capable of withstanding ten times more hard washing than other emulsion paints. It is Gaymel Emulsion, available in nearly 60 colours. The resin base is a copolymer of polyvinyl acetate and acrylic, and is made in very fine particles. The acrylic adds the toughness and resistance to abrasion, and the fineness of the particles gives binding power for the pigment. In the process of making the copolymer, a semi-gel structure is incorporated, so that though the paint is not entirely drip-free, it is nevertheless easier to apply than conventional paints. A fungicide is also added to prevent the growth of mould when the paint is used for bathrooms and kitchens and wherever condensation is a problem.

Improved Pressure Cooker

A domestic pressure cooker with the usual rubber pressure seal and, in addition, a leaf spring mounted in the cooker head, is said by Rudolf Fissler K.G., of Idar-Oberstein, Germany, to be safer and more effective for the accelerated cooking of foods than ordinary pressure cookers. The ends of the leaf spring are forced against the rubber seal by the steam pressure inside the cooker, and cause any incomplete sealing between the head and body of the cooker to be rectified. The effective life of the cooker is increased because "fatiguing" of the rubber seal is avoided.

Heated Tubes for Hot Liquids

Screws with a left-hand thread near the head embedded in their insulation are now available from Samuel Moore and Company, Mantua, Ohio, for carrying liquids which must be kept hot. Two nickel-chromium wires, insulated with a fluorcarbon plastic, run alongside the steel tube. Both wires and tube are covered with plastic foam in an outer PVC sleeve which protects the foam insulation. When connected to a power supply, the elements are said to keep the tube contents 200 degrees Fahrenheit above ambient temperature.

Screws with Two-way Thread

Screws with a left-hand thread near the head and a right-hand one further down the body are being made for use in the manufacture of wireless receivers, gramophones and other household appliances. They are being supplied by the Shakeproof Division, Illinois Tool Works, St. Charles Road, Elgin, Illinois. When the left-hand thread is tightened in a panel the shank with the right-hand thread protrudes. Loudspeakers or other parts can be fitted over them and held by ordinary nuts tightened on the right-hand threads. Tightening the nuts also turns the left-hand thread slightly for increased holding power.

Cuffing Electric Motor Slot Liners

A new technique, developed by two British firms, for the mechanical cuffing of polyester film slot liners used in electric motors, saves time and cuts costs. For several years, slot liners have been made by laminating calendered board and other dielectric materials to polyester film of a thickness in the range 0.001 in. to 0.003 in. More recently, there has been considerable interest in using polyester film in the range 0.005 to 0.10 in., by itself without laminations. Mechanical cuffing (bending over the edges) of this film is easy, when the hot shaping method is used, but most automatic shaping machines operate cold, and there is a risk with them of cracking the outer edge of the cuff. A machine developed for the purpose forms a groove in the film before cuffing the edges. The forming rollers have a flange that forces the film into a groove in the bed plate. This reduces mechanical stress when the film is folded in the cuffing stage. The rollers are adjustable to suit different thicknesses of film and to ensure that the surface of the film is not scratched or otherwise damaged.

Removing Wax from New Cars

A solution for removing the wax from new cars without damaging the paint-work, the chrome, or the rubber sealing strips has been developed in Britain by Gramos Chemicals Ltd., Dundas Lane, Portsmouth, Hampshire. Waxes used to protect cars between factory and showroom have a high melting point, and are difficult to remove. The new solution, a mixture of solvents and emulsifiers, is applied to the waxed surface and left to penetrate for five to ten minutes, after which, the dissolved wax is easily wiped off with warm water. Rubbing with a soft cloth then produces a smear-free shine.

Ultrasonic Dip Tinning Equipment

High quality tinning of small components, in many cases without the use of fluxes, can be achieved by ultrasonic dip tinning equipment being produced by a British firm. Ultrasonic energy is used to cause vibration in the solder. This removes the oxide film on the work surfaces allowing a wetting action to take place and eliminating the risk of dry joints. As fluxes are not required for many materials—including aluminium wire—corrosion does not take place. The equipment consists of an electrically-heated solder pot to which is fitted a magnetostrictive transducer with a stainless steel probe. This has a natural resonant frequency of about 20 kilocycles. The probe is introduced into the solder bath through a ring-type gland clamped on the centre line of the probe, thus imparting maximum energy into the solder. Cooling is provided to prevent excessive heat transmission from the solder to the transducer by blowing compressed air through a cooling manifold.

Direct Conversion of Heat into Electricity

A £2 million development programme is being undertaken by Britain's Central Electricity Generating Board to establish the feasibility of a system designed for the direct conversion of heat into electricity. The system being investigated depends upon the passage of a hot ionised gas between the poles of a powerful magnet. A voltage appears across the gas, and this provides a power source, the electricity being extracted through probes inserted in the gas stream. Chief advantage of the system, which is known as M.H.D., over conventional generators is that much higher working temperatures, possibly up to 2,000° C., are expected to allow higher overall efficiencies to be achieved. M.H.D. power appears as direct current, and so it would involve conversion to alternating current before it could be fed into the grid.

Adhesive Laminating Equipment

A new machine for processing fabrics or webs to a maximum of 72 in. width, specifically designed for customers, who plan to enter the adhesive laminating field for the first time, is being produced by Weston-Evans and Company of Manchester. It has an average processing speed of 5 to 7 yds. a minute, and a production range of 1 to 20 yds. per minute. The firm, having long experience in the foam-backing and combining fields, has felt that a need exists for a simple machine enabling customers to become familiar with the adhesive process techniques before investing in the more costly, high output, production equipment.

Glueing Steel Saves Money

Scientists of the Iron Metallurgy Institute in Gliwice, in Poland, have recently put in industrial operation a new, interesting technological method. It consists of covering with tool steel inlay plates for the presses forming ceramic and fire-proof products. The plates made of carbonising steel, used until now, were substituted with two layer plates. They consist of a soft steel foundation and a steel sheet, 2.5 millimetres thick, made of hard tool steel and glued to the foundation with a glue for metals. After the steel sheet wears out, a quick, inexpensive and easy renewing of the plates takes place by ungluing the worn out sheet, and replacing it with a new one. The plates used to be thrown away after the steel wore out, but now the glued-together type can serve quite long, even a few years. Almost 200 tons of steel are saved yearly through this invention.

Calcium Chloride as Memoriser

Calcium chloride acts as an excellent memoriser in an electronic memory device designed by the Institute of Electronics, Automation and Telemechanics of the Georgian Academy of Sciences, in the Soviet Union. It is based on the optical memorisation of information. A fine film of calcium chloride covering a transparent screen records the signals of an electronic ray. "Travelling" over the screen in a pre-set direction, this ray records information in the form of dark and light dots. The new type of optical memory has great advantages over electronic-ray tubes or photo-sensitive materials now used in memory devices. Under the new method, information can be repeatedly recorded on the same memory element. The device needs only tens of milliseconds to record information. The ray-recorded information can be kept by such a "chemical memory" for an unlimited period. It is preserved even with electric tension switched off from the device.

Self-bonding Coatings

Self-bonding tungsten carbide powder that can be flame-sprayed to produce very hard coatings on almost any metallic surface is now being marketed by Metco, of Chobham, Working, Surrey. It can be sprayed directly on to a clean surface and no heat treatment is required after spraying, so that a low-melting point base material can be coated. For short exposures, the sprayed coatings will tolerate temperatures higher than their softening point (slightly above 1,000° Centigrade). It is stated that the coatings, in thickness from .002 to .015 inches, can be applied at a lower cost than similar materials deposited by any other process.

Make-your-own Boxes

For those who continually face the problem of parcelling awkward shaped objects, there is now a specially designed board which can be quite easily formed into boxes. It is being marketed by Progressive Stationers, 81, Parkway, London, N.W.1. The board has equally spaced creases running parallel with each other, and forming 3 inch squares and giving a pleasing embossed appearance. Boxes can be produced by first forming the board into a rectangular sleeve longer than the article and then cutting the surplus material at each end along the crease line at the corners. Fold-over flaps are formed, and these can be held in place by adhesive tape. The boxes formed are strong enough to send goods through the post.

IDEAS IN BRIEF

New light and heavyweight plastic products have the full transparency of tinted glass and colours ranging from red to bluish-orange. It is produced by Farbenfabriken Bayer, 22c Levarkusen Bayerwerk, West Germany.

A way of removing old paint from the body-work of cars almost as fast as it was put on originally has been patented by Gerhard Collardin, 215 Widdersdorferstrasse, Koln, Ehrensfeld, West Germany.

An organic reagent has been patented to produce extra bright nickel deposits on car bumpers by Kemiska Candor, 10, Storgatan, Stockholm, Sweden.

Improved magnesium alloys are said to have excellent mechanical properties and resistance to oxidation at temperatures beyond 500 degrees Centigrade. It is being developed by French Atomic Energy Commission, 69 rue de Varenne, Paris 7, France.

Building blocks, refrigerator bodies, wall coverings and doors can be made more cheaply and quickly, it is claimed, by a simple one-step moulding process made by Antonio Zanettei, Fegli, Via Oberdau 22, Pordenone, Italy.

A fast but simple way of compressing industrial powders has been produced by Deutsche Gold und Silberscheideanstalt, 9 Weissfrauenstrasse, Frankfurt 1, West Germany.

A new thermostat control unit relies for its operation on the expansion of rubber in a cylinder rather than on the expansion of a metal or a liquid according to Svenska Gasaccumulator, Lidingo, Sweden.

A special type of jacket is claimed to keep steelworkers cool as they work in front of hot furnaces says W. A. Bemelman, Baambrugse, Zuwe 125c, Vinkeveen, Netherlands.

I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

PETROCHEMICAL INDUSTRIES IN INDIA

THEIR IMPORTANCE—PLANS FOR DEVELOPMENT

By V. S. Swaminathan, M.A., M.Sc. (Lond.)

WE have had three capital reports regarding the prospects of establishing and fostering the growth of petrochemical industries in India, one by Dr. Kane, another by Dr. Henney and a third by the planning group for petrochemical industry. All have made far-reaching and constructive recommendations relating to the industry which in other Western and Eastern countries has, perhaps, registered the fastest growth rate. In this article, we deal with the beginnings of the industry, the competing raw materials, basic techniques, equipment and processes, economics of scale, plant obsolescence, availability of feedstocks and targets set for 1970-71. Then we review, in brief, outline, seven groups of petrochemicals—solvents, synthetic detergents, plastics, synthetic rubbers, synthetic fibres, nitrogen fertilisers and carbon black, and conclude with a consideration of the factors conducive for the growth of this young and dynamic industry.

Historical Landmarks

Ever since the Bronze Age, the chemist (and before him the alchemist) has played an important part in the utilisation of naturally occurring materials to serve the needs of man. Until the middle of the nineteenth century, the chemical industry was concerned with the manufacture of acids, alkalis and mineral salts, extraction of various natural products like dyes and sugar, and various fermentation processes. But even before the foundations of organic chemistry were laid by Liebig, Wohler and Dumas, who prepared a series of derivatives of natural products with inorganic reagents, chemists first tried to ascertain the molecular structure of natural products and then synthesize them in the laboratory. Between 1896 and 1910, the number of known organic compounds rose from 200 to 200,000. They now number over a million.

In 1824, Wohler blazed the trail by synthesizing urea by reacting carbon dioxide with ammonia. Soon afterwards, Faraday announced the discovery of benzene, which forms the basis of modern synthetic dye industry. In 1845, Professor Hofmann separated benzene from coal tar. This was followed by his pupil, Perkin, who found a method of synthesizing aniline dyes from benzene in 1856. Just over a century ago, Alexander Parkes revealed a new material, Parkesine, which, in due course, ushered in the plastic industry, now a serious rival to the Indian lac industry. In 1886, alizarin was synthesized which quickly supplanted the cultivation of madder. The synthesis of indigo by Bayer in 1880 led to the displacement of the Indian indigo crop. Later followed the use of gas products from coke ovens as simple molecules for organic synthesis. In the first decade of the current century, the conversion of coke oven gas and synthesis gas for the production of ammonia was made possible by the work of Basch and Faber. As a result, the natural nitrate industry of Chile and India languished.

A Veritable Catalyst

In the following decade, organic synthesis shifted from coal to petroleum and natural gas for its raw materials. Ethane and propane from natural gas was used to make ethylene and propylene, and isopropyl alcohol was obtained from refinery gases. Then followed the synthesis of polystyrene plastic by polymerising styrene derived from benzene. Later, Wallace Carothers produced the first synthetic rubber, neoprene, and the first truly synthetic fibre, nylon. In the 1930s, Imperial Chemical Industries produced, for the first time, polyethylene plastic by the high-pressure process. When Karl Ziegler invented the organo-metallic catalysts, it became possible to polymerise ethylene by low-pressure method into polyethylene. The advent of these catalysts led to Giulio Natta's conception of polymerising propylene by the low-pressure technique to obtain polypropylene plastic. The Second World War acted as a veritable catalyst in stimulating the growth of the petrochemical industry, particularly in the United States.

What are Petrochemicals ?

Any chemical compound derived from petroleum or natural gas has been named a "petrochemical" since the 1940s. The terminology is not quite an exact one since the word signifies "rock chemical." According to the molecular arrangement of their carbon atoms, petrochemicals are broadly classified as straight-chain types (aliphatics), or ring types (aromatics and naphthenes). Aliphatics and aromatics are more important commercially than naphthenes.

The main aliphatic materials are: methane, ethane and ethlene, acetylene, propane and propylene, butane and butylenes, butadiene, pentane and pentenes. The principal aromatics are: benzene, toluene, xylenes, naphthalene and cresylic acids. In addition to these, some inorganic chemicals form a part of the petrochemical family, the most important of which are ammonia, hydrogen, sulphur and carbon black.

When the demand for motor fuels rose sharply following the mass production of cars soon after the First World War, it was found impossible to produce sufficient quantities of gasoline by means of the simple distillation processes then in use. Therefore, the industry set about converting the heavy products to light ones by means of a decomposition process termed cracking. There are two variants of this technique—thermal and catalytic cracking. The cracking process at the same time yielded very large quantities of highly reactive olefin gases. The search for the possibility of utilising them gave the main impetus to the development of the petrochemical industry.

Competing Raw Materials

Petroleum has advantages over coal as a starting material for synthesis in being liquid, and in the fact that hydrogen is already combined with carbon. As compared with vegetable products, it is more easily and economically transported, and gives a higher yield of chemicals on a weight-for-weight basis, besides being much more stable in price. The principal attractions of petroleum hydrocarbons as raw materials for the chemical industries are that they supplant or replace base stocks in inadequate or erratic supply; provide the required feedstocks in virtually unlimited quantities, at constant quality an often at appreciably lower cost than attainable by using alternative sources. The chemical industry is only a relatively minor customer of the oil and natural gas industry. After the spectacular growth shown by this industry in recent decades, only some 1.5 to 2 per cent of world oil output, and less than 5 per cent of world natural gas production, find their way into chemicals. It is this factor that lends long-term confidence to the stability of the price structure of chemical commodities derived from hydrocarbon sources. (See Table 1.)

Techniques, Equipment and Processes

The idea of synthesis, as we have already shown, is not new, but polymerisation became a major industrial process only during the Second World War. Polymerisation stands for the combination of identical chemical molecules (repeating chemical units) to form larger ones known as high polymers or simply polymers. In some instances, it is possible to form polymers from two or even three monomers which may differ from one another in chemical form and yet be capable of linking to form mixed monomer chains. These are kown as co-polymers, and they form the basis of the most important types of synthetic rubber, including Butadiene-Styrene rubber.

One major distinction between an oil refinery and a petrochemical plant is that oilmen deal in products measured in terms of thousands of barrels a day, while, in most cases, the chemists are satisfied with daily outputs measured in a few tons. In other words, petrochemistry turns out rather limited quantities (ignoring inorganic commodities like ammonia, hydrogen, sulphur and carbon black) of relatively expensive end-products. While chemists showed petroleum technologists how to use the surplus refinery gases to economic advantage, the latter demonstrated how the products could be turned out more cheaply by adopting the techniques of continuous operation, thus doing away with frequent and costly cyclic shutdowns entailed by batch production. All the problems pertaining to industrial chemistry, such as high and low temperatures, high pressure, high vacua, special materials of construction, analytical techniques, quality control, etc., also affect the petrochemical industry.

Since the volume of materials handled by the chemical plant is generally much less than that of an oil refinery, smaller individual items of equipment are used for continuous physical operations like distillation, extraction, filtration, etc. Conditions for chemical conversion are very precise, calling for careful control of temperature, pressure, reaction velocities and so on. These factors determine the dimensions and construction of the equipment. In continuously operating units, the process conditions are generally controlled by automatic instruments. Many chemicals are corrosive, so stainless steel is widely employed in plant construction. Glass and plastics are favoured as linings for reaction vessels.

Many of the processes followed in the petrochemical industry had been known for a long time, but the gap between laboratory synthesis and commercial production was often very wide. Although the raw materials are available in refineries from the cracking processes, they are present as mixtures and the separation of any one material in a state of sufficient purity to be the feedstock of a chemical process often involves intricate operations. Also, the industry's initial base stock was refinery gas, but, as the change from thermal to catalytic cracking led to a reduction in reactive olefin content of this gas, other feedstocks such as natural gas, liquefied petroleum gases, naphtha and even residual fuels had to be pressed into service.

Naphtha Cracking

In a typical process, naphtha is fed to thermal crackers operating in the temperature range of 1,200 to 1,400° F., which are specially designed to produce large quantities of valuable olefins. The residence time in the hot zone is not more than one to three seconds, and the total product is rapidly cooled as it leaves the reactor. The cracked product is a complex mixture, ranging from hydrogen and methane upwards. The first step towards its utilisation is the separation of the compounds which are gases under ordinary conditions, hydrogen upto and including the C_4 hydrocarbons, from those which are liquid. Apart from hydrogen and methane, the gas is composed of valuable lower olefins (ethylene, propylene and butenes butadiene), and it is now split by distillation under conditions of pressure and refrigeration into C_1, C_2, C_3 and C_4 fractions.

The perfection of commercial processes for the separation of lower olefins permitted the petrochemical industry to come into existence. Demand for the industry's products made it economically successful and, thereafter, ensued a rapid expansion in which initially unthought of feedstocks and methods of converting them have led to an ever-increasing diversity, as well as quantity, of production. New and improved techniques of analysis of feeds and process streams are contributing to the soundness and vigour of the industry's growth. The main products from petroleum and natural gas are found in Tables 2, 3, 4 and 5.

Economics of Scale

Chemical processes become more economical when operated on a larger scale. With continuous, in place of batch, production, a plant with a lower capacity serves the purpose and there is a saving in capital cost. Investment required for a plant making 20,000 tons of synthetic general-purpose rubber may be anything between $10 to 20 million ($500 to 1,000 per annum ton of production) depending on methods of manufacture. A plant of 50,000-ton capacity will call for an outlay of $25 to 35 million, reducing unit cost of installation to $400 to 700 a ton. These economies of size will also be reflected in reduced operating costs, which, for the larger plant, may be 16 to 17 per cent lower than for the smaller one.

Again, a plant producing 20,000 tons of chemicals from petroleum per year gives a return of 12.5 per cent on capital, whereas the yield goes up to 25.6 per cent by stepping up output to 60,000 tons per annum at an enhancement of capital by 2.27 times only. The return on low capacity investment is not bad at full throughput, but, if the plant operates at 70 per cent of capacity, the profit in the former case declines to so low as 0.53 per cent, while the larger plant gives a return of 6.63 per cent. Dr. Taylor, of I.C.I. Ltd., recently pointed out that capital cost per unit of output falls to a quarter for a tenfold increase in capacity.

For these reasons it is well worthwhile expanding existing capacity to realise the economies of scale. Such a proposition is cheaper and less time-consuming than building a new plant. This enlargement of the scale of operation would often have the effect of bringing down the unit cost of production.

Plant Obsolescence

In this age of rapidly advancing technology, apart from *process* obsolescence, one must also reckon with *product* obsolescence. There are two main categories of products: (1) chemical intermediates manufactured in large quantities and to precisely defined chemical specifications such as ethylene, ethylene oxide, vinyl chloride, mono-styrene, etc.; (2) chemical agents and end-products, whose usefulness lies in their ultimate functions and performance like plastic polymers, plasticisers, rubber emulsifying agents, pharmaceuticals and dyestuffs. In the first case, the manufacturing plants are usually assured of a life of 15 to 20 years, unless they are rendered obsolete within a shorter period by process changes. A very much shorter life is to be expected for some of the plants turning out the second group of products, whose useful life is more often determined by that of the product than the durability of the processing equipment. With this background knowledge, we are in a better position to assess the prospects for petrochemicals in India.

Feedstocks and Finance

Although several schemes have been licensed for execution during the current Plan period in the organic chemical field, almost all the plants in operation at the beginning of the fourth Plan are likely to be based only on industrial alcohol, carbide-based acetylene, and coal-tar byproducts and distillation products. The exceptions are the fertiliser plants of F.A.C.T. and E.I.D.-Parry based on naphtha, the fertiliser and methanol plants at Trombay using naphtha and refinery gases and the Shell plant at Bombay producing solvents. The country's organic chemicals industry now depends largely on imports of intermediates for plastics, plasticisers, detergents, dyestuffs, agricultural chemicals, etc. The planning group for petrochemicals estimates that, at the close of the third Plan, the capacity and production of some of the organic chemicals may be as indicated below:

(In '000 tons)

Product	1965-66 *Latest appraisal*	
	Capacity	*Production*
Polyethylene	12	12
Polyvinyl chloride (PVC)	15	9
Polystyrene	14.2	10
GRS—rubber	30	24
Acetic acid, acetic anhydride, butanol	5.5*	4.4*
Methyl alcohol	30	16

* In terms of alcohol consumption.

According to the same group, the following capacities would need to be established by the end of the fourth Plan period (1970-71):

(In '000 tons)

Product	*Capacity required*
Polyethylene	120
Polypropylene	10
PVC resin	110
Vinyl chloride for PVC	115
Nylon	28
Polyester	20
Polyvinyl alcohol	10
Synthetic rubbers	120
Ethanol	315
Benzene	174
Detergent alkalate	20

Where are the feedstocks for the chemical plants to come from? The answer is from petroleum fractions, of which naphtha is by far the

most important, refinery gases and natural gas. Assuming India's oil refining capacity will go up from 13.4 million tons in 1966 to 24.8 million tons in 1971, Dr. Henney of the French Petroleum Institute reckons that the net amounts of naphtha available for producing petrochemicals would be:

Net Naphtha Available for Petrochemicals

(In '000 tons)

Refinery	1966	1967	1968	1969	1970	1971
Digboi	155	116	74	29	..	..
Gauhati	..	..	..	..	..	..
Barauni (East India) ..	..	..	..	..	371	321
Burmah-Shell (Esso Eastern) ..	417	307	247	264	240	540
Gujarat	178	169	160	380	370	359
Caltex	43	40	36	32	28	23
South India (1 and 2) ..	50	38	255	241	225	209

In order to permit installation of a large-scale petrochemical complex, Dr. Henney avers, there should be a continuing availability of over 150,000 tons of naphtha. From this standpoint, it should be possible to start operating major petrochemical plant groups at the following places and times:

Bombay and Gujarat 1966 initial phase and further large phase 1969 and 1971 respectively.

South India initial phase 1968.

Gauhati-Barauni (East India) initial phase in 1970.

The refinery gases, too, will become available for use. In addition some 37 million cu. ft. a day of natural gas is expected to be available from Duliajan and Moran areas in Upper Assam for new uses. This quantity is expected to go up to 70 million cu. ft. daily by 1968. Cambay is another commercial producer of natural gas. The Ankleshwar oilfield also carries associated gas. All in all, the feedstock position should improve during the fourth and fifth Plan periods.

The capital outlay on plant and equipment for the manufacture of basic feedstocks for the industry in 1970-71 is estimated at Rs. 120 crores (Rs. 65 crores in foreign currency). The corresponding investment in regard to derived products is of the order of Rs. 200 crores (with a foreign exchange component of Rs. 100 crores). Finally, if one takes into account distribution of end-products by technically trained salesmen, the grand aggregate expenditure would amount to, say, Rs. 500 crores.

Solvents

Alcohols rank next to water in importance as solvents. Until 1920, they could only be manufactured at the cost of human and animal foodstuffs. They were produced by fermentation processes, in which grains, potatoes and molasses formed the base materials. Today, many valuable solvents are manufactured from petroleum by chemical means. They include alcohols, ketones, esters, ethers and chlorinated hydrocarbons. These chemical solvents are to be distinguished from hydrocarbon ones such as white spirits and special boiling point (S.B.P.) spirits obtained from petroleum from distillation and fractionation. While the cost of ethylene production via alcohol route is of the order of 50-60 paise per lb., it is only 35-45 paise per lb. by petrochemical means, including profit-margin in both cases.

These solvents are used in oilseed extraction, cleaning processes, metal de-greasing, wool degreasing, rubber processing, printing inks, polishes, pharmaceuticals and cosmetics. Most constitute intermediate materials for further chemical synthesis. Thus acetone is manufactured from isopropyl alcohol; phenol, styrene, detergent alkylate and insecticides from benzene; TNT (explosive), several dyestuffs and pharmaceuticals from toluene; terephthalic acid (used in manufacturing polyester fibres like Terylene) from P-xylene; acrylic resins, Epikote resins and acetate rayon from acetone and formaldehyde (used in the manufacture of thermo-setting plastics) from methanol.

The first petrochemical plant for preparing organic chemicals on a large scale is being put up at Trombay, by Mafatlals in collaboration with Shell International Petroleum Chemical Company, to manufacture isopropyl alcohol, which in turn is to be converted into acetone, diacetone alcohol and methyl isobutyl ketone. Esso Standard Refinery Company of India is manufacturing special products like hexane, an industrial solvent, and has plans to produce solvent 2445 used extensively in textile industry. There is ample scope for establishing several more chemical solvents plants in the country.

Synthetic Detergents

Until very recently soaps could be made only at the expense of edible fats. It was then felt that, if materials other than oil and fat could be found for manufacturing them, a most important economy could be effected. During and soon after the Second World War, petroleum raw materials were first used for the large-scale manufacture of the now familiar synthetic detergents. The development of the latter was partly the result of a shortage of animal fats and vegetable oils needed for soap making during that emergency, and in part because synthetic detergents have special properties which give them advantages over soap. These properties include freedom from scum formation in hardwater, and ability to lather in salt water. Certain detergents are also stable in water solutions of acids and other chemicals, and this property is of use in a wide range of industrial applications. The effect of a detergent is to impart surface-active properties to the water, namely, good wetting power (ability to wet surfaces which are normally water repellent), dispersing power (ability to hold particles of solid dirt in suspension), and emulsifying power (ability to hold in suspension particles of another immiscible liquid, say, oil, in a very fine state of division).

Synthetic detergents have ever-growing household and industrial uses. Powder products are considered more suitable for clothes and linen, while liquid products are specially formulated for washing dishes, paintwork, floors and carpets. In the industrial field, textile manufacturers are the largest users of synthetic detergents from the scouring of raw wool, yarns, woven goods to the milling of woollen piecegoods. Cotton, rayons and synthetic fibres are also scoured with them. The versatile detergents are employed as wetting agents and dyebath assistants in dyeing and finishing. For laundries, special blends are made in liquid or paste form. Synthetic detergents are favoured in the engineering industry for metal de-greasing, in mining for dust laying, in paper manufacture as wetting agents to assist pulping of raw material, and in general cleaning of every type of establishment.

Considering that millions of Indians lack adequate fat (and protein) in their diet, live amid conditions of squalor and dirt, and there has been a sharp increase in the prices of domestic groundnut and coconut oils at a time when prices of imported copra and palm oil have gone down, there is, indeed, a promising future for synthetic detergents in India.

In 1960-61, India consumed 375,920 tons of soap, an increase of 270 per cent on 1950-51. The production target set for soap in 1965-66 is 508,000 tons, including 20,000 tons of synthetic detergents. At present, Hindustan Lever and Swastik Oil Mills formulate synthetic detergents from imported intermediates, largely dodecyl benzene, and their production in 1961 was 2,387 tons. Three more units, with a combined capacity of 5,300 tons, have been licensed to manufacture synthetic detergents. In fine, there are promising prospects for manufacturing alkyl aryl sulphonates based on benzene and propylene, and also alkyl sulphates derived from slack wax in the manufacture of lubricants.

Plastics

Plastics are among compounds produced by chemists which have no counterpart in nature, but which are of fundamental importance in the manufacture of new base materials for diverse processing industries. Synthetic resins are familiar to most of us as plastics, but they have other important uses in the manufacture of surface coatings, glues, synthetic textile fibres, etc.

A product of post-war development so far as India is concerned, plastics are here to stay and grow. A capital of nearly Rs. 25 crores is already invested in the industry which employs about 30,000 persons. Investment in it is reckoned to increase at an annual rate of Rs. 5 crores in the next five years. In terms of value, the production of plastics goods and materials rose from Rs. 10 crores in 1956 to Rs. 20 crores in 1960. Exports of plastics goods totalled Rs. 2.64 crores in 1963-64,

TABLE 1—ALTERNATIVE SOURCES FOR SOME ORGANIC CHEMICALS

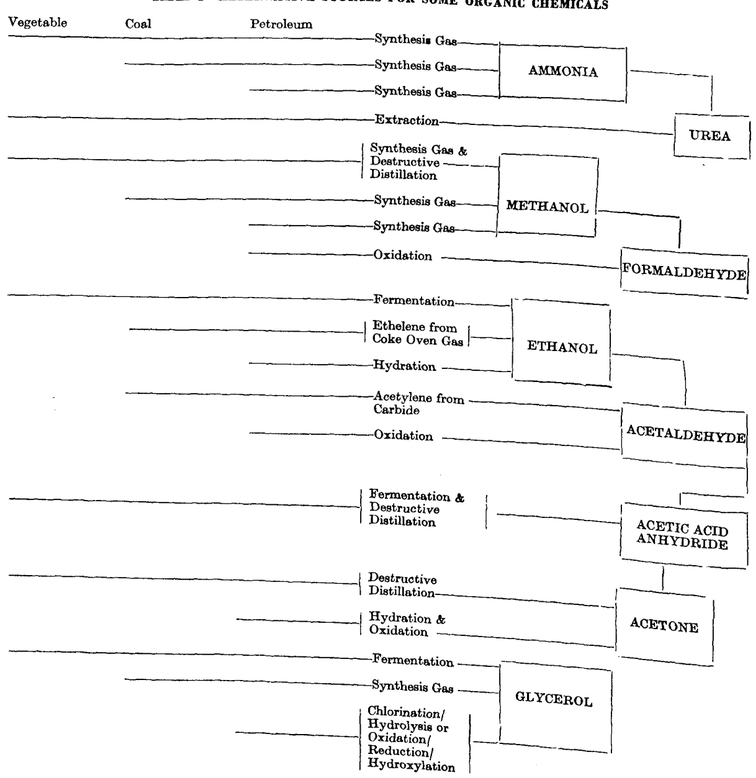

TABLE 2—SOME COMMERCIAL USES OF OLEFINS

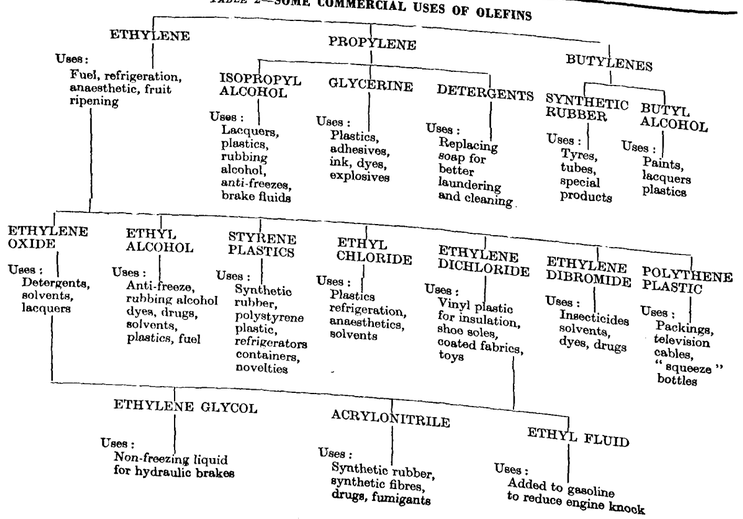

We at Remington Rand have been with typewriters a long time—you can say we have always been the first with typewriters. That's why we are so careful about them—careful about things that matter, like *precision, touch.*

The equipment we've invested in at our factory—the Optical Profile Grinder and the Type Aligning Projector—are for just this reason: that the typewriter you invest in is *perfect.* The care we take over accuracy—1/10,000 th of an inch in machined parts, tools and dies, and the perfect alignment of types and typebars, you can call us fussy—even finicky. But then that's why Remington Typewriters are such a good buy.

Our attention to detail means you get precision balanced typebar action that flashes to and from the paper, keys that don't stick even with several typebars in flight, finger-fitted keys designed to cushion finger tips, smooth carriage and lighter, more rhythmic, highly responsive typing.

Remington Typewriters are now better than ever

That's why we are so proud of....

as against Rs. 7.82 lakhs in 1955. The export target for 1964-65 is Rs. 5 crores.

The only indigenous raw materials now used for making plastics are ethyl alcohol and acetic acid from molasses, and benzene and toluene from coal tar. There are substantial imports of intermediate chemicals for plastics and plasticisers.

The Government's basic objectives in the plastics plan are twofold: (1) the utilisation of the country's natural resources for the production of plastics materials, achieve low costs by linking plastics to the cheapest source materials, that is, petrochemicals, and provide unlimited scope for the consuming industries; and (2) exploitation of the use of plastics as an engineering material for construction and industry in substitution of, and as supplement to, traditional materials, particularly those in short supply.

It is known that the cheapest source of methanol would be streams of carbon monoxide and hydrogen from gasification plants of fertiliser projects. The Trombay project, which will come on stream before the end of 1964, and designed to produce 90,000 tons of urea, will besides have the first methanol unit in the country with a daily capacity of 100 tons. This would support the existing formaldehyde plants, now dependent on imported methanol. The establishment of a major urea nitrogen industry in the country based on petroleum feedstocks, and production of methanol as adjunct, will make available low-cost technical grade urea and cheap methanol for conversion to formaldehyde. This will put domestic urea industry on a firm footing and go a long way to achieve production on conditions of competitive world economy.

Demand potential for plastics in 1966 is placed at 133,000 tons, made up of thermoplastics 90,000 tons, thermosetting resins 23,000 tons and cellulosics and others 20,000 tons Facilities for the production of polystyrene, polyethylene and polyvinyl chloride are to undergo marked expansion, as also phenol formaldehyde, urea formaldehyde, cellulosics, etc., largely based on petroleum feedstocks. There are two proposals for manufacturing linear low-pressure polyethylene, and two more for producing polypropylene. It is noteworthy that, of the estimated requirements of building blocks for the plastics industry of 84,500 tons in 1965-66, not less than 52,000 tons are to be obtained from petroleum; and of 247,000 tons in 1970-71, feedstocks derived from petroleum will account for nearly 200,000 tons. All in all, the Indian plastics industry has outstanding growth prospects, spearheaded by thermoplastics.

Synthetic Rubber

In the twelve years since 1950 the share of natural rubber in total world production shrunk from 77.7 per cent to 48.7 per cent, while that of the synthetic product expanded from 22.3 per cent to 51.3 per cent. In other words, the manufacture of synthetic rubber rose from 534,500 tons to 2,225,000 tons, and production of natural rubber also increased but from 1,860,000 tons to 2,110,000 tons. During the years 1952-61, India's rubber production increased only 33.6 per cent, whereas its consumption rose by as much as 171 per cent, the shortfall being met by importing 36,856 tons in 1961. For 1964, world natural rubber production is estimated at 2,135,000 tons and consumption 2,225,000 tons. The corresponding global figures for synthetic rubber are production 2,690,000 tons and consumption 2,545,000 tons. For the same year, India's natural rubber output is placed at 40,000 tons and synthetic rubber 15,000 tons; and the country's requirements 78,000 tons, made up of 62,000 tons of natural rubber and 16,000 tons of synthetic product. Whereas the average domestic yield of plantation rubber per acre is 320 lb., in Malaya it exceeds 700 lb. These facts and figures give much food for thought.

The greater proportion of synthetic rubbers are made by the co-polymerisation of butadiene with styrene, both derived for the most part from petroleum. Other types of synthetic rubber include butyl, a polymerisation product of isobutylene; nitrile, obtained by the co-polymerisation of butadiene with acrylonitrile; Neoprene, prepared by polymerising chlorobutadiene; Hypalon, made by treating polyethylene with chlorosulphonic acid; polybutadiene and polyisoprene. The petroleum industry provides the raw materials for all of these rubbers. The speciality rubbers are employed in applications best suited to their individual characteristics, that is, resistance to temperature, resistance to effects of oils and solvents, flexure strength, etc.

India's consumption of rubber is estimated to total 100,000 tons in 1965-66 (30 per cent synthetic) and 167,000 tons in 1970-71, of which only 62,000 tons may be met by natural rubber. Synthetics and Chemicals Ltd. has commissioned a plant with capacity to produce 30,000 tons per year of styrenebutadiene general-purpose rubber based on alcohol from molasses and benzene from coal tar. Mr. Tulsidas Kilachand, the Company's chairman, stated recently that it would be possible for the plant to operate on a profit basis if it works to full or near full capacity. For the first five months of 1964, the output was 6,500 tonnes, but, on account of poor offtake, stocks rose to nearly 8,000 tonnes. The low level of output and high prices of raw materials are given as reasons for the high costs of production. Also, the Company has to pay heavy excise duties on imported chemicals.

When this plant switches over to petroleum feedstocks, the price of synthetic rubber should come down. Mr. Kilachand also indicated the feasibility of producing stereo-rubber in collaboration with Firestone and a scheme would be submitted to the Government for its approval. Mr. Humayun Kabir stated in Bombay on 12th July that at the Koyali site it is proposed to set up a synthetic rubber plant with an annual capacity of 20,000 to 25,000 tons. It is understood that the location of the proposed 20,000 tons Cis-4-polybutadiene plant would be shifted to Bombay on economic grounds. One must visualise the setting up of more economically viable synthetic rubber plants, especially those turning out speciality rubbers based on petroleum feedstocks.

Synthetic Fibres

The dependence of textile industry on scientific research becomes ever more apparent as time passes by. Whether it be in the production of regenerated fibres from cellulose, or truly synthetic fibres like nylon and Terylene, it is based on modern chemical engineering. Here, again, the petrochemical industry has made a significant contribution to the development of the latter group of fibres. The nylon-type fabrics are manufactured from adipic acid which can be made either from cyclohexane or phenol. The British Terylene (Dacron in U.S.A.) is a polyester formed by the reaction of ethylene glycol with terephthalic acid, the latter being obtained for P-xylene by oxidation. Acrilan, derived from acrylonitrile, is obtained by the action of hydrocyanic acid on either ethylene oxide or acetylene.

That the man-made fibre industry is developing and progressing fast in the world is indicated by the fact that, from 2 million lb. in 1900, the world output of these fibres rose to 9,590 million lb. in 1963, and the potential capacity of the industry is placed at around 11,466 million lbs. The share of the man-made fibre industry in the global textile output has increased from 1 per cent in 1921 to 25 per cent in 1963. There has been a decline in the shares of natural fibres in the textile output in the world; the share of cotton fell from 81 per cent in 1900 to 60 per cent in 1963 and that of wool from 21 per cent in 1900 to 9 per cent last year.

Now India's consumption of man-made fibres went up from 57 million lb. in 1951 to 140 million lb. in 1960. The 1966 target has been set at 215 million lb., including 10 million lb. of true synthetics. The Central Government has already approved five companies for manufacturing a total of 14 million lb. of nylon; two companies for manufacturing between them 10 million lb. of Terylene and one company for putting up a 7.5 million-lb. plant for producing acrylic fibres. The capacity of truly synthetic fibres envisaged as targets during the fourth Plan is: Nylon filament and staple 15 million kg., nylon tyre yarn, fishing net and industrial yarn 13 million kg., polyester (Terylene) 10 million kg., polyacrylonitrile 10 million kg., and polypropylene 5 million kg.

Inasmuch as India spent nearly Rs. 70 crores on importing a million bales of raw cotton in 1962 and petroleum feedstocks will assume increasing importance during the fourth Plan and later, there is much to be said for fostering a domestic man-made fibre industry. It is to be hoped that the textile machinery needed for their manufacture into fabrics will also be made in India.

Nitrogen Fertilisers

Petroleum and natural gas are also the source of several inorganic chemicals, notably ammonia, carbon black and sulphur. In the draft Plan frame prepared early in 1955, Prof. Mahalanobis succeeded in convincing the Planning Commission of the close interlocking of progress in industry and agriculture. Industrial development is essential to provide an ever-increasing supply of fertilisers, pesticides, machinery and equipment for farming, irrigation, drainage and land improvement. An increase in agricultural production is vital for providing additional food and raw materials for industrial progress.

Of the three tonnage fertilisers, namely, nitrogen, phosphates and potash, the first is of the greatest importance. India has plans to have a total installed capacity of 1,000,000 tons in terms of nitrogen by 1965-66. Making certain assumptions, the Development Council for Fertilisers and Fertiliser Association of India arrived at the following broad conclusions: Foreign exchange for import of foodgrains through 1960-66 would total around Rs. 16,798 million; savings in foreign exchange by import of fertilisers rather than foodgrains would amount to Rs. 11,248 million; and savings in foreign exchange by import of fertiliser plants rather than foodgrains would be of the order of Rs. 15,716 million. The assumptions made were that all the nitrogen produced is used for food production; a ton of nitrogen gives 10 tons of foodgrains and 20 tons of straw; the cost of foodgrains is Rs. 400 a ton, and straw Rs. 27 a ton, and the cost of imported nitrogen is Rs. 1,500 a ton.

The third Plan for fertilisers envisages a target of one million tons of nitrogen. Among nitrogenous fertilisers accent is placed on urea, as it provides a concentrated form of nitrogen (46 per cent), as compared with ammonium sulphate (21 per cent) and ammonium-sulphate-nitrate (26 per cent), and is therefore economical for transport. During the current Plan period eight urea plants are to be established. They will be located at Neyveli (Madras), Kothagudum and Vishakapatnam (Andhra), Bombay (Maharashtra), Korba (Madyha Pradesh), Gorakhpur (Uttar Pradesh) and Namrup (Assam).

The plants at Kothagudum and Korba will be based on gasification of coals from mines in the vicinity, and that of Neyveli on lignite. The Namrup project is based on natural gas available from Nahorkotiya oilfields. All the other projects are based on refinery gas and/or petroleum naphtha. The Bombay, Baroda and Gorakhpur units are linked to the refineries at Trombay, Koyali and Barauni, respectively. The use of

naphtha as natural gas has been suggested for the production of fertilisers in preference to coal, except in plants where coal or lignite is available at site and the product is consumed locally. The comparative costs of producing a ton of ammonia on the basis of raw material used is as follows:

	Rs.
Natural gas, refinery gas, byproduct coke oven gas	300
Naphtha	320
Coal (at Rs. 30 a ton)	400

The U.N. Fertiliser Committee has estimated the cost of different fertilisers in terms of cost per ton of nitrogen thus:

	Rs.
Ammonia (82 per cent N)	454
Urea (46 per cent N)	810
Ammonium calcium nitrate (30.5 per cent N)	1,030
Ammonium sulphate	1,320

It follows that the manufacture of ammonium sulphate is the least economical. Also, it costs twice as much to transport a ton of this fertiliser as a ton of urea.

It has become the fashion to blame private enterprise for the admittedly slow and disappointing progress of the nitrogen fertiliser industry. But it is conveniently forgotten that the industry is capital-intensive, and that the authorities had been slow and dilatory in matters of assenting to terms of foreign collaboration, and the prices to be charged by the manufacturers in the private sector for their products.

Carbon Black

Since olden times carbon black has been used for the manufacture of inks, paints and varnishes. Today nearly 90 per cent of all black used is consumed by the strategic rubber industry, the bulk of it going into the manufacture of tyre and tubes, as filler and reinforcing agent. More recently, this versatile commodity has been found to be a most valuable addition to plastics.

Demand for various grades of carbon black required by the domestic rubber industry alone amounted to nearly 14,000 tons in 1962 of a c.i.f. value of Rs. 1.72 crore. This is reckoned to go up to about 30,000 tons by 1965-66.

India's three carbon black plants are located at Gauhati, Assam; Durgapur, West Bengal; and near Bombay, Maharashtra. The first and third units with installed capacities of 20 million and 30 million lb. are to be based on petroleum fractions. The Durgapur plant, now in production, was built by Messrs. Duncan Bros. & Co. Ltd., Calcutta, in collaboration with Phillips Petroleum Company of U.S.A. It is designed to account for 30 million lb. of black, and entailed a capital outlay of Rs. 5 crores. It uses coal tar residues as feedstocks. This unit's capacity is to be raised to 40 million lb. in the near future. When all the three units are in operation, India will become virtually self-sufficient in this key commodity.

Conclusions

Since no industry, least of all the one based on petroleum and natural gas, can thrive in a vacuum, it is worth re-stating certain conditions governing general industrial growth in India. National prosperity, as Sir Jehangir Ghandy observed recently at Jadavpur, depends upon the effective combination of three factors—capital, natural resources and technology. Of these, technology is the most important, because appropriate scientific techniques could overcome the handicap of poor physical resources (Britain and Japan, for example). Similarly, the requirements of capital could be cut down by scientific and technical ingenuity. In the context of Indian conditions, our aim should be to seek improvements in efficiency and productivity at the minimum capital cost with the least displacement of labour. It is for our scientists, engineers, administrators and statesmen to find the right solution.

India is striving to catch up with developed countries by importing foreign techniques and "know-how." To a large extent this is inevitable. After all, Japan's industrial development was based almost entirely on "borrowed" research and design. Indeed, that country is spending nearly Rs. 380 million a year at present on royalties and other payments for using borrowed technology. Speaking at Azad Bhavan, New Delhi, some time ago, Professor P. M. S. Blackett was emphatic that developments in emerging countries must be in keeping with their requirements. The planners must know which technologies could be bought off the shelf from the "world's supermarket of technologies," and how they should be adapted to local conditions. A close watch should be kept on the development of new technologies in advanced countries. Only, India should not make a fetish of foreign collaboration, though she should have her own advanced research and development centres.

Turning to the specific needs of petrochemical industries, the plan prepared by Dr. Henney of the French Petroleum Institute, at the instance of the Oil and Natural Gas Commission, envisages a total investment of around Rs. 536 crores (Rs. 263 crores being the estimated cost of the proposed five complexes, and the balance their working capital, cost of petrochemical utilisation equipment and housing). The foreign exchange component will amount to nearly 65 per cent of the total cost. Of these petrochemical plants, one each is to be set up at Bombay, Calcutta, Barauni, Koyali and in South India.

In the establishment of these petrochemical installations, Dr. Henney is emphatic that the Union Government should "actively seek" foreign participation because of three main factors: (1) the industry is highly capital-intensive, and India does not have enough foreign exchange of her own to foot the bill; (2) a foreign participant who is already in the business will be able to provide the specialised formulations and technical-commercial know-how which is changing very fast in an increasingly competitive world; and (3) a partner already having, or readily able to create, a commercial network will be able to provide the consumer the requisite guidance and the essential technical sales service.

This French expert has warned that the cost of producing petrochemicals will be about 130 per cent more than the "parity price," i.e., the representative Western European domestic price. This 130 per cent cut off point has been suggested after taking into account the experience of some advanced countries including Britain. This comparatively high production cost is due to three reasons: (1) erection cost of imported plant compared to that in European countries most of which fabricate their own equipment and the extra cost of transportation, insurance, import duties and the like; (2) since most of the projects will be financed at least partly by foreign credits, the extra cost of financing will be reflected in the ultimate cost of output; and (3) the private foreign capital tends to seek a theoretical five-year pay-out (20 per cent return on investment) after taxes, but the payment period in the case of a typical project financed with 40 per cent equity capital and 60 per cent loan capital in India will be a little over seven years. The difference in the pay-out period will have an impact on the selling prices of products.

Making allowance for the time lag, the final report of the planning group for petrochemical industry follows, in the main, the recommendations made by Dr. Henney. Organised on a scale to facilitate their viability, the report states, these complexes would involve substantial investments not normally within reach of many industrial houses in India. Some of the products are substitutes to natural raw materials and their growth would have to be co-ordinated with due regard to the possibilities for fullest exploitation in the farming sector. The State is expected to extend its sphere as well as regulate the overall growth in this field. The report emphasises the importance of co-ordination between the private and public sectors, since petrochemical developments are both of strategic significance and are capable of improving the economics of the refinery industry. The main manufacturing centres recommended are Bombay, Barauni, Koyali, Calcutta area and South India.

The planning group has made several recommendations calculated to assist the growth of the industry. Against a f.o.b. plant price of Rs. 80 per ton for naphtha assumed by Dr. Henney's report, *vis-a-vis* Indian plants, it is now reckoned the figure would exceed Rs. 90 per ton. The first generation of naphtha crackers should have an ethylene capacity of between 100,000 and 200,000 tons rather than 50,000 tons as suggested by the report of the French Institute of Petroleum. The petrochemical installations should be treated as "bonded warehouses" with duties payable only on the finished marketable products. There is need for a long-term policy in the case of naphtha in place of ad hoc arrangements now obtaining. Expensive catalysts employed by the industry should be exempt from payment of customs duties. Also, there should be a downward revision of rail freight rates on vinyl chloride, butadiene, benzene and certain other intermediate chemicals. Finally, to economise on expenditure of foreign exchange over engineering and construction, the planning group has stressed that Indian companies should be set up early.

To summarise, there must be an adequate and dependable supply of feedstocks at competitive prices; and they should preferably be adjacent to plant locations. The markets should be large enough to justify the construction of viable units. Capital must readily be forthcoming, since petrochemical installations, being continuous in operation and largely automatic, are very expensive, and must moreover be quickly amortised. The erection of a plant must be preceded by market assessments and preparation. Then there must be trained technical staff for sales and service. Above all, there must be ample facilities for research and development work. There must be a co-ordinated approach to the setting up of economic units in complexes whereby it will eventually be possible to manufacture chemicals at internationally competitive prices. If the foregoing factors are accorded due weight, the prospects of a healthy petrochemical industry taking roots in India in the late 'sixties and early 'seventies are, indeed, promising.

TABLE 5

MAIN CHEMICAL PRODUCTS FROM PETROLEUM

Chemicals and Hydrocarbon Solvents including:
- Alcohols, ketones, esters, others
- Special boiling point spirits
- White spirits

Synthetic Detergents including:
- Alkyl aryl sulphonates
- Alkyl sulphates
- Non-ionic detergents

Plastics and Resins including:
- Polyethylene and polypropylene
- Polystyrene
- Vinyl resins
- Epoxy resins
- Phenolic and urea resins

Synthetic Rubbers including:
- S.B. rubber
- Polyisoprene
- Polybutadiene

Synthetic Fibres including:
- Nylon and perlon
- Acrylic fibres
- Polyester fibres

Agricultural Chemicals of the "Pesticide" type including:
- Aldrin, dieldrin, endrin
- D.D. Nemagon

Glycerine, glycols, glycol amines and glycol ethers and ether esters

Ammonia and nitrogen fertilisers, carbon black, sulphur and sulphuric acid, hydrogen peroxide

Notices

THE RAGHUVANSHI MILLS LIMITED
BOMBAY-13

NOTICE IS HEREBY GIVEN THAT THE THIRTY-FIFTH Annual General Meeting of the Company will be held at 3.00 p.m. on Monday, the 21st September, 1964, at the Registered Office of the Company, 11-12 Haines Road, Mahalaxmi, Bombay-13, to (*a*) receive and adopt the Directors' Report and the Audited Balance Sheet and Profit and Loss Account of the Company for the year ended 31st March 1964, (*b*) declare a dividend on Ordinary Shares, (*c*) appoint Directors in place of those who retire by rotation, (*d*) appoint Auditors for the current financial year and fix their remuneration, and (*e*) as and by way of Special Business to consider and if thought fit, to pass with or without modification Ordinary and Special Resolutions, amending the Articles of Association of the Company and appointing Shri Krishnakumar Maganlal as a Director of which Special Notice has been received and also approving and confirming transactions with an Associate Concern.

Copies of the Notice in detail together with the Explanatory Statement and the Audited Balance Sheet and Profit and Loss Account for the year ended 31st March 1964 have been posted to the Members at their last given addresses.

A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote thereat instead of himself. A proxy need not be a member.

The Register of Members of the Company will be closed for transfers from 11th September 1964 to 22nd September 1964 (both days inclusive). Payment of dividend as declared will be made to those Shareholders whose names stand on the Register of Members as on 22nd September 1964.

By Order of the Board of Directors,
For THE RAGHUVANSHI MILLS LIMITED,
For RAVINDRA MAGANLAL & CO. PRIVATE LIMITED,
RAVINDRA MAGANLAL,
Managing Director,
Managing Agents.

BOMBAY,
August 5, 1964.

THE GWALIOR RAYON SILK MFG. (WVG.) COMPANY LIMITED
Registered Office:
BIRLAGRAM, NAGDA

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Seventeenth Annual General Meeting of the Shareholders of the Company will be held on 18th September, 1964, at 3 p.m., at the Registered Office of the Company, to transact the ordinary and special business mentioned in the Notice which is being posted to the Shareholders of the Company along with the Explanatory Statement required under Section 173 of the Companies Act, 1956, Balance Sheet, Profit and Loss Account and the Directors' Report for the year ended 31st March, 1964.

N.B.—A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a Member.

NOTICE is also given that the Register of Members and Transfer Books of the Equity Shares of the Company will remain closed from 31st August, 1964 to 18th September, 1964, both days inclusive.

The Dividend on Equity Shares when sanctioned will be made payable at the United Commercial Bank Ltd., on or after the 18th September, 1964, to those shareholders whose names stand on the Register on 18th September, 1964, to whom dividend warrants will be posted.

By Order of the Board,
B. N. PURANMALKA,
Secretary.

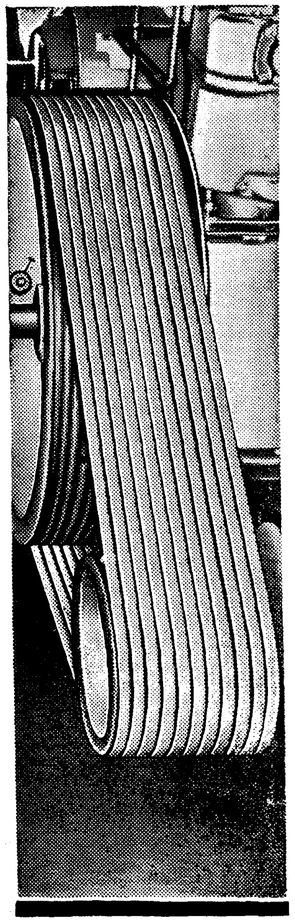
BIRLAGRAM, NAGDA
21st August, 1964.

NOW-A NEW VEE-BELT WITH 40% INCREASED HORSE POWER RATING

DUNLOP

introduces

MAXRATE



Maxrate is one more major development by Dunlop in the field of industrial rubber products in India. This premium rated belt will bring economy of drive space, weight and cost. How? Read on.

The basic factor in assessing the utility of any vee-belt is its horsepower carrying capacity. More hp means more profitability. Maxrate is developed to do exactly this. Besides, it is backed by the technical know-how and expertise of Dunlop and manufactured from the finest materials for top performance.

Here's why Maxrate 40% higher hp capacity means more economy than normal vee-belts.

1. Higher hp capacity results in compact drives.
2. Compact drives mean savings in space, weight and cost.
3. No increase in price ; thus increased value for your money.

Maxrate is manufactured by Dunlop in a wide range to suit every requirement. See your nearest Dunlop dealer for details or write to :

THE DUNLOP RUBBER CO. (INDIA) LIMITED
Industrial Products Division, 57B, Free School Street, Calcutta-16.

BUSINESS NEWS FROM EUROPE

TURNING POINT FOR COMMONWEALTH TRADE?

MATCH INDUSTRY—DECLINING INDUSTRIAL AREAS—RUMANIAN CHEMICALS

From Our Special Correspondent

NOW that the dust has settled after the Commonwealth Prime Ministers' meeting in London last month, it is possible to see that some of the economic decisions taken could have a big bearing on the development of trade. The call for a Commonwealth secretariat and the need for trade rather than aid could help to stop the decline that has taken place in the Commonwealth's share of world trade. These two considerations are likely to be big talking points with the Commonwealth Finance Ministers when they meet in Kuala Lumpur next month.
