BIRD'S CENTENARY YEAR

MINERALS IN MULTI-MILLION TONNES FOR STEEL

India's rising steel production demands an increasing supply of raw materials. To help meet this demand, the total minerals output of the Bird-Heilgers Group has increased in the last five years from just under 4 million tonnes to over 7 million tonnes per year. The Group is among the biggest mining organisations in the world—and still growing— producing coal, iron ore, limestone, manganese and dolomite.

Deploying the skills acquired over a hundred years, the Bird-Heilgers Group is making important contributions to the economy . . . through planned diversification and expansion.

NOT A FUTILE CONFERENCE

CONTRARY to common belief, the Chief Ministers' conference on food at New Delhi in the latter half of last week has been useful in many ways. It revealed many things. One of them was that Mr. Lal Bahadur Shastri did well in entrusting the Food and Agriculture portfolio to Mr. C. Subramaniam. The observations of Mr. Subramaniam at the conference and thereafter show that, within a few days of his taking over his new responsibility, he has grasped the problems well. They give room to hope that, given freedom from ideological pressures within the Party and a reasonable amount of co-operation by his colleagues at the Centre and in the States, he will be able to impart a certain amount of stability to the food front. The way in which he rushed to Bombay a few minutes after the Chief Ministers' conference was over to tackle the problem of congestion of food ships in the Bombay Port and to facilitate speedy unloading and quick movement of foodgrains, as well as fertilisers, is indicative of a refreshing dynamism for quick action which, it is to be hoped, will be sustained in the days to come. Another thing that emerged from the conference was the unpleasant fact that some of the surplus States in the North, notably Madhya Pradesh and Uttar Pradesh, are more conscious of their own needs than those of their neighbours who are in deficit. This attitude is, of course, nothing new. It was there in the past. But it is unfortunate that it should still continue, as it is not conducive to the formulation of a national food policy by the Centre. In pleasant contrast to this was the helpful attitude of Andhra Pradesh, a surplus State; it readily agreed to the Centre's proposal for lifting the restrictions on the movement of rice to Madras, Mysore and Kerala. The third thing that emerged from the conference was the presence of a high degree of realism on issues such as nationalisation of rice milling and abolition of existing trade channels. The way in which Mr. Subramaniam and the Chief Ministers tried to contain the ideological and impracticable proposals of some powerful interests in the Party was, of course, not very commendable and might yet involve the Government in experiments of dubious value, but one can have the satisfaction that it is a lesser evil than wholesale nationalisation.

It is not correct to underestimate the value of the conference by pointing to its failure to arrive at a decision in regard to long-term solutions, for these solutions require careful consideration. The first thing that needs to be done, as Mr. Subramaniam has rightly been saying, is to prevent the prices from going up further and then force them down to levels that will be fair to both the producer and the consumer. The preoccupation of the conference with short-term measures, that is, measures meant for giving immediate relief, was, therefore, natural and proper. These measures are:

1. The Southern Zone, comprising Andhra, Mysore, Madras and Kerala, should be treated as one compact area. All restrictions on the movement of rice and paddy within this zone have been withdrawn forthwith. Procurement of rice in Andhra Pradesh and Madras has also been abolished, so that traders in this region are free to market, subject to the usual overall controls, the entire surpluses offered for sale by the producers. The results of this step have so far been favourable. There has been a perceptible fall in the prices of rice in South India, without any pronounced spurt in Andhra Pradesh.

2. This policy could have been extended to the Eastern Zone comprising Orissa, Bengal, Bihar and Assam. But the Chief Ministers appear to have felt that it involved too much of a risk, what with Calcutta a virtually bottomless pit. So the existing controls will continue, with Calcutta zoned off with rationing. The Government of India has given an assurance that adequate quantities of rice and wheat will be supplied to West Bengal. Mr. P. C. Sen, the West Bengal Chief Minister, is happy with this arrangement. He claims that prices of rice are going down in the various parts of Bengal and that all the 6.6 million citizens of Calcutta are assured of their fair requirements at fair maximum prices. One would, however, like to wait and see rather than jump to the conclusion that the worst is over, because something or other always goes wrong with Bengal, the problem State of India. There are already several complaints about the way in which rationing is working in Calcutta and the evil of ghost ration cards is said to have assumed serious proportions. Meanwhile, it is comforting to find that neither Orissa, nor Assam, nor Bihar has any serious complaints. Things seem to be going on well in these States, at least on the food front.

3. The Central Government's announcement on the opening day of Chief Ministers' conference abolishing the restrictions on the movement of rice from Madhya Pradesh to Gujarat and Maharashtra has been reversed in deference to the wishes of Madhya Pradesh and the existing arrangements, under which rice is exported by holders of export licences to the States of Western India, are to continue. The chief reason why Mr. Subramaniam decided to lift the ban on the free movement of rice in this region was the failure of the present arrangement. He gave convincing evidence in support of his decision. The Madhya Pradesh Food Minister had agreed a few days ago that he would deliver rice to Maharashtra at the rate of at least 1,000 tonnes per day, but, actually, the quantity moved was only 40 to 50 tonnes a day. Despite this overwhelming proof of the inability of Madhya Pradesh Government to work its procurement policy and inter-State movement controls, the Centre had to bow to it and reverse its decision merely on the assurance of that Government that it would somehow fulfil its undertaking to Maharashtra and Gujarat. The Centre, however, has had to reassure these two deficit States by promising to make good the shortfall, if any, from its stocks and sources of supply.

4. Unlike in the case of rice, the Centre preferred to continue the existing wheat zones and this was supported by the majority of States, except Gujarat and Maharashtra which wanted the lifting of restrictions on the movement of wheat from Madhya Pradesh into their areas. The views of these two States did not get the necessary support in this case also, but the Centre gave an undertaking that it would provide all the deficit States with enough wheat, imported as well as domestic. So the wheat zones continue undisturbed.

One reason why the Centre wanted to abolish, at least in part, the zonal system in rice but retain it in wheat may be the claim that, while there has been an increase of nearly 4.5 million tonnes in rice production to the neighbourhood of 36.5 million tons, production of wheat has suffered a fall. No reliable indication of the extent of shortfall in wheat is available, but it is placed by some at about two million tons. Another reason is that the Government does not wish to disturb a scheme introduced only as recently as in March 1964. But these arguments are not sufficiently convincing to justify the adoption of one set of policies for wheat and another, wholly contradictory, for rice. After all, the total production of all cereals in the 1963-64 harvest year does not show any significant increase over that in the previous year. Further, the zonal barriers and procurement of a substantial quantity of marketable surplus of foodgrains have aggravated the effects of inadequate supply of foodgrains on prices and unleashed a vicious circle. The introduction of zonal systems has not halted the rising trend of prices even in the surplus areas. In Madhya Pradesh, for instance, there has been a rise of 30 to 33 per cent in the prices of wheat and rice alike since the close of the harvest season. This is not surprising, because the high prices ruling in the neighbouring deficit areas do get reflected in prices in the surplus States through circumvention of various controls. Mr. Subramaniam realised this point perfectly well, when he said in his address to the Chief Ministers of States thus:

> "It is important to remember that we cannot insulate the price trends in surplus areas completely from the effect of rise in prices in deficit areas. Inevitably, if prices rise in deficit areas, expectations are aroused that there will be a similar movement of prices in other areas also. Therefore, the price trend in the deficit areas has a deleterious effect on the country as a whole."

The failure of Chief Ministers to realise the limitations of their enforcement machinery and the impossibility of dividing the country into watertight compartments of surplus States and deficit States is fully demonstrated by the firm trend displayed in rice and wheat prices in North India where the *status quo* is being continued, in contrast to the downward trend in prices in South India where the rice zone has been greatly widened and procurement abandoned. If it was thought that it was too risky to abolish the wheat zones, there should have been at least a realistic readjustment of these zones. Anyway, behind the decision of the Centre to import more wheat and rice, though it involves a certain amount of drain on the limited foreign exchange resources of the country, lies the realisation by the authorities that, even as a short-term solution, controls of the type now in vogue cannot have any decisive and sustained effect on price levels. So far so good.

So much for the short-term solutions designed to prevent the upward trend in prices from gathering further momentum. As for the long-

term measures, the Government has ruled out nationalisation of existing rice mills in favour of establishing in the public sector new mills with up-to-date machinery that would give more rice per given quantity of paddy. One wonders whether even this step is necessary, when the rice mills can be effectively controlled, if the Government machinery is efficient and honest. Perhaps, much better results can be obtained if the existing millers are encouraged to scrap their old machinery and install modern ones and to expand their capacity, so that the economies of scale can be realised. If, however, the Government decides to stick to its decision of establishing large, modern rice mills, it is to be hoped that it will not deny the necessary facilities to millers in the private sector who wish to modernise their equipment and expand their capacity.

The second long-term proposal of the Government of India is to fix maximum prices for both wheat and rice that will be fair to producers and consumers alike. This idea is an old one, but it has proved to be an elusive one, as it bristles with innumerable difficulties. An indication of its complexity can be had from the elucidation provided by Mr. Subramaniam in his opening speech at the Chief Ministers' conference. He said:

"In my view, the first step is to set up an agency to arrive at a determination of producers' prices for foodgrains on an all-India basis which is fair and economical to the producer. Of course, the prices will have to be fixed with due reference to the considerations of region, quality of grain and the time of delivery. That is to say, prices will have to be fixed allowing for variations of cost of transport. The price may have to vary over time from the harvest to a later period to allow for costs of storage and finance. Necessarily, it will have also to take into account the varietal changes.

"The determination of producers' prices on this basis is an expert job which has to be done by agricultural economists, on the basis of the latest sophisticated statistical methods taking into account the various factors and costs and going into agricultural inputs. Prices will also have to take into account the average realisation in previous years and the realisations from competing crops. Once we have arrived at a set of agricultural producers' prices, the 'authority' for determining the agricultural prices should also fix reasonable consumers' prices allowing for margins for transport, holding charges, godown charges and profits. I propose that a high level technical agency should be set up for this. The wholesaler and the retailer are only stages between the consumer and the producer. The wholesalers' margin and the retailers' margins should also be suitably fixed.

"In the proposed set-up, retail trade will also have to be regulated strictly, particularly in urban areas, so that the retail traders come within the discipline of the scheme. Specified maximum retailers' prices will be declared based on wholesalers' prices already announced and predetermined margins."

The predecessors of Mr. Subramaniam had also toyed with this idea, but nothing came out of it. There is no reason to think that the outcome will be different under his regime. Assuming he succeeds in evolving a workable solution, care must be taken to ensure that it does not contain built-in inflation. Experience has shown (as, for instance, sugarcane and raw cotton) that, once prices are fixed on the lines outlined above, all subsequent revisions will only be in one direction, namely, upward.

The third long-term solution put forward by Union Food and Agriculture Minister is the establishment of a State-owned foodgrains trading corporation which will not supplant or dislocate the existing trade channels. The basic objective of this Corporation, which will be run on businesslike lines as a commercial corporation, is to stabilise prices for consumers and ensure a fair return to producers. It will essentially be a buffer stock agency. This, too, is no novel thought and had received detailed consideration at the hands of the Asoka Mehta Committee some seven years ago. It only goes to show how old the problem of stabilising food prices is. If it is still with us, it is because no serious attempts have been made to implement solutions that are difficult, requiring a high degree of administrative ability. Further, the very mention of a State trading corporation for foodgrains provoked opposition from certain vested interests. This was meaningless. All over the world, agriculture is heavily protected and subsidised by the State, more so the growing of food. What has been proposed—rather revived, to be accurate—by Mr. Subramaniam now is nothing different from what is being done in many countries of the free world, as, for instance, the U.S., the U.K., and West Germany. A prosperous agriculture, based on expanding production, is vital for the economic growth of India. The proposed State trading corporation for foodgrains can make a significant contribution to the attainment of this prerequisite, if it is operated efficiently and on the lines described by Mr. Subramaniam, without importing doctrinaire considerations. It can be a useful instrument for establishing a uniform all-India agricultural policy. Mr. Subramaniam must vigorously pursue the idea and try hard to win the distinction of being the first Minister to put it into practice.

AN IMMEDIATE PLAN FOR ROAD TRANSPORT

FOR some time now the transport situation in the country has been relatively easy, in striking contrast to the "crisis" experienced in the first two years of the current Plan. This improvement is explained by the fortuitous emergence of surplus haulage capacity on the railways—*fortuitous* because of three unexpected factors. One of these is that the Bokaro Steel Project has not been taken up for construction in accordance with the original schedule. The second factor is that the expansion projects of the existing public-sector steel plants, too, have been somewhat delayed in execution. And, thirdly, poor agricultural performance and slower industrial growth in the last two years have meant less additional traffic than what had been anticipated. Thanks to these factors, transport bottlenecks have not been much in evidence in the last one year. A certain mood of complacency has, therefore, set in, especially at the official level. But things are not likely to be that comfortable on the transport front in the last two years of the Plan, considering that both agriculture and industry are being geared for larger production and the tempo of construction activity is being accelerated. As Plan implementation thus gains momentum, the transport situation may again deteriorate even as it did in the closing stages of the second Plan. It is in this context that Dr. F. P. Antia's presidential speech at the 36th Annual Meeting of the Indian Roads and Transport Development Association, held at Bombay last week-end, may be seen to have been particularly timely. To be forewarned is indeed to be forearmed.

Dr. Antia's argument, in short, is that, although the railways have increased their capacity in accordance with their targets, it would be too much to hope that rail transport alone might adequately cater to the large additional traffic offerings expected at the close of the third Plan period. The railways' estimate of their carrying capacity of 260 million tons by the end of the Plan, according to him, falls very much short of the sum total of likely transportation demands on account of both defence and development. This total has been estimated by him at 375 million tons. As the railways cannot obviously handle that much goods traffic and as inland water transport and coastal shipping are relatively insignificant, the only alternative is to get road transport to handle the *bulk* of the balance of 115 million tons. Even if it is thought that Dr. Antia's estimate may be somewhat on the high side, there is everything to be said for taking some prompt and purposive action, by way of abundant precaution, in the field of road transport. That would any day be preferable to hasty improvisations after the emergence of a transport crisis. For has not Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, himself recognised, in his address at the I.R.T.D.A. meeting, that "transport facilities should be developed in step with and, if possible, a little ahead of (other) developments in the economy"? And has he not also drawn the lesson from past experience "that, if we allow pressures and bottlenecks to develop in transport, they disrupt production schedules in specific industries and projects and act as a major brake on the general economy"?

If the powers-that-be have really learnt this lesson, they should bestir themselves forthwith and take suitable steps to maximise the utilisation of the existing road system and vehicles as part of an immediate or short-term plan. That such a plan, involving practical measures to free road transport from some of the shackles that are presently restraining it, has been outlined by Dr. Antia himself should make the task of the authorities easier. For they have here an immediate basis to go upon, whether or not they accept all the elements of his "immediate plan." How absolutely necessary and eminently practical the suggested measures are will be readily acknowledged. For instance, his suggestion that the present tax incidence (which works out to more than 60 per cent each of the initial purchase price of a commercial vehicle and of its operating cost) should be reduced by at least 20 per cent, to start with, is a sensible one, all the more so because it is related to the suggestion that higher revenues can more assuredly be raised by rationalising the entire motor vehicle tax structure. It has thus the twin merit that the road transport industry would be left with sizable resources for rapid expansion and the Exchequer, too, could make up on the roundabouts what it loses on the swings. Dr. Antia's allied suggestion that the octroi and terminal taxes, the collection costs of which represent as much as two-thirds of every rupee charged, should be completely scrapped without delay is, of course, not new. But it gains urgency from the fact that the operational efficiency of road transport is seriously impaired by stoppages at innumerable check posts and weigh-bridges and by consequent delays and harassments. Likewise, there is a strong case for abolishing the time-consuming practice of checking road consignments at innumerable sales tax posts and for limiting such checks to points of origin or destination.

On the licensing and regulation sides, Dr. Antia's immediate plan calls for some imaginative measures of liberalisation. Possible extension of "all-State validity" for private and public carrier permits and more liberal issue of through inter-State permits on arterial routes are two of them. Another related suggestion, which is of crucial importance, is that the mileage restrictions on road transport should be removed. It is indeed atrocious that such restrictions, which were considered necessary in the "depressed" 'thirties to protect the railways against competition from long-distance road transport, are sought to be maintained in some form or other in the "expanding" 'sixties the demand optimum utilisation of both road and rail transport. There can be no justification, in the present situation of economic expansion and relative inadequacy of total transport capacity, for keeping alive the Union Transport Ministry's notorious 1958 circular to State Governments—the circular recommending that permits for routes longer than 300 miles should not be issued without consulting the railways. It is high time this circular was withdrawn. At the same time, laden weight restrictions, which militate against efficient transport performance, would need to be relaxed. Dr. Antia's suggestion, in this connection, is that, to start with, at least all National Highways shall be thrown open to 33,000-lb. two-axle vehicles and 50,000-lb. three-axle vehicles, following the example of Maharashtra and Gujarat. Simultaneous encouragement to truck-trailer and tractor-trailer combinations should also form part of an immediate plan for road transport.

What is remarkable about this short-term plan of action, outlined on behalf of the road transport industry, is that it embodies no impractical or extravagant demand. But it is a little surprising that Mr. Asoka Mehta has not explicitly recognised the immediate need for reactivating the road transport sector. He has instead indulged in some generalities. One such is that, "in a planned economy, there need be no conflict between rail, road and other modes of transport." Another is that, "in the present context of planned development, it seems a retrograde step to plead for a return to a *laissez faire* approach to road transport." Yet another is that "regulation of rail and road transport is a common feature in all countries and is not limited to India." But he has also said, in the same breath, some heartening things—heartening from the point of view of long-term growth of road transport. His pointed reference to the need for linking up road transport with regional development programmes and for developing it on long-distance routes, as a secondary supporting service to the railways is encouraging in its own way. This, along with his recognition that rationalisation of motor vehicle taxation is desirable and that the production costs of vehicles should be reduced in the interest of road transport expansion, points to the possibility that the Planning Commission's Committee on Transport Policy and Co-ordination may succeed in formulating a reasonably sound long-term policy for road transport.

MARKET GOSSIP

Non-Plan Expenditure

WRITING on the price situation in a leading article three weeks ago (*vide* page 1006 of *Commerce* dated 13th June), we said that, whatever the measures taken to hold the price line, they would not by themselves be of much avail, unless the Governments cut down non-development and unproductive expenditure to the barest minimum, for it was such expenditure that always aggravated the inflationary potential. Within a fortnight after these lines appeared in print, both the Prime Minister and the Finance Minister urged strongly the need for a drastic cut in Government expenditure. Addressing the Chief Ministers' Conference on food at New Delhi on Friday, 26th June, Mr. T. T. Krishnamachari, Union Finance Minister, observed:

"We are all running at a high rate of expenditure. We are now in a particular state of economy in the country when we cannot incur additional expenditure. This is an important matter. It is necessary to create an atmosphere where inflation will not rise further. The economy will have to be controlled in key centres. . . . Non-plan expenditure should be cut to the extent possible. This is necessary to curb the rising spiral of prices."

Mr. Krishnamachari did not merely deliver a sermon. He himself gave a lead in announcing that he would cut down the non-Plan expenditure of Central Government by Rs. 70 crores annually. And he called upon the State Governments to explore the possibilities of curtailing their expenditure. Stoutly supporting the plea of the Finance Minister, Mr. Lal Bahadur Shastri said:

"We should not be tinkering with the problem. If there is a surplus department, the department may be eliminated completely. I know that, if the Secretariat so desires and it is earnest about it, it can cut down expenditure by 25 per cent. . . . If expenditure is not cut down, the whole population will suffer and commodities will get dearer. I hope every State will take care of this problem."

No other words can be more emphatic than these. Never before was the need for pruning non-Plan expenditure so urgent as it is today. Take the case of State Governments. The aggregate non-Plan expenditure of State Governments has gone up quite markedly in the past three years, the budget estimate for the current [illegible]-65 financial year being as high as Rs. 1,594 crores, a rise of Rs. 389 crores as compared with the Rs. 1,205 crores actually incurred in 1961-62. In particular, unproductive expenditure must be reduced to the minimum, if it cannot be avoided altogether. Such expenditure, it is needless to say, amounts to unfair treatment of the taxpayer with whose money it is financed. Mr. Krishnamachari has done well, indeed, in taking the initiative, albeit belatedly, to apply the axe to non-Plan expenditure at the Centre and to urge the States to do likewise. It, however, remains to be seen how far the Finance Minister will stand by his word and to what extent the State Government will pay heed to his and the Prime Minister's appeal.

Mafatlals' Petro-Chemicals Complex

The industrial progress of Maharashtra will be greatly accelerated when the Rs. 45-crore highly integrated petro-chemicals complex of Mafatlal House is fully implemented. An application for a 500-acre site off the Thana-Belapur Road has been made to the Maharashtra Industrial Development Corporation. The details of the various projects, which will employ as many as 5,000 workers during the construction period and play the role of a mother industry when they go into production, have been discussed with the Government of India and its agreement in principle has been obtained. The formal sanction is expected to be received any time now. It has taken no less than 4½ years for the original proposal of Mafatlals to take the concrete shape it has done. At one stage, there were serious doubts whether the Government would allow this scheme to materialise, for it was very much enchanted with the idea of making petro-chemical industry a State monopoly. It is gratifying to find that, finally, it has not succumbed to its doctrinaire predilections but has allowed practical considerations to prevail. The whole country will gain as a result of this decision, for it has improved the prospects of a speedier economic growth than would have been possible if this industry were to be the exclusive preserve of the public sector. The impact of petro-chemical industry on industrial development is quite significant, as it yields a variety of synthetic raw materials at stable prices and in a dependable flow for a number of industries essential for a modern economy. There will be a large saving of foreign exchange, accompanied by the establishment of numerous medium and small industries. If everything goes well and according to schedule and if all the facilities promised by the State and Central Governments are made available in time, the plants may be ready to go on stream in October 1966, that is in two years' time from the commencement of work after the current monsoon.

A unique feature of Mafatlals' petro-chemicals complex is its international character. The Indian public, a leading Indian business house, British, Dutch, and German interests are all joining hands to bring it into existence. The Americans, too, are participating in it, in that the services of a U.S. engineering firm are being availed of for carrying out the engineering and construction work of the principal section, as we shall presently show. Another feature is that, besides equity participation, the foreign collaborators are providing long-term loans which are outside the aid agreed to by the Aid-India Club. Accordingly, this industrial complex does not cut into foreign aid meant for other projects in both the public and private sectors. A third feature is that, in terms of capital outlay, scale of operations and variety of products, it will be the first large petro-chemical complex to come into existence in India. It is true that the Union Carbide's petro-chemical plant at Trombay may go into production earlier, but its capacity and range of production are relatively smaller. And, finally, the technology to be adopted in this complex will be the most up-to-date and latest in the world. From this point of view, the long delay that has taken place in finalising the project has been a blessing in disguise, according to Mr. Arvind N. Mafatlal, Chairman of the Group, who gave the details of the petro-chemical complex at a Press conference on Monday this week.

This industrial complex consists of four divisions. At the top is the National Organic Chemicals Industries Ltd., N.O.C.I.L. for short. Then there is Polyolefins Industries Ltd. (P.I.L.), followed by Hoechst Dyes and Chemicals Ltd. (H.D.C.), and the Indian Dyestuff Industries Ltd. (I.D.I.). The last two are existing companies and their activities will be expanded and diversified to fit into the complex, while the first two are entirely new companies.

The capital outlay of N.O.C.I.L. is estimated at Rs. 30 crores. Its project is being established in collaboration with Shell International Chemical Company Ltd. of the U.K. and its affiliates. It is proposed to raise Rs. 10 crores as equity capital, the Mafatlal Group subscribing Rs. 3.33 crores and Shell Petroleum Company Ltd., Rs. 3.33 crores and the balance of Rs. 3.33 crores being offered to the public. The foreign exchange requirements for the project will be Rs. 14.5 crores. Excluding Rs. 3.5 crores available as equity participation, all the necessary foreign exchange will be provided as a long-term loan by Shell Petroleum Company Ltd., from sources outside the Aid-India Club. The rupee requirements will be borrowed from local banks.

When completed, the N.O.C.I.L. project will be capable of processing 225,000 tonnes of naphtha per annum from the Burmah-Shell Refinery. Naphtha cracking will yield ethylene (60,000 tonnes), propylene (35,000 tonnes), benzene (14,000 tonnes), butadiene (7,200 tonnes), methane (2,700 tonnes), etc., for the manufacture of chemicals and plastics on a scale hitherto not undertaken by any other chemical company in India. A wide range of these chemicals and plastics will be manufactured by N.O.C.I.L. itself, with a total value at full output of the order of Rs. 20 crores. The products will be used in such diverse industries as plastics, paints, lacquers, plasticizers, brake-fluid, anti-freeze, detergents, explosives, synthetic fibre, synthetic rubber, pharmaceuticals and antibiotics.

The engineering and construction of the N.O.C.I.L. project will be carried out by Stone and Webster Engineering Corporation, U.S.A. Messrs. Bataafse Internationale Chemie Maatschappij N.V., Holland, associates of Shell International Chemical Company Ltd., will supervise the establishment of the plant.

A part of the capital of N.O.C.I.L. that is being taken up by Mafatlals will be offered to the shareholders of Standard Mills—one of their companies—as, originally, the whole project was to have been part of this Company. The Government, however, desired that a separate company should be formed with provision for public participation on a substantial scale.

The P.I.L. is also a new company separate from N.O.C.I.L. The capital outlay on its project is Rs. 8.76 crores, with a foreign exchange component of Rs. 3.39 crores. Its equity capital is Rs. 3.60 crores, of which Rs. 1.20 crore will be provided by the West German combine of Farbewerke Hoechst, Rs. 1.20 crore will be taken up by N.O.C.I.L. and the balance of Rs. 1.20 crore will be offered to the public. Hoechst will also assist the Company in making arrangements for a long-term loan (Rs. 2.19 crores) to cover the balance of foreign exchange required. This source also will be outside the Aid-India Club. P.I.L will manufacture high density polyethylene (20,000 tonnes per year), processed polyethylene products (5,600 tonnes) and ziegler catalysts (320 tonnes). It will take its raw material (ethylene) from the N.O.C.I.L.

The I.D.I. will establish an electrolysis plant to be located in the same area to produce chlorine which will be used by N.O.C.I.L. for P.V.C. manufacture. This plant will have an annual capacity of 30,000 tonnes of chlorine and 34,500 tonnes of caustic soda/caustic potash. The H.D.C.'s expansion programme is so designed as to enable it to make in this complex vinyl acetate monomer (8,000 tonnes per annum) and polyvinyl acetate (12,000 tonnes per annum) out of the ethylene to be supplied by N.O.C.I.L. The utility services required by all the projects in the complex will also be provided by the apex company, N.O.C.I.L. The capital outlay on the expansion projects of I.D.I. and H.D.C. is estimated at Rs. 6.24 crores, giving a total of Rs. 45 crores as the outlay on the entire integrated complex.

The rates of royalty payable on the patented processes to be supplied by the foreign collaborators varies from product to product, but in no case does it exceed 2½ per cent. The foreign collaborators will also receive a small service charge for such technical services as are rendered by them. The plant and machinery, we are told, will not be supplied by them. They will be bought on the basis of global tenders, the foreign equity capital and loans being multilaterally convertible. There is thus no risk of foreign collaborators dumping on this country their own equipment found surplus in their domestic sphere.

The Chairman of the Group, Mr. Arvind Mafatlal, disclosed at the Press conference that the two new companies mentioned above would not be approaching the capital market until the climate improved. This, however, does not mean that the work on the project will be delayed, for enough resources will be provided by the foreign investors as well as the promoters. This is a good arrangement, as it would reduce the waiting period for the investing public to get a return. The shares will be in denominations of Rs. 100 each, but the unit of trading will be fixed at one, in order to suit the convenience of small investors.

Tax Burden On Sulphuric Acid

It is somewhat unfortunate that sulphuric acid, which is an essential raw material used widely in the manufacture of fertilisers, rayon yarn and staple fibre, and several other products, is subjected to a heavy tax burden. Indeed, the consumer price of sulphuric acid would have been much lower today but for the stiff increase in taxation effected in recent years. Between 1959-60 and 1963-64 (ended June), the total of State levies on sulphuric acid has gone up, according to a note prepared by Dr. H. S. Singh, Business Economist, Delhi Cloth and General Mills Company Ltd., from just Rs. 2.60 per ton to as much as Rs. 21.20, representing a rise of over 800 per cent. Thanks to such a stiff increase, the State levies accounted for more than 11.0 per cent of the consumer price in 1963-64, as against 1.7 per cent in 1959-60. The table below indicates the trend of sulphuric acid prices and incidence of State levies in the past five years:

	Year ended June				
	1964	1963	1962	1961	1960
Consumer Price:					
Actual price (Rs. per ton)	192	183	164	137	151
Index (1959-60=100)	127	121	109	91	100
Incidence of State levies (Rs. per ton):					
Excise duty . .	14	14	14	—	—
Customs duty . .	7.23	7.23	5.39	5.54	2.64
Total . .	21.23	21.23	19.39	5.54	2.64
State levies as % of consumer price	11.1	11.6	11.8	4.0	1.7

Note: Consumer price is on ex-works basis, inclusive of excise duty.

It will be seen from the above figures that the consumer price of sulphuric acid has increased by Rs. 40 per ton, the actual price in 1963-64 being Rs. 192 per ton. The increase has been due partly to additional tax impost and partly to higher prices of sulphur, which is an imported commodity. A very pertinent point that Dr. Singh has highlighted is that the producer of sulphuric acid has no control on consumer prices, since these prices are controlled by the Government, the profit margin being fixed irrespective of costs over which also the producers has no control. Surely, the rise in the consumer price of sulphuric acid because of State action, as Dr. Singh rightly observes, is characteristic of current economic situation in India where the State is helping the price spiral through continuously raising the incidence of taxes and levies.

U.S. Business Investments In India

When it was announced that a mission of forty top-ranking industrialists connected with some 28 well-known business houses in the U.S. would be visiting India by the middle of April 1964, great hopes were expressed about the outcome of this visit. The hopes were strengthened considerably by some of the observations made by Mr. R. Galloway (leader of the mission) and other members, as well as by Mr. Franklin D. Roosevelt (U.S. Under-Secretary of Commerce) who also accompanied the mission. Although these hopes might not have been fully justified, one has to admit that the mission's visit has been quite a success, in that the discussions held by the mission with the Indian businessmen and Government officials have put the problems pertaining to U.S. private investments in India in their correct perspective and placed the solutions therefor in much better focus now than ever before. This, at any rate, is the conclusion that emerges from the Press reports covering the mission's views as formulated at a "debriefing session" held at New York recently; representatives of about 120 major companies are believed to have participated in this session.

American businessmen, we are told, are fully aware of the vast investment opportunities that exist in India. Besides political and economic stability and immense potential of the Indian market, the genuine anxiety of the Government of India to promote foreign investment is itself considered to be a "big" factor that is conducive to foreign investment. Wide satisfaction is expressed over the country's record in honouring its external obligations, the freedom accorded for repatriation of foreign capital, profits and capital gains, the safeguards against risks of appropriation, currency inconvertibility and war, and the series of incentives provided in the Central budget (1964-65) to attract foreign capital. Satisfaction is also expressed over the recent moves of the Central Government to speed up industrial licensing and cut short procedural delays involved in the grant of approvals to foreign collaboration cases. A high-powered committee has been constituted, with Mr. L. K. Jha, Economic Secretary, as Chairman, to guide foreign investors in relation to their proposals. It is, however, felt by the American businessmen that the fiscal and in-

TREND OF SHARES

MARGINS RELAXED

(From Our Own Correspondent)

BOMBAY, 2nd *July*

THE share market moved irregularly both ways on alternate spells of bull liquidation and short-covering during the week under review. The market tended to sag towards the end of the week, but closing prices, wherever changed, showed small to moderate variations. Reports of the Prime Minister's illness did disturb sentiment early in the week, but the market was not slow to rally once it became known that he had recovered and was well on the way to resume normal work. The other spell of hesitancy towards the close of the week was induced by the sharp reaction in National Rayon, following rumours of a downward revision of rayon prices as well as talk that, in place of the much hoped for bonus shares, Telco would be issuing only preference shares. This caused a sharp setback in shares yesterday (Wednesday). The market, however, made an attempt to rally. The inauguration of the Unit Trust and the hope that it would provide a link between the small investor and the entrepreneur was a bull factor. So was the Government's announcement raising the prices of cement, although cement interests murmured that the quantum of increase was far below their expectations.

On top of these came the announcement relaxing margin restrictions. Margins had been enforced when forward dealings in shares were resumed after being suspended at the time of Chinese aggression. The stock market had never reconciled itself to these restrictions and there had been repeated representations for their relaxation, if not complete withdrawal. The relaxation is in respect of margins payable on the daily outstanding purchases and sales of each security and on additional margin on aggregate purchases and sales carried over. The scale of automatic interim margins has also been lowered. The existing method of calculating margins, however, will remain unchanged. Further, the two per cent carryover margin stays and it was to this that there had been so much of opposition. The Governing Body of the Bombay Stock Exchange accepted the revised margin regulations and made it effective forthwith, but the consensus among brokers was that the relief was inadequate in achieving the much desired objective of broadening the activity in shares. The lack of any relief in the two per cent carryover margin came in for particular criticism. The reduction in exemption limit did not mean much.

The announcement of these relaxations created some enthusiasm and, in the first flush, shares did look up. In kerb dealings on Wednesday, Tata Steel was bid up from the official closing rate of Rs. 153 to Rs. 154.25 and Indian Iron was bid up from Rs. 25.30 to Rs. 25.50 and Hindustan Motors to Rs. 18.64. National Rayon improved from Rs. 376.50 to Rs. 380 and Telco from Rs. 278 to Rs. 279. The rise in Telco, though small, was significant in that the shares had lost as many as six points during the official session.

By Thursday, margin relaxations had fallen flat on the market. Moreover, with the settlement ahead, operators were in no mood to extend their commitments and the closing list showed small changes either way. Associated Cement gained a rupee to Rs. 154, while Century, among mill shares, was fractionally easy at Rs. 599. Bombay Dyeing was unchanged at Rs. 57.80 but Standard moved up by two points on balance to Rs. 650. National Rayon closed the week with a Rs. 2.50 gain at Rs. 380.50. Among shippings, Scindia which was active throughout the week gained moderately to be quoted at Rs. 15.44.

Svadeshi, however, was fractionally down to Rs. 255.50 and so was Premier Auto at Rs. 102.50. Bombay Burmah was quiet at Rs. 58 and Premier Construction at Rs. 186. Voltas were quoted a rupee lower at Rs. 252, but Hindustan Motors were better at Rs. 18.72, as against Rs. 18.52. Among sugars, Belapur was more or less steady at Rs. 213.

On balance, Telco lost five points to end the week at Rs. 277, but steel shares were notably stubborn and sentiment continued to be assisted by expectations of a higher dividend. Over the week, Tata Steel was better by Re. 1.50 at Rs. 154 and Indian Iron by 30 nP at Rs. 25.55.

Equally brilliant were the members of the Mafatlal group—Standard and Indian Dyestuff. Standard closed the week at Rs. 650 and firmness in Standard was induced by the announcement by Mafatlals of their petro-chemical project. The proposed company—National Organic Chemical Industries or N.O.C.I.L—will have an equity capital of Rs. 10 crores of which the Mafatlal group and its foreign collaborators—Shell International—will subscribe Rs. 3.33 crores each. The balance is to be offered to the public, but the shareholders of Standard Mills will receive preferential allotment. In fact, Standard shareholders had been looking for this since long, but it is good that it has come though rather belatedly.

The prospects for N.O.C.I.L. are considered very excellent in that it is supposed to process some 2.25 lakh tons of naphtha a year yielding ethylene, propylene and other products used in making chemicals and plastics. The value of the products is expected to be of the order of Rs. 20 to 25 crores. Construction work will, it is said, begin after the monsoon and, according to Mr. Arvind Mafatlal, market conditions are likely to be favourable at the time when the project goes into production.

It is a pity that the Chairman of Synthetics and Chemicals had to ring a bleak note at the annual meeting of the shareholders, but Mr. Tulsidas Kilachand was not to blame for the Company's hazards. Its future, as he pointed out, depends upon the Government's policy regarding the imports of rubber and making available to the Company its raw materials at cheaper rates. Meanwhile, the shares are lying low at a heavy discount.

An eyesore of the market is the rubber tyre section with some of them quoted much below par. The industry seems to be facing a hard time and it is difficult to imagine how rubber tyre shares can hold their heads up particularly after the bleak prospects held out by Ceat Chairman. Knowledgeable sources in the market, however, think that, for those investors who have their eye on long-term returns and not on near-term capital appreciation, rubber tyres should be a good proposition. The glut in the market will not, after all, continue for long and, with the scope for the development being what it is, rubber shares must have their day sooner or later.

The cash section was selectively better with Gwalior Rayon, Hindustan Aluminium and Borosil well supported. But activity in the cash section was more in the nature of bargain hunting. Unless cash shares follow up the rise in speculatives, bull operators will find it hard to carry the market in their favour.

Technical analysts think that the liquidation which the market underwent during the week is not sufficient and that there is still scope for decline and consolidation before the market can move up again. The price pattern in the coming week will, perhaps, give an indication of the course which the market is likely to take.

MARKET GOSSIP

(Concluded from previous page)

dustrial policies of the Indian Government need certain adjustments if the pace of investments is to be accelerated. The specific fields in which the Galloway mission wants adjustments, it is said, cover the following:

1. The present levels of taxation, including the new taxes, do not permit of an acceptable rate of return on capital employed compared with competitive opportunities outside India.

2. The definition of technical and engineering staff, who are exempt from taxation for three years, needs to be widened to include managerial personnel. In some industries, as, for instance, petro-chemicals, where foreign technical staff may have to continue for long periods, say, upto eight years, it would be manifestly unfair to limit the tax concession to three years.

3. Curbs on imports of foods and other consumer goods used by Americans, which sometimes make managerial personnel reluctant to move out to India, must be removed.

4. Most of the American firms would accept a 49 per cent equity participation, though some have indicated that they would welcome a 50-50 participation.

5. American businessmen are more anxious to have management control commensurate with contribution of foreign exchange and know-how In their view, such control should continue until Indians are trained in adequate numbers and, in the case of capital-intensive industries, until a loan taken by them from a bank is paid up.

6. Where there is collaboration between American capital and the Indian public sector—for instance, in machine-building industry—the Americans would prefer a pattern of investment which would give them 40 per cent, the public sector another 40 per cent, and the Indian private sector 20 per cent, so that majority managerial control remains in the hands of the private sector Indian and foreign.

7. The U.S. businessmen are not keen on taking out their profits. Rather, they would like to be assured that there would be scope for ploughing back of profits and that permission for expansion and growth of business would be accorded as a matter of course.

8. Since many of the industries for which collaboration is sought would be export-oriented, the U.S. firms would expect lower rates of import duty on machinery and industrial raw materials to assure minimum unit investment and operating costs.

9. There should be freedom to select raw material sources consistent with commercial competitive pricing and impact on foreign exchange.

10. Although some of the administrative procedures are being simplified in the light of the recommendations of the Swaminathan Committee, the Americans would like to judge the results in terms of whether decision-making is integrated at one central point, so that decisions can be taken expeditiously.

The aforesaid pleas are, by and large, unexceptionable. Considering the massive outlay that has to be incurred in the coming years to step up the tempo of economic development, the need for augmenting the resources of the corporate sector from within as well as from without cannot be stressed too strongly. When foreign private investors are willing to come to India on an increasingly large scale, the Government of India must, indeed ought to, remove, to the extent possible, the obstacles which are standing in their way.

outstanding performance

For more tread miles at moderate cost...for high reinforcing properties...for overcoming tough obstacles ...for excellent mould flow...for smooth and easy extrusion...versatile PHILBLACK. Developed to cover diverse rubber processing needs and famous all over the world for outstanding performance, four types of PHILBLACK are now available to you from India's first Carbon Black Plant at Durgapur.

Let any or all the types of PHILBLACK work for you.

PHILBLACK G, General Purpose Furnace Black

PHILBLACK A, Fast Extrusion Furnace Black

PHILBLACK O, High Abrasion Furnace Black

PHILBLACK I, Intermediate Super Abrasion Furnace Black

PHILLIPS CARBON BLACK LTD.

REGISTERED OFFICE & HEADQUARTERS: 'DUNCAN HOUSE', 31, NETAJI SUBHAS ROAD, CALCUTTA-1

LONDON LETTER

STEEL IN THE MELTING POT

RE-THINKING ON PRICE POLICY?

(From Our Own Correspondent)

LONDON, 27*th June*

IN a few days Mr. Heath, Secretary for Industry and Trade, and Mr. Brown, Labour's Deputy Leader, are to engage publicly in a debate—in response to a challenge by Mr. Brown—about nationalisation. This is the follow-up to a heated day in Parliament when at last the Government back-benchers were able to draw out the Opposition on the subject. Not that they learnt anything new, but they did derive inspiration for electioneering attacks. Mr. Brown, for instance, told them that there was no mystery about Labour's plans: they were going to re-nationalise the iron and steel industry; nationalise water undertakings (these are mostly owned by municipalities at present but there is great need for co-ordination); partly nationalise long-distance road haulage (enough to have a co-ordinated road-rail policy) and nationalise land which came onto the market for building development. In addition—and this is where the sting is—a Labour Government would reserve the right to bring under public control in some form (perhaps by a shareholding interest) industries which were inefficient or monopolistic and where the fault, whatever it was, militated against the public interest.

This last group could mean nothing or a great deal according to what interpretation was put upon it, but it is not in fact Labour policy to involve itself in business ownership for other than hard practical reasons, of which probably the most important is the need to supply funds for development. Where an industry is financially assisted it is probable that the *quid pro quo* for State money will be a seat on the Board and a shareholding investment. The one case in which it can be argued that State ownership might be undertaken for political reasons is that of steel. The Tory Party is really worried about this industry, which itself is spending large sums in advertising to convince the public that the industry should be left alone. The Opposition, it is alleged, want re-nationalise steel for no better reason than that in 1951 they nationalised it, in the face of Tory determination to denationalise it as soon as possible. When the Tory Government did denationalise it, the Socialists declared they would re-nationalise it—and so it has gone on. But the Labour leaders claim that steel is one of the "commanding heights of the economy" and that a Government which hopes to plan the economy in the interests of expanding production ought to control the progress and potential of this industry.

Present Set-up

There is in existence an Iron and Steel Board, whose functions are mainly price-fixing, although they are supposed to extend to coordination. Now this week the activities of the Board has at last, as was inevitable, come under the scrutiny of the Restrictive Practices Court and equally inevitably the Court has found that not only is the Board one whose price-fixing has exactly the same effect as if the industry were a centrally-owned monopoly, but that such price-fixing has no redeeming graces. The industry's case was that price-fixing made for stability especially if the market was weak. Without such prices weak sellers would undercut each other and the industry no longer make enough profit to allow it to develop. In short, the argument was that in a buyer's market the steel industry would cut its own throat. The Restrictive Practices Court was not impressed by these arguments which they regarded as speculative and the upshot was that the Iron and Steel Board stood condemned.

In ordinary circumstances, one would ask "What next" and look to the Government to bring pressure on the Board to ensure that its recommended prices were true maxima and that each firm was free to quote as it wished. But the industry is at the moment facing the much more serious threat of nationalisation. The problem raised by the findings of the Court that the fixing of steel prices amounts to a monopolistic abuse, extends also into the realm of a re-nationalised industry. For if it is contrary to public interest to fix prices when the industry is privately owned, would it not be equally wrong to fix such prices when the industry was publicly owned? Yet the fact of public ownership would raise price policy outside the reach of the criticism of the Restrictive Practices Court.

However, this could not be the end of the story, because the Court is after all concerned with the promotion of healthy competitive practices in the national interest and, therefore, if they have found that the Steel Board's practices were not in the national interest, the same argument must be true of a re-nationalised industry. So the Labour Party, if it comes to power, will straightaway have to consider how to run a steel industry without automatically taking over the fixed-price policy which now obtains.

Some serious rethinking on State-owned industry price policy is, therefore, posed, the results of which can go far beyond the steel industry—and the lessons of which are not confined to the U.K. The steel industry consists of a great many different firms. The first possibility is that only the largest need to be re-nationalised—simplifying the problems of central control and keeping a yardstick in the shape of the smaller private firms as a check on efficiency. The second is that each unit firm could be left free to charge, within the limits of a range, perhaps, of minimum and maximum prices (not too close together) what it thought proper. The competitive power of the industry would undoubtedly be strengthened by such a move which would also be popular with the U.K.'s export customers whose freedom of shopping would be extended.

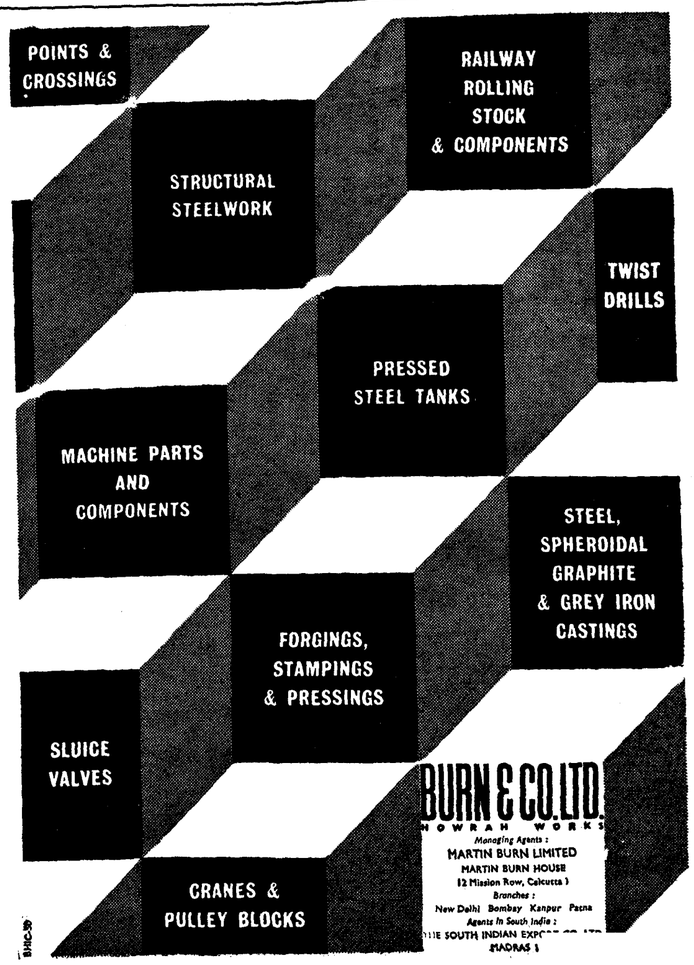
U.K.'S TECHNICAL ASSISTANCE TO DEVELOPING COUNTRIES

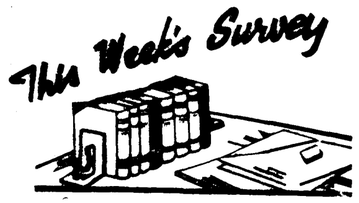
The British Government will be announcing an increase in its contributions to the United Nations Expanded Programme for Technical Assistance and the Special Fund at the pledging conference next autumn. This was stated by Mr. Robert Carr, Secretary for Technical Co-operation, in the House of Commons on 25th June. He added: "We shall do all we can to persuade other donors to follow our example and, if they do, there is a good possibility that the target of $150,000,000 may be reached in 1965." In a series of answers to parliamentary questions, Mr. Carr, gave the House the following facts and figures of a two-way movement between Britain and the developing countries:

Of the 64,320 oversea students receiving full-time education in Britain last year, 50,100—four times the total number of all oversea students in Britain in 1950—came from the developing countries. At the beginning of last year, about 2,600 British teachers were serving in developing countries under the auspices of the British Government. Mr. Carr said that he did not know how many were there less officially. During the year another 1,300 teachers were appointed under official auspices, more than 400 were known to have been sent out by other bodies, and an unknown number were recruited directly by some of the developing countries. The Department of Technical Co-operation employs or financially supports more than 1,200 scientists for research on problems affecting the developing countries. Just over a quarter of this staff is home-based; the rest are in oversea research oganisations. Of the 91 scientific research workers whom the Department has engaged for service overseas, 643 are in Africa, 142 in the West Indies, and 108 in the Far East and the Pacific region. Their help covers agriculture, fisheries, medical and veterinary work, pest control, the social and economic sciences and other subjects. The Department of Technical Co-operation had increased by 170 per cent its expenditure on bilateral assistance to non-Commonwealth countries. This was now about 10 per cent of its total outlay on assistance.

TWO I.D.A. CREDITS FOR PAKISTAN

Two credits aggregating the equivalent of $35 million have been extended by the International Development Association (I.D.A.) for the improvement and expansion of the railway systems in East and West Pakistan. The credits, comprising $10 million for the Pakistan Eastern Railway and $25 million for the Pakistan Western Railway, will help to finance the completion of the Railways' programmes under the second Five-year Plan (July 1961-June 1965). Both credits are for a term of 50 years. After a 10-year period of grace, repayments of principal will begin on 15th September 1974. Thereafter, 1 per cent of the principal will be repayable annually for 10 years and 3 per cent will be repayable annually for the final 30 years. The credits are free of interest, but a service charge of ¾ per cent per annum on the amount withdrawn and outstanding will be made to meet I.D.A.'s administrative costs. The Government of Pakistan will relend the proceeds of the credits to the Provincial Governments of East Pakistan and West Pakistan on I.D.A. terms. The Provincial Governments will in turn make the proceeds available to the two Railways. The parts of the credits used for replacements of equipment and facilities will be repaid by both Railways to the Provincial Governments over a period of 20 years, including 3½ years of grace, with interest at 5 per cent. On funds used for additions, the Railways will pay an interest of 4 per cent annually. The two credits of $35 million, together with five earlier World Bank loans aggregating $93.7 million, make the Railways the largest beneficiary of Bank-I.D.A. lending in Pakistan.





JUTE INDUSTRY

JUTE manufactures constitute the largest earner of foreign exchange for India, accounting as they do for one-fifth of the total earnings. Thus, out of the aggregate exports amounting to Rs. 766 crores in the financial year 1963-64, the share of jute manufactures alone was over Rs. 157 crores. Three traditional markets for Indian jute goods are the U.S., the U.K. and Canada, which together bought from India in 1963-64 jute goods worth Rs. 62 crores, representing about 40 per cent of the total exports of jute goods. In view of the importance of these markets and considering the growing competition not only from the Pakistan jute industry but also from alternative packaging materials, it was just as well that a special jute delegation visited the aforesaid markets with a view to studying the recent trends there. The delegation, which returned to Calcutta on Friday last week after a month's tour abroad, was led by Mr. G. C. L. Joneja, Jute Commissioner, and consisted of four well-known jute millowners, namely, Messrs. H. R. Morrison, A. T. Robertson, D. Duncan Smith and H. R. Singhania. One has to wait for some time before the findings of the delegation's study are published. The findings, there is no doubt, will be very valuable, in that they will enable the Government to understand the problems of jute goods export trade better and the industry so to reorient its production as to suit the requirements of overseas markets.

The broad impression reported to have been gathered by the delegation is that the jute industry, if it is to consolidate the markets built up in the U.S., the U.K., Canada and other countries, will have to pay special attention to two vital aspects, namely, diversification of production and strict quality control. It is stated that the needs of the American automobile industry alone of specialised jute fabrics of diverse nature are so large as to induce the Indian manufacturers to be on the vigil and prepared to switch on to new lines of production. For obvious reasons, strict quality control is regarded as the *sine qua non* in the changed pattern of manufactures, a change from production of rough package material to that of fabrics for industry. The present time is considered to be quite ripe for consolidating the confidence of consumers of Indian jute products which has been attained through maintenance of stability in prices and supplies over a long period.

It must, indeed, be said to the credit of the Indian Jute Mills Association that it is working closely with the U.S. converters and consumers for consistently adapting to the requirements of the American market and meeting competition from synthetic and natural fibre substitutes. Working on a contract with the Association during the last nine months, the Fabric Research Laboratories of Dedham (U.S.) has been conducting a jute product development programme. India will be spending about $85,000 annually according to the present programme.

During the year 1963-64, it may be noted here, the jute industry set new records in respect of both production (1.3 million tons) and exports (more than 900,000 tons). Fears have been expressed in certain circles that this performance may not be repeated and that the industry may be faced with a crisis in the not too distant future. Here is what Mr. R. P. Goenka, the retiring President of the East India Jute and Hessian Exchange Ltd., said in his speech at the seventh annual meeting of the Exchange held at Calcutta on 26th June:

"Despite good performance by the jute industry, some disquieting trend is noticed. The hitherto sellers' market has changed into a buyers' market and the jute industry in Pakistan is making heavy inroads into India's sacking export market, as a result of which the export of sacking dropped by 21 per cent during the period 1960-63. . . . The termination of the Working Time Agreement from the beginning of February this year was too sudden, burdening the market with a bearish tendency and defeating the purpose. The industry is now feeling the depressing effects."

In the context of the keen competition offered by the Pakistan jute industry which enjoys the benefit of a direct export subsidy, there is, of course, some force in the plea of Mr. Goenka for some assistance to the Indian jute industry in the form of export incentives. But one should not ignore the possibility of the Pakistan Government raising the export subsidy the moment it comes to know about the grant of any special incentive to the industry by the Government of India. At any rate, export incentives are only short-term palliatives. From the long-term point of view, what is needed is maximum production of quality jute goods at an economic cost. It is the duty of the Central and State Governments to create the necessary conditions to ensure such production both in the primary stage (that is, jute growing) and in the secondary stage (that is, jute goods manufacture).

REFRACTORIES INDUSTRY

The refractories industry, which caters to the needs of iron and steel plants, foundries, merchant ovens and cement, glass, ceramics and chemical industries, produces mainly fireclay refractories, silica bricks and sillimanite refractories in diverse shapes and sizes. The actual production of such refractories nearly doubled over the second Plan period, rising from 2.9 lakh tons in 1955-56 to 5.5 lakh tons in 1960-61. Under the third Plan, the overall requirements of refractories were originally estimated at 15 lakh tons—10 lakh tons for the steel industry on its operational and constructional sides and five lakh tons for other consuming industries. These requirements were worked out on the basis of the targets laid down for the respective industries. As for the target capacity for the refractories industry, it was fixed at the level of 20 lakh tons, so that, with the assumed 75 per cent utilisation, that much capacity could ensure an actual output of 15 lakh tons in the last year of the third Plan. The growth of the industry in terms of installed capacity upto the end of 1963 does not seem to have confronted to plans, for the actual installed capacity at the end of that year aggregated no more than 8.3 lakh tons, according to the Refractories Panel. Of course, this is expected to increase to 12.8 lakh tons at the end of 1965, although it would still be much less than the target capacity of 20 lakh tons.

It may be thought that this slow growth of capacity in the refractories industry must be causing a lot of difficulty to the industries which require its products. Actually, however, it has turned out to be a blessing in disguise, for the iron and steel industry, which is the biggest consumer of refractories, is now expected to achieve its third Plan target of 10 million tons of steel ingots only by 1967-68 and is thus not in a position to absorb all the possible output of refractories by the end of the Plan. In fact, according to Mr. J. Dalmia, Chairman of Orissa Cement Limited, whose speech at the fourteenth annual general meeting of the Company is published elsewhere in this issue, the latest estimate of demand for firebricks, silica bricks and basic bricks from the iron and steel industry will represent only 56 per cent and 54 per cent, respectively, of the capacity available with the industry in the years 1964-65 and 1965-66. The problem is thus already one of idle capacity in the industry which, in the opinion of Mr. Dalmia, does not stand in need of any further expansion insofar as the third Plan is concerned.

Mr. Dalmia's plea, in short, is that the industry's third Plan target should be treated as the fourth Plan target. This apparently means that further progress towards that capacity target can conveniently take place during the fourth Plan period in conformity with the growth of the iron and steel industry. The authorities would be well advised to take note of the data provided by Mr. Dalmia before they proceed to provide foreign exchange for the additional capacity of 3.3 lakh tons licensed by them. Where there is already a lot of idle capacity, it would not be prudent to add to such unutilised capacity during the current Plan period unless, of course, there is a spurt in demand from consuming industries other than iron and steel. In any case, a re-assessment of demand for refractories can be usefully undertaken by the Government to determine whether or not further expansion of the industry is called for during the third Plan period.

OIL INDIA'S PERFORMANCE

India's aggregate output of crude petroleum in 1963 was a little more than a quarter of the third Plan target of six million tonnes. It was 1.65 million tonnes, to be precise. At this rate, it is doubtful whether the target as a whole would be achieved. But, at least Oil India Limited (the joint venture of the Government of India and the Burmah Oil Company) seems to be confident about its capacity to fulfil its share —more than half—of the six-million-ton target. In fact, according to Mr. Khandubhai Desai, Chairman of O.I.L., who addressed its fifth annual general meeting held at Duliajan (Assam) last week, the Company has already achieved its drilling targets and, with the wells drilled and completed, it is now in a position to meet the requirements of the public-sector refineries at Gauhati and Barauni and the private-sector refinery at Digboi, to the extent of its commitments. This is indeed gratifying news, although, on present indications the two public-sector refineries together may not achieve a throughput of upto three million tonnes in the last year of the Plan. The fact that the Barauni refinery, which has still to put on stream even its first unit, is expected to take only "some quantity of crude oil during the current year" may be noted in this connection. Now that Oil India's Rs. 45-crore pipeline system connecting its oilfields with the two refineries has been completed and fully commissioned, it is upto the refineries to absorb the possible crude supplies.

The financial results of Oil India's operations (covering both oil and natural gas supplies) in 1963 are noteworthy. In spite of the fact that the delay in the commissioning of the Barauni refinery was responsible for a lower offtake of crude by the Indian Refineries Ltd. than what had been originally anticipated, the Company was able to show a net surplus of Rs. 3.36 crores on the year's working, after providing for depreciation, taxation and development rebate. Thanks to this impressive performance, the Company was able to declare on 23rd June a dividend of Rs. 120 (including the interim dividend of Rs. 40 declared in December 1963) per share of paid-up equity capital. This represents a minimum dividend of nine per cent after payment of all taxes, including taxes payable on dividend. Considering that the Company's supplies of crude to refineries and of natural gas to industrial consumers will progressively increase, it is to be reasonably expected that the heartening dividend performance of 1963 may be bettered in coming years.

HIRE-PURCHASE SYSTEM

The hire-purchase system is increasingly coming into vogue in India. "Own now—Pay later" advertisements in the press or other media of publicity are quite common these days. The system is very useful in that it ensures the availability of costly durables like automobiles, refrigerators, electric appliances, sewing machines and furniture to consumers and machinery to small-scale industrialists on the basis of deferred payments. This system, which has had its origin in the affluent societies of the West, has a promising future in India's developing economy too. But it has, of late, become the target of criticism, especially in the Western countries. The argument here is that, as hire-purchase produces additional demand in the economy, it has a high inflationary potential. It is because of its inherent inflationary tendencies that various curbs have been put on it and the central banking authorities in some advanced countries of the world have been authorised to restrict the creation of consumers' credit. But in India no such alarming conditions, calling for curbs, exist insofar as the hire-purchase system is concerned, for it has not yet reached that massive stage at which it can add to the inflationary trends. On the other hand, it can greatly help the country's economic development by making available the necessary farming requisites like pumpsets, machinery for small industry, and vehicles and equipment for road transport. As for consumption goods, though their supply may be deemed unproductive, the fact cannot be denied that the system makes it possible for middle income groups to own durable goods and gadgets which are so very essential for comfortable living but which, with their limited disposable incomes, they would not otherwise be able to purchase in one lump.

How the system can help industrial growth in India should be clear from the example of transport industry. The target for automobile production in the current plan is 60,000 vehicles, costing approximately Rs. 150 crores or an average of Rs. 12.5 crores a month. About 90 per cent of commercial vehicles and 40 to 50 per cent of passenger cars are already being financed by the hire-purchase system. This works out to a monthly value of hire-purchase in the vicinity of Rs. 8 to Rs. 10 crores, which gives an idea of how useful the system is in sustaining the road transport industry.

The Union Minister for Law and Social Security, Mr. A. K. Sen, while speaking at a meeting of the Hire-Purchase Association held at Calcutta on 23rd June, urged the hire-purchase businessmen to provide farmers with power tillers and other modern gadgets for improving agricultural production. This is, of course, a commendable piece of advice. But it is necessary to add, in this connection, that, if this line of activity is to be pursued by private financiers, the Government itself should set an example. Just as the Small-scale Industries Corporation is catering to the needs of small industrialists by providing machinery and tools on hire-purchase, some institutional set-up could also be devised to cater to the agriculturists. The Government should also try to remove the difficulties faced by the hire-purchase system in India by making suitable provisions in the proposed Hire-Purchase Bill. Some of these difficulties, incidentally, have been pointed out by Mr. R. P. Patodia, President of the Hire-Purchase Association, in his speech at the meeting of the Association.

There is, for instance, the element of risk which means that, as the asset transacted is always in the custody of the user, the latter may misuse his liberties, thereby impairing the rights of the financier. As bank assistance is of the utmost importance for the financier, another problem facing the hire-purchase system is the element of bank charges. While some of the banks grant advances against the hire-purchase documents, most of them insist on insurance guarantee which further adds to the cost. The rate of interest charged by the bankers usually range around 10 per cent, which is high compared with the rates on other advances. Besides, there is the restrictive policy followed by the Reserve Bank of India. The enunciation of a clear policy on hire-purchase advances by commercial banks will greatly reduce the amount of risk and clear the climate for the grant of advances. At present some of the banks do not even entertain proposals submitted by financiers for the grant of credit against hire-purchase documents. Moreover, there is the element of high establishment charges. The hire-purchase companies have to maintain a large staff for the collection of amounts and for the maintenance of accounts. Given a helpful official policy, these difficulties can be overcome in due course. But, if the Government were to take the stand, as Mr. A. K. Sen has done, that there is no general scope for the growth of the system in India in view of the low purchasing power of the masses, it would be very ill-advised indeed.

MAHARASHTRA'S INDUSTRIAL CENSUS

The Government of Maharashtra, it will be recalled, collected comprehensive data on all types of industrial establishments in the State as part of its 1961 census operations. This industrial census, which is not to be confused with the Census of Manufactures carried out annually by the Central Directorate of Industrial Statistics, has revealed that, out of the 320,460 factories and workshops of all types in Maharashtra State, 63 per cent are in rural areas and only 37 per cent are situated in urban areas. However, it is the factories in urban areas that account for nearly 69 per cent of the total number of industrial workers (835,702 out of 1,212,210). The extent of concentration could be gauged from the fact that the 12 cities of the State together employ 52 per cent of the workers engaged in manufacturing. Greater Bombay, alone, provides employment to 468,000 workers in some 26,000 establishments. The State as a whole stands second in respect of the proportion of workers in the registered factories to the total labour force, having 19.1 workers per thousand workers, as compared with West Bengal's 19.9.

Another finding of the census is that nearly all the major industries in the State are concentrated in urban areas. Only industries, such as tobacco products, leather and wooden products are located in the rural areas. The cotton textile industry occupies the pride of place among industries inasmuch as it has the highest proportion of workers engaged in manufacturing—274 per thousand industrial workers. It employs some 332,000 workers in its 38,000 establishments. Other industries employing more than 100,000 workers in order of importance are tobacco (137,000), basic metals (113,000) and foodstuffs (102,000). Textile miscellaneous industry, manufacture of wood and wooden equipment, chemical industry, leather goods industry, printing and publishing industry and textile silk industry employ 94,000, 73,000, 66,000, 40,000, 39,000, 28,000 and 18,000 workers, respectively. The remaining industries, such as beverages, rubber, petroleum and coal products, non-metallic mineral products and paper and paper products employ relatively smaller numbers.

Greater Bombay, according to the census, tops the list among the different districts of the State in terms of the number of employees per thousand workers, with a figure of 386. Bhandara, Nagpur, Sholapur, Poona, Kolhapur and Nasik stand in order of importance with 106, 67, 49, 44 and 39 workers, respectively. On the other hand, districts such as Satara, Sangli, Aurangabad, Osmanabad, Bhir and Kolaba, which are generally industrially backward, have such pitifully low ratios as 21, 18, 12, 8, 7 and 6 workers, respectively.

Some of the most interesting findings of the census pertain to the extent of power consumption. For instance, the census shows that the proportion of industries using no power of any kind in rural areas is 926 per 1,000 establishments, while the corresponding proportion is 829 per 1,000 establishments in urban areas. So far as electricity is concerned, the proportion of establishments using it is low, that is, 7 per 1,000 establishments in rural areas, while it is much higher, that is, 145 per 1,000 in urban areas. Establishment using electricity are increasing rapidly as rural electrification is speeded up. Further, the figures of electricity consumed by industries shows that the consumption was 816 kw.h. in 1951. It increased to 1,620 million kw.h. in 1959-60 and further to 1,853 million kw.h. in 1960-61 and to 2,148 million kw.h. in 1961-62. This trend of increased consumption is bound to be further accelerated as comparatively cheaper electricity from the Koyna hydel and other projects becomes available. It is indeed revealing that, out of the electricity consumed in 1957-58, as much as 60 per cent was accounted for by Greater Bombay.

MERICAN LETTER

SUBSTANTIAL ADVANCES IN KEY SECTORS

WAS THE STIMULUS PROVIDED BY TAX CUT?

By N. Pattabhi Raman

NEW YORK, 27*th June*

AT the mid-point of 1964, the U.S. economy looks healthier than it did six months ago and promises to be in even better shape six months hence. Substantial advances have occurred in several key sectors, though the major problems—inadequate growth rate, high unemployment and imbalance in international payments—still loom large.

Since the beginning of the year, industrial production has increased by three per cent. The output rise amounted to 1.3 points on the index of industrial production—the largest increase since May 1963 when stockpiling of steel as a hedge against an expected strike stimulated a substantial increase. In May, the gain in output was smaller, but at the end of the month, the index stood at 130.3 per cent of the 1957-59 average.

Personal income, (which includes wages and salaries, the net income of farm and non-farm proprietorships, dividends, interest, net rents, and other types of individual income), was equal to an annual rate of $481 billion in the first five months of the year. This was $25 billion or five per cent above personal income during the comparable period last year.

Consumer outlays, too, have increased. This is showing up across the board—in the purchases of automobiles, furniture, appliances, clothing and a variety of soft goods. Retail sales rose one per cent in April and 1.5 per cent in May. Almost all of this increase was financed out of cash, which has swelled in the hands of consumers as a result of the tax cut.

Corporate Sector

At the corporate level, too, earnings and expenditures have risen. Profit margins have improved perceptibly, though they are generally still narrower than in past periods of good business. During the first quarter of the year, after-tax profit per dollar of sales of manufacturing companies equalled 4.9 cents, as compared with 4.2 cents in the comparable period of 1963. The rate of profit on stockholders' equity was 10.5 per cent, as compared with 8.6 per cent in the first quarter of 1963. The improvement occurred in both durable goods and non-durable goods industries.

Business expenditures on new plant and equipment have gained further momentum. According to a survey conducted in May by the Department of Commerce and the Securities and Echange Commission, businessmen have increased their plant and equipment programmes from those reported last February. Actual spending in the first quarter was at a seasonably adjusted annual rate of $42.5 billion or three per cent above the fourth quarter of 1963; little change between these periods had been expected previously. Capital outlays are now anticipated to increase steadily to a rate of $45.4 billion in the final quarter, bringing the rate for the entire year to $43.9 billion. For the year 1964 as a whole, therefore, a 12 per cent increase in outlays is now indicated, as compared with the 10 per cent rise indicated by the February survey. This upward revision largely reflects the increased spending programmes of manufacturing and transportation firms. Manufacturers are, in fact, currently projecting 1964 capital spending to a figure 16 per cent above the 1963 outlay—with durable and non-durable goods firms contributing about equally to the increase.

Another Government survey conducted in May indicates that manufacturers expect to set new heights in sales and invest moderately more in inventories in the second and third quarters of the year. Sales are expected to reach a seasonally adjusted volume of $113 billion in the third quarter, as compared with $109 billion in the opening quarter of the year. Durable goods manufacturers expect sales of $59.5 billion and non-durable goods producers $53.5 billion in the third quarter; this would be a record volume in each sector.

Gains in Employment

Even in the area of employment/unemployment, advances have been made. Month-to-month increases in employment since December last have averaged more than 100,000. In mid-May, the number of employed workers reached an all-time high of 71.1 million, including 58.5 million in the non-farm category.

Until recently, gains in employment did not have much impact on the rate of unemployment, since the new jobs created were barely enough to take care of additions to the labour force. However, the unemployment rate, which has long hovered around 5.5 per cent of the civilian labour force, dropped to 5.1 per cent in mid-May from 5.4 per cent in mid-April. This was the lowest rate in four years; it was previously reached in May 1960, at the peak of the recovery from the 1958 recession. The lower unemployment rate means that presently some 3.6 million persons are without jobs—300,000 below the April level.

Outlook

On the basis of these developments, it is possible to agree with President Johnson's view that the outlook for the economy is one of "continued growth."

While the evidence is still not conclusive, the recent upsurge in many sectors of the economy may be attributed to the stimulus provided by the reduction in personal and corporate income taxes which was approved by Congress earlier this year. Government economists now predict that Gross National Product will be close to $620 billion or even higher, representing an increase of $35 billion or more. If realised, it will be the biggest increase that the U.S. economy has registered since the current recovery phase began in 1961.

The decrease in joblessness is definitely traceable to the continuing improvement in general economic conditions. This suggests that, while structural unemployment is a major element in the chronic situation, probably the most important cause is unemployment resulting from inadequate demand.

When the tax cut measure was being approved by Congress earlier this year, spokesmen for organised labour contended that the Government's expectations of the economic stimulus resulting from the tax reduction could be too optimistic. They argued that the lower- and middle-income consumer groups would not derive sufficient increases in income to give an adequate boost to demand, while, given the slack economic conditions, such increased corporate investment as occurred as a result of the tax cut might be channeled largely to job-destroying "modernisation" rather than job-creating expansion. They argued too that, along with the tax cut, Government spending should be stepped up, not held back or cut back.

The response to the tax cut does not as yet provide a conclusive answer to these arguments. While it would seem that the expectation of the Government's economists are just beginning to be fulfilled in a measure, trade unions feel that there are greater indications today that additional steps to stimulate the economy are needed. Referring to the gratifying drop in the unemployment rate, the A.F.L.-C.I.O., the national confederation of trade unions in America, observed recently: "With profits and sales booming, a 5.1 per cent rate is unacceptable. The programmes and policies to reduce that rate even more sharply than in May are still critically needed if the nation is to move truly toward maximum employment and production." This view of organised labour must be placed against the actual expectations of the Government in regard to the unemployment problem. The President's Council of Economic Advisers stated earlier this year: "The more rapid expansion of production in 1964 should lower the unemployment rate. By the end of the year, it is expected to fall to approximately 5 per cent. Thus the year promises progress in reducing unemployment, but attainment of the interim goal of four per cent lies beyond 1964."

The recently approved tax cut, it may be recalled, represents a major experiment in U.S. fiscal policy inasmuch as it comes on top of a period of budget deficits. Until this measure was approved, traditional wisdom ruled the Treasury. A balanced budget was the be-all and end-all of Government activity, though deficits persisted in actuality in most of the post-war years. The tax cut measure hence reflected the acceptance of the new theory that, since the budget is a major policy instrument, its balance should not, by itself, be regarded as a policy objective. It followed the realisation that the true test of the success of fiscal policy is not whether the budget is in surplus or in deficit, but whether the economy on the whole is in balance.

This new approach, of course, shocked the so-called fiscal conservatives and these predicted dire dangers—inflation, bad business, increased unemployment, and a worsening of the position of the dollar. However, none of these dangers have come to pass.

No Inflation

While the Government has been wary of possible inflationary pressures, there is no inflation at present nor is there any sign yet of its coming in the near future. In one of his rare comments on the situation, the Chairman of the Federal Reserve Board said recently that he saw no immediate prospects for an increase in interest rates based on supply and demand factors. This has been widely interpreted as the Federal Reserve's judgement that inflation is not likely to appear on the scene in the near future.

Moreover, the staff of the Federal Reserve Board has indicated in a study that, despite the acceleration, the economy is probably in no danger yet of a supply-and-demand inflation. The study revealed that, while capacity utilisation for major materials went up to 86 per cent in April, as compared to 79 per cent a year before, the progress towards full capacity operation has been far slower than in the inflationary period of the 1950's. The study concluded by saying that "the recent rate of 86 per cent capacity use for major materials and projected increases in capacity would seem to permit further increases in production—substantially in some lines—without much, if any, increase in unit costs."

The wholesale price index for May showed continued price stability, scattered price increases in some lines being offset by declines in others. The overall index stood at 100.1 per cent of the 1957-59 average.

* * * *

In discussing the advances made by the U.S. economy in this year of fiscal innovation, it is appropriate to refer to a recently published study which contrasts the willingness of the post-war governments in Western Europe to use direct measures to promote economic growth with the timidity in such matters in the United States. According to this study—"Economic Growth in the West: Comparative Experience in Europe and North America," by British economist Angus Maddison—this contrast in approach accounted for the difference between spectacular European expansion and much slower rates of growth in the U.S., the U.K. and Canada.

Maddison writes: "The main achievement of (European) policy was to maintain very high and steady levels of demand. This had an unexpectedly large pay-off in raising profits, investment and productivity. The tools of fiscal policy were used often, in and between budgets. New tax measures were used with discriminatory impact on both investment and consumption."

"There was none of the hesitation which froze fiscal action in the United States," he adds. "Government policies in Europe were actively interventionist and little reliance was placed on automatic built-in stabilisers. Monetary policy was used more brutally than in the U.S. with bigger changes in bank rate, quantitative credit controls and detailed directions to banks on credit measures, and use of reserve ratios in both directions."

Maddison believes that, in governmental willingness and competence to manage demand, there has been a permanent sophistication in Europe in the technique of managing a capitalistic economy with wide-ranging economic policy tools. In this respect, he is convinced that U.S. performance has been much poorer than in Europe where "the rhythm of growth is virtually uninterrupted by recession."

The tax cut in the U.S. this year may be held to signal the beginning of "sophistication" but the guess is hazardous that the U.S. Congress, with its cumbersome processes—it took a long time legislating the tax cut which was recommended by the late President Kennedy on an urgent basis—will allow this "sophistication" to grow.

IN THRALL TO GOLD

By Questor

ECONOMIC policy in time of peace can work only within the limits of what is socially acceptable. These limits are set by history, and there are at least three important respects in which the history of the U.S. and Britain differs from that of the countries of Continental Europe.

First, both Britain and the U.S. experienced industrial depression in the nineteen-thirties of a sort which was more painful and politically serious than that of European countries (excepting Germany). It conditioned the "Anglo-Saxons" to accept, among other interferences of Government, a relatively high level of taxation.

Second, neither Britain nor the U.S. has experienced either foreign invasion, political revolution or galloping inflation for some time past. Thirdly, we were both until recently rich enough to ignore foreign exchange problems and now share the inherited disadvantages of running a reserve currency. When the community of language is added to this community of history and economic attitudes, it is scarcely surprising that our mutual understanding tends to make the Europeans seem unco-operative at times when co-operation is essential to keep the international monetary system working.

In Britain, for example, though tax avoidance is not unknown the bulk of the population does not attempt to avoid paying up. If the Government chooses to increase direct taxation by so much in the pound, it can count on receiving all but a negligible fraction of the increase: the years of unemployment and the war have made high taxation acceptable and tax evasion immoral.

We find it difficult to understand, therefore, the fact that the rich in some European countries would rather export their capital than pay taxes, that European Governments have to rely to so large an extent on regressive sales taxes for revenue that their ability is extremely limited. This inability to make use of fiscal measures, of course, is the reason for the great reliance placed on monetary measures which, however necessary, seem to many people in the U.S. and Britain extremely blunt. It also explains the relatively greater importance of central bankers.

The difference of tradition, however, is probably more important at present where it concerns attitudes to gold. The U.S. and Britain were able to wean their nationals easily from the use of gold because a habit of confidence had long prevented them from demanding it. British subjects have been forbidden since the First World War to hold gold; in a crisis they run to South African gold shares. U.S. citizens have been forbidden to hold gold at home for thirty years and since 1962 to hold it abroad; some still do, no doubt, but the majority of U.S. investors are not interested.

In Europe, by contrast, with its long history of violence—as well as in other significant countries like India—the right to hold gold is an entrenched civil liberty. The arrangements differ from country to country—some, in particular, allow imports only under official licence—but in all the countries of Continental Europe there is a fairly free private market in some form of gold. One tends, in the U.S. and Britain, to regard the hoarding of gold (which has accounted for over half of newly-mined supplies over the past few years) to be a business for the Middle East and India. But the habit of accumulating gold against inflation or international crisis is deeply imbedded in Europe, and no Government dares try to eradicate it.

This is perhaps one reason, as Dr. Georg Tugendhat suggested in a recent article, why European Governments are reluctant to help the U.S. out of a temporary difficulty by accumulating dollars or to support the various plans put forward for a new international reserve currency based on something other than gold. Although private holdings of gold have long been outlawed in Britain and are now outlawed in the U.S., even these countries both insist on keeping a very high proportion of our official exchange reserves in gold, simply because they have foreign depositors who may at any time demand to be repaid in this form.

European central banks know that they have few means of preventing a domestic run out of the national currency if ever a crisis of confidence develops, and that the first result of such a run will be an enhanced private demand for gold. Even if there is no longer an official gold-backing for the currency, the ghost of it still lingers livelily on.

All exhortations to closer economic co-operation, in short, come up—as even the Six are finding—against differences in national institutions and attitudes which are deeply rooted in national history. It will be a long time before there is a Government in Italy, for example, self-confident enough to tax the wealthy and the masses in a way which will meet the requirements both of economics and of justice. It will be a long time before there is an international capital market in Germany capable of absorbing its surplus of foreign exchange. But it is not so generally recognised that there is also a difference of attitude to gold between countries whose nationals still insist on their right to acquire it freely and those who were able to annul this particular civil liberty thirty years ago.

UNIT TRUST OF INDIA

(ESTABLISHED UNDER THE UNIT TRUST OF INDIA ACT, 1963)

Sale of Units Begins on 1st July 1964

Units of the face value of Rs. 10/- each, available in multiples of ten, will be sold initially at Rs. 10/- from 1st to 31st July 1964.

Investment in units gives you major advantages:

* Assured Income
* Liquidity of Investment
* Safety of Capital
* Important Tax Concessions

UNITS WILL BE AVAILABLE AT ALL BRANCHES OF THE FOLLOWING BANKS:

State Bank of India, State Bank of Hyderabad, State Bank of Mysore, State Bank of Bikaner & Jaipur, State Bank of Indore, State Bank of Travancore, State Bank of Saurashtra, State Bank of Patiala, Bank of India, Central Bank of India, Punjab National Bank, Indian Overseas Bank, Indian Bank, United Commercial Bank, Canara Bank, Bank of Baroda, National & Grindlays Bank, Syndicate Bank, Devkaran Nanjee Banking Co., United Bank of India, Andhra Bank, Allahabad Bank, Chartered Bank of India, Bank of Behar, New Bank of India, First National City Bank, Mercantile Bank, Hongkong and Shanghai Bank, Krishnaram Baldeo Bank, Tanjore Permanent Bank, Bank of Rajasthan, Lakshmi Commercial Bank, Hindusthan Mercantile Bank, Bank of Maharashtra, Union Bank of India, Netherlands Trading Society, Oriental Bank of Commerce, and British Bank of the Middle East.

Also from sharebrokers registered with Stock Exchanges at: Ahmedabad, Bangalore, Bombay, Calcutta, Delhi, Hyderabad, Indore and Madras.

UNIT TRUST OF INDIA
P. B. 2000, Bombay-1.

A NEW DIMENSION TO INVESTMENT

THE UNIT TRUST OF INDIA—I

OBJECTS AND ORGANISATION

THE Unit Trust of India, which commenced this week the sale of units to the public through a network of more than 4,000 branches of 38 scheduled banks and recognised stock brokers, combines the advantages of private ownership, independent management and Government's credit, just in the same way as the units issued by the Trust provide an assured income, safety of capital, liquidity of investment and important tax concessions. The Unit Trust offers to the individual saver and the small investor a reasonable return on his savings through an expert management of investment portfolio, a safe avenue for investment by spreading the risks over a balanced and well-distributed portfolio, and a liquid asset through its willingness to repurchase the units at stated prices.

Although the collections under the small savings schemes of the Central Government do not come up to expectations, this is an era of small investors; the standard of living and expectations of many people have reached such levels that they are willing and able, albeit to a small extent, to participate in the industrial expansion of the country. Investment in shares and stocks, a privilege of the rich few till recently, now offers opportunities and attraction to many, but there are pitfalls and disillusionments too—as the stock exchange investors, who oversubscribed every new issue during the optimistic boom of 1960-62, must have realised only too well since then. The unit trust movement the world over has endeavoured and contributed more than any other system of financial organisation to bring the benefits of equity investment to small investors without involving them in undue risks and hazards. The basic principle underlying the Unit Trust of India, as with unit trusts in other countries is, therefore, to afford the small investors a means of acquiring a share in the widening prosperity based on steady industrial growth of the country, by combining minimum risk with reasonable return. In addition, the Trust helps mobilisation and investment of resources, thus supplementing the resources of the capital market, changing its mood, increasing the overall productivity of capital and facilitating the growth of the economy. Incidentally, the industrial growth of the country will be reflected in the steady growth of the value of units too, which will provide some measure of insurance to investors against inflationary erosion in the value of money.

Unique Features

Most of the unit trusts the world over are mutual societies—a joint co-operative venture—where savings of small investors are pooled to work in the interests of them all. The trusts are constituted by a trust deed; a bank or an insurance company is appointed a trustee for the custody of the securities bought with the trust funds, which are run by managers who are responsible for the administration of trusts and management of investments with the assistance of investment advisers. The Unit Trust of India is unique in many ways. In the first place, the initial capital has been provided by the Reserve Bank of India (Rs. 2.5 crores), Life Insurance Corporation (Rs. 75 lakhs), State Bank of India (Rs. 75 lakhs), and scheduled banks and other specialised financial institutions (Rs. 1 crore). The initial capital has already been invested in a balanced portfolio of fixed-income and variable-dividend securities. But there is a provision for refunding the initial capital when sufficient unit capital is collected through the sale of units to the public.

Secondly, the selling organisation of the Trust is unique in itself. Nowhere in the world are the commercial banks willing to undertake sales of units through their own branch network. In the U.K., the branch managers of clearing banks categorically declined to undertake the task, in view of the wide variety of trusts, savings schemes and units competing with each other. In part, the willingness of the contributing scheduled banks to offer their branch network for the sale of units is due to the fact that there is a single trust and single type of units: but it is also a reflection of their desire to offer their services for the promotion of units. The promotional character of the Unit Trust of India distinguishes it from its counterparts elsehere.

Thirdly, instead of separating the functions of trustees and managers, the general superintendence, direction and management of the affairs and business of the Trust are vested in a Board of ten Trustees headed by a Chairman. The Trust itself is established under an Act of Parliament, but the Chairman, the Executive Trustee and four other trustees are appointed by the Reserve Bank, from amongst the persons having special knowledge or experience in commerce, industry, banking, finance or investment; they include an executive director of the Reserve Bank, two managing directors of reputed private business firms of Bombay and Calcutta and a Chartered Accountant of Madras. The L.I.C. and the State Bank of India are represented by their own Managing Directors. Two other trustees to be elected by the other institutions contributing to the initial capital of the Trust have for the present been nominated by the Reserve Bank; they are the chief executives of a Delhi bank and of the I.C.I.C.I. The Economic Adviser to the Reserve Bank of India is himself the Executive Trustee of the Unit Trust. The public sector monopoly of the Trust distinguishes it not only from the Unit Trusts in the U.K., the U.S.A. and West Germany but also from those in the French public sector which are competing with each other.

Although a majority of the trustees, the Chairman and the Executive Trustee are all appointed by the Reserve Bank and although the bulk of the initial capital has been provided by the public sector corporations, the Unit Trust of India Act clearly enjoins upon the trustees the duty to act on business principles with due regard to the interests of unit holders. But the freedom of the trustees is considerably circumscribed in cases where the Reserve Bank thinks that any matter of public policy is involved and issues a written directive which shall be binding upon the trustees.

There has been some criticism of this ultimate theoretical power of the Reserve Bank of India over the discretion of the trustees, but it has not been realised that the Reserve Bank would rarely exercise its power to give directions. The eminent people who are the trustees would hardly invite a situation where they may lay themselves open to a charge of acting against public policy. Moreover, the interests of unit holders would not normally clash with the public interest. Above all, an Executive Director and the Economic Adviser of the Reserve Bank are themselves two of the trustees of the Unit Trust of India. It is, therefore, difficult even to conceive a situation where the Reserve Bank may have to exercise the power to issue a directive.

Investment Policy

The investment policy of the Unit Trust has twin objectives—security of capital consistent with chances of capital appreciation and a reasonable return. Two guidelines prescribed by the Unit Trust Regulations lay down that investments by the Trust in any one company should not exceed 5 per cent of the total investible funds of the Trust or 10 per cent of the value of securities issued and outstanding of such company, whichever is lower. Secondly, not more than 5 per cent of the investible funds should be invested in the initial issues of securities of new industrial undertakings. The proportion of the investible funds that should be invested in Government securities has not, however, been disclosed. The Act does not prescribe any fixed proportion of Unit Trust investments in Government securities, but the intention of the Government of India was apparent from the debates in the Parliament where it was disclosed by more than one Minister that one of the reasons behind starting the Unit Trust was to ensure a substantial measure of *individual* public support for Government securities. How the trustees will resolve this conflict between Government's expectation and the low-yield of Government securities is not known, but it will certainly be known at the end of the first year's operations of the Trust, since the detailed composition of the Trust's investments is to be disclosed once a year in the annual accounts. It is possible that the Government may bring some pressure upon the Unit Trust to invest in Government securities, but it is quite certain that, if investments in Government securities exceed 10 per cent of investible funds, the Unit Trust will not be able to distribute the promised 6 per cent dividend.

The Unit Trust of India Act provides two types of tax concessions, one to the Trust and the other to the Unit holders. The Trust itself is exempted from payment of all taxes on its income, profits or gains and is, therefore, entitled to receive its dividend and interest income without deduction of tax at source. Secondly, the income up to Rs. 1,000 received by individual unit holders is exempted from income-tax. Such income is also exempted from super tax in the case of a unit holder who would not have been liable to pay super tax but for the inclusion of this income in his total income. Income will be distributed by the Trust to such individuals without any deduction of tax at source.

These tax concessions are significant and would provide an incentive to small investors to purchase units, rather than purchase Government securities or deposit money in banks, and suffer a double loss of earning a lower rate of interest and paying tax on that income. The Trust hopes to build a portfolio of good securities which will yield a return of about 6 per cent to unit holders. The Trust's investment policy will be geared to have first class securities which secure to it an overall yield of more than 6 per cent, although securities with a lower yield up to 5 per cent may also be acquired if they offer growth prospects.

Income Distribution

The income of the Trust will be distributed among the unit holders every year after the accounts are closed. The Act provides that the management expenses which can be charged to the income allocated to unit capital shall not exceed 5 per cent of gross income, and at least 90 per cent of the gross income *less* management and interest expenses shall be distributed. The difference of 10 per cent, as well capital gains which shall not be distributed, may be utilised for building up an investment reserve as a cushion against any possible depreciation in the value of units. It is a wise policy of utilising capital gains for consolidating the investments and building reserves in order to avoid frequent, needless and sharp fluctuations in the value of units. And the capital gains will always be reflected in the sale price of the units which will be based upon a valuation of the investments of the Unit Trust.

Every unit will have a face value of Rs. 10 in order to suit small savers. There is no limit to the number of units that may be purchased by any person, but each such purchase has to be in the multiples of ten. During the month of July 1964, the units will be sold at par, but, thereafter, prices will be fixed by the Trust daily and announced over the All-India Radio and in the newspapers. The Trust will begin repurchase of units only after 1st November 1964. Transfers in favour of parties other than banks will be permitted only after a year, though, in special cases, earlier transfers may be allowed by the Board of Trustees.

In fulfilment of the obligation placed upon by it by Section 21 of the Act, the Unit Trust has now prepared the Unit Scheme which lays down the manner in which units will be sold to or repurchased from the public, the manner in which sale and repurchase prices will be determined, and the rights and obligations of the unit holders and the Unit Trust of India *vis-a-vis* each other, arising from the operation of the Scheme. The next article will discuss the prospects for, and policies and perspective of, the Unit Trust of India in the light of this Scheme.

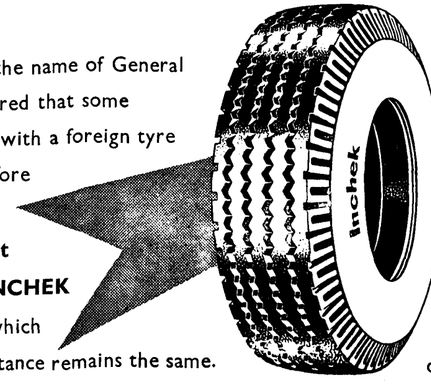
General Tyres Limited

WILL NOW BE KNOWN AS

Inchek

Tyres Limited



After we had announced the name of General Tyres Limited, we discovered that some people were confusing us with a foreign tyre company. We have therefore renamed our company and product. **Our product will now be known as INCHEK** but the superior quality which earned countrywide acceptance remains the same.

Our Company is the **only wholly Indian owned automobile tyre company.** We are dedicated to produce the best tyres for this country...to use and develop Indian talent to the fullest extent. **INCHEK** Tyres are specifically designed and manufactured to suit Indian road conditions—**the finest choice for economy.**

ITL/6/22

SYNTHETIC FIBRE INDUSTRY IN JAPAN

PRODUCTION AND CAPACITY RAPIDLY RISING

THE most striking feature of development in the international textile economy in recent years is the growing popularity of fabrics produced from synthetic fibres. Reflecting such popularity is the marked expansion in the consumption of synthetic fibres (other than rayon and acetate). Thus, between 1957 and 1963, while the total world consumption of all fibres has risen by about 18 per cent (from 13.70 million metric tons to 16.13 million tons), the quantity of synthetic fibres consumed has gone up by as much as 200 per cent (from 466,800 tons to over 1.43 million tons). Consequently, the share of synthetic fibres in the aggregate fibre consumption has increased appreciably from 3.4 per cent in 1957 to 8.9 per cent in 1963. The persistently rising demand for synthetic fibres is to be ascribed to three important factors: one, growing preference for higher grade textiles which are easier to handle and which cater to the need of the leisure-seeking public; two, rising enthusiasm for handling synthetic fibres on the part of intermediate processors and distributors because of stable profit yields; and, three, general recognition of the merit of these fibres for industrial uses.

Japan is one of the countries where the growth of the synthetic fibre industry has been spectacular. The actual output in 1963 touched the all-time peak of 239,205 tons, whereas it was no more than 28,782 tons in 1956 or a eight-fold increase in just seven years. And indications are that the next few years will witness a further notable expansion of the industry. The daily installed capacity of the industry, according to the Japan Chemical Fibres Association, is expected to reach nearly 1,129 tons by the end of next year (December 1965), as against 739 tons installed as of November 1963. How remarkable has been the growth of the Japanese synthetic fibre industry and how briskly the expansion projects are being implemented have been well brought out in an interesting article published in the *Monthly Review* (May 1964) of the Mitsui Bank Ltd., Tokyo.

The pivot of Japan's textile industry, according to the *Review*, has been moving swiftly from natural fibres to synthetic fibres through the transfer from mechanical processing of natural fibres to the chemical treatment of man-made materials. Such a swift movement is indicated by the spurt in the ratio of synthetic fibres to the total demand for textiles from a bare 4.5 per cent in 1957 to as high as 16.3 per cent in 1962, while that of natural fibres has declined from 61.6 per cent to 57.4 per cent. The demand for synthetic fibres has been increasing at a steady tempo with a faster gain in prospect. In view of the persistently rising trend of demand, it is no wonder that the daily operating capacity of synthetic textile equipment has nearly quadrupled over the same period from 151 tons to 599 tons and the actual output increased by 462 per cent from 42,383 tons in 1957 to 239,205 tons 1963.

EQUIPMENT CAPACITY AND INVESTMENTS

Synthetic fibre	Daily capacity (Metric tons)		Plant and equipment investments (Thousand Yen)	
	End-1965	End-Nov. 1963	1964	1962
Nylon	337.2	237.1	279	170
Polyester	298.1	171.6	228	98
Vinylon	160.6	144.8	26	10
Acrylonitrile	180.1	80.9	83	5
Polypropylene	64.5	26.4	59	35
Others	88.1	69.3	3	2
Acetate	...	...	42	4
Total	1,128.6	739.1	711	333

The quantity of synthetic fibre yarns actually spun during the year 1963 was 239,000 tons, representing a sharp rise of nearly 31 per cent as compared with the output in 1962. The rise was accounted for mainly by long-staple yarn the production of which went up by 39.7 per cent to 108,000 tons. The high-growth of long-staple yarn is attributed to (*a*) keener demand for higher-grade items, (*b*) improvement in weaving techniques, (*c*) advance to the field of knitted items following the improvement in processing methods (as witnessed in the case of woolly nylon), and (*d*) rising demand from industrial sectors for tyre cords.

Eight different types of synthetic fibres are now being produced in Japan. The chief among them, however, are nylon, polyester, acrylonitrile and vinylon, together accounting for about nine-tenths of the total output. Of these four major fibres, the first three are faring very well, while vinylon is said to be *marking time*. The production of nylon has gone up from just 15,334 tons in 1956 to as much as 80,053 tons in 1963. The polyester fibre, which was marketed for the first time in 1958, has been *making swift headway*, because of its "easier to wash and wear" merit. In 1961, the production of this fibre surpassed that of vinylon and came close to nylon output. Indeed, out of the total production of all fibres amounting to 239,205 tons in 1963, the share of polyester fibre alone was over 26 per cent; its actual output being 62,296 tons, a rise of 33.1 per cent over 1962.

Acrylonitrile, which is regarded as a promising substitute for wool, remained depressed for sometime, chiefly due to excessive equipment and qualitative demerits. As it is, however, being used more widely for making knitted products, it has come steadily into the limelight, the actual output of 36,015 tons in 1963 being well above the 44 tons *produced in 1956*. In contrast to these fibres, vinylon, as already stated, has continued to mark time. Although its production in 1963 at 37,376 tons ranked third among synthetic fibres, coming next to polyester, the rate of increase stood low at only 5.5 per cent. The relatively slow pace of growth in this fibre is due chiefly to lack of any specific merits in it, as well as to intensified competition from nylon and polyester in the sphere of industrial uses.

Besides the "Big Four" fibres, polypropylene, the *Review* says, deserves special note for its future growth potential, though its positive advance has so far been delayed on account of the difficulty of dyeing process. Along with the progress of dyeing technique, this fibre has lately come to enjoy an increasing demand for making fishing nets and other products. Actual output in 1963 was 5,900 tons; its place among synthetic fibres was sixth, the fifth place having been held by vinyliden.

PRODUCTION TREND
(In metric tons)

Synthetic fibre	1963	1962	1961	1956
Nylon	80,053	57,717	49,549	15,334
Polyester	62,296	46,821	37,330	3,012*
Vinylon	37,376	35,430	30,002	10,718
Acrylonitrile	36,015	27,392	23,033	44
Others	23,465	15,384	13,210	2,685
Total	239,205	182,744	153,124	28,781

* Relates to 1958 when production commenced for the first time.

Spurred by a persistently high level of demand the synthetic textile companies in Japan have been rapidly expanding their capacity. The aggregate daily operable equipment capacity at the end of last year (1963) stood at 764 tons, representing an increase of 27 per cent over the capacity in existence a year before. Over one-third of this capacity is accounted for by nylon, the actual daily capacity amounting to 241 tons. The share of polyester was 22.7 per cent (173 tons), of vinylon 19.0 per cent (145 tons) and of acrylonitrile 14.2 per cent (109 tons). With the completion of new and expansion projects in progress at present, the combined equipment capacity of the Japanese synthetic fibre industry is expected to rise by 50 per cent to 1,129 tons by the end of May 1965.

As synthetic fibre production demands large capital accumulation and advanced technical know-hows protected by the world-wide network of patent rights, the entry into this industry by new enterprises was extremely difficult until recently. As a consequence, the industry was monopolised by a limited few. From about 1962, however, new enterprises have risen in succession on the basis of technical know-hows either developed in Japan or inducted from abroad. As a result, the number of synthetic textile companies increased from two or six for nylon and polyester and from four to six for acrylonitrile.

About thirty companies are now engaged in the manufacture of synthetic textiles. Of the total equipment capacity (739.1 tons in November 1963) of these companies, the share of five companies alone comes to over 541 tons, their estimated capacity by the end of 1965 being put at 743 tons. The five companies are Toyo Rayon, Teijin, Asahi Chemical Industry, Nippon Rayon and Kurashiki Rayon.

Plant and equipment investments by synthetic textile companies in yarn divisions have continued to be brisk. Such investments in the fiscal year ended March 1964 were estimated by the Ministry of International Trade and Industry to have reached 72,700 million yen, representing a sharp increase of 112 per cent over the previous year's total of 32,900 million yen. Of this, 59,200 million yen went directly to production expansion projects, with nylon (29,600 million yen) acrylonitrile (6,300 million yen) and polyester (14,300 million yen) accounting for 85 per cent. With their total plant and equipment investments in the year 1963-64 estimated at 74,200 million yen (inclusive of 1,500 million yen for acetate), synthetic textile companies depended on loans for 41,600 million yen or 56 per cent. The funds raised out of their own purses and through capital expansions accounted for only 25,900 million yen, or 35 per cent, as compared with 43 per cent in 1961-62 and 72 per cent in 1962-63. Plant and equipment investments in the current year (1964-65) are estimated to continue high at around 66,900 million yen, only 8 per cent less than in 1963-64. As the enthusiasm of synthetic textile manufacturers for equipment expansion is still high, particularly in nylon and polyester sectors, equipment projects in 1964-65 are expected to surpass the estimated framework.

EXPORT TREND

	1963	1962	1961	1960
Staple (metric tons)	7,911	4,580	2,279	1,210
Yarn (Metric tons)	12,658	9,460	6,372	3,080
Fabrics ('000 sq. metres)	187,339	128,679	98,650	65,419

Alongside of the energetic expansion of equipment capacity, the operating rate has also continued to be high, particularly for nylon, polyester and acrylonitrile, due to the quickly *increasing* demand. The operating rate for vinylon, on the other hand, has remained low at about 81 per cent. The average operating rate of equipment for other synthetic fibres has remained at between 80 per cent and 90 per cent. It is thus noted that the differential has become gradually evident between popular and unpopular items.

In striking contrast to the growth of synthetic fibres as a sector of chemical industry in several Western countries, the development of these fibres in Japan has progressed as a branch of the textile industry itself. The Japanese system, so claims the *Review*, has such advantages as easy access to the rich experience of textile companies and avoidance of large capital outlay by acquiring their raw materials from petro-chemical enterprises. There is, however, one drawback, namely, "inability to enjoy the direct blessing of the rapid progress in development of petro-chemical raw material." It is not surprising, therefore, that many synthetic fibre companies in Japan are either entering into close contact with chemical concerns or expanding their own chemical divisions.

Although the export ratios of Japanese textile products have been extremely high, particularly in the cotton phase, synthetic fibre products have been relatively dull in export sales, as they have so far catered mostly to domestic demand. Export ratios to production in 1963 still stood low at 6.1 per cent for synthetic fibre staple, 4.7 per cent for yarn and 2.3 per cent for fabrics. The increasing tempo of exports of synthetic fibre products, however, has been brisk, the average annual growth rate during the period from 1959 through 1963 reaching 169 per cent for staple, 64 per cent for yarn and 52 per cent for fabrics. The rising tempo is expected to continue high along with the progress of equipment expansion projects in the future.

The domestic consumption of synthetic fibres in Japan is rising at such a fast rate that the ratio of these fibres in the total demand for all fibres by 1967 is expected to be not less than 27 per cent, as against 16 per cent in 1962. It may be noted here that the proportion of expenditure on clothing in the total real personal consumer spending is 8.8 per cent, as compared with 10.7 per cent in the U.K. and 12.5 per cent in France. As the rising trend of Japanese consumer spending for clothing is expected to continue, the *Review* concludes that the high growth rate of synthetic fibres is bound to continue in the future. Since synthetic fibres depend on raw materials made available through chemical reaction, a reduction in their cost and improvement in quality will naturally depend on the scale of expansion in production and changes in manufacturing methods.

MANCHESTER LETTER

AGREEMENT REACHED ON PACKAGE DEAL FOR LABOUR

A NEW ANGLE ON PROSPECTS FOR INDUSTRY

From Our Special Correspondent

MANCHESTER, 23rd *June*

A THREE-YEAR "package deal" affecting 14,000 Lancashire cotton workers provides for a phased programme of improvements in pay, working hours and holidays over the period. The agreement will give spinning, weaving and doubling workers an extra 4 per cent in their pay packets each year—the first payment beginning next month—together with a cut of half-an-hour each year in the basic single-shift working week of 42½ hours, and an additional one day's holiday, making three days in all over the three years. The main provisions of the pact, which is expected to improve the "image" of the industry and provide a more stable basis for forward planning, can be amended only in the event of serious unforeseen changes in the national economic situation.

The annual wage increase of 4 per cent. will become payable in the July of each of the three years and the first half-hour cut in working hours will operate from next January. There will be no cut in working hours on multiple shift systems, but wage adjustments will be made to compensate these workers.

The first extra day's holiday will be taken over the Christmas-New Year period this year. The employers have got the unions to co-operate in a bid to cut down on mill absenteeism immediately before and after holidays. The "package deal" has written into it the gradual introduction of measures to minimise this absenteeism by disentitling workers to holiday credits unless they have a reasonable case for being absent. It also rules out the tabling of any sectional or group applications for higher wages during the three-year period. There is to be an examination "at an early date" of the use of time clocks and greater flexibility in shift work systems.

An important aspect of this innovation in the relations between employers and operatives in the industry is that it provides for a period of stability. "Standstill" schemes have been adopted in the past, but no graduated concessions have ever been agreed. For the next three years at least, sectional claims are barred and, although overheads will be raised, traders will have the advantage of knowing what is in store on the hours-and-wages issue.

From the union angle, there may be individual complaints about the restrictive nature of a graduated "pay pause," but independent observers would regard the terms as generous indeed. Both sides must consider the scheme as an aid to recruitment, so vital a factor in keeping the trade competitive.

Prospects and Policy

Many spokesmen for the industry, as well as observers like ourselves, have been criticised in the past for dwelling too frequently and at considerable length on the bygone glories of the trade and its distinguished record on behalf of Britain's economic growth. Mr. G. H. K. Rae, in his final statement as Chairman of the Cotton and Rayon Merchants' Association, cannot be so blamed. For a refreshing change, he devoted his remarks almost entirely to consideration of future policy and prospects.

It has been the custom to describe the industry as being "at the crossroads" on many occasions, but Mr. Rae justified his look ahead by pointing out that many of the current import arrangements were due to expire at the end of next year, that a new Government would be formed before the end of 1964, and that the five-yearly review of the Cotton Board was already in progress. After describing the break-through achieved on imports with the Government during the past year and praising the relatively swift provision of machinery to prevent sudden growths from foreign sources, he warned that anyone who believed that quantitative restrictions would exist for ever was being dangerously complacent.

"Unless Lancashire can become reasonably competitive in price she will one day be thrown to the dogs," Mr. Rae declared. "In the long run the only protection Lancashire can expect is that of a reasonable tariff." A policy for a further period of years from the end of 1965 onwards will have to be formulated in the months ahead. It should be aimed not only at providing a further breathing space for the industry, but also at seeking, by the programmed introduction or adjustments of tariffs, a point of balance at which Lancashire could meet the challenge of the low-cost countries. This policy, he further observed, would be decided by a new Government, whatever its political complexion. The trade associations, and in particular the Merchants' Association, had a right and a duty to make representations so that this policy should be moulded to give the industry a measure of continuous prosperity.

The Right Answer

On the future of the Cotton Board, most individuals connected with textiles have their own independent and often conflicting views. It is widely known that the critics of the present composition of the Board and its functions have lately been exceedingly vocal. Mr. Rae believed that it was not the moment for any radical change in the Government of the industry and that, for some time at any rate, something very like the present Cotton Board was the right answer. Apart from anything else, he continued, the presence of representatives of the trade unions on the Board was invaluable. It had played an important part in maintaining industrial peace in the industry, had enabled the trade to speak with one voice and had made both employers and labour recognise that they were confronted with joint problems.

Two major policy changes for the direction of the industry had been suggested, Mr. Rae said. The formation of an industrial board with no independent chairman or members, he felt, would leave open to doubt whether what might appear to be a minority view would receive as much attention as one expressed by an independent body.

Sectional selfishness and shortsightedness, blamed by many on the horizontal structure, was declining rapidly, he added, and the area of disagreement on fundamental matters between the sections was small. In the past few years, differences of outlook and opinion had been very few and unimportant, with a remarkable and cordial collaboration in all major matters.

All-Textile Board

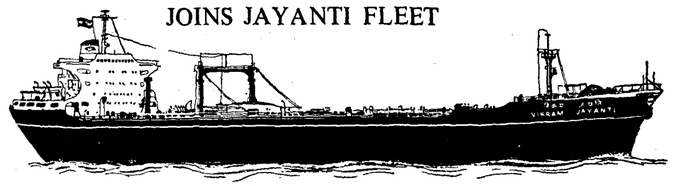
The other proposal to establish an all-textile board embracing wool, linen, flax and jute as well as cotton and man-made fibres, to say nothing of lace, cordage, narrow fabrics, knitting and other products, presented very substantial problems, Mr. Rae continued. The integration of man-made fibres within the Cotton Board was welcome, but much greater caution was necessary when considering fibres spun, woven and knitted on entirely different machinery and in entirely different mills. "I think a strong case could be made out for a properly constituted all-textile committee to make all the different textile industries aware of each other's problems," Mr. Rae added, "and to co-ordinate action wherever possible. But the other textile industries have different problems from ours. There sources of raw material, although in some cases over-lapping, are different, their import and tariff problems are different, their export problems are different, their labour problems are different."

By the very diversity of its interests, such a board, he felt, would be inhibited from acting sufficiently vigorously on behaf of any one of its constituent industries. Apart from the friction which might be caused by actual divergence of interest between two separate constituent industries, the very size of an all-fibre board would tend to result in "bureaucratic stultification."

VIKRAM JAYANTI

54,350 TON SUPER OIL TANKER

JOINS JAYANTI FLEET



VIKRAM JAYANTI, Jayanti Shipping Company's 54,350 Ton Super Oil Tanker, now joins Jayanti's fast growing fleet.

The vessel, built by Mitsubishi Shipbuilding & Engineering Co. Ltd., was delivered to Dr. J. Dharma Teja, Chairman, *Jayanti Shipping Co. Ltd., in Japan.*

VIKRAM JAYANTI, with its overall length of 754 feet and its breadth of more than 107 feet, will be the largest vessel on Indian Registry. It has a capacity of carrying more than 52,000 tons of oil when fully loaded and requires a 36 feet draft.

VIKRAM JAYANTI will start earning valuable foreign exchange for India the moment it leaves the Shipyard as the vessel has already been Time Chartered for a period of 12 years by ESSO Standard Eastern Tankers Ltd.

With the addition of VIKRAM JAYANTI to Jayanti's fast growing fleet, the Company's tonnage touches the high mark of 4,50,000 DWT. The Company now owns, besides the new Super Tanker, twelve 10,000/11,000 DWT cargo vessels, seven Bulk Carriers, totalling 2,31,000 DWT, and the Oil Tanker Adi Jayanti.

WORLD COTTON SITUATION

UPWARD TREND OF CONSUMPTION LIKELY TO PERSIST

REVERSING the downtrend of the past three seasons, world cotton consumption is rising again, the projections for the current season (August 1963-July 1964) indicating an increase of around two million bales (of 478 lbs. net) as compared with 1962-63. And the rise in consumption is likely to persist in the coming season beginning on the 1st of next month. Indeed, it looks as though the world consumption of cotton will set a new record. This at any rate is the conclusion arrived at by the International Cotton Advisory Committee (Washington) after a study of the recent trends in the world cotton economy, the findings of which are published in the May-June issue of its *Monthly Review*.

In support of its conclusion, the Committee says that in the United States special conditions prevail. Recent legislation, making cotton available to domestic mills at the world price, is expected to provide a major stimulus to cotton consumption by improving cotton's competitive position versus the other fibres and cotton textile imports. Consumption in the United States should also be favourably affected by the continuing expansion in the general economy and there is general optimism that the recent tax cut will boost the economy further this year, with a projected increase of about 6 per cent in the G.N.P. The improved outlook for cotton consumption in Japan originates in the increase in domestic demand for textiles and reflects the recovery in the overall economy. Export of both cotton yarn and piecegoods in 1963, however, fell to their lowest level in several years. Stocks of cotton textiles have been reduced to more manageable levels and the rate of yarn production curtailment has been relaxed. The third group of countries is where the rate of consumption is influenced to a large extent by the volume of domestic cotton production. This applies to India, the U.S.S.R., and Mainland China. With carryover stocks returned to normal and barring any adverse crop developments, consumption in India is likely to continue at a record level. Cotton consumption in the U.S.S.R. is expanding steadily, but production of man-made fibres seems slated for a proportionately rapid expansion in the future. With cotton textiles still rationed, there is considerable potential for cotton consumption in Mainland China if indigenous supplies and supplementary imports permit such an increase.

Supply Position

In the context of the rising trend of consumption, the question naturally arises as to whether the total supply of cotton would be sufficient to meet it. On the basis of the data available, it would appear that there may be decline in world cotton production, but, in view of the increase of about two million bales in carryover stocks, the Committee is quite confident that the aggregate world supply of cotton in 1964-65 would be at least as high as in the present season, namely, 73 million bales.

A notable feature of international trade in cotton during the past decade, especially in the current season, has been the growing importance of the U.S.S.R., Eastern Europe and Mainland China as import markets for cotton. A record value of cotton shipment to these countries in the current season speaks of their emergence as principal importers of cotton and demand from these countries will be the key factor in the export outlook for the next season. There is indeed scope for increasing the level of cotton consumption—particularly in Mainland China—but the extent to which cotton imports are authorised depends, *inter alia*, on the size of the domestic crop, textile import demand and balance of payment considerations.

Conditions, according to the Committee, appear favourable for a continuing high level of cotton exports in 1964-65. In the aggregate, stocks in net importing countries have increased slightly during the present season, but this increase has been proportionately somewhat less than the increase in consumption. It follows, therefore, that, with carryover stocks in importing countries still basically at minimum levels, there will again be only limited opportunity next season to consume out of stocks. With this in mind, consideration must also be given to the possible effect on trade of the expected level of consumption in 1964-65. Here, as previously stated, the outlook is for a probable further modest expansion over the present season's near-record level, despite intense competition from the man-made fibres. If this materialises, the level of world cotton exports will have to expand in approximately the same volume in order to meet mill requirements.

World trade in cotton next season will also be influenced by price trends which in recent years have been closely associated with price developments in the United States, but it is difficult at this stage to assess the probable effect of these policies. Elsewhere, the typical situation in recent years has been for prices to weaken slightly during the heavy harvesting period followed by a firming trend as the season progresses. The strong demand and relatively tight supply of extra-long staples make for a favourable outlook for these cottons.

As for the influence of stocks on the world trade in cotton, the Committee has the following to say:

"Based on historical practice, the ratio of stocks to consumption of raw cotton as of next 1st August will be comparatively low. However, it may be significant that smaller raw material inventories in relation to consumption levels have been the vogue in most mills for a number of years now. To some extent in the past, this practice has reflected price uncertainty and perhaps at times, the inability to secure sufficient quantities of certain desirable grades and staples. Nevertheless, it would seem that the carrying of "minimum" stocks has become almost standard procedure in many countries and is likely to remain main so as long as there is a surplus of cotton concentrated in one country—the United States—whose surplus disposal policies have so far been conducive to short-run price stability. This tends in a way to exert a restricting influence on international trade in cotton but the situation could change if world consumption and production were more closely in balance."

WORLD COTTON BALANCE

(In million bales of 478 lbs.)

Item	1961-62	1962-63	1963-64 (Estimated)
Stocks (1st August):			
United States	7.2	7.8	11.2
Other Net Exporters	3.5	3.8	3.6
Net Importers	6.6	5.5	5.9
Total	17.3	17.1	20.7
U.S.S.R., Mainland China and Eastern Europe	2.9	2.5	2.3
World total	20.2	19.6	23.0
Production:			
United States	14.5	14.9	15.3
Elsewhere	19.5	21.8	21.6
Total	34.0	36.7	36.9
U.S.S.R., Mainland China and Eastern Europe	12.1	12.2	13.1
World total	46.1	48.9	50.0
Total Supply	66.3	68.5	73.0
Consumption:			
United States	9.0	8.4	8.6
Elsewhere	23.6	23.2	24.2
Total	32.6	31.6	32.8
U.S.S.R., Mainland China and Eastern Europe	14.1	14.3	15.2
World total	46.7	45.9	48.0
Destroyed	0.1	0.1	0.1
Total	46.8	46.0	48.1

Cotton production is expected to exceed disappearance albeit by a small margin. The sharp upturn in world consumption, as noted above mitigates, to some extent, the larger than expected production, but the total world carryover on 1st August 1964 is likely to show an increase of two million bales; the total stocks as on 1st August next are estimated at 48.1 million bales, the highest level touched since 1956. The national marketing quota for the 1964 Upland cotton crop in the U.S. is 14.3 million bales. It is unlikely that all factors will be favourable next season and the chances are that the average yield per acre will decline. In Mexico, the planting of the 1964 crop was retarded by cool weather in Sinaloa, Southern Sonora and Mexicali. Early reports from Middle East are generally optimistic concerning crop prospects for 1964-65. Efforts to increase cotton production in Pakistan seem to have been concentrated on intensive cultivation for the acreage under this crop has declined in the last three years. Even so, the chances are that the last season's record yield may decline in 1964-65. Acreage is likely to remain constant in Sudan, but is expected to expand in several other countries of Africa. In India, the planned increase in the capacity of the cotton textile industry is expected to create demand for additional raw cotton. Every effort is being made to expand indigenous production, particularly long-staple varieties, to meet the growing needs of the domestic industry.

On balance, it is probable that total acreage will decline but the key to production, as the Committee rightly points out, lies in higher yield per acre.

Insofar as the current season is concerned, despite increase of two million bales to 48 million bales in consumption the total demand has lagged behind the supply actually available. This imbalance is attributed mainly to the fact that production has been much larger than was expected due to higher yields per acre. The aggregate world production in the current season is estimated about 50 million bales—a new record high—which represents an increase of one million bales over the last season. The accompanying table gives a comparative account of the world supply and disappearance for the season 1963-64 as compared with the position obtaining in 1961-62 and 1962-63.

The total supply, that is, the opening stocks of about 23 million bales as on 1st August, 1963 plus the peak production of 50 million bales, during the year, is estimated at a record 73 million bales, representing an increase of 4.5 million bales over 1962-63. Of this increase, the U.S.A. alone accounts for 3.7 million bales and the rest in the U.S.S.R. and Communist China. Total world exports of cotton during the current season are estimated at 17.5 million bales, as compared with about 16.0 million bales in 1962-63, the major beneficiary being the United States. The increase in world exports is due to higher offtake by few countries—for example, Japan, Canada and the U.K.—where the rate of cotton consumption has increased significantly. With reduced availabilities in other countries, exports from the United States are expected to increase by more than for the world as a whole. The latest estimates put the actual exports at 5.2 million bales, as against 3.4 million bales in 1962-63. The sharp increase in cotton trade and relatively stable prices are expected to result in increased total foreign exchange earnings from cotton this season. Though most of the benefit will accure to the United States, yet the Central American, Middle Eastern including Greece and Pakistan have also improved their reserve position. As regards prices, the excess of world production over consumption and the accumulation of further surpluses have tended to hold down cotton prices, though the prices of long staples have tended to increase having an impact on other varieties of cotton, especially the Upland type.

The stock distribution pattern at the end of the current season will be about the same as in recent years, with the United States holding the bulk of the world surplus. Based on official estimates for disappearance it appears that the end-season carryover in the U.S. will be closed, to 13 million bales—an increase of 1.7 million bales from a year ago. This increment accounts for most of the world's increase, for only minor variations are likely in other countries. At the present time, the stocks owned by the Commodity Credit Corporation aggregate 4.8 million bales and net entries under the 1963-64 loan programme 6.7 million bales. Cotton continues to be re-possessed but, even so, more than three quarters of the carryover at the end of this season is likely to be in the hands of the C.C.C.

In the other net exporting countries, stocks in total are likely to decline and will be at the lowest level for many years. The major decline will probably be in the Sudan, as a result of the abnormally small crop and a continued large volume of exports, but a moderate decline is also expected in Brazil.

Once again, there is no apparent evidence of any re-building of cotton stocks in Western Europe. On the other hand, if the present relationship between imports and consumption in Japan persists, stocks may show a further increase. Some increase in stocks is also expected in India this seas-

CRIMES ON BOARD AIRCRAFT

HOW TO ENSURE PROTECTION AGAINST PIRACY AND SABOTAGE

By Our Aviation Correspondent

TRUTH, we are told, is stranger than fiction —a saying which, with modern "thrillers" and "horror" films, is rather hard to believe. Sometimes, however, events occur, so macabre, so shocking in character, that we are compelled to acknowledge that life does indeed outrival fiction. One such event occurred recently in the United States when an airliner of Pacific Airlines, flying from Reno to San Francisco, crashed near the town of Concord, killing all the 44 passengers and crew on board.

Now an air crash is not, of itself, an unusual occurrence. It was the circumstances surrounding this particular accident which make it one of the strangest that has ever happened. Some airlines in the United States have started to install voice recorders on the flight deck. Such instruments provide a running record of all operational and other messages passed by radio telephony to the ground control. It so happened that a recorder had been installed on the Pacific Airlines' aircraft in question. This was recovered from the crash and, when played back, the captain's voice, in the middle of a routine message, was heard to cry: "My God, I've been shot."

The investigation of this strange case is still proceeding. At the time of writing, no positive conclusions have been reached. There seems to be evidence, nevertheless, that, on the body of a passenger who had insured his life for a large sum just prior to the flight, was found a revolver and six spent cartridges. Circumstantially, therefore, there appear to be grounds for suspecting that this passenger shot both the captain and the co-pilot, thus causing the deaths of 43 innocent men and women.

Although in some respects unique, this is by no means the only incident on record where sabotage for a similar motive has been suspected. Not so very long ago, an aircraft was destroyed in flight by what appeared to be the explosion of a bomb. This, it was suspected, was planted on board with the object of securing the life assurance proceeds of one of the passengers. Deeds of this ghastly nature may well seem to belong to the realms of fiction but there is plenty of evidence that it has happened—and could happen again.

Peculiarly Vulnerable

The fact is, of course, that an aircraft is a peculiarly vulnerable vehicle. Unlike a ship or a train, an aircraft can be almost instantaneously destroyed. Those who contemplate or perpetrate such crimes imagine, no doubt, that no incriminating evidence will ever be found. Now sabotage, by its very nature, may be an extremely rare occurrence but we have to remember that an aircraft can be destroyed by acts not necessarily intended even to endanger it. Acts, for instance, committed by persons temporarily deranged or intoxicated.

What steps can be, or are being, taken to counter these and similar dangers? One remedy is to step up the severity of penalties for offences on board aircraft. So far, most crimes of this nature, including a number of incidents involving the pirating of aircraft at gun-point, seem to have occurred in the United States. That country, consequently, has been the first to enact new legislation. The most stringent of the new laws is that which makes piracy punishable by death or, if the death penalty is not imposed, by not less than 20 years' imprisonment.

Safeguards

In addition to increasing the severity of punishment, the United States has applied a number of safeguards. A special corps of "Sky Marshals" has been enrolled, for instance, and trained for duties on board aircraft; airlines have been authorised to issue firearms to crew members trained in their use; intoxicated persons can be barred from boarding aircraft and the carriage of concealed arms has been made a very serious offence. The latest regulation requires a door to be installed, and kept locked, between the flight deck and the passenger cabin. And the mandatory installation of voice recorders—like that which provided such vital evidence on a recent occasion—is also under consideration.

None of these measures, of course, would normally afford much protection against sabotage. However, short of searching every passenger and every piece of baggage—an almost impossible proceeding—how can such crimes be prevented? Whether sabotage stems from political, financial, or other motives, these acts are the work of mad men and, we have to assume, will rarely be repeated. For the rest, the locked door and the voice recorder are, obviously, sensible measures. The latter, admittedly, will not prevent crime but may provide useful evidence. The former will certainly provide a measure of protection against deliberate acts of piracy or attacks upon the crew. It does not, on the other hand, appear to meet the more common danger of the intoxicated or deranged passenger—who can, after all, be as dangerous in the passenger cabin as on the flight deck.

No Cause For Alarm

So far, as one has already written, most of the crimes aboard aircraft seem to have occurred in the U.S.A. Unfortunately, however, a pattern of crime, like an epidemic, has a habit of spreading from one country to another. This has been recognised in the U.K. where, for example, the locked door regulation has already been adopted and will be enforced next year. The British authorities regard this as a purely precautionary measure. They take the view that, since very few incidents aboard British aircraft have been reported, there is no immediate cause for alarm.

The British view may well be correct but one factor, perhaps, should not be ignored. Amongst air crews in general, there is growing a certain feeling of uneasiness, if not of frustration. This stems, it appears, from the absence of clearly defined and internationally recognised powers which the commander of an airliner can exercise and, secondly, from the lack of any effective means of enforcing such powers as their own national laws afford them. A British pilot, writing in *The Aeroplane and Commercial Aviation News*, puts it like this:

> "What use is it to say that U.K. law makes it an offence to be drunk, behave in a dangerous manner, or to disobey the captain of a U.K. registered aircraft? What powers of restraint do we have? Our fists? We still do not have any idea if there is to be ratification of The Hague protocol to define the powers of aircraft commanders. Can I be sued if I use or authorise use of force on an unruly or dangerous passenger? Does my protection in U.K. law extend outside U.K. air space and to non-U.K. nationals?"

This illustrates, perhaps, some of the incidental difficulties and uncertainties of the exercise of command of a modern airliner. The problems posed are plain enough—but are not necessarily so easily resolved. At least, however, they appear to merit the attention of aviation authorities everywhere.

THE AUTOMOBILE INDUSTRY . . . .

To rush men and material to threatened frontiers, motor vehicles are the quicker, more flexible, more economical means of transport.

In times of emergency, defence production may call for the mobilisation of suitable factories such as provided by the automobile and ancillary industries. They offer the scope for quick conversion of production to defence needs. They can turn out special types of vehicles to transport the army of men and their equipment more speedily, even to regions unapproachable by other means.

This is not the only way that the automobile industry serves the country's defence.

Each vehicle sold provides the Government with a large share of money in the form of taxes, duties and levies. An Ambassador car, for instance, contributes some 5140 rupees or one third of the "on the road" price of the car in Calcutta to the Government in this form. This revenue and those received from the ancillary industries that are largely dependent for their existence on the automobile industry provide to Government the wherewithal to meet a substantial portion of the cost of defence requirements.

SOIL EROSION—A WORLD PROBLEM

CONSERVATION MEASURES IN INDIA INADEQUATE

BY far the most important natural resource is still land—arable or pastoral. But such land is extremely limited, accounting for no more than one-twelfth of the total earth's surface. The human race, which may well number 7,000 million within the next 40 years, will be desperately dependent on this relatively meagre extent of land for its food and thus for its very survival. Unfortunately, however, man's improvident stewardship of this land, the fertility of which depends on just nine inches of top soil, does not augur well for the future. That this precious soil-inheritance—the product of countless centuries of natural processes—has been partly squandered beyond repair is the view of several soil scientists and conservators. For instance, two Soviet Academicians, have recently given this finding: "In many countries of the world, the development of erosion processes of soils, droughts, dry winds and the frequency and intensity of disastrous floods have increased to enormous proportions. The total area of land subject to erosion is reckoned to be 600 million to 700 million hectares (1,500 million to 1,750 million acres) throughout the world. This constitutes almost half of the total cultivated area of the world. A certain part of this vast area cannot be cultivated any longer." How this rape of the earth has been perpetrated is better described in the words of a U.N. publication entitled *Science and Technology for Development*. Thus, it says:

"In part, this has been due to avariciousness—exacting from, but not replenishing, the soil; in part, to ignorance—a failure to understand the interaction of natural forces; and, in part, to the failure, since it has been nobody's business, to keep an inventory—to budget the uses of the greatest asset. The indiscriminate cutting down of forests has meant that the rains, which were once tempered and filtered into the underground springs, now scour the soil from bereft hillsides, like the run-off from a tiled roof, and produce floods in the water-glutted, silt-raised riverbeds. While soil, properly husbanded, will give even greater yields after centuries of careful use, soil which is ravished for quick returns will become desiccated as deserts, or, unprotected from the winds, will blow away and the noonday sun can be, and has been, blotted out by dust clouds which were once fertile soil. Even irrigation, man's conscious redistribution of surface water in areas of erratic rainfall, can be destructive."

Water-logging Menace

There is the well known example of damage caused even by irrigation in West Pakistan's Indus Valley where the population is increasing at the rate of ten more mouths to be fed every five minutes and where, every five minutes, an acre of land is being lost through water-logging and salinity. This damage is increasingly in evidence in the Punjab (in India), too, where the Sutlej and Bhakra-Nangal canals have contributed their share to water-logging. This is how the thousands of miles of canals dug into the surface of the Indus plain in both West Pakistan and India have caused, and continue to cause, water-logging and salinity. Apart from the water which is spread over the fields, as much as 40 per cent of the water in the unlined distribution canals seeps underground and does not find its way back into the river, to be drained into the sea. The result is that the water-table of large areas, which, before the canals, used to be generally well below the surface, has risen close to the surface and lowlying areas have become water-logged, drowning the crops. In other parts, the water creeps continually upwards from the water-table to the surface, where it evaporates and leaves behind its dissolved salts to accumulate in the top layers of the soil, thereby poisoning the crops.

Of course, not all irrigated lands, which account for only 14 to 15 per cent of the world's arable lands, are currently affected by such water-logging and salination. But they certainly run the risk of deterioration if artificial irrigation happens to be unscientific and indiscriminate. Hence the concurrent need for soil conservation in suitable ways even on irrigated lands. On the unirrigated 85 per cent of lands, however, the problem is twofold. It is, firstly, one of regulating surface run-off, so as to prevent soil erosion (that is, removal of fertile top-soil). Here methods of soil conservation also include forest conservation and afforestation. Secondly, in areas where rainfall is not adequate, it is a problem of how best to conserve water (moisture), so as to conserve the top-soil and prevent its being blown away by winds. Here the shortage of water is a more critical factor than even the availability of land, and hence the need for water conservation in suitable ways.

In India particularly, the need for soil conservation in all its aspects is being increasingly felt in the context of the need for stepping up agricultural production. But the soil conservation programme, which is under way in some mountainous areas, as also on dry lands, will cover only about 40 million acres under the third Plan at an aggregate cost of about Rs. 100 crores, though it has been estimated that a fourth of the country's land surface, accounting for 200 million acres, is suffering from soil erosion. Adoption of contour bunding and dry farming techniques, afforestation of catchment areas of rivers, reclamation of alkaline, usar and ravine lands, and special soil conservation measures for desert areas and other wastelands form part of the programme. The results of the programme will, however, be felt only over a period of time.

Currently, a part of the programme, designed to prevent premature silting of reservoirs by suitable conservation measures in the catchment areas of river-valley projects, is receiving particular attention. At an all-India conference on soil conservation measures in river-valley catchments, held at Srinagar on 27th and 28th June 1964, it has been pointed out that water reservoirs in the northern parts of the country need greater protection than those in South India, for a larger amount of soil is washed down by rivers from the Himalayas. The rate of silting in the Bhakra reservoir, for instance, is twice as much as what had been originally anticipated. As the catchments of river-valley projects generally lie in mountainous regions which are most vulnerable to erosion, something drastic would have to be done to put a stop to indiscriminate felling of trees and to deal with the problems of grazing and shifting cultivation in such areas. The immediate objective here is to ensure soil retention on the mountain slopes and reduce the sediment load in the streams, thereby prolonging the useful life of the reservoirs. The magnitude of the effort required may be inferred from these figures. As many as 25 river-valley projects, with catchments covering nearly 300,000 square miles, would have to be covered by the programme. Even assuming that only 10 per cent of each catchment area will require intensive treatment, about 30,000 square miles will have to be brought under the programme.

Very little progress has been made so far in this field. In the second Plan period, only an area of about 218 square miles was treated in the catchments of the D.V.C., Bhakra, Machkund, Hirakud and Chambal projects through such measures as afforestation of scattered bits of land, contour bunding and bench terracing in agricultural land. Under the third Plan, the physical target for treatment, at a cost of Rs. 11 crores, is only about 1,025 square miles in the catchment areas of 14 river-valley projects. Of this limited area, nearly 600 square miles remain to be treated during last two years of the Plan. At this rate, it may not be possible to complete the soil conservation measures in the catchment areas even within the proposed period of 20-25 years. The need for stepping up the present tempo of conservation work and also for making it more adequate should thus be obvious.

JAYANTI'S SUPER OIL TANKER

Vikram Jayanti, the 54,350-ton super oil tanker built by the Mitsubishi group of Japan for the Jayanti Shipping Company, was delivered to the Company on 22nd June 1964. According to a message received by the Company's operational headquarters in Bombay, Dr. Jayanti Dharma Teja, Chairman of the Company, took delivery of the ship at Nagasaki. The Union Minister for Transport, Mr. Raj Bahadur, who has been in Japan in connection with talks on Cochin shipyard, congratulated the Company on acquiring such a big tanker.

With the addition of this oil tanker which, incidentally, is the biggest ship to join the Indian shipping registry, the Jayanti fleet now consists of 21 vessels, aggregating 288,954 G.R.T. The new vessel has already been chartered to Esso and is expected to call at Bombay on its way to the Persian Gulf.

Over 100 Years of Banking in India

NATIONAL AND GRINDLAYS BANK LIMITED

(Amalgamating National Bank of India Limited, Grindlays Bank Limited and the Eastern Branches of Lloyds Bank Limited)

Registered in London under the Companies Act of 1862 on the 23rd March, 1866. The Liability of Members is Limited.

Bankers to the Government in Aden, Kenya, Uganda and Zanzibar.

AUTHORISED CAPITAL	...	£ 9,000,000
ISSUED AND PAID-UP CAPITAL	...	£ 5,703,000
RESERVE FUND	...	£ 5,400,000

HEAD OFFICE: 26, BISHOPSGATE, LONDON, E.C.2.

London Branch:

13, ST. JAMES'S SQUARE, S.W.I.

Branches throughout Aden, Ceylon, India, Kenya, Pakistan, Northern and Southern Rhodesia, Somalia, Tanganyika, Uganda, and Zanzibar.

The Bank conducts all classes of Banking and Exchange Business throughout the world.

Bombay Branches:

Road); 21/29, Princess Street, (Lloyds Branch); 117-119, Kazi Syed Street, Mandvi; 65F, Linking Road, Santa Cruz; 2/571, Gowalia Tank Road, Cumballa Hill; Shivaji Mandir, N. C. Kelkar Road, Dadar; 24B, Club Road, Byculla; Agra Road, Kolbad Road, (Near Castle Mills), Thana.

NGB/46A

NEW PRODUCTS AND PROCESSES

Machine Parts "Float on Air"

BRITISH engineers have perfected a machine which incorporates the century-old idea of making the working parts float on air instead of running on ball bearings or on a film of oil. It has been developed at the National Engineering Laboratory at East Kilbride in Lanarkshire (Southern Scotland) by staff of the Department of Industrial and Scientific Research, who demonstrated a grinding machine and two milling machines, each incorporating the principle of "air bearings."

Powdered Plastic Coatings

Shell International Research, of 30, Carel van Bylandtlaan, The Hague, says it has found a rapid and efficient way of covering large and small irregularly shaped objects with a plastic (epoxy resin) that sets hard and resists chemicals. It is also said not to soften if heated again after it has set. The objects are heated and dipped in a bed of the powdered plastic which is kept fluid and buoyant by an upthrust of inert gas. Particles of the powder stick to the object and then melt and fuse together into an even coating as they absorb heat from it.

Boiler Burns Anything

A steam boiler that runs on oil or gas but which will simultaneously burn any kind of solid fuel or waste refuse has been designed for hotels and factories by Gebruder Mittelmann Fabrik Moderner Badeofen, of Laasphe-Westphalia, Germany. The solids are partially burnt in one compartment and then the gases from them pass to a second compartment where they are further burnt together with the oil or gas.

Emergency Brake for Mowers

Still seeking safer motor mowers, an American company now offers an emergency brake to halt the spinning blade in case of danger. Clinton Engines Corporation, of Maquoket, Iowa, says the brake will stop a blade moving at 3,000 r.p.m. in less than half a second. Brake bands operating on the flywheel are lifted off against the compression of a strong spring before the mower is started. In case of emergency, the brake lever can be tripped and the brake shoes stop both the engine and the mower blade.

Swiss Machine Tool

Complex profiles previously requiring a battery of milling machines to carry out facing operations can be quickly and economically machined in one operation on a horizontal surface broaching machine produced by Mandrin G.m.b.H., of Erlach, Switzerland. John MacNab (Machinery), 94, Water Lane, Wilmslow, Cheshire, is the U.K. agent for the machine which has a production capacity varying between 200 and 1,000 pieces per hour, depending on the complexity of the profile and the hardness of the material. The "down time" for change over of broaches is between one and two hours and this means that it can be economically employed on medium-size runs, although the manufacturer suggests a minimum of 2,500 pieces. The machine will cost about £11,000 in the U.K.

Keeps the Pointer Steady

A small device for protecting pressure gauges and other sensitive instruments from the pulsations in a pipeline caused by a reciprocating machine or pump is now being marketed by Chemiquip Europa S.R.L., via Gian Giacomo Porro 18, Rome. Called a snubber, the device is placed in the line immediately upstream of the instrument being protected. It smoothes out the pulsations or fluctuations of pressure and enables the pointer on a gauge to give a steady reading. An added advantage is that the gauge itself is protected from damage due to sudden surges.

Device Detects Bad Welds

A new system for use with the resistance welding process, developed by the British Welding Research Association, Abington Hall, Abington, Cambridge, England, can monitor weld quality as the weld is made. It can guarantee the quality of each weld, increase the reliability of joints, and reduce the number of welds required. It will detect electrode deterioration and increase knowledge of electrode performance. A sensing device measures the rate of electrode separation and passes a signal to a monitoring instrument. The monitor discriminates between the signals given by good and bad welds and gives a visual indication. It can also be arranged to stop further welding when a poor weld is made, and could be developed for automatic control of weld quality. Changes in weld quality can be detected by the monitor from various factors, including surface condition, bad fit, and inductive losses.

New TV-Phone System

A system of transmitting television signals over ordinary telephone lines is being developed experimentally by British Telecommunications Research Ltd., at Taplow, near London. Telephone cables are not normally capable of carrying the enormous amount of information that is necessary to make up a normal television picture but a relatively new system—called pulse code modulation—is being used for transmission. The signals from a television camera are sampled electronically at high speed. The samples are, in fact, electrical pulses corresponding to the brightness of the picture at particular points. These pulses are then turned into coded signals. At the receiving end, electronic equipment decodes the signals into others reproducing the original samples from the camera and these are then fed to a television tube to produce a picture in the normal way. This is believed to be the first time that pulse code modulation has been used for television transmission. The system is purely experimental so far but it has worked satisfactorily in the laboratory.

JAIPUR METALS AND ELECTRICALS LTD.

NEW LINES OF MANUFACTURE TO BE UNDERTAKEN

CHAIRMAN, MR. R. H. KAMANI, URGES STABLE FISCAL POLICY

THE need for a stable fiscal policy for at least a certain minimum period was underlined by Mr. R. H. Kamani, Chairman of the Jaipur Metals and Electricals Ltd., in his speech at the Twentieth Annual General Meeting of the Company held at Jaipur on Thursday, 25th June 1964. Frequent changes in the fiscal policy, Mr. Kamani declared, were a disturbing factor, resulting in uncertainty in regard to the future planning and development of industries. Referring to the working of his own Company, he hoped that, ere long, the Company would be self-sufficient in the manufacture and procurement of meter components, as the manufacture of the few imported items like magnets were under consideration. Striking a note of optimism about the future, he revealed that the Company would very soon produce enamelled copper wires, as well as cotton, silk and paper covered wires and strips.

The following is a summary of Mr. Kamani's speech:

Extending a cordial welcome to the shareholders of the Company, Mr. R. H. Kamani referred to the great national tragedy created by the passing away of our beloved Prime Minister. In a moving reference, he solemnly stated that all-out efforts would be made by the Company to realise the dream of Jawaharlalji for a prosperous India through industrialisation. He prayed for the peace of the departed soul.

Mr. Kamani then presented the Directors' report, audited profit and loss account and balance sheet and proposed them to be adopted.

Accounts

The working of the Company, Mr. Kamani stated, had shown quite satisfactory progress with the total turnover and the profits touching new heights viz., from Rs. 2,32,76,000 to Rs. 2,69,39,000 and from Rs. 23,79,000 before providing for depreciation and the Managing Agents' remuneration to Rs. 30,24,000 respectively, being 16 per cent higher.

He then recounted the allocation and stated that the amount provided for taxation was less at Rs. 5,65,000 including the dividend tax on last year's equity dividend as against Rs. 6,85,000 in the previous year: while the Managing Agents' remuneration was Rs. 1,72,000 as against Rs. 1,48,000 in the previous year. Depreciation rose from Rs. 7,38,000 to Rs. 10,89,000 as also the development rebate from Rs. 3,50,000 to Rs. 4,92,000. He also referred to the abolition of super profit tax and the introduction of sur-tax and the dividend tax calculated at 7.5 per cent on the amount of dividend on equity capital distributed by the Company. He stated that while the net effect of the abolition of super profit tax and introduction of sur-tax was beneficial to the corporate sector, the introduction of tax on equity dividends has whittled down the reliefs so obtained.

He welcomed a rebate of 10 per cent of income-tax and super-tax and a rebate of 20 per cent in sur-tax in case of certain key industries to which category the Company also belonged, as also the withdrawal of super-tax on inter-corporate investments. He expressed his opinion that frequent changes in the fiscal policy of the Government was a disturbing factor, which would result in uncertainty of future planning and development of industries. He, therefore, emphasised the need for a stable policy on the part of the Government for at least a certain minimum period.

Mr. Kamani then dwelt upon the salient features of newly introduced Companies (Profits) Sur-tax Act, 1964 and emphasised that in order to avail of the full benefits under the Act and to meet the expenses of the development and expansion schemes, it was very necessary that the Company should have a strong capital base. He added that it was for this purpose that the Board of Directors recommended dividends at 6 per cent each on preference and ordinary shares and have recommended to transfer a sum of Rs. 3,61,000 to the general reserve. By doing this, the capital resources of the Company would increase, on the one hand, while, on the other, liability on account of sur-tax would decrease.

Factory Working

The Chairman informed the Company that the production tempo has been maintained and the production and sales—both in the Meter and Metal Divisions—were the highest ever reached. He also expressed satisfaction at the timely commencement of the production of A.C.S.R. and all aluminium conductors more especially when the allocation of copper for conductor industry was discontinued by the Government. He stated that with the ever-increasing production of electricity in the country, the prospects for the manufacture of A.C.S.R. and all aluminium conductors were bright.

In the sphere of meter production, he cautioned a note of warning that since recently many meter manufacturing units had come into existence in the country, as a result of which there was a very stiff competition in price. The Company was fully conscious of this position and was, therefore, taking all the necessary measures to face the situation.

Expansion and Development

Mr. Kamani informed the Company that efforts were afoot to make the Company self-sufficient in the manufacture and procurement of meter components. He was happy to state that, except for jewel bearings, magnet and a small percentage of sub-parts of the cyclometer unit which were presently imported, all other parts and components were either made in the factory or indigenously obtained. He stated that all the machineries required for the manufacture of magnet were installed. The Company was now awaiting the arrival of technical experts from our collaborators in Japan and no time will be lost to commence the production of magnet. The Company will also be able to manufacture the remaining small percentage of sub-parts for the cyclometer unit during the course of the current year.

Mr. Kamani sounded a note of optimism that the Company, in the near future, will also be able to manufacture enamelled copper wires and cotton, silk and paper covered wires and strips.

Research

Mr. Kamani stated that with a view to improve the quality of products as also to reduce the cost of production, all-out efforts were made by the Company and added that this was very vital for the economical development of the industry.

The Chairman attributed the good working results to the efforts and co-operation of the workers and members of the staff as also to the encouragement and backing of the shareholders received from time to time. He thanked them all.

Note: *This does not purport to be the proceedings of the Annual General Meeting.*

DOMESTIC ENQUIRIES

PRINCIPLES AND PROCEDURES OUTLINED

By G. K. Menda

[With the rising tempo of industrial development in India, employer-employee relations have assumed considerable importance, particularly in the context of industrial peace and increased production. Towards this end, Governments, at the Centre and in the States, have embarked on large-scale measures for labour welfare and social security. Simultaneously, there has been placed on the Statute Book a number of enactments designed towards maintaining industrial harmony and discipline. In this article, the author, who is closely connected with the legal aspect of industrial relations, explains succinctly the principles and procedure to be observed in the conduct of enquiries against delinquent employees.—ED.]

WITH the rapid industrialisation of our country, the need for maintenance of discipline and industrial harmony has become vital. As a result, we find that labour legislation is more and more tending to interfere with the sanctity of private contract. Protection in various forms has been given to workmen, say, in the form of social legislation, with the result that considerable restrictions have been imposed on the Common Law right of the employer, namely, the right to "hire and fire" an employee. We do not now live in that era when the master's mere wish used to be the last word and the law for his servant and when he went out into the open market, employed whomsoever he liked, paid what he liked and dismissed him when he liked and, above all, the State permitted him to do so. The doctrine of the absolute freedom of contract has thus to yield to the higher claims for social justice.

The right to dismiss an employee is controlled, subject to well-recognised limits in order to guarantee security of tenure to an industrial employee. It is also now recognised that, for the maintenance of industrial peace and harmony, the employer and the employee should, apart from their mutual contractual rights, understand clearly their statutory rights and responsibilities. It is mainly with this object that the Code for Discipline in Industry was adopted by the Tripartite Standing Labour Committee in October 1957 and ratified by the workers and various organisations of employers.

From a study of recent legal decisions, it is apparent that it is not very seldom that disciplinary action imposed by management on a delinquent employee, though otherwise justified, is upset by the Tribunals merely on technical grounds.

Generally speaking, apart from the statutes applicable to a workman, there is no obligation on the part of management to follow a strictly legal procedure similar to judicial proceedings for conducting domestic enquiries. The relevant statutes, mostly applicable to industrial establishments or factories, are (i) The Shops and Establishments Act, (ii) Industrial Disputes Act, and (iii) the Industrial Employment (Standing Orders) Act, 1946. An establishment to which the last mentioned Act is applicable is required to take disciplinary action against a workman in accordance with the Standing Orders certified under the Act.

"Audi Alteram Partem"

The whole subject matter of "domestic enquiries" centres round the principles of natural justice. It, therefore, follows that these principles have always to be kept in mind while conducting such enquiries. One of the cardinal principles of natural justice is expressed in the well-known Latin maxim, "*Audi alteram partem*"—no man shall be condemned unheard.

The Supreme Court has now clearly held[1] that an enquiry cannot be said to have been properly held, unless the following conditions are complied with:

(i) An employee proceeded against has been informed clearly of the charges levelled against him;

(ii) Witnesses are examined—ordinarily in the presence of the employee—in respect of the charges;

(iii) The employee is given a fair opportunity to cross-examine the witnesses;

(iv) He is given a fair opportunity to examine the witnesses including himself in his defence if he so wishes on any relevant matter, and

(v) Enquiry Officer records his findings with reasons for the same in his report.

Before the drama of domestic trial begins, the employee concerned should be given a charge-sheet, preferably in the presence of a witness, setting forth clearly and precisely particulars of the alleged misconduct, including the date and time of its commission, and requiring explanation.

In the absence of any specific provisions requiring service of a formal charge on the workman, it is not obligatory on the part of the employer to serve a charge-sheet, though generally, it is safer to do so. It is also advisable, for obvious reasons, to serve the charge-sheet in the presence of a witness. If a workman refuses to accept a charge-sheet, it should be served by registered post. Under certain circumstances, subject to the Standing Orders, service of a charge-sheet could be effected by affixing it on Notice Boards ordinarily seen by workmen.

Enquiry

The enquiry should not generally be held earlier than two days from the date on which the charge-sheet is served on the employee. The object is to give him sufficient time to prepare his defence. "It may be that failure to intimate to the workman concerned about the date of the enquiry may, by itself, not constitute an infirmity in the enquiry, but, on the other hand, it is necessary to bear in mind that it would be fair if the workman is told as to when the enquiry is going to be held, so that he has an opportunity to prepare himself to make his defence at the said enquiry and to collect such evidence as he may wish to lead in support of his defence. On the whole, it would not be right that the workman should be called on any day without previous intimation and the enquiry should begin straightaway. Such a course should ordinarily be avoided in holding domestic enquiries in industrial matters."[2]

The employee should be permitted to bring witnesses at the enquiry in defence and produce any other evidence. Generally, where Standing Orders are applicable to an establishment, a workman is also permitted to be represented at the enquiry by any other employee of his choice. But, as has been held by the Supreme Court, he has no right to be represented at such an enquiry by the representative of his Union, though, of course, an employer in his own discretion can and may allow his employee to be represented as such.[3]

If an employee does not present himself at the enquiry, it may be conducted in his absence. However, if the workman has a valid reason for not being present at the enquiry, then, reasonable adjournments thereof should be allowed. If the Enquiry Officer is satisfied that the reasons given by the workman for being absent at the enquiry are unsatisfactory, he may proceed with the enquiry, allowing the workman to be present at the rest of the enquiry.

The employee can be suspended pending enquiry against him, but whether it is desirable to do so must be decided by the Enquiry Officer.

When the employee presents himself at the enquiry, witnesses and any other evidence adduced must be examined and produced in his presence and he must be given an opportunity to ask any relevant questions from the witnesses.

A concise summary of the evidence led on either side and the questions asked and the answers received, the evidence submitted and any statement made by the employee concerned, including the workman's plea, should be recorded. It is advisable for the Enquiry Officer to put the following question to the employee before concluding the enquiry—"Have you anything further to state?" and record his answer thereto.

Powers and Duties of Enquiry Officer

As regards the powers of the Enquiry Officer to examine and cross-examine witnesses, the enquiry must be of such a nature that a Tribunal examining the matter may not entertain any doubt as to the management's *bona fides*. It is with this view that the Enquiry Officer should be a person with an open and unbiased mind and should not have prejudged the issue. The principle that a prosecutor cannot be a Judge is not strictly applicable to departmental enquiries. But he must not lower himself to the status of a common prosecutor, that is to say, of a person who feels it is a part of his function to bring the guilt home to the accused at any cost. That a person who conducts a departmental enquiry should not himself give evidence in that enquiry is a well-established principle of natural justice.[4]

In order to arrive at an impartial finding, it is within the competence of the Enquiry Officer to question and re-question the witnesses both of the management and the workman, and get all doubts and suspicions cleared. It is open to the Enquiry Officer to disallow any evidence after recording the reason in writing.

The observations of the Supreme Court in the Associated Cement Company's case which lay down the scope of the principles of natural justice serve as a valuable guide to the Enquiry Officer:

"If an officer himself sees the misconduct of a workman, it is desirable that the enquiry should be left to be held by some other person who does not claim to be an eye-witness of the impugned incident. Domestic enquiries must be conducted honestly and *bona fide* with a view to determining whether the charge framed against a particular employee is proved or not and so, care must be taken to see that these enquiries do not become empty formalities. If an officer claims that he had himself seen the misconduct alleged against an employee, in fairness, steps should be taken to see that the task of holding an enquiry is assigned to some other officer. In other words, it is desirable that the conduct of domestic enquiries should be left to such officers of the employer who are not likely to import their personal knowledge into the proceedings which they are holding as enquiry officers.

"It is further necessary to emphasise that, in domestic enquiries, the employer should take steps first to lead evidence against the workman charged, give an opportunity to the workman to cross-examine the said evidence and, then, should the workman be asked whether he wants to give any explanation about the evidence led against him. It is not fair that, in domestic enquiries against industrial employees, the employee should be, at the very commencement of the enquiry, closely cross-examined even before any evidence is led against him. In dealing with domestic enquiries held in such industrial matters, the fact should be borne in mind that, in a large majority of cases, employees are likely to be ignorant and so it is necessary not to expose them to the risk of cross-examination at the very commencement of the domestic enquiry."[5]

The Enquiry Officer as a person, other than a person competent to issue punishment, has only to commend the punishment commensurate with misconduct.

Report by Enquiry Officer

After completion of the enquiry, a report has to be made by the Enquiry Officer, wherein he should give his finding and the reasons in support thereof. He should also mention in his report the punishment which, in his opinion, is befitting. In deciding the quantum of punishment, he should take into account the previous record of the employee and the gravity of the misconduct and also any extenuating or aggravating circumstances. It is open to the authority competent to award punishment to confirm the punishment or to modify or set aside the order.

Thereafter, a letter should be addressed to the workman stating the punishment awarded. In cases where Section 33 of the Industrial Disputes Act is attracted, the requisite approval/permission of the Conciliation Officer or the Tribunal should be obtained before discharging or punishing the workman and the procedure laid down in that Section followed.

Subject to the service rules or statutory provisions, it is not obligatory for the management to supply copies of the proceedings of the enquiry to the workman. However, whenever rules provide the right to appeal from such

SHREE DIGVIJAY CEMENT COMPANY LIMITED

AUTOMATIC ESCALATION CLAUSE FOR COST INCREASES URGED

CHAIRMAN, MR. G. L. BANGUR'S SPEECH AT ANNUAL MEETING

THE Government is anxious that the cement industry should step up its production. But it is yet to recognise that, unless an appropriate rise in the cement price is sanctioned so as to neutralise the cost increases, savings in the hands of producers would not be adequate for expansion purposes. A definite formula for giving effect to the automatic escalation clause, as recommended by the Tariff Commission, is, therefore, urgently required. In making this plea in his speech at the Nineteenth Annual General Meeting of Shree Digvijay Cement Company, Ltd., held at Sikka on Monday, 29th June 1964, Mr. G. L. Bangur, Chairman, emphasised that it was necessary to ensure a proper return to the industry in the interests of its accelerated development.

The following is the full text of Mr. Bangur's speech, delivered in his absence by Mr. B. D. Somani:

I have pleasure in welcoming you to the nineteenth annual general meeting of the Company. The Directors' Report and Audited Statement of Accounts have been in your hands for some time past, and, with your consent, I take the same as read.

We are meeting today under the shadow of a great national loss by the sudden passing away of our beloved Prime Minister Shri Jawaharlal Nehru on 27th May 1964. In him our country has lost a jewel, a noble image of the aspirations of India's teeming millions and a great soul who lived and laboured for the betterment of the country, nay, the whole world. The best memorial to the departed leader and architect of modern India is to work for fulfilment of his dream of a peaceful, prosperous and united India.

The working results of your Company for the year under review have shown definite improvement over the previous year. The improvement in earnings, as indicated in the Directors' report, is due to satisfactory working of both the Cement and Asbestos Products Divisions. Recently, the two-lakh-tonnes expansion plant in the Cement Division has commenced production from November 1963. As such the working for the current year may be expected to show better performance.

Capacity Expansion

Your Directors have approached the Government for grant of an industrial licence for additional two lakh tonnes expansion and I have no doubt, if the Government sanctions adequate foreign exchange and gives us the import licence for import of certain essential portion of the plant and equipments, the new capacity of two lakh tonnes may be expected to be achieved by 1965.

The Company has taken in hand the construction of deep water jetty at Sikka Port which would link the factory by ropeway and provide for direct loading of steamers. The Company is grateful to the Gujarat Government for having agreed to allow some concession in wharfage for a period of ten years in respect of cargo cleared from the proposed deep water jetty.

We have also approached the Government for an industrial licence to expand the capacity of our Asbestos Products Division by another 40,000 tonnes per year for manufacturing asbestos cement sheets and pressure pipes.

The Company has very recently effected two shipments of asbestos cement sheets and pressure pipes to Iran and Pakistan. An agreement has also been made with International Johns Manville Corporation of Beirut, the associates of Johns Manville Corporation, New York, our collaborators, to promote the sales of asbestos cement products of your Company in the Middle East and African countries.

Progress of the Industry

As you are aware, the rise in demand has far outstripped the rise in the output of cement. There is anxiety on the part of the Government, as well as of the industry, that production should be increased substantially, but the reasons for the slow growth of the industry have to be looked into. The cost of production is going up continuously and, unless an appropriate rise in the price is given, savings in the hands of the manufacturers are not adequate to embark upon any programme of expansion involving heavy capital cost. Unless, therefore, the necessary favourable circumstances by which the industry can find the required capital outlay are created, it will be very difficult to bring about any appropriate increase in production capacity.

Another major factor coming in the way of the rapid growth of the cement industry is the limited availability of foreign exchange to the industry. Deliveries of indigenous machinery, I understand, are very long and, therefore, it takes several years before any new cement project or expansion of any old unit can be brought into production. In the interest, therefore, of speedier development of the industry, it is desirable to allow some relaxation in the matter of foreign exchange for importing cement plant and equipments which will enable an accelerated rate of development programme as envisaged under the Five-year Plans.

The industry has been constantly pleading for laying down of a definite formula or a basis for giving effect to automatic escalation clause, as recommended by the Tariff Commission, to facilitate immediate effect being given to increase in specified items of cost without undue delay. The development of the industry depends mainly on the return available to the industry and the imperative need to assure proper return to the industry to accelerate its development activities is amply revealed by no less a person than the Deputy Chairman of the Planning Commission, Mr. Asoka Mehta, in his following remarks:

"It is obvious that the country needs both a high rate of investment and a high enough rate of profit on the investment made. Adequate margins of profits will enable us to make larger inputs. In the modern sectors of our economy, including those publicly owned and operated, a 10 per cent rate of return has to be insisted upon. If a particular service or commodity has to be provided at lower than the full economic rate, it has to be through the provision of a subsidy."

Subsidy for Coal moved by Sea-cum-Rail Route

As you are aware, the Government had introduced compulsory movement of coal by sea-cum-rail route for large consumers situate on Western and Southern coasts from April 1962 to relieve the strain on the railways and to provide additional traffic for coastal shipping on the specific assurance that the extra cost involved in this movement would be met by grant of adequate subsidy. Pursuant to this arrangement, your Company has been receiving a large part of its requirements of coal by sea route. The scheme for payment of subsidy, in the first instance, did not function for about a year and large amounts were involved in arrears. Subsequently, another scheme was evolved by the Government to make fixed payment of subsidy for specific ports. This subsidy falls short in the case of your Company by Rs. 4 to Rs. 5 per tonne and involves a considerable loss over the quantity moved so far. We have been repeatedly representing this matter to the Government but it is regretted that necessary decision from the department is still not forthcoming.

Switch Over to Oil Firing

Some time back, the Government of India introduced compulsory switch-over to use of oil from coal in the case of cement factories situate in the Southern and Western parts of India and again assured that reasonable increase in ex-works price of cement would be allowed to compensate for the extra cost involved in the use of furnace oil. Although we have partly switched over to oil firing since September 1963 and have been making representations to the Government of India for allowing the revision in price of cement on this account, yet it appears, here again, that adequate compensation may not be allowed and the same may fall short of the extra cost involved. This obviously has involved us in incurring capital expenditure in the installation of oil-firing equipment.

Cement Corporation

I may refer to the Cement Corporation proposed to be formed by the Government. I hope the Corporation will be a source of assistance to the industry in conducting surveys of raw material availability, preparing project reports, helping promotional activities by financial assistance and reviewing, from time to time, the handicaps being faced by the industry and advising remedial measures to ensure better working and expansion of existing units and formation of new companies.

In closing, I am happy to report that the relations between the management and the employees of the Company continue to be cordial and satisfactory. It gives me pleasure to convey, on behalf of us all, our appreciation of the services rendered to the Company by the employees.

N.B.—*This does not purport to be the report of the proceedings of the Annual General Meeting.*

"ELECTRO-PAINTING"

A paint process has been developed for car bodies that will substantially reduce the risk of corrosion and improve the overall quality of vehicle bodies. The new process—known as electrocoating—is being used by Ford of Britain to give a primer coat to two of their current range—Anglia and Corsair—in production at their new Halewood plant in North-West England. All models will be treated in the same way within the next two years. The new process, which replaces conventional primer spraying and dipping processes, is essentially a dipping operation in which an electric current is passed between the car, completely immersed in a tank containing thousands of gallons of paint, and a second electrode. As the body submerges, electrical contact is made and paint particles cling to it, quickly building up an even coating over all surfaces.

ORIENTAL FIRE AND GENERAL INSURANCE CO., LTD.

SPEECH OF CHAIRMAN, MR. B. K. KAUL

BUSINESS EXPANSION IN MIDDLE EAST UNDER WAY

THE Oriental Fire and General Insurance Company Limited continues to pursue its cautious policy in regard to expansion of business outside India. This was revealed by Mr. B. K. Kaul, I.C.S., Chairman of the Company, in his speech at the Sixteenth Annual General Meeting of the Company held at Bombay on Tuesday, 30th June 1964. Mr. Kaul, however, stated that the Company had explored the possibility of expansion in the Middle East and other Arab countries. Negotiations in some cases, he said, were quite far advanced and it might be possible to make a beginning in some areas in the current year.

The following is the full text of Mr. Kaul's speech:

The report, accounts and balance-sheet for the year ended 31st December 1963 are already in your hands and, with your approval, I propose to take them as read. Before we proceed to consider these for adoption, I would like to review some of the points which had a bearing on your Company's working during the year.

Mr. Jawaharlal Nehru suddenly passed away on Wednesday, 27th May 1964. Mr. Nehru's death is a stunning blow to the entire nation. An anguished nation has been mourning the sudden passing of her most beloved son, an illustrious fighter for freedom, an outstanding statesman, a world leader. He occupied a place in the hearts and hopes of hundreds of millions of our countrymen. He was the architect and symbol of modern India. By his death, our country, in particular, and the world, in general, has suffered a grievous loss. The best tribute we can pay to our departed leader is to work hard and do our duty well so that our country may prosper.

As I mentioned last year, your Company was appointed by the Government as its sole Agent in connection with the administration of the Emergency Risks Insurance Schemes (Goods and Factories). During the year 1963, the Company received over 424,279 applications under these schemes at 163 centres all over India. I am glad to say that the Company was able to cope with the enormous work connected with the applications in a satisfactory manner. The work was done by the Company entirely on a non-profit basis.

Foreign Business

In the foreign field, the Governments of Ceylon and Burma restricted the writing of general insurance to State institutions from 1st January and 1st February 1964, respectively. In both these territories, we had been doing modest but profitable business for a number of years. As the unexpired business is not being taken over, we are required to run off the existing risks and, therefore, have to keep a skeleton staff for some time to come.

In Kuwait, a new agency was established in 1963 and their results have been satisfactory.

Whilst our operations in Pakistan gave us cause for concern in earlier years, we have been able to take effective measures to put the business on an even keel by setting up a regional office at Dacca exercising better control on underwriting and claim and by exploring fresh avenues of profitable business.

In Africa, a Union of the Republic of Tanganyika with Zanzibar was recently announced. We have been operating in East Africa, including these two territories, for a number of years, and I have no doubt that the Union shall provide increased opportunities for expansion of our business.

I had stated last year that we were progressing in the matter of expansion of our foreign business with caution. Whilst this policy has continued, we have explored the possibilities of expansion in the Middle East and other Arab countries. It may perhaps be possible to make a beginning in some of these areas during this year, as our negotiations in some cases are quite far advanced.

Working Results

Turning now to the results of the year's working, the net profits for the year of the Company after making provisions for taxation is Rs. 17.11 lakhs, as against Rs. 19.40 lakhs for the year 1962. The slight fall in the net profits has been due to an increase in claims and in the salary and allowances paid to the staff under the revised agreement.

The gross premium income of the Company in 1963 was Rs. 1,014.93 lakhs, as compared with Rs. 878.62 lakhs in 1962. After fulfilling the statutory obligations and making other cessions, the net premium of all departments increased from Rs. 492.29 lakhs for the year 1962 to Rs. 583.88 lakhs for 1963, showing an increase of Rs. 91.59 lakhs, that is, 18.60 per cent over the previous year's figure. This increase is made up of Rs. 74.25 lakhs from business transacted in India and Rs. 17.34 lakhs from business transacted out of India. Considering the market conditions, this rise may be considered quite satisfactory.

Overall Claims Ratio

The overall claims ratio of net claims to net premiums has shown an upward trend, that is, 59.71 per cent for 1963, as against 56.09 per cent for 1962.

In the fire department, the claims ratio for the year 1963 was 46.31 per cent as compared with 34.83 per cent for the year 1962. The increase in the claims ratio was mainly due to adverse experience on our foreign acceptances. On the miscellaneous side, the claim ratio has increased from 57.79 per cent for the year 1962 to 61.22 per cent for 1963, largely on account of continued adverse claims experience in motor department in India and out of India. On the marine side, the claims ratio for the year 1963 has registered a fall to 90.34 per cent, as compared with 93.26 per cent for 1962.

The overall ratio of commission and expenses of management to net premiums is around 32.4 per cent which is considered satisfactory.

As a result of the year's working, the departmental reserves have shown an impressive increase of Rs. 44.53 lakhs at Rs. 328.69 lakhs for the year 1963, as compared with Rs. 284.16 lakhs for the year 1962, showing an increase of 15.67 per cent over the previous year's figure.

Investments

Our investments as at 31st December 1963 aggregated Rs. 457 lakhs and the total depreciation thereon was around Rs. 4.50 lakhs and is more than adequately covered by the investment reserve. Considering the magnitude of the total investments and the general fall in the prices of shares and securities, it will be seen that the depreciation of 0.98 per cent is nominal.

Your Directors have recommended dividend at the rate of 8 per cent (subject to deduction of tax at prescribed rates) on the paid-up value of shares, as compared with 6 per cent for the year 1962.

The general reserves have been further augmented by an appropriation of Rs. 3.75 lakhs.

The year's working has resulted in a substantial increase in the funds of the Company from Rs. 454.14 lakhs in 1962 to Rs. 504.60 lakhs in 1963, registering an increase of 11.11 per cent over the previous year's figures.

In conclusion, I take this opportunity to express my thanks to our clients and well-wishers both in India and abroad who have continued to extend us their support. I also thank the officers, staff and development officials of the Company for their loyalty and good work.

N.B.—*This does not purport to be a record of the proceedings of the Annual General Meeting.*

...always finds something new. New developments in welding make constant demands on the skill and knowledge of the welder. He now works in a specialised industry the basis of which is an exact science.

Organised research has made the maximum use of such elemental powers as heat, light, sound, water and electricity. The result is a series of complex welding processes in various stages of development—Plasma Arc, Mig, Tig, Laser, Friction Welding, Electroslag, Ultrasonics, Fine Wire Mig and Electron Beam.

The pioneer of this industry in India, Indian Oxygen is occupied today in introducing the latest processes, thus leading the industry and the men behind it to greater recognition.

FERRO ALLOYS CORPORATION LIMITED

SOLUTION OF BASIC PROBLEMS URGED

SPEECH OF CHAIRMAN, MR. DURGAPRASAD SARAF

A WARNING that, unless the basic problems of the ferro-manganese industry such as procurement of quality ore and coke, some relief in railway freight charges, adequate power supply at cheaper rates and reduction in taxation were satisfactorily solved, the industry, a potential foreign exchange earner, would not be able to face world competition, was uttered by Mr. Durgaprasad Saraf, Chairman of the Ferro Alloys Corporation Ltd., in his speech at the Eighth Annual General Meeting of the Company held at Tumsar (Maharashtra), on Saturday, 27th June 1964. He stated that, while the price of coke had been increased abnormally, the quality of supplies had not improved as such. The 15 per cent special surcharge on electricity consumption imposed by the Andhra Pradesh Electricity Board, he said, had imposed a heavy burden on the industry. Referring to prospects of the Company, he struck a note of optimism. He revealed that the efforts to step up production of ferro-silicon and silico-manganese had proved successful.

The following is the full text of Mr. Saraf's speech:

GENTLEMEN,

I am very happy to extend to you all a hearty welcome to this eighth annual general meeting of the Company.

The Directors' report and the audited statement of accounts for the year 1963 are already in your hands for some time now and, with your permission, I take them as read.

Exactly on this date last month, our country suffered its greatest loss in the passing away of our beloved leader and Prime Minister, Shri Jawaharlal Nehru. It is rightly said that Nehru was India, and by his sudden and unexpected death a void has been created which it is difficult to fill, for, the like of him are born once in centuries. He was an international figure, widely loved and respected throughout the world. The light has gone out but not without illuminating the hearts of millions and millions of people. He has taught us many things and among them, which I value most, are to love our brethren, to work hard and to keep united. While paying our humble tributes to him let us all resolve that we shall prove worthy followers of our great leader.

Exports

I hope you have perused the Directors' report and the statement of accounts. It is possible, your first impression may not be quite satisfactory looking to the steep fall in the turnover and in the profits. However, you will recall that the Company commenced production from 1958 and for the first two years there were no profits as there were no barters and no home sales either. Subsequently, the first barter deal came to the industry's rescue. During the last year, although the exports were negligible (being only 14 per cent), your Company has made a turnover of Rs. 161 lakhs. Sales of ferro-manganese which is basically an export product will always be fluctuating, but last year's sales are indicative of the fact that the internal demand for the product is steadily increasing year after year with the expansion of the steel industry. Thus, the industry is now on a more sound and firm footing than what it was hitherto. There is, therefore, no cause for any undue apprehension, and we can look forward for better prospects in future.

On the export side, the Indian ferro-manganese is still a high-priced commodity. However, the Government has been trying to boost up its exports through barters, both public and private. As stated in my speech last year and in the Directors' report, now with you, a Barter Agreement has been signed under which 128,000 tons of ferro-manganese will be exported to U.S.A. against import of agricultural commodities, mainly cotton. Your Company has been allotted the largest quota for supply. By now your Company has already shipped 28,000 tons against this barter and one more steamer is awaiting berth for loading. The management has planned its production programme so as to deliver the balance quantity well within the stipulated time.

Profits

Your Directors' report has dealt with all important matters concerning the business of the Company including production and accounts, and so it is not necessary to recount them here. Indeed, 1963 imposed increased burdens on your Company as a result of additional taxation, extra costs arising from enhanced price of coke, increase in the percentage of sales tax, levy of 15 per cent special surcharge on electricity and premia payments in respect of Emergency Risk Insurance. Despite these adverse factors, the Company has been able to maintain a fair ratio of profits to turnover.

Ferro-manganese is a basic and key industry and can be a potential foreign exchange earner with the active support of Central and State Governments. The industry cannot face world competition until its basic problems are solved. The problems are varied and many, and relate to procuring quality manganese ore and coke, obtaining relief in railway freight on transport of manganese ore and finished product, securing power supply at cheaper rates and of receiving relief in taxation. Year after year, we have been voicing our grievances and hardships to the concerned authorities and it will be our constant endeavour to seek their satisfactory solution.

Raw Materials

Arrangement for procuring quality manganese ore, the principal raw material for the industry, is an important problem. The management has been anxious to acquire its own mines. It is with this purpose that your Company proposes to invest in the Best Minerals Private Limited, a reputed concern holding several mining leases for manganese ore in the States of Maharashtra and Madhya Pradesh. This Company has been supplying manganese ore to us since the beginning and after acquiring the same we propose to develop and make maximum use of its mines.

Adequate supply of quality coke at economic rates is equally vital for the industry. The price and supplies of coke are controlled by Government. While price of coke has been abnormally increased, the quality of supplies has not improved as such. Representations have already been made to the Government in this regard and the matter is being pursued.

While this important industry has been clamouring for help, it is a matter of regret that the Andhra Pradesh State Electricity Board has imposed a special surcharge of 15 per cent on electricity consumption. It is a heavy burden on this industry. The Company has contended that in accordance with the terms of the Special Agreement entered into with the Electricity Board, this levy is not applicable to it. The Electricity Board has however taken a different view, and the matter had, therefore, to be referred to arbitration. We hope the decision will be in our favour, but apart from the legal aspect the levy on this industry is not at all justifiable. The Andhra Pradesh Electricity Board will, therefore, do well to reconsider this matter dispassionately and in the larger interest of the industrial development of the country.

Wanchoo Committee

The problems confronting the industry have been put forth in all its aspects before the Wanchoo Committee appointed by the Government about two years ago. Several changes have taken place since then, and it is hoped that these will be considered by the Committee in its report which is eagerly awaited. We hope the Committee's recommendations will be beneficial to the industry and that the Government implement them expeditiously.

We are glad that the ferro-manganese industry has been classified as a basic industry by the Government, thus making it eligible for a rebate of 10 per cent of the income-tax and super-tax. This rebate will also be available to the industry in respect of sur-tax. Further, the revival of additional depreciation allowance for third-shift working at 50 per cent of the normal rate of depreciation is a welcome feature. We are grateful to the Finance Minister for these concessions.

Prospects

You are aware that your Company has successfully carried out experimental production of ferro-silicon and silico-manganese. The demand for these products has been found to be quite encouraging. Owing to our commitments under the barter deal, further manufacture of these items could not be undertaken. However, they hold out good prospects for the Company in future. Besides, the management has also been trying to sell the slag which is at present going waste and for which a demand has developed recently.

When we look back over our efforts and achievements of the year under review and of the years past, we really feel proud that we were able to steer successfully through critical times. To the shareholders, we can, therefore, hold out hopes of encouragement for better times ahead. It may, however, be remembered that after all, in every business ups and downs are but natural and we have to face them with faith and confidence.

Before I conclude, I wish to express the management's appreciation of the devoted services of the workers and the staff at all levels. Special mention should however be made of the technical staff for carrying out valuable research work, for improvement in the tapping system, for contribution to the National Productivity Council as its member and for preparing a useful paper on the utilisation of metallurgical wastes which was read at the International Symposium held at Jamshedpur.

In conclusion, I would like to record my warm appreciation and thanks to my colleagues on the Board for their co-operation.

Note: *This does not purport to be the record of the proceedings of the Eighth Annual General Meeting of the Company.*

YOUR BANK WITH THE PERSONAL TOUCH, AT YOUR SERVICE, WITH 91 BRANCHES

THE METAL BOX COMPANY OF INDIA LTD.

REVIEW BY THE CHAIRMAN, MR. M. K. VELLODI

NEED FOR ENSURING ADEQUATE SUPPLY OF TINPLATE VITAL

THE Thirty-first Annual General Meeting of The Metal Box Company of India Ltd. will be held on Wednesday, 22nd July 1964, at 59C Chowringhee, Calcutta.

The following is a copy of the Review by the Chairman, Mr. M. K. Vellodi, which has already been circulated to members:

I am glad to be able to report another year of fruitful endeavour particularly as, in my review last year, I struck a somewhat pessimistic note based on the assumption that the greatly increased taxation, both direct and indirect, including such impositions as the compulsory deposit in the last year's budget was bound to curb the purchasing power of the consumer. Happily this assumption proved incorrect, and our product sales in the year ended 31st March 1964 increased by 17 per cent to Rs. 13.85 crores.

Sales

Sales in all significant product groups increased, and during the second half of the year the new Paper Group commenced production. The encouraging volume of our order book for paper products at the year end is an indication that this addition to our packaging service will be widely welcomed.

Throughout the year and especially during the second half, the irregularity in the supply of raw material and, with certain products such as tubes, capacity considerations affected the service we were able to give our customers. In spite of these difficulties, ingenuity and good planning by the Company's managers again resulted in increased productivity, and generous long-term credit arrangements with our associates in England are now enabling us to undertake long overdue modernisation programmes. The sales of non-tinplate products will be promoted vigorously during the coming year and with Calcutta No. 2's difficulties in tooling up for Defence work largely overcome, the sale of industrial components should be particularly strong. However, the availability of raw materials, especially tinplate and polyethylene, also capacity to produce certain products will continue to determine the extent to which we can meet this year's strong demand.

Of late, Government has become increasingly aware of the important function of scientific packaging in the preservation of goods packed and the protection of the consumer. This is reflected in current plans for new manufacturing capacity for such essential packaging materials as tinplate, aluminium and polyethylene. A time lag is, however, inevitable before new capacity can be brought on stream. In this interim period, the packaging needs of the third Plan must be serviced without interruption. Failure to do so will have an immediate and severe inflationary effect. In the case of tinplate, for example, Rs. 1 lakh spent on imports generates the distribution of over Rs. 22 lakhs of essential consumer goods. In this connection, it is worthwhile considering the growth of all packaging, over the years of the third Plan. We reckon that in 1960-61 the production of consumer packages valued at Rs. 107 crores, and employing 100,000 men enabled the distribution of Rs. 2,870 crores of consumer products. This amounts to 12 per cent of the aggregate value of the country's supplies in that year. By 1965-66 it is estimated that the planned growth in production of essential consumer commodities will require packaging materials valued at Rs. 213 crores and made by 150,000 men for the distribution of goods worth Rs. 6,620 crores.

A Welcome Development

If these statistics have been seldom considered in past Plans, it is perhaps because packaging as a service industry must of necessity operate behind the scenes. Our contact with the public is indirect. It is therefore all too easy for the proper consideration of our contribution and our problems to go by default. The consequence of apathy can be serious. It is, for example, essential that the country maintains an international standard of packaging and presentation if its consumer products are to succeed in world markets. Every well-packaged item of consumer goods may be a potential export; already some Rs. 28 crores of packaged consumer goods are exported annually from India to almost 60 countries all over the globe. The packaging service essential to the effort to diversify India's exports is a specialised one, requiring technology of a very high order. Fortunately, both Government and industry recognise this need. We therefore welcome Government's move to establish an institute of packaging in the country to assist Indian exporters with packaging and marketing know-how.

Package manufacture the world over is located substantially in the organised section of industry requiring as it does precision mass-production methods; investment in complex machinery; long-term research and development; and close scientific collaboration both with packers and the suppliers of raw material. Export requirements demand that India must have access to the mainstream of world packaging technology. Your Company serves this role and, by maintaining laboratories and development facilities in Calcutta and Bombay, makes sure that new techniques and product improvements are developed in consonance with India's own particular requirements and material availability.

Help to Small-scale Sector

In view of the current interest in the scale of industrial operations, it is relevant to mention that, as in the case of your Company, far from being prejudicial to the development of the small-scale sector, large-scale enterprise can be of vital assistance to its development. Metal Box, for example, establishes research facilities and develops new packages and packaging systems, builds up markets for them, establishes raw material supplies available to all, trains technicians and supplies for unrestricted sale previously imported packing machinery. Whether we like it or not we have in a most effective way brought up competition in our wake. In addition, we provide a direct stimulus to small industry from which our purchases each year exceed Rs. 60 lakhs. More important, the majority of our 1,500 customers belong to the small-scale sector. All of our customers, large and small, have access to our research and technical resources and a fund of technological and marketing know-how particularly valuable to the small packer. To take one example, our precision packages and advisory services have helped enterprising prawn canners on the West Coast—all of them relatively small-scale in comparison with their competitors overseas—to export over Rs. 73 lakhs worth of canned fish last year to markets as competitive as the U.S.A. Our Cochin Factory was established particularly to provide these canners with on-the-spot can service. We also evolved a 'flattened' system of can despatch to reduce the freight cost factor for canners all over the country. For small canners in North and South India, we have set up reforming installations at Delhi and Madras which assemble, at cost price only, flattened open top cans made on high-speed lines in Calcutta and Bombay. We have supplied similar equipment to the Uttar Pradesh Government to serve the needs of small-scale canners in the rural areas of the U.P.

Defence

Sales of ordnance supplies were below forecast during the year, owing to unexpected problems in equipping ourselves and in meeting the standards required by the ordnance inspection authorities. Your Company has so far invested more than Rs. 6 lakhs in plant, equipment, tools and dies for Defence work. As our difficulties appear largely to have been resolved, we anticipate a substantial increase in sales during the year ahead.

Exports

After the previous year's setback, export sales went ahead again, increasing by 33 per cent to a new level of Rs. 28 lakhs. Extensive overseas touring by senior sales staff to reinforce the work of our agents secured notable gains in Burma, Ceylon and East Africa in particular. Our exports of domestic hardware and publicity materials increased by approximately 55 per cent and, to our great satisfaction, machinery sales again rose by more than 100 per cent.

Experience last year has made it abundantly clear that in the face of intense international competition it is far from easy to achieve and maintain the extremely high quality standards required in markets abroad. Your Company's efforts will be further intensified during 1964-65 although we anticipate problems arising out of political developments in Burma and in Ceylon.

I have already referred to our main contribution to the country's foreign exchange earning: the provision of packages made to international standards. In the past year our customers have earned more than Rs. 8 crores in foreign exchange through the export of goods packed in our containers.

To stimulate the growing awareness of scientific packaging, both for home and export markets, we organised over the year a series of seminars on consumer packaging for senior executives from amongst our customers, advertising agencies and Government. The seminars aimed at providing a comprehensive background on the subject of packaging to those concerned with the distribution and marketing of consumer products. This effort has been very well received.

Raw Materials

Throughout the past year, and especially during the last four months, the procurement of raw materials presented difficulties. Owing to delays in licensing procedures and the failure of the Russian authorities to fulfil commitments and a disappointing performance by Rourkela, tinplate stocks were very low during the last quarter.

The unfortunate communal disturbances at both Rourkela and Jamshedpur further reduced your Company's tinplate stocks and, although the authorities were reasonably appreciative of our difficulties, arrivals against import licences cannot be expected in time to prevent further difficulty in meeting our customers' requirements. Increasingly we are being directed to import tinplate from sources which involve AID or Government-to-Government trading. While the need for this is accepted, the result for your Company is a loss of control over specifications and an unsatisfactory timing of deliveries through repeated procedural delays: also a general increase in tinplate prices.

The strongest possible representations have been made to persuade Government that India requires a minimum importation of 75,000 tons of tinplate during 1964-65. The demand for tinplate is now rising sharply and to the extent that it is not met a broad range of essential consumer products will not reach the markets. Every effort is being made, and must continue to be made, to develop substitute packs, but the climatic conditions, the rough handling and extended shelf-life to be expected in our country set a severe limit to the use of substitutes. For a long time to come, therefore, tinplate alone, for a majority of packs, will be able to meet these exacting requirements.

The foreign exchange bill for 75,000 tons of tinplate would be a little more than Rs. 8.60 crores; while the problems of financing importation at this level are not underrated, it is a relatively small price to pay in terms of the health of the consumer economy when set against the fact that this tonnage means the marketing of consumer goods including foodstuffs and many household necessities worth more than Rs. 190 crores at retail prices. Failure to import at this level must mean shortages which can only have a highly inflationary impact on retail prices.

Aluminium supply scarcely balanced demand through the past year but availability in 1964-65 is likely to improve and advantage will be taken of this to push sales of non-tinplate products.

Polyethylene supply virtually dried up during the second half of 1963: the national sugar shortage led to an inadequate supply of industrial alcohol to the two polyethylene producers and the situation is not expected to improve much during 1964. Bearing in mind [illegible]

an extent polyethylene, either alone or when laminated with other materials, can for certain packs, be a substitute for tinplate, it is regrettable that this shortage has been allowed to develop when adequate capacity for indigenous polyethylene production is either available or about to be commissioned.

With the starting of your Company's new Paper Group, we became for the first time buyers of board and paper on a substantial scale. It is clear that the quality of indigenous board leaves a great deal to be desired. However, our buyers, technical staff and research people are co-operating with suppliers in endeavouring to improve the quality available to us.

Research, Design and Development

Paper Group: Modern high speed equipment has been installed at Worli in Bombay for the manufacture to international standards of paper packages: treated and laminated paper and boards, cartons made therefrom, wrap-around labels, labels for cans and punched labels for bottles. The low quality of boards at present available will continue to give rise to scientific and mechanical problems, but they have not stood in the way of a successful start. We already have a nucleus of highly skilled personnel and the training of staff has continued throughout the year.

Bombay No. 2: The new factory at Deonar was completed on schedule and the entire open top operation was transferred from Worli to these new premises. The transfer of tin printing has been slightly delayed due to the late arrival of imported balancing equipment. Deonar has been built to allow room for Paper Group at Worli and to enable the re-laying of our can-making equipment. When the transfer is completed the congestion at Worli will be considerably eased, resulting in the more efficient utilisation of plant and machinery.

Flexible Packaging: During the year under review the Government sanctioned the expansion of our manufacture of Flexible Packages. Currently new equipment is being specified which will permit the expansion of our product range. A new laminate has been developed as a tamperproof diaphragm for tinplate containers combining the protective properties of foil, polyethylene and paper. This material has already been introduced for some packs and its functional properties are being examined for a wide range of other products.

Calcutta No. 2: Throughout the year Industrial Components section has been heavily engaged with ordnance supplies: technical resources have been fully stretched and the Technical Development Division played a major role in the design and manufacture of press tools required for this work. Several heavy presses have been installed and the Factory now has a balanced press shop for a wide range of components for the electrical and automotive industries and components for munitions.

Machinery Building: Our plans for developing the Machinery Building Section of your Company have been affected by the defence requirements. Nevertheless the supply of closing machinery to customers has continued undisturbed. A valuable export order for production equipment was received from our overseas associates and here again the resources of the Technical Development Division were used to complete the project on time. Further export orders for similar equipment are currently under manufacture.

Research Division: A Customer Research Canning Laboratory is being established at Research Division to augment our advisory services to the industry. In this laboratory we will be able to reproduce cannery conditions and experiment directly with the canning of new products. Throughout the year the Research laboratories in conjunction with suppliers have continued to develop wholly indigenous materials. Their field of operation has extended to cover the new Paper Group.

Visits from Associates

During the year we had the pleasure of welcoming Mr. C. E. Sutton and Mr. A. L. Stuchbery, Directors of The Metal Box Company Limited. Mr. Sutton, who is in charge of the Home Company's Administrative Services, was able to apply to your Company's problems his very considerable experience, particularly that in the field of raw material procurement. Mr. Stuchbery, heading Research and Technical Engineering, apart from being one of the world's leading can-makers, is Chairman both of the Council of the Institution of Production Engineers in the U.K. and the Production Engineering Research Association. He was therefore in an unrivalled position to give us help in the planning of our defence production and the development of our Machinery Building and Industrial Component operations. Needless to say we welcome such visits which are both pleasant and useful.

Employee Relations

During the year under review, labour relations in the country deteriorated and the cordial atmosphere generated by the Emergency and the Industrial Truce Resolution unhappily began to disappear. This was most evident in the engineering industry of which we are a part: it particularly affected our employee relations in Bombay and North India.

If, as we are asked to believe, we are living in a state of emergency, and if the country's paramount needs are increased productivity to strengthen its defence and its export trade and at the same time raising the living standards of the people, then it is essential that there should be on the part of labour an adequate realisation of its responsibilities in this matter and on the part of the Government a determination to ensure that unreasonable demands and indifference to the common weal either by employers or by labour are not given any encouragement.

In Bombay, where over the last ten years we had successfully negotiated with representative committees elected by our employees, a concerted attempt was made by an outside trade union to create unrest and disturbance. As a consequence our relationship with our employees there during the last few months of the year was under considerable strain. Charters of demands were presented to the Company by three separate unions, all pressing for formal recognition by the Company. Acting in accordance with the Code of Discipline, we have not recognised any union so far. We have, however, concluded an agreement on dearness allowance and gratuity with a union which represents a majority of the monthly-rated staff as certified by the Maharashtra State Labour Commissioner. The demands made by the other two unions were taken to conciliation which was infructuous. However, a bipartite agreement was reached with one of the unions representing the daily-rated employees.

Signs of tension were noticed in Faridabad throughout the year, which culminated in a four-day strike in March. This strike was entirely unjustified, since the issue on which it was called was already under investigation by the Conciliation Officer of the Punjab Government. The issue has now been referred to the Labour Tribunal.

After protracted negotiations, a comprehensive agreement covering terms and conditions of service was concluded with the daily-rated employees at Calcutta No. 1, Calcutta No. 2 and Technical Development Division. I am happy to report that with the signing of this agreement (operative till 31st December, 1967) the restlessness which I mentioned amongst our daily-rated employees in the Calcutta establishments last year and in 1962 has largely disappeared.

Your Company continued to emphasise training at all levels within the organisation. Five officers and one Research Associate underwent training by Metal Box in the U.K. One senior manager was sent to the Administrative Staff College at Henley-on-Thames, and another attended the Advanced Management Programme organised by the All India Management Association at Bombay. We sponsored a candidate to the nine-month Junior Management Development Course of the Indian Institute of Management, Calcutta. A further thirty-seven managers have undergone the Company's residential Management Course in Calcutta at which we continue to welcome the participation by managers from our Malaysian and Pakistani associates.

Courses for supervisors were organised in the units in man management, safety and work study. Forty-one apprentices were recruited under the Apprentices Act, in addition to seventy-three currently receiving training under the Company's apprenticeship schemes.

It is a pleasure for me to record the valuable co-operation of the Company's employees in our widespread activities and I thank them and the management for yet another year's splendid performance.

Board Changes

It was only last year that I paid tribute to the services of Mr. K. C. Mahindra who served as Chairman of our Company for five eventful years. Unhappily he was not destined to enjoy for long the rest from all his labours in the interest of industry in general and our own Company in particular. His death on 31st October 1963 was deeply mourned by all of us in Metal Box and to his family who survive him, we sent our sympathy in their bereavement.

It was with real regret that your Board agreed to release Mr. John Cochrane-Barnett from the Board. His services to the Company during the last seventeen years and more—the last three as Deputy Managing Director—have been most valuable. His drive and determination, backed by his intimate knowledge of production and marketing in India have contributed in a substantial way to the continued growth of your Company's sales. His tactful and painstaking advocacy of our own and the packaging industry's needs for raw materials have been as much respected and appreciated by officials in the Government as have his loyalty and breadth of vision by his colleagues on the Board. We shall miss him: and I should like on your behalf and also mine to convey our thanks and good wishes to him.

We have lost another valuable colleague by the resignation of Sardar H. S. Malik from the Board. After a very distinguished career in the Indian Civil Service, Sardar Malik joined our Board as a Director in 1957. During the last seven years he has, by his wide experience of men and affairs, and by his ability in presenting our problems to the Government, been of the greatest assistance to the Company. On your behalf and also on mine I should like to convey our thanks and good wishes to him.

Conclusion

As a comparative new-comer to your Company I have been doing a certain amount of research into its fortunes. The graphs reproduced at the beginning of this report bear eloquent testimony to the Company's growth and prosperity which have been attained by hard work and by the application of progressive methods of production and management.

All are Labourers in the Same Vineyard

The smooth and effective manner in which the Company was able successfully to float in March 1964 a Rights Issue of over two crores of rupees is proof of both the soundness of your Company and the confidence that it enjoys in the country.

The speech of the Chairman at the Annual General Meeting of a Company has become an occasion in this country and elsewhere for a review of the important events of the year or for the exposition of one facet or another of industrial philosophy. Sometimes these speeches include criticism—mild or otherwise—of the policy of the Government, and in particular of its Finance Minister. The temptation to join this chorus is great for the simple reason that I find myself in agreement with most of what has been said, and will continue to be said by others in the same position as myself. But I have often wondered what one would do if one were to find oneself in the unenviable position of the Finance Minister of the Government of India. Given the conditions that exist in our country today, namely, the need to finance successive Five-year Plans of increasing dimensions and defence budgets of staggering proportions, has a Finance Minister much of an alternative? His business is to raise the necessary finance. He cannot do so without hurting someone. All taxes, by whatever name they are called, are an abomination of the Lord: no one likes to pay taxes; but taxation of some kind or other in a civilised and democratic country is the most approved and legitimate means of raising money. All this does not mean that I do not share the views of far more experienced Chairmen of companies than myself on the Budget and all that it implies: but it is just as well to remind ourselves that all of us—Parliament, Government and industry—are labourers in the same vineyard: as we sow, so shall we reap.

I cannot conclude this report without referring to the untimely death of our beloved Prime Minister on 27th May 1964. All our units closed on the afternoon of that day and all the following day in token of our grief. Our management and staff met together to mourn their and the country's loss. We "shall not look upon his like again."

NOTE: *This does not purport to be a record of the proceedings of the Annual General Meeting.*

BUSINESS NEWS FROM EUROPE

EUROPEAN DRINKING HABITS CHANGING

FRESH MOVE TO HEAL MOSCOW-PEKING RIFT

EUROPEANS are changing their drinking habits at the same time as they are drinking more. Drinking as a whole is rising steadily and the amount being spent on all drinks, non-alcoholic as well as alcoholic, is climbing. But inside each country the pattern of drinking is changing. The traditional wine-drinking countries (France, Italy) are shifting to spirits and beer. The beer drinkers (Britain, Belgium) are shifting to wines.

The appeal of different kinds of drinks is also changing. Young people are drinking more beer in Holland, less in France and Belgium. Women are drinking more in Britain. Last year, Italians spent almost nine per cent more on drink than in the previous year. In Britain, the amount spent on alcoholic drinks was up by 6.1 per cent in 1962 and, if prices are taken at a constant 1959 level, the rise would have been even faster—6.3 per cent.

Total French spending on all drinks has been increasing steadily since 1950, in spite of periodic attempts to keep it in check by the Government. The 1962 drinks bill was 88 per cent up on the 1956 level and almost three times the 1950 figure.

Consumption in the Belgium-Luxembourg Economic Union has also risen, if rather more fitfully. Beer consumption has held steady for the past 10 years or more at between 10.2 million hectolitres and 10.9 million, but the amount spent on spirits and soft drinks has grown consistently over the period. In the Netherlands, beer consumption trebled between 1950 and 1962 and that of wine increased fivefold.

Soft Drinks

This general rise has been marked by several divergent trends. There has been a large increase in the consumption of, and spending on, soft drinks. Fruit juices and lemonades now play a considerable part in almost every continental European economy. There has also been a fairly widespread shift towards spirits. Gin, whisky and to a lesser extent aperitifs, have done well. But in Britain one of the most startling advances has been made by wine.

Only one new drink has appeared in Europe over the past 15 years—vodka. Almost unknown at the end of the war, vodka has established a firm foothold in Britain and is beginning to be developed in Europe. Almost every other drink on sale was already established in 1939.

Without a doubt, whisky has become the market leader. It is very much the fashionable, snob drink. It is also becoming the young people's drink. But whisky has been also accepted by all age groups and almost all income groups throughout Europe. It has made big inroads in France, where it now rivals brandy in "smart" popularity (if not yet in total consumption). It has a breachhed in Italy, possibly the most difficult market for it to tackle, has challenged beer's hitherto impregnable position in Belgium, met the challenge of gin in the Netherlands and become a firm favourite in West Germany. More could be sold were not so much being exported to the United States.

Another significant feature in European drinking habits has been the big increase in soft drinks. It has been particularly noticeable that these have been increasingly drunk by the younger people. In France, consumption has increased over the period 1950-62 from 30,000 hl to 742,000 hl. The same trend is becoming apparent in the rest of continental Europe.

Whether it is being repeated in Britain is not clear, because statistics for this part of the industry are difficult to collate. However, 1963's output, at 424 million gallons (representing a consumption per head figure of just below 40 litres) was just below the record 1961 output of 449 million gallons.

Beer has also been making steady inroads in the traditionally wine-drinking countries, though there has been a tendency for consumption to stick in both Belgium (where consumption per head is the highest in the world) and Britain. In France, spending on beer has gone up almost sixfold over the £23 million (64.4 million dollars) spent on it in 1950, most of the increase being in the second half of the period.

The amount of money spent in Britain on liquor has been boosted by a well-planned advertising campaign. Attempts have been made—successfully—to change the images that certain drinks have and so get them accepted by a wider clientele.

Beer, for instance, has long been the "man's drink." Now women are being wooed by the brewers through a subtle advertising campaign and lighter beers. The same applies to other drinks, such as aperitifs, whisky and gin.

The amount spent on advertising in 1962 reached £23.25 million (65.1 million dollars), of which nearly half was spent by the brewing industry. Other major advertising industries were wines, whisky and cider.

The British still spend more on beer than any other alcoholic drink. But the proportion of total expenditure on drink taken by beer is tending to fall very slightly. In 1959 beer sales comprised 60 per cent of total spending on drink; by 1962 the figure had fallen to 59.2 per cent even though the actual spending on beer had risen by some 20 per cent. Total spending on all alcoholic liquors in 1963 was about £1,125 million (3,150 million dollars).

Perhaps because of a rather Puritanical outlook, a considerable proportion of the Dutch people never drink at all. But such drinking as there is tends to take place largely in the home. The Dutch are not a very gregarious people and tend not to frequent cafes or bars very much (though the French, who would almost certainly be classified as gregarious and likely to frequent bars and bistros, also drink more in the home).

Wine

Wine drinking has increased fivefold since 1950 and in 1962 had reached 3.05 litres a person, almost a quarter being accounted for by home-produced wines. It is noticeable in beer drinking that the Dutch are experiencing a trend directly opposite to those of its neighbours, France and Belgium. The Dutch trend is for more beer to be drunk by the under-29 age group which now accounts for 41 per cent of total consumption though the group accounts for only a quarter of the population. Both in France and Belgium it has been noticeable that alcoholic drinking has been falling off among the youngest age groups.

Trying to Heal the Sino-Soviet Rift

A call by Poland for a Communist summit meeting, to include every national party, is seen in the West as an attempt to heal the Moscow-Peking rift which is increasingly dividing the Communist world into two mutually incompatible camps. Such a conference is unlikely to be held in the near future, even if it is accepted by all parties. Although the big opponent would probably be the Chinese, the Russian view is unknown. It is not thought that the Poles are flying a kite for Russia with the suggestion.

The Polish view is that the conference should be held probably within the next 12 to 18 months. The Chinese attitude is that about five years should elapse. This would suit their plans much better. Such a long preparatory period would give them time to see how far they could go in getting the Russians to accept their view that Communism must inevitably win the battle with capitalism. It would also give them a good period in which to overcome economic difficulties and turn the mighty potential of their economy into some solid progress. Lastly, it would allow them time to attempt to convert other Communist parties, such as the Rumanian, which are dissatisfied with Moscow's leadership.

It appears to students of Communism that at the root of the Sino-Soviet dispute lies the Russian refusal to help the Chinese build up a nuclear industry. Russia's signing of the nuclear test-ban treaty last year was a severe blow to Chinese hopes. Russia's aim was then thought to be limiting the spread of nuclear weapons. It is now considered that this act may bring about radical changes in the Communist empire.

Book Trade in Britain Booming

At the end of its first World Book Fair in London, Britain's book trade is looking forward to a satisfactory year ahead. Once regarded as the occupation for the talented amateur, and always as one operated on a shoestring, the trade is now playing an important part in Britain's exports. Last year, with a record number of new titles, total home and overseas sales reached £85 million (238 million dollars) at wholesale prices, eight times more than in 1939 and a threefold increase over 1946.

Exports last year reached £38 million (106.4 million dollars), 46 per cent of total output. This means that the book trade's contribution to exports is larger proportionately than most others'; larger, for instance, than the share of the motor industry.

Increasing education, particularly in developing countries overseas, is expected to stimulate the demand for text books in English. This section is already the most profitable for many publishers and subsidises publication of novels. Biggest single export market is the United States, which took £5 million (14 million dollars) worth last year. Australia was second and Japan is also a valuable market. But Europe, considered as a whole, is the largest buyer, and the Italians take most books from Britain.

Total titles printed last year rose by six per cent to 24,617, after the slight decline in 1962. New titles rose to 18,567 out of this figure, and showed an uninterrupted rise since 1960. Previous best year for the increase of total titles was 1961, when 5.4 per cent more were produced. Much of the increase has come about because the trade has managed to contain costs. Although paper is about seven times its pre-war cost, book prices have gone up only about three times.

Arabs Seek Economic Unity

Last January's Arab summit conference in Cairo now appears to be having economic effects, even though the meeting itself was largely political. If the plans then discussed and now being acted upon are carried through, the Arab world could become economically stronger. But the extent to which it does so really depends on the maintenance of anti-Israeli feeling. If this were to fade away, or even recede, Arab unity (and economic advancement) would be endangered.

Some five projects have been brought out and dusted over, none of them really new. The most important is the suggestion by the Arab Economic Council that a common market be set up over the next 10 years. A progressive reduction of tariffs amongst members, a common external tariff, co-ordination of economic development and a common policy *vis-a-vis* outside countries was agreed. So far five countries have ratified the agreement—the U.A.R., Syria, Iraq, Jordan and Kuwait—which started on 1st April.

In addition, a development loan bank has been set up with a combined capital of over £80 million (224 million dollars). The largest contribution has come from the Arab Financial Organisation, with £25 million (70 million dollars) and Kuwait, which is to be its headquarters, has promised £5 million.

Other projects are for an Arab tanker company, a pan-Arab airline organisation and a shipping company. The tanker company is to have a capital of £35 million subscribed in equal shares and when it comes into being the States are likely to put pressure on the oil companies to ensure that the company carried part of the oil which is mined in Arab States. The airline organisation is, as yet, to be merely a co-ordinating body. Its capital is £17 million. The shipping company has a capital of £5.3 million and is to provide passenger and cargo services.

Progress Report on Israel

Israel's booming economy is threatened by an inflation that is rapidly gaining momentum. In the first quarter of this year, imports have risen to meet demand for consumption goods. Unless the Government takes some of the traditional steps—budgeting for a surplus, economies in Government departments, tighter credit, stricter controls on borrowing abroad—much of the good effects stemming from the 1962 devaluation will have been undone.

The trouble is that Israeli imports are only covered 56 per cent by direct exports. The rest are met by capital remittances. But much of this inflow of capital will dry up by 1970, so that a big export drive now is essential if the country is to pay its way. Much has, however, been done. Gross National Product per head is higher than in some European countries —Italy or Austria for instance—and Israel is rapidly approaching European economic standards generally. Indeed, Israel is in the state of an in-between country. By Middle Eastern standards, she is no longer a developing country. With an expansion rate of 10 per cent a year for the last 15 years, she has made great strides forward. Yet, by European standards, she is still not a developed country.

Israel has attracted considerable development capital from a great variety of sources, but particularly from Britain and America. Since 1959 some £180 million (484 million dollars) has flowed in from abroad, to which the Government has contributed another £60 million and £50 million has been raised by local interests.

Last year's balance of payments deficit was £16 million (44.8 million dollars). There is hope that tourism will bring in a substantial income, but the main source of income must be citrus fruits, which helped largely towards commodity exports of £120 (336 million dollars) last year, a 24 per cent rise.

Greek Farm Incomes Drive

The Greek Government expects farmers' gross incomes to rise by about one-fifth this year, following the introduction of a new support policy for wheat, tobacco and other basic crops. Greek agriculture, highly fragmented and engaging far too high a proportion of the population, is regarded as one of the poorest in Europe. The Government last week announced official guaranteed prices for wheat 10 per cent above those of last year. It has already made similar changes for most other important crops.

The Greek authorities claim that the extra budgetary cost of the new wheat price guarantees—about £1.2 million—will be saved. The small difference between the free market price and the new Government one, they say, will virtually abolish the clandestine threshing which has been a feature of rural life in recent years.

It is feared privately in Athens, however, that the Government in promising to buy the whole wheat crop at a fixed guaranteed price may have bitten off more than the Exchequer can chew. The current crop is estimated at more than 2 million tons—at least 500,000 tons more than Greece can possibly consume itself.

Help for Spanish Wheat Farmers

Spanish wheat farmers are to receive an average of £3 a metric ton more for their grain this season and have access to a £13.2 million Government fund for structural improvement. The average guaranteed producer price for 1963-64 was £36 16s. a ton. The new scheme, announced in a Government decree, is aimed partly at increasing productivity under a new long-term farm programme, partly at offsetting possible shortages this year.

Spain normally produces about 3.5 million tons of wheat annually, but for the last two years, contrary to most European experience, has had bumper crops. On fairly small increases of acreage, the harvest in both years exceeded 4.8 million tons. This season, however, two months of early drought have done a good deal of damage in the central and southern wheat-growing areas.

Spain was once as big a wheat exporter as France, selling more than 249,000 tons abroad in 1959. Since then, however, increasing home demand has brought annual exports down to a few thousand tons and there were no overseas shipments at all last year.

France Mounts Big Grain Export Drive

Almost certainly deprived of a unified common market for cereals until late next year, the Government and farmers of France are gearing themselves to a massive drive to export more of their mounting grain surplus. It is believed in Paris that this will mean much more extensive use of France's two-tier price system for grains—one price for the home market and another for exports. A common European price would probably have given French producers about £36 a ton for wheat; as it is, they get £33. This, together with the large size of the surplus for 1964-65 now being predicted, means that farmers will have to pay much more than usual in levies towards the cost of exporting. The levy operates to the extent that the harvest exceeds an official maximum of 7.5 million tons—likely to be beaten by a handsome margin in the coming season. But all the signs are that the producers are prepared to pay. There will be no harmonised Common Market prices to provide easier sales access to the important West German market, and minimum import prices are to be applied next month in Britain, where French grain shippers have long had high hopes, sometimes justified, of good business. Nonetheless they are determined to move back in force into these two markets if at all possible, and to find new ones as well.

The French Government, through its market investigators, is backing these efforts. At the same time, there is acute anxiety both in Paris and in the countryside to present an image of France as a responsible and reliable exporter. One of the ways of smoothing out violent fluctuations of exportable supplies is considered to be the improvement of storage facilities.

Encouraged by the authorities, the farmers' co-operatives are currently redoubling their efforts to build new grain drying plants and storage silos. In the last month or two, their white towers have sprung up in ever-increasing numbers in the main grain areas.

The 1964-65 grain surpluses themselves are expected to reach formidable proportions. There has been little or no spring frost damage, and rain and sun have been in just about the right proportions since Whitsun. Barring heavy rain in late August and September, everything points to a bumper harvest. French domestic demand for wheat over the next year is likely to be just over six million tons. Even allowing for a poorish harvest last year, average annual output since 1961 has already reached eight million tons.

But this year acreage down to wheat is about 20 per cent higher than last. Yields are rising with the Agriculture Ministry's campaign to get farmers to sow productive strains and the increased use of both chemical fertilisers and irrigation.

Taking all these factors into account, most analysts agree in putting total output for 1964-65 at about 13 million tons, of which three million will be retained for seed, feed and farmhouse milling. Of the 10 million tons remaining at least four million tons, possibly five million, will be available for export.

Topical Briefs

A convention to set up *Air Union*, the projected pool of airline companies in the Common Market, will be ready for signing before the end of next month. Recent discussions among representatives of the six Governments and seven airlines (France has two) have hammered out answers to questions on quota allocations of the traffic pool. One of the stumbling blocks was the trade with Africa which Sabena and the two French lines have. The three have now agreed to include this traffic in the pool. There still remains the question of K.L.M.'s South American traffic and "growth quotas" for Lufthansa and Alitalia. Another problem was the standardisation of flying material. This, it has been decided, should be left in the hands of a committee which will standardise the use of aircraft manufactured in the Common Market, but only subject to consideration of price and performance. This committee will now deal with all policy questions, including inter-company quotas and exchange of traffic rights with other countries.

Caravan makers in *Britain* hope to profit from the rise in popularity of caravanning in Europe. British exports, which were a mere 3,200 units in 1959 rose to 11,900 last year and there is every indication that this year will better that figure. The figure for the first two months of the year was well above the corresponding 1963 total. Exports now account for a quarter of total output, which just touched 44,000 last year. Most successful market has been the Netherlands, with some 3,000 caravans. It was followed by West Germany, 2,300, and Denmark, 1,800. The figure for Denmark compares with exports of five caravans in 1959. Greece and Portugal are also thought to be future lucrative markets. Continental buying habits are likely to be the same as the British: first, an interest in the smaller caravan; then a move into larger ones; finally, an interest in the large van to be left in one spot.

Britain's housewives now spend an average of just over 6s. a week on *tinned goods*, 12.5 per cent more than in 1958. A survey of spending habits showed that the largest proportion of weekly outlay on tinned goods went on fruit and fruit juice—22 per cent. Other main lines were milk, cream and soups, with 18 per cent, and vegetables and pasta, 15.3 per cent. Half the increase over the six years has been due to the rapidly rising popularity of tinned meat, on which average expenditure is almost 1s. a week. Most kinds of fish are also growing in popularity, except for sardines, which is declining. Two thirds of all housewives buy tinned fruit once a week, and 60 per cent buy peas and baked beans. The survey also showed, not surprisingly, that 60 per cent of all spending on tinned goods takes place on a Friday and Saturday. The survey is probably already slightly out of date as it was taken a year ago; then it showed that average weekly expenditure on 70 branded goods (tinned and non-tinned) was almost £1 13s., a rise of nine per cent on 1958. Most important items were cereals and bread, 30 per cent, and fats and beverages, both 15 per cent.

The *European Economic Community* has now decided on a timetable for Greek association. A two-stage plan has been prepared by the Council of Ministers for bringing Greek and Common Market agricultural policies into harmony. Greece has asked for a speedy harmonisation of agricultural policies instead of having to wait until the end of the 22-year transitional period provided under its association agreement. The first stage of the new plan foresees Greece applying the levies and other mechanisms of the common agricultural policy, but without implementing the Community's price regime. Under the second stage, Greece would progressively align her agricultural prices and protection levels on those prevailing in the Common Market and open her markets to Community farm exports. American agricultural assistance would probably have to be discontinued.

DOMESTIC ENQUIRIES

(*Concluded from page 20*)

orders, the workman should be supplied with copies of such proceedings and the orders passed, so that it may not be contended that his right of appeal was denied to him. "There is no doubt that, if a copy of the order of dismissal is not supplied to the workman, he may find it difficult to make an appeal in proper time. It would be improper conduct for the manager not to comply with the provision that a copy of the order should be supplied and, if, by reason of such conduct, the workman suffers injury, it will be for him to seek such remedy as may be available to him in law against the manager of the company. That, however, cannot be held to make the provision to supply a copy of the order a condition precedent to the validity of the order."[6]

Again, the Supreme Court in another recent case has addressed some words of caution to persons conducting such enquiries:

".... The court can take judicial notice of the fact that many industrial workers in India are illiterate and sometimes even the representatives of labour union may not be present to defend them. In such a case, to read over a prepared statement in a few minutes and then ask the workman to cross-examine would make a mockery of the opportunity that the rules of natural justice require that the workers should have to defend themselves. It seems, therefore, that, where one is dealing with domestic enquiries in industrial matters, the proper course for the management is to examine the witnesses from the beginning to the end in the presence of the workman at the enquiry itself. Oral examination always takes much longer time than a mere reading of a prepared statement of the same length and brings home the evidence more clearly to the person against whom the inquiry is being held.

"It is quite possible to have another method of conducting a domestic enquiry, as laid down in the decision in A.I.R. 1963, S.C. 375, but such should not be the rule but an exception only. Normally, where the witnesses are not examined from the very beginning at the enquiry in the presence of the person charged, the person charged should be given a copy of the statements made by the witnesses which are to be used at the enquiry well in advance before the enquiry begins (say, two days before the enquiry is to begin). Where this is not done and the concerned workmen were asked to cross-examine the witnesses then and there, it could not be said that the principle of natural justice, which requires that the person charged should have an adequate opportunity to defend himself, was observed."'

THE PRIVATE SECTOR AFTER NEHRU

MORE ALERTNESS REQUIRED IN REGARD TO ITS ROLE

By A Special Correspondent

ALTHOUGH Nehru was a staunch believer in socialism from his early days and, after he became Prime Minister, he followed a policy of rapid and vigorous expansion of the public sector, his attitude to the private sector was friendly and helpful. From 1947 until last year, he regularly inaugurated the annual sessions of the Federation of Indian Chambers of Commerce and Industry and exhorted the business community to increase the wealth and welfare of the country. No doubt, businessmen occasionally came in for his criticism. But this was due more to his lack of expert knowledge of economic problems.

For example, at a meeting in Delhi in March, 1960 Nehru said: "Far too much reliance on money being poured out of Government coffers into the private sector is not good. How does it remain a private sector, if it is run largely with Government's funds?" It was left to the then President of the Federation of Indian Chambers of Commerce and Industry to clarify the position and to point out that, in terms of the total investment in the private sector, the assistance extended by the official financial institutions was a small percentage; and that, though such assistance might be of great help to some of the units, taking the private sector as a whole, the total assistance was not of any serious magnitude. The Federation's President added that "even this small dependence on the financial institutions sponsored by the Government would not be there, if the fiscal policy had left adequate savings in the hands of the individuals."

Nehru was a great believer in enterprise. He once said, "I want enterprise. I want the enterprise of the individual who tries to climb up the Everest. I want the enterprise of a man who risks his life and who has full capacity to grow mentally and otherwise. I want that freedom, because I do believe in the freedom of the individual."

However, sometimes Nehru gave the impression that he did not favour the private sector to undertake big projects, because it would be led to concentration of economic power. He asked businessmen, "Why does not the private sector take charge of a million small enterprises in India?. . .No, it wants particularly some major enterprise not only because it is major but because it brings economic power in its train."

Although Nehru's attitude to the private sector sometimes appeared contradictory, the fact remains that, during the last seventeen years, it has been able to make an impressive contribution to India's economic progress. In 1960-61, about 95 per cent of the output of organised industries was in the private sector and its contribution to national income went up from 5.8 per cent in 1950-51 to 10.5 per cent in 1960-61. The private sector is responsible for developing a very large number of industries including cotton textiles, sugar, tea, cement, paper, engineering goods, chemicals and so on. The following statement shows the investment made by the private sector during the First, Second and Third Plans:

Investment by Private Sector during the Plans

(Rs. crores)

Heads of Development	First Plan (Actual)	Second Plan (Actual)	Third Plan (Estimated)
Agriculture	125	675	850
Power	50*	40	50
Transport	75	135	250
Village and small industries	450	225	325
Organised industry and mining	450	725§	1,100§
Housing and other construction	700	1,000	1,125
Miscellaneous, including inventories	200	500	600
Total	1,600†	3,300‡	4,300‡

* Including irrigation.
† F.I.C.C.I.'s estimate.
‡ Including transfers from public to the private sector.
§ Exclusive of investment for modernisation and replacement of about Rs. 150 crores.

It should be pointed out, however, that the Government, under Nehru's leadership, did not take the full advantage of the experience and talent of the private sector, because of ideological reasons. Sir Theodore Gregory, in his report to the Associated Chambers of Commerce in 1961, observed that the original attitude taken up by the State and the Planning authority towards the organised sector of the economy was "one of definite unfriendliness," that "its motives were suspect, its positive contribution to the economy was belittled, its future was to be restricted and its role was to be underestimated."

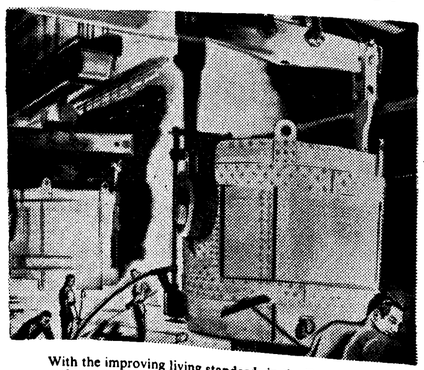
Mr. Eugene Black, a former President of the World Bank, wrote to the Finance Minister of India in 1958, "while I recognise that Government must play an important role in India's economic development, I have the distinct impression that the potentialities of the private sector are commonly underestimated in India and its operation is subjected to unnecessary restrictions." The Economic Survey of Asia and the Far East, issued by the United Nations in March, 1961, made the following comment: "In fact, the Government appear to be contented with the substantial performance by the private sector, even though that was lower than the potential maximum."

Mr. Lal Bahadur Shastri has indicated that his Government will broadly follow the policies laid down by Nehru. So far as the basic objective of a socialist pattern of society is concerned, there can hardly be any serious difference of opinion if all it means is that we should work for an increase in national income and for its fair and equitable distribution. If so, it is essential that the resources of the private sector should be most effectively utilised, so that not only will production increase steadily but the prices also can be brought down and employment stepped up. This will be possible only if the industrial policy and the fiscal policy are changed suitably. In particular, immediate measures should be taken to revive the climate for investment, so as to encourage the people to augment their savings and invest them for industrial development. The Finance Minister surely knows what to do but, unfortunately, he seems to hesitate to adopt the right course, because of political pressures. It should be emphasised that, in the interests of the Congress itself, it is not advisable to allow the present economic situation to continue. If prices do not come down and employment does not increase, it is difficult for the Congress Party to make the electorate enthusiastic about its victory in the general elections to be held after about two years.

The private sector should also be more alert in regard to its role. Not only should it continue to give of its best to the country but it should improve its public relations, so that the Government, legislators and the people will have a correct idea of its problems and achievements. For instance, soon after the Chinese aggression in October, 1962, the Federation of Indian Chambers of Commerce set up price vigilance committees in different parts of the country, but these, it appears, were disbanded after a few months. There is no doubt that business organisations can, by pressure and persuasion, do much to prevent a rise in prices, though effective steps in this direction can be taken only by the Government.

The future of the private sector in an underdeveloped country should normally be quite encouraging, since the public sector, even with the best efforts, cannot by itself do much to develop the economy in a big way and in a short time. In forming his Cabinet, Mr. Shastri has taken care to avoid the inclusion of leaders with extreme views. If the Prime Minister can also bring about appropriate changes in various aspects of economic policy solely from the point of view of stimulating the growth of the economy, without being influenced by ideological considerations, he will be rendering a most valuable service for improving the lot of the common man.

DEVELOPMENTS IN THE EAST



With the improving living standards in the East comes the prospect of trade expansion and of increasing opportunities for profitable marketing. The world-wide facilities of three great banking organizations, merged into a single comprehensive service, are at your disposal with up-to-date information and expert advice on all aspects of finance and trade in these areas.

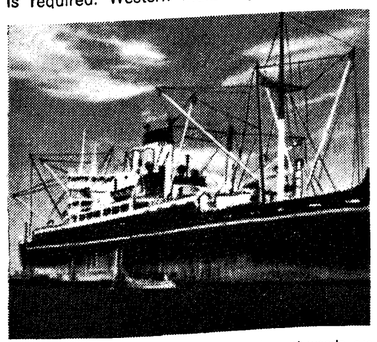
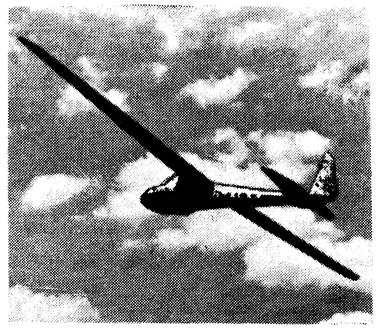
WESTERN INDIA PLYWOODS LIMITED
are the largest suppliers of marine plywoods in India

Different industries need different types of specialised plywoods. In ship-building, for instance, plywood processed to resist the rotting influence of moisture, salt water and destructive insects, is required. Western India Plywoods are the largest suppliers of such plywoods in India. ■ Western India Plywoods are, in fact, the largest manufacturers of processed woods in India. They make numerous varieties of plywoods to meet the industrial, architectural and defence needs of our country. They also manufacture 'WESTON' Hardboards, 'WIPEX' Paper laminates, Flushdoors and Block Boards.

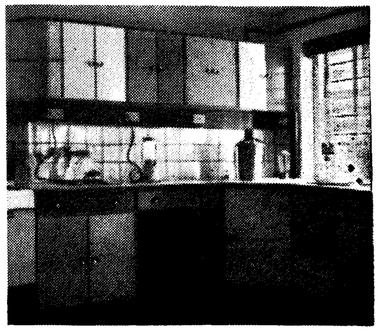
* * *



Specially processed 'Westindply' marine plywoods are unusually tough, resist the rotting influence of salt water and fungi.



Special aircraft plywoods engineered to meet the demands of lightness and strength, go into the gliders and other aircrafts built in India.



Chairs, table tops, panels, shelves, cup-boards, flooring—infinite is the scope of 'Westindply', 'Weston' and 'Wipex'.

ORISSA CEMENT LIMITED

CHAIRMAN, MR. J. DALMIA, HIGHLIGHTS PROBLEMS OF REFRACTORY INDUSTRY

IMPORTS CONTINUE DESPITE IDLE CAPACITY

ADDRESSING the Fourteenth Annual General Meeting of the Orissa Cement Limited at Rajgangpur (Orissa State) on Monday, 29th June 1964, the Chairman, Mr. J. Dalmia, pointed out that the setback to the working results of the Company had been due to a contraction in the demand for both silica and basic refractories. He highlighted the existence of idle capacity in the industry, in general, and argued that there was no scope for permitting any further increase in the capacity of the industry until the end of the fourth Plan. If any expansion were allowed, it would, he averred, lead to chaotic conditions in the industry, forcing some of the existing units to close down, with the unhappy consequences of unemployment, industrial unrest and a waste of rupee and foreign exchange resources already invested. He expressed concern over the paradox of continued imports of refractories from abroad in face of idle capacity in the home industry. He urged the Government to enforce a policy of restricting imports of refractories, until and unless it had been established that suitable indigenous material was not available. For the utilisation of idle capacity, the Chairman suggested that possibilities for exports of the products of this industry must be explored.

The following is the summary of the speech of the Chairman:

GENTLEMEN,

I welcome you to the 14th annual general meeting of your Company.

Although more than a month has passed since that fateful 27th day of May, we are still burdened with the sense of our heavy loss and great sorrow at the sad and sudden passing away of our great leader, Pandit Jawaharlal Nehru, who, as the first Prime Minister of India, has guided and shaped the destinies of our country since independence. His passing away has been mourned by the world at large for he was not only the architect of modern India but an acclaimed and accepted leader in the international sphere. His devotion to the ideals of peace and brotherhood of man stands out like a beacon to guide the path of mankind through the years ahead. Let us, in tribute to his memory, resolve to move forward together to achieve his dream of a peaceful, prosperous and united India.

The New Prime Minister

We are, indeed, fortunate that the leadership of our country is now in the hands of Shri Lal Bahadur Shastri, who took up the onerous burden of the Prime Ministership of the country on the 9th June. Shastriji, as he is commonly and affectionately known throughout the country, can best be described as the great commoner. Of humble birth, he has risen to the leadership of the nation. A conciliator and negotiator *par excellence*, he was relied upon by Pandit Jawaharlal Nehru in many a difficult situation. During his tenure as Home Minister, Shastriji amply demonstrated his acumen and firmness. His services to the nation and to the common man are too well known to need repetition. In his devotion to the ideals of the Father of the Nation, Mahatma Gandhi, handed down to him by Panditji, and his pragmatic approach to national and international problems, we must find hope again to move forward to the goal of a prosperous India and a peaceful world. In offering our respectful felicitations to Shastriji, let us also pledge ourselves to strive, each within his own sphere, to help in the immense task of nation building.

Your Company has suffered a grievous loss in the untimely death on the 27th of April 1964 of Mr. N. C. Roy, who was a member of your Board and had also served the Company as its Technical Advisor. In the course of his long association with our Organisation extending over 30 years, Mr. Roy had rendered dedicated service and was held in high esteem for his deep knowledge of the industries with which he was associated. He made valuable contributions to the work of various Technical Committees and the Panels on the cement and refractories industries set up by the Government of India. I was closely associated with Mr. N. C. Roy throughout his service with our organisation and his sad demise is a great personal loss to me. I am sure you will join me in placing on record our deep appreciation of his manifold services to the Company and expressing our heartfelt sympathies and condolences to the bereaved family.

Silica and Basic Refractories

The major reason for the setback to the working results has been the shrinkage in demand for both silica and basic refractories. Last year, I had warned against the creation of excess capacity in the refractory industry. My fears have come true and the despatches of silica and basic refractories have suffered during the year under review on account of lack of orders. Factors beyond the control of the producers, such as increases in the coal price, surcharge on railway freight etc., have resulted in increases in production costs of cement. The industry has reported the incidence of these various levies to the Government of India and has represented that the retention prices payable to the producers be increased but, it is regretted, that till date no decision has been taken by the Government. Compensatory increases in the retention prices in respect of actual increase in production cost due to Governmental action had been recommended by the Tariff Commission and agreed to by the Government. It is only fair that these assurances should be implemented and the increase in retention prices expedited.

Both in my address in June 1962 and last year, I had emphasised the need for a careful appraisal of the future demand for refractories for planning increase in the capacity of the industry. Last year, I also drew attention to the demand for refractories falling short of the growing capacity and consequent increase in idle capacity with the industry. The position has deteriorated further and the industry is faced with a crisis, which is likely to continue for sometime, due to its production capacity, existing and to be implemented by 1965-66, far exceeding the demand which until 1967-68, is unlikely to increase substantially over the 1963-64 requirements.

Installed Capacity

As derived from discussions at recent Refractories Panel meetings, the installed capacity of refractory industry (excluding mortars and dead-burnt magnesite) at the end of 1963 was 8,28,980 tonnes which, at the end of the years 1964 and 1965, will rise to 11,04,380 and 12,81,320 tonnes, respectively. Though additional capacity of 3,26,700 tonnes has been licensed, I am not taking that into consideration for presenting the present plight of the industry, as foreign exchange has not yet been provided for it. The expansion of refractories industry, just mentioned by me, was planned and is being implemented on the basis of annual production target of 10 million tonnes of the steel ingots by the end of the third Five-year Plan. According to the revised forecast, this target can be achieved only by 1967-68, and ingot steel production for the earlier years is estimated at 5.92, 6.32 and 7.16 million tonnes for 1963-64, 1964-65 and 1965-66, respectively.

Based on steel production of 6 million tonnes during 1964-65 and 7 million tonnes during 1965-66, estimated demand of refractories—firebricks, silica bricks and basic bricks—during these two years will be about 56 per cent and 54 per cent respectively, of the capacity available with the industry. This confirms my forecast last year that by 1964-65 about 50 per cent of the industry's capacity would be idle. These figures are based on consumption pattern in 1963. With the introduction of an all basic open hearth furnace, the consumption of silica refractories has steadily declined and before long the steel industry may consume very little silica bricks, except for the construction of new coke oven batteries. The capacity released will of course be available for the production of other products. But with the switch over to all basic construction and with the supply of increasingly better quality materials, as well as greater operational experience by the steel industry, the consumption of refractories has shown and will show a marked downward trend. As against the estimated overall consumption of refractories at the end of the second Five-year Plan of 90 kg. per ingot tonne for open hearth process using silica roof, the present official estimation is only 57 kg. per ingot tonne, comprising 35 kg. for firebricks, 14 kg. for basic and 8 kg. for silica. The corresponding consumption figures for highly advanced steel producing countries are now approximately 7.5 kg., 7.3 kg. and 2.8 kg. per ingot tonne, respectively. The steel industry will no doubt make efforts to reduce the consumption further due to the emphasis by the Government on cost reduction. This trend cannot, therefore, be ignored by the refractory industry in the planning for its future growth. When these factors are taken into consideration, it is conceivable that the refractory industry may find itself with well over half of its capacity idle by the end of the third Five-year Plan.

Production Pattern

According to the data furnished to the Panel on Refractories the production pattern in regard to the target of 18 million tonnes of steel by 1970-71 will be—open hearth 7.35, L.D. 9.70 and electric steel 1 million tonnes, respectively. Thus, ingot steel production by open hearth process by 1970-71 will be only little more than the anticipated production by this process at the end of 1965-66, and bulk of the additional steel production, when the 18 million tonnes target for 1970-71 is achieved, would be by L.D. process in which dolomite replaces conventional refractories to a large extent. As such, growth of the demand for refractories in relation to the growth of the steel industry will be at a much lower rate than hitherto. In regard to rate of consumption of refractories for the conventional open hearth process and electric steel process, there is divergence of opinion even within the steel industry, and the studies by the Indian Refractory Makers Association support the view of those who hold that the consumption will be very much less than that put forward by the protagonists of high consumption. This divergence has been reflected in the discussions of the Refractories Panel where a clear picture has not emerged partly due to want of adequate data from some of the steel plants. We hope they will furnish the required data for which they have been requested.

Firebricks

At a recent meeting of the Refractories Panel, revised firebricks consumption at a level of 18 million tonnes of steel production has been placed at 8,61,600 tonnes which, according to the industry, is very much on the higher side. The requirement for repairs for blast furnaces has been placed at too high a figure, while the future offtake of firebricks by non-steel consumers is likely to be around one-fourth of the total consumption instead of one-third. A more correct estimate would, thus, be 7,26,000 tonnes. By the adoption of continuous casting process by the steel industry and the repairing of the entire blast furnace linings by gunning and not by shaped and fired bricks, the consumption of firebricks will fall further substantially. By 1966, the industry will have a capacity to produce over 10 lakh tonnes of firebricks, which will be sufficient to cover the demand for such refractories even when the steel production target of 18 million tonnes is achieved. I would refer here to what has been described as steel plant quality brick to support the contention that the entire capacity of the industry is not suitable for the manufacture of refractories for the steel plants. Not all refractories indented by the steel plants are of this quality as at least one-third of the total indent by a steel plant is of IS 6 and IS 8 variety which are being made by almost every firebrick maker in the country. The remaining demand for high quality bricks can easily by catered to by the major refractory works. The conclusion is inescapable; there is no deficit of firebrick production, nor will there be in 1970-71, when the steel production capacity of 18 million tonnes is targetted for. On the contrary, there may still be even an excess capacity of nearly 2 lakh tonnes.

In the case of basic refractories the issue is even more controversial. At the meeting of the Refractories Panel in March last, a total figure of 1,36,103 tonnes of basic bricks was arrived at for a level of steel production of 18 million tonnes according to open hearth, L.D. and electric steel processes. This figure has been questioned not only by the Indian Refractory Makers Association but by some of the steel producers as being unnecessarily high. As indicated by various steel plants, their consumption of basic bricks by open hearth process per million tonnes of ingot steel is—Rourkela, 6,000, T.I.S.Co. 7,270, I.I.S.Co. 9,090, Durgapur 12,100 and Bhilai 20,000 tonnes. An average consumption rate of 13 kg. per tonne was derived from these figures, which, however, does not give a true picture as four out of the five plants show substantially less consumption and their average comes to about 8.5 kg. per tonne. The corresponding consumption figures by major steel producing countries in the world ranges from 4 kg. to 9 kg. per tonne. Bhilai Steel plant has been requested to furnish details for such a high consumption of refractories in their modern plant for proper assessment of their future requirements.

It is felt that, if this question is examined properly, the consumption rate of basic bricks at Bhilai would not be more than at Durgapur, that is, 12,000 tonnes per million tonnes of ingot steel, which would reduce the total requirement of basic refractories for the open hearth process plant by 20,000 tonnes on Bhilai's projected capacity of 2.5 million tonnes of ingot steel. For the manufacture of electric steel, the Panel assumed tentatively a consumption rate of 10 kg. of basic bricks per tonne of steel. The consumption pattern of existing smaller electric furnace steel units is very much less than this. The authoritative figure of basic brick consumption in electric furnaces given by Debenham of U.S. Steel is only 5 kg. per tonne. As the new and large electric steel furnaces which are to be put up for the production of one million tonnes of electric steel will doubtless incorporate the latest technological improvements, it would be safe to assess the consumption of basic refractories for such production at 5 kg. per tonne of steel.

Consumption

Furthermore, in the total figure of basic bricks consumption, arrived at tentatively by the Refractories Panel, there is a provision of 10 per cent of the total consumption of basic bricks by the steel industry for other consumers. In 1963 only about 3.5 per cent of the total despatches of basic bricks went to consumers other than the steel plants. With the doubling of the production of basic bricks over the 1963 level, the percentage of supplies to other consumers as against those to the steel plants will fall further and it would be more than adequate if a provision of 3 per cent for other consumers is made instead of 10 per cent. After allowing for these three factors, the total requirement for basic bricks by 1970-71 is placed around 101,700 tonnes, about 30 per cent less than that arrived at by the Refractories Panel. By 1966, the industry will have a capacity of 135,000 tonnes for basic bricks which would be more than adequate to cater to this demand particularly when allowance is made for further reduction in the rate of consumption of basic refractories due to further improvements in the quality of indigenous refractories and due to the increasing experience in steel technology which the Indian steel industry will doubtless have. Introduction of the "gunning" process for repairing of open hearth furnaces instead of by relining with shaped bricks will also reduce basic brick consumption.

I have referred earlier to the virtual elimination of silica refractories by the steel industry in future. The silica bricks capacity, a great part of which is already idle, would be available for switching over to basic brick manufacture, should that be necessary. There is, therefore, already a substantial built-in reserve available to the industry for further production of basic refractories without having to seek any extension in its capacity.

I, therefore, submit that, for the reasons stated earlier, the third Plan target for the refractory industry should be considered as having been converted into the fourth Plan target to cater for an 18 million tonnes steel industry. Any further expansion of this industry, therefore, cannot be justified at present and, if created, must lead to chaotic conditions, forcing some of the existing units to the wall, with the unhappy consequences of unemployment, industrial unrest and waste of rupee and foreign exchange resources already employed. I believe that Government would be glad to utilise the country's limited financial, material, and trained man-power resources in other sensitive sectors of the economy, instead of permitting further expansion in an industry where such expansion is not only unnecessary but would be injurious to the industry itself. It is pertinent to add here that, whereas a new steel plant takes five to six years to go into operation, much can be accomplished by the refractory industry within a short space of time and at a fractional cost. If, therefore, it is found that, for any reason, the demand for refractories is likely to exceed the forecasts made, additional capacity, as required, can be created well in time to meet the additional demand. This is, therefore, another reason why any proposals for further major expansions of the industry should be deferred for some years, until it can be definitely established, by a pragmatic approach to the problem, that there are reasons justifying creation of further capacity.

A Paradox

It is a paradox that, while the industry today is burdened with idle capacity, imports of refractories of the type manufactured in the country have been continuing, generally in the guise of package deals, even though Government have informed the Indian Refractory Makers' Association in June 1963 that imports of such refractories would be allowed only after very careful screening. I would like to refer here to the recommendations of the Rao Committee on the "Utilisation of External Assistance" and Government's decisions thereon. Two of these recommendations which have been accepted are likely to increase the imports of refractories as items of major plants and particularly by the public sector projects. I would earnestly appeal to Government to ensure that, in the implementation of these recommendations, the policy restricting the imports of refractories should be strictly enforced, until and unless it has been established, in consultation with the industry, that suitable material is not available indigenously.

Exports of Refractories

With idle capacity as discussed by me, the refractory industry must explore possibilities for export. Your Company is alive to this need and, at the invitation of the Government of India, is participating in the New York World Fair as one of the two exhibitors from India of silica and fireclay refractories and the sole exhibitor of basic refractories. During 1963, the Indian Refractory Makers' Association had suggested to the Government of India to include refractories in all their trade agreements with other countries and in their trade journals as one of the main commodities which can be exported in accordance with international standards. Africa, Middle East and South East Asia should be natural outlets, but, unfortunately, ocean freight rates discriminate unfavourably against Indian exports. The Association is collecting data regarding the ocean freight rates in comparison to those from European and Japanese ports and will shortly submit to Government their recommendations to enable the Indian refractory industry to meet competition more effectively.

I had referred last year to your Company having developed the manufacture of certain special types of refractories such as silica coke

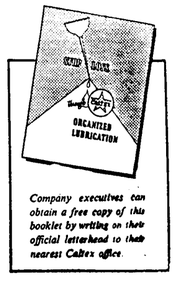
Keep Production rolling with Caltex "STOP LOSS" programme

When a machine bearing fails, it's not the cost of replacement that's expensive, it's the lost production. A Caltex "Stop Loss" Programme can virtually eliminate the most common cause of bearing failure—improper lubrication.

HOW "STOP LOSS" WORKS: Caltex Lubrication Engineers help you set up a fool-proof system of lubrication control. From woodyard to shipping platform, they see to it that every piece of equipment gets the right amount of the right lubricant at the right time. The results: maintenance costs down as much as 15%, number of major lubricants required reduced to as few as six, purchasing simplified.

Production is worth a lot of money—keep it rolling with Caltex "Stop Loss" Programme.



Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex office.

RESULTS OF SHAW WALLACE EXCELLENT

SHAREHOLDERS GET MORE

THE working results of the Shaw Wallace and Company Ltd. (Chairman: Mr. C. M. A. Bathurst, Calcutta) for the year ended 31st December 1963 are in refreshing contrast to those for the preceding year. Improvement is discernible in almost every item from sales to the net profit, but the more heartening feature is the dividend which is up by five points to 12.5 per cent. At their improved level, the results are, of course, as yet no match to those achieved during 1960—the best year so far—considering the vast increase in sale proceeds over that year, for expenses have risen during the intervening period. Thus, whereas turnover during the year under review shows an advance of about Rs. 3 crores as compared with 1960, expenses are up by over Rs. two crores and the excise duty has more than trebled.

Thanks to the higher output recorded by almost all the manufacturing units of the Company and improved sales of fertilisers, gross sale proceeds have risen further to Rs. 10.41 crores from Rs. 9.63 crores a year ago. Although expenses have continued to rise as a result of the inflationary tendencies in the economy, the gross profit has expanded handsomely from Rs. 55 lakhs to Rs. 64.10 lakhs. The profit margin (ratio of gross profit to sales) has, therefore, improved by almost one point to 6.6 per cent. In consonance with the higher gross profit, the provision for taxation has gone up from Rs. 23.13 lakhs to Rs. 34.19 lakhs, while that for depreciation is lower at Rs. 10.91 lakhs, as compared with Rs. 12.35 lakhs a year ago. The resulting net profit of Rs. 24 lakhs compares very favourably with the Rs. 19.52 lakhs earned in the preceding year. Adding to this the Rs. 5.57 lakhs brought in, the Directors have transferred Rs. 13.90 lakhs to reserves and set aside Rs. 3.75 lakhs for payment of preference dividend in respect of the year. The enlarged ordinary dividend of 12.5 per cent (subject to deduction of tax) claims Rs. 9.37 lakhs and leaves Rs. 3.56 lakhs to be carried forward, as against the Rs. 5.57 lakhs brought in.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st December			
	1963	1962	1961	1960
Sales	10,40.69	963.40	907.52	759.18
Agency and other commission and allowances	53.21	56.78	51.39	55.08
Other income	16.80	15.27	14.75	16.93
Closing stocks	155.54	148.92	201.74	173.90
Excise duty	98.94	71.95	55.25	30.92
Other expenses	949.28	855.68	859.65	736.55
Gross profit	69.10	55.00	59.80	68.49
Provision for—				
Depreciation	10.91	12.35	12.02	12.36
Taxation	34.19	23.13	22.50	25.76
Net profit	24.00	19.52	25.28	30.37
To reserves	13.90	13.55	1.20	11.58
Dividends—				
Preference	3.75	3.75	4.00	4.00
Ordinary	9.37 (12.5%)	5.62 (7.5%)	11.25 (15%)	11.25 (15%)
Carry forward	3.56	5.57	8.97	5.14
Market price of ordinary shares (in rupees)	1964	1963	1962	1961	1960
High	17.69	24.00	24.00	26.62	26.62
Low	15.25	14.50	14.75	21.87	19.25

The Company's own funds as at 31st December 1963 aggregate Rs. 223.11 lakhs, made up of Rs. 75 lakhs in preference shares of Rs. 100 each, an equal amount in ordinary shares of Rs. 10 each, and the balance of Rs. 73.11 lakhs as reserves and surplus. As against this, the outside interest is as high as Rs. 546.26 lakhs, comprising Rs. 309.76 lakhs as borrowings and Rs. 236.50 lakhs as current liabilities and provisions. This is covered partly by current assets and loans and advances amounting to Rs. 497.22 lakhs and partly by investments, mostly in subsidiaries, carried in the books at a cost of Rs. 175.17 lakhs. The written down value of fixed assets is Rs. 96.98 lakhs, whereas the block account is Rs. 167 lakhs, inclusive of Rs. 6.05 lakhs representing the cost of additions made during the year.

Although the widespread shortage of credit facilities in the rural sector of the economy continued to inhibit more rapid growth in the use of fertilisers, the offtake was the highest on the Company's record and a total quantity of 187,762 tonnes could be sold, as against 178,888 tonnes in 1962 and 183,464 tonnes in 1961. In South India, the sale of products showed a rise of 25 per cent over the previous year, but, in North East India, there was a setback in sales, due largely to inadequate profit margins permitted to certain State Governments. It will be recalled that the Company was issued a licence for the manufacture of fertilisers at Mangalore and it was its intention to manufacture on the basis of 100,000 tonnes of nitrogen per annum in collaboration with a suitable foreign firm which would be interested in providing equity as well technical know-how. Unfortunately, the Company's efforts to find a suitable foreign collaborator have failed and it has, therefore, been forced to advise the Government that it is no longer interested in the venture. The Directors however, inform that this does not mean the end of the Company's efforts to enter the field of manufacture of nitrogenous fertilisers and that other projects are at present under consideration.

The setback suffered by the superphosphate and sulphuric acid factory in the previous year owing to an unfortunate breakdown early in that year proved as anticipated, shortlived and the output of sulphuric acid advanced from 25,139 tonnes to 26,385 tonnes and that of superphosphate from 67,605 tonnes to 69,943 tonnes. It is heartening to note that the levels reached during the year under review exceed those attained in 1961 by a fair margin. Although the entire production of superphosphate could be sold during the year itself, conditions are not likely to be as favourable during the current year due to the fact that two new units of production have recently begun manufacture and there is, therefore, likely to be increased competition which may have its effect on sales until demand once again catches up with productive capacity. On the side of agro-chemicals, the arrangements to sell insecticides and fungicides produced by Tata-Fison Ltd. came to an end, but the Company has recently completed negotiations to sell the products of Sandoz (India) Ltd. and Flintrock Products Pvt. Ltd. which will provide the Company with a comprehensive range of agro-chemicals products to sell on an all-India basis.

The profits earned by both the Madras Sprayer factory and the Sprayer organisation at Calcutta were satisfactory. Approval has been received from the Government to enter into collaboration with the Micron Sprayers Ltd. of the U. K. for the manufacture of power sprayers and it is hoped that this will be in market during the second half of the current year. Production of glue at the Madras factory beat pervious records, the actual output advancing from 7,544 quintals to 9,000 quintals. Higher output and a noticeable improvement in quality led to profit margins exceeding all previous levels. At the distillery at Calcutta, the new distil, which was installed in the middle of 1962, worked throughout the year at maximum capacity and a substantial increase of 44 per cent in production was achieved. The total production was easily disposed of during the year and possibilities of expanding production further are being examined. Production at the Tinplate Company of India Ltd. during 1963 was 84,107 tonnes, thus maintaining the upward trend for the fifth year in succession. The Company has an industrial licence for modernisation and expansion and it is hoped that, during the current year, plans will be finalised to increase production by 80,000 tonnes per annum of cold reduced tinplate and the expanded production should be available by 1967. The Indian Yeast Company Ltd. has at last come on to a revenue earning basis, though it will be some time before it will be able to make a contribution to profits, as the accumulated loss has not yet been made good. Sales during the year doubled as compared with 1962 and measures to increase output to cater to the enlarged demand are well under way.

While the world production of tea during 1963 almost equalled that of the previous year, there was a further shortfall of 14 million lbs. in the North East Indian crop. But the total crop produced by the two tea companies under the Company's management recorded a small increase from 329,783 maunds to 334,280 maunds.

Prices obtained, however, were disappointing, in keeping with the general trend of the world market, and earnings showed a material reduction over the previous year. The coal companies achieved further success in operations and raising improved from 22.81 lakh tonnes to 25.52 lakh tonnes, an increase of over 10 per cent. The flour companies have another satisfactory year, with production reaching a fresh record level of 59,454 tonnes, as against 55,402 tonnes previously. Profit margins, unfortunately, continued to be disappointing.

Commenting on the prospects for the current year, the Chairman observes that the Company had a good year in 1963 and, so far, 1964 shows good progress. It is the intention of the Company, he says, to expand and develop the traditional activities rather than diversify, and this policy will enable the Company to utilise to the full the considerable experience and know-how of the staff for both production and sale.

The Rs. 10 paid ordinary shares are now available at Rs. 15.69 *cum-div.* and fetch a net return of over 6.8 per cent per annum on an *ex-div.* price.

SWADESHI MILLS' GROSS PROFIT BETTER

Thanks to the satisfactory working of its units despite the stresses and strains to which the textile industry has been put, the Swadeshi Cotton Mills Company Ltd. (Chairman: Mr. Mungturam Jaipuria, Kanpur) has been able to recover, during the year ended 31st December 1963, a major portion of the ground lost during the preceding year. The turnover has advanced by Rs. 3.21 crores, or over 27.6 per cent, to Rs. 14.83 crores and the gross profit has risen, though less markedly, from Rs. 81.84 lakhs to Rs. 87 lakhs. A more encouraging feature of the year's working is that closing stocks of finished goods, which had been showing a rise ever since 1960 and which had reached the peak level of Rs. 191.25 lakhs as at the close of 1962, have declined heavily to Rs. 44.56 lakhs. If in spite of these improvements the profit-margin (ratio of gross profit to sale) shows a decline of 1.1 point to 5.9 per cent, it is because of the continuing upward thrust of cost of production.

It will be observed from the comparative table below that two items of expenses which do not vary directly with production, namely, staff expenses and other expenses have risen quite markedly, the former by Rs. 17.13 lakhs to Rs. 237.91 lakhs and the latter by Rs. 6.16 lakhs to Rs. 141.45 lakhs. These apart, the provision for depreciation is also higher by Rs. 13.38 lakhs to Rs. 54.74 lakhs and since this has lowered the taxable profit to Rs. 32.26 lakhs from Rs. 40.48 lakhs for the previous year, the provision for taxation has been reduced from Rs. 19.00 lakhs to Rs. 12.56 lakhs. Unfortunately, this reduction has not helped matters much and the resulting net profit is, therefore, down by Rs. 1.78 lakh from Rs. 21.48 lakhs for the year before. Adding to this Rs. 9.16 lakhs brought forward from the previous year, Rs. 0.41 lakh as income relating to prior year, and Rs. 7.74 lakhs withdrawn from reserves and provisions, the Directors have appropriated Rs. 10.60 lakhs (Rs. 13.15 lakhs) towards writing off expenses relating to prior years and have credited Rs. 9.30 lakhs (Rs. 6.60 lakhs) to the development rebate reserve. They have utilised a sum of Rs. 3 lakhs for the payment of preference dividends and have declared a dividend of 5.71 per cent on the preferred ordinary shares. No dividend has again been recommended for the ordinary shares. The aforesaid appropriations leave a much reduced carry forward of Rs. 5.11 lakhs, as against Rs. 9.16 lakhs brought in.

The vicissitudes in the fortunes of the Company during the past four years are well reflected in the following table:

(In lakhs of rupees)

	For the year ended 31st December			
	1963	1962	1961	1960
Sale of goods ..	14,82.87	11,62.45	964.94	10,77.50

N.A.—Not available.

During the year under review, the Kanpur mills of the Company had to face closure for about a week on account of non-supply of power. There was also intermittent labour unrest resulting in partial strikes and cessation of work by the workmen due to a number of problems arising out of interpretation and implementation of Dr. Sampurnanand's Award which, according to the Directors, not only complicated the working but also imposed recurring liabilities on account of retirement gratuities and additional paid holidays. The award, however, has been helping the gradual introduction of rationalisation of work and increased number of working days.

The working of the Naini mills continued to be satisfactory, in spite of a further increase in the cost of production due to higher wages, higher prices of stores and spare parts and raw materials. The excise duty on staple fibre also increased with the imposition of a surcharge of 33¼ per cent with effect from 1st March 1963. The industry's request for a suitable adjustment in the selling price of staple fibre was, however, not conceded till November 1963. With effect from 1st January 1964, the price regulation scheme introduced by the Indian Cotton Mills' Federation in respect of staple yarn has been discontinued and the surcharge of 33¼ per cent has also been lowered to 15 per cent. Conditions on the labour front, however, deteriorated in the early months of the current year and the mills experienced considerable labour trouble owing to inter-union rivalries. This affected production and a considerable number of spindles remained idle for some weeks. As regards the setting up of a new mill at Naini, consisting of 25,000 spindles for cotton yarn, the Directors say that 9,240 spindles have already been installed and a further 3,960 spindles will be installed soon. An order for a further 6,300 spindles are expected to be delivered and installed during the current year. This means that, out of the licensed number of 25,000 spindles, 19,500 will have been installed by the end of the current year.

The mills at Udaipur achieved gratifying results during 1963. The capacity of this unit was brought to 18,000 spindles and steps are being taken to install and commission additional 6,160 spindles for which a licence has been received. Unfortunately, the working of the Pondicherry mills did not show much improvement due to continued rise in cost of production and the continuance of the voluntary price regulation scheme. The unit, however, executed considerable orders for export and for supply to defence departments on marginal profits. An order for a complete mineral khaki dyeing plant was placed during the year and expectations are that it will be installed and commissioned in the current year.

There has been no change in the paid-up share capital of the Company which stands at Rs. 210 lakhs comprising of Rs. 35 lakhs in cumulative preference shares of Rs. 100 each, Rs. 17.50 lakhs in ordinary shares and Rs. 157.50 lakhs in preferred ordinary shares both of Rs. 10 each. The reserve complement has, however, declined marginally to Rs. 289 lakhs and so have borrowings and current liabilities and provisions, the former by as much as Rs. 133.47 lakhs to Rs. 414.43 lakhs and the latter by Rs. 5.08 lakhs to Rs. 272.97 lakhs. On the assets side, current assets and loans and advances have contracted from Rs. 612.51 lakhs to Rs. 463.97 lakhs and so also investments at book value fractionally from Rs. 195.80 lakhs to Rs. 195.55 lakhs. The blck acoount, on the other hand, has risen to Rs. 881.38 lakh[illegible] of the additions [illegible]

the year under review mostly to Naini and Udaipur mills. On deducting the amount of depreciation provided so far, the net block works out to Rs. 526.88 lakhs.

COLOUR-CHEM DOES VERY WELL

A pleasant outcome of Colour-Chem Ltd.'s (Chairman: Mr. Ramniwas Rr. Ruia, Bombay) highly impressive performance showing a pretty sharp rise in sales from Rs. 274.62 lakhs to Rs. 411.28 lakhs and also in gross profit from Rs. 122.43 lakhs to Rs. 169.37 lakhs during the year ended 31st March 1964 is a four-point increase to 16 per cent per annum in the dividend on the 100-rupee equity shares. The dividend aggregating Rs. 20 lakhs is to be paid entirely out of the special reserve comprising tax-free profits, to which Rs. 19.28 lakhs, expected to be exempt from tax under Section 84 of the Income-tax Act, 1961, have been transferred out of the year's profit. Thus, once again, the entire dividend is free of tax.

The improvement of Rs. 47 lakhs in gross profit has been reduced to less than half at the level of net profit which shows an increase of roughly Rs. 22 lakhs from Rs. 47.35 lakhs to Rs. 69.51 lakhs, because the tax provision has shot up from Rs. 64.29 lakhs to Rs. 90.50 lakhs. The year's tax provision includes Rs. 19.82 lakhs for sur-tax, which is higher as compared with Rs. 14.78 lakhs provided for S.P.T. in the previous year. While the dividend absorbs Rs. 5 lakhs more at Rs. 20 lakhs, the net amount retained in business (after allowing transfer from reserves and provisions) is slightly higher at Rs. 49.37 lakhs as compared with Rs. 48.25 lakhs a year before. The surplus carried forward is Rs. 16,332, as against Rs. 1,134 brought in.

The following table brings out the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sale proceeds	411.28	274.62	236.04	112.05

Low	310.00	300.00	316.25	287.75

* Paid fully from special reserve (except for 1961-62, when only upto Rs. 11.50 lakhs, or Rs. 9.20 per share) to which is transferred the tax-free profit of the respective year.
† To the extent it is paid from special reserve, it is tax-free.

Good demand for the Company's products has enabled sales to keep pace with satisfactory production during the year. Since the close of the year, both production and sales have remained satisfactory. The total duty payable on all the Company's products during the current year is likely to be around Rs. 50 lakhs following the increase in the excise duty on pigment emulsions and the imposition of a 24 per cent *ad valorem* duty on binder materials in the last budget. This burden is, however, being shared with the Company's customers.

The phthalocyanine blue project which was expected to commence regular production after the installation of the sulphuric acid reconcentration plant last October has not been commissioned because indigenous components of the sulphuric acid reconcentration plant have not been received. But efforts are being made to expedite the delivery of these components and start the manufacture of phthalocyanine blue as early as possible. Further plans to produce other new products are being finalised with the foreign collaborators. Sales for purchasing additional land adjacent to the Company's factory are being prepared.

The Company's paid-up capital which is unchanged at Rs. 125 lakhs is backed by reserves and surplus (excluding Rs. 20 lakhs required for the year's dividend liability) amounting to Rs. 144.80 lakhs. Current liabilities and provisions (including the year's dividend liability) work out to Rs. 182.78 lakhs and are quite adequately covered by current assets, loans and advances shown at Rs. 324.39 lakhs. The gross block which has grown during the year from Rs. 147.10 lakhs to Rs. 171.94 lakhs has been written down to Rs. 128.19 lakhs.

The Rs. 100 fully paid ordinary shares of the Company fetch a net yield of 4.6 per cent per annum at their current market value of Rs. 363.75 *cum-div.*

AMBIKA SILK MILLS

The Directors of the Ambika Silk Mills Company Ltd. (Managing Agents: Messrs. Maganlal Bhagwandas and Company, Bombay) write in their report for 1963 that the milestone in the life of the Company, namely, the completion of 25 years of its existence on 11th January 1964, was appropriately celebrated by issuing concessional cloth sales cards to the shareholders. But the Directors have not been able to repeat the 1962 dividend of 20 per cent in 1963 the rate for which, after including 2.5 per cent silver jubilee payment, is 15 per cent per annum on the 100-rupee shares, because tax has eaten into gross profit to the extent of 60 per cent against 55 in the previous year. Whereas the replacement of S.P.T. by Sur-tax has reduced the liability from Rs. 4.33 lakhs under the former to Rs. 2.95 lakhs under the latter, the normal tax liability has gone up from Rs. 12.98 lakhs to Rs. 17.40 lakhs raising the total tax provision by Rs. 3.04 lakhs to Rs. 20.35 lakhs. The higher normal tax provision is explained by both the improved gross profit of Rs. 33.97 lakhs as compared with Rs. 31.35 lakhs a year before and the reduced credit for development rebate as evidenced by the transfer of a lower sum of Rs. 27,150 as compared with Rs. 42,000 in the previous year to that reserve.

The dividend is payable on the capital which has increased during the year from Rs. 20 lakhs to Rs. 25 lakhs. But that would have presented no hitch in maintaining the dividend had the tax liability not gone up to the extent of reducing net profit by Rs. 1.25 lakh to Rs. 6.95 lakhs. While the dividend is lower, the amount carried to reserves is higher by roughly Rs. 30,000 at Rs. 4.22 lakhs and the carry forward is Rs. 21,367, as against Rs. 26,452 brought in from the previous year. Before concluding the review of the year's financial results, it may be pointed out that, whereas, reflecting the rising popularity of the Company's quality products, sales have improved by Rs. 43.30 lakhs to Rs. 231.40 lakhs, the gross profit has moved up by only Rs. 2.62 lakhs to Rs. 33.97 lakhs because of an all-round increase in costs. This failure of gross profit to keep pace with sales is yet another factor explaining the Directors' inability to cheer investors in the silver jubilee year.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st December			
	1963	1962	1961	1960
Sales, less excise..	231.40	188.10	126.80	112.50

Low	275.00	220.00	160.00	131.25	..

Addressing the Company's shareholders at their 25th annual general meeting at Bombay on 22nd June last, the Chairman, Mr. Ravindra Maganlal, said that the raising of the corporate taxation of the closely held manufacturing concerns from 50 per cent to 60 per cent was, to say the least, to ignore their contribution to the development of the country. The Company's total tax, he added, worked out to 75 per cent.

Giving some idea of the Company's modernisation and renovation programmes, which, he said, had become a continuous process, Mr. Maganlal told the shareholders that, during the year under review, additions to machinery had been to the tune of Rs. 5.95 lakhs and that further orders for Rs. 8.72 lakhs had already been placed. The new machinery, he added, would positively go a long way towards improving the economic working and profitability of the Company.

The increase in the Company's paid-up capital from Rs. 20 lakhs to Rs. 25 lakhs has been brought about by the issue of 5,000 right shares at par. Together with Rs. 22.17 lakhs in reserves and surplus (excluding Rs. 3.75 lakhs required for meeting the year's dividend liability as appropriated to general reserve out of the year's profit) the "own" funds amount to Rs. 47.17 lakhs, as against which the gross block of Rs. 57.14 lakhs (Rs. 50.46 lakhs a year before) has been written down to Rs. 23.13 lakhs. Current assets, book debts and investments amounting to Rs. 137.77 lakhs exceed the total short-term indebtedness of Rs. 113.84 lakhs comprising borrowings of Rs. 55.02 lakhs and current liabilities and provisions (including the year's dividend liability) of Rs. 58.82 lakhs.

Currently quoted at Rs. 284 *cum-div.*, the Rs. 100 fully paid ordinary shares of the Company offer a net yield of 4.2 per cent per annum.

NEW GREAT INSURANCE CO., LTD.

A small rise in net premium and underwriting profit is disclosed by the statement of accounts of the New Great Insurance Co., Ltd. (General Manager: Mr. M. G. Mody, Baroda) for the year ended 31st December 1963. The combined net premium in the fire, marine and miscellaneous departments increased from Rs. 1.19 crore in 1962 to Rs. 1.34 crore during the year under review. The net underwriting profit was higher at Rs. 5.06 lakhs, as against Rs. 4.60 lakhs in the previous year. Net profit after taxes, however, was a shade lower at Rs. 3.37 lakhs, as against Rs. 3.42 lakhs in 1962. The Directors have, however, proposed to maintain the dividend at last year's level of Rs. 3 per share of Rs. 20 paid-up, that is, 15 per cent. The following table summarises the working results of the Company during 1963, as compared with those of the two previous years:

(In lakhs of rupees)

	Year ended 31st December		
	1963	1962	1961
Fire :			
Net Premium	63.83	60.47	50.61
Claims	31.01	22.31	22.41
Commission, expenses, etc. ..	23.93	20.23	20.22
Underwriting profit or loss(+) ..	+7.85	9.28	4.16
Fire Fund	31.92	30.24	25.31
Marine :			
Net Premium	20.76	16.99	14.86
Claims	14.85	15.23	14.31
Commission, expenses, etc. ..	4.83	3.58	2.69
Underwriting profit or loss(+) ..	—2.33	—3.64	+2.92
Marine Fund	20.76	16.99	14.86
Miscellaneous :			
Net Premium	49.63	41.46	40.40
Claims	26.24	23.73	22.05
Commission, expenses, etc. ..	20.21	18.66	17.13
Underwriting profit or loss (+)	—0.46	—1.04	—2.62
Miscellaneous Fund	24.82	20.73	20.20
Net Profit	3.37	3.42	6.30
Provision for taxation	3.75	3.28	0.74
Dividend	3.00 (15%)	3.00 (15%)	2.50 (12½%)

Claims experience in the fire department, as will be seen from the above table, was adverse. The loss ratio for the year was 48.58 per cent, as compared with only 36.68 per cent in 1962. The increase was mainly due to losses incurred on reciprocal treaties, especially in respect of fire business which the Company had accepted in the past from foreign insurers. As a result of the higher claims cost the underwriting profit declined from Rs. 9.28 lakhs in 1962 to Rs. 7.85 lakhs in 1963. The fall in underwriting profit would have been sharper but for the slight improvement, small though it is, in expenses, the ratio being lower at 28.92 per cent, as against 29.70 per cent in 1962.

The marine department turned in a better performance than in the previous year, although it continued to be in the red. As a result of the year's operations the deficit in the marine department (underwriting loss) was reduced to Rs. 2.33 lakhs, as against Rs. 3.64 lakhs in 1962, thanks to the improvement in net premium from Rs. 16.99 lakhs to Rs. 20.76 lakhs and better claims experience. Claims paid and outstanding worked out to 71.52 per cent, as against 89.62 per cent in 1962. Expenses, too, were lower, the ratio being only 36.53 per cent, as compared with 43.76 per cent in the previous year.

There was a further reduction of losses in the miscellaneous department from Rs. 1.04 lakh in 1962 to a mere Rs. 46,000 during the year under review. This was made possible by the rise of Rs. 8.17 lakhs in net premium and the decline in claims ratio from 57.24 per cent in 1962 to 52.86 per cent in 1963. A similar trend was also evident in expenses which worked out to 25.09 per cent, as against 29.89 per cent in 1962. Reserves for unexpired risks have been maintained at 50 per cent of net premium in both fire and miscellaneous departments and 100 per cent of premium in the marine department.

The net contribution of the different departments to the profit and loss account, as noted above, aggregated Rs. 5.06 lakhs. Net profit, after earmarking Rs. 3.75 lakhs for taxation and taking into account miscellaneous receipts and expenditures, amounted to Rs. 3.37 lakhs to which was added the sum of Rs. 22,823 brought forward from the previous year. The amount available for distribution thus amounted to Rs. 3.60 lakhs. Of this a sum of Rs. 40,000 has been transferred to the gratuity reserve. The proposed dividend will absorb Rs. 3 lakhs, leaving a balance of Rs. 20,414 to

Notice

THE TITAGHUR PAPER MILLS COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT THE undernoted 'A' Ordinary shares of Rs. 10 each (Rs. 2.50 paid up) in the issued capital of the Company (the subject of the Allotment Letters mentioned below) are liable to forfeiture unless payment is made on or before the 31st July, 1964, at the Registered Office of the Company at Chartered Bank Buildings, Calcutta, of the second instalment amount due in respect thereof, i.e., Rs. 7.50 per share, together with interest thereon at the rate of 9 per cent per annum calculated from the 6th April, 1963, until the date of actual payment.

High	29.87	30.56	35.87
Low	27.00	25.75	27.00

† Upto 20th June 1964.

Extracts from the Directors' report: Trading results for the period under report have been influenced by the continued voluntary price control of yarn and cloth and the rising trend in the cost of raw materials, labour, power and stores etc.

The Company has installed new machinery worth Rs. 17.90 lakhs for replacement, modernisation as well as for the diversification of its products.

In order to increase the production of yarn and cloth in the country, the Central Government by way of general permission to the cotton textile industry has sanctioned an increase of additional spindles equivalent to 7½ per cent of their existing spindles and 10 per cent of their installed loomage. Necessary action for the purchase and installation of the additional spindles and looms has been taken.

The Company, as per its application under the Industries (Development & Regulation) Act 1951, has also received licences, one for 12,040 spindles and another for 65 automatic looms. A scheme of installation of spindles and looms is receiving active consideration of the Directors.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	38,00,000	Gross block	1,99,66,772

† Upto 12th June 1964.

Extracts from the Directors' report: One kiln had to be stopped for overhauling for about two months, which affected production. Production and despatches have been as under (in tonnes).

	Production		Despatches
	Clinker	Cement	Cement
1961 ...	2,00,488	2,03,694	1,98,451
1962 ...	2,20,377	2,34,640	2,42,120
1963 ...	2,11,150	2,29,220	2,30,005

The profits during the year have borne the impact of the heavy increase in costs under different heads. There has been continuous rise in costs consequent upon governmental actions. These increases in costs have been on accounts of increases in pit-head price of coal, increase in royalty on limestone, railway freight, higher incidence on account of increased dearness allowance under Wage Board Award, increase in rate of contribution to Employees' Provident Fund, etc. Notwithstanding the specific assurance, the Government did not take timely action in compensating these increases in cost. An increase of Rs. 2.75 per tonne in the ex-works retention price of cement was announced by the Government of India as late as on 1st June, 1963 and made effective from that date only. This increase in price was totally inadequate and did not cover the heavy rise in costs that had already taken place. The Industry through the Cement Manufacturers' Association has represented that increase in retention price allowed is not adequate to compensate the incidence of increase in costs under various heads. The Government have also been informed about further increases in costs and they have been requested to expedite their decision as regards relief to the industry in this respect.

Acute shortage of cement continues. As acknowledged by the Minister for Industry also in Parliament, the lack of expansion in capacity has been due to non-implementation of many licenses issued for establishment of new units. The Industry has been very much concerned about this stagnation in its growth and has been urging upon the Government to have a more realistic price policy conducive to its development.

Accounts in brief as at 31st December 1963 are as under:—

Low	29.12	21.25

Extracts from the Directors' report: *Operations.*—Sales of *Switchgear* and *Electric Motors* again improved, and the profit earned during the year was considerably greater than in 1962.

Provision has been made for the Company's liability to tax under the Companies (Profits) Surtax Act, 1964 and for the tax on dividends distributed, and having regard to the need for conserving resources while the Company's activities continue to expand, the Board has made a substantial allocation to general reserve.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	25,00,000	Gross block	44,64,472

* Profit before providing for depreciation and Secretaries and Treasurers' commission.
§ Preference dividend for the two years 1947 and 1948.

Extracts from the Directors' report: *Operation*: Sales and production during the year were Rs. 63.40 lakhs and Rs. 62.23 lakhs respectively compared with the previous year's figures of Rs. 58.92 lakhs and Rs. 58.14 lakhs respectively. Production during the year would have been much higher were it not for the dislocation resulting from the transfer of Machine shops from Byculla Works to Chinchwad Factory. 421 machines valued at Rs. 62.25 lakhs were delivered during the year against 391 machines worth Rs. 57.51 lakhs during the previous year. The value of general engineering orders executed during the year was Rs. 1.15 lakh or slightly less than in the previous year.

Machine Tools: The new factory at Chinchwad went into production in June 1962 with the manufacture of a new *High Speed Lathe* (type L-160). With the transfer of the machine shop from Byculla, all manufacturing activities have been centred at Chinchwad and by the end of the year the products manufactured included, in addition, *lathes* (type L-200), *drills* (type PD-50) and *radial drills* (type RD-32), the last-named machine machine being marketed from January 1964.

The designing of another *pillar drill* (type PD-25) has been completed. It is proposed to market this during the third quarter of 1964. Another model of *radial drill* is at present on the drawing board for production in 1965.

Out of the issue of 25,000 new ordinary shares of Rs. 100 each at par to existing ordinary shareholders, 17,402 shares were applied for and allotted. Arrangements are being made to make this issue fully subscribed.

The Company received Rs. 5,47,500 by way of instalments from the agreed loan of Rs. 50 lakhs from the National Industrial Development Corporation Ltd. The aggregate loan amount so far received from the N.I.D.C. is Rs. 45,36,500.

Arrangements are being made for executing the Technical Collaboration Agreements with Okuma Machinery Works Ltd. as also for sending some of the Company's technicians for a short duration to get in-plant training at Okuma Works. Thereafter, the manufacture of Okuma models will commence at Chinchwad with the help of Japanese technicians.

Borrowing Power: To implement the Company's expansion and diversification programme inclusive of the manufacture of two models of Okuma designs, as also for setting up of a new foundry at Chinchwad, additional finance will be required. The Board considers that the limit of its authority to borrow should be increased from Rs. 1.50 crore to Rs. 2.00 crores.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	60,11,275	Gross block	1,53,79,349

Extracts from the Directors' report: *Operations.*—Although an increase in the turnover for the year was again recorded, the profit earned was approximately the same as in last year. After providing for the Company's liability to tax under the Companies (Profits) Surtax Act, 1964 and for the tax on dividends distributed, the Board has recommended the payment of a dividend at the same level as last year.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	12,00,000	Gross block	1,56,55,242

High	9.10	9.25	11.85
Low	8.50	8.12	8.90

† Upto 20th June 1964.

Extracts from the Directors' report: The increase in crop over the previous year as well as reduction in expenditure have been responsible for the comparatively better results for the year 1963. The year 1964 has begun with a prolonged drought and a serious shortfall in crop. Moreover it is understood that the Tea Wage Board has recommended a second interim increase in minimum wages effective from 1st May. Taking into account all these adverse factors and also the need to meet commitments under the Plantation Labour Act, the Directors have decided to recommend the payment of a dividend of 7½ per cent.

Crop: 5,94,973 kgs. tea was produced during the year under report against an estimate of 5,75,000 kgs.

The stock of tea remaining unsold as at 31st December 1963, was 1,30,355 kgs. all of which has since been sold.

Cost and Price, etc.—A tabulated statement giving details of cost, price etc. for the last three years is given below:

	1961	1962	1963
Yield in kgs. per hectare	962	1,074	1,211
Yield in lbs. per acre	858	957	1,080
Estate cost—Cents per kg.	360	365	315
Estate cost—Cents per lb.	163	164	143
All in cost—Cents per kg.	420	403	355
All in cost—Cents per lb.	191	183	161
Average sale price—Cents per kg.	447	432	432
Average sale price—Cents per lb.	203	196	196

Estimates: The estimate for the year ending 31st December 1964 is 6,00,000 kgs. tea to be produced at a cost of 337.66 cents per kg. The estimates of capital expenditure will be Rs. 68,500.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	15,75,000	Gross block	34,08,581

Market value of equity shares (in rupees):	1964†	1963	1962
High	15.37	15.12	14.25
Low	13.75	13.00	9.62

† Upto 20th June 1964.

Extracts from the Directors' report: The working results of the Company improved significantly in the year 1963 as compared to the previous year. The value of production which in 1962 amounted to Rs. 1,55,83,347 rose to Rs. 2,00,51,957 in the year 1963. This improved position reflects the increase in production of *Steel Castings* at the Company's Works.

The production of *Centre Buffer Couplers* improved considerably during the year under review and this is reflected in higher payments to the Company's foreign collaborators. These stand at Rs. 6,28,245 as against Rs. 3,84,101 during the year 1962. During the year 1963 the Company received a large order for *Couplers* which is, perhaps, the largest single order for *Steel Castings* ever placed by the Railway Board. The capacity of the Company's plant for the production of *Centre Buffer Couplers* has been further increased and the Directors hope that the Railway Board will continue to make the best utilisation of this capacity.

In its efforts to add new items of production, the Company has been making attempts for some time to interest the Indian Railway Board in the purchased of *Cast Steel Bogies* which consist mainly of *Steel Castings* components and also to secure foreign collaboration for the production of such *Bogies* in the Company's works. These efforts have now met with success. Negotiations for technical collaboration with M/s. Amsted Industries International, Chicago, U.S.A. have been completed and a letter of intent has been signed. The Directors also expect that in the near future an Educational Order will be received by this Company from the Railway Board. The production of *Cast Steel Bogies* will make a tremendous demand upon the technical resources at the Company's disposal; but, it is confident of its ability to successfully execute this developmental work.

The demand for *Steel Castings* continues to be satisfactory and the plant is now fairly well booked. In the last year's report the Directors had referred to the programme for expansion of the capacity and they are glad to report now that substantial steps have been taken during the intervening period in this direction. Land has been purchased at Baruipur, at a distance of about 13 miles from the Company's existing Ballygunge Works and approximately Rs. 20,00,000 have already been spent on the expansion programme. The total capital cost of the programme has been estimated at Rs. 1,07,00,000. To meet this expenditure, an application for a loan of Rs. 70,00,000 has been submitted to The Industrial Credit and Investment Corporation of India Ltd. and this application is being processed now. The balance of the expenditure will be met from internal resources.

Accounts in brief as at 31st December 1963 has since been sold.

ORISSA CEMENT COMPANY

(*Concluded from page* 31)

oven bricks, forsterite bricks, etc. Efforts continue to be made to achieve further diversification of production as a possible method of meeting to some extent the difficulties arising from overproduction in the industry. While such diversification will doubtless assist the industry, its salvation must lie in controlling its further growth as the bulk of the requirements and hence of the production is for the conventional types of refractories which are already produced.

Refractory industry continues to face the problem of multiple specifications regarding quality, shape and size adopted by the steel plants. The Indian Standard Specifications formulated with the help of steel industries' representatives still remain unaccepted in many cases. We hope Government will take further action to ensure universal adoption of the Indian Standard Specifications for refractories by the steel plants. This would help to restrict unnecessary imports and facilitate the manufacture and supply of refractories to the steel plants at short notice.

Delays continue to be experienced in the disposal of mining lease and prospecting licence applications, although there are indications of some improvement in this direction. I would like to repeat here the suggestion which I had made last year that rules and regulations should be devised whereby the legitimate claims of manufacturers and actual users of certain raw materials which are extremely scarce are recognised and upheld to prevent good properties, while being evaluated, passing into the hands of speculators thereby making it extremely difficult to programme the manufacture of heavy duty products such as refractories on a regular basis.

Before I conclude, I would like to express our appreciation of the services rendered by the officers, staff and workers of the Company during the year.

JAI HIND.

N.B.—*This does not purport to be a report of the proceedings of the General Meeting.*

Notice

JAGATJIT COTTON TEXTILE MILLS LIMITED

NOTICE

THE 17TH ANNUAL GENERAL MEETING of the Shareholders of the Company will be held at the Registered Office of the Company at "Thapar House," 25, Brabourne Road, Calcutta, on Friday the 31st July, 1964 at 3-00 p.m.

AGENDA:

1. To receive and adopt the Directors' report and the audited accounts of the Company for the year ended the 31st January, 1964.
2. To declare dividends on Preference and Equity Shares.
3. To elect Directors in place of those who retire by rotation:
   (*a*) Seth Bhagram Handa, Director of the Company being longest in office, is due to retire and being eligible, offers himself for re-election;
   (*b*) Shri L. M. Thapar is also due to retire being longest in office and as he is an associate of the Managing Agents of the Company, a notice has been received from a shareholder of the Company, proposing his re-election. A special notice as such is hereby given for passing the following resolution with or without modification as a special resolution:

   RESOLVED:

   "That pursuant to Section 261 of the Companies Act, 1956, Shri L. M. Thapar, an associate of the Managing Agents of the Company, be and is hereby re-elected Director of the Company."

   (*c*) Shri J. K. Srivastava also retires, being longest in office, and as he is an associate of the Managing Agents of the Company, a notice has been received from a shareholder of the Company, proposing his re-election. A special notice as such, is hereby given for passing the following resolution with or without modification as a special resolution:

   RESOLVED:

   "That pursuant to Section 261 of the Companies Act, 1956, Shri J. K. Srivastava, an associate of the Managing Agents of the Company, be and is hereby re-elected Director of the Company."
4. To appoint Auditors for the current year and to fix their remuneration. The present auditors, Messrs. S. P. Chopra & Co., retire and are eligible for re-appointment.

Note: (i) The Share Transfer Books of the Company will be closed from the 22nd July, 1964 to 31st July, 1964, both days inclusive.

(ii) A member unable to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member of the Company.

(iii) Explanatory note pursuant to Section 173 of the Companies Act, 1956 in respect of items No. 3(*b*) and (*c*) of the agenda has been sent to all the shareholders along with the notice.

By Order of the Board,
KARAM CHAND THAPAR & BROS.
PRIVATE LTD.,
Managing Agents.

Registered Office:
"THAPAR HOUSE,"
25, BRABOURNE ROAD,
CALCUTTA
The 22nd June, 1964.

The International Monetary Fund has agreed to a drawing by the Government of Morocco equivalent to $13.125 million, to be made half in French francs and half in deutsche mark. This will be the first occasion on which Morocco has used the Fund's resources. A stand-by arrangement for $25 million in November 1959 expired unused a year later.

INDIAN MERCANTILE INSURANCE COMPANY LIMITED

CHAIRMAN, MR. KRISHNARAJ THACKERSEY WANTS REVISION OF INSURANCE ACT

A STRONG plea for fixing the expenditure limits of insurance companies at a reasonable level has been put forward by Mr. Krishnaraj M. D. Thackersey, Chairman of the Indian Mercantile Insurance Company Limited, in his annual statement to shareholders circulated along with the balance-sheet and accounts of the Company for the year ended December 1963. With the ever-rising costs, he declares the Indian Insurance Act of 1950 required a thorough revision, especially the provisions relating to the limitation on expenses of management. He hopes that the Tariff Committee would look into these problems and give relief to the industry. Incidentally, he is satisfied at the manner in which the Life Insurance Corporation is conducting general insurance business as a non-tariff insurer.

The following are extracts from Mr. Krishnaraj M. D. Thackersey's speech:

GENTLEMEN,

Before proceeding and commenting on the year's results and some of the important topics relating to insurance industry, I wish to refer to the shocking news in the event of the sudden death of our beloved Prime Minister, Jawaharlal Nehru who passed away on 27th May. The death by laying its icy hand on Jawaharlal Nehru removed from our midst the maker of modern India, a man of action and a towering personality who held and dominated the Indian scene for last seventeen years at a most critical time in the history of our nation when India needed him most. In his death the nation has suffered an irreparable loss and the void which his death has created is difficult to fill. However, I am sure that the sound common sense of our people will see to it that modern India marches on and occupies its rightful position in the comity of nations by following and dedicating to the ideals of national unity and solidarity which our beloved Prime Minister, Jawaharlal Nehru preached and emphasised in his lifetime. I wish to put on record and you will join with me in expressing our sense of terrible sorrow and profound anguish which has overtaken our nation at this juncture of his death. May his soul rest in peace.

The report, the statement of accounts and the balance sheet for the year 1963 which accompany this statement relate to the Company's operations for the 56th year and they show that the Company has continued to maintain its record of consistent progress.

Non-Tariff Insurer

An important event which will shape the course of insurance industry in India is the decision of the Government authorising Life Insurance Corporation of India to operate and transact General Insurance business from 1st April 1964 as a non-tariff insurer. Though the Life Insurance Corporation is authorised to operate as a non-tariff insurer, I am glad to note that the understanding with which the L.I.C. proposes to operate in the market to avoid rate war and approach and underwrite business at tariff rates will go a long way to stabilise general insurance business. The Tariff Committee and insurers operating in India have extended their support to the L.I.C. in connection with their business, and in turn the L.I.C. has entered into certain re-insurance arrangements with a view to retain as much Indian premium as possible in Indian market. I am confident, given goodwill, friendly spirit and mutual understanding between the L.I.C. and the insurers operating in India to operate in insurance market in India to the mutual advantage of all concerned, it will result in building up a strong base for the insurance industry in the country. I hope that the new Tariff Committee which will be shortly elected will address themselves to a task which will establish close and fuller co-operation between the L.I.C. and other insurers in the country to create a very strong insurance market in the country.

Last year I had referred to the difficulties experienced by the insurance industry as cost of its operations is controlled by the provisions of the Insurance Act, as framed in 1950. It is a matter of common knowledge that since 1950, cost of everything has gone up and it is becoming increasingly difficult for insurers to conduct their operations within the prescribed limits. This difficulty becomes all the more pronounced when the taxing authorities have decided to disallow, and tax excess expenditure over prescribed limits controlling the cost provisions. I hope the new executive committee which is recently elected will, having regard to the reality of the situation, press their way and see that adequate relief is granted which in turn is accepted by the taxing authorities so that the hardships experienced by insurers are avoided.

Accounts

Coming back to accounts, I am glad to inform you that the Company has written a gross premium income of a little over Rs. 56.5 lakhs in the year representing approximately a rise of 10 per cent over previous year. The net premium income of the Company amounts to Rs. 48.90 lakhs as against Rs. 46.52 lakhs in the last year. The underwriting profits amount to Rs. 7.42 lakhs as compared to Rs. 5.36 lakhs in the previous year. This shows a rise of nearly 40 per cent over last year. You will have noticed that your Directors have transferred to the taxation reserve Rs. 5,75,000 and Rs. 5,00,000 to the dividend equalisation reserve. As a result of the year's operations, the funds of the Company have gone up by Rs. 5 lakhs and they now stand at Rs. 77 lakhs.

You know that last year your Company contributed Rs. 21,150 to the National Defence Fund. It was publicly announced by the Government that such contributions will be income-tax-free. Unfortunately, the taxing authorities have decided otherwise. The problem is being pursued earnestly by Indian Insurance Companies Association, and I am quite confident that these contributions made by insurers will be treated in the assessments of insurers as income-tax-free as advised and announced.

Your Directors have resolved not to charge any fees for the transfer or transmission of shares or splitting or consolidating of the share scrips with effect from 1st March 1964, as recommended by the Government of India, Ministry of Finance, Stock Exchange Division.

Your Directors have recommended the dividend at the rate of Rs. 8 per share subject to tax which is 16 per cent amounting to Rs. 3,38,448 and the dividend when approved and paid will be debited to dividend equalisation reserve.

Note:—*This does not purport to be a report of the proceedings of the Annual General Meeting.*

CHANDRAPURA THERMAL STATION

The I.G.E. export division of General Electric (U.S.) has been awarded a contract for nearly $3 million to supply a steam turbine-generator complete with accessories to the Damodar Valley Corporation (D.V.C). The 144,500-kilowatt generator will be installed in the Chandrapura Thermal Power Station in Bihar. The order is being financed through the U.S. Agency for International Development. According to the I.G.E.'s manager of electric utility sales, "addition of this unit, the fourth turbine-generator unit of this size which I.G.E. has furnished the Damodar Valley Corporation, will make Chandrapura India's largest thermal power station." One of the three previous units is for use at D.V.C.'s Durgapur thermal power station in Bengal. The other two units which are scheduled to be in operation this year at D.V.C.'s Chandrapura station are presently being installed by the International General Electric Co. (India) Private, Ltd., of Bombay.

EUROPE'S LARGEST "NYLON TANKER"

The nylon tanker, jokingly termed "oil sausage" by its Hamburg builders, is Europe's largest. Unlike some smaller experimental specimens, which were used to transport crude oil from source to refinery, it is to serve as a floating service station. In conjunction with a service-raft, it is to supply ships on the high seas—mainly deep-sea fishing vessels, away from port for prolonged periods—with fuel. The thin, transparent "Flexitainer" (its official name) is 42 metres long, of 3.30 m. diameter, and can carry a total of 300 tons of floating fuel. The Hamburg firm of "Internationale Container-Bau" produced the giant tank by order of the Marine Traffic Department of the West German Federal Ministry of Transport. Our photos show the nylon oil-sausage in the factory, shortly before completion and a technician, giving the finishing touch to the floating tank. It seems to be certain that this inexpensive tanker, pulled to its destinations by a small tug, will have a brilliant future.

OGALE GLASS WORKS LIMITED

CHAIRMAN'S SPEECH AT ANNUAL MEETING

PLEA FOR FAIR RETURN ON CAPITAL

ADDRESSING the Forty-third Annual General Meeting of the Ogale Glass Works Limited, held at Ogalevadi (Maharashtra) on Monday, 15th June 1964, the Chairman of the Company, Mr. Jagannath Maharaj Pandit, made a fervent appeal to the Government to allow medium-scale industries to deduct a sufficient amount from their profits as essential expenditure for paying a fair return on equity capital. Such a step, he hoped, would induce more funds to flow into the corporate sector and enable companies to build up some reserves for development, resulting in better earnings, and consequently, greater revenue to the Government in the form of taxes. He wanted the Federation of Indian Chambers of Commerce and Industry to take up this proposal with the authorities concerned.

The following are extracts from the speech of Mr. Pandit:

GENTLEMEN,

I have great pleasure in welcoming you to this forty-third annual general meeting of the Company.

The year's total production exceeded by about Rs. 19,50,000 over that of the previous year, but the margin of profit did not increase proportionately due to rising costs.

It is now an accepted fact that medium-scale industries earning a modest margin of profit cannot plough back in the industry for its development, any part of their earnings after meeting the ever increasing prices of raw materials and stores, labour charges, levies and taxes, payment of income-tax and finally a small return on the share capital.

A Reasonable Suggestion

I should like to make the following suggestion and request the various trade associations, chambers of commerce and particularly the Federation of Indian Chambers of Commerce and Industry to take this matter up with the Ministry of Finance in the Central Government; this suggestion, in my opinion, is extremely reasonable and indisputable:

"That an amount sufficient to pay a minimum of 6 per cent return on the equity capital of a company be permitted to be deducted as essential expenditure before assessing its profits for income-tax purposes, in the same manner as interest charges on the borrowed capital are permitted to be deducted."

This, I hope, may induce more capital to flow in industrial investment and enable companies to build up some reserves for development, and result in better earnings and consequently increased revenue to the Government in the form of sales tax, excise duties and also income-tax in due course.

Workers' Responsibility

I would like to impress on the workers that they apply their mind and energy to put in better production, minimising breakages and wastages especially during hard times like the present, since their prosperity lies in the prosperity of the industry in which they serve.

I am thankful to the workers, staff and the executives of the Company for the good work turned out during the year under the able guidance of our Managing Agents.

Note: *This extract does not purport to be a report of the proceedings of the General Meeting of the Company.*

BENGAL PAPER MILL COMPANY LIMITED

CHAIRMAN, MR. N. D. BANGUR, ON PROBLEMS OF COSTS AND RAW MATERIALS

PRESENT PRICE STRUCTURE RETARDING GROWTH OF PAPER INDUSTRY

INCREASED costs of production, non-revision of prices and inadequate supply of raw materials were referred to as the major problems facing the paper industry by Mr. N. D. Bangur, Chairman of the Bengal Paper Mill Company Limited, in his speech at the Annual General Meeting of the Company held at Calcutta on 29th June 1964. He was doubtful if the third Plan production target of 700,000 tonnes of paper would be achieved despite the increase in installed capacity. He apprehended that, if the question of prices was not given due consideration, the growth of the paper industry would be retarded. He expressed concern over the reluctance of some States to provide raw materials to industries situated in other States and urged the Central Government to ensure the continuance of the traditional sources of raw materials.

The following is the full text of Mr. Bangur's speech:

GENTLEMEN:

I have great pleasure to welcome you to this annual general meeting of your Company. The Directors' report and audited statement of accounts for the year have been in your hands and, with your permission, I take the same as read.

Before anything, it is my painful duty to refer to the sad and sudden passing away of our beloved leader and Prime Minister, Shri Jawaharlal Nehru, on 27th May 1964. Shri Nehru, the architect of modern India, was a source of strength and security to the teeming millions of the country. He was acclaimed as a world statesman and his name became almost a legend in his own lifetime. There would be no better tribute to the memory of the great champion of liberty and peace than our determined efforts towards fulfilment of his dream of a peaceful, prosperous and united India.

On this occasion I offer my respectful congratulations and best wishes to our new Prime Minister. His unanimous election has been universally acclaimed and I have no doubt that under his wise guidance our country will swiftly march forward to prosperity.

Economic Situation

The signs of vigorous growth which ought to be there in a planned economy are not visible. I would particularly like to invite the kind attention of the Government to the conditions in the capital market. Only two years ago the climate for investment was so healthy that the public, belonging to every level of income group, showed tremendous interest in investing in industrial shares. The new issues were heavily oversubscribed. But the steep increase in taxation has dampened the enthusiasm of the investing public. Little savings are left in the hands of the public and consequently entrepreneurs are finding it increasingly difficult to raise funds barring the financial institutions. Friendly foreign countries have been generous in giving us assistance in various ways but unless the climate for investment in India is made attractive it will not be possible to take full advantage of the foreign aid.

Immediate attention therefore has to be given to measures for reviving the climate for investment so that once again the capital market can become active and investors and entrepreneurs may vie with one another in their efforts to develop the economy. I have no doubt that the Government will give serious thought to the present situation and adopt appropriate measures to give a big push to our economic progress so that the much needed production targets may be achieved. It is therefore essential that a growth-oriented fiscal policy should be followed.

So far efforts made by the Government through L.I.C., Unit Trust and establishment of Development Bank towards reviving the confidence in capital market are appreciated, yet it would have been much better had a liberal atmosphere be created by reviewing personal tax structure which is complicated and high at all levels of income group. I may mention that all personal taxes taken together at a stage even accounts more than total earning of an individual which amounts to expropriation of capital. A liberal revision of personal tax structure will open the way for wider investment out of personal savings from all classes of people throughout the country which, in turn, will give birth to new enterprises in different lines, solve unemployment problem and boost production leading to prosperity in the country. Time has come for mass education through publicity drive by institutions and stock exchanges to educate the urban and rural population to bring home the benefits of more and more investment.

Third Five-year Plan and Price Policy

In the third Five-year Plan the Planning Commission has fixed a target of 7,00,000 tonnes of actual production of paper. At the end of 1963, the production of paper and board was 4,65,000 tonnes with an installed capacity of 5,50,000 tonnes. Taking into account the increased capacity, production in 1965-66 is estimated to be 6,00,000 tonnes, leaving a gap of 1 lakh tonnes between the estimated demand of 7 lakh tonnes and the actual production. To meet this shortfall, the Government recently have invited schemes from all the existing units for increasing production by adjustments and modifications of their machines and installing balancing equipments with the least foreign exchange expenditure and in quickest possible time. Additional installed capacity of 1,20,000 tonnes is expected to materialise by these schemes. If all these schemes are put in commission by 1966, the third Plan target's capacity may be achieved. But, it is doubtful whether the production of 7 lakh tonnes will be achieved, because a part of the installed capacity may not become productive and may be delayed.

The industry has submitted a detailed representation for an upward revision of the prices. The cost of production has gone up due to various reasons beyond the control of the industry. The prices are governed by the provisions of Tariff Commission allowing a meagre 12 per cent return on capital including interest charges, etc. Even this small 12 per cent return on capital employed is not available now, due to the continuous rise in costs. In this situation, if the question of price is not given due consideration, the effect will be a retarded growth of the industry. It is not a happy feature that an increase in the selling prices of end-products should become possible only after a long-drawn process. I am of the view that price increase should be automatic and it should not be difficult to evolve a formula in terms of which paper prices could be revised as soon as costs of production tend to vary beyond agreed limits. As matters stand, the representations now pending before the Government for price increase have already become outdated because there have since been further substantial increases and it is hoped that Government will give due consideration to the matter of price increase at an early date.

Raw Materials

There has been no improvement in the difficult situation faced by the industry in respect of its requirements of raw materials. It is being found that some of the States favour local development of industries and are reluctant to continue giving raw materials to industries situated in other States. When industries have been set up banking on the availability of raw materials from neighbouring States, the above trend is causing serious anxiety in the minds of entrepreneurs. The Central Government should immediately consider this matter and formulate a policy by which traditional sources of raw materials to the industries are not disturbed.

By recent research, it has been found that hardwood could also be utilised as a substitute raw material in India and I am glad to inform you that your mill is using a considerable quantity of hardwood by mixing with bamboo and other conventional raw materials. In this view, so far as your Company is concerned, the raw material position is assured.

In my last year's speech I had referred to the necessity on the part of the Government of West Bengal to allocate sufficient waste lands to the paper industry for development of plantation. We have found that eucalyptus can be grown in the district of Midnapore and if proper arrangements for supply of manure and nurseries are made, eucalyptus can be grown in a shorter time than what bamboo normally takes and it will be another raw material for the industry. I will therefore again appeal to the West Bengal Government to take an early decision.

Some time ago the Development Council for Paper, Pulp and Allied Industries recommended to the State Governments to grant long-term leases of forests to the paper mills and a specific basis for determination of royalty was suggested. I am not aware of any State having considered and adopted this basis.

The present allotment of foreign exchange for import of wires, felts and spares hardly makes it possible for the mills to meet emergencies and quite often mills have to resort to air-freighting. If the paper industry has to produce to the maximum extent of installed capacity, it is of utmost importance that the mills are allowed to build buffer stock of consumable stores. I would therefore urge that a liberal policy is followed in the matter of releasing foreign exchange to the mills for import of these materials.

Considerable difficulties are still being experienced by the industry in getting at reasonable prices its full requirement of chemicals. The prices of chemicals have gone up and the paper industry finds it difficult to meet with the fixed selling prices of paper.

Sales

Since the commissioning of the multi-stage bleaching plant, the shade of our paper has improved and is being liked by the consumers. It is the constant endeavour of the mill to improve the quality of the paper and also to go in for manufacture of special qualities such as, the paper for Formica and Melamines, wrapping paper for photo films, etc. for industrial use, the demands of which in the country are being met by imports. We urge the Government to gradually restrict the import of these qualities to provide an incentive to indigenous industry and save foreign exchange most needed by the country.

We have supplied to one of our customers cable insulating paper manufactured from imported pulp and thus have seen that we can produce this quality provided the import of the required type of wood pulp is allowed. We feel it will be in the interest of the country if import of pulp is allowed to us for manufacture of such qualities of paper rather than to allow their import. The Government have been approached for this purpose and we hope they will take a realistic view of the position. We do not feel any justification of the installation of new units to produce such qualities when the existing units have adequate equipment and experience for their production.

I welcome the concession granted in the excise duty to the new units as well as to the mills which have expanded their existing capacities by installing new machines since 1st March 1964. The Joint Committee of the Paper Industry immediately represented the case to the Government that other new units and expanded units which have already come into production before 1st March 1964 should also be entitled to such concession. On this representation, the Government has agreed to grant the concession on excise duty to the new units which came into production between 1st April 1961 and 1st March 1964. The Government has not considered the case of those units which have expanded their capacities during this period and a further representation has already been made to clarify this position and I hope the Government will take due cognisance and allow the same concession to those units. After all they have also incurred heavy expenditure on installation of new machines like the new units and there seems to be no justification to deny this concession to the units expanded after 1st April 1961.

The production and the gross profit during the year were 22,567 tonnes and Rs. 64,75,025 compared to 21,588 tonnes and Rs. 60,02,630 dur-

SELECTED SATGRAM COLLIERIES LIMITED

ENGINEERING WORKS PROPOSED TO BE SET UP

SPEECH OF CHAIRMAN, MR. S. D SHETHIA

ADDRESSING the Nineteenth Annual General Meeting of the Selected Satgram Collieries Ltd., held at Calcutta on Monday, 29th June 1964, Mr. S. D. Shethia, Chairman of the Company, revealed that the Company had decided to set up an engineering works with foreign collaboration with a view to diversifying its activities. This new venture, he said, would not only stabilise the Company but also help maintain an adequate return on capital. He pointed out that, by catering to the consumers' needs even at a slightly higher cost, considerable benefit would accrue to the firm. Referring to the problems of the coal industry in general, he stated that the two "musts" requiring immediate attention were neutralisation of the higher cost of non-coking coal of certain grades and grant of depletion allowance to the industry. These, he added, were necessary to maintain the tempo of production.

The following is the full text of Mr. S. D. Shethia's speech:

LADIES AND GENTLEMEN,

With sad heart, I must refer to the calamity that has befallen our country. In losing our late beloved Prime Minister, Pandit Jawaharlal Nehru, we have not only suffered an irreparable loss, but has also seen the change of an era under the dynamic leadership of such a great man whose sincere and devoted missionary service to all of us, his countrymen, has immortalised him in our minds as well as in the eyes of the citizens of the world. May I urge you kindly to stand in silence for two minutes as a mark of respect towards him and pray for eternal peace for the departed soul.

It is now meet and proper that we all resolve to stand together in response to the timely call of our President and the new Prime Minister, Shri Lal Bahadurji, who shoulder very great responsibilities of building our country at such a difficult time.

I have great pleasure in welcoming you all to the nineteenth general meeting of the Company and address you after a lapse of nearly two years. Last year, as you will remember, we were prevented from meeting in this manner by Rule No. 52 of the Defence of India Rules which were promulgated in the wake of national emergency arising out of naked and unprovoked aggression from Red China.

New Directors

I have the pleasure in welcoming two new members to your Board of Directors. Shri Prabhakar L. Kirloskar, who belongs to the well-known firm of Kirloskars, a progressive industrial group of Western India, and Shri Bharat S. Shethia, ex-officio Director from the Managing Agents, who has, after joining in 1956 and having been assigned the responsibilities of our producing units, now gained necessary experience.

While recording with regret the resignation of one of your Directors, Shri C. M. Dave, on eve of his retirement, as he desired, I take this opportunity in appreciating on your behalf his services to the Company and wishing him peaceful retirement from hectic activities the present times demand.

With your permission, I am taking as read the audited statement of accounts and the Directors' report for the year ended 31st December, 1963 which have been with you for quite sometime. The accounts for the year ended 31st December, 1962 were circulated to you upon removal of the restrictions of the Defence of India Rules.

Performance

Since we last met, by the grace of the Almighty, raisings during 1962 increased by 1,81,986 tonnes over the figure of 1961 and during 1963 by 98,100 tonnes over 1962; despatches have also shown improvement specially in 1963 and our collieries are holding a stock of 10,459 tonnes against 20,046 tonnes at the end of 1962 (mere 19 per cent of our monthly production). This has been mainly due to the efficient sales organisation of the Managing Agents and their associates who have helped us in the disposal without charging us anything in this respect despite the present market conditions.

In terms of money, our turnover has increased by Rs. 22,68,322 to Rs. 86,97,953 or 35 per cent excluding Rs. 27,38,654 of New Majri Colliery which was worked by us until beginning of the last year as raising contractor and had earned the net remuneration of Rs. 1,55,949. The net remuneration from the raising contract of South Joyramdanga Colliery came down by Rs. 1,88,784 to Rs. 1,15,656 due to the depillaring operation that was delayed owing to withholding of the permission by the authorities concerned and on account of other unforeseen payments. The operating profit of your concern has increased from Rs. 10,22,449 to Rs. 16,41,804 despite the increase in cost of production in respect of the expenses of statutory and various other nature, incidence of installation of substantial expansion, interest charges, emergency risk insurance, steep increase in the rates of premia for workmen's compensation and substantial increase in the prices of essential materials required by the coal industry. The profits also include Rs. 1,17,449 received from the Managing Agents and their associates.

You will have noticed that despite the increase in the profits, the provision for taxation has not increased proportionately. This is on account of applicability of Section 84 of Income Tax Act of 1961 to the unit New Majri Colliery. Thus, after provision of various statutory and necessary reserves amounting to nearly Rs. 9,02,600, your Directors have recommended maintenance of dividend at the same rate as that of last year, viz. Rs. 10 per share. Considering the tax holiday, this share gives in your hands a net yield of Rs. 7.02 per cent on the existing prices as against 5.60 per cent last year.

Reserves

The reserves of your Company have increased from Rs. 8,70,685 to Rs. 16,17,485 which is about 40 per cent of the capital. The policy of husbanding a bigger proportion to the reserves has been on various matured considerations, principal amongst them is consideration of the effect of new 'Sur' tax upon your Company, when the substantial medium-term loan would be paid off. Today, the net worth of your shares is Rs. 140 as compared to its latest market value of Rs. 114 as against Rs. 121 and about Rs. 125 (on an average) last year.

The construction and development of housing and dispensary facilities at all of your collieries have maintained a satisfactory trend. At New Satgram Colliery, the Central Hospital provides for extra medical facilities in the shape of twelve-beds unit with an air-conditioned operation threatre. This is being extended during the current year. The progress of the labour housing at New Majri Colliery has been little or none owing to the fact that according to the Housing Board regulations, this facility is available to the units which can demise their land for forty years with enough scope for the mines working upto that time. Though the reserves of New Majri Colliery are adequate, the lease of the colliery would expire in 1973, and the Board is not inclined to give assistance to your Company in this respect. An application, however, has been earlier made to the Government of Maharashtra, who had been realistic and encouraging in the past, for remedial measure by renewing the leases of this unit for a further period of thirty years as available under the Mineral Concession Rules 1960.

Recreational facilities in the form of games, sports, cinema show have been available to all the staff and workers even of the new units and the co-operative societies are functioning satisfactorily as lending institutions.

Safety-consciousness

During the Safety Week celebration, the programme which has been rightly sponsored with great emphasis by the Chief Inspector of Mines for successful measure for increasing safety-consciousness amongst the workers, you will be pleased to know that your New Majri Colliery stood first in the Chanda Coalfield and New Satgram Colliery has ranked amongst the top ones.

Though progress in other spheres have been at a satisfactory level, there has been little or no progress in acquisition of the surface land through the Government, though a provision has been inserted by the Land Acquisition Act for easier acquisition of the necessary land for industries for public purpose and belonging to the public limited corporation.

Labour-management relation has continued at the same satisfactory level as before.

Coal Industry

Never before has the coal industry passed through such an utter chaotic state. Only in my last address to you, I had mentioned about exhorting urgent call of honourable Union Minister, then in charge of Mines and Fuel, to increase the production and meet the ever-increasing demand for coal in the country. The industry in response had geared all its energies and resources and put them to realisation of the objective with the help of the Central Government including getting of Rs. 16.7 crores of foreign exchange from the World Bank for the import of necessary machineries. As a result of all-round efforts accelerated by the urgency stressed during national emergency, the production of this vital commodity of fuel came up. In the normal circumstances, such strenuous efforts, so much of risk taken, such a lot of huge investment put and the resulting increase would at least warrant a pat on the back. In this particular case, however, a very queer phenomenon was observed when for the year ended 31st March 1963 the output of coal was about 64 million tonnes, the demand all of a sudden slumped. The present chaotic state of affairs in coal industry has perhaps aptly been described as follows:

"That over every corner of our coal economy overhangs the dismal cloud of confusion and doubt and that every solution of our difficulty turns sour in the end and that our remedies themselves require a cure."

For this quandary, who is to be blamed? This is a very difficult question to answer. There have been several factors which have contributed to it. To mention a few overestimation of demands, slow speed of industrial growth created, amongst others, by the Chinese aggression, the Government policy in subsidising the furnace oil and thus encouraging several industries in Western and Southern India to use oil instead of coal, improvement in coal transport, etc.

Remedial Measures

It would not be easy to offer a ready-made solution for this is a very complex problem. One thing, however, is very necessary and that is a careful searching and realistic enquiry at a very high level to determine the root cause of the present state. Then the short-term, the medium-term and the long-term remedial

Notice

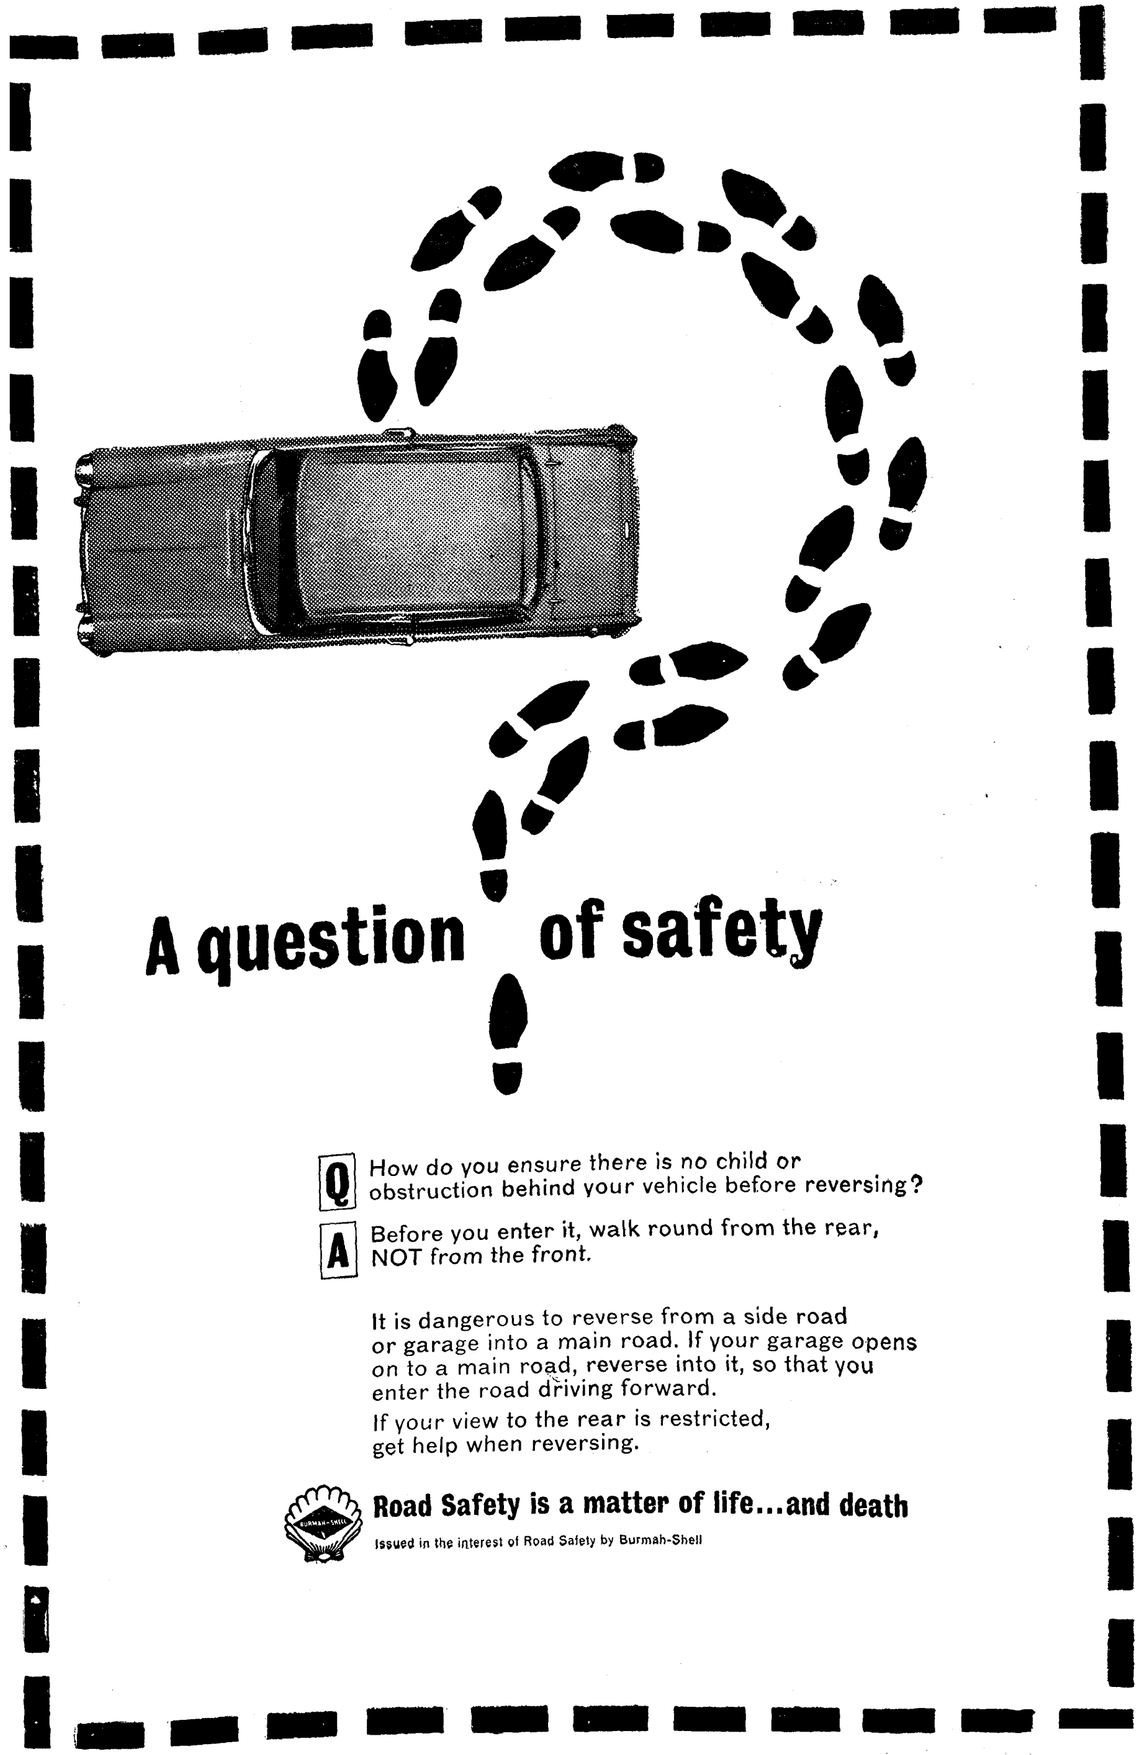
THE INDIAN IRON AND STEEL COMPANY LIMITED

NOTICE

THE ORDINARY SHARE REGISTER AND Transfer Books of the Company will be closed from Saturday, the 1st August, 1964 to Saturday, the 22nd August, 1964, both days inclusive, for the purpose of payment in due course of dividend on Ordinary Shares in the Company for the year ended 31st March, 1964. The dividend when declared will be paid to those Shareholders whose names appear on the Company's Register of Members for Ordinary Shares on the 22nd August, 1964 or to their mandatees.

By Order of the Board,
MARTIN BURN LIMITED,
F. G. LIVERSEDGE,
Managing Director,
Managing Agents.

Registered Office:
12, MISSION ROW,
CALCUTTA-1,
23rd June, 1964.



measures would have to be found out so that a consistent and steady policy could be adopted; not only for proper and continued development of the industry which is in *core of our Plans*, but also of supply of proper quality coal that the consuming industries require, at the same time not wasting our good coal for which our resources are very limited. This would need careful striking of the balance between the two, so as to avoid shortage of this essential raw material in future.

While on this, I cannot but mention a few bold measures taken by the Honourable Shri Subrahmaniam, the Union Minister in-charge of this portfolio till recently. Increase of selective grade of coking and non-coking coal, decontrol of the movement of the lower grades of coal, pegging of the output of some of the metallurgical coal which would be badly required for our future progress and whose reserves are very meagre, and persuading the Finance Minister to include coal in the list of essential industries, as a result of which the companies mining coal would have to bear lesser tax incidence and would be able to ploughback more to their resources. What results these measures would bring is very difficult to say at this premature stage when there is so much confusion about demand of coal. Two points in my opinion need immediate attention.

The neutralisation of the higher cost of non-coking coal of grade I variety in Bengal and Bihar area and of grades I and II in the outlying coalfields, on the same basis as other selective coals is not only in the interests of equity and justice but also a definite *must*, to maintain the tempo and effectively use our valuable foreign exchange. These have been the coals, the production of which was thoroughly scrutinised by the high level Technical and Finance Sub-Committees constituted by the representatives of the World Bank, the Government and the industry. Secondly, the granting to coal industry depletion allowance in respect of its wasting assets. This point has been raised from time to time with great emphasis, having got the precedent in case of oil industry, and it is high time this realistic help is given to the industry.

While requesting the Government to help the coal industry to full measures, I do not wish to brush aside the main question that faces your Company in particular and the industry in general. Catering to the exact requirement of the consumer and giving him satisfactory and dependable service even at a slightly higher cost would help us considerably in the disposal of our product and your Company is making every feasible endeavour to fulfil these needs.

Fiscal Policy

The Union Budget for 1964-65 has brought a new ebb to the hopes and expectations of an individual investor as has been reflected by the crisis in the investment markets. The market expectations were raised by the realistically balanced speech of the Union Finance Minister in Parliament which have not been realised as the implications of the Budget became clear. There were also major changes in respect of taxation policies and some of the measures which had earlier been discarded were adopted, whereas some measures which were adopted were discarded. The stability of the taxation policies cannot be gainsaid. The need for bringing about confidence in the mind of the common man and the investor by adopting proper policies on the long-term loans which would improve the investment climate, and channelise the savings in the industry require complete reorientation of the fiscal measures, and it is not too late even now to realise the importance of building psychological confidence by giving adequate net return to an individual, to his present savings and in respect of what he can transfer to his first line of successor by not squeezing every bit from his estate. How, otherwise, can the industrial production go up?

Bonus Commission

The report submitted by the Bonus Commission, it has been strongly felt by the coal industry, would only tend to bring about the state of industrial unrest and utter confusion in this labour-intensive and more difficult industry, where the absenteeism is more than anywhere else. Why no emphasis could be put on proper attendance, on adequate return to the capital in this highly risky industry, adequate provision of the rehabilitation reserve in this wasting industry, and realisation of the fact that adoption of the majority report of the Bonus Commission would necessitate increase in the price of coal to adequately neutralising the high resultant cost is beyond me. All I can say is that present attendance bonus is more than adequate in this primary industry. From my recent experience in Japan, I can reiterate this with more emphasis, having heard the Japanese Prime Minister strongly objecting on the incidence of increasing labour bill on prices.

Diversification

In the present stage of the coal industry the old adage "not putting all the eggs in one basket" is realised more than ever before and I feel that your Directors' recent decision to develop your Company by diversification is perhaps the correct answer to the primary call of the present time.

Your Directors have decided to intensify the activities of the Company in the direction of setting an engineering works with proper foreign collaboration and I hope that this change in the weightage and the Company's decision would not only stabilise the Company, but also maintain the adequate return on capital for future too.

Prospects

The question has frequently been posed before us; what all these expansion means to a shareholder? how is an ordinary shareholder benefited? I shall endeavour to answer this question in the context of present stage of development of socio-politico economy of ours. You will have seen that intrinsic value of your share has been increasing. Even a cursory glance at your balance-sheet would convince you of this *prima facie* position. When your Directors made the valuation of the properties belonging to your Company at New Satgram Colliery, an increase of about 129 per cent was observed. Therefore, there can be no doubt that with the development of our economy, your Company's keeping pace will not only have stability that we expect, fair return for future, but also the satisfaction of having contributed our mite to the growth of the country which is all-important call before every patriot in the country.

To keep pace with the developing nature of your collieries' activities we have been consciously making efforts to suitably train the personnel that man and head its various operations. We have sent our senior and junior staff to the courses, seminars and lectures from time to time which impart necessary training in the fields of finance administration, sales, safety and human development.

Before I conclude, it would not be out of place for me to place on record our sincere appreciation to workers and staff of your Company headed by Shri J. Singh, General Manager of the Collieries and his team, other senior officers, for their making sincere endeavours to keep pace with the ever-increasing needs of our growing concern in exercising various controls. I have faith that they would continue this relentlessly in the coming difficult time. The efforts of your Managing Agents not only in helping proper and timely disposal of your product at such a critical time but also meeting vital financial needs of your Company from time to time needs a laudable mention. It is but meet and proper that your Directors have recommended the renewal of your Managing Agents' agreement, and we do hope that the Central Government will unhesitatingly sanction it after your approval. In return of their singular service, I do take it, I have your approval in congratulating them as a member of Shethia Group for having completed fifty years of their satisfactory and dependable service to customers.

In conclusion, on your behalf and mine, I express our sincere gratitude to members of the Board of Directors who have continued to give their able and mature guidance so spontaneously; we do count a lot upon their continued co-operation in future.

With your permission now, I propose that the report of the Directors and the audited statement of accounts for the year ended 31st December 1963 be hereby approved and adopted.

TREND OF MARKETS

MONEY DISTINCTLY EASY

(From Our Own Correspondent)

BOMBAY, 1st *July*

The short-term money market ruled distinctly easy during the week under review. Demand for funds was rather limited, while the available supply was plentiful. Borrowers, therefore, found no difficulty at all in obtaining their requirements. Inter-bank call rate for both renewals and fresh money stood at 2¼ per cent, as against 2½ per cent a week before. Calcutta, too, reported distinctly easy conditions, renewals being quoted at 1⅞ per cent and fresh money at 2 per cent; last week, both were standing at 2¼ per cent.

Thanks to the prevailing highly comfortable conditions, the 91-day Government of India Treasury Bills continued to elicit excellent response. The total amount (Rs. 4.50 crores) offered against Bills, the tenders for which opened on Monday, 29th June, was more than double the amount (Rs. 2 crores) invited and accepted. The average rate of accepted tenders declined slightly from Rs. 2.995 per cent per annum to Rs. 2.994 per cent. The Intermediate Treasury Bills also evoked very good support, though the amount of Bills actually sold from 24th to 27th June was less at Rs. 7.60 crores, as against Rs. 13.32 crores a week before.

India's foreign exchange reserves fell by a further Rs. 4.24 crores to Rs. 96.61 crores during the week ended 26th June, bringing the total decline since 22nd May to Rs. 19.98 crores. A part of this decline is apparently due to the second instalment ($25 million) of repayment of the I.M.F. credit of $250 million drawn from the Fund on 1st August 1961. In a Press note issued yesterday, the Government of India announced that it had arranged to refund to the Fund a sum of $25 million. The first instalment was repaid on 20th February last. The whole of the remaining balance will have to be repaid in suitable instalments before the end of July 1966. The fall of Rs. 4.24 crores in reserves in the aforesaid week was mostly in the foreign securities held in the Issue Department of the Reserve Bank which declined by Rs. 4.00 crores to Rs. 89.46 crores. Balances held abroad were lower by Rs. 23.61 lakhs at Rs. 7.15 crores. Loans and advances to scheduled banks decreased by Rs. 2.88 crores to Rs. 1.14 crore, while deposits of these banks with the Reserve Bank improved by Rs. 8.46 crores to Rs. 97.67 crores. Notes in circulation moved down again by Rs. 33.15 crores to Rs. 2,484.12 crores.

The total credit made available by scheduled banks to their clients fell by a further Rs. 23.56 crores to Rs. 1,785.38 crores during the week ended 19th June. Since, at the same time, their deposits went up by Rs. 26.83 crores to Rs. 2,536.32 crores, borrowings from the Reserve Bank receded by Rs. 13.79 crores to Rs. 4.58 crores, including Rs. 2.63 crores (a drop of Rs. 2.90 crores) obtained against usance bills. Investments spurted by Rs. 13.61 crores to Rs. 633.46 crores, while total cash was lower by Rs. 1.70 crore at Rs. 148.87 crores.

As a prelude to the ensuing flotation of Central Government loans, the Reserve Bank of India has suspended all its open market operations in Government securities with effect from 29th June. The Bank was hitherto selling 4 per cent 1970 at Rs. 99 and 4½ per cent 1989 at par and buying 3½ per cent 1965 at Rs. 99.85 and 3½ per cent 1966 at Rs. 99.65. Details of the loan announcement which is expected any day were being awaited with great interest. Meanwhile, the Gilt-edged market was marking time. Business put through was limited, with practically no change in quotations for both Central and State loans.

In the foreign exchange market, the banks' selling and buying rates for U.S. dollars improved by a further 25 nP to Rs. 479.50 and Rs. 476.00 per $100, respectively. In New York, the pound sterling eased *vis-a-vis* the dollar, the spot rate declining by 0.160 cent to 279.190-279.220 cents and the three months' forward by 0.150 cent to 278.820-278.850 cents.

GOLD EASY, SILVER STEADY

(From Our Own Correspondent)

BOMBAY, 1st *July*

Gold suffered a setback in value during the week under review, while silver was steady, though it staged a retreat today. The setback in gold followed selling pressure from some parties, especially those who had bought heavily last week. Reports of low offtake due to the rainy season also acted as a danger. Silver met with good support during the major part of the week, thanks to fears of an acute shortage of supplies developing in future. Consequently, values moved up. The rising tendency was halted yesterday when the metal encountered selling and drifted downward. Over the week it was a shade better.

Fourteen-carat gold began the week at Rs. 71 as against the previous close of Rs. 71.50, and declined steadily to close at Rs. 68.25 today. Sovereign was dull at Rs. 92. Pure gold, in unofficial trading, which had shot up from Rs. 118 to Rs. 129 per 10 grams last week came down to Rs. 121 this week.

Silver moved up from Rs. 247.50 to Rs. 251, but receded thereafter, and touched Rs. 248 today. The daily average arrivals of silver was around 22 bars, as against 25 bars last week, while offtake remained unchanged at 10 bars.

The international price for gold at the London market was a shade lower at $35.07¼ per fine ounce. The sterling price, however, was marked slightly up by 2½*d.* at 251*s.* 3½*d.* Both ready and forward silver remained unchanged at 111⅜*d.* and 111⅝*d.* respectively, as also silver in New York at 129.3 cents.

The Government has introduced one simple new form of accounts for the gold dealers and refiners to submit their returns, following their representations to the authorities about the existing cumbersome procedure. Under the Gold Control Rules, they have to submit every month three sets of accounts regarding receipt, issue and stock of gold. In addition, they are to maintain an entry book, a manufacture register and a stock account in the prescribed forms. Though the revised form is to come into effect from today, the dealers and refineries are allowed to make necessary arrangements to introduce them before 1st September.

The following table shows the trend of prices during the week under review:

	1-7-1964 (closing)	High	Low	24-6-64 (closing)
SILVER	Rs.	Rs.	Rs.	Rs.
Ready (996 fine) ..	248.00	251.00	247.00	247.50
GOLD				
Ready (14-carat) ..	68.25	71.25	68.25	71.50
Sovereign	92.00*	—	—	92.00*
London—				
Gold ..	251*s.*3½*d.*	251*s.*3½*d.*	251*s.*1½*d.*	251*s.* 1½*d.*
Silver Ready ..	111⅜*d.*	—	—	111⅜*d.*
Silver Forward ..	111⅝*d.*	—	—	111⅝*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

COTTON FUTURES FINISH LOWER

(From Our Own Correspondent)

BOMBAY, 1st *July*

Cotton futures, which ruled distinctly firm during the earlier part of the week, developed a sagging tendency yesterday and the downward trend continued even today. The firmness in the initial sessions was engendered by bear-covering on a large scale. There was also speculative buying by some upcountry operators. Active mill demand, scarcity of good quality cotton and encouraging advices from other markets, too, imparted strength. Consequently, prices moved up. The upward trend was, however, halted yesterday following reports of beneficial rains in several cotton tracts, besides profit-taking at higher levels. A large part of the earlier gains was erased. Even so, the closing rates today were higher than those at the end of last week.

The Jarilla August contract which closed at Rs. 736 last week maintained a firm upward trend during the first four days of the week and touched a new high of Rs. 743.75 on Monday (29th June). Thereafter, the contract drifted downward and closed at Rs. 739. The net gain over the week was Rs. 3.

The spot market at Sewri was quite active. The supply of cotton available was inadequate to meet spinners demand in a number of cases. Interest was shown by needy mills in varieties like L.147, 197-3, Digvijay and Co2, American and Khandesh.

It is reported that the indigenous production of cotton in the current (1963-64) season will be a record one exceeding 6.0 million bales. The cotton season is said to be quite satisfactory in Rajasthan, Maharashtra and Madhya Pradesh. Sea Island cotton seems to be a crop which holds promise for the eastern parts of Palghat District. The extension work of the Sea Island Development staff in Palghat has borne fruit. In 1963-64, the total area under the crop was 750 acres as against 250 in the previous season.

The following are the latest quotations for some of the popular varieties:—

Uklana Rs. 727 K; Chopda Rs. 1,090; Karanpur Rs. 800 K; Podampur Rs. 777 K; Shrirampur Co2 Rs. 1,731; Nagar Co2 Rs. 1,730; Jalgaon Rs. 1,130; Nandgaon Rs. 1,025.

In the foreign section, it was hoped that the export duty on Bengal *Deshi* would be removed to enable the domestic trade to meet Pakistani competition. The Cotton Textile Consultative Board, which is scheduled to meet on the 7th inst. is expected to consider this question. Interest continued to be shown in Egyptian cotton, but, pending the renewal of the Indo-Egyptian Trade Agreement, trade in this variety has almost come to a standstill. Great hopes are attached to the visit of a 14-man trade delegation from the U.A.R., as it is expected that the trade agreement between India and that country will be renewed. Stray mill interest was reported in the American, Sudan and African varieties.

TURNOVER IN PEPPER THIN

(Messrs. Parekh and Co.)

BOMBAY, 1st *July*

Malabar black pepper during the week ruled steady but quiet with thin turnover in both ready and forward. America is totally out of picture with chances remote for is coming in the Indian market. Recent improvement in London is likely to bring about some inquiries from rupee payment countries in the near future. Almost all East European countries have now become price-conscious. As a consequence, they generally base their buying price on the parity of London prices. When London market is weak, they in all instances sit on the fence, even though they continue to send feelers for judging the pulse of the market.

After the failure of Tokyo conference, Singapore suffered from war-psychosis and, as a consequence, market there improved, under pressure of short covering. Black pepper improved to $(M) 115 from $(M) 107½ and white from $(M) 135 to $(M) 142½. London rallied from 32*d.* to 34½*d.* for white and from 24*d.* to 26½*d.* for black. New York spot ruled quiet at $0.31½ with minor changes under pressure of heavy arrivals with grinders sidelining.

Ungarbled at Cochin ruled at Rs. 336 throughout the week without inquiries to test the market. Garbled moved round about Rs. 348. *Jeth* delivery in Bombay went off the board at Rs. 368. *Shravan*, after touching the highest at Rs. 382, came down to Rs. 370 before improving to Rs. 375. *Badrapad* is quoted at a premium of Rs. 6.

July delivery at Cochin came down to Rs. 358 from Rs. 365 with business very very small.

The future of pepper is uncertain and is likely to take shape according to the selling policy of Indonesia. There are reports current in the market that the next crop of Malabar will be smaller and that the arrival of the new crop will be delayed. But it is too early to forecast the size of the crop and it is nothing but foolhardy to believe in such report at this time of the season.

Ready black pepper in the local market is quoted at Rs. 184 per 50 kgs.

CASTOR FUTURES AT A STANDSTILL

(From Our Own Correspondent)

BOMBAY, 1st *July*

The Board of the Bombay Oilseeds and Oil Exchange, with the consent of the Forward Markets Commission, announced this week that the maximum permissible level to which the September contract could rise was Rs. 181.50. This announcement brought trading to a temporary standstill, but, in the evening's unofficial dealings, the contract was quoted at Rs. 182.25, though it declined subsequently to Rs. 181.62. Since then the contract has been quoting just under the ceiling and there is no reason to believe that it is going to suffer any sizable reaction. In fact, the earlier ceiling for the September contract was Rs. 186 and, as the lower ceiling holds good only until the end of August, bulls interpreted that the contract would naturally come to its own after the time limit was over. Bears, too, should have thought likewise, for they came to cover their position on fears that they might incur further losses. The point is that the spot market in castor is very strong, with Madras quality quoted at Rs. 36.75 and Kanpur bold at Rs. 35.62. Oil Commercial ready and B.S.S. are also firm at Rs. 15.35 and Rs. 15.80, respectively. Export business in castor oil has been satisfactory. About 2,000 to 3,000 tonnes were said to have been transacted this week. Business was accounted for mainly by the communist bloc with Russia and East Germany being conspicuous among them. Export houses were, therefore, active buyers, while sellers in spot were inclined to keep away from the market.

There are some in the market who feel that the current levels of castor are much lower than they ought to be. Today castor fetches just half the price of groundnut. It is argued that, as the yield of oilseeds per acre is only two-fifths that of wheat or any other foodgrain for that matter, the former should normally be quoting at two-and-a-half times the latter, in order to make it remunerative for the farmer to grow more oilseeds. For example, Sharbati wheat is quoted today at Rs. 130 per quintal which works out to about Rs. 330 per candy. Castor should be quoting at Rs. 330, too, but it cannot be traded at more than Rs. 181.50. This argument looks quite sound, but it is a moot point whether the Forward Markets Commission will let castor seek a level of Rs. 330.

Castor June went off the board during the week at Rs. 178 plus a penalty of Rs. 5. Delivery orders for 1,575 tonnes were issued.

Linseeds June, too, ran out during the week at Rs. 42,75 and no delivery orders were issued. However, activity in linseeds was at a low ebb, although the market in both seeds and oil was firm. The September contract continued to be quoted at Rs. 44.75 which was just below the ceiling. The trend in linseeds was induced mainly by the general firmness of the market. Otherwise, nothing worthwhile happened during the week in this section.

Activity in the groundnuts section was moderate, but, here again, the trend continued to be firm. The supply position was tight and, consequently, the spot market was bid up to fresh high levels with Madras quality touching Rs. 64.25 per 50 kg. and Khandesh Rs. 64.50. Spot groundnut oil touched an all-time high of Rs. 24.85 and ex-mill Rs. 25.25.

United Kingdom advices were favourable and, although the market in London had at one time been marked down to £119, it improved again to £121. As mentioned in this column last week, at present, India has very little of groundnut oil to offer on the world market, but, with the demand being what it is, one can expect the prices to be maintained at the present high levels. Burma is mentioned as a keen buyer.

The most active counter during the week under review was groundnut extractions which touched a new high of Rs. 430 per ton. Market men were calling this an all-time high, but it now appears that no level is an all-time high one, as one cannot say with the slightest measure of certainty that the market will not seek a yet higher level.

In keeping with the trend in extractions, expellers touched a peak of Rs. 507 per tonne. It was said that East Germany bought about 12,000 tonnes for July and that the price paid by it ranged between Rs. 432 and Rs. 438 per tonne f.o.b. However, reports of beneficial weather induced unloading by bulls, with the result that extractions eased to Rs. 420 and expellers to Rs. 500. But the undertone of the market remained firm with extractions ready meal quoted at Rs. 428 and expellers ready at Rs. 504 on Wednesday.

In London, groundnut extractions advanced to £38-15 for June-July, £38-10 for August, £38 for August-December and £37-10 for November-

January. But it must be pointed out here that, at higher levels, there were more sellers than buyers.

Coming back to castor, the Board of the Bombay Oilseeds Exchange has decided to postpone the weekly clearing until its meeting convened for tomorrow. The steps taken by the Board are supposed to give a chance to bears to cover their positions. The Board will, however, review the situation as and when occasion demands. Further, the new contract will come into force from after 15th July and, as such, there is ample opportunity for operators to switch over to it. By and large, the basic position of the market continues to be strong. Spot prices are sizably higher than in the previous week, barring cottonseeds which have reacted in anticipation of large tenders. The spot section is also weak. The supply position, however, is easy but there is very little interest in the market on the part of operators.

The following table shows the closing prices of oilseeds and oils as on 1st July as compared with those of the two previous weeks.

	1-7-1964	24-6-1964	17-6-1964
Groundnuts	Rs.	Rs.	Rs.
Nizam bold	63.25	61.25	59.00
Khandesh quality	64.50	62.00	60.50
Oil ex-mill	25.25	24.25	22.95
Oil Rly. Receipt	24.80	23.80	22.05
Castorseed			
September 1964 contract.. ..	181.50	179.75	178.87
Ready Madras	36.75	35.12	34.87
Ready Kanpur	35.62	34.12	33.75
Oil B.S.S.	15.80	14.75	14.45
Oil commercial	15.30	14.15	13.75
Linseed			
September 1964 contract.. ..	44.75	44.62	44.47
Bold ready	47.50	46.25	45.00
Linseed oil	19.40	19.10	18.30
Cottonseed			
July 1964 contract	98.50	102.00	104.50

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

TEAS IN GOOD DEMAND

(From Our Own Correspondent)

CALCUTTA, 30*th June*

Good demand featured yesterday's export sales as also during the internal sales held in the last week. The tidal bores in the Hooghly affected shipments during the week, and demand for space in ready as well as forward loaders was intense. Heavier shipments are expected to take place in the coming few weeks. That shipments to the U.K. would continue to be heavy is indicated by the low level of stocks in U.K. which were only 126 million lbs. at the week ended 19th June as against 130 million lbs. in the previous week. Encouraging note has been taken of the increasing interest evinced in tea by the European Common Market nations. British consumption is about 10 lbs. per head and the Irish about 8 lbs., but consumption in the E.C.M. countries is much less than that. The *per capita* consumption in many European countries is stated to be less than 1 lb. Russian consumption per head is above ½ lb. This position emphasises the immense possibilities of expansion of the tea market in the U.S.S.R. and many other European countries. As a result of the efforts by the Tea Board, which has initiated promotional activities in the E.C.M. area with the unit's headquarters at Brussels, it is expected that exports of Indian tea to these countries would increase.

The difficulties faced by the tea industry in the Terai area in regard to securing adequate finance for capital and other expenditures, were dealt with at length by Mr. S. G. Raha in his address at the Annual General Meeting of the Terai Indian Planters' Association, held recently at Matigara in Siliguri. Referring to the restrictions imposed by banks on hypothecation loans, Mr. Raha demanded the Tea Board's intervention in the matter so that the industry was able to procure loans at least to the extent of the cost of production per lb. He also asked the Tea Board to consider easier capital repayment terms, lower rates of interest and easier terms of security for replantation loans which are granted by the Board. He also suggested the introduction of a deferred payment of excise duty to be collected at the time of the auctions, refund of excise duty on exports in respect of gardens succeeding in exporting 65 per cent of their total production, and a subsidy on freight. Mr. Raha emphasised that, if the industry were to achieve the plan target of output, the only alternative for the Government was to pay greater attention to make available more revenue and block capital for the industry. In this connection, he referred to the difficulties which the gardens are facing in implementing some of the recommendations for labour, like housing, due to lack of adequate funds. Mr. A. C. Roy, Chairman of the Indian Tea Planters' Association, also addressed the T.I.P.A. and said that it is also necessary for Government to pay greater attention to the matter of irrigational facilities to gardens as many of the drought-affected gardens had no alternative source of water for irrigation.

Strong demand characterised last week's internal sales, when dusts on offer totalled 8,832 chests. The brighter liquoring teas were particularly favoured by buyers. First flush C.T.C. teas were quiet, but all other C.T.C. teas were absorbed at increased rates. Bright Assam orthodox teas were also a strong feature, and prices recorded a liberal addition. Legg-cut teas hardened with the smaller powdery types being in the forefront. No quotations were issued in view of the absence of adequate quantity of representative grades. During the export sale held yesterday, offerings totalled 25,004 chests, which met with a good general demand. Buyers closely followed quality. The quotations per 1 kg. inclusive of excise duty were: Best Assam C.T.C. fannings Rs. 7.50 to Rs. 8.50; best Assam C.T.C. B.P. Rs. 7.40 to Rs. 8.40; medium Assam C.T.C. fannings Rs. 5.80 to Rs. 6.60; medium Assam C.T.C. B.P. Rs. 5.60 to Rs. 6.60; clean plain pekoe Rs. 5.20 to Rs. 5.40; plain B.P. Rs. 4.50 to Rs. 4.70; and plain fannings Rs 4.30 to Rs. 4.50. Keen competition was offered to the good and medium C.T.C. teas with brighter liquors, and fanning grades received more attention. Other C.T.C. teas met with less support, and prices were irregularly lower. Plain orthodox teas were firm. Dooars and medium Assams eased, but the brighter liquoring teas hardened. Flavoury Darjeelings were taken at higher rates, but the lesser kinds met with poor support. Whole leaf grades and the new tippy teas were steady.

UNORTHODOX TEAS DEARER

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, 25*th June*

A total of 779,000 kgs. was offered in sale No. 25 held on the 23rd inst. Quality of teas was generally maintained. There was strong general demand with interest being shown for all types on offer. Highgrowns were a little irregular but sold well with prices more often fully firm with quality. Good mediums were well supported, although somewhat irregular, but prices were on the whole fully firm. Medium brokens were about steady, while similar fannings showed a slightly easier tendency. Low mediums encountered keen competition and were fully firm to dearer. Plainest descriptions followed the firmer tendency of the market. Black leaf descriptions were again in good demand at fully firm rates. Whole leaf grades were the strongest feature of the sale, particularly orange pekoes. Unorthodox teas evoked stronger demand and were dearer. The small selection of tippy teas on offer met improved demand.

The quotations (per kg.) were:—

	1964	1963
	Rs.	Rs.
Low mediums	4.10-4.40	3.90-4.15
Mediums	4.30-4.60	4.20-4.35
Good mediums	4.60-5.10	4.40-5.20
Nilgiri B.O.P.	4.40-5.85	4.30-5.50

The average price realised in sale No. 45 was Rs. 4.31 per kilo, as against Rs. 4.31 a week ago and Rs. 4.05 in the corresponding sale last year.

In the dust sale held today, 290,000 kgs. were on offer. The market met with strong general demand. Highgrown descriptions were well supported at rates generally above last. All mediums were well sought after and were generally fully firm to dearer, but Wynaad types were somewhat irregular and barely steady. Unorthodox descriptions were in more demand and sold at firm to dearer rates.

The average price realised in dust sale No. 45 was Rs. 4.35 per kilo, as against Rs. 4.25 a week ago and Rs. 3.87 in the corresponding sale last year.

COLOMBO: There was good general demand. Best liquoring Western descriptions met improved demand. Uvas were irregular, although selling at rates above last, with all other types showing little change.

London: North Indian and other growths: In Monday's sale, there was good demand and prices were fully firm to dearer, except some plainer sorts which were irregular. Ceylon and South Indians: 29,525 packages were offered in Tuesday's sale, of which 4,458 packages originated from South India. There was strong general demand for Ceylons at dearer rates, with the exception of plain, thin liquoring B.O.Ps. South Indian teas received irregular support with the best being firm.

As we go to press, Messrs. Forbes, Ewart, and Figgis Private Ltd. wire us as follows:

"Leaf sale No. 26: 579,000 kg. offered. Good demand. Low mediums and mediums about steady. Good mediums firm. Highgrowns elicited more enquiry and were generally fully firm. Unorthodox barely steady."

JUTE GOODS STEADIER

(From Our Own Correspondent)

CALCUTTA, 30*th June*

Following more business in B. twills with the Government of India, steadier conditions were in evidence in the jute goods market during the week under review. Reports of a threatened strike by jute mill workers in Pakistan also contributed to pushing up sentiment for a time. The publication of figures showing a higher offtake for export last month, contrary to earlier expectations, was also a favourable factor. While heavy goods recorded small gains, hessian remained unchanged but steady, as there was no encouraging news from the New York burlap market where (40" 7½ oz. hessian at 8.65 cents a yard and the 10 oz. hessian at 11.40 cents a yard) remained unchanged. Earlier in the week, moderate interest was shown by shippers. Due-date business as well as covering aided sentiment. Although the waiting time for incoming ships at the Sandheads had been rapidly reduced since a few weeks, the tidal bore in the Hooghly experienced later in the week has led to a deterioration in the shipping position. This has led to the hold-up of ships at the Sandheads, in view of the difficulty in mooring them at the port for loading and unloading. As a result, shipments were affected this week. The shortage of lighters was not felt so much as in the previous week, because of the shortfall in loading as a result of hold-up of ships at the Sandheads. Ships could not be brought to berth at the riverside jetties and only a limited number of priority ships containing incoming foodgrain consignments could be attended.

The fall in U.S. consumption of burlap so far this year is naturally causing anxiety. This tendency, despite higher economic activity in the U.S.A., has led to the conclusion that, once again, substitutes are affecting prospects for hessian. It is now reported that, in the four months ended April last, U.S. imports aggregated only 332 million yards, representing a marked fall of 65 million yards or 16.37 per cent as compared with the corresponding period of 1963. While in the period under reference, Pakistan recorded a small increase in exports of hessian to the U.S. at 33.7 million yards, as against 33.3 million yards previously, Indian exports to the U.S. fell by 65 million yards to 280 million yards. It may be noted that this fall is equivalent to the total fall of imports into the U.S.A. This position calls for more vigorous campaigns in that country in favour of hessian and, against this background, it is good news that the Indian jute pavilion in the New York world fair elicited keen interest by overseas visitors. Following this fair, both the Government of India and the industry in Calcutta have already received some inquiries, and it is significant that these inquiries include interest in some new products. This emphasises the importance of the market research and product development work undertaken by both the Indian Central Jute Committee and the Indian Jute Mills Association. The recent trade delegation headed by the Government of India's Jute Commissioner, Mr. G. C. L. Joneja, to the U.S.A. and other West European countries has been timely. While, as a result of the long-term bilateral trade agreements with the U.S.S.R. and other East European countries, exports of jute goods to these countries have increased, it is emphasised that continuing attention to the traditional markets is essential. In the context of heavy fibre stocks with mills and the prospects of a bumper crop, increased exports of goods will be the only incentive for mills in India to continue production at the maximum capacity. In view of Pakistani ability to under-quote India in goods and supply overseas mills raw jute at lower prices than Indian mills pay for the indigenous fibre, the industry has again and again pointed out that a cut in fibre prices has become essential. It is thought that, by intensive cultivation and improvement of quality, the farmers have realised some economies and, having regard to the fact that in the production of heavy goods mills are sustaining losses, the case of mills for lower prices of fibre has become stronger than previously.

In an attempt to enable the industry to realise the aim of increased exports of goods this year—in 1963, exports amounted to 900,000 tonnes, the highest level since 1948—the Government of India has taken a series of measures in recent months. Further, modernisation of mills is encouraged, as this is necessary to cater to the new needs of highly quality-conscious markets such as the U.S.A. and Canada. Also Indian mills should introduce the latest technological innovations in an attempt to reduce production costs and improve quality. In this context, the new scheme introduced by the Government of India recently to enable mills to get equipment from abroad must be welcomed. Styled the self-financing scheme, it allows mills to pay the cost of imported machinery out of their foreign exchange earnings within a stipulated period. Allocations of foreign exchange for the import of machinery have been liberalised, and it is stated that licences issued for the import of jute mills machinery in the ten months to January last aggregated Rs. 5.40 crores which represents a three-fold increase as compared with those for the whole of 1961-62.

Against the background of the market belief earlier that exports in May had fallen as a result of shipping difficulties at the Calcutta port, it is gratifying to note that total despatches by mills for export in May increased to 75,600 tonnes from 71,200 tonnes in the previous month. Itemwise, while sacking fell by 1,300 tonnes to 20,300 tonnes, hessian, carpet backing cloth and miscellaneous goods rose by 4,500 tonnes, 400 tonnes and 800 tonnes to 40,100 tonnes, 6,200 tonnes and 9,000 tonnes, respectively. Total despatches against internal consumption at 28,900 tonnes showed a small rise of 1,300 tonnes. Both miscellaneous goods and hessian fell by 200 tonnes and 1,300 tonnes, respectively, to 3,100 tonnes and 3,700 tonnes, but sacking at 22,100 tonnes showed a rise of 2,800 tonnes. As a result, the combined despatches for export and internal consumption at 104,500 tonnes showed the welcome rise of 5,700 tonnes, with hessian at 43,800 tonnes accounting for a rise of 3,200 tonnes and miscellaneous goods at 12,100 tonnes showing a rise of 600 tonnes. Sacking fell from 40,900 tonnes to 42,400 tonnes. There is no change in the figure for carpet backing cloth, since this item figures in export trade only.

The fibre market ruled easy. Welcome rains interspersed by bright sunshines in several jute districts in West Bengal excited the anxiety of holders of old crop to find buyers. What is available now from the old crop is mostly mesta and other inferior grades. Even discounted offers failed to be responded by mills and their agents earlier in the week. However, subsequently mills showed more interest, as they needed to cover for the remainder of the June quota. Interest was confined to higher grades of mesta. At this time, there were reports of flood damage to crop in some low-lying areas of Assam. However, these did not lead to a hardening trend, since it was thought that, in the context of a higher crop prospect, some loss due to floods would not matter much. Moreover, every year, floods cause some damage to plants. Quotations for the old crop were as follows: Daissee bottoms Rs. 33.00, Assam bottoms Rs. 30.50, and Northern bottoms Rs. 29.50. Conditions in the goods market, as already stated, were steadier during the week under review, due to more shipper-covering and more tenders on behalf of the Government of India. Reports of labour troubles in Pakistan jute mills led to larger interest by overseas buyers for a time. The trade welcomed the President's speech at the annual meeting of the East India Jute and Hessian Exchange Ltd. held at Calcutta on 26th June. For it stated in no unmistakable terms the need for measures to assist the industry in its attempts to increase exports. The

sellers' market, which prevailed hitherto, had changed into a buyers' market, and Pakistan has emerged as a challenging competitor in India's sacking markets abroad.

On Tuesday last, ready hessian 40" 10 oz. was quiet at Rs. 44.40, while profit-taking made B. twills fall from Rs. 115.40 to Rs. 114.75. These prices were unchanged on the following day, when the feature was Government's tender for 5,150 bales of standard B. twills for July-August deliveries. The market was officially closed on Thursday, when B. twills and hessian 40" 10 oz. were nominally quoted at Rs. 114.75 and Rs. 44.25 respectively. On Friday, B. twills strengthened to Rs. 115.15, but hessian 40" 10 oz. eased to Rs. 44.26. Over the week-end, prices were firm at Rs. 115.00 and Rs. 44.10, respectively. Near and ready delivery B. twills again formed a Government tender, and business to the extent of 7,400 bales was done. This resulted in better conditions yesterday, when B. twills hardened to Rs. 115.60 and hessian 40" 10 oz. to Rs. 44.25.

MIXED TREND IN FOODGRAINS

(From Our Own Correspondent)

HAPUR, 29*th June*

A mixed trend was witnessed in the foodgrains market during the past week. While wheat and *gram* drifted lower, rice, coarse grains and pulses continued to move up. At the call of the Government to check the rising trend in prices, grain dealers of Hapur and six other towns of U.P. have voluntarily fixed ceiling prices of the best and inferior varieties of wheat at Rs. 24 and Rs. 22 per maund respectively, and export ban was declared from Meerut district by the District Magistrate.

Wheat declined here by Rs. 3 to Rs. 4 per quintal according to quality during the week following the ban on export from U.P. Average quality was now quoted between Rs. 55 and Rs. 57.50, and farm produce between Rs. 60 and Rs. 65 per quintal. Demand from the consumers side was also reported to be slack. Daily arrivals averaged 1,000 to 1,200 maunds, and local stocks were estimated around 2,500 quintals.

Rice continued to rule firm on brisk seasonal demand in the face of paucity of stocks. *Gadda* variety rose as much as Rs. 5 per quintal. Other varieties also were marked up. Stocks with trade were reported around 4,000 quintals. Week-end prices were:—Rice *basmati* superior Rs. 96.45 to Rs. 99.13; *sela* Rs. 93.77 to Rs. 96.45; *mainpuri* Rs. 77.70; *ramajwayan* Rs. 83.06; *raimunia* Rs. 84.40; and *gadda* Rs. 80.38 per quintal.

Gram was subdued on poor buying support due to the ban on exports from U.P. Prices eased by Rs. 2 to Rs. 3 per quintal to be quoted now at Rs. 58.50 per quintal for local produce and Rs. 57.60 for Punjab quality. Both stocks and arrivals, however, were poor. Barley and *bejhar* advanced sharply by Rs. 3 and Rs. 2.50 per quintal respectively, and prices now ranged between Rs. 47.50 and Rs. 50 and Rs. 48.50 to Rs. 51 per quintal. Demand was reported to be brisk in the face of poor arrivals. *Juwar* and *guwar* hardened further on good demand for seed purposes. Oats and *methi*, however, ruled quiet. Other sections were almost stationary. Week-end prices were:—Maize Rs. 47.50 to Rs. 50; *methi* Rs. 52.50 to 55; *juwar* Rs. 47.50 to Rs. 50; *guwar* Rs. 61.62 to Rs. 62.50 and oats Rs. 57.50 to Rs. 58.50 per quintal.

* * * *

The International Wheat Council, at the end of a three-day meeting on Thursday last week, recommended extension of the International Wheat Agreement of 1962 without amendment; the Agreement is due to expire on 31st July 1965. The extension, it was agreed, should not exceed two years and the Council would decide the exact length of the extension at its next meeting to be held from 18th to 25th November next. The Wheat Agreement, it may be noted here, seeks to assure supplies to importing countries and markets to exporting countries at reasonable prices and to promote international co-operation in solving wheat trade problems. The Wheat Council is made up of representatives of all Governments that signed the 1962 Agreement. The countries to be represented on the Executive Committee for the 1964-65 crop year are Australia, Canada, Soviet Union, and the United States among exporting countries and Benelux (Belgium, Netherland, Luxembourg), Canada, Soviet Union, India, Japan, Portugal, South Africa, and the United Kingdom among importing countries.

SUGAR RISES AGAIN

(From Our Own Correspondent)

HAPUR, 29*th June*

Sugar in the open market recorded further gains during the week on brisk buying support of the commodity in the face of poor supply position through fair price shops, coupled with non-availability of *khandsari*. The U.P. Government, however, has made arrangements to sell *khandsari* through fair price shops to bulk consumers. Sugar in the open market was quoted at Rs. 175 to Rs. 180 per quintal, as against the controlled price of Rs. 134.

Trading in *khandsari* continued at a standstill. The State Government has freezed *khandsari* stocks at Rs. 108 to Rs. 109 per quintal according to quality, but trade circles and *khandsari* producers are still urging for a rise in prices. The U.P. Government, however, is in mood to revise these prices and have threatened traders that, if they were to start some agiation in this connection, they would suffer losses.

There was selling pressure by stockists, as the quality of stocks left was of poor quality. The week's offtake against import permits aggregated 10 wagonloads during the week. Daily arrivals averaged 300 to 400 maunds and local *gur* stocks were estimated at 18,000 quintals, while the corresponding figure last year was much lower at 150,000 quintals. Cane crop prospects were fair, but damage to standing crop in some areas due to *salai* pest was reported. It was, however, stated that the cane crop needed rains now for healthy progress.

Shakker, was much in demand due to non-availability of crystal sugar in the market. Week-end prices here were:—*Gur pansera* superior Rs. 29 to Rs. 29.25; average Rs. 28.50;*kotha* selected Rs. 28.75; dry wet Rs. 28 to Rs. 28.37; and *shakker* Rs. 31 to Rs. 33 per 40 kilogram.

METALS QUIET

(From Our Own Correspondent)

CALCUTTA, 30*th June*

The comparatively quiet conditions that were in evidence in the Calcutta metal market during the week under review followed an improvement in the supply position as a result of fresh arrivals. The present attempts made abroad to arrest the up-trend in copper on the genuine apprehension entertained by the producers about a boost in substitutes in the event of the continuation of the up-trend for any length of time also helped the market. Considering the fact that producers in Rhodesia and Chile have stepped up production, the apprehension of a world shortage is dismissed. By the end of this year, it is expected that the free world copper output would have exceeded the demand. The copper price stabilisation policy of the Anglo-American and Rhodesian Selection Trust has been significantly hailed by the Northern Rhodesian Prime Minister, Mr. Kenneth Kaunda, who declared that a spectacular boom in copper followed by a disastrous slump should be avoided. On the London Metal Exchange during the week under review, spot copper wire-bars strengthened to £296 a ton after opening at £291 and being lower at £287 for a time. Spot cathodes and spot fire-refined metal closed higher on balance at £287½ and £281 respectively as against the opening rates of £282 and £280. On the other hand, the improvement in the supply position of the virgin metal, utensil copper scrap, in Calcutta, eased from Rs. 675 per 100 kgs. to Rs. 660.

The trade and industry have noted with disappointment the recent changes made by the Government of India in regard to the export promotion scheme as applicable to the non-ferrous metals products. According to these changes, the import entitlement of a manufacturer or merchant trader, exporting specified items has been reduced to 75 per cent from 100 per cent of the f.o.b. value of items exported. The merchant exporter is no longer entitled for the import quota, but the licences will be issued only to a manufacturer-exporter. The group system, according to which manufacturers of various items had been differently grouped for the purposes of the export promotion scheme, is given up. It will be remembered that it was only in the last year that the import entitlement quota was raised to 100 per cent and since then the exports of non-ferrous metal products have been increasing. It is regretted that without allowing sufficient time to the trade and industry to show better results, the Government's policy has been reversed.

Overseas reports have hinted at the possibility of the U.S.A. becoming a member of the new International Tin Agreement that will become effective in 1966. Although the U.S.A. is not a producer of tin, and only producing countries sign the Agreement, the heavy national stock-piles of tin in that country and their weekly releases have meant that the U.S. stocks is also a factor in the moulding of the international price of tin. In recent months, the price of tin has been steadily moving upward, and a new high of £1,260 a ton on the London Metal Exchange has been reached. United States has often declared that its policy of weekly releases would be so shaped as not to impart a non-stabilising influence, but that the U.S. Government should safeguard supplies to low-income countries. The U.S. Assistant Secretary of State, Mr. G. Griffith Johnson has recently indicated America's readiness to support formal commodity agreements aimed to improve conditions in particular commodity markets. The L.M.E. price for spot tin during this week closed at £1,200 a ton, after opening higher at £1,240. In Calcutta, the quotation rose from Rs. 2,850 per 100 kgs. to Rs. 2,900.

On the L.M.E., spot zinc opened at £139 a ton but skid to £134, with the three-months quotation closing lower on balance at £121½ as against £123¾ earlier in the week. The rate in Calcutta steadily rose to Rs. 324 from Rs. 318 per 100 kgs. United States will soon release about 75,000 tons from its stocks, but, if the world price should be prevented from a further rise, a higher release is called for. Consuming countries are pressing the States for direct allocations from its national stocks. Spot lead in London opened at £91¾ a ton and after hardening to £92¼ closed lower on balance at £91½. In Calcutta, the price moved down from Rs. 298 per 100 kgs. to Rs. 290.

Notice

THE METAL BOX COMPANY OF INDIA LIMITED

NOTICE OF ANNUAL GENERAL MEETING

NOTICE IS HEREBY GIVEN THAT THE Thirty-first Annual General Meeting of the Company will be held at the Registered Office, 59C Chowringhee, Calcutta, on Wednesday, the 22nd day of July 1964, at 12.30 p.m., for the following purposes:

1. To receive and consider the Statement of Accounts for the year ended 31st March 1964 and the Reports of the Directors and Auditors thereon.
2. To declare a Dividend.
3. To elect Directors.
4. To re-appoint and fix the remuneration of Auditors.
5. To transact any other ordinary business of the Company.

SPECIAL BUSINESS

The consideration of the following Resolution which will be proposed as a Special Resolution:

"That the consent of the Company be accorded by this Special Resolution to the holding by Mr. T. M. Rama Aiyangar, who is an Alternate Director of the Company, of the office or place of profit of General Commercial Manager."

Explanatory Statement and Note

The consent of the Company by Special Resolution is requisite to the holding of his office or place of profit by an Alternate Director of the Company.

A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member. Proxies, in order to be effective, must be received by the Company not less than 48 hours before the Meeting.

NOTICE is hereby given that the Ordinary Share Register of the Company will be closed from 6th to 22nd July 1964, both days inclusive.

By Order of the Board.

B. BARKER.
Secretary.

59C CHOWRINGHEE, CALCUTTA,
27th June, 1964.

BENGAL PAPER MILL CO. LTD.

(Concluded from page 37)

ing the previous year. The net profit, however, declined to Rs. 3,52,330 during the year compared to Rs. 15,18,412 during the previous year. The decline in the net profit has been due to increased provision for depreciation and development rebate. In view of the increasing cost of production and fixed selling prices, the above profit should be considered satisfactory. After considering the various aspects, your Directors have recommended the same dividend of 20 per cent on equity shares for the year under review.

Expansion and Modernisation

The shareholders will be pleased to know that the Company has been able to complete the first phase of the expansion and modernisation programme. The new paper machine No. 6 was commissioned on the 13th November 1963 as per schedule. This is the machine having the highest running speed of all the machines so far installed in this country. Along with this machine your mill is able to produce 100 tons of paper a day.

The stock preparation plant, multi-stage bleaching plant and coal-fired boiler were commissioned during the year according to schedule, as indicated by me last year. The new turbo generator was commissioned in January, 1964 and the recovery boiler in May 1964. There were, however, teething troubles, and especially a serious interruption took place in the power generating unit which was recommissioned at reduced speed by the help of foreign technicians. Additional arrangements have also been made with the power supply companies by which the mill would be able to keep up the production programme. The full utility of the Company's power plant will be available as soon as the delivery of the turbine shaft is received from U.S.A. The Government of India invited the paper industry to submit such schemes which by modification, adjustment and by adding balancing equipment, would increase the paper production in the country within a short time and involving a minimum foreign exchange. Your company also submitted a scheme to increase the capacity by another 21,000 tonnes at an approximate cost of Rs. 1.5 crore. I am glad to inform you that our scheme was approved by the Government and we have been granted an industrial licence for this increase in the capacity. Necessary steps for implementation of the same will be taken in due course.

The relation with staff and workers continues to be cordial and I would, on your and on my behalf, like to express our appreciation of their sincere services rendered to the Company.

Note: *This does not purport to be the proceedings of the Annual General Meeting of the Company.*

STOCK & SHARE QUOTATIONS

Abbreviations :—D.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N:—Nominal quotations, x.d.—Ex. Dividend. c.d.—Cum. Dividend. I—Interim Dividend. C.R.—Cum. Right. XR.—Ex. Right.

Shares :—If a company has different classes of shares—as for example : 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up' per share.

Accounts :— Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

VOL. CIX. No. 2777 BOMBAY, 11th JULY 1964 PRICE Rs. 2

WHAT IS WRONG WITH CAPITAL MARKET?

THE inauguration of the Industrial Development Bank of India in Bombay on the 3rd inst. provided an opportunity to businessmen and industrialists to understand the mind of the Union Finance Minister on an issue that is causing them great anxiety, namely, the depressed state of the capital market. It was to his issue that Mr. T. T. Krishnamachari devoted the major part of his inaugural speech. There need be no hesitation in recognising that the speech was on the whole constructive in approach, though it did not contain clear-cut solutions designed to boost the sentiment of the capital market excepting for the statement that the Capital Issues Control had been asked to relax, in suitable cases of new issues, the debt-equity ratio of 2:1. Mr. Krishnamachari was, of course, candid enough to admit that, if the response to new issues and the barometer of the share market were indicators of the state of wealth of the economy, there was room for concern. But he was not prepared to concede the need for any major modifications or concessions in the Government's economic and fiscal policies.

Mr. Krishnamachari has no doubt been emphasising, ever since his return to the Finance Ministry last year, the need for reviving the confidence of investors. And he has also taken quite a few steps in that direction. Mention may be made of the abolition of the Super Profits Tax and its replacement by a milder Surtax calculated on a wider capital base, the incentives provided in the Finance Act for the corporate sector, the lower rate of tax for technical fees payable to foreign companies, and a number of other incentives to foreign investment. All these, as Mr. G. L. Mehta, Chairman, Indian Investment Centre, stated in his speech at the annual general meeting of the Centre in Bombay on Thursday this week, have sought to rectify the situation to some extent. But there is as yet no evidence to suggest that these steps, in their totality, would achieve the accelerated rate of growth that every one is keen on. At any rate, the confidence the budget proposals sought to infuse in the capital market has not been reflected by stock markets. The all-India index number of variable dividend industrial security prices (base: 1952-53=100), which stood at 174.3 just before the presentation of the budget, has gone down to 164.0 (for the week ended 27th June). That the budget proposals have not been adequate to tone up the capital market will be evident from the marked decline in the number of "further" issues (especially those made at a premium) and the poor response to the "initial" issues, barring a few selected good ones. Indeed, the public support for several new issues has been so niggardly that the underwriters have had to take up a substantial portion of them.

If, in spite of Mr. Krishnamachari's claim that his recent budget has accorded "large" concessions to the private sector, the capital market is dull and drab, the question arises: Why? According to Mr. Krishnamachari, the reasons are the following:

1. It might well be that there is no money or perhaps not enough money available for investment.

2. It might even be that the money that is available would not come out for the reason that it might then be taxed.

3. It might also be that managing agencies are no longer able to inspire confidence and attract capital as they once did.

4. The present phase might be the inevitable counterpart of the scramble for new issues which developed in 1960 and 1961. Feverishness, whether in a man or in a stock exchange, is always a symptom of bad health.

Few can disagree wholly with this assessment, as also with Mr. Krishnamachari's emphasis that there are two basic weaknesses which need early attention on the part of private enterprise. One is that the promoters do not care to canvass for investment. The other is the large reliance on underwriting institutions as an end in themselves. To these weaknesses, we may also add a third factor, namely, the grave mistakes made by promoters. There are some industries in which the private sector has not lived up to the promises held out at the time of issuing prospectuses. The depreciation in the value of investments made in these industries is so high that it has dampened the enthusiasm of investors for new issues. Several new issues, too, have recorded a depreciation in their values.

When such is the state of the capital market, how can the private corporate sector be expected to fulfil the huge investment target of about Rs. 3,200 crores tentatively set for it in the fourth Plan? This target represents a rise of Rs. 1,200 crores as compared with the total investment of Rs. 2,000 crores expected to be incurred in the current Plan. What is more, a significant part of the outlay (Rs. 1,500 crores out of the total of Rs. 3,200 crores) will have to come out of the internal resources of the corporate sector; the amount of Rs. 1,500 crores is exactly double the corresponding estimate for the third Plan. Mr. Krishnamachari himself pointed out that there was no escape from a policy of encouraging larger savings in the corporate sector and measures to channel them into desired lines of development. But he did not spell out clearly the elements of this policy. All that he said was that some of the measures in the last budget were formulated with this very objective.

There is no gainsaying the fact that both entrepreneurs and investors continue to adopt an extremely cautious attitude which is restraining the new issue activity. The establishment of the Industrial Development Bank and the Unit Trust will no doubt go some way in strengthening and broadening the framework of the capital market as the source for the supply of funds to industry. But, if the cautious attitude of entrepreneurs and investors is to yield place to a venturesome one, it is imperative that the Finance Minister should have a second look at his budget proposals with a view to (*a*) encouraging larger savings in the corporate sector, (*b*) inducing more entrepreneurs to launch new enterprises, and (*c*) providing sufficient incentives to individuals. The dividend tax, for instance, can be made applicable only to excess dividends or, if this is not possible, a rebate can be given to companies on the amount transferred to reserves and retained in business. Further, the tax on notional capital gains on bonus shares must be done away with and the heavy incidence of Estate Duty and Gift Tax reduced. Again, small companies with a paid-up capital of Rs. 10 lakhs or a turnover of Rs. 20 lakhs, whichever is higher, should be exempted from the mischief of Section 104 (old Section 23A) of the Income-tax Act. The Annuity Deposits Scheme, too, requires a thorough modification, if not complete abandonment. The present exemption limit (annual income of Rs. 15,000) must be raised substantially and the rate of deposits reduced drastically.

Mr. Krishnamachari, it is somewhat regrettable, refuses to believe, in spite of convincing arguments put forward by many, including this journal, that the increase in Estate Duty and Gift Tax has significantly acted as a damper to investment. In one breath, he emphasises that the flow of savings into equity stock must increase and that every effort must be made to sustain such an increase. But, in another breath, he says that "there is no use arguing, as some people do, that a reduction of taxation, greater incentives to the private sector, or Government giving up its determination to pursue socialist objectives would do the trick and revive the capital market." What a capital market needs is, according to him, not the speculator in search of quick gains, a herd of bulls in pursuit of bears, but the genuine investor who, when he buys the shares of a new company, does so with the knowledge that he will have to wait for some time before he gets any return; of course, the return which he ultimately gets has to be adequate and commensurate with the period of waiting.

While speculation with the object of getting quick gains to which Mr. Krishnamachari has referred is highly undesirable, the point is that the bulk of the investments going into shares comes from shareholders who belong largely to the middle-income group. It is this group that is fin

PARTIAL TEXTILE CONTROL

IT will be idle to pretend that the scheme of textile control, outlined by the Cotton Textile Consultative Board at its meeting held this week in Bombay, is free from defects or that it is easy to work it. If the scheme has been generally welcomed even in industrial circles, it is because it retains a certain measure of freedom for the mills in respect of their marketing operations. In other words, the welcome feature of the scheme is that it keeps controls to what it considers to be a fair minimum proportion of the total mills' output of cloth. In doing so, it has set its face against full-fledged control on cloth which, as past experience shows, raises more problems than it solves. Finding that the *ad hoc* voluntary control on textiles instituted by the industry has not worked as well as was originally expected, the Board has found it necessary to replace it by a statutory control on 40 per cent of the mills' production of cloth (except cloth meant for defence and exports).

If the industry's voluntary price control did not work as well as was once thought possible, the blame must rest squarely on the Government's shoulders. Had the Government been imaginative enough to build into this scheme some flexible method whereby cloth prices could reflect changes in production costs, the scheme might still hold the field today. The Government did nothing of the kind. Despite repeated reminders by the industry that it had no sanctions to enforce a scheme which was being weighed down under the rising pressure of production costs, the Government chose to sit pretty tight on it in the hope that the industry would carry on as best as it could. But then the inevitable result took place. Several mills found it difficult to work this scheme and, having abandoned their self-imposed restraint, they raised the prices. Judging from press reports, the Government did not take kindly to what the industry did. But, if it was in earnest about maintaining the scheme intact, it was still open to it to reform the scheme in a manner that would have made it a realistic mirror of the changing elements that go to make the overall textile costs. From the general tenor of its proceedings, it is clear that the Board was determined to scrap the scheme and to replace it by a more comprehensive measure. Broadly speaking, the reform envisages, as already stated, a control on 40 per cent of the mills' production, leaving the mills free to produce and market the balance as they please.

As it will take some time—at least some three months—before the statutory controls can come into effect, it is now agreed that the working of the voluntary price regulation scheme should continue during the interim period. Again, during this period, the prices of certain old varieties—that is, those which were in existence before 1st January 1962—will be refixed by the Textile Commissioner in consultation with the industry. However, no increase in prices will be allowed in respect of new varieties of cloth which the mills commenced producing after 1st January 1962. Fearing that any further change in the pattern of cloth production will make the transition to the new system of controls more difficult, the Board has held that no new varieties should be produced during the interim period. When the new regulation comes into effect, the controlled varieties will have the prices marked in red and the non-controlled varieties in blue. The choice of the varieties that will come under control is left to an Advisory Committee consisting of official and non-official representatives. The controlled cloth will be made available through consumer co-operatives and fair-price shops. To avoid any malpractice at the retail end, the Board has suggested that vigilance committees of consumers, public workers and other interests should be set up in each town or city.

Such in broad outline is what the Board has proposed as a solution to the problem of rising cloth prices. The success of the scheme would depend on how ably the Government succeeds in meeting the three difficulties that seem to be inherent in the scheme itself. In the first place, much will depend on a wise choice of the varieties that will come under control. If the varieties are chosen wrongly, they just will not appeal to the consumer. It must be remembered that consumer preferences have changed a great deal in the last decade or two. Consumers seem to want better cloth. There are also regional differences in the varieties of cloth consumed and also differences in consumer tastes as between the rural and the urban areas. It is no easy task to assess these differences and set the right pattern for mill cloth production under the controlled categories. Secondly, the co-operatives and the fair-price shops which will have to lift the cloth must have adequate finance if they are to serve as efficient channels of distribution. Moreover, past experience shows that even co-operative societies prefer superior varieties of cloth to slightly inferior varieties. And if they choose to distribute only the popular varieties, whether controlled or non-controlled, and refuse to take the rest of the cloth, the mills may be overburdened with an unsold surplus. Thirdly, the scheme does not provide for any situation arising out of unsold cloth and of any possible tendency among mills to inflate the prices of uncontrolled varieties and also downgrade the quality of the controlled varieties. These shortcomings are bound to come up time and again when the scheme begins to be worked. They are stated here not so much as an argument against the entire scheme but as a pointer to the pitfalls which one should expect in the working of the scheme. It is better to be warned of the dangers than to be caught by them unawares.

Realising that it is essential that the textile output as a whole should be raised in order to meet the rising demand for cloth, the Board has done well to outline two commendable measures. First, it has suggested that the mills should work their plant and machinery more intensively. Secondly, the Board has pleaded for more imports of balancing machinery and equipment such as will enable the mills to undertake a vigorous scheme of expansion of their output. It may be mentioned here that the Indian textile machinery industry is now not in a position to meet fully the textile industry's requirements of machinery. And insofar as the Board's suggestions envisage more imports, they should be welcomed as a realistic approach to the problem. In fact, any modest expenditure in foreign exchange which such imports might involve would be adequately compensated by increased production and exports. In any case, if the measures now recommended by the Board result in increased production, they will have contributed not a little to the easing of the cloth position. In the first five months of the current year, cloth production has moved up by 69 million yards to more than 2,060 million yards and the output of yarn by about 63 million lbs. to over 850 million lbs., as compared with the corresponding period of last year. Given better co-operation from labour and adequate supplies of cotton, it should be possible to raise cloth output further. When such an increase in textile production is achieved, it will be easier to implement any specific scheme of control over cloth; absolute shortages in supply will lead to a situation in which even the most rigorous scheme of cloth control must fail. The essential thing to do is to raise the output of cloth. In the final analysis, the Board's proposals will be judged by the fillip they provide to higher production.

BUNGLING IN FOOD

THE Union Ministry of Food and Agriculture, it is well known, has been fashioned all along to devote most of its energies to such questions as imports, prices, procurement, movement, distribution, zoning, cordoning, trading, licensing and the like. It has thus come to accord primacy to "food" as a problem of scarcity. In its anxiety to solve the problem (or, perhaps, not to solve it), the Ministry has built up over the last seven or eight years a cumbersome machinery for directing or administering partial food controls in all their bewildering complexity. Incidentally, these partial controls, which do not involve monopoly procurement from producers at control prices and statutory rationing as in 1948-52 when full-fledged control was in force, have been thought of as a half-way house between a wholly free economy and a fully controlled economy. But they have in fact become a cobweb of restrictions, complicating further an already complex food problem, with the result that they either seem to combine the worst features of both types of economy or do not seem to combine the best features of either. It is within this framework of partial control that restrictions are periodically relaxed or tightened up with no lasting results in terms of either lower prices or fuller supplies. The entire framework is such that it is inextricably linked with the problem of food distribution. This is the legacy that Mr. C. Subramaniam, the new Minister for Food and Agriculture, has inherited. Whether his "dynamic" impact on the Ministry will turn it in the right direction—the direction of greater food production—remains, however, to be seen.

As of today, there are no encouraging pointers to such a salutary result. On the other hand, there is the depressing spectacle of the Food and Agriculture Minister continuing to think of food as a problem of procurement, distribution, prices and imports. He has just announced (*vide* his Press conference at New Delhi on the 3rd instant) that 2,000 rice mills, capable of handling 20 million tonnes of rice, are to be established in the public and co-operative sectors by the end of the fourth Plan "in keeping with the Government's policy of securing a commanding position in the procurement and distribution of foodgrains." And he has also stated that neither new rice mills would be licensed in the private sector nor would existing rice mills, with their obsolete equipment and technology, be taken over by the State. If, thus, the Union Food and Agriculture Ministry has chosen to violate the spirit of the Bhubaneswar Congress resolution on the taking over of rice mills, could it not have also wisely decided not to think in terms of setting up rice mills in the public sector? After all, it would any day be easier and cheaper to expand and modernise the existing rice mills than to set up entirely new ones with imported machinery and equipment. Only, for this, the Government might have to evolve suitable financing arrangements under which, incidentally, effective control over the operations of the rice milling industry could also be ensured. As even otherwise the industry's procurement and distribution activities could be suitably regulated, it would not be prudent to incur heavy capital outlays on hundreds of public-sector rice mills, as if the establishment of these mills would, by some magic, enlarge the supplies of rice. But such imprudence would seem to be inevitable in the context of the Union Ministry's chronic obsession with food as a problem of procurement and distribution.

INDEX NUMBER OF WHOLESALE PRICES

(1952-53=100)

Year	Cereals	Sugar and Gur	Oilseeds	Fibres
1956-57	99	92	117	121
1957-58	96	113	116	111
1958-59	101	128	128	107
1959-60	103	141	140	125
1960-61	100	117	160	176
1961-62	102	122	148	126
1962-63	103	148	143	134
1963-64	123	168	166	136

Likewise, the Food Ministry is always obsessed with the elusive goal of evolving a set of foodgrain prices that would be acceptable to both producers and consumers. Mr. Subramaniam's view, expressed at his Press conference, is that a long-term policy could be evolved to stabilise prices for the consumer without making them unremunerative to the producer. The expectation here seems to be that, at such an ideal level of prices, ample supplies will flow into the market. But it has been ignored, in this context, that the trend of commercial crop prices is bound to have a significant impact on the course of prices and marketed supplies of foodgrains. One may recall, in this connection, that the increase in the wholesale prices of commercial crops (*vide* the accompanying table) was relatively very much higher over the period 1952-53 to 1962-63 than the increase in cereal prices. The further rise in the prices of commercial crops in 1963-64 may have been partly responsible for the rise in cereal prices, because, when the money returns from commercial crops were obviously greater, the cash needs of agriculturists should have been met to a substantial extent, thereby obviating the need for premature selling of their cereal surpluses.

This price analysis is not meant to suggest that commercial crop prices should be restrained, thereby lending support to the Food Minister's view that no price policy should encourage growth of cash crops to the detriment of food crops. If anything, there can be no question of restricting the commercial crop sector, for larger production of sugar, cloth and edible oils would be necessary to meet the ever-rising consumer demand for these products. As it is well-nigh impossible to bring foodgrain prices and commercial crop prices into some sort of balance, the only sensible course would be to undertake stabilisation operations with the possible help of the proposed Foodgrains Trading Corporation or Corporations, purchasing foodgrains at certain floor prices in a falling market and selling them at fair prices in a rising market. For the rest, the market forces of demand and supply should be allowed greater freedom to bring about a natural and organic balance between the prices of foodgrains and those of commercial crops.

MARKET GOSSIP

Central Government Loans

SOON after we went to press last week, the Government of India announced (late in the evening of Friday, 3rd July) the second instalment of its borrowing programme. The instalment consists of two cash loans for a total amount of Rs. 150 crores. The loans are a further tranche of (*a*) 4 per cent 1970 loan at Rs. 99 per Rs. 100 (nominal) repayable on 15th April 1970 and (*b*) 4¼ per cent 1989 loan at par repayable on 15th April 1989. The list opens on Monday the 13th inst. and will close on the 15th inst. or earlier in case the total subscriptions amount to Rs. 150 crores. The Government reserves the right to retain subscriptions upto 10 per cent in excess of the notified amount, that is, upto Rs. 165 crores.

This year's borrowing programme of the Central Government differs from that of last year in four important respects. In the first place, the programme seeks to cover the requirements of the Centre only, whereas last year's programme was a combined one launched on behalf of both the Centre and the States. Secondly, the second instalment of the borrowing programme this year, as already stated, consists of two purely cash loans, unlike last year when two cash-*cum*-conversion loans were issued. Thirdly, one of the two loans this year is a long-dated one, maturing after about 25 years, while one of the loans issued last year was a medium-dated one, maturing after ten years; in both the cases, the other loan is a short-dated one, maturing after six years. Fourthly, for the short-dated loan, the Government is paying a little higher than last year, though the two loans bear the same rate of interest (4 per cent), for the issue price of this year's loan is 50 paise lower than that (Rs. 99.50) of last year's.

The 1964-65 budget of the Central Government, it will be recalled, provides for a total market borrowing of Rs. 295 crores. Since a sum of Rs. 141.52 crores has already been obtained from the two conversion loans (against the 3½ per cent National Plan Loan 1964 and 3 per cent Loan 1964 issued in April last), the balance is only Rs. 153.48 crores. The aggregate amount of the two cash loans announced now more or less corresponds with this figure, after taking into account the Government's right to retain subscriptions up to ten per cent in excess of the notified amount.

Besides the Centre's borrowing programme of Rs. 295 crores, the State Governments also will be entering the market individually later in the slack season, presumably in the second half of next month or early in September. The total collections are expected to be of the order of Rs. 100 crores. In other words, the aggregate market borrowings by the Centre and the States for 1964-65 will amount to about Rs. 395 crores, as against the Rs. 367 crores raised in the previous year.

The total amount of the Centre's two new cash loans might have been less than Rs. 150 crores, if the response to the two conversion loans (issued in April) had been fully encouraging. Although the conversion facilities offered were attractive and the Reserve Bank had held a sizable portion of the holdings, the two loans were converted to the extent of only Rs. 141.52 crores (total), as against the aggregate outstandings amounting to Rs. 188.51 crores. The shortfall thus of Rs. 46.99 crores had to be repaid in cash. The response to the new cash loans, however, is likely to be very much better. Indeed, the indications are that the loans may be oversubscribed by a considerable amount for the following reasons:

1. The terms of the new loans are quite favourable. Their issue prices are same as the current market rates of loans of identical maturities: the 4 per cent 1970 is currently quoted at Rs. 99 and 4¼ per cent 1989 at Rs. 100.

2. The redemption yields on the new loans are fairly attractive: 4.20 per cent in the case of 4 per cent 1970 and 4.75 per cent in respect of 4¼ per cent 1989.

3. With the enforcement of higher statutory liquidity requirements of the banking system with effect from 1st September next (28 per cent, as against 20 per cent at present), the banks will have to go in more for Government securities.

4. Conditions in the money market are extremely comfortable, with the call money rate now quoted around ½ to ¾ per cent, as against 1½ per cent on the eve of loan flotations last year. The banks may be expected to lend good support to the loans, especially to the short-dated loan, while the Life Insurance Corporation, Provident Funds and Trusts will invest largely in the long-dated loan. The banks are certainly in a much better position today than before to subscribe to the new loans. The net accretion to the deposit portfolio of scheduled banks is expected to be larger in the current slack season as compared with the previous season. The actual increase since the beginning of the season upto 26th June was as much as Rs. 66 crores, as against Rs. 38 crores in the corresponding period last year. While the growth of deposits has been faster, the total credit made available by scheduled banks has contracted to a greater extent—by Rs. 77 crores, as against Rs. 68 crores. The cash balance of banks has improved, while borrowings from the Reserve Bank have been reduced more markedly than a year before (*vide* the accompanying table). The position of banks is expected to improve further in the coming weeks.

Judged against this background, one can reasonably expect that the banks will invest sizably in the new loans, especially the short-dated loan. It is true that, as a result of larger investments in Government securities and higher interest rates on deposits, the banks' average rate of earnings will be lower. But the banks know that they can make up for the loss by charging their customers a little extra. There are already rumours that the average lending rate of banks will be raised by ¾ per cent to 8½ per cent from September. The average, it is said, will be achieved individually by all banks and not under any agreement, though the minimum lending rate will continue to be maintained at the level of 6½ per cent prescribed under an inter-bank agreement.

The possible upward revision in interests on bank advances and the higher yield pattern of the new loans prompt one to ask: Will there be a rise in the Bank rate from the present level of 4½ per cent? Many are inclined to feel that such a rise is inevitable in the present context of highly inflationary conditions.

Cement Price Increase

The Government of India has revised, with effect from 1st July 1964, the price of unpacked cement from Rs. 97.75 per tonne to Rs. 99.75 per tonne, f.o.r. destination. The price increase is thus to the tune of Rs. 2.00 per tonne and is stated to have been sanctioned in the light of an official appraisal of increases in cost of production, freight, etc. Of this increase, only Re. 1.25 per tonne will go to the benefit of cement producers. In other words, the ex-works price of cement has been increased by just Re. 1.25 per tonne. The Cement Manufacturers' Association has taken the stand that this increase is too little, for, together with the net increase of Rs. 2.50 per tonne allowed in the retention price from 1st June 1963, it can only partly neutralise the cost increases since 1st November 1961 when the cement retention price was fixed in terms of the Tariff Commission's report.

The Association has pointed out that the last effective increase of Rs. 2.50 per tonne in the retention price with effect from 1st June 1963 fell short of the actual increase of Rs. 4.89 per tonne in costs of production till that date. Since that increase was not given retrospective effect from 1st November 1961, the industry had incurred huge losses which ate into its meagre resources. Between 1st June 1963 and 30th April 1964, costs had gone up further by Rs. 1.025 per tonne. Thus, over the period 1st November 1961 to 30th April 1964, the cost increase was as much as Rs. 5.915 per tonne. But the price increases granted by the Government so far have come to only Rs. 3.75 per tonne in all. What is more, since the latest price increase has effect only from 1st July 1964, the industry as a whole has lost a further Rs. 3.25 crores over the period 1st June 1963 to 30 June 1964. The loss is very real, for the cost increases have been on account of power, fuel, rail freight, etc. It cannot be recouped except by an adequate price increase. The niggardly increase of Re. 1.25 per tonne just sanctioned cannot also be expected to enthuse the industry which, according to general recognition, has a low margin of profit and a low level of reserves and consequently finds it difficult to attract capital for expansion. The very fact that the present price increase has practically had no effect on cement share prices—some cement shares have actually declined since 2nd July 1964—would seem to suggest that the market's assessment of the industry's basis difficulties has not undergone any change.

T.I.S.Co. Raises Dividend Again

In consonance with general expectations of stock markets, the Directors of the Tata Iron and Steel Co., Ltd. (T.I.S.Co.) have stepped up the ordinary dividend again from Rs. 11 to Rs. 12 per share of Rs. 75 (subject to deduction of tax) for the year ended 31st March 1964. The increase of Re. 1 thus is larger than the increase of 64 nP announced last year when the total dividend was raised to Rs. 11 from Rs. 10.36 distributed in 1961-62. What is more, a higher dividend has been proposed for 1963-64 after making all essential provisions and without using reserves. Indeed, this is the first time in the past six years that the Company has not withdrawn anything from reserves for the purpose of dividend distribution. The rise in dividend has been rendered possible largely because of the encouraging working results for the year. The Company's turnover in 1963-64 touched the all-time peak of Rs. 110.44 crores, representing a rise of as much as Rs. 11 crores as compared with the previous year's turnover of Rs. 99.53 crores. The shareholders are, however, a little disappointed in that, despite a sharp rise in turnover and the handsome profit of Rs. 80 58 lakhs accruing from the previous year's operations, the gross profit of the Company has risen by no more than Rs. 2.23 crores to Rs. 24.44 crores. This is apparently due to the impact of the steep advance in production costs and other expenses, unaccompanied by a corresponding increase in retention prices. Out of the gross profit of Rs. 24.44 crores, the Directors have made the following essential allocations:

(In lakhs of rupees)

	1963-64	1962-63
Depreciation at the rate of 5 per cent on original cost	797.04	770.28
Additional depreciation provision to make up the total amount admissible under the Income-tax Act ..	Nil	395.47
Transfer to general reserve	275.00	Nil
Transfer to development rebate reserve	100.00	870.00
Transfer to deferred taxation reserve.	270.00	Nil
Taxes	475.00	80.00
Total ..	19,17.04	21,15.75

The above allocations leave a balance of Rs. 5.27 crores, of which Rs. 5.25 crores have been transferred to the dividend reserve from which the distribution of dividends is to be made, the balance being carried forward. The total dividend absorption will amount to Rs. 440.92 lakhs.

The Inflationary Malaise

Inflation is a world phenomenon—a persistent danger to stability almost everywhere. The rate at which monetary depreciation (that is, the yearly shrinkage of the buying power of money) has taken place in recent years, however, varies from country to country. Noteworthy, in this connection, is the latest annual review of the comparative rates of depreciation of money, contained in the *Economic Letter* (July 1964) of the First National City Bank of New York. This review contains a table which presents in two ways the shrinkage of purchasing power of the currencies of 42 countries over the ten-year period 1953-63. The shrinkage, incidentally, has been calculated inversely from the increases in cost-of-living or consumer price indices as reported by Governments.

One of the ways in which the extent of monetary depreciation in each country has been brought out pertains to the provision of an "index of value of money" with its base 1953=100. It is seen from the index numbers for 1963 that the value of money in that year represented less than 10 per cent of its value in 1953 in four countries, namely, Argentina, Brazil, Chile and Bolivia, 18 per cent in Uruguay, 38 per cent in Turkey and 40 per cent in Colombia, 46 per cent in China (Taiwan) and 50 per cent in Peru, between 50 and 60 per cent in Israel, Spain, Iran and Mexico, 66 per cent in France and 67 per cent in Finland, between 70 and 80 per cent in Greece, Denmark, Japan, Sweden, Norway, Italy, New Zealand, United Kingdom, Netherlands, Ireland, Austria and *India*, between 80 and 90 per cent in Australia, Philippines, South Africa, West Germany, Switzerland, Ecuador, Pakistan, Portugal, Canada, Belgium and the United States, and between 90 and 95 per cent in Venezuela, El Salvador, Ceylon and Guatemala. Inflation was particularly acute in several of the major countries in Latin America. Brazil, for instance, suffered the most serious loss in purchasing power—43 per cent in one year—while the value of Chile's currency sank by 31 per cent and that of Argentina by 20 per cent. The severe inflationary problems in these countries, it is said, have held down their growth rates below the annual target of 2.5 per cent *per capita* set by the Alliance for Progress.

Looked at in another way, that is, in terms of compounded annual rates of monetary depreciation, the world inflationary picture shows that most countries have been afflicted with "creeping inflation" in the sense of a slow but steady depreciation of the buying power of money. Such inflation is taken here to connote an annual rate of depreciation of up to four per cent. The countrywise picture, in this connection, shows that in the period 1953-63 the annual rate of monetary depreciation ranged between three and four per cent in Sweden, Japan, Denmark, Greece, Finland and France, between two and three per cent in West Germany, South Africa, Philippines, Australia, *India*, Austria, Ireland, Netherlands, United Kingdom, New Zealand, Italy and Norway, between one and two per cent in the United States, Belgium, Canada, Portugal, Pakistan, Ecuador and Switzerland, and between 0.5 and one per cent in Guatemala, Ceylon, El Salvador and Venezuela. Inflation was more serious, with the rates of monetary depreciation exceeding five per cent per annum during the period under reference, in the following countries:

	Per cent		Per cent
Mexico	5.0	Turkey	9.3
Iran	5.6	Uruguay ..	15.8
Spain	5.7	Argentina ..	21.1
Israel	5.7	Brazil	24.4
Peru	6.7	Chile	26.3
China (Taiwan) ..	7.5	Bolivia	30.5
Colombia ..	8.7		

It is noteworthy that the United States suffered the lowest rate of depreciation of any of the

TREND OF SHARES

SAGGING TENDENCY

(From Our Own Correspondent)

BOMBAY, *9th July*

AFTER being bid up to new high levels in the recent uptrend under the lead of steels and selected engineering and miscellaneous issues, equities staged a setback later in the week on profit-taking by bulls and inadequate follow-up support. The tone at the close was easy with the list showing fairly sizable losses on a wide front.

The week began with a distinctly buoyant tone, sentiment being sustained by hopes of a higher dividend on steel shares. Corporate news from Telco more than fulfilled market's expectations, in that both profits and turnover have reached new peaks, and the Directors, besides maintaining the dividend at Rs. 14.50, seem to be confident of paying the same rate even on the increased capital. The one-for-five right issue caused some disappointment not because of the ratio but because of the 50-point premium which the Directors propose to collect. On the whole, the market was apparently well pleased and the shares were bid up to Rs. 293 in the kerb, as against the day's low of Rs. 272. Although at the close they were subdued, the closing rate today was still satisfactory at Rs. 288. It may be mentioned here that, in 1963, the shares moved between Rs. 245 and Rs. 304. In the current year, the shares had touched Rs. 317.50 on Budget day, though they had declined to Rs. 259 on 27th May. Reports of A.I.D. credit for expansion helped sentiment.

Tata Steels, along with some selected industrials, led the decline. The Directors stepped up the dividened to Rs. 12 for the year to March 1964 from the Rs. 11 distributed in the previous year, but the swift reaction in the quotation from the high of Rs. 158.50 to Rs. 156 and finally to Rs. 155.25 at the close on Thursday indicated that the market was not satisfied with the rise in the dividend. Although, by itself, corporate achievements may be spectacular, shares may yet decline either because the benefits fall short of market's expectations or because operators sell on good news. Let us suppose it was both in the case of Tata Steel. At Rs. 155.25, the shares yield around 8 per cent and, normally, an investor would be satisfied with a return of this nature on steels. One disappointment is that the profit margin (ratio of gross profit to sales) for the year is lower despite the rise of 11 per cent in turnover which has passed the Rs. 100-crore mark. It would, however, be better to await the Directors report and the profit and loss account before arriving at conclusions.

Even during the previous week, technical analysts had been saying that the state of the market warranted a correction, but there had been no sign of it in the early part of this week. The assurances of prompt food supplies from the United States was noted with satisfaction, but reported the move of banks to raise interest rates on advances from September dampened enthusiasm. The decline that set in later did please technical analysts. The general feeling among them is that the market will resume its upward movement once the present gains are digested. The working of the market in the current week will perhaps give an indication whether the process of digestion is complete or whether there still remains much for the market to consolidate before it could advance further.

It is rather difficult yet to understand the full implications of the recommendations of the Cotton Textile Consultative Board, but it is believed that, by and large, mills should benefit from the proposal to free 60 per cent of their output from controls. The recommendation for an interim revision of prices should also help, but, on the whole, the report seemed to have fallen flat on the textiles section of the stock market. It appeared that mill shares were content to follow the lead of steels and engineerings rather than assert themselves on their individual or collective merits. In keeping with the general trend, leading mill shares failed to maintain their gains and closed the week with small to moderate on-balance losses. Bombay Dyeing, however, was better at Rs. 58, while Century which had moved up to Rs. 621 declined to close at Rs. 608. Standard lost 10 points to quote at Rs. 638. National Rayon was also conspicuous for its weakness having lost more than seven points to Rs. 371.

Automobile shares were well held and Hindustan Motor improved from Rs. 18.68 to Rs. 18.76 following A.I.D. loan. Premier Auto was fractionally better at Rs. 102, as against the previous week's close of Rs. 101.50. Voltas was another market leader which closed on a stronger note at Rs. 256.

Among the other active scrips, a notable loser was Indian Dyestuff which moved down by 10 points to Rs. 280 over the week. Tata Chemicals, among the leaders in the group, was also easy at Rs. 18.56, as against Rs. 18.72. Paper shares were steady to quiet, with Sirpur fractionally down to Rs. 11.96 and West Coast slightly shaded at Rs. 161. Sugars were quiet, with Belapur quoting at Rs. 214.50 and Phaltan at Rs. 100. Bank shares were almost neglected.

As for shares which are considered to possess considerable growth potential, Union Carbide has on hand a Rs. 9-crore expansion programme and Metal Box has come out with excellent results for the year to March 1964. Guest, Keen, Williams has reported a 25 per cent increase in sales and the gross profit is also sizably up. Though the current yield cannot be termed high, investors feel that the Company's prospects should bring in additional benefits to shareholders. Another satisfactory performance is by Zenith Steel. The Company has recommended a tax-free dividend of 8 per cent for the year ended April 1964 after stepping up its sales to around Rs. 433 lakhs.

* * * *

The Calcutta market indicated a mixed trend. Initially sentiment here, too, was induced by the same factors which helped a firm and buoyant tone in Bombay such as dividends and development bank, but the market sagged later. Jute shares lacked interest following reports of bleak outlook for gunnies as well as cutback in business from Argentina, in view of that country's foreign exchange difficulties. Later, however, there was some selective support, but interest fagged again. Teas were dull throughout, though off and on, interest was shown in a limited way in some selected scrips. Paper shares were shaded. Kesoram was easy. Dunlop Rubber closed on a weak note at Rs. 33.75 and Birla Jute was quoted at Rs. 33.50, as against Rs. 33.56 and Orient Paper at Rs. 35.60, as against Rs. 35.90. Kesoram declined from Rs. 27.37 to Rs. 26.87.

* * * *

Madras was active and, at the time of writing, business was confined to plantation shares. Teas and Coffees attracted selective support, but activity in textiles was rather mainly in cash scrips. Miscellaneous shares were generally inactive.

MARKET GOSSIP

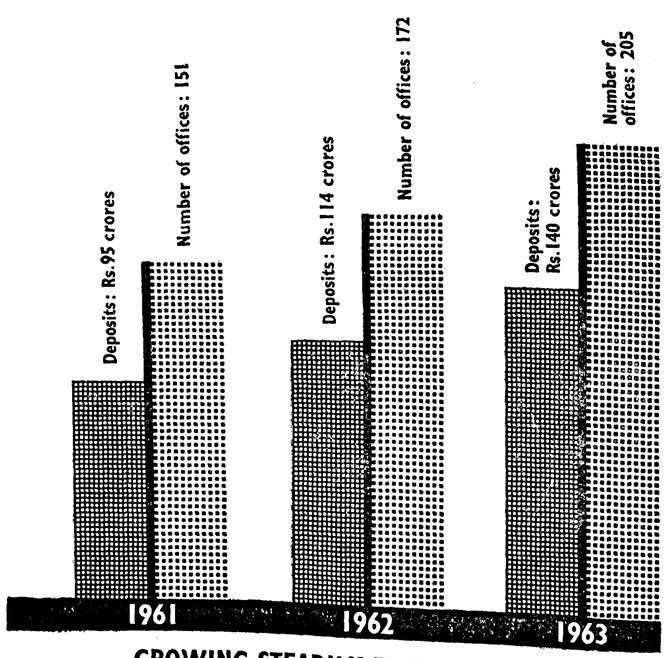
(Concluded from previous page)

major industrial nations, for its average annual rate of shrinkage was only 1.3 per cent for the decade ended 1963. The fact that the dollar has lost value at a far slower rate than most other currencies helps to explain why it continues to be so widely used and respected as an international standard of value. In most European countries, on the other hand, the rates of depreciation over the decade have been of the order of 2.5-4.0 per cent. The European Economic Community, in particular, has, therefore, formulated a programme to combat inflationary pressures. It is being recognised that reasonable monetary stability is an essential prerequisite for restoring the faith of people in long-term promises to pay. If, for instance, a 2.5 per cent annual rate of shrinkage in the value of a currency were projected over the life of a 20-year bond denominated in that currency, the real value of the bond would be reduced by 40 per cent at maturity. Viewed thus, India's 2.4 per cent annual shrinkage rate—this should have been somewhat higher if a more representative and scientific cost-of-living index had been in vogue in this country—is sufficiently disquieting, if not alarming. A better record of price stability is called for in India for the purpose, among others, of building investor confidence in bonds.

U.S. LOANS FOR AUTOMOBILE INDUSTRY

The U.S. Government has authorised this week three credits totalling $37.8 million (Rs. 18 crores) to help the Indian automobile industry to expand and modernise its production facilities and to increase its heavy engineering capacity. The credits will be used to purchase machinery to increase annual production in India by 10,500 trucks, 15,000 heavy duty automobile engines and 24 power shovels. The loans, extended by the U.S. Agency for International Development, are: two credits of $23 million and $3 million to Hindustan Motors Ltd. and a credit of $11.8 million to the Tata Engineering and Locomotive Company Ltd. (T.E.L.Co.).

The Indian firms will repay to the Government of India the rupee equivalent of the U.S. A.I.D. dollar credits over a period of 10 years, with an initial grace period of two years. They will pay the Indian Government interest at the rate of 5½ per cent.



GROWING STEADILY EVERY YEAR—

THE BANK OF BARODA

Established as a local bank with about 20 employees, the Bank of Baroda is now one of the leading banks in the country, with 205 branches. These are spread all over India and abroad and collectively employ over 5,000 people. Deposits total more than Rs. 140 crores. This dramatic and dynamic growth has been the result of meticulous planning and courteous service. Moreover, the Bank of Baroda has on its Board of Directors, men who are eminent in the industrial and financial world—thereby enhancing the bank's stability and prestige.

Directors

Tulsidas Kilachand *(Chairman)*	Lt-Col. H.H. The Maharaja Fatesinh Gaekwad of Baroda
R.D. Birla	Keshav Prasad Goenka
Kantilal Nahalchand	Narsing Das Bangur
Naval H. Tata	Rasesh Navinchandra Mafatlal
Anandlal Hiralal Sheth	Navnitlal M. Chokshi *(Managing Director)*
Chinubhai Chimanbhai	A. M. M. Arunachalam
B. K. Daphtary	Navnitlal S. Shodhan

Capital Structure

Capital Authorised ... Rs. 8,00,00,000
Capital Issued and Subscribed ... Rs. 4,00,00,000
Capital Called Up and Paid Up ... Rs. 2,00,00,000
Reserve Fund and other Reserves ... Rs. 2,24,93,760

THE AUTOMOBILE INDUSTRY ....

is a key industry

In a country like India; where industrial development is in full swing, the Automobile Industry is a KEY Industry. Its growth contributes to the national prosperity and well-being in many ways:

It saves foreign exchange through progressive manufacture of motor vehicles, which will gradually eliminate imports;

it generates work and income for numerous other industries and trades;

it contributes to the development of agriculture through speedy road transportation of produce to markets;

it generates high revenue to Government for numerous development projects;

it helps to raise standard of living and do away with poverty;

it helps the integration of the country through greater mobility;

it contributes to the improvement of vocational education and technical 'know how', through apprenticeship schemes, mechanics' and engineers' training courses, technical institutions, etc.;

it contributes to the country's defence through supply of the required vehicles to the armed forces.

The Indian automobile industry, therefore, deserves the fullest measure of support from the Government and the public.

A SOVIET CEYLON?

IN recent years several non-communist countries in the underdeveloped part of the world, notably India, Egypt and Burma, have taken to the socialist road. The kind of socialism sought to be established by these countries, it is supposed, is a more desirable alternative to communism. This may not always turn out to be so, for indiscriminate and sweeping measures of nationalisation, such as those of Burma, would only pave the way for communist totalitarianism. That a democratic country like India has not gone that far is no doubt a consoling thought. But democrats in this country are bound to be disturbed by the news from democratic Ceylon that its Coalition Government, consisting of Sri Lanka Freedom Party and the pro-Marxist Samasamaja Party, has formulated a programme of 'sovietisation" so as "to carry forward the country along socialist lines." The programme, incidentally, was announced by Ceylon's Governor-General in his "Speech from the Throne" on the 2nd instant.

The most disquieting ingredient of this programme is that the Coalition Government intends to depend on "people's committees" (another name for Samasamaja Party's original idea of "little Soviets") for transforming the country on "socialist lines." It is envisaged that the workers in State-owned corporations and trade unions will be mobilised by law to share the burden of running the Government "efficiently." Workers' advisory committees and vigilance committees are proposed to be set up for different purposes. In particular, workers' committees, which are to be associated with the administration at all levels, will have power to investigate and advise on elimination of waste, inefficiency and corruption. Vigilance committees, which are to be set up in Government, local government and semi-governmental institutions, will be empowered to advise the Government on elimination of bureaucratic inefficiency and obstruction. Government officers who are found to be inefficient or who do not co-operate with the Government in the implementation of this programme will be compulsorily retired. The people's committees proper will be legally empowered to eradicate hoarding, black marketing and corrupt practices and be also closely associated with the distribution of goods.

The proposed programme of "little Soviets," taken along with the policy statement that imports of all essential goods would be monopolised by the State and that the export trade, too, would be nationalised gradually, points to ominous possibilities which are reminiscent of the slogan, "all power to Soviets," that heralded the October Revolution in Russia in 1917 and of the Communist take-over in Czechoslovakia in 1948. Power to people's committees of different kinds carries with it revolutionary implications, especially when such committees happen to be led, as they are bound to be, by a militant Marxist minority. There can be no surer way of subverting democracy. It is indeed strange that the Sri Lanka Freedom Party, led by Mrs. Bandaranaike, has exceeded the limits of prudence in its anxiety to please the minority partner in the Coalition Government. Whether Srimavo's Party would be strong and resourceful enough to checkmate possible subversion at some stage or other remains to be seen.

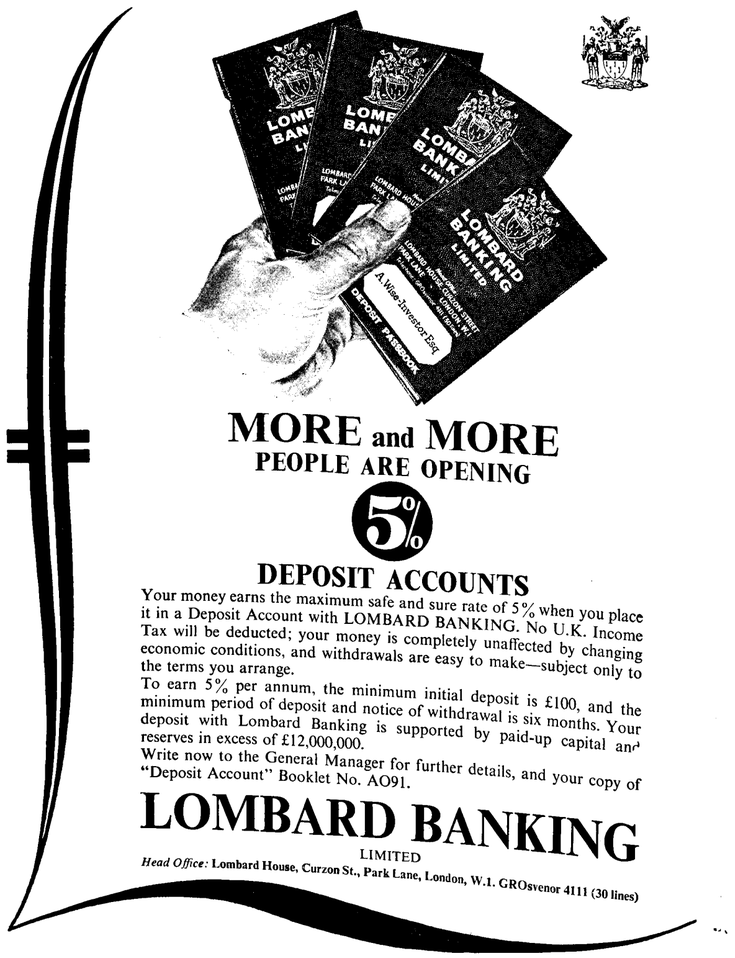
SOAP INDUSTRY

The third Plan's target of soap production in the organised sector is 220,000 tonnes. It is doubtful whether the industry would be able to reach this target, for the growth of production in the first three years of the Plan has been pretty slow. How slow this growth has been will be seen from these figures of actual production: 142,800 tonnes in 1960; 149,000 tonnes in 1961; 150,300 tonnes in 1962; and 158,000 tonnes in 1963. At this rate, it is scarcely to be expected that the industry would be able to produce as much as 220,000 tonnes in 1965 (or 1965-66 to be precise). The utmost level of annual output that it may reach is 175,000 tonnes by the end of the Plan. This, incidentally, is the estimate made by Mr. P. A. Narielwala in his speech at the annual general meeting of the Indian Soap and Toiletries Makers' Association held at Calcutta last week. If that is all that can be reasonably hoped for under the third Plan, the possible achievement by the end of the fourth Plan may not be more than 250,000 tonnes, according to his further estimate. That this is not an unduly cautious or conservative estimate could be inferred from the fact that the *additional* annual production (75,000 tonnes, that is, 250,000 tonnes *minus* 175,000 tonnes) expected by the end of the fourth Plan would be more than double the *additional* annual production (32,200 tonnes, that is, 175,000 tonnes *minus* 142,800 tonnes) expected by the end of the third Plan.

The question arises, in this connection, as to how much *additional* capacity would have to be installed so that the industry can reach an annual output level of 250,000 tonnes by the end of the fourth Plan. If the figures provided by the Department of Technical Development are to be believed, there will, of course, be no need to license any further capacity, for the aggregate installed capacity in the organised sector is already 255,000 tonnes. To take this official figure of existing capacity as correct and reliable would, incidentally, be to suggest that as much as 38 per cent of that capacity is now idle. Mr. Narielwala, however, has questioned the veracity of this official estimate and pleaded for a review as follows:

"This figure of capacity of 255,000 tonnes, which is to be found in the records of the Development Wing, is a mythical figure and it needs to be reviewed. How this figure of capacity was arrived at we have not been told. There are also on the records of the Development Wing a large number of units, many of which are either moribund or have gone out of existence. It is, therefore, doubtful whether the capacity of 255,000 tonnes is the real capacity or the one which exists only in name with the Development Wing. A time has come when the Development Wing should seriously set about to find out for itself what the true capacity of the industry is. I am making this suggestion because we may suddenly find ourselves in a position when the real capacity is much less than what has been stated and the industry may find itself in difficulties if it is asked to undertake a sudden expansion."

Mr. Narielwala seems to be convinced that, if a possible fourth Plan target of 250,000 tonnes is to be achieved, there will be need for expanding capacity. But that is not all, for many old and obsolete plants in the industry would have to be replaced by modern equipment in keeping with the technological developments that have taken place elsewhere in soap manufacture. It would thus appear that on account of both expansion and modernisation there is a lot to be done. That the Association has offered to assist the authorities in studies pertaining to all these aspects is no doubt encouraging. But, in the ultimate analysis, it will be the Government's responsibility to ensure the requisite foreign exchange for expansion and modernisation. The Government's responsibility will not, however, stop there, for it will have to take steps to ensure a more adequate supply of fats for the industry. This will be a particularly difficult problem in the context of the disappointing rate of growth of oilseeds production. Unless a systematic effort is made to manufacture fatty acids from rice bran and to locate and exploit the non-edible oil resources of the country, the organised industry's partial dependence on imported fats may increase. And that will only add to the Government's foreign exchange difficulties.



MORE and MORE
PEOPLE ARE OPENING
5%
DEPOSIT ACCOUNTS

Your money earns the maximum safe and sure rate of 5% when you place it in a Deposit Account with LOMBARD BANKING. No U.K. Income Tax will be deducted; your money is completely unaffected by changing economic conditions, and withdrawals are easy to make—subject only to the terms you arrange.
To earn 5% per annum, the minimum initial deposit is £100, and the minimum period of deposit and notice of withdrawal is six months. Your deposit with Lombard Banking is supported by paid-up capital and reserves in excess of £12,000,000.
Write now to the General Manager for further details, and your copy of "Deposit Account" Booklet No. AO91.

AID TO DEVELOPING COUNTRIES

The international flow of capital, both private and public, has a tendency to concentrate on a relatively small number of countries. This is one of the findings of the latest U.N. study on the "international flow of long-term capital and official donations in 1960-62." As the study report, published last week-end, elaborates, 15 of the 52 developing countries received as much as two-thirds of the long-term assistance during the period under reference. Nearly half of this two-thirds share went to five countries, namely, India, Argentina, Puerto Rico, Brazil and Indonesia. While private capital flowed largely to Latin America, more than 70 per cent of the total official funds were received by countries in the Far East and Africa. The net inflow into India during the period was $767 million in 1960, $630 million in 1961 and $711 million in 1962.

The report further reveals that the flow of foreign capital to the developing countries in particular increased during 1960-62, albeit at a slackening pace. It estimates, in this connection, that the net inflow of long-term capital and official donations increased from $5,200 million in 1960 to $5,700 million in 1961 and then to only about $5,900 million in 1962. In the 1960-62 period, the annual net flow of funds from the advanced nations to the rest of the world—"the rest of the world" here includes developing countries, international institutions and centrally planned economies—averaged about $6,300 million, or 14 per cent above the $5,500 million averaged in the 1955-59 period. However, rising prices of manufactured goods imported by the developing countries reduced the real aid provided by international funds. Thus, ten per cent rise in aid in 1961 and the four per cent rise in 1962 amounted, in actual effect, to only a nine per cent and three per cent increase in capacity to finance imports.

The United States, the largest net exporter of long-term funds to the developing nations, accounted for nearly three-fifths of the total aid. She was followed by France and the United Kingdom, with 18 and 10 per cent, respectively. Funds from the developed countries to the rest of the world rose from $6,000 million in 1960 to $6,500 million in 1961 and then declined to $6,300 million in 1962. Private capital, which represented 22 per cent of the total flow of funds from the advanced countries in 1960, fell to 16 per cent in 1962. However, their contributions to international institutions went up from 21 per cent in 1961-62 to 42 per cent in 1962. There was also an increasing shift towards loans rather than grants in the aid provided to the underdeveloped areas, accompanied by an "easing" of loan terms.

The assistance provided by the centrally planned economies, that is, the Communist bloc countries, also increased rapidly after 1954. Their total credit commitments reached a peak of about $1,168 million in 1961. It is noteworthy that over 75 per cent of credit commitments went to the developing countries in 1959, while the corresponding percentages for 1960, 1961 and 1962 were 56, 62 and 59, respectively. Soviet Union led the socialist countries in granting aid and was followed by Czechoslovakia, Hungary and Poland. Their economic aid to the developing nations consisted entirely of credits which were almost exclusively in the form of shipments of equipment and materials needed for the construction of specific projects. And the receiving countries, too, were normally entitled to repay such credits by shipments of its exports.

MAN-MADE FIBRES

The man-made fibre industry in India, as elsewhere in the world, has made rapid strides. Thus, in a short span of thirteen years from 1951 to 1963, the production of viscose rayon yarn has gone up from a bare 4.5 million lbs. to as much as 68.57 million lbs., and the number of rayon manufacturing units has increased from two in 1951 to 26 in 1963. The output of staple fibre has also risen from 6.80 million lbs. in 1954—it was in that year that this fibre was first produced in the country—to 71.24 million lbs. in 1963 and that of acetate rayon yarn from 2.30 million lbs. in 1955 to 4.30 million lbs. in 1963. A notable development during the last five years has been the production of nylon yarn; the actual output has risen from just 300,000 lbs. in 1962 to 1.58 million lbs. in 1963. Thanks to the phenomenal progress made by the indigenous rayon industry, there has been a considerable saving of foreign exchange which would otherwise have been spent on imports in order to meet the expanding domestic requirements. An idea of this saving can be had from the marked reduction in the quantum of imports, from 46 million lbs. in 1957 to no more than 16 million lbs. in 1963. While the progress made by the man-made fibre industry is thus impressive, it should not engender any sense of complacency for there is the urgent need to step up production further, what with the rapidly expanding domestic demand for its products. The magnitude of the problem of further development and expansion was clearly indicated by Mr. Babubhai M. Chinai, M.P., in his speech at the tenth annual general meeting of the Association of Man-made Fibre Industry held at Bombay on 30th June. Mr. Rasiklal J. Chinai, Chairman of the Association, was absent. The industry, according to Mr. Babubhai Chinai, has suggested a development programme under the fourth Five-year Plan which envisages a total production of 713 million lbs. (596 million lbs. of cellulide man-made fibres and 117 million lbs. of non-cellulide fibres) by 1970-71. If the programme were accepted by the Planners and the Government, the production of viscose rayon yarn and staple fibre alone would have to be augmented to be significant extent, the former from about 69 million lbs. (as of 1963) to 176 million lbs. by 1970-71 and the latter from 71 million lbs. to 330 million lbs. In the context of the large-scale expansion of capacity, there is the need to remove certain difficulties now being faced by the man-made fibre industry. The two major handicaps to which Mr Chinai drew pointed attention are the heavy burden of excise duty and inadequate and irregular supplies of certain important raw materials like rayon grade caustic soda.

In view of the rising trend in population and the expected rise in the standard of living of the people in this country in the coming years and, bearing in mind that the natural fibres alone cannot in the foreseeable future satisfy the entire clothing requirements of the country, the need for expanding the man-made fibre industry cannot be over-emphasised. The plea of Mr. Chinai for relief in taxation is quite justified. Equally justified is his plea for modification in the decision governing wood-pulp. He said:

"Manufacturers of viscose yarn welcome with gratitude the decision of the Government to delink the requirements of pulp of the industry with the export of piecegoods. Under the linking arrangements, viscose yarn manufacturers had to pay 50 per cent higher premium for supplies of their essential raw material, namely, wood-pulp, which will now be a thing of the past. However, I would like to bring to the notice of the Government that while announcing the new decision, they have asked the manufacturers to fulfil their back-log, which requirement, looking to the present conditions of the industry and particularly the heavy excise duty put on it during the last Budget, is uncalled for. I, therefore, appeal to those in authority to reconsider the matter and release the manufacturers from the obligations to fulfil their back-log."

Referring to the problem relating to the supplies of rayon-grade caustic soda, Mr. Chinai said: "The various units are finding it increasingly difficult to have reasonable reserves of this basic raw material. Even the quantities allotted to the industry by the Government are quite insufficient. The allocation of quantities of this material to the industry is not only inadequate but also irregular." Alluding to the reported move of the State Trading Corporation to import Rs. 90 lakhs worth of caustic soda, he suggested that the Government should make available a part of this quantity to the man-made fibre industry. This suggestion is unexceptionable. Since caustic soda is one of the basic raw materials used by the industry, it is obvious that, unless its supplies are adequate, the industry will not be able to utilise its capacity fully and maintain a high level of output.

TRAFFIC PRESSURE ON AIRPORTS

HOW IT CAN BE RELIEVED

By Our Aviation Correspondent

MAN is not particularly blessed in the matter of foresight. We have only to observe the many, various, and, now, often insoluble problems created by the motor vehicle to realise how far short our pre-planning has fallen. And yet the onslaught of the motor vehicle on our lives and times has been no sudden or unforeseeable phenomenon. It has been, in fact, a gradual process and it is only during the last decade that the very size of the problem has begun to excite public anxiety. Will air transport, in course of time, confront us with some similar sort of situation?

Unlike the roads, the sky is high, wide, and three-dimensional. Even so, there are already plenty of problems in respect of aircraft separation, particularly, of course, in the vicinity of major air terminals. Were personal flying ever to become one hundredth as popular as personal motoring, then indeed, there would be immense problems to be met. There are no signs, however, that, within the foreseeable future, we face such an eventuality. On the whole, all the indications are that, for the next decade or so, the principal difficulties to be encountered will be those concerning airports.

In the early days of air transport, the provision of airports was probably the least of the problems involved. It was, of course, a much larger world than it is today. There was not the same pressure of population on building land in the vicinity of cities that there is at the present time. In the second place, the requirements of an airport were extremely modest. A grass field, eight or nine hundred yards in length, a hangar, an office for aerodrome staff and customs, a waiting-room perhaps, a wind-sock, some paraffin flares, and a telephone —these comprised almost the entire needs of a major air terminal.

It was, of course, the vehicle itself which forced the pace. By the early nineteen-thirties, concrete or asphalted runways had become essential—aircraft had become too heavy for operation on grass in wet weather. The capacity of aircraft had also increased—as had the frequency of services. This kind of progress called for more staff, larger and more sophisticated buildings, additional amenities, a greater range of equipment, and better communications of all kinds.

The Second World War still further accelerated the pace. The increasing demand for air transport for all sorts of purposes made airport expansion a matter of supreme urgency. Take India, for example. Once the war had spread to the East, existing aerodromes were found to be totally inadequate not only in terms of location and numbers, but also in size. At both Delhi and Bombay, entirely new airfields had to be built. At Calcutta, the existing airfield had to be vastly extended and supplemented by another at Barrackpore.

In planning for the post-war era of air transport, almost all the world's major cities were faced with problems of a complex and largely unexplored character. It must have been extremely difficult in the mid-nineteen-forties to foresee not only the rapidity with which air traffic would increase, but also the major technological advances which would occur in the construction of aircraft and power plants. London's Heathrow, perhaps, offers a typical example. Planned and commenced in 1945—and only recently completed—it has been faced, during the intervening years, with progressive demands for longer and stronger runways.

With the introduction of subsonic jets, we have reached a stage where, at most major airports and for the next decade, runway demands, in terms of length and strength, have probably been met—or, at least, can be foreseen. The principal problems now to be resolved are partly technical, partly social and partly financial. They can be summarised as, firstly, how to bring aids and facilities into line with the increasing tempo of operations; secondly, how to meet the requirements of a continually expanding volume of traffic; thirdly, how to improve communications between airports and cities.

It would be out of place here to discuss the complex technicalities of aircraft separation, all-weather landing, automated control, and other allied subjects. Let us turn rather to the question of how the ever-increasing volume of traffic —freight as well as passenger—is to be handled. It has been argued that this can only be achieved by supplementing existing city airports with others. In some cases, of course, this has already been done. London, for instance, has supplemented Heathrow with Gatwick and many of the world's major cities have two airports. To continue this process, however, is bound to raise immense problems, not of cost alone but fraught with very thorny social issues. The scarcity of suitable sites and mounting public opposition could make this apparently simple solution almost impracticable.

Some means, it seems, will have to be found to handle a far greater volume of traffic at existing airports. Nor is this necessarily so difficult. In 1963, Heathrow handled 168,538 aircraft movements. In the U.S.A., we are told, there are at least 30 airports, each one of which handles considerably more traffic than that. In 1962, O'Hare Airport at Chicago, for instance, recorded an average of 47 movements per hour. That is 2.5 times as many as Heathrow's average of about 18 movements per hour.

One does not pretend to know how, in this particular sphere, the Americans contrive to do so much better than others. On the face of it, however, it seems that either they plan their airports better, or their traffic control methods are superior, or there is some other factor in their favour. The fact remains that they do it—and if they, why not others? In the light of this evidence, it is at least reasonable to assume that pressure on existing airports is not quite such an immediate problem as has been supposed. Even if it is, it might be relieved by the adoption of American methods.

That brings us to the third problem—that of improving communications between airports and cities. In many respects, this is perhaps the most difficult problem of all. Even if airports can be planned to meet the ever-increasing volume of traffic, the roads linking airports to cities could become such a bottleneck as to offset all the benefits of improved airport planning. Apart from that aspect, there is also the case of short-haul traffic. In almost all operations of this nature, passengers spend as much, or even more time in travelling to and from airports than on the actual air journey itself.

Many means to surmount this difficulty have been suggested. Some have been tried—monorail or helicopter links, for example. To date, both from the practical and financial points of view, these have achieved somewhat indifferent success. Almost inevitably, the answer will have to be provided by vertical take-off and landing aircraft. Only thus, one suggests, can short-haul services continue to be attractive. In the event of V.T.O.L. services, however, there immediately arises the need for new airports at or near city centres—and all the attendant social problems of space, noise and public opposition. It is here, if anywhere, one suggests, that pre-planning now could avoid an infinity of trouble at a later date.

(Concluded from next column)

relationship between the official "investment" in the Commonwealth and the needs of the emergent countries seems inadequate. However, the delegates to the Conference will have a very poor cupboard to stare into, if they consider the U.K.'s overseas investment potential. The detailed balance of payments figures for the first quarter reveal an overall deficit (trade *plus* invisibles) of over £60 million accompanied by a record long-term capital "outflow" of £90 million. Fortunately this "outflow" (so much of it is due to a drying-up of the normal inflow of capital into the U.K.) was countered by unidentified receipts, presumably of short-term money, of a similar amount, so that the final adverse balance of monetary movements, the actual fall in monetary resources, was limited to the current account deficit of over £60 million. But, in the current quarter, the unidentified receipts may not be so large and the final monetary deficit larger—hence the concern with which the June drop of £17 million net (excluding the £3 million for loan service to the U.S.A.) in the gold reserves was received. It is quite obvious that the U.K. is not producing the resources with which to finance overseas development at the present time. Indeed, it is equally clear that it is the net receipts (including capital inflows) of some Commonwealth countries which are supporting the sterling area at the present time.

LONDON LETTER

COMMONWEALTH AND CAPITAL

(From Our Own Correspondent)

LONDON, *4th July*

THE Commonwealth Conference now assembling in London will meet against a somewhat confused background of national problems in the various member-countries. Britain is still the reluctant "mother country," a concept the Government does its best to dispel.

But Britain, to the 28 Commonwealth countries, is not simply a member with whom the political relationship is changing, but one with whom the economic relationship is also in decline. The Government appears complacent about this. They note that between 1959 and 1963 the value of intra-Commonwealth exports increased by 5 per cent, while the Commonwealth's exports to the rest of the world increased by 31 per cent. Even if the U.K.'s exports are excluded, intra-Commonwealth exports increased by 10 per cent and exports to the rest of the world by 28 per cent. In 1963 over two-thirds of the Commonwealth's total exports went to non-Commonwealth countries. In effect, trade between the U.K. and the other Commonwealth countries (three-quarters of total intra-Commonwealth trade) and trade between the other Commonwealth countries themselves is becoming just what one would expect it to be, whether the Commonwealth were there or not.

In spite of Commonwealth preferences, which cover about half the total trade between members, U.K. imports from the Commonwealth declined from 36 per cent of total imports in 1959 to 32 per cent in 1963. (The actual value of imports into the U.K. did, however, rise from £1,418 million to £1,545 million, as compared with a rise in Britain's total imports of £850 million.) U.K. exports to the Commonwealth fell from 36 per cent of total to 30 per cent of total, the total value of such exports actually falling when the value of total British exports rose by £750 million.

Compared with this picture of diminishing trading relationships, the volume of private investment into the Commonwealth from the U.K. appears to be well maintained. The annual flow of private capital of all kinds from the U.K. to the rest of the Commonwealth has averaged about £200 million in recent years, about two-thirds of total private investment outside the U.K. There has been a slight decline since 1960, but the figure for 1962 is higher than that for 1959. A Board of Trade analysis of U.K. companies shows that (excluding oil, banking and insurance) their investment overseas is £3,500 million, of which £2,200 million or 63 per cent is in the Commonwealth. Of course, this has a historical basis—the largest volume of investment being in Canada, next in Australia, third, but a long way lower, in India. So it is significant that since 1959 inspite of increasing investment in the E.F.T.A. countries and the Common Market countries, and in spite of a declining investment in such a historical market as Canada, rising annual investment in Australia and India in particular has maintained the importance of the Commonwealth to the U.K. as an investment area. India has become the second largest investment market for U.K. companies, though the annual total of commercial investment there is only £13 million.

As for official investment and assistance this has been on a steadily rising scale and yet the total appears inadequate in relation to the resources of the U.K. and the volume of development required in the Commonwealth. The following table shows the progress over the past ten years:

	(£ million)	
	1954-55	1963-64
Loans	22.5	72.9
Grants	33.4	39.5
Technical assistance	2.8	23.8
Total	58.7	136.2

Of course, Commonwealth countries receive aid in one form or another from international agencies and the U.K. is the second largest contributor towards the cost of technical assistance and other aid provided through the United Nations, while more of the experts in the field under U.N. programmes come from the U.K. than from any other country.

Yet, when one considers that the U.K. has a population of 53 million, the "white" Commonwealth countries 32 million and the rest of the Commonwealth some 650 million, the

By Questor

THE U.S. balance of foreign payments may still be in substantial deficit, but "the economic trouble spot has shifted from the United States to Continental Western Europe," as the Bank for International Settlements puts it. Strains are most apparent at present inside the European Community itself. Italy, France and, to some extent, Holland are all experiencing the effects of a straightforward demand inflation; whereas Germany, having been fairly successful in avoiding inflation at home, is determined not to import it from abroad.

The striking fact about this situation is that most European Governments are relying very largely on monetary policy to keep their economies under control. Not only Britain but France, Belgium, Holland, Sweden, Denmark and now Switzerland have raised the official discount rate during the past few months, and long-term interest rates, too, have risen generally. Monetary weapons may well be the handiest, but I doubt whether such reliance on them will do much good.

From the purely national point of view, they may well prove to be ineffective. Higher interest rates are not going to have much effect on consumer spending or current public expenditure, which seem to be the main source of trouble in France and Italy at the moment. And nowadays, with exchange controls all but gone, high rates are likely to attract an inflow of short-term capital from abroad to frustrate the efforts of the monetary authorities to regulate national liquidity.

From the international point of view, the result of such a competition for short-term money is likely to be an upward spiral in interest rates which may well discourage investment in new plant and equipment and will certainly discourage the development of an effective long-term capital market in Western Europe.

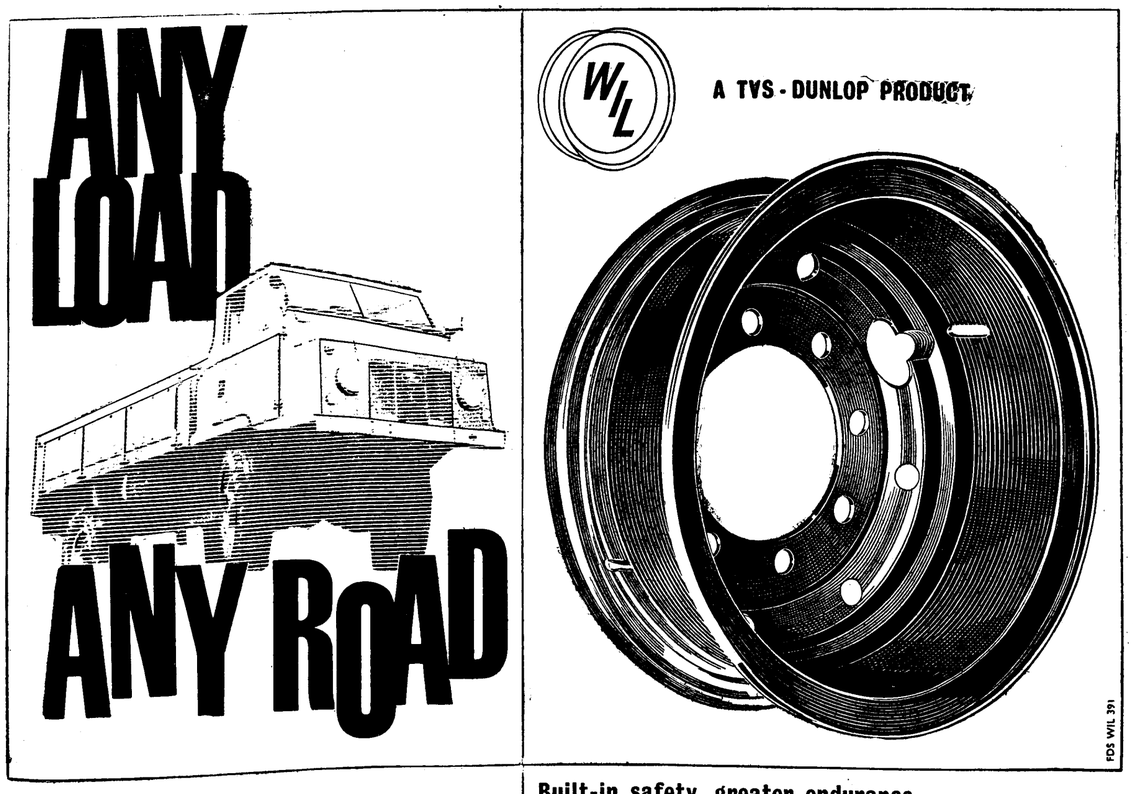
Some countries, it is true, are now becoming aware of the disadvantages, national and international, of high short-term rates. Germany, Switzerland and France all forbid the payment of interest on foreign-owned deposits, and Germany intervenes regularly in the forward exchange market to persuade her commercial banks to invest in New York. France, too, recently lowered the bank's minimum liquidity ratio to prevent them from withdrawing funds on an embarrassingly large scale from London. Central bankers are not only ready to devise new measures when these are needed to maintain their control over the domestic market but are willing to admit some responsibility for the international repercussions of their domestic actions.

But there is a limit to what can be achieved without major changes of policy. So far as the rest of the world is concerned, they can hardly fail to notice that the exchange reserves of the Six rose by $1.5 billion last year even though the current payments account was in slight deficit. Now, on the one hand, the deficit countries in the E.E.C. are tending to tackle their problem with high interest rates which bring in fresh funds from abroad. On the other hand, Germany—whose trade surplus so far this year has been more than double what it was in the same period of 1963—is determined to prevent any increase in costs and prices, whatever may happen in the rest of the world.

This determination, however virtuous in itself, may turn out to be more disruptive than the French or Italian deficits. These two countries, after all, are at least doing something to come into line. Germany's behaviour, on the other hand, ignores the assumption on which the move towards economic union rests, that the Six should be ready to harmonise conditions in their different countries. It is disruptive of monetary order because it implies a refusal to admit any international rules which run counter to the prejudices of the national central bank. Even under the gold standard, after all, the natural result of the rise in Germany's surplus would be an easing of credit, a tendency for economic activity to grow and prices to increase. Now, instead, the very size of the surplus is causing the German authorities to worry about the risk of importing inflation.

It is possible, however, that they will not find it easy to reduce the surplus. Most measures to encourage imports are ruled out by the rules of the Treaty of Rome or by domestic political pressures. For the moment, the Bundesbank is concentrating on attempts to lend its surplus abroad—by encouraging foreigners to issue securities in Germany rather than invest there. But in the long run, as foreign exchange dealers have recognised for some time past, there are only two ways of dealing with a persistent surplus. One is to let costs and prices gradually rise to meet those of one's neighbours, the other is to alter the exchange rate.

Germany is still protesting her refusal to accept either alternative. The longer she continues to do so, the longer the exchange markets will remain unsettled and the possibility of an unmanageable movement of short-term funds will persist. The Bretton Woods system envisages occasional small alterations in exchange parities when these are needed to recognise the emergence of permanent changes in the economic situation. Can there be any doubt that this is a course which both Germany and Italy should be considering now?



Built-in safety, greater endurance and longer life.... (WL) wheels are ahead of others both in performance and service.

WHEELS INDIA LIMITED Padi, Madras-50.

THE UNIT TRUST OF INDIA—II

PROSPECTS, POLICIES AND PERSPECTIVE

IT was shown in the outline of the objects and organisation of the Unit Trust of India last week that the unit issued by the Trust offers a unique form of investment because it combines several important advantages. It minimises risk. For the Trust operates on the principle of investing its funds in a balanced and well distributed portfolio of investments. A unit holder with a minimum investment of Rs. 100 participates in the entire portfolio consisting of Government securities, industrial debentures, preference shares and equities.

Equity capital, however, is basically risk capital and, as equities move up and down, the unit prices are also bound to fluctuate, based as they are on the value of the underlying securities. There should, therefore, be no illusion in the minds of investors that the prices of units will appreciate only and that there will be no chance or possibility of their being sold or repurchased at a discount. It is true that such a possibility is remote, because, firstly, the Government has staked quite a lot on a single Unit Trust in the public sector and would not like the investors to lose confidence and, secondly, in the next few months, the trends in the stock market are bound to look upwards in the hope and expectation of realistic economic, fiscal and monetary policies from the new Government. Nevertheless, as the Trust will spread its holdings over many companies, investors will be protected better than if they held shares only in a few companies. The example of the U.K. during the last five years makes interesting reading in this connection. During 1959, the leading unit trusts in that country averaged a capital appreciation of 62 per cent—much higher than the *Financial Times* average of ordinary shares index. On the other hand, early in 1960, equities fell at one time by nearly 10 per cent, but unit trusts never fell by more than 8.4 per cent. A great advantage of unit trust movement is that it evens out fluctuations and provides a steady income.

Ready marketability is a great and important attraction for small investors, for they are able to get immediate cash if they are forced to do so any time. After the initial period of brisk sale is over, units can be sold back to the Trust whenever the money is needed. With effect from 1st November 1964, the Unit Trust will announce daily its purchase prices and the Chairman of the Trust has repeatedly assured the investing public that the difference between the sale and purchase prices will never exceed five per cent but may be lower than that, as against the 10 per cent margin usually kept in foreign countries.

Prices of Units

The Unit Scheme 1964 provides extensive details of the method for fixing the prices of the units. The units are now being sold at par but, from the 1st of next month, the price at which a unit will be sold on any day by the Trust [that is, the sale price (=S.P.)], will be arrived at under the following formula:

$S.P.=\frac{V}{U}+M$ where V is the value on any day of the assets of the Unit Trust as at the close of business on the immediately preceding working day, reduced by its liabilities other than contingent liabilities or liabilities in respect of the initial and unit capital and reserves at the close of business on the same day; U is the number of units sold and outstanding on that day; and M is the amount estimated to cover brokerage, commission, taxes, if any, stamp duty or such other management or investment charges. The result is to be rounded off to the next higher 5 nP.

The price at which units will be repurchased (=RP) by the trust on any day shall be arrived at by a similar formula $RP=\frac{V}{U}-M$, the only difference being that M is deducted from the result instead of being added to it.

For the purpose of arriving at the *value* of assets of the Trust, the assets other than investments will be taken at their book value. The investments shall be valued by taking the closing prices on the stock exchange. If the security is quoted on more than one stock exchange or if it is not quoted at all, the manner of determining the value shall be decided by the Trust which shall take into account what may be regarded by it as the *fair value* of such investment. The value so arrived at will be further adjusted for interest accrued but not taken credit for or dividend declared but not received.

Although the procedures seem to be elaborate, the Unit Trust plans to mechanise all its routine and voluminous operations and processing. We may thus safely assume that a unit holder is assured that he can realise his investment any time he chooses at very short notice and at a definitely ascertainable price quoted in the national newspapers and announced over the radio. It may also be possible to borrow against units from banks.

All this will, of course, be possible only so long as sales and repurchases take place during the normal course of business. If, however, an emergency or a universal loss of confidence in equities forces all unit holders to sell their units to the Trust, it may not be possible for it to repurchase all the units on offer, in spite of the various powers of the Unit Trust to borrow from the Reserve Bank for supplementing its liquid resources. In such circumstances, the Reserve Bank may, by a written directive, prohibit the Trust from selling or repurchasing the units.

Some of the investment trusts or companies in foreign countries have a fixed capital and pattern of investment. But the Unit Trust of India, like many other unit trusts, is an open-ended fund. As more and more people buy its units, the Trustees will be able to buy corresponding amounts of securities. The Trust can thus go on expanding so long as the units are in demand.

Savings or Thrift Plans

What are the prospects for the sale of units? It is widely believed that, in the present state of the capital market and with higher and rising prices of essential commodities, as well as higher and rising taxation liabilities, public response to the Unit Trust may not be very encouraging. Advertisements, however, have already started to keep the Unit Trust in the public eye. Unit trust is a novelty to the Indian investor and, once the initial inertia or resistance is overcome and a momentum is gained, substantial new investment should flow into the Unit Trust. The Chairman has also expressed the intention of the Trust to initiate at a later stage savings or thrift plans designed to enable a saver of even moderate means to invest in units.

Experience of unit trusts abroad has shown that savings plans have great appeal to small investors, particularly salaried classes. There can be several types of such plans for automatic reinvestment of regular and accumulated savings into units, or plans that combine unit trust investment with life insurance. In the U.K., for example, advertisements, thrift plans and block offers keep several competing unit trusts in the public eye. And trust managers are finding other ways of promoting the sale of units, particularly links with life insurance. Rapid strides have been made from a total investment of £60 million in units in mid-1960 to £200 million by the end of 1959 and £370 million by the end of 1963. More than £1 million net are being invested in unit trusts each week presently, and the number of investors is steadily growing. There are more than a million unit-holding accounts now. In the U.S.A., the total assets of the mutual funds exceeded $25 billion at the end of 1963, having risen from $6 billion in 1960. The total number of accounts is now 6 million. What does this all show? True, savings are high throughout the U.K. and the U.S.A. But the increasing popularity of the unit trusts suggests that a significant number of small savers are pinning their long-term hopes on unit trusts. If something like a similar revolution in peoples' ways of thinking, saving and investing is brought about here in India, it shall not be long before the target of Rs. 100 crores investments in units may be reached. In the U.K. and the U.S.A., where there are several competing Unit Trusts, each one is on its own for the sale of units and, as was pointed out in the previous article, banks have refused to sell them over their branch counters, in view of their inability to choose from the multiplicity of offers available for sale at any one moment. In India, in spite of many other disadvantages of a State monopoly of a single trust, it must be admitted that over 4,000 branches of 38 banks in both private and public sectors, in addition to several share-brokers, will be able to sell units simultaneously. The already existing machinery of banks will thus give a great boost to the Unit Trust of India.

Any buyer or holder of a unit has an equal right in the beneficial ownership of the assets of the Trust. This means, as the Unit Scheme lays down, that all the units rank equally for the distribution of dividends, no matter *when* they were sold. It would clearly be unjust to give the same return to two investors who have made their investments on two dates which may be more than eleven months apart. It may, however, be expected that the price of the units will steadily appreciate as the dividend date draws near.

There is no doubt that the sale of units will involve great effort and expenditure, at least initially. It is not known whether it is scepticism or cynicism that has prompted, in some quarters, a comparison of this new scheme with the effort and expense that went behind the fiasco of the prize bond schemes. The comparison, however, ignores the differences of circumstance, attitude and organisation. In spite of the fact that the Reserve Bank advised the Government on and conducted sales and draws, of prize bonds, they were basically departmentally administered. The superintendence, direction and management of the Unit Trust of India is, on the other hand, entrusted to an autonomous institution whose Board of Trustees consists of successful people who have made their mark in various fields of life. Moreover, the Government adopted a very rigid attitude towards the defects in the administration of the prize bond schemes, but, as it appears now, the Board of Trustees of the Unit Trust of India has a very flexible and rational attitude on many problems facing it. The restriction of the sale of prize bonds to only a few offices came in the way of its widespread sales, whereas the units can be purchased at almost any of the 4,000 bank branches.

Considering the unit scheme from all its aspects, there is no doubt that it will succeed. It seems almost certain that India is on the threshold of attracting the small investors into the Unit Trust and that Savings Schemes and thrift plans will play a dominant part in the future growth of the movement. India is fortunate that the entire new movement is in the hands of competent and clever persons possessing a visionary mind.

(Concluded)

WEST BENGAL FINANCIAL CORPORATION

The West Bengal State Financial Corporation received during the year ended March 1964 ninety-nine applications for Rs. 4.86 crores but sanctioned only forty-three applications for Rs. 1.71 crore. The amount actually disbursed was Rs. 1.29 crore or 76 per cent of the sanctions. This represents a substantial progress from the 46 per cent disbursements in the previous year. The total commitments of the Corporation in respect of loans sanctioned since its inception upto 31st March 1964 come to Rs. 7.84 crores, of which Rs. 4.93 crores have so far been disbursed. The gap between sanctions and disbursements is under the close attention of the Board of Directors of the Corporation which, we are told, have already taken appropriate steps to reduce the gap further.

Considering the growing demand for assistance, the resources of the Corporation would appear to be inadequate, in spite of the borrowing facility with the Reserve Bank of India and Refinance Corporation for Industry Ltd. The Corporation does not expect that substantial amounts could be raised by way of deposits at the present time. It has, therefore, decided to raise a further Rs. 1 crore by issuing fresh bond, in addition to the Rs. 2 crores raised in the past.

The financial results of the Corporation for the year 1963-64 are substantially better than those for the previous year. Net profits amount to Rs. 10.37 lakhs, as against Rs. 7.49 lakhs. The Corporation is able to meet its liability for guaranteed dividend liability aggregating Rs. 3.50 lakhs and no subvention from the State Government has been necessary. The total outstanding liability for this subvention received in the past is Rs. 11.87 lakhs, against which the reserves and special reserves built up from the dividend forgone by the State Government and the Reserve Bank amount to Rs. 8.01 lakhs. The provision for taxation is Rs. 4.69 lakhs.

An important step taken by the Corporation during the year was the appointment of a panel of technical advisers for examining the technical competence of the schemes financed by the Corporation. With the assistance of this panel, the Corporation, it is hoped, will be in a better position to judge the soundness of schemes for financing than has been possible in the past.

DENA BANK'S PROFIT

The profit of the Devkaran Nanjee Banking Co., Ltd., for the half-year ended 30th June 1964 is Rs. 16.58 lakhs (subject to tax), as against Rs. 14.15 lakhs for the corresponding half of 1963. The Directors have recommended an *ad-interim* dividend of 8 per cent or Rs. 2 per share, subject to deduction of tax. Including the Rs. 1.78 lakh brought in, the total available for distribution comes to Rs. 18.36 lakhs. The interim dividend will absorb Rs. 4 lakhs, leaving Rs. 14.36 lakhs to be carried forward to the second half-year's account.

PROGRESS OF COTTON MILL INDUSTRY

MORE SPINDLES AND LOOMS NEED TO BE INSTALLED SOON

IT is now clear that the cotton textile industry will not be able to achieve the third Plan production and export targets fixed for the year 1965-66. For so wide is the gap between these targets and the current rate of output and shipments. Thus, as against the production target of 9,300 million yards of cloth, the actual output is currently running at an annual rate of no more than 8,000 million yards (4,950 million yards in the mill sector and 3,050 million yards in the decentralised sector comprising handlooms and powerlooms). As for yarn, the present output is only 2,050 million lbs. whereas the target is 2,250 million lbs. Similarly, in the case of exports, the actual shipments are maintained at an annual rate of just 600 million yards which is well below the export target of 850 million yards fixed to be achieved by 1965-66.

In view of the lag in exports and considering that the *per capita* consumption of cloth within the country has not increased as envisaged in the Plan, the requirements of cotton piecegoods in 1965-66 would naturally be less than the estimate of 9,300 million yards. The total requirements, according to the Planning Commission's Working Group on Cotton Textiles, are expected to be around 9,000 million yards. Assuming that the Working Group's expectation regarding the successful fulfilment of the production target (3,500 million yards) assigned to the decentralised sector will prove correct, the mill sector will have to produce at least 5.500 million yards in order to meet the total requirements of 9,000 million yards (revised estimate). The Working Group does not think that this much production will come from the mill sector. The maximum output that can be expected by more intensive utilisation of existing capacity is estimated at 5,000 million yards. The shortfall in supplies in 1965-66 will thus be of the order of 500 million yards. The Working Group has done well, indeed, to warn against a cloth shortage in the last year of the third Plan and to urge the Central Government to provide foreign exchange for the import of some capital equipment. For achieving a production of around 5,000 million yards in the mill sector by 1965-66, it is considered necessary to ensure the installation of at least 16,000 additional looms by the end of the current financial year (March 1965).

Stocks Depleted

The fears about a possible shortage of cloth supplies developing in the coming years are not exaggerated. There has already been a considerable depletion of stocks with mills and, unless the rate of production is raised, there will be a further depletion. Such a depletion is not desirable. A reasonable quantity of cloth must always be held as stocks in mills' godowns and in the pipelines. The table below indicates the mill cloth supply position during the first half of 1964 and 1963, as well as in the whole of 1963 and 1962:

(In million yards)

	January-June		Whole of	
	1964	1963	1963	1962
Opening stocks	456	686	686	543
Production	2,472	2,388	4,837	4,987
Imports	1	1	1	2
Total available supply	2,929	3,075	5,524	5,532
Less closing stocks	290	457	456	686
Offtake	2,639	2,618	4,068	4,846
Of which:				
Domestic consumption	2,364	2,340	3,537	4,338
Exports	275	278	531	508

Corresponding to the cloth production target of 9,300 million yards, the target envisaged for yarn, as already noted, was 2,250 million lbs. In order to achieve this target, spinning capacity in the mill sector was to be expanded by an additional four million spindles over the 13.66 million spindle capacity achieved at the end of the second Plan. To begin with, it was envisaged that three million spindles should be licensed. Although capacity of the order of 3.7 million spindles has been licensed, the actual progress in the installation of spindles has been slow. On the basis of the present assessment, it is unlikely that more than 1.5 million spindles would be actually installed before the close of the third Plan. The Working Group, therefore, emphasises that concerted efforts will be necessary to accelerate the rate of installation of additional spindles.

Since the progress made in the installation of spindleage is slow, it has been decided that the existing composite spinning mills may increase their spindleage to the extent of 7½ per cent of their registered spindleage and, in exceptional cases, up to 10 per cent, if found necessary for balanced and economic working. The production of yarn is currently running at about 1,960 million lbs. In order to achieve the target, the working Group points out, an additional production of the order of 290 million lbs. will have to be achieved in the next two years. In the opinion of the Group, the current utilisation of spindleage is very satisfactory and any additional production by further intensified utilisation of capacity can only be marginal. Corresponding to the cloth production of 9,000 million yards in 1965-66, the requirements of yarn in that year will work out to about 2,180 million lbs. As there is little scope for increasing production from the existing capacity, an additional capacity of the order of one million spindles, it is said, will have to be installed by the end of 1964-65 to ensure extra output of about 200 million lbs. of yarn in 1965-66. The Group is quite confident that, with concerted efforts, it should be possible to install about 1.5 million spindles by 1965-66. Of this, at least one million spindles should be in production at the beginning of 1965-66.

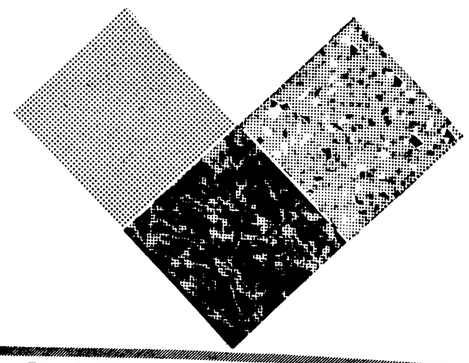
Imports

To the extent the requirements of machinery for the additional capacity indicated above cannot be met from indigenous sources, imports will be necessary. It is true that such imports entail foreign exchange spending, but, fortunately, several aid-giving countries have agreed to make available to India untied credits. A part of the credits can certainly be allotted to the cotton mills for import of capital equipment.

It may be noted, in this connection, that the State Trading Corporation of India is arranging for the import of textile machinery worth about Rs. 10 crores (£7.6 million) from the U.K. for being used by five mills in the private sector, 11 co-operative mills (in Maharashtra, Gujarat and Uttar Pradesh) and one public sector unit in West Bengal: all these mills are new units. The machinery and equipment will be supplied by Messrs. Platt Brothers Ltd. of Oldham, a subsidiary of the Stone-Platt Group of Britain. Out of the total cost (7.60 million) of machinery, 20 per cent, that is, £1.52 million, will represent down payment. The balance of £6.08 million will be financed out of a loan granted by the Midland Bank Ltd. An agreement covering £5.3 million was signed at London last week-end by the Chairman of the S.T.C., Mr. B. P. Patel, and the General Manager (Overseas) of the Midland Bank, Mr. G. I. Williamson. This agreement will be followed by a supplementary agreement at a later date to cover the remaining part of the loan. The loan is repayable over twelve years.

Raw Cotton

Necessary imports of textile machinery and increase in production within the country are both urgent for enabling the cotton mill sector to expand its capacity. Equally urgent is the need for the requisite supply of raw cotton. Basing itself on the rate of mill cotton consumption during the year 1962, the Planning Commission's Working Group has estimated that about 6.5 to 6.6 million bales of cotton will be required to produce 2,180 million lbs. of yarn by 1965-66. As the actual production of cotton has fluctuated between 3.85 and 5.50 million bales in the past four seasons, it is somewhat difficult to say whether the estimated crop would be sufficient to meet the estimated requirements of 6.5-6.6 million bales. The Working Group has rightly stated that, to the extent there is a shortfall in cotton output, imports are inescapable.



GREATER STYLE
with new
VYNATILE
WONDERFUL PLASTIC TILES FOR FLOORS!

There's nothing like VYNATILE—the unique new floor covering! Strong, flexible and beautiful, VYNATILE does wonders for rooms—looks distinctive on any floor. Ideally suited to offices, shops, restaurants, showrooms, banks, theatres, homes and hospitals!

Choose VYNATILE in 3'x3' sheets, in thicknesses of 1.5 mm. or 2 mm. Or ask for it in any economical size. Better still, take it as tiles to fit into your scheme of things!

VYNATILE...better in so many ways!
- So durable. Won't rot, crack, break or scratch!
- Can be used on any surface!
- Superbly finished. In 28 attractive colours and patterns!
- Can be wiped clean in seconds!
- Professionally laid to last for years!

MANCHESTER LETTER

MODERN METHODS OF WORK IN MILLS

EMPLOYERS AND UNIONS GIVE FINAL SEAL OF APPROVAL

From Our Special Correspondent

MANCHESTER, 30*th June*

DETAILS of a new agreement affecting operatives in the spinning section of the Lancashire cotton textile industry working modern high-speed and high-production machinery have been announced. It is claimed that it will bring into force the most modern wage structure in the U.K.

The new agreement signed by the British Spinners' and Doublers' Association and the National Association of Card, Blowing and Ring Room Operatives will be applied as soon as possible to all mills or parts of mills which have been modernised. There will be no immediate adjustment in wage levels either upwards or downwards as a result of the agreement, but it is expected to provide a considerable incentive to employers to install new equipment with the assurance that it will be fully utilised and to operatives to accept reorganisation and new methods of working with higher potential earnings.

The main point of the agreement is the acceptance by both employers and unions of work measurement and modern work study methods. "The negotiations have been based on the principle that it is in the interests of both parties to find a fair and right solution to problems involving wage levels and work allocations rather than to rely on the old tug of war methods," said a statement. The sharing of the benefits of increased productivity by the workers is recognised, but it is also agreed that the wage bands arrived at with the help of job evaluation and practical experience should not be upset by unjustifiable claims for wage increases on behalf of individuals or groups of workers at mill level. The agreement also includes a new training and apprenticeship scheme designed to attract good quality recruits into the spinning industry.

Welcoming the agreement, Mr. R. W. Greenhalgh, President, British Spinners' and Doublers' Association, said that it gave the final seal of approval by employers and unions to modern methods of work organisation. It allowed for maximum flexibility at mill level while preserving a common pattern and wage structure throughout the industry. "Provided that the agreement is operated with the same spirit of co-operation and fairness with which it was negotiated, it will make a great contribution to the efficiency and well being of the industry and all engaged in it," he added.

Profusion of Reports

Continuing the current assessment of the trade position as outlined by company chairmen whose reports are now coming through in profusion, the era of expansion is only just beginning if their forecasts are carried into practice. Mr. P. R. Gell, Chairman of Ashton Brothers, says:

"We do not believe that a mammoth scale of operations is essential in order to release the economies that follow from vertical integration, but it is the Board's policy to continue the development of the group by suitable acquisitions of other businesses and by the investment of funds in the most modern and up-to-date machinery within its own mills."

Although the Company's results during the year to the end of March were eminently satisfactory, Mr. Gell warns against false optimism. "There has been a tendency in some quarters to regard present conditions as a boom," he observes and adds: "This is certainly not so in the textile industry where the effect of imports cannot be ignored." The Government, he hopes, having accepted the need for control of imports, will ensure that it is developed still further.

"Be Realistic" Plea

A call for a more realistic attitude towards textile imports is also made by Mr. H. M. F. Carrington, Chairman of Carrington and Dewhurst, the spinning and weaving company in which Courtaulds, I.C.I. and Bradford Dyers (and through the latter, Viyella International) are financially interested. Were it not for apprehension about the Government's policy towards textiles generally, he says, he would view the group's future with complete confidence. Forthcoming G.A.T.T. negotiations could commit Britain to a reduction of up to 50 per cent in duties, without any guarantee of reciprocal action by other countries.

"The development of man-made fibres in this country reached its present stage behind a tariff barrier," Mr. Carrington continues. "It is utterly unreasonable of the Government to expect an industry such as ours to compete successfully overseas whilst fighting to maintain a profitable home market." Further expansion, through re-equipment, leasing of more factory space in Northern Ireland, the knitting trade and additional merchanting facilities, is in prospect, while the proposed acquisition of William Totton & Co. adds another chapter to the group's development programme.

Textile Recovery

A year ago, the Bleachers' Association changed its name to Whitecroft Industrial Holdings, making it clear that non-textile interests now represented the bulk of the Company's business. Subsequently, more expansion into other fields has been carried out, including the acquisition of firms engaged in carpet manufacture, plumbers' merchants, builders and contractors.

Nevertheless, Mr. Charles D. Greenhalgh, the Chairman, is able to report much more profitable trading by the textile finishing branches of the group in the year to the end of March. Profits from this section, he says, contributed 37 per cent of the total of £904,000, which itself was an increase of £377,000. More cloth for processing has been available and the benefit of branch reorganisation and the installation of modern plant is now apparent.

The policy of the Company, however, as declared by the Chairman, is to widen its scope still further by broadening the spread of its non-textile investments, as well as of its textile interests, where appropriate. New acquisitions may follow discussions now in progress.

Market Letter

All the above adds colour to the comments made by a prominent firm of Manchester stockbrokers who have devoted their current market letter to the trend of textiles. The financial activity by the two giant man-made fibre producers, it is pointed out, has attracted most of the publicity, but it has also stimulated equally important consolidation moves by other companies, both public and private, to maintain or improve their competitive position. "In addition to reducing the number of independent production units in Lancashire," the report adds, "this tightening of the industry's structure is also changing the pattern of distribution. An increasing proportion of yarn, cloth and garments is coming under the control of relatively few organisations."

This not only reduces the amount sold in the open market, but is especially significant, in view of the growth of large retailing and industrial groups which take the final textile product. The increased co-operation possible could make a substantial contribution towards reducing the amplitude of cyclical fluctuations in the industry.

Growth in demand for rayon and the synthetics has not all been at the expense of natural fibres; in the case of leisure wear particularly, the report observes, the easy-care properties of the new fibres has made them ideally suited for the needs of what is virtually a new market created by changing social habits. Recent technical advances have increased demand for rayon and the synthetics, but as total demand for fibres is unlikely to grow at a rate of more than 2 or 3 per cent per annum, significant changes in the pattern of fibres used can certainly be forecast.

REORIENTING AGRICULTURAL SCIENCE TO THE NEEDS OF INDIAN FARMERS

By A. D. Pandit

[Why has modern science and technology failed to make a sufficient impact on Indian agriculture? And what are the factors that impede the transfer of knowledge from agricultural colleges and research institutions to the farmer? In this article, (abridged) Mr. A. D. Pandit, Vice-President of the Indian Council of Agricultural Research and Special Secretary, Department of Agriculture, Ministry of Food and Agriculture, Government of India, attempts an answer to these problems. Agricultural production has increased by about 40 per cent since the beginning of India's first Five-year Plan. Production of foodgrains has gone up from 57.6 million tons at the beginning of the first Plan to about 80 million tons in the last few years. Except for Brazil and Japan perhaps, no other country in the world has achieved a comparable increase in production over the same period. However, for achieving a break through on the agricultural front, Mr. Pandit feels, it is essential that India's agriculture should take advantage of the latest techniques devised by agricultural science.]

WHILE efforts are being made by social reformers and educationists to remove the barriers to the adoption of a more receptive attitude in the farmer, the agricultural administrator and the scientists must, meanwhile, put their house in order. The agricultural scientist must develop a more practical outlook and devote his working life to the study of the fundamental research work carried on in other countries and devise techniques which can readily be applied to our soil and climates. The agricultural administrator must do everything possible to enhance the prestige of teachers and research workers in agricultural science. In every country, agriculture, being an unorganised industry, is usually at a disadvantage compared to other economic interests and the agricultural administrator must ceaselessly advocate the cause of the farmer and ensure a fair deal to him.

It is widely recognised in developing countries that, without special efforts, the findings of research may remain confined to the laboratory. Extension or advisory services have been set up in all developed countries to make available to the farmer the latest advances in agricultural science and technology. These services also advise industries catering to the needs of the farmer how to produce farming requisites cheaply and efficiently.

In India, the first attempt to establish an agricultural extension service was made in 1932, and today every village is covered by the village level worker who is the extension agent at the bottom of the ladder. He is assisted by a sprinkling of agricultural graduates and a few experts at the divisional headquarters, a division constituting four or five districts.

In the U.S.

The extension service in America is based on the Land Grant Colleges where the Director of Extension is a member of the faculty and the county extension agents live in the neighbourhood of the college and function under his technical control. This ensures a two-way traffic between the farmer and the scientific experts. The Land Grant Colleges through the extension services themselves conduct an adult education programme designed to channel scientific and technical information to farmers and to the agricultural supply and processing industries with a view to speeding the rate of adoption of new techniques and encouraging more efficient application of techniques already in use. Recently, the extension agent has been buttressed by a central staff of extension specialists in physical and social science fields related to agriculture in recognition of the fact that scientific knowledge is getting more and more specialised.

In coming years, it would be necessary to replace, to the extent that our educational resources will permit, the multipletype village level worker with a graduate extension agent and to give him technical support by the provision of a set of experts in agronomy, soil and water management, and plant protection in every district. These experts should be located at an agricultural college, if one already exists, in the district; and where there is no agricultural college, a research farm with the necessary laboratory should be established so that these experts can carry on research on local problems in their own disciplines.

The linking of the extension services with educational and research institutions will ensure that problems from the farmers' field are taken by the extension agents to the colleges and research institutes, and solutions to these problems, as and when they are found, are taken by the extension agents back to the farmer.

The reader will naturally want to know what steps are being taken to remove the obstacles that stand in the way of the advent of science in Indian agriculture. The syllabus of agricultural colleges has been scrutinised by an Expert Committee and the revised syllabus places a greater emphasis on practical work. Subjects such as soil and water management now receive more attention than in the past. The course of instruction of the village level worker has also recently been revised so as to devote more hours to agriculture and less to other subjects such as health and social education. Arrangements have been made for practical extension work by trainees in the blocks around the training centres.

Applied Research

The Indian Council of Agricultural Research, as its last session, discussed measures for reorienting agricultural research to the needs of the farmers. The principle was accepted that fundamental research, some of which is necessary for progress in applied research, should mainly be carried on in Central research institutions and Universities and that State research institutions should concentrate on the investigation of local problems. The Council emphasised that, as in other investments, investment in agriculture research will also have to be judged from the return in the form of an increase in income from agriculture that can be traced directly to such research, and that research for the sake of research, could not be defended in agriculture.

When we consider that the first serious effort to apply scientific methods to Indian agriculture is not more than 30 years old, and that more advanced countries have had to wait for half a century before there was an appreciable impact of science on agriculture, we can say that a cautious optimism about the future of Indian agriculture would be justified. If the agricultural scientist reorientates his outlook to the needs of the times and resources within the next five years permit the building up of a competent extension service, it will be possible to make the much needed break-through in agriculture within a short time. The beneficent social changes being brought about by the spread of education to all classes, particularly to women, are bound to give rise to the desire for a higher standard of living in the rural areas and transform peasant economy from a subsistence economy to a commercial economy. Experience elsewhere proves that the only way in which this can be done is the assimilation of techniques devised by agricultural science and the increasing use of products of industries, such as implements, fertilisers and pesticides backed up by technical advice.

A Major Factor

The application of science and technology to industry and agriculture is a major factor in economic growth. Spectacular increase in agricultural productivity has been achieved by countries which have adopted the latest techniques devised by science.

In the last half century, the U.S.S.R., Britain, the U.S.A., Australia and Japan, among others, have increased their yields of wheat by between 50 to 100 per cent, whereas the yield in India has gone down by 6 per cent. During the same period, while rice yield in countries such as Japan, Australia and the U.S.S.R. rose 50 to 100 per cent, that in India fell by 11 per cent. It is well known that yields per acre in India are a third, or, in some cases, a fourth of the present yields in countries where agriculture has attained a high level of efficiency.

Several factors are responsible for the low output and the low rate of growth in yield of vegetable, as well as animal food, in less-developed areas. But perhaps the most important among them is the low educational level of the farmer in countries constituting this region and the consequent failure of modern science and technology to make a sufficient impact on the traditional techniques of cultivation followed by them.

The developed countries of today have over the past century devoted considerable resources to scientific research and education. They have built up institutions to pass on the fruits of research to the farmer in the form of agricultural extension services. Scientific agriculture involves the use of materials produced outside the farm and, therefore, the developed countries have built up industries to provide non-farm inputs, such as agricultural implements fertilisers and pesticides and organised their wide distribution and made arrangements to ensure that adequate credit for the purchase of these materials is available to the farmer on convenient terms.

Technological Revolution

The index of farm output rose the large-scale mechanisation of American when agriculture and the wide use of chemical fertilisers became features of most American farms. The Morrill Act of 1862 established the Land Grant Colleges from which sprang the extension services to render advice on the latest scientific techniques to the farmer; the Hatch Experiment Station Act of 1887, which gave each State an yearly grant for the support of an agricultural experiment station, brought out a flowering of agricultural research in the last decades of the 19th century. The number of persons that a farm worker could support increased from 9.8 in 1930 to 10.7 in 1949, 14.6 in 1950 and 22.8 in 1957, thus making it possible not only to feed the population of the country according to the highest nutritional standards but to supply a large part of the widening gap between food production and rising populations in some of the less-developed regions of the world. The technological revolution in American agriculture included widespread progress in mechanisation, greater use of lime and fertiliser widespread use of cover crops and other improved practices, use of improved varieties, the adoption of hybrid corn, a more balanced food for livestock, the more effective control of insects and disease, and the use of chemical weedicides and defoliants.

A similar connection between research, education and technology and the improvement of agriculture can be traced in the case of other developed countries, such as Britain and Japan. In Japan, agricultural research was rigorously directed to the felt needs of farmers and the extension services were staffed on a scale which made advice on farm management readily available to all farmers. The research workers evolved an agricultural technology specifically adapted to physical and economic characteristics of Japanese agriculture. These factors led to a rapid growth in productivity. From the Meiji Restoration (1868) until the outbreak of World War I, the annual growth rate of agricultural output averaged 2.3 per cent and the increase in the production of food crops was sufficient to outstrip the growth rate of population.

In India, the Imperial Agricultural Research Institute, now known as the Indian Agricultural Research Institute, was established in Pusa in Bihar in 1905 and subsequently shifted to New Delhi in 1936. Soon after, agricultural colleges were established in Poona, Kanpur, Nagpur, Lyallpur (Pakistan), Coimbatore and Sabour. The Veterinary Research Institute, which was started in 1889 in Poona, was shifted to Mukteswar in 1893, but much of the educational and agricultural research framework of this country was built as a result of the recommendations of the Royal Commission on Agriculture headed by Lord Linlithgow.

Yields in India Static

The figures about changes in yields of wheat and rice during the last 50 years go to show that Indian agriculture has been static during this period and, from such data as is available, it appears that yields of the principal crops have, in fact, gone down. There are several factors responsible for this somewhat depressing picture, but it will be beyond the scope of this article to examine all those factors. The most important of them is the large growth in population during this period and the extension of cultivation to marginal and sub-marginal lands which has brought the average down. There is, however, no doubt that, had the Indian farmer been converted to scientific methods of farming early enough, he would have met the additional demand for food by increasing yields from present acreage and would not have extended cultivation to lands which were only fit for growing pasture and forests.

Why have modern science and technology failed to make a sufficient impact on Indian agriculture? And, what are the factors that impede the transfer of knowledge from our agricultural colleges and research institutions to the farmer?

The adoption of a foreign technology or even a technology based on research carried on elsewhere but adapted to local conditions cannot be absorbed by a traditional society in a few years. The application of science for the betterment of the economic and social life of a people involves the breaking down of traditional resistances, the growth of appropriate institutions, and the broadening of the educational base. The aversion to manual work among some classes, the laws of inheritance responsible for fragmentation of holdings, the pessimism generated by years of poverty, and the consequent lack of initiative and disinclination to take risks, are some of the social factors underlying the conservatism of the Indian farmer. Time and the influence of education now being made available to everyone under our successive Plans can alone lead to the growth of a commercial and scientific outlook in the agricultural community.

We cannot also expect any improvement in the quality of our agriculture until the attitude of our urban educated classes to agriculture and agriculturists undergoes a radical change. A vast educational campaign is necessary to make not only children but even the adults realise that our economic goals and a higher standard of living for the people can be achieved only if we are able to increase the productivity of our land.

Best Talent Deprived

The low value attached to agricultural pursuits has deprived agriculture, agricultural institutions and agricultural research of the best talent in the country. It is not intended to belittle the performance of some of our agricultural scientists who have devoted the best years of their lives to the improvement of the common crops grown in the country. The series of rust-resistant and high-yielding varieties of wheat developed in the Pusa Research Institute, the Coimbatore varieties of sugarcane and the Indo-American hybrids of cotton, which have replaced the indigenous varieties practically all over the country, are a tribute to their work. In spite of these exceptions, however, it would be true to say that both the quality of agricultural education as well as research has suffered because of the relatively low prestige accorded to agricultural services in the country. Then, in common with other professional education, teaching in agricultural colleges has in the past been somewhat theoretical and bookish and the student has lacked the practical skills and the self-confidence necessary to enable him to solve the problem in the farmer's field.

Lacking prestige in terms of salary and status, the research worker has often tried to seek compensation by doing abstruse work which would enable him to contribute a paper to a reputed international journal instead of taking up problems of applied research which would yield economic benefits to the farmer. Instead of evolving varieties of crops calculated to give high yields in difficult conditions which confront the farmer over a large part of the country, such as, a low moisture content in the soil, prevalance of insect and other pests and the short growing season, too much time is spent in the study of methods of breeding and genetics. Local problems such as soil and water management have been neglected in favour of fundamental studies on run-offs, and crop and animal husbandry sacrificed to work on plant and animal genetics. Foreign scientists who have taken a cursory look at Indian agricultural research and education have been struck by the divorce between the preoccupations of the scientists and the problems that stare the cultivator in the face in different parts of the country.

F.I.C.C.I. CONFERENCE ON AGRICULTURAL DEVELOPMENT

A two-day Conference on Agricultural Development and Economic Progress, organised by the Federation of Indian Chambers of Commerce and Industry, will be inaugurated at New Delhi on 28th August next by Mr. C. Subramaniam, Minister for Food and Agriculture. The Federation has issued a special invitation to Mr. B. R. Sen, Director-General, Food and Agriculture Organisation, to address the Conference. The Conference is expected to provide a forum for exchange of ideas and experiences in the fields of production and distribution or agricultural commodities for producers, traders, experts and Government officials. The agenda is being so framed as to highlight major aspects of agricultural production—trends and fluctuations, crop pattern, methods to improve productivity, credit facilities, etc. And other points such as the size of land holdings, pricing, purchase and import policies, which have an important bearing on agricultural production, will also come up for consideration.

LAW RELATING TO INCOME-TAX RETURNS

HONEST TAXPAYERS SUBJECTED TO HARDSHIP

By S. V. Ghatalia, B.Com., F.S.A.A., F.C.A.

A CLOSE study of the history of tax legislation in our country reveals four distinct stages: Formerly, we had good laws well drafted; then we had good laws badly drafted; then we had bad laws well drafted; and now we have bad laws badly drafted. The changes in law relating to submission of returns are contrary to accepted principles of jurisprudence and rules of natural justice and equity. They are aimed at reducing tax evasion, but, in practice, are likely to hit the honest taxpayer. The available statistics on income-tax collection clearly show that there is a sizable evasion of tax. For the year ended 31st March 1961, only 10,300 individuals reported an income above Rs. 50,000 and only 4,900 individuals reported an income above Rs. 70,000. The changes in law will not hit the quarters where there is real evasion of tax but will cause avoidable hardship to the honest taxpayers. The rule of law appears to be that, if you are honest, you are penalised.

Income-tax return is a device by which a major portion of your income is returned to the Government. Once a man received an income-tax notice for the first time; he went through it and sent it back with a note saying: "after carefully perusing your prospectus, I have decided not to join your association." This aptly reflects the sentiments of taxpayers and non-taxpayers under the penal scheme of taxation in our country.

However, I would not like to underestimate the importance of rigid laws to eradicate evasion. Al Capone, the notorious American gangster, committed 110 murders with a number of gun battles in the street. In 1931, he was brought to trial and fined $50,000 and sentenced to 11 years' imprisonment. He was convicted not for murder, riot or robbery but for failure to submit his returns and for non-payment of income-tax. I regret to say that the recent ill-conceived changes would rope in very small Al Capones in this country who are more foolish than criminal. The real Al Capones would continue to elude the grasp of the law.

It is not understood how, for the non-submission of returns in time, late payment of tax or an honest mistake in submitting returns the penalty could be greater and swifter than a penalty on high dignitaries who might be shown to have committed an offence far more grave and much more against the public interests.

Law Before the Amendments

Before I deal with the changes, let me briefly recapitulate the law as it stood before the amendment. Under Section 139, the returns are required to be submitted voluntarily within the prescribed time limits. If the total income does not include income from business or profession, then the return must be filed before 30th June. If the total income includes income from business or profession and the accounting year expires on or before 31st December, then also the return must be submitted before 30th June. In case one has income from business or profession and the accounting year expires after 31st December, then the return must be filed before the expiry of six months from the end of the latest previous year. The return must also be filed within the above prescribed time limits, if there is a claim for carry forward of loss in business or speculation or capital loss.

The income-tax officer is empowered to issue a notice calling upon any person to furnish a return within 30 days from the date of service of the notice. In case the return becomes due on 30th June, the income-tax officer may extend the time upto 30th September without charging any interest and thereafter on the basis of interest at six per cent. Where the return is required to be submitted after 30th June, extension may be granted upto 31st December without charging interest and thereafter on the basis of interest at six per cent. The income-tax officer may reduce or waive the interest in certain cases. For failure to submit the return of income according to law, under Section 271, an assessee becomes liable to a penalty equal to two per cent of the tax for every month during which the default continues but not exceeding 50 per cent of the tax.

Until now, there were four methods of payment of tax, namely, deduction of tax at source, advance payment of tax, provisional assessment and regular assessment. Under Section 141A, relief was granted to the extent of one per cent on the tax paid before 1st January of the relevant assessment year and interest was charged at two per cent where the assessee did not file his return by 31st December or having filed the return did not pay the tax on his own, on the basis of the return by that date. Section 141A is now deleted and replaced by Section 140A.

Law After the Amendments

Self-assessment

A new Section 140A which replaces Section 141A introduces a principle of self-assessment according to which the assessee is now required, on his own, to pay the tax on the basis of the return within 30 days of filing the return and in default he is made liable to a penalty. Section 140A applies in the following circumstances:

When a return has been furnished under Section 139 and

The tax payable on the basis of the return as reduced by tax already paid exceeds Rs. 500.

This new section comes into operation from 1st April 1964 and, therefore, normally it will apply to the assessment year 1964-65. However, it appears that this section will also apply to returns in respect of prior assessment years where the return is submitted after 1st April 1964.

Even if a revised return is filed under Section 139(5), the difference in tax should be paid under Section 140A within 30 days of the filing of the revised return. The revision of the return would not entail any penalty under Section 140A of the Act on the ground that, in the original return, a smaller amount of income was shown and, consequently, a smaller amount was paid on self-assessment. Such revised return may, however, entail a penalty under Section 271 or a fine under Section 277. The provisions in regard to self-assessment will also apply to cases where a return of income is submitted in the event of reopening of assessments.

A question may arise as to whether on self-assessment the additional super-tax under Section 104 should also be paid. Normally when the return is filed, the statutory period for distribution of dividend namely, 12 months from the end of the previous year, would not have expired and hence the amount of tax would not be due. Secondly, such tax would become due only in consequence of the order of the income-tax officer. It appears that, until the amount is due, there could be no liability to pay tax on the basis of self-assessment.

The amount of tax on self-assessment should be paid within 30 days of furnishing the return. Where extension for furnishing the return is granted, the payment of tax will also be automatically delayed, as the payment is required to be made within 30 days of the date of filing the return. The amount of tax paid by the assessee under Section 140A will be adjusted towards the final tax liability on completion of the regular assessment.

If an assessee fails to pay the tax or any part of such tax on the basis of the self-assessment, he would incur a penalty except in cases where provisional or regular assessment has been made before the expiry of 30 days of filing the return. The amount of penalty is left to the discretion of the Income-tax Officer, but the penalty should not exceed 50 per cent of the amount of *tax not paid* on the basis of self-assessment. Before levying the penalty, the assessee is entitled to a reasonable opportunity of being heard. The income-tax officer would decide upon the amount of penalty on his own without the prior approval of the Inspecting Assistant Commissioner of Income-tax. The Finance Minister has assured (*Economic Times* of 22nd April 1964) that instructions would be issued to officers not to invoke the penalty provisions for non-payment of tax, if circumstances did not justify it. The order of the income-tax officer levying the penalty is appealable under Section 246 of the Act. In respect of the power of the income-tax officer to levy penalty, no time limit, before which or after which the penalty could be levied, is indicated.

The principle of self-assessment appears to have been borrowed from the practice in the U.S.A. In our country, having regard to the level of education and complexities of tax laws, it is extremely difficult for a layman to determine the amount of tax on his own. Even the Finance Minister may have to invoke the aid of a Chartered Accountant. The period of 30 days is too short, because the computation of tax is a lengthy process on account of complicated rate structure. In most of the cases, the amount payable on self-assessment would not be large, as advance payment of tax would have already been made. Even if self-assessment was not introduced, the provisional assessment was sufficient to collect the amount of tax. The new provision would not so much expedite the recovery of the tax as shift the administrative burden of determining the provisional tax from the department to the public.

While introducing the principle of self-assessment, the legislature has not extended the same principle to the refunds due to the assessee. If the tax is required to be paid within 30 days, then logically the excess tax must be refunded within 30 days of submitting the return. There is no time limit for granting refund of excess tax paid by the assessee and the assessee is entitled only to interest at 4 per cent on the refund, if the refund is not granted within six months of the date of the order.

Penal Provisions

Under Section 271, penalty is imposed where the assessee has concealed the particulars of his income or *deliberately* furnished inaccurate particulars of such income. Now the word "deliberately" is omitted. The consequence is that, even if the assessee has furnished inaccurate particulars of his income without any deliberation but either through pure accident or an honest mistake, he may be liable to a penalty. The penalty for this offence is a sum not less than 20 per cent and not more than one and a half times the amount of the tax, which would have been avoided if the income has returned had been accepted as the correct income.

Under the new explanation to Section 271(1), if the total income returned is *less than 80 per cent of the correct total income*, the assessee is deemed to have concealed the particulars of his income or furnished inaccurate particulars thereof unless he proves that the failure to return the correct income did not arise from any fraud or any gross or wilful neglect on his part.

For the purposes of explanation, the correct income means the total income as reduced by the expenditure incurred *bona fide* for the purpose of making or earning such income, but which has been disallowed as a deduction. The deduction is permitted in respect of expenditure, but it appears that a mistake in the amount of depreciation would not be allowed to be adjusted as depreciation is not an "expenditure." The same appears to be the position in respect of development rebate.

In determining the correct total income, only expenditure incurred for making or earning the income and not allowed is excluded. Under Section 37, expenditure incurred wholly and exclusively for the purposes of business is allowable and yet the exclusion under Section 271 is limited to a much narrower quantum of expenditure. It is apprehended that expenditure incurred wholly and exclusively for the purpose of business but not shown to be incurred for making or earning the income would not be excluded in order to arrive at the correct income.

The difference of 20 per cent between the returned income and the correct income is misconceived. If a person has returned an income of Rs. 4,000 but is assessed at Rs. 6,000, he would incur a penalty in respect of Rs. 2,000. But an assessee who has returned an income of Rs. 1,00,000 but is assessed at Rs. 1,20,000 would not be liable to a penalty under the explanation, because the difference is within the limit of 20 per cent of the correct total income. It follows that small assessees would become liable to a penalty for a small offence, but the same degree of offence by a higher assessee would not entail a penalty.

It was already a practice to treat all taxpayers as tax-dodgers and with the amendment of Section 271 the said practice has now the blessings of the legislature. Even if a criminal has a presumption of innocence as well as the well-known doctrine of benefit of the doubt in his favour, it is very strange that a taxpayer

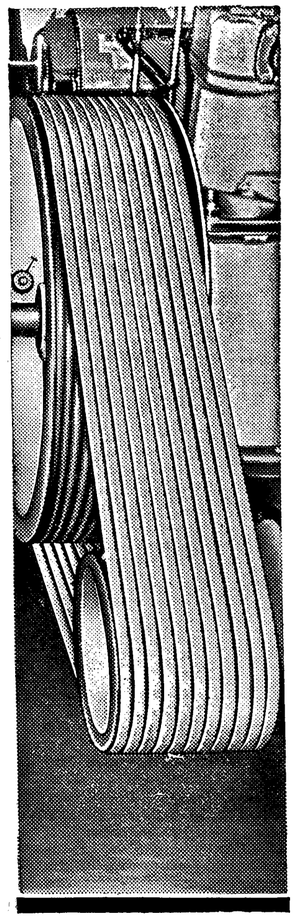
NOW - A NEW VEE-BELT WITH 40% INCREASED HORSE POWER RATING

DUNLOP

introduces

MAXRATE



Maxrate is one more major development by Dunlop in the field of industrial rubber products in India. This premium rated belt will bring economy of drive space, weight and cost. How? Read on.

The basic factor in assessing the utility of any vee-belt is its horse-power carrying capacity. More hp means more profitability. Maxrate is developed to do exactly this. Besides, it is backed by the technical know-how and expertise of Dunlop and manufactured from the finest materials for top performance.

Here's why Maxrate 40% higher hp capacity means more economy than normal vee-belts.

1. Higher hp capacity results in compact drives.
2. Compact drives mean savings in space, weight and cost.
3. No increase in price ; thus increased value for your money.

Maxrate is manufactured by Dunlop in a wide range to suit every requirement. See your nearest Dunlop dealer for details or write to :

THE DUNLOP RUBBER CO. (INDIA) LIMITED

Industrial Rubber Products Division, 57B, Free School Street, Calcutta-16.

CONDITIONS FOR ECONOMIC GROWTH—I

WHAT INDIA CAN DO TO ATTRACT FOREIGN PRIVATE CAPITAL

By Professor W. H. Hutt

[This article is being published by the Forum of Free Enterprise *in the form of a booklet. It is reproduced here with the kind permission of the* Forum. *The author is one of the leading world economists. He is a member of the well-known Mont Pelerin Society with which leading economists who believe in a free market economy are associated.*—ED.]

HOW can India progress most rapidly from relatively very low average standards of living to standards comparable with those achieved in, say, Western Europe and United States?

The question can be usefully put in another form. Why is it that, in spite of an ancient cultural background and in spite of powerful world forces which (it will be argued) are tending to spread to underdeveloped areas the modern technologies of industry and agriculture, with the accompanying outputs, high wages and good living conditions, the great mass of the Indian people are somehow being prevented from enjoying what the world has been offering her?

This reference to what the world has been "offering" does *not* relate to that assistance which, springing from altruism and enlightened self-interest, takes the form of "foreign aid" to friendly nations. Gifts of that kind, we shall argue, are of negligible importance in relation to what foreign profit-seekers for whom no altruistic intention can be claimed, would be able to achieve for the poverty-stricken Indian masses if policies in India were *rationally* aiming at the rapid material advancement of the common people.

The speed of growth in material well-being on the part of any underdeveloped region depends ultimately upon the thrift of its people. For thrift is simply the net accumulation of capital.

By "capital," we usually mean income-earning assets; but as used here the term is intended to include also what we today call "human capital." Capital in this form is accumulated through the improvement of the powers of the people, especially by means of education and technical training, which increase their ability to use physical assets effectively.

Respect for Thrift

Because of the enormous importance of thrift, if the aim in India is to catch up, as quickly as possible, with the standards achieved in, say, the United States, their leaders ought to make one of their top priorities the creation of great respect for thrift. This they can do most effectively by gradually discarding *discriminatory* taxation;[1] and that will mean avoiding one of the worst mistakes of the western powers during the present century. It is neither to the advantage of India as a whole nor of its poor if the provident are taxed for the benefit of the thriftless, the industrious for the benefit of the lazy, the enterprising for the benefit of the complaisant or the plodder, or the competent for the benefit of the incompetent.

A case can, admittedly, be made out for death duties to limit the size of inheritance.[2] But, under economic democracy, this case rests on an important proviso. The sums acquired by inheritance taxes (or by any "progressive" element in taxation) must be constitutionally protected from squandering by the politicians. If the community's progress—through provision for the future—is not to be braked, the proceeds of death duties (or of the "progressive" element in taxation) must be *maintained intact and devoted to the production of income yielding assets*, whether in the form of loans to private businesses, investment in equities via a collectively-owned investment corporation,[3] or devotion to State enterprises.[4]

Among the "assets" into which the proceeds of death duties or the "progressive" element in taxation *may* be legitimately invested are the people themselves. In so far as capital raised by discriminatory taxation is devoted to general and technical education which actually *does* play a part in raising the real earning powers of the people,[5] the capital transferred may well be maintained intact. But a large proportion of expenditure on education will necessarily be in the nature of replacement. The developed powers of a person ultimately decline as he ages, and die with him. Hence some part of expenditure on education and training must, properly speaking, be regarded as in the nature of consumption and ideally be met out of *proportional* taxation (i.e., taxation which takes the same proportion from all incomes down to the point at which it does not pay to collect).

But increased expenditure from taxation on education may require concurrent or prior provision of additional physical assets from savings if that investment is to be fertile. And the skills of men not only need tools if they are to be productive. They require an appropriate development of communications (roads, railways, ports, etc.) and trading institutions.

Investment in Human Capital

It is equally true that the accumulation of equipment may be wasteful unless accompanied by complementary investment in human capital.

In a stimulating recent contribution on this topic, Dr. H. D. Gideonse writes:

"If we ignore the fact that labour as a productive force derives its value from the investment of capital in the form of in-service training and formal education, it is impossible to understand comparisons of economic growth in the U.S.A. and in the U.S.S.R., or to develop an intelligent understanding of our experience with the Marshall Plan in Western Europe when it is contrasted with the disappointing result of our billions of foreign aid in Asia or Latin America. In Western Europe the 'aid' produced increases in productivity that were more than proportional. In Korea or Indonesia there was no measurable enduring response in productivity. . . .

"In the European case, our 'dollars' literally 'primed the pump'—a human pump consisting of trained and educated manpower with moral or customary attitudes that were compatible with development. In the Asian or Latin American cases the absence of the corresponding—or preceding—investment in the human factor doomed the venture from the beginning. . . . The experience of Japan, which has shown an increase in productivity that is more than proportional to the flow of private capital assistance which it has received, is additional confirmation of the hypothesis that the rate of human investment is the crucial factor. . . .

"In the underdeveloped countries educational policy is more easily recognized as a part of overall economic policy. The difficulty here is the emotional resistance to the acceptance of a rank-order of priorities that is compatible with a reasoned strategy of economic development. In the egalitarian passion for literacy which was encouraged by some of the less fortunate activities of UNESCO, programmes for national literacy—the first six years for everyone—were sometimes encouraged at the expense of all other educational and economic development. Literacy at the sixth-year level is not a reliable foundation for step-by-step articulation of a programme that supplies essential human skills as they are needed in the acceleration of economic development."[6]

To discern the potentialities of growth in a country like India, it is essential to appreciate that it is to the advantage of the *developed* countries that the economic progress of the *underdeveloped* countries shall be fostered. If there were no restraints imposed by the governments of the more advanced areas, the resources needed for the rapid economic expansion of the backward regions would flow into them far more rapidly than is happening at present. But most of the governments of the western world are committed to policies known as "central economic planning;" and among the aims which the "planners" nearly always pursue is that of retaining resources at home, or, as it is usually phrased, "preventing the outflow of capital." Now this discouragement of investment abroad is not to the material advantage of the people of any country which resorts to it; for resources (i.e., capital) are only sent to other countries when their prospective yield (i.e., their forecast contribution to the well-being of the nation) is higher abroad than at home. But the greater harm caused by restraint on the free international movement of capital is to the areas which, like India, are thirsting for capital. The economic and industrial progress of such countries has, indeed, been much slower than it would have been if the private owners of capital in Western Europe and United States had been allowed greater freedom to seek profits, without restraint, in those areas of the world judged to be most productive.

Why do we know that the underdeveloped regions could attract so much of the savings (that is, the accumulating resources) of the western world under unrestrained private enterprise? The answer is that *setting under-utilised resources to work is nearly always the most fruitful form of investment.* When there are no restrictions imposed by governments, investors will find it profitable to supply both equipment and co-operating capital; and this will enable the world's markets not only to provide more remunerative employments for the masses of the poorer countries, but to create an incentive for training the backward peoples in more productive and higher paid occupations. It is not *altruism* which will have this result. The development of virgin resources (by which is meant undeveloped or underdeveloped factors of production) simply happens to provide the most remunerative of investment outlets.

Secondary Activities

Moreover, there are other factors which are tending to spread secondary industrial activities over regions in which they do not as yet exist, or are as yet only beginning to emerge. The more advanced industrial countries do not themselves possess sufficient resources (labour, skill, equipment and "gifts of nature") to supply the world with machinery, machine tools generally and other products for the manufacture of which they have "*acquired* advantages" (or special natural advantages) *and* at the same time to manufacture secondary industrial products cheaply enough to export. During the last few decades a new division of labour has been brought into being by these circumstances, and it is currently creating a strong propensity to industrial progress in countries where there are as yet no local secondary industries.

Unfortunately, this propensity has nowhere been allowed free scope. On the contrary, it has been resisted almost everywhere. For instance, under world freedom of trade a country in India's position (like many other economically underdeveloped countries) would probably have experienced incomparably more rapid industrial progress than it has in fact enjoyed. For had pure profit-seeking been permitted or encouraged, both by the governments of relatively wealthy countries with capital seeking outlets, and by the governments of the poorer countries wishing to raise their living standards, there would have been relatively little need for "aid" from other governments. Indeed, the advantage which the Indian people would have won from the new employment offered by private foreign investments would have been almost unbelievably greater than any benefits received from foreign governmental resources, or from World Bank loans.

Under existing circumstances, of course, foreign aid is not without material importance. But if international freedom for investment had existed, and the free market system had existed internally, the significance of "aid" would have rested firstly in the gesture of goodwill which it has expressed, and secondly in the possibility of its being utilised *educatively*, the sums advanced being maintained intact as "capital" (in which, of course, we must include "human capital"). Thus, if the immediate aim had been to provide Indian businessmen *with loans* to develop their enterprises, or directly with *risk-capital* (through some form of investment corporation), the fruits would have been cumulative and the whole population would have shared in the results.

If there is one country in the world for which this could have been confidently predicted, it is India, which has a well established commercial class and an ancient trading tradition. In the writer's judgment, the aspect of industrial progress which is most important during the formative stage of any industrial revolution is the marketing—the buying and selling—aspect. Business (including industry) consists largely of continuously predicting changes in consumer demand for particular products and changes in the availability of means of production, together with action in response to such predictions. The response takes the form of business planning and budgeting. Through rational foresight of this kind, diverse capital resources are committed to specific uses for varying periods. The costs of particular "inputs" are incurred in anticipation of prospective prices of the corresponding "outputs." In a more enlightened world, "foreign aid" would have been primarily devoted to training business men in the art of managing this process simply by financing *private* business. That this has not been done has been due, firstly, to the governments responsible for "aid" not having understood the issues I have just been discussing; and secondly, to the political aims which have motivated it.

Because the Western governments have wanted to discourage the countries assisted from becoming "communist," they have financed foreign governments rather than peoples. But governments are, after all, merely small groups of private persons; and they are all too apt to squander foreign aid, as well as their own people's savings, in striving to maintain themselves in office. This does not imply that, given the existing political situation in the world, this political aim of the donors of aid has not been legitimate[7], or that it has not had some of its intended effects. But direct aid to private Indian profit-seekers would have meant far more to the impoverished masses in India. It would have raised the employment opportunities at their disposal, released incentives for the improvement of their powers, and silenced the cynical allegation that the supposed generosity of foreign aid has merely been bribery of governments.

Private Investment

It has already been suggested, however, that capital advanced in the form of gifts from friendly governments could never have been nearly as fruitful as capital advanced in the form of purely private investment under normal business incentives. It is now further suggested that the development potentialities of India would soon become a magnet to that part of the world's savings which is not being withheld by restraint on the export of capital, *firstly*, if the Indian Government declared itself to be committed to economic democracy (i.e. private enterprise in business), and *secondly*, if constitutional guarantees were somehow created to ensure that private foreign capital investments would be safe from confiscation by future governments (whether through nationalisation, taxation or other subterfuges). In the writer's judgment, fear of spoliation via the State is currently creating the most formidable *internally imposed* barrier to a rapid transition to industrial modernity and the high living standards associated with it, not only in India, but in most other underdeveloped communities.

But what of the fear that, progress of these regions having been financed by aliens, we should ultimately find foreign ownership—with foreign control—of the greater part of the industrial assets of the countries financed? The answer is that a progressive economy would soon have its own savings to invest. Substantial investment from overseas is necessary in order to set going what has been recently called the process of "self-sustaining growth"; but subsequently, according to the extent to which thrift can be stimulated, a country such as India will be able to provide for itself a gradually rising proportion of the capital needed for its continued expansion.

During the transition to self-sustaining growth, direction from abroad represents the reasonable resolve of overseas investors, who are hastening the transition, to ensure the conservation and efficient use of their hard-won savings. Moreover as we have seen, "foreign control" may provide expertness in risk-taking, management and technical competence. Indeed, its presence may be expected to exercise a powerful educative effect. Whilst college courses in management can communicate recorded experience of business forecasting, budgeting and administration, and provide formal training in the relevant technical skills, real expertness in the decision-making of commerce and industry can be learnt only in action. What sentimentalists, or politicians appealing to sheer prejudice, may describe as "foreign domination" of industry can be the channel through which the most valuable capital of all can be transferred (from, say, American, British and German managements to Indian managements), namely, proficiency in prediction and the direction of business effort. There is not the slightest doubt in the writer's mind that Indians have *innate* talent for the development of managerial ingenuity.[8] Their best opportunity of developing that talent may well be via co-operation with managements responsible to foreign investors. An attempt to learn it independently, through bitter experience (with some help from books and lectures), can certainly succeed; but will it not command success much more slowly?

(To be concluded)

[1] It is conventional to describe taxation which discriminates against the higher incomes as "progressive taxation."

[2] This case may be based on the feeling that it is unjust to allow a person to enjoy the advantage of an inherited income in the achievement of which he can have played no part. But the wife and children of a rich man must necessarily benefit from his wealth during his lifetime. Is there, then, any compelling ethical reason why these benefits should end at his death? Or the case for death duties can be defended on the grounds that, *properly administered*, they may promote a larger measure of equality of opportunity.

[3] The earnings of any such corporation should naturally be used to reduce the load of the proportional taxation required to pay for the services of the State.

[4] Amenities like parks as well as "free" public utilities such as roads, bridges and sewers, may fall under this heading.

[5] As distinct from expenditures on "education" aimed at conditioning people's minds, so that they are amenable to control in the interests of the politically powerful.

[6] H. D. Gideonse, *College and University*, Summer, 1963, pp. 424-7.

[7] The urgency of the situation created by an *apparent* threat from the militaristic, totalitarian imperialisms of Russia and China, bent upon world domination, seems to have made it expedient for peace-loving and freedom-loving powers, like the United States and the western powers generally, to seek the favour of the governments of the backward areas rather than directly to assist the inarticulate and untutored people of those areas.

[8] Indians in the Republic of South Africa have succeeded remarkably in the trading field, against the obstacles of Governmental-imposed discriminations and powerful prejudice.

Notice

THE MYSORE KIRLOSKAR LIMITED

NOTICE

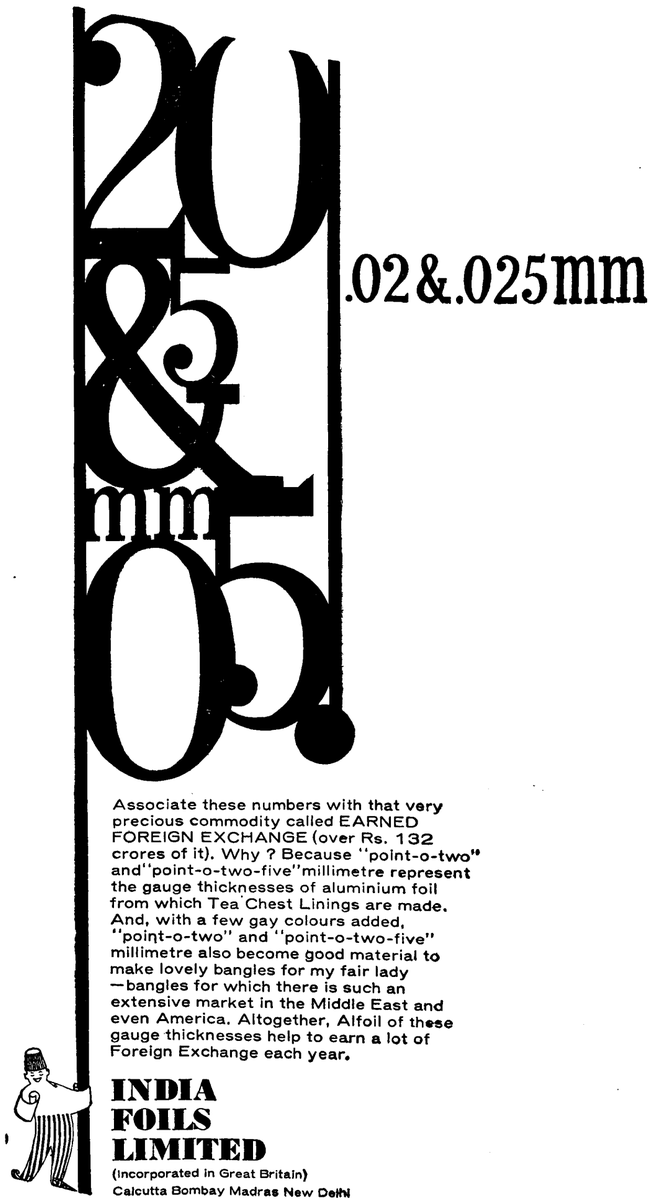
NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the Company will be held on Saturday the 25th July, 1964, at 3-00 p.m. (I.S.T.), at the Registered Office of the Company at Harihar to transact the business, the details of which have been made known to the shareholders separately by notice sent to them individually.

A MEMBER entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member of the Company.

The Share Transfer Books and Membership Register shall remain closed from the 17th July, 1964, to 25th July, 1964 (both days inclusive).

For THE MYSORE KIRLOSKAR LTD.,
V. K. BODAS,
Assistant Secretary.

Date: 27th June 1964.



Associate these numbers with that very precious commodity called EARNED FOREIGN EXCHANGE (over Rs. 132 crores of it). Why ? Because "point-o-two" and "point-o-two-five" millimetre represent the gauge thicknesses of aluminium foil from which Tea Chest Linings are made. And, with a few gay colours added, "point-o-two" and "point-o-two-five" millimetre also become good material to make lovely bangles for my fair lady —bangles for which there is such an extensive market in the Middle East and even America. Altogether, Alfoil of these gauge thicknesses help to earn a lot of Foreign Exchange each year.

WORKERS IN COTTON MILL INDUSTRY

THE CASE FOR STANDARDISATION OF WAGES

By Dr. Prem Narain Saxena

IT is true that wages form the pivot round which most labour problems revolve. The wage is the price of labour with which the employer tempts the labourer to engage in one of the processes of production, which together with other factors of production make up our complete, although complex and gigantic, industrial system. The purchasing power which the wage possesses, limiting the standard of living of the worker in general, his relative efficiency as well as its cost as an item in the cost of production—all these pertain to this problem. The surplus of this wage over conventional necessities measures the opportunity of his family's development. If your culture is to be democratic, the common man is to have access to the fullness of life and it is only possible by the grace of the plain ordinary pay envelope.

The coming of industrialisation has made the labourer dependent for his living, his welfare and his development upon a vague, mysterious and powerful system of prices. His economic existence is put up within two sets of prices. The price at which he can dispose of his labour and the prices at which he can purchase the goods and services which appear upon his household budget. He does not know what determines his income. He only knows that a large income is divided between wage-earners and several groups of non-workers who receive dividends, interest, profits, and what not. But the reasons for this division are actually wrapped up in mystery.

Again, the limit of his expenditure is fixed by the prices which he must pay for services and goods he consumes. In case the amount that the worker gets is small, the rising prices nibble away his hard-earned income and, by falling, they bless him with unexpected and plenty of goods. Truly speaking, to the worker the prices of the goods he buys are the upper and lower milestones of the wage system. As a matter of fact it is wages that give to the worker or withhold from him real things of life —goods and services, leisure, and what not. If he is to be efficient, if he is to have leisure for his own use, if the native gifts of his children are to be developed, if his family is to share in the culture which is the common heritage of all, his wages must be adequate to get all these necessaries of life for him.

It is only of late that employers, the State and the society have come to realise that the workers have got their own place in the economic system of a country and that they are entitled to some social status and civic rights, which must be given to them either by employers or, failing that, by the Government of the country or by the society as a whole. Besides this, wages have assumed importance for the following reasons:

1. There is an urgent need to prevent industrial unrest.
2. The intense desire to promote the standard of living.
3. To ensure that the worker gets at least a living wage.

Again the importance of wage problem lies in the fact that different wage rates in the same type of work in different units of the industry lead to migration of workers from industry to industry and factory to factory. Sometimes these things have become the cause of industrial unrest and disputes resulting in huge loss to employers, loss of working hours and lastly, but not least, loss of national income.

In the Textile Industry

Looking to the history of wages in cotton textile industry, it may be stated that during the war and early post-war years there existed a wide disparity in the earning of the workers, not only between province and province or between different centres in the same province, but even between workers in the same unit in the same centre and employed in the same type of work. In this connection, the U.P. Labour Enquiry Committee has stated in their report as follows:

"That in seven out of twelve industries cases have been recorded in which variation in earnings in the same occupation goes up to the magnitude of 300 per cent or more. In other words, earnings in certain occupations in one factory amount to over three times of those in the same occupations in another factory. The highest average variation in the earnings of the same occupation is shown by the oil industry, where it comes to 194 per cent in order of magnitude of average variation, glass comes next with 180 per cent followed by sugar 174 per cent, leather 160 per cent and cotton textile 151 per cent."

The Indian Tariff Board (Cotton Textile Enquiry) recommended the standardisation of wages as early as January, 1927 and reported:

"We cannot regard as satisfactory the present system under which the wages in Bombay mill industry vary from mill to mill even when the managing agents are the same and would recommend for the consideration of the Millowners' Association the adoption of a system for standardised wages for the same class of work, as between mill and mill. We realise that the adoption of such a system presents very great difficulties in Indian conditions owing to the illiteracy and imperfect organisation of labour, and that its introduction might probably cause discontent among those operatives whose wages might be prejudicially affected. Nonetheless we think that the standardisation of wages throughout the Bombay industry would tend to strengthen its position. A suitable scheme could, of course, only be drawn up in consultation with representatives of labour. It is obviously preferable that it should be adopted by all mills, but if a large proportion of the mills were willing to accept it, it would not be long before others followed suit."

Immediately after this recommendation the question was considered by several bodies and at least by the Bombay Textile Labour Enquiry Committee in 1937, which prepared a new scheme of standardisation of wages. However, the scheme could not be introduced as the Government did not think it proper at a time when the Second World War was going on.

Standardisation as such could not be enforced till the minimum wages for the least skilled worker were fixed in 1947 by the Industrial Court, Bombay. Similarly in other centres, minimum wages were fixed in 1947 and subsequent years. Once the minimum wages were fixed the problem arose with regard to the fixation of differentials for higher categories of workers. Generally these were also fixed by the same industrial authority which fixed the minimum wages in various centres of textile industry in the country.

Wage Differentials

All the wage-fixing authorities agreed that wage differentials should be based not only on customs and historical factors but on the training, required skill, experience, efficiency and responsibility, etc. While some industrial authorities have left the determination of wage differentials to negotiations between employers and employees, others have broadly classified workers into three divisions: unskilled, semi-skilled, and skilled. They have fixed the rates for each one of these categories separately. In some important centres schemes for standardisation of wages were prepared by the assessors, or by the committees specially appointed for the purpose.

In the various standardisation schemes which are operating in the different centres of cotton textile industry, generally what has happened is that the wages have been fixed for the different categories of workers above the minimum wage, but the jobs and occupations have not been standardised. For example, from a close study of wage rates it would appear that the occupational minima are very great. The difference is obvious, the differentials have not been correctly and scientifically assessed. For example, at least the schemes in U.P. and Bengal do not seem to have been worked out on any scientific system because there are unwarranted and wide disparities.

Standardisation of wages as such, without the standardisation of occupational nomenclature, is incomplete. As a matter of fact, a standard rate is a rate of wages fixed according to some definite standard which should be uniform in its application. It must be borne in mind that a standard rate does not mean the maximum rate. It is a rate fixed for the average worker. Thus, first the minimum basic wage should be fixed on which the whole wage structure in an industry is erected. the differentials should then be worked out and added to the basic minimum to find out the occupational minimum. But in Indian cotton textile industry, standardisation of wages has been mixed up with the question of fixing minimum wages. The occupational minima which have been fixed in schemes of standardisation represent only the basic minimum for each occupation rather than an occupational standard wage. Fixation of occupational minima is only a part of the process of standardisation of wages. In India, the standard rate is only a distant target which has to be attained gradually in future.

Although we have achieved some sort of standardisation of wages in cotton textile industry in India in almost all the regions on a State level, since it has not been possible so far to achieve the standardisation of jobs, this work will have to be handled again by the general or central wage board when the national minimum or the regional minimum will be fixed for each occupation in the industry. As regards the scheme of standardisation of wages, it is suggested that it should be so framed as will:

(a) cause labour to be allocated among the different occupations, industries and geographic areas in the economy in such a manner as to maximise the national products;

(b) enable full employment of the resources of the economy to be attained; and

(c) facilitate the most desirable rates of economic progress.

The Fair Wages Committee has rightly remarked that in fixing wage differentials the skill required, the training and risk involved, the responsibility borne, the physical and mental strain undergone, efficiency of the performance and the experience should be taken into consideration. They think that there should be as few differentials as possible and that differences between the lowest and the highest paid worker should not be abnormally large.

The wage structure in the different centres of textile industry in this country shows that the wage differentials have either to be based on questions of supply and demand, accident of history and sociological considerations or on any scientific appraisal of the factors that should be taken into consideration. It is, however, suggested that the following factors should be taken into considerations in fixing wage differentials:

1. Degree of skill.
2. The strain of work.
3. The experience involved.
4. The training required.
5. The responsibility.
6. The mental and physical requirements.
7. The disagreeableness of the task.
8. The fatigue involved.
9. The hazard attendant on the work.

It is difficult to estimate what weight should be attached to each factor; that is a matter which will gradually be evolved on the basis of experience. No doubt there are difficulties in achieving standardisation of wage rates, because the manufacturing work in textile industry comprises a number of operations, requiring varying degrees of skill and effort. Again, the type of machinery and material in use, the conditions in which the work is carried on, the quality of the goods manufactured etc., also vary from centre to centre and from mill to mill in the same centre. Still standardisation of wage rates can be achieved if the employers' and workers' representatives work in a spirit of co-operation and friendly attitude and try to fix standard rates for different occupations by mutual discussions. But a change in the attitude of both the employees and the employers is needed.

Role of Collective Bargaining

Thus standardisation of wages can be best obtained only by collective bargaining and mutual discussions. Standardisation will require the standardisation of occupational nomenclature and this can best be done by State Boards which must have experts to advise on the problem and draw up standardisation schemes. It is admitted that there is bound to be certain variations in the earnings of workers in the same occupation in various mills on account of variations in machinery, material, working conditions, character of goods and the efficiency of works. But the disparities at present are too large to be accounted for by all these reasons. They can only be ascribed to lack of uniformity in the system prevailing in the various mills for the determination of wages. Such wide disparities will have to be removed, because they cause discontent, endangering industrial peace.

The Government of India is going to constitute the second Wage Board for the textile industry to revise the wage structure. This situation affords an opportunity for the industry to build up a fair and scientific classification of jobs into various grades and thus plan for a scientific standard of wage rates in this industry. There is no purely scientific basis to classify jobs into different grades but the four important techniques of job evaluation, namely, the ranking method, the grading method, the factor composition method and the pivot method, can be used fairly and accurately to classify the jobs into different [illegible]

TRAVANCORE CEMENTS LIMITED

COMPANY MUST BE ALLOWED TO RAISE ITS SELLING PRICE

CHAIRMAN, MR. C. S. LOGANATHAN'S PLEA

A PLEA to allow the Travancore Cements Ltd. to raise its selling price along with the other cement companies, was put forward by Mr. C. S. Loganathan, Chairman of the Company, in his speech at the Seventeenth Annual General Meeting of the Company held at Nattakom in Kottayam, on Monday, 29th June 1964. He assured the shareholders that necessary representation was being made to the Government both by the Company and the Cement Manufacturers' Association. Higher costs of production, he declared, had been primarily responsible for lower profits and smaller dividend in 1963.

The following is the full text of Mr. Loganathan's speech:

GENTLEMEN,

I welcome you all for the seventeenth annual general meeting of our Company.

We are meeting at a time when the entire nation has not yet recovered fully from the gloom cast on account of the passing away of Sri Jawaharlal Nehru, our illustrious past Prime Minister. The phenomenal industrial progress of our country since we gained independence was mainly due to his foresight and drive, and it is the sacred duty of every one of us to keep up the tempo and help building up a prosperous India for which he lived, labour- ed and died. As a mark of respect to our late Prime Minister, let us all rise up and observe a minute's silence.

The audited accounts and the annual report for the year 1963 have been circulated to all members and with your permission, I shall now take them as read.

Higher Sales, Lower Profit

During 1963, the Company has been able to keep up the high production and sales levels. During the year, we produced 53,160 tonnes of grey cement and 6,300 tonnes of white cement and have sold 52,678 tonnes of grey cement and 6,082 tonnes of white cement. Our sales of white cement have been gradually improving year by year and sales during 1963 have been 31 per cent more than what it was in 1962, and 76 per cent more than that of 1961.

You would have noticed from the Directors' report that our profit for the year 1963 has been only Rs. 7,17,163 as against Rs. 9,67,529 for the previous year. The reasons for the decline in profit have been due to increased cost of production as explained in the Directors' report. Your Directors have, therefore, been able to declare a dividend of only 6 per cent for the year 1963 as against 7 per cent for the year 1962.

Retention Price

The retention price payable to the cement producers was fixed based on the Tariff Commission's Report in November 1961, and is to be in force till March 1966. However, the Government of India had in principle agreed to make suitable changes in the retention prices, whenever there are material increases in the cost of production. From June 1963, an increase of Rs. 2.75 per tonne was allowed to all cement producers excepting ourselves to meet the increased cost of production. As explained in your Directors' report, representations have been made to the Government of India to extend this price increase to our factory also, and the matter is still pending with the Government. Since June 1963, there have been further increases in the cost of production due to increase in coal price, railway freight etc., and the factories individually and through the Cement Manufacturers' Association have requested the Government of India for a further suitable enhancement of retention price. It is hoped that Government will favourably consider this request of the industry and in our case, mete out justice which was denied to us at the time of allowing a general increase to the industry from June 1963.

Taxation

As per the Finance Act of 1964, in the case of industries engaged in the production of basic and essential commodities, a rebate in the tax is allowed. Cement is one among such industries and we are getting a relief of 5 per cent in the taxation, but there is an extra levy of dividend tax at the rate of 7.5 per cent of the amount of dividend.

The total amount of tax to be deducted from dividends has been reduced from 30 per cent to 20 per cent and this is a good relief to the shareholders.

Board of Directors

Gentlemen, you are aware that the Government of Kerala have two nominees in the Board of Directors. Sri C. S. Padmanabha Iyer who was Government nominee in the Board has been appointed by the Government of India as Chief Engineer of Cochin Port Trust, and consequently, Sri Padmanabha Iyer has resigned from the Board. In this vacancy, the State Government has nominated Sri T. P. Kuttiammu, Chief Engineer, Irrigation and Projects. I take this opportunity to express our thanks to Sri C. S. Padmanabha Iyer for his valuable guidance and services to the Company, and also welcome Sri T. P. Kuttiammu to the Board.

Before I conclude, I would like to express my thanks to my colleagues on the Board of Directors for their valuable services to the Company and to the Works Manager and all employees for their continued co-operation and efficient service.

I now request that the Directors' report and the audited accounts for the year 1963 may be taken up for consideration and adoption.

Note: *This does not purport to be a record of the proceedings of the above Annual General Meeting.*

LAW RELATING TO INCOME-TAX RETURNS

(*Concluded from page* 68)

who pays his legitimate dues to the State should at least not be presumed to be honest until he is found to be otherwise. In the United Kingdom, the Inland Board of Revenue, in spite of the anxiety of the Royal Commission to do so, did not wish that their powers be enlarged on the ground that it would be resented by the public. In our country, at no level of administration such anxiety prevails. We have more and more and stricter and stricter laws and yet more and more people transgress the law with impunity. We have the distinction of having more laws but lesser compliance than before.

Prosecution

False statement in declaration—Section 277: In addition to penalty, a person becomes liable for punishment in respect of false returns, account or statement or verification thereof which is false and which he either knows or believes to be false or does not believe to be true. The amendment also provides that punishment shall not be less than six months in absence of special and adequate reasons to the contrary to be recorded in the judgment of the Court. Thus, the discretion of the Court in awarding punishment is very much fettered. If the Court wishes to award punishment of less than six months, it must record special and adequate reasons for the lesser punishment. The prosecution under Section 277 is in addition to the penalty and not in substitution thereof. Similar changes have been made in respect of offence in connection with abetment of false return, account, statement or verification.

The conditions for meting out punishment under Section 277 are different from the conditions for levying a penalty under Section 271. If a person under a due process of law is found to have committed an offence, there should be no objection to a rigid provision for punishment. It should be noted that, for the punishment under Section 277, there should be an element of knowledge and deliberation in committing the offence.

We have so far witnessed a phenomenon of multiple taxation. Now we are entering a more advanced phase of *Ram Raj*, namely, multiple penalisation. Ill-considered, stricter laws without adequate and discriminating administration may tend to have the opposite effect than intended by driving honest people to dishonesty. I am afraid that jail-going for tax offence may become a status symbol as it was during the days of the freedom movement.

RUBY GENERAL INSURANCE COMPANY LIMITED

CHAIRMAN, MR. M. L. SHAH'S SPEECH

IN his speech at the Twenty-eighth Annual General Meeting of the Ruby General Insurance Company Limited, held at Calcutta on 29th June 1964, the Chairman of the Company, Mr. M. L. Shah, referred to the entry of the Life Insurance Corporation of India into general insurance business from 1st April 1964. He urged the Corporation to open fresh avenues of general insurance, instead of disturbing the existing business of private insurers.

The following is a summary of Mr. Shah's speech:

GENTLEMEN,

It gives me great pleasure to welcome you to the twenty-eighth annual general meeting of the Company.

We are meeting under the shadow of a national tragedy. Shri Jawaharlal Nehru, our beloved Prime Minister and Leader, who guided the destinies of the nation since independence, is no more with us. Not only India but the whole world mourns his loss. Such great personality is seldom born and it is impossible to replace him. However, it is gratifying to note that Shri Lal Bahadur Shastri has been appointed our new Prime Minister with promise of all-round support and I am confident our country will continue its onward march of progress under his able guidance.

The statements of accounts of the Company for the year 1963 have been with you for some time and you must have noted with satisfaction that the Company has again shown good results.

Your Company has been making steady progress since its inception, and particularly during the last few years has shown very good results. As compared with the premium income of Rs. 1,85,12,084 for 1962, the premium income for 1963 has been Rs. 1,89,85,871 and the capital and funds during the same period have increased from Rs. 1,67,75,481 to Rs. 1,81,05,006.

The premium income for the year has increased from Rs. 78,21,379 in the year 1962 to Rs. 83,36,101 and profit from Rs. 16,43,000 to Rs. 18,40,247.

The premium income for the year has been reduced from Rs. 93,07,083 in the year 1962 to Rs. 88,52,631 due to reduction in foreign motor business which has not been profitable. The profit increased from Rs. 4,17,262 in the year 1962 to Rs. 4,48,283.

The premium income for the year has increased from Rs. 13,83,622 in the year 1962 to Rs. 17,97,139. The working of the department shows a loss of Rs. 3,99,290 as against a profit of Rs. 1,30,940 in the year 1962, mainly due to the increase in the premium reserve from Rs. 13,83,622 to Rs. 17,97,139.

The net profit after taxation has increased from Rs. 13,35,783 in the previous year to Rs. 13,85,873.

The Directors have recommended a dividend of Re. 1.25 per share as before. The Directors have also decided to take steps to capitalise Rs. 6,40,000 out of the premium on shares and issue one fully paid bonus share of Rs. 8 as against five existing shares.

The most important event in the Indian insurance industry during the year under review has been the decision of the Government to permit the Life Insurance Corporation of India to write general insurance business. The L.I.C. has commenced business from 1st April 1964 and decided to follow the tariff rates for the present. The L.I.C. should not disturb the existing business of the private insurers but should open new avenues and look for fresh business.

The voluntary code of conduct has proved very useful in improving the tone of the industry and I hope the encouragng results achieved so far will be continued.

Before I conclude I would like to place on record my sincere appreciation and thanks to our patrons for their continued support and to the executives, staff, field-workers and representatives in India and abroad f co-operation and devotion to duty enabled the Company to achieve gr

Thanking you, gentlemen.

Note: *This does not pur of the proceedings of t Meeting.*

WORLD OUTPUT OF NON-METALLIC MINERALS

COMMONWEALTH'S SHARE SUBSTANTIAL

INDUSTRIAL and constructional activities throughout the world have led to a tremendous increase in the consumption and production of non-metallic minerals, such as sulphur and pyrites, gypsum and anhydrite, asbestos, asphalt and bitumen, magnesite, graphite, mica and diamonds. The Commonwealth makes a substantial contribution towards the production of these important industrial raw materials. According to a recent review published by the Commonwealth Economic Committee, the Commonwealth produces nearly half the world's asbestos, almost a third of diamonds (by value), a quarter of gypsum and anhydrite and most of the sheet mica. It also contributes one-eighth of the recorded non-Communist output of sulphur and pyrites, petroleum bitumen, magnesite and natural graphite.

Production

The following table shows the comparative trends of production of important non-metallic minerals in the world and in the Commonwealth countries:

Table 1: *Production of Certain Non-metallic Minerals*
(In thousand tons unless otherwise stated)

	World production		Commonwealth production	
	Average 1949-54	1962	Average 1949-54	1962
Sulphur (*a*), (*b*)	11,490	17,830	1,226	2,461
Gypsum and anhydrite ..	23,570	40,930	6,425	10,929
Asbestos	1,320	2,740	892	1,279
Petroleum bitumen (*b*) ..	15,170	31,420	1,770	3,508
Magnesite (*b*)	1,550	3,030	136	285
Natural graphite (*b*), (*c*) ..	94	110	14	10
Sheet mica in thousand lbs. (*b*) ..	27,920	29,240	22,350	23,644
Diamonds in thousand carats ..	17,420	31,400	2,448	5,607
Diamonds in £ thousand ..	39,130	89,300	7,773	25,218

(*a*) Native and recovered sulphur and sulphur-in-pyrites.
(*b*) Recorded non-communist production only.
(*c*) Excluding fuel-quality graphite.

Sulphur

Non-Communist production of sulphur from all sources (native and recovered sulphur and sulphur-in-pyrites) showed an upward trend from 1949 to 1962. Sulphur is used very widely in industry and the acceleration in its production reflected the stepping up of the rate of industrial expansion in some of the principal consuming countries. This mineral has many applications in the modern economy. About four-fifths of the world's sulphur is used in the form of sulphuric acid, the most important basic raw material consumed by the chemical industry. It has been estimated that as much as 64 per cent of the current world acid output is used in the manufacture of fertilisers, notably superphosphates and ammonium sulphate. Other uses for this acid are in rayon, metallurgy, dyestuffs, detergents and plastics, while the most important non-acid use of sulphur is in the manufacture of wood-pulp and viscose rayon.

In India and Australia, the fast rates of increase in total sulphur consumption are noteworthy. This is mainly because of the increasing use of fertilisers in agriculture. But in Canada, growth has been due more to increased usage in pulp industry and also in uranium ore processing. The higher rates of increase in Japan and the E.E.C., as compared with those in the United Kingdom and the United States, reflect the differences in the rates of general industrial growth between the countries concerned in the period covered. A significant fact is that the consumption of sulphur has been little affected by substitution, for the comparatively low price and easy supply of sulphur has limited the opportunities for competing materials.

Among the producers of native sulphur the United States continues to hold first place, though its output has fallen from the record level in 1956. Mexico, which began production in 1954, continues to expand its output. Among the leading non-Communist pyrites producers Japan and Italy have gained in relative importance since 1949, while Spain and Cyprus have lost ground. Production of all forms of sulphur in the Sino-Soviet group of countries is estimated to have been rising steeply in recent years. The competitive position of the U.S. and Mexican native sulphur may be improved by the plans for the development of deliveries in liquid form to Europe from the current year onwards.

Gypsum and Anhydrite

Gypsum is used predominantly for making moulding plaster and Portland Cement and also, in ground form, in the paint, paper and cotton finishing industries and as a soil conditioner. In some countries anhydrite, as well as gypsum, is used in the making of sulphuric acid and, as a substitute for sulphuric acid, in the manufacture of ammonium sulphate. Substantial increases in usage of gypsum and anhydrite have been recorded by all consuming countries, the fastest growth being in Japan, India and the E.E.C. and the slowest in the United States. The bulk of gypsum consumption in India, and over half the usage of anhydrite in the United Kingdom are in the manufacture of ammonium sulphate for fertilisers, while most of the remainder of the U.K. usage of anhydrite is in the making of sulphuric acid and cement.

Recorded world production of gypsum and anhydrite has risen quite steeply since 1949, from an average of 23.6 million tons during 1949-54 to 4.09 million tons in 1962. This has been due, firstly, to the post-war reconstruction drive and, subsequently, to the general building boom throughout the world. Resources of gypsum are widespread and abundant and output takes place in many countries, the largest producers being the United States, Canada, the Soviet Union, France, the United Kingdom, Spain and Italy. The United States share of output has, however, been falling in recent years, while the relative contributions of a number of smaller producers, notably Spain, Austria, Japan, Egypt and the Dominican Republic, have increased.

Asbestos

Like gypsum, the consumption of asbestos is also dependent on activity in the building and construction industries, the manufacture of asbestos cement constituting the greatest demand for the material. This is used in roof shingles, sheeting, pipes and the various heat insulating moulded cement articles. It is also used in fire-proof industrial textiles and clothing, while certain kinds of high grade materials are used for electrical insulation. The motor industry uses asbestos in brake linings and clutch-facings, while the shortest grades of asbestos fibre have recently become very important as fillers in plastics, putties and paints. Since about 1954 demand for shorter grades of fibres used for building materials has risen relatively faster than demand for the textile fibres which more recently has tended to level out. But, by 1963 the expansion of production facilities had created surplus capacity for all grades. Known world reserves of asbestos have been estimated to be sufficient for 25 to 30 years of output at current rates.

Production of asbestos has shown a very marked upward trend since 1949, associated chiefly with increased demand for asbestos cement for building purposes and increased use of the shortest asbestos fibres as fillers in the manufacture of other building materials, such as asphalt floor tiles. Consumption in Japan and E.E.C. showed by far the steepest rise. In the Commonwealth, India's consumption was pronounced, while in Canada, U.K. and Australia the increases were relatively smaller. There is no general substitute for asbestos, but limited competition is offered to it in certain applications by materials, such as fibreglass, silicon products and plastics.

While Canada was still, in 1962, by far the largest producer, its output has accounted for a declining proportion of the world total since 1955, because Soviet production has been growing faster. In 1962, in fact, Soviet output is estimated to have approached the Canadian figure. The other principal producers of asbestos are the Republic of South Africa, which is world's only producer of the type of asbestos known as amosite and the biggest producer of crocidolite, and Southern Rhodesia, which specialises in low-iron chrysolite asbestos of spinning grade.

Petroleum Bitumen

The general growth in the production of petroleum bitumen has been due to its use in making bituminous mixtures for new or reconstructed roads built to take a rapidly increasing amount of traffic. Its other applications are for coating weather resisting materials, especially roofing felts and a variety of uses in the coal, rubber, agriculture and textile industries. The output of this material has been continuously using since 1949, though the rate of increase has tended to fall. The main basis of the rise has been the ever increasing number of motor vehicles which have given rise to greater road building and construction activities. The United States is the largest producer of this material, the others being Venezuela, Japan, West Germany, Italy and India. The consumption in Japan, however, has been very marked in contrast to that in United States and Canada where the consumption growth has slowed down.

Magnesite

Virtually all magnesite is calcined to magnesia before use and most of it is employed in the manufacture of basic refractory furnace limps and bricks, primarily in the steel industry but also in certain other non-ferrous metal smelters and in rotary cement kilns. Its other uses include the manufacture of magnesium cement, magnesium salt and magnesium metal. The production of crude magnesite, as will be seen from Table I, has almost doubled during the period from 1949 to 1962. This has been associated with an increase in the demand for refractories, particularly by the steel industry, and increasing preference for magnesite refractories as against other types. Not only does the natural magnesite face the growing competition of synthetic magnesia but it can also be replaced for some refractory purposes, particularly in oxygen converter steel-making, by dolomite. The Soviet Union is estimated to be the world's largest producer of magnesite, with Austria and China in second and third places, respectively. But, of these three countries, only Austria publishes production statistics. It is also produced in Yugoslavia, Spain, Brazil and South Africa and the United States. Large reserves of magnesite exist in many countries and, if the possibilities of obtaining magnesia from sea water are taken into account, total reserves of this mineral may be said to be unlimited.

Graphite

The largest single use for graphite is in foundry facings and moulds, to which it gives a smooth skin enabling the metal castings to be removed easily from the moulds on cooling. Medium grade graphite is employed in the manufacture of crucibles for melting metals, especially non-ferrous metals, while high purity graphite is used in the manufacture of various types of lubricants and in the electrical industry for making carbon brushes. Consumption has greatly increased in Japan, E.E.C. and India. Artificial graphite may be substituted for natural graphite in nearly all uses except crucibles, but in practice the relatively high cost of the artificial material tends to limit its application to those uses in which its exceptionally high purity is required. The leading producers are Mexico, Austria, the Malagasy Republic, West Germany, Ceylon, Norway and Japan. It is also produced in South Korea and Hong Kong for use as fuel. Artificial graphite is produced in the United Kingdom and the United States from petroleum coke and pitch coke. Natural graphite is available in almost all countries of the world and, though data for some of the most important producers are not able, reserves can be said to be enormous.

Mica

Commercial demand for sheet mica (block, film and splittings) comes almost entirely from the electrical and electronic industries, where the material is employed for its insulating properties. As will be observed from Table I, the growth of mica production has been sluggish and its consumption has not matched the growth of the electronics industry. Between 1949-54 and 1959-62 there were declines in the consumption rates in the United States, the United Kingdom and Austria. The falls have been due to mica saving through miniaturisation of electrical and electronic components and also, to a minor degree, substitution of alternative materials in certain uses. India is overwhelmingly the largest producer of block mica, followed at a considerable distance by Brazil and the Malagasy Republic. Though accurate measurement of mica reserves is well-nigh impossible, because of the unpredictability of the mica content of deposits in advance of actual mining, Indian reserves may be said to be very large.

Diamonds

Consumption data cannot be calculated for either gem or industrial diamonds. The U.S. Government buying of industrial stones has been an important element in the world demand for rough diamonds, which has been greatly rising since 1949. A development affecting gem diamonds has been a rapid rise in the Israeli cutting industry which is now offering strong competition to the Belgian industry, the latter still maintaining the leading position. The development of synthetic diamonds may be said to be supplementing, rather than supplanting, natural industrial diamond. Almost all the world production of diamonds outside the Soviet Union and Brazil comes from Africa. In terms of quantity, the Congo Republic is by far the world's largest producer but its output consists mainly of industrial diamonds and in terms of value, it takes the third place after South Africa and South West Africa. About 80 per cent of the world diamond production is marketed through the Central Selling Organisation of the Beers Group.

Exports by Commonwealth

Since 1955, the Commonwealth share of diamond exports has risen in terms of both weight and value, as a result of the expansion of Ghana, Tanganyika and Sierra Leone shipments. The share of sulphur exports contributed by the Commonwealth was at a high point in 1957 and 1958, but it has since fallen off somewhat as a result of reduction in Canadian and Cyprus exports. The Commonwealth shares of mica and crude gypsum exports have been well maintained since 1955, though they are in each case currently somewhat lower than in 1949-54. The proportion of asbestos exports, after falling from 1955 to 1958 owing to rise in Soviet exports, has since stabilised.

Prices

The following table (No. II) relates to the United Kingdom prices of the non-metallic minerals, except diamonds for which no price quotations are available. In all cases, except graphite, the indices are of average wholesale prices and have been published by the U.K. Board of Trade.

Table 2: *Prices of Non-metallic Minerals*
(Base : 1954 = 100)

	1955	1961	1962	1963
Sulphur, crude for acid making (*a*)	110.6	71.9	74.2	66.7
Pyrites (*a*)	105.6	62.6	60.3	58.1
Gypsum plaster	102.0	114.0	114.0	114.0
Asbestos cement products (*b*) ..	103.4	124.8	130.4	134.9
Mixed asphalt (*c*)	100.9	116.7	119.1	119.8
Magnesite, calcined, unground (*d*)	100.0	100.0	100.0	100.0
Artificial graphite (*e*)	147.7	182.4	325.4	N.A.
Natural graphite (*e*)	113.1	96.2	97.1	99.0
Mica (Indian)	95.4	91.5	91.8	94.3

(*a*) Imported.
(*b*) Almost entirely corrugated sheets.
(*c*) Prepared to comply with British Standard 594.
(*d*) The indices relate to mid-points of a narrow range.
(*e*) Average unit values of total U.K. imports.

The indices for crude sulphur show a steep and almost continuous fall in prices between 1956 and 1963, reflecting the change in the world sulphur supply situation during this period from shortage to abundance and increasing competition between the major suppliers of elemental sulphur. This, in turn, has led to a similar decline in pyrites prices over the same period. Prices of crude and calcined gypsum tend to have only a local significance. The indices for gypsum plaster showed a continuous rise from 1954 to 1958, after which they followed a stable course. The rise in the asbestos cement prices from 110.6 points in 1955 to 134.9 in 1963 suggests that it has been due to increases in cement prices in general, and possibly due to increased manufacturing costs. The index for asphalt mixture shows an almost continuous rise of about 20 per cent between 1954 and 1963. The price indices for natural graphite cover varying proportions of different grades and are, therefore, unrealiable guides to price trends. In the case of artificial graphite, however, they may provide a better indication as the synthetic product is uniform in quality. The average values for the artificial materials have risen very steeply during 1959 to 1962. In 1962 there was an extremely sharp rise due to an increase in receipts of exceptionally dear material from France. The indices of Indian mica prices fluctuated fairly narrowly from 1959 to 1963.

NEW PRODUCTS AND PROCESSES

High-speed Mixer

MATERIALS hitherto regarded as impossible to mix can now be produced as emulsions or dispersions by equipment to be marketed by Sigmund Pulsometer Pumps, of 20, Lamb's Conduit Street, London, W.C. 1. Demonstrated in London for the first time yesterday, the machine produced a permanent emulsion of oil and water in under 30 seconds and a suspension of mercury and water in about the same time. Called the S.P.P. Fiscalin Reactor, it has a mixing vessel with a pipe entering the top and ending in a flow nozzle of special design just short of the bottom, and a circulation pump. The vessel is filled with the material to be mixed (it may be either a liquid or a powder) and it is drawn out at the bottom and pumped back into the vessel through the reactor pipe. There are no moving parts. The equipment is suitable for either batch or continuous production and can also be used for the gasification of liquids and crystallisation. Sigmund says that experimental work done by Continental manufacturers using pilot models indicates that fundamental changes in established methods of mixing and processing are possible.

Melting Pure Metal

A way of rapidly melting and re-shaping a sample of pure metal while preventing it from touching any other substance, so that it cannot become contaminated, has been reported by the Institute Fur Angewandte Physik Der Reinststoffe, of 28, Winterbergstrasse, Dresden A 20, Germany. Applications are in research and in the manufacture of semi-conductor and transistor components. Freedom from contact is achieved by levitating the metal in a vacuum with the aid of magnetic forces; high-speed melting is achieved by bombarding it with a beam of electrons. As the metal melts it becomes less magnetic and drops fall on to an ingot of the same metal below.

Pipeline Control System

Equipment designed to monitor the flow of a liquid in a pipeline and to provide an audible and visual warning when the density of the liquid varies from a pre-set value is being produced by Photronic Controls, of Randalls Road, Leatherhead, Surrey. Particular applications are the control of effluent discharges into rivers and control of processes involving the movement of liquids in breweries and soft drink manufacturing. The equipment consists of a viewing chamber which is inserted in the pipeline and is fitted with a light source on one side, and a photoelectric cell on the opposite side. In this way, a beam of light passes through the liquid as it flows through the pipeline and is monitored by the photocell. The output from the cell varies in accordance with the obscuration of the beam, and this varying current is fed into a unit which is fitted with a sensitivity control. When the light beam is obscured, a relay operates an alarm bell and red indicating light.

Quickly-made Sleepers

A quick method of making railway sleepers from sheets of laminated cement and asbestos by compressing them lightly in a mould is reported by Eternit S.p.A., of Piazza della Vittoria 11, Genoa, Italy. The Company states that sleepers of consistently high mechanical properties and an exact geometrical shape ideal for rapid track laying are obtained in the process.

Rigid Vinyl Sheet

Imperial Chemical Industries (Hyde) has now introduced Sintilon, a rigid vinyl sheet suitable for many kinds of building applications. It is available in a range of forms, including transparent, diffused and opaque grades, natural, green and yellow colours, and three profiles as well as flat sheet. Sintilon can be used for roofing, canopies, illuminated ceilings, partitions and display signs and weighs 7-8 ozs. per square feet. It will not rust, rot or corrode and when exposed to flame is self-extinguishing.

Ionisation Anemometer

To help in studies of air movement and its distribution patterns in rooms, supplementing flow visualisation techniques, Brightside Engineering Holdings, G.P.O. Box 118, Sheffield 1, has brought out and improved version of ionisation anemometer. The work was done in conjunction with the Physics Department of Birmingham's College of Advanced Technology which calibrated the instrument in its wind tunnel. The device, which has been used to measure air velocities in the range 12 to 60 feet/minute, may be produced commercially.

Slide Rule for Water Flow

A slide rule for the quick estimation of water flows through weirs, notches and orifices has been announced by Paterson Engineering, 129, Kingsway, London, W.C. 2. It is intended to help engineers make trial estimates and arrive rapidly at the most satisfactory arrangement of the deciding design factors. It gives scales for British and metric units, together with the formulæ to be applied once the interim selection of weir or notch has been made.

Trays for Meat and Produce Packaging

A new range of trays for prepacking fresh meat and produce has been developed by Bowaters' Paper Products Division. Known as Unitrays, they are made of white board. The trays are equally suitable for hand, semi- or fully-automatic wrapping with all types of film and the round corners will not puncture the film. A name or advertising message can be printed on the sides. When used in microwave cookery the laminated paper and board permit the passage of the microwaves without loss or interference. Cost of the U73S size, for example, is £2 18s. per 1,000 for 1,000 lots.

Kitchen Accessories

An integrated line of kitchen accessories, all powered by the same electric motor, has been developed by the Jerome Murray Corporation, of 401, East 58th Street, New York City. The motor is mounted under an unbroken counter-top—operating the appliances above the top by a rotating magnetic field. Mixing is done by a plastic-covered block of steel which moves in a container above the counter, impelled by the field below it. One standard accessory is a pot cleaner which scrapes the insides of pans. The magnetic coupling means that there is no problem of water-tight seals between motor and container. The unit and five accessories are estimated to sell for under $100.

Handled Like Toys

Looking like a mammoth lathe, a railway car rotator built by the Ransome Company of Scotch Plains, New Jersey, will turn a 40-ton car upside down for repair in seconds. It was designed for the Berwind-White Coal Mining Company of Hollidaysburg, Pennsylvania, to substitute for an expensive crane. The headstock and its motor and the tailstock unit moves on railway tracks so the distance between them can be adjusted for the length of the car. Closing on the car between them, the headstock grips it, lifts it 6 feet into the air and rotates it as much as 360 degrees. This permits such repair work as under-body welding to be carried out easily.

Mailing Machine

The new 5.500 mailing machine from Pitney-Bowes (U.K.) is intended for the office that deals with small to medium quantities of letters and parcels. It can seal, frank and stack letters in one operation and can be simply adjusted to print a small advertisement on the envelope in addition to the postmark. Once the date and postal denomination have been set by means of controls on the postage meter, the three operations are performed automatically on turning a handle at the side of the machine. The meter, which contributes 10½ lb. to the machine's total weight of 28 lb., is detachable so that it can be taken separately to the Post Office when the time comes for it to be reset. It keeps a visible record of how much of the allotted postage has been spent and how much remains, and will print denominations between a halfpenny and 99s. 11½d. on letters or labels. An envelope stacker, a label dispenser and a carrying case for the meter are supplied as free extras with the machine.

Furniture from Groundnut Shells

High quality building board which can be used for furniture, partitions and ceilings can now be made from groundnut shells, available in India in large quantities as waste material. The Tropical Products Institute in London has completed manufacturing trials on the board, and is now analysing results in detail. Research work at the institute had shown the possibilities of the material, which is pressed into board under heat after spraying with ureaformaldehyde. According to the institute, a plant for producing the board would not be expensive to set up. The cost of the board itself works out to half that of board made from wood chips. The groundnut shell board is the result of an extensive programme of research carried out at the Tropical Products Institute on possible uses of tropical waste material. They include bagasse, coffee shells, cottonseed residue and coconut husks.

New Phone Receiver

A new telephone receiver especially designed for persons who are hard-of-hearing will be manufactured soon, according to Mr. Norman Gleis of the Swedish Board of Telecommunications Research Centre, in Fonsta near Stockholm. The new microtelephone differs little from ordinary telephones. An amplifier with a volume adjuster has been attached to the upper part of the receiver. The amplifying of the sound is provided by two built-in transistors. It is mainly designed for people who have moderate hearing difficulties.

New Ideas in Brief

A new kind of fertiliser spreader consists of an enamelled steel hopper with a strong steel body mounted on rubber-tyred wheels. It is produced by Carlo Girelli, Piadena (Cremona), Italy.

Metallised synthetic net-curtain material with heat-insulating properties is being produced by Metalen Thermostoffen, Botlekweg, Rozenburg, Rotterdam, Netherlands.

A computer designed for use by engineers is claimed to be as simple to work as a slide-rule or desk calculator, and is developed by Electronic Association, Burgess Hill, Sussex, England.

A range of 11 universal boring and milling machines, known as the AD/AF series, has been introduced by Ceruti, Milan, Italy.

An automatic control system for self-advancing roof supports in coal mines can be used on nearly all long-wall coalfaces. It is produced by 7.M.I. Electronics, Hayes, Middlesex, England.

INDIA'S FOREIGN TRADE IN 1963-64

TERMS OF TRADE DETERIORATE

By V. Bhanu Koti

THE year 1963-64 was one of further consolidation and expansion of India's external trade in merchandise. In fact, exports (including re-exports amounting to Rs. 4 crores) at Rs. 794 crores touched a new high, the increase of Rs. 73 crores over the previous year being the highest on record. This is very significant in the present context of our export promotion efforts. The imports at Rs. 1,149 crores recorded a nominal increase of only Rs. 14 crores. These figures include trade of Goa, postal exports of precious stones and land-borne trade with Nepal. The broad trends in the external trade are summarised below:

The rise of Rs. 76 crores in exports in 1963-64 was well spread over several commodities and destinations. It was due mainly to an increase in the quantum than to any rise in prices, which is indicated by the rise of the index number of quantum of exports (1958=100) from 112 to 126. The index number of unit values, on the other hand, fell from 106 to 105. Tea was the only major item which recorded a fall. Another important feature is the greater diversification of the exports which is reflected in the increased exports of new manufactures such as ferro-manganese, base metals and engineering goods. Further, the trade with most of the countries expanded excepting the U.K., Canada and Australia.

Re-exports recorded a decline of Rs. 3 crores from Rs. 7.2 crores in 1962-63 to Rs. 4.0 crores in the year under review.

The overall increase of Rs. 14 crores in imports was due to larger imports of machinery and crude petroleum. This was, however, partly offset by decreases in imports of cereals, chemicals, manufactured goods and crude materials. By countries, the imports were larger from the U.S.A., Saudi Arabia, Canada, Russia and Denmark, but those from the U.K., West Germany, Italy, Australia, Sudan and Netherlands were lower.

The balance of trade remained unfavourable for most of the countries excepting the sterling area. The adverse balance, however, declined from Rs. 414 crores in 1962-63 to Rs. 355 crores in 1963-64. Further, while the gap in the trade with the U.K. was considerably reduced, the favourable balances with Ceylon and Singapore increased appreciably.

By currency areas, India's total trade (exports plus imports) with the countries of dollar area, East Europe and "other soft currency area" increased, but the trade with the E.C.M. and sterling area countries decreased.

Exports

India's total exports of merchandise, including overland supplies to Nepal and postal exports of precious stones, pearls, etc., increased from Rs. 714 crores in 1962-63 to Rs. 790 crores in 1963-64. The table below gives the break-up of exports for the broad groups of commodities:

(In crores of rupees)

Group	1962-63	1963-64	Percentage rise or fall
Plantation crops (chiefly tea)	137	132	— 5
Agricultural produce	196	228	+32
Minerals	63	62	— 1
Textiles and fibre products	225	241	+16
Other manufactured products	32	47	+15
All others	61	80	+19
Total ..	714	790	+76

The commodity-country trends for principal items are reviewed below:

Sugar: Exports aggregated Rs. 26.1 crores (430,000 tonnes) during 1963-64, as compared with Rs. 17.3 crores (410,000 tonnes) in 1962-63. The increase was due partly to larger quantum of exports and partly to realisation of higher prices, the average export price actually realised rising from about Rs. 400 to nearly Rs. 600 per tonne. The U.S.A. and Japan stepped up their offtake from Rs. 4 crores and Rs. 1 crore to Rs. 10 crores and Rs. 4 crores, respectively. Malaya also stepped up its purchase from Rs. 2.6 crores to Rs. 4.7 crores, although the quantity declined from 60,000 tonnes to 47,000 tonnes. Exports to Canada, however, declined from Rs. 5 crores to Rs. 3 crores.

Jute manufactures: Exports increased from Rs. 149 crores (840,000 tonnes) to Rs. 157 crores (910,000 tonnes). The exports of jute cloth and "other jute manufactures" (other than jute bags) rose from Rs. 99 crores and Rs. 10 crores to Rs. 105 crores and Rs. 16 crores, respectively, but those of jute bags receded from Rs. 40 crores to Rs. 36 crores. The U.S.S.R. and the U.S. took more, the respective increases being from Rs. 6 crores to Rs. 12 crores and from Rs. 61 crores to Rs. 65 crores.

Precious stones, pearls, etc.: Exports of these items, which are normally sent by post, increased from an estimated figure of Rs. 8.0 crores to Rs. 15.7 crores.

New manufactures: The increase in exports of new manufactures from Rs. 21 crores to Rs. 28 crores was accounted for mainly by the rise in the exports of base metals from Rs. 3.3 crores to Rs. 7.7 crores, footwear from Rs. 2.7 crores to Rs. 3.4 crores, engineering goods from Rs. 9.0 crores to Rs. 9.5 crores and ferro-manganese from Rs. 1.2 crore to Rs. 1.7 crore. The increase in exports of chemicals and allied products was relatively small—from Rs. 3.8 crores to Rs. 4.0 crores. Among the engineering items, sewing machines and electric fans showed lower exports, but the decrease was compensated by larger exports of other items such as iron and steel trunks, tubes, and fittings.

Vegetable oils (non-essential): Exports in 1963-64 at Rs. 20.0 crores (145 million kgs.) were the highest in recent years. In 1962-63, they amounted to Rs. 13.4 crores (99 million kgs.). The bulk of the increase was in groundnut oil. Its exports rose from Rs. 7.9 crores to Rs. 13.4 crores. Exports of castor oil also moved up from Rs. 4.3 crores to Rs. 4.8 crores. The countries accounting for larger exports were Burma, Spain and the U.S.S.R.

Tanned and dressed leather: Exports rose from Rs. 22.5 crores (19.3 million kgs.) to Rs. 26.2 crores (19.8 million kgs.). The higher unit price also contributed to the larger earnings. The bulk of the exports went to the U.K. which rose from Rs. 12 crores to Rs. 13 crores. The U.S., Czechoslovakia and Italy also took more.

Oilcakes: Exports increased from Rs. 31.1 crores (840,000 tonnes) to 35.4 crores (960,000 tonnes). Larger offtake by Japan (from Rs. 40 lakhs to Rs. 2.7 crores), East Germany (from Rs. 1.9 crore to Rs. 2.9 crores) and Czechoslovakia (from Rs. 1.3 crore to Rs. 2.8 crores) mostly accounted for the increase. Exports to the U.K. and West Germany, however, declined from Rs. 15.8 crores and Rs. 1.5 crore to Rs. 13.4 crores and Rs. 90 lakhs, respectively.

Cotton fabrics: The declining trend in the exports of cotton textiles was arrested during 1963-64. In fact, appreciable progress was made. The exports rose from Rs. 51.9 crores (541 million metres) to Rs. 54.5 crores (568 million metres). The improvement was recorded mainly in respect of the U.K. (from Rs. 11 crores to Rs. 16 crores) and Ceylon (from Rs. 2 crores to Rs. 4 crores). Exports to the U.S.A., Sudan and Nepal, however, declined from Rs. 6, crores, Rs. 3 crores and Rs. 6 crores to Rs. 4 crores. Rs. 2 crores and Rs. 5 crores, respectively.

Tobacco: Exports rose from Rs. 18.9 crores (62 million kgs.) to Rs. 21.7 crores (65 million kgs.), because of larger offtake by the U.S.S.R. (from Rs. 3.3 crores to Rs. 4.9 crores) and Poland (from Rs. 30 lakhs to Rs. 1.0 crore). Exports to the U.K. rose slightly from Rs. 9.6 crores to Rs. 9.7 crores, but those to East Germany decreased from Rs. 1.2 crore to Rs. 70 lakhs.

Art silk fabrics: Exports increased from Rs. 7 crores to Rs. 10 crores, the increase being largely in respect of Singapore (from Rs. 2 crores to Rs. 3 crores).

Other traditional items: Cashew kernels recorded a rise from Rs. 19.3 crores to Rs. 21.4 crores, spices from Rs. 13.8 crores to Rs. 16.0 crores and woollen manufactures from Rs. 5.1 crores to Rs. 7.7 crores. Exports of coffee, iron ore and manganese ore, however, increased nominally amounting to Rs. 8.3 crores, Rs. 36.4 crores and Rs. 8.3 crores in 1963-64, as against Rs. 7.6 crores, Rs. 35.3 crores and Rs. 8.0 crores, respectively, in 1962-63.

Tea: In spite of a slight rise in unit price from Rs. 5.8 per kg. to Rs. 6.0 per kg., exports decreased from Rs. 129.0 crores (220 million kgs.) in 1962-63 to Rs 123.4 crores (210 million kgs.) in 1963-64, mainly on account of the decline in despatches to the U.K. which fell from Rs. 75.6 crores to Rs. 70.4 crores. Exports to Iran, Australia, the U.S.A. and Irish Republic were also lower slightly, but those to the U.S.S.R., the U.A.R. and Tunis increased. Exports to the U.S.S.R., the second largest buyer of Indian tea, rose slightly from Rs. 10.6 crores to Rs. 10.7 crores.

Mica: Exports declined from Rs. 10.3 crores (34 million kgs.) to Rs. 9.2 crores (30 million kgs.) mainly because of the fall in exports to the U.S.A. from Rs. 2.3 crores to Rs. 1.8 crore, presumably due to development of substitutes. Japan, the U.K., the U.S.S.R. and Poland also made less purchases.

Raw hides and skins: Despite a rise in the unit price from Rs. 7.4 to Rs. 8.3 per kg., exports fell from Rs. 10.9 crores to Rs. 9.7 crores. The exports, which were mostly to the European countries, declined in each case, excepting those to the U.S.S.R. which, increased slightly from Rs. 4.8 crores to Rs. 5.1 crores.

Other major commodities: Exports of raw cotton registered a small decline from Rs. 12.2 crores to Rs. 12.1 crores. Exports of coir manufactures also receded from Rs. 12.2 crores to Rs. 11.7 crores.

Imports

The rise in imports was comparatively less as compared with that in exports. Total imports, including those by land from Nepal, increased from Rs. 1,135 crores to Rs. 1,149 crores. The break-up of the figures for broad group of items are given below:

(In crores of rupees)

Group	1962-63	1963-64	Percentage rise or fall
Food	180	165	—15
Crude materials, inedible, except fuels	129	123	— 6
Mineral fuels, lubricants, etc. ..	88	105	+17
Chemicals and allied products ..	101	88	—13
Manufactured goods classified according to kind	204	196	— 8
Machinery and transport equipment	387	422	+35
All others	46	50	+ 6
Total ..	1,135	1,149	+14

The commodity-country trends for principal items are indicated below:

Machinery and transport equipment: This group recorded the largest increase. Machinery items showed a substantial rise, but transport equipment items showed a fall. The machinery imports rose from Rs. 315 crores in 1962-63 to Rs. 361 crores in 1963-64. The imports from the U.S.A., the U.S.S.R., Switzerland and East Germany increased from Rs. 63 crores, Rs. 30 crores, Rs. 5 crores and Rs. 3 crores to Rs. 101 crores, Rs. 34 crores, Rs. 6 crores and Rs. 5 crores, respectively. Imports from the U.K., West Germany, Japan and Czechoslovakia, however, decreased from Rs. 89 crores, Rs. 53 crores, Rs. 24 crores, and Rs. 14 crores to Rs. 85 crores, Rs. 51 crores, Rs. 20 crores and Rs. 13 crores, respectively. As regards transport equipment, imports decreased from Rs. 72 crores to Rs. 61 crores, owing to lower arrivals from the U.S.A., Japan and Italy, the fall being from Rs. 22 crores to Rs. 20 crores, from Rs. 6 crores to Rs. 3 crores and Rs. 4 crores to Rs. 2 crores, respectively. Imports from U.K., however, rose slightly from Rs. 17.7 crores to Rs. 17.9 crores.

Crude petroleum: Imports increased from Rs. 30 crores to Rs. 46 crores, consequent on larger supplies from Iran and Saudi Arabia, the rise being from Rs. 23 crores and Rs. 6 crores to Rs. 28 crores and Rs. 16 crores, respectively. Imports of petroleum products rose nominally from Rs. 57 crores to Rs. 58 crores.

Food: According to the published figures, the largest decrease was in food items (mainly cereals) which fell from Rs. 180 crores in 1962-63 to Rs. 165 crores in 1963-64. This trend is, however, likely to be reversed on receipt of complete data for cereals which are imported under the Note Pass system. The figures as at present show that imports of wheat declined from Rs. 113 crores to Rs. 103 crores, owing to lower supplies from Australia and the U.S.A. which receded from Rs. 11.5 crores and Rs. 101.0 crores to Rs. 3.4 crores and Rs. 99.5 crores, respectively. Imports of rice also fell from Rs. 28 crores to Rs. 22 crores. The supplies from the U.S.A. were reduced from Rs. 22 crores to Rs. 13 crores, but those from Burma increased from Rs. 5 crores to Rs. 7 crores.

Chemicals: The fall in imports of chemicals from Rs. 101 crores to Rs. 88 crores was caused mainly by less purchases in U.K., West Germany, Italy, France and U.S.S.R., the fall being from Rs. 20 crores to Rs. 14 crores, from Rs. 16 crores to Rs. 13 crores, from Rs. 7 crores to Rs. 4 crores, from Rs. 6 crores to Rs. 3 crores and from Rs. 4 crores to Rs. 1 crore, respectively. The imports from Japan and East Germany, however, increased from Rs. 7 crores to Rs. 10 crores and from Rs. 2 crores to Rs. 3 crores, respectively, while those from the U.S.A. rose from Rs. 21.4 crores to Rs. 21.7 crores.

Manufactured goods: Imports of manufactured goods (classified chiefly by material) declined from Rs. 204 crores to Rs. 196 crores. Metal manufactures (from Rs. 21 crores to Rs. 16 crores), textile yarn and fabrics (from Rs. 15 crores to Rs. 13 crores) and paper and paper board (from Rs. 14 crores to Rs. 12 crores) contributed to this fall. Imports of base metals, however, increased from Rs. 144 crores to Rs. 145 crores.

Crude materials, inedible: The fall in the imports of these was mainly the result of lower imports of raw cotton which decreased from Rs. 57 crores to Rs. 49 crores. The supplies from Sudan and Kenya receded from Rs. 17 crores and Rs. 4 crores to Rs. 8 crores and Rs. 2 crores, respectively. There were practically no imports from West Pakistan, as against Rs. 5 crores in 1962-63. On the other hand, the U.S.A. and Egypt increased their supplies from Rs. 18 crores and Rs. 9 crores to Rs. 22 crores and Rs. 15 crores, respectively.

Direction of Trade

India's trade by currency areas is shown in the table below for the two years under review:

(In crores of rupees)

Currency area	Exports (including re-exports)		Imports	
	1962-63	1963-64	1962-63	1963-64
Dollar area	143	157	365	416
European Common Market ..	48	67	159	138
East European countries ..	92	109	110	123
Sterling area	268	283	235	247
Other soft currency area ..	170	188	216	225
Total ..	721	794	1,135	1,149

In spite of increase in exports, the gap with the dollar area countries increased in 1963-64, due to larger imports. The same trend is reflected in India's trade with the U.S.A., the biggest among them. While the exports to that country increased from Rs. 114 crores to Rs. 128 crores, imports rose from Rs. 347 crores to Rs. 390 crores. Exports to Canada, the next important country in the region, decreased from Rs. 22 crores to Rs. 21 crores, but imports rose from Rs. 17 crores to Rs. 24 crores, thus converting the favourable balance in 1962-63 into an adverse balance in 1963-64. Despatches to Cuba at Rs. 4.0 crores in 1963-64 were also higher by Rs. 50 lakhs, while imports were almost *nil*.

The adverse balance in India's trade with the E.C.M. countries was reduced by Rs. 30 crores in 1963-64 as a result of larger exports and lower imports. Exports to each of them increased, the largest increase being in respect of West Germany and Netherlands, from Rs. 15 crores and Rs. 9 crores to Rs. 19 crores and Rs. 11 crores, respectively. Imports also decreased, the fall being the highest in the case of West Germany (from Rs. 99 crores to Rs. 89 crores), Italy (from Rs. 22 crores to Rs. 16 crores) and Netherlands (from Rs. 14 crores to Rs. 10 crores) came next in the descending order. Imports from France and Belgium were almost stationary at Rs. 14 crores and Rs. 9 crores, respectively.

India's trade balance with the East European communist countries also showed some improvement in 1963-64. Total exports to these countries rose by Rs. 17 crores, as against the increase of Rs. 13 crores in imports, thereby reducing the adverse balance by Rs. 4 crores. Exports to the U.S.S.R. increased considerably from Rs. 38 crores to Rs. 52 crores, while imports improved from Rs. 59 crores to Rs. 64 crores. Exports to East Germany rose from Rs. 9 crores to Rs. 10 crores and imports from Rs. 8 crores to Rs. 10 crores. On the other hand, exports to Poland declined from Rs. 12 crores to Rs. 10 crores, but imports rose from Rs. 8 crores to Rs. 10 crores. Exports to Czechoslovakia went up from Rs. 11 crores to Rs. 16 crores, but imports receded from Rs. 20 crores to Rs. 17 crores, thus reducing the trade gap. While exports to Yugoslavia fell from Rs. 11 crores to Rs. 9 crores, imports increased from Rs. 8 crores to Rs. 10 crores.

An interesting and welcome trend in trade with the sterling area countries is the transformation of adverse balance into a favourable balance because of larger exports and lower imports. The rise in exports resulted from larger despatches to Ceylon (from Rs. 13 crores to Rs. 19 crores), Malaya (from Rs. 7 crores to Rs. 13 crores) and Singapore (from Rs. 9 crores to Rs. 17 crores). Exports to the U.K., however, declined from Rs. 163 crores to Rs. 161 crores. Exports to Australia, Nigeria and Pakistan also declined from Rs. 19 crores, Rs. 6 crores and Rs. 9 crores to Rs. 18 crores, Rs. 4 crores and Rs. 7 crores, respectively. The fall in imports was due to less deliveries from the U.K. which decreased from Rs. 186 crores to Rs. 169 crores. Imports from Australia, Pakistan, Singapore and Ceylon also recorded a substantial fall from Rs. 24 crores to Rs. 17 crores, from Rs. 17 crores to Rs. 9 crores, from Rs. 8 crores to Rs. 5 crores and from Rs. 8 crores to Rs. 6 crores, respectively. Imports from Malaya, however, rose from Rs. 11 crores to Rs. 12 crores.

The balance of trade with the countries of "other soft currency area" also showed an improvement during 1963-64 because of higher exports and smaller imports. India's exports to Japan, the biggest trading partner in this area, rose from Rs. 33 crores in 1962-63 to Rs. 59 crores in 1963-64, but imports fell from Rs. 65 crores to Rs. 63 crores. Exports to the United Arab Republic decreased from Rs. 13.0 crores to Rs. 12.6 crores, but imports rose from Rs. 9.8 crores to Rs. 15.3 crores. Both exports to and imports from Sudan fell from Rs. 9.0 crores to Rs. 7.8 crores and from Rs. 17.1 crores to Rs. 8.5 crores, respectively. Exports to Argentina improved from Rs. 8.1 crores to Rs. 10.1 crores, but imports were negligible in both the years. Imports from the main oil producing countries of Iran and Saudi Arabia went up from Rs. 46 crores to Rs. 48 crores and from Rs. 12 crores to Rs. 22 crores, respectively. Exports to Iran, however, decreased from Rs. 6.4 crores to Rs. 4.7 crores, but those to Saudi Arabia increased from Rs. 2.7 crores to Rs. 3.2 crores.

Terms of Trade

"Terms of Trade" is a concept designed to measure the degree of achievement of the highest possible prices for exports and the lowest possible for imports. Terms of trade are of two kinds—gross and net. The index of quantum of imports as percentage of that of exports defines the gross terms of trade. It measures the gain from the trade by comparing imports actually received with exports actually despatched. A rising index shows that more imports have been obtained in exchange for a given volume of exports. The net terms of trade, which isolates the price effect, is, on the other hand, the index of unit prices of exports as a percentage of that of imports. It measures the real cost of imports in terms of exports. A rising index shows that larger volume of imports can be obtained for a given volume of exports on the basis of price relations, that is, imports are becoming relatively cheaper than exports. Thus, a favourable position is indicated by a rise and an adverse position by a fall in the terms of trade. The two types of terms of trade for the years 1962-63 and 1963-64 are given in the table below in regard to India's foreign trade:

Index	1962-63	1963-64
Unit value index No. of exports	106	105
Unit value index No. of imports	94	97
Quantum index No. of exports	112	126
Quantum index No. of imports	131	135
Net terms of trade (1÷2×100)	113	108
Gross terms of trade (4÷5×100)	117	107

The above index numbers of exports and imports have been constructed with 1958 as base. In comparison to the base year, there has been a definite improvement in the terms of trade (net and gross alike) both in 1962-63 and in 1963-64 which is indicated by their rise. As compared with 1962-63, however, the position deteriorated in 1963-64 which is reflected by a fall. In other words, we obtained in terms of both prices and quantum less from our exports to other countries in that year. The situation calls for a remedial action of larger and larger exports at more remunerative prices.

CAUSTIC SODA INDUSTRY IN INDIA

PLEA FOR EXTENSION OF PROTECTION

THE caustic soda industry, it will be recalled, was first granted tariff protection in 1954. Thanks to protection, the industry has made rapid headway. Both installed capacity and actual production have gone up quite considerably. The quality of the product is also said to be fairly satisfactory. With the continuously rising demand for caustic soda, which, as is well known, is used as one of the basic raw materials by a wide range of industries, especially soap, textiles, paper, rayon and aluminium, there is vast scope for further expansion. Caustic soda being a basic raw material, the development of the industry, maintenance and enhancement of productive efficiency, discovery of avenues for fuller utilisation of chlorine, improvement of quality, and arrangements for ensuring that the product reaches consumers readily and at reasonable prices—all these require, as Dr. R. Balakrishna, Member of the Tariff Commission, rightly stated while opening the public inquiry into the question of extending protection to the industry beyond December 1964, held at Bombay last week, close attention.

The industry has pleaded for continuation of protection, which is due to expire on 31st December next, until the industry reaches the stage of self-sufficiency, in order to fulfil its overall obligations of a protected industry. As imports are necessary to meet the growing demand and since the import prices are lower, the industry, it is contended, cannot do without protection to maintain the pace of advance. The industry's plea has been supported by consumers who, however, emphasise that the Tariff Commission should exhort the industry to develop sufficiently so as to provide adequate supplies of standard quality caustic soda at fair prices. The Director-General of Technical Development, Government of India, has also lent his support to the plea by saying that the industry's growth is very vital to the economy of the country.

Capacity

The growth of the caustic soda industry since the grant of protection has certainly been appreciable. Thus, between 1954 and 1963, the number of units has risen from 12 to 20, installed capacity from 39,317 tonnes to 209,185 tonnes and actual production from 28,993 tonnes to 150,330 tonnes. As part of the expansion programme, seven existing units have been granted an additional capacity of 64,200 tonnes capacity and fourteen new factories have been licensed to put up a total capacity of 153,968 tonnes. With the completion of these schemes, the total installed capacity of the industry will rise from 209,185 tonnes (as of 1963) to 427,353 tonnes. The technical optimum or the economic size of a caustic soda plant varies from unit to unit depending on the purpose for which production is meant, that is, for self-consumption or for sale or for use as a by-product. Taking the average technical optimum per unit as 100 tonnes a day, most of the indigenous units even after expansion already sanctioned, according to Dr. Balakrishna, will continue to be below the economic level. Since the size of a caustic soda unit has an important bearing on its cost of production, the Tariff Commission will do well to discuss the prospects of further expansion of at least some of the units to the economic size.

Production

Production of caustic soda (on 100 per cent NaOH basis) has gone up from 118,646 tonnes in 1961 to 150,330 tonnes in 1963. The production of caustic soda liquid as well as of flakes has registered a progressive rise. The share of the former in the total output was 53 per cent in 1961 and 57 per cent in 1963, while the latter accounts for about 6 per cent and 8 per cent respectively, during these two years. This improvement is obviously at the expense of caustic soda fused solid, the production of which represented 41 per cent in 1961 and 35 per cent in 1963. Another development since the last inquiry has been an increase in the output of rayon grade caustic soda from about 44 per cent to 47 per cent.

Demand

In 1961, the Tariff Commission had estimated the domestic demand for caustic soda at 201,800 tonnes and expected it to rise to 319,000 tonnes in 1964. But the actual consumption would appear to be well below these estimates, being 138,660 tonnes in 1961, 198,506 tonnes in 1962 and 218,843 tonnes in 1963. The estimates of current and future demand for the product made by the Director-General of Technical Development (D.G.T.D.) and the Alkali Manufacturers' Association of India (A.M.A.I.) vary widely, as will be seen from the table below:

(In thousand tonnes)

Consuming industries	1964	1965	1966	1967
Soap Industry:				
A.M.A.I. estimates	36	40	44	48
D.G.T.D. ,, ...	43	47	52	60
Textile Industry:				
A.M.A.I. estimates	43	46	49	52
D.G.T.D. ,, ...	45	46	47	48
Paper and Paperboard Industry:				
A.M.A.I. estimates	53	61	69	76
D.G.T.D. ,, ...	56	71	77	83
Rayon Industry:				
A.M.A.I. estimates	76	89	103	115
D.G.T.D. ,, ...	80	85	115	130
Aluminium Industry:				
A.M.A.I. estimates	12	16	20	30
D.G.T.D. ,, ...	14	18	23	31
Miscellaneous Industries:				
A.M.A.I. estimates	25	30	35	45
D.G.T.D. ,, ...	22	28	36	48
Total:				
A.M.A.I. estimates	245	282	320	366
D.G.T.D. ,, ...	260	295	350	400

As chlorine is a joint product in the manufacture of electrolytic caustic soda, its profitable utilisation has a direct bearing on the development and pricing policy of the caustic soda industry. The Tariff Commission will, therefore, have to assess the domestic requirements of chlorine. It may be noted here that, in its previous report, the Commission had anticipated that the demand for chlorine would rise from 68,000 tonnes in 1961 to 132,000 tonnes in 1964. In connection with the present inquiry the D.G.T.D. has assessed the demand for chlorine at 110,000 tonnes for 1964, 135,000 tonnes for 1965, 170,000 tonnes for 1966 and 210,000 tonnes for 1967, while the Alkali Manufacturers' Association of India has estimated the demand at 132,000 tonnes, 147,000 tonnes, 164,000 tonnes and 183,000 tonnes for these four years, respectively.

With the domestic output of caustic soda falling short of actual requirements, imports have been a regular feature. The actual imports were 20,000 tonnes in 1961, 76,000 tonnes in 1962 and 68,000 tonnes in 1963. The present tariff rate for caustic soda is 70 per cent *ad valorem*, preferential and 80 per cent *ad valorem* standard on import values of Rs. 28 per quintal of fused solid and Rs. 52 per quintal of caustic soda of other forms. Further, a surcharge of 10 per cent on import duty and a countervailing excise duty of Rs. 4 per quintal are also levied on all imports.

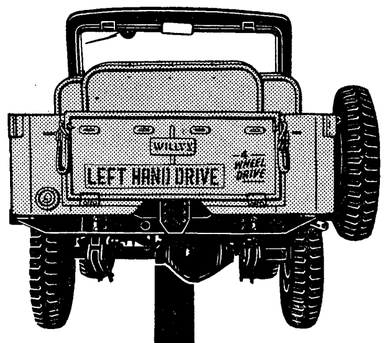
Of the 20 caustic soda plants in the country, all but one have adopted the electrolytic process. Common salt, the chief ingredient in caustic soda production by the electrolytic process, is easily available. But electricity accounts for a significant portion of the cost of production. The Saurashtra Chemicals uses the chemical process. Caustic soda, which is produced in two grades, namely, technical grade and rayon grade, generally conforms to the standard specifications laid down by the Indian Standards Institution.

Prices

Since the selling prices of caustic soda were decontrolled in December last, there has been a general increase in prices. The producers maintain that the price rise was long overdue, in view of the steep rise in costs. But the consuming industries like soap, textiles, rayon and paper, have strongly objected to the price increase. Alluding to the price question, Dr. Balakrishna said that the Tariff Commission would examine the question especially in view of the moral obligation cast on a protected industry to keep its selling price in fair relation to costs of manufacture.

Distribution

Consumers, on the whole, are dissatisfied with the present system of distribution of caustic soda. While some have complained that they do not get regular and adequate supplies and are compelled to buy from the open market at exorbitant prices, others have suggested a quota system to ensure fair supplies.



PARTICULAR SERVICING FOR PARTICULAR PEOPLE

It means more life, more mileage if your Jeep is serviced by Jeep Dealers. It is oiled, cleaned, tuned and adjusted by people who know each nut and bolt of the Jeep. They have been trained to give you factory specialised servicing. There are over a 100 dealers spread throughout the country with a complete range of equipment.

Trust your Jeep to a JEEP DEALER for reliable, efficient servicing.

BUY NATIONAL DEFENCE CERTIFICATES

METAL BOX'S PROFIT RISES MARKEDLY

BUT RETURN ON HIGHER CAPITAL PRUNED

BOTH sales and gross profit of the Metal Box Company of India Ltd. (Chairman: Mr. M. K. Vellodi, Calcutta) have touched new peaks of Rs. 13.85 crores and Rs. 182.53 lakhs, respectively, during the year ended 31st March 1964. This performance is all the more significant in view of the fact that, in the previous year, while sales had gone up, in contrast with the fall in the growth rate from 11 per cent to 8 per cent in 1961-62, by 13 per cent to Rs. 11.85 crores, gross profit had recorded a marginal improvement of Rs. 9.53 lakhs to Rs. 145.59 lakhs and was, in fact, below the best level then of Rs. 149.36 lakhs registered in 1960-61. The improvement in profit has stemmed from a 17 per cent rise in sales. But, in his review of the year's operations, the Chairman Mr. M. K. Vellodi, states that sales in all significant product groups have increased but those of ordinance supplies are below forecast owing to "unexpected problems in equipping ourselves and in meeting the standards required by the ordnance inspection authorities." He also refers to the commissioning into production of the new paper group during the second half of the year and to the encouraging volume of order book for paper products at the year-end which, he says, is an indication that this addition to the Company's packaging service will be widely welcomed. One may safely conclude from what Mr. Vellodi says that this new paper group has made a considerable contribution to the sales and profit during the year under review. Considering that the supply of raw materials and certain products (such as tubes) was irregular during the second half of 1963-64, the year's results are pretty impressive.

After allowing Rs. 20.04 lakhs (Rs. 16.86 lakhs a year before) for depreciation and Rs. 92.50 lakhs for taxation, out of which Rs. 18.50 lakhs are attributable to Surtax and Dividend tax (Rs. 79 lakhs in all in the previous year, out of which Rs. 16 lakhs were for S.P.T.), the net profit is higher by more than Rs. 20 lakhs at Rs. 69.99 lakhs. But after providing Rs. 7.88 lakhs (Rs. 5.08 lakhs) for gratuity and taking Rs. 17.50 lakhs (Rs. 42 lakhs) to reserves, the return on the 10-rupee ordinary shares has been pruned further by one point (six points in the previous year) to 18 per cent per annum. The reduction has been made in the final dividend which is 9 per cent, because it is payable on the capital increased in March 1964 to Rs. 322 lakhs by the issue of 1,610,000 shares at a premium of Rs. 2.50 per share in the proportion of one new share for every share held. The shareholders took up 99.37 per cent of the shares offered; the remaining 0.63 per cent were allotted in proportion to their holdings to those who had applied for more. A sum of Rs. 40.25 lakhs is shown in the share premium account.

Tabulated below are the salient features of the Company's progress in the past four years:—

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Product sales	13,84.99	11,85.41	10,49.68	970.08
Other income	25.95	25.02	23.73	22.57

Provision for—				
Depreciation	20.04	16.86	16.71	16.10
Taxation	92.50	79.00	58.10	60.00
Net profit	69.99	49.73	61.25	73.26
Withdrawals from provisions ..			0.77	1.47
Provision for gratuity	7.88	5.08	5.00	10.00
To reserves	17.50	42.00	14.20	18.00
Dividends—				
Preference	1.50	1.50	1.60	1.60
Ordinary	48.47 (18%)	30.59 (19%)	40.25 (25%)	40.25 (25%)
	0.02	0.39	29.83	28.86
Carry forward				

Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	51.00	55.00	65.00	48.12	44.25
Low	28.50	38.87	53.50	36.62	32.12

During the current year, the Company plans to promote vigorously sales of non-tinplate products. Further, with the No. 2 factory at Calcutta having overcome difficulties in tooling up for Defence, the sale of industrial components should be particularly strong. However, the availability of raw materials, especially tinplate and polyethylene, and also capacity to produce certain products will continue to determine the extent to which the Company can meet the strong demand that has emerged in the current year. Thanks to the generous long-term credit arrangements with its associates in England and with the ingenuity and good planning by its managers, the Company has been able to undertake its long overdue modernisation programmes. Expenditure on fixed assets during the year under review was Rs. 83.07 lakhs, of which Rs. 57.21 lakhs were spent on machinery and plant. Work on the Bombay No. 2 factory at Deonar was completed during the year and the machinery installed. In July last, the newly established paper group commenced carton and label production at the Bombay No. I factory.

The Company's paid-up capital of Rs. 352 lakhs, including Rs. 30 lakhs in 6 per cent (taxable) redeemable cumulative preference shares of Rs. 100 each, is backed by reserves and surplus amounting to Rs. 296.73 lakhs. Short-term loans of Rs. 29.94 lakhs (additionally, there are unsecured loans of Rs. 34.05 lakhs from the Metal Box Company Overseas Ltd.) and current liabilities and provisions amounting to Rs. 369.01 lakhs bring the total short-term indebtedness to Rs. 398.95 lakhs, as against which current assets, book debts and investments aggregate Rs. 742.61 lakhs. The gross block of Rs. 527.52 lakhs (Rs. 447.55 lakhs a year before) has been written down to Rs. 339.11 lakhs.

The net yield on the Rs. 10 fully paid ordinary shares of the Company at their current market value of Rs. 31.25 *cum-div.* (final) works out to 4.7 per cent per annum.

TRAVANCORE RAYONS CUTS DIVIDEND

Protracted labour troubles in the rayon spinning section and continuance of the system of concessional sales of yarn to weavers under the export promotion scheme for rayon fabrics have been mainly responsible for the somewhat disappointing performance of the Travancore Rayons Ltd. (Managing Agents: Messrs. Emecets & Sons (Travancore) Private Ltd., Madras) during the year ended 31st December 1963. Thanks to a welcome improvement in the production of cellulose film—though that of rayon yarn has declined "precipitously"—turnover has advanced by approximately ten per cent from Rs. 313.04 lakhs to Rs. 343.15 lakhs, but the gross profit has remained almost unchanged, being Rs. 59.31 lakhs, as against Rs. 59.72 lakhs the year before. The profit margin (ratio of gross profit to sale proceeds) has thus contracted for the fourth successive year and works out to 17.3 per cent for the year under review, as against 19.1 per cent for 1962 and 32.6 per cent for 1961 which was the most profitable year on record so far. This decline is obviously due to the drop in production consequent on the labour troubles, the loss suffered on the compulsory sale of yarn at concessional sales and the continued upward thrust of costs of production.

The lower gross profit has naturally attracted a lower provision for the Managing Agents' commission of Rs. 1.25 lakh, as against Rs. 1.34 lakh, but, since that for depreciation has risen steeply from Rs. 26.75 lakhs to Rs. 32.20 lakhs, the profit subject to taxation has come down heavily by Rs. 5.77 lakhs to Rs. 25.86 lakhs. However, with a saving of Rs. 13.13 lakhs at Rs. 4.60 lakhs in the provision for taxation, the net profit shows a welcome increase to Rs. 21.26 lakhs from Rs. 13.90 lakhs a year ago. Supplementing this with the Rs. 3.00 lakhs transferred from reserves, as was done in the previous year, the Directors have credited Rs. 8.50 lakhs (as against Rs. 1.15 lakh) to the development rebate reserve and have also provided Rs. 3.25 lakhs for payment of preference dividend in respect of the year. With a lower surplus available, they have been obliged to reduce the ordinary dividend once again—this time by 2.5 points—to 12.5 per cent subject to deduction of tax. This claims Rs. 12.50 lakhs, leaving Rs. 19,156 to be carried forward, as against the Rs. 18,587 brought in.

The steady deterioration in the profits of the Company during the past four years owing to a continuation of extraneous factors is revealed by the following comparative data:

(In lakhs of rupees)

	For the year ended 31st December			
	1963	1962	1961	1960
Sale proceeds	343.15	313.04	366.49	376.88

Depreciation	32.20	26.75	40.13	36.47
Taxation	4.60	17.73	30.60	27.30
Net profit	21.26	13.90	35.58	51.53
Withdrawal from reserves ..	3.00	3.00	..	..
To reserves and provisions ..	8.50	1.15	12.25	27.20
Dividends—				
Preference	3.25	3.25	3.25	4.00
Ordinary	12.50 (12.5%)	15.00 (15%)	20.00 (20%)	20.00 (20%)
Carry forward	0.19	0.19	2.69	2.61

Market price of ordinary shares (in rupees):	1964	1963	1962	1961	1960
High	26.50	29.75	46.10	47.50	40.40
Low	20.65	22.75	28.60	32.25	24.95

By utilising the residual profit and the amount credited to the depreciation account for augumenting its holdings under fixed assets, the Company has built up a strong financial position. The issued share capital, which still remains unchanged at its original level is Rs. 150 lakhs, comprises of Rs. 50 lakhs in preference shares of Rs. 219.68 lakhs made up of Rs. 163.26 lakhs as borrowings, and Rs. 56.48 lakhs as current liabilities and provisions (excluding the provision for gratuity which is included under reserves). Borrowings no doubt are on the higher side, but, being mainly on account of payment towards capital; additions are taken due care of by the gross block. Besides current assets, investments and loans and advances themselves at Rs. 210.05 lakhs very nearly equal the total outside interest. During the year, new assets worth Rs. 78.30 lakhs were acquired and these have raised the block account to Rs. 655.93 lakhs. But it has been very well written down through the depreciation account to Rs. 250.41 lakhs. Together with Rs. 26.34 lakhs as the value of capital work-in-progress, the overall net block works out to Rs. 276.75. lakhs.

It will be recalled that, towards the close of 1962, the rayon spinning section of the Company experienced unsettled labour conditions which resulted in the dismissal of nearly all the spinners and, as matters grew worse, in a layoff in October of that year. It was not until the end of January 1964 that the layoff could be lifted and, consequently, production of rayon yarn declined precipitously from 2.16 million kg. in 1962 to 1.38 million kg.—or less than half the rated capacity—during the year under review. Fortunately, the output of cellulose film (Trayophane) registered a welcome improvement from 1.48 million kg. to 2.37 million kg. and thus helped the turnover show a rise over the previous year. Production of rayon grade pulp from cotton lintas was achieved on a commercial scale during the year and the quality of the pulp was found satisfactory; it was superior to that of imported wood pulp. The full rated capacity of 10 tons per day could not be attained owing to non-receipt of some balancing equipment. Since this have now been received, production can be stretched the full length to 10 tons per day during the current year.

In their report to shareholders for the year 1962, the Directors had referred to the orders placed for six new spinning machines. They now state that these have been received and are being installed. It is expected that full production from these will be available by the last quarter of the current year. As for the electrical carbon di-sulphide plant, the same is ready for commissioning and production will commence as soon as position with regard to power eases.

Speaking at the annual general meeting held on 25th June 1964, the Chairman informed, the shareholders that labour was acquitting itself satisfactorily and that the quality of rayon yarn and the quantity of production had shown a marked improvement. Sales, too, had been, of late, picking up and, should this trend continue, the Chairman had every hope that the year 1964 would see promising results.

At present, the Rs. 10.00 paid ordinary shares of the Company are quoted at Rs. 22.80 *cum-div.* and fetch a return of 4.6 per cent per annum on an *ex-div.* price.

LAKSHMI MILLS PAYS SAME

In spite of a spurt of Rs. 140.32 lakhs to Rs. 598.59 lakhs in their Company's sales during the year ended 31st March 1964, which contrasts with the slight drop of Rs. 10.84 lakhs recorded in the previous year, the shareholders of the Lakshmi Mills Company Ltd. (Managing Agents: Messrs. G. Kuppuswamy Naidu & Co., Coimbatore) have got the same 20 per cent return (to which level it was reduced in the previous year by another five points on the same paid-up capital of Rs. 106.50 lakhs) on their Rs. 50 fully paid shares. The reasons for this are two. One, there has been a sharp rise of Rs. 115.67 lakhs to Rs. 398.09 lakhs in the cost of materials and stores consumed eating up the bulk of the improvement in sales at the level of gross profit which shows an increase of only Rs. 24.43 lakhs to Rs. 100.64 lakhs. And, two, the essential provisions are higher, resulting in a net profit of only Rs. 30.04 lakhs at which level it is still below the Rs. 31.75 lakhs earned during 1961-62 when sales amounted to Rs. 469.11 lakhs. Out of the net profit, a sum of Rs. 6 lakhs (Rs. 5.65 lakhs in the previous year) has been carried to development rebate reserve and Rs. 2.65 lakhs (Rs. 70,000) have been provided for work people's gratuity. The dividend absorbs Rs. 21.30 lakhs, leaving a surplus of Rs. 25,194, as against the Rs. 17,087 brought in.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sale proceeds	598.59	458.27	469.11	440.03

Equity shares' market value (in rupees):	1964	1963	1962	1961
High	137.00	142.50	170.00	181.00
Low	130.00	130.50	138.00	148.00

During the year, the Coimbatore and Kovilpatti Mills worked three shifts from October. In the Palladam branch, only the staple fibre unit has commenced third shift working since January 1964.

The Company has now a total installed capacity of 147,920 spindles in its three units and 364 looms at Coimbatore. During the year, 15,232 spindles were commissioned in the Palladam staple fibre unit. It is proposed to install another 8,768 spindles to reach the licensed capacity of 24,000 spindles. Sixty-four out of the 96 automatic looms ordered have been received.

The Company's paid-up capital of Rs. 106.50 lakhs is divided in the same number (142,000) of Rs. 50 fully paid and Rs. 25 'A' class fully paid ordinary shares. It is supplemented by reserves and surplus amounting to Rs. 102.98 lakhs. The year has closed with secured loans of Rs. 143.82 lakhs (about Rs. 9 lakhs less than in the previous year) and current liabilities and provisions amounting to Rs. 139.43 lakhs. The total indebtedness to outsiders thus works out to Rs. 283.25 lakhs and is taken care of by liquid assets of Rs. 322.29 lakhs, comprising investments of Rs. 62.35 lakhs (of which Rs. 7.50 lakhs are quoted at par) and current assets, loans and advances shown at Rs. 259.94 lakhs. The gross block has appreciated during the year from Rs. 419.15 lakhs to Rs. 452.26 lakhs and has been written down to Rs. 204.59 lakhs.

Currently quoted at Rs. 131 *cum-div.*, the Rs. 50 fully paid shares of the Company offer a net yield of 6.1 per cent per annum.

EQUITABLE COAL MAINTAINS DIVIDEND AGAIN

Thanks to the improvement in the availability of wagons for coal movement, which, by augmenting despatches, has actually warded off the effects of a drop in raisings, the Equitable Coal Company Ltd. (Managing Agents: Messrs. MacNeill and Barry Ltd., Calcutta) has been able to report more encouraging results for the year ended 31st December 1963 than previously. The realisation from sales and despatches of coal has advanced from Rs. 413.66 lakhs to Rs. 449.75 lakhs and, as other income has also risen by Rs. 8.80 lakhs to Rs. 21.89 lakhs, the gross profit at Rs. 28.10 lakhs shows a gain of Rs. 2.93 lakhs over the previous year. Considering the increases in selling prices of coal granted by the Government to compensate for the changes in wage structure and other costs, subsidies for sand stowing, and adverse mining conditions, the gross profit could well have been higher. But this has not been the case, because coal subsidies have offset only a part of the costs of operation, while many demands of increased and increasing costs remain unneutralised by the price increases.

Inclusive of adjustments in respect of prior years—a credit of Rs. 0.84 lakh, as against a deficit of Rs. 2.81 lakhs—the gross profit stands higher at Rs. 28.94 lakhs, as against Rs. 22.36 lakhs for the year before. In view of this betterment, the provision for Managing Agents' remuneration has gone up from Rs. 0.64 lakh to Rs. 1.47 lakh and that for taxation has almost doubled from Rs. 3.28 lakhs to Rs. 6.23 lakhs, while the provision for depreciation at Rs. 15.31 lakhs is only slightly lower than Rs. 15.93 lakhs a year ago. Consequently, the resulting net profit is lower at Rs. 5.09 lakhs, as against Rs. 5.32 lakhs. There is, therefore, to be no change in the dividend of 10 per cent subject to deduction of tax, for the third year in succession. This absorbs Rs. 2.96 lakhs and leaves Rs. 1.58 lakh to be carried forward, as against the Rs. 45,000 brought in. The transfer to reserves has been lowered somewhat, but this is mainly because of a smaller withdrawal from past provisions.

The following comparative table presents the working results of the Company for the past four years:

(In lakhs of rupees)

	For the year ended 31st December			
	1963	1962	1961	1960
Sale proceeds	449.75	412.66	398.57	392.56
Other income	21.89	13.09	13.67	2.88

Despatches (tonnes)	1,852,814	1,831,041	1,863,720	1,837,588
Closing stocks (tonnes)	57,621	70,528	55,451	93,576
Market price of ordinary shares (in rupees):	1964	1963	1962	1961	1960
High	29.62	26.87	25.31	32.50	31.87
Low	21.25	22.87	20.87	26.50	25.75

During the year the Company raised 1,839,912 tonnes of coal, as against 1,859,398 tonnes in 1962 and 1,825,596 tonnes in 1961. The fall in output was due in the main to difficult mining conditions and availability of fewer working places at certain collieries. Further, the system of working on rest days introduced soon after the beginning of the Emergency was not continued during the year under review and the benefit of additional production was, therefore, not obtained. Fortunately, the availability of rail transport showed an improvement in the latter half of the year, with the result that despatches picked up from 1,831,041 tonnes to 1,852,814 tonnes, though they were no match to the record of 1,863,720 tonnes attained in 1961. With this improvement, stocks did not accumulate at pitheads and the Company could close the year with a stock of 57,621 tonnes coal on hand, as against 70,523 tonnes a year ago.

Else, the Directors state, are not unmanageable, though lack of demand for the lower grades of coal is beginning to cause concern.

Development of Hurriladih Colliery of the Company progressed satisfactorily during the year and raisings were due to commence in April 1964. Preliminary development work at Kottadih Colliery was undertaken during the year and good progress has been made in the driving of inclines and sinking of shafts. The Company has also availed of the facilities afforded by the Government for import of equipment under the World Bank loan scheme. Essential machinery and spare parts are now being received. The expenditure on this account, occurring at a time when the rate of profitability in the industry is at a low level, is reported to have placed a considerable strain on the financial resources of the Company.

As regards the prospects for current year, the Directors report that the estimated results for the first quarter are not as encouraging as those for the corresponding period last year and that the Company shares the apprehensions of the industry that the demand for coal may not rise with actual and planned production for some time.

The Rs. 20 paid ordinary shares of the Company are currently available at Rs. 21.50 *cum-div.* On an *ex-div.* basis, these fetch a net annual return of 3.9 per cent on fresh investment.

SELECTED SATGRAM COLLIERIES DOES WELL

The working results of the Selected Satgram Collieries Ltd. (Managing Agents: Messrs. S. D. Shethia and Co. Private Ltd., Calcutta) for the year ended 31st December 1963 are heartening. With a 15 per cent increase in raisings of coal from 551,413 tonnes to 649,513 tonnes and a 17 point rise in despatches from 637,946 tonnes to 526,368 tonnes, turn over has expanded by as much as Rs. 50.07 lakhs to an all-time high of Rs. 114.37 lakhs. The gross profit has risen correspondingly from Rs. 13.89 lakhs to Rs. 23.11 lakhs. Yet another pleasing feature is that, in spite of increased raisings, closing stocks of coal have been reduced from 20,046 tonnes to 10,459 tonnes (from Rs. 2.25 lakhs to Rs. 1.88 lakhs in terms of value). Due to increased activity and a higher gross profit, all the essential provisions are naturally larger—that for the Managing Agents' commission at Rs. 1.70 lakh, as against Rs. 1.09 lakh, for depreciation at Rs. 5.40 lakhs, as against Rs. 3.95 lakhs, and for taxation at Rs. 3.35 lakhs, as against Rs. 2.69 lakhs. Even so, the net profit at Rs. 12.66 lakhs shows a gain of more than 100 per cent over the previous year's figure of Rs. 6.16 lakhs. To this has been added the Rs. 1.56 lakh withdrawn from the development rebate reserve excess provided during the previous year, making a total of Rs. 7.72 lakhs. A sum of Rs. 1.56 lakh has been set aside to cover the tax liability in respect of prior years. The dividend remains unchanged at 10 per cent, subject to deduction of tax, but claims a slightly bigger amount of Rs. 4.00 lakhs, as compared with Rs. 3.83 lakhs a year ago. The credit to reserves having been stepped up from Rs. 2.36 lakhs to Rs. 8.62 lakhs, including Rs. 6.20 lakhs, as against Rs. 2.26 lakhs to the development rebate reserve, the carry forward is lower at Rs. 1,672, as against the Rs. 5,303 brought in.

The Company's performance during each of the past four years is presented synoptically in the following comparative table:

(In lakhs of rupees)

	For the year ended 31st December			
	1963	1962	1961	1960
Sale proceeds	114.37	64.30	51.07	52.71

	(10%)	(10%)	(14%)	(10%)
Carry forward	0.02	0.05	0.07	0.03
Market price of ordinary shares (in rupees):	1963	1962	1961	1960
High	118.00	127.00	156.00	192.00
Low	118.00	107.00	110.00	160.00

The rapid expansion in activities undertaken since the Company was converted into a public limited company in 1961 has strained its financial position to some extent. Thus, whereas the "own" funds aggregate Rs. 56.19 lakhs (comprising Rs. 40.00 lakhs in equity shares of Rs. 100 each and the balance in reserves), outside interest is no less than Rs. 106.17 lakhs. This is made up of Rs. 67.05 lakhs as secured and unsecured loans and Rs. 39.12 lakhs as current liabilities and provisions. On the assets side, too, the block account, inclusive of additions worth Rs. 2.35 lakhs made during the year, stands as high as Rs. 110.28 lakhs, while the net block is Rs. 88.34 lakhs, the depreciation written off being Rs. 24.54 lakhs. Current assets and loans and advances total Rs. 72.08 lakhs, thus falling short of current liabilities and borrowings by about a third.

The New Satgram Colliery remained the main producing unit and raised 56 per cent of the total raisings. The output was obtained by exploiting and depillaring operations of Bogra and Satgram seams. A new pit is now coming up and simultaneously planned to the assisted siding and to raise all the coal of Bogra and Satgram seams from this pit. Production from the New Jamuria Colliery increased considerably, though cost of production remained high, consequent upon the installation of a large number of plants and machineries at substantial investment of capital funds output at the New Majri Colliery acquired towards the close of 1962. This colliery was producing grade III coal which was upgraded to the second grade in October 1963. A new licence was obtained for an annual production of 98,000 tonnes of coal and a further application seeking permission to raise the production to 30,000 tonnes per month has been made. Production at the South Jayramdanga Colliery decreased on account of depillaring permission being withheld in Manoharbabal seam where working places were not sufficient. Depillaring of Lower Dhadka seam, however, was completed and raisings were discontinued from this seam at the end of the year. The industrial licence in respect of the New Satgram Engineering Works is under active consideration. Meanwhile, it has been decided to set up a structural workshop with a capacity of about 1,200 to 1,500 tonnes per annum.

It will be recalled that the Company was permitted to raise additional capital by the issue of equity shares. The Directors inform that the issue could not be proceeded with, in view of uncertain market conditions. The shares will now be issued at the appropriate time after underwriting arrangements are made which are expected to be completed shortly. The Company has also applied to the West Bengal Financial Corporation for a loan.

The current market quotation for Rs. 100 paid ordinary shares of the Company is Rs. 118 *cum-div.* On an *ex-div.* basis, the net yield per annum works out to 7.3 per cent.

CALTEX OIL REFINERY (INDIA) LTD.

The processing operations of Caltex Oil Refining (India) Limited during the year ended 31st December, 1963 were quite encouraging, although throughput was still limited to the extent to which licences for the import of crude oil were available. The Company was able to process as much as 7,771,988 barrels of crude as against 7,079,023 barrels in the previous year. But the income from refining which had dropped from Rs. 355.50 lakhs in 1961 to Rs. 262.55 lakhs in 1962, remained almost stagnant at Rs. 263.01 lakhs in the year under review. The gross profit has further fallen from Rs. 146.34 lakhs in 1962 to Rs. 141.46 lakhs during 1963, while net profit has increased from Rs. 1.61 lakh to Rs. 17.76 lakhs. The increase in net profit has been mostly due to a lesser provision of Rs. 34.25 lakhs for taxation as against Rs. 54.18 lakhs surplus left is Rs. 17.12 lakhs.

The year 1963 stands unique in the history of the Company in that, for the first time since its inception in 1957, it decided at an Extraordinary General Meeting held on 12th December, 1963 to pay a dividend of 10.58 per cent on paid-up share capital; this has been distributed out of prior years' tax-free profits. An amount of Rs. 47.60 lakhs was paid out of Reserve No. 1 and Reserve No. 2 created last year. A sum of Rs. 40.00 lakhs was utilised from Reserve No. 1 representing profits exempt from tax under Section 15C of the Income Tax Act, 1922 and an amount of Rs. 7.60 lakhs out of Reserve No. 2, representing profits exempt from tax under Sections 84 and 101 of the Income Tax Act, 1961. A balance of Rs. 42.4 lakhs which was left in Reserve No. 2 has also been declared as another tax-free dividend at the rate of 9.42 per cent on paid-up equity share capital of the Company.

The Company has now converted all its accumulated profits till date into a "General Reserve" to which a sum of Rs. 492.67 lakhs has been appropriated in the following manner:

a) The balance of the profits of the year ended 31st December, 1963, namely, Rs. 17.12 lakhs, together with the balance of Rs. 333.49 lakhs in the Profit and Loss Account of 1962.

b) An amount of Rs. 6.33 lakhs from the Development Rebate reserve representing excess accrual of Development Rebate reserve as on 31st December, 1963.

c) A sum of Rs. 135.73 lakhs from the Tax Equalisation Reserve.

The entire paid-up capital of Rs. 450 lakhs in Equity shares of Rs. 100 each is held by the California Texas Oil Corporation and its nominees and the Company's Reserves and surpluses amounted to Rs. 621 lakhs. Secured loans representing 54 per cent 1966-70 debenture-stock and unsecured loans from Caltex (U.K.) Limited, stood at Rs. 200 lakhs and Rs. 400.70 lakhs, respectively. The total capital, that is, the aggregate of the borrowings and the "own funds," employed in the business of the Company, amounted to Rs. 16.71 crores. The gross block as shown in the books is at Rs. 14.79 crores and, after the deduction of depreciation value of Rs. 5.70 crores, has been written down to a net of Rs. 9.09 crores. With the total of current assets standing at Rs. 8.35 crores and current liabilities at Rs. 0.73 crore, the net assets work out at Rs. 7.62 crores.

The following table gives an account of the Company's progress since the year 1960:

(In lakhs of rupees)

Particulars	For the year ended 31st December			
	1963	1962	1961	1960
Income from refining	263.01	262.55	355.50	346.52
Other income	7.41	7.18	7.75	17.38
Materials and stores consumed	20.30	20.56	20.51	17.28
Power charges	11.03	10.17	10.51	10.22
Staff expenses	53.59	48.82	49.46	59.08

To other reserves	350.60	00.00		52.87
Carry forward	..	333.49	422.81	312.71

The Company has commenced the production of Liquid Petroleum Gas under the trade name of "Calgas," licence for which was obtained last year. The Company is also expecting Government sanction for the expansion of the Visakhapatnam Refinery. The duty protection on diesel and fuel oils was relinquished by the Company on 1st April, 1963 under the Refinery Agreement. Though this has represented a loss to the Company to the extent of Rs. 76 lakhs, it is a corresponding gain to the Government. The duty protection on motor spirit, it may be recalled, was surrendered by the Company as early as 1st October, 1959.

Efforts to Indianise the personnel in the Company have been continued during the year 1963 and the number of expatriate staff has been further reduced from six to four, the total number of staff employed in the Company being 511, inclusive of foreign staff. Two Senior Indian employees are currently receiving training in the United Kingdom and two others are scheduled to participate in the Caltex Management Development Training Programme in the United States during the current year. The Management claims to have maintained excellent relations with the employees. During the year 1963 the Company chartered a 33,600-ton tanker of the Shipping Corporation of India. This chartering will result in a saving of foreign exchange.

Some of the striking contributions of the Company to India's economy during the year under review may also be noted here. These are:—1) Caltex tankers entered the Visakhapatnam port 119 times either to discharge or load products. This accounted for about 48 per cent of the total port tonnage and contributed Rs. 58 lakhs to the revenue of the port; 2) Charges paid for utilities to the local authorities amounted to Rs. 11 lakhs; 3) the Government collected nearly Rs. 29 crores on account of excise duty on the products refined by the Company; and 4) the Company has, in its endeavour to use indigenous products to the maximum extent, been able to reduce the number of its foreign purchase items to 5,240, as against 6,800 in the previous year.

MADRAS MOTOR AND GENERAL INSURANCE CO., LTD.

The progress of the Madras Motor and General Insurance Co., Ltd. (Chairman: Mr. T. S. Santhanam, Madras) has been so sustained that the company, which was established as late as in 1950, now ranks, in terms of premium and total assets, twelfth among the general insurance companies in the country. From the point of view of net profits, Madras Motor's position is even better; it ranks fifth, according to the *Indian Insurance Yearbook* 1963, which relates to the year ended 31st December 1962. The Company was underwriting only motor insurance up to 1959. Fire, marine and other classes of business were added to its portfolio thereafter, so that today it is a fledged general insurance company doing every class of general insurance business.

Motor insurance, of course, continues to be the mainstay of its business. Its fire insurance business is expanding fast as is evident from the fact that the net premium has increased more than twelvefold, from less than a lakh of rupees in 1960 to Rs. 12.30 lakhs during the year ended 31st December 1963. Similarly, net marine insurance premium has jumped up from Rs. 41,000 to Rs. 3.47 lakhs. Net premium in the miscellaneous department, which also includes motor business, has risen from Rs. 37.96 lakhs in 1960 to Rs. 62.17 lakhs in 1962 and further to Rs. 68.30 lakhs in 1963. This is more than four times the combined net premium in the fire and marine departments.

Normally the profit position of a company that leans so heavily on motor business, which is notoriously unprofitable, should be precarious. But in the case of Madras Motor, such dependence has not affected profits which have actually been increasing steadily. Thus net profits (after taxes) increased from Rs. 6.70 lakhs in 1959, the year in which the Company became a full-fledged general insurance company, to Rs. 10.24 lakhs in 1961, Rs. 10.95 lakhs in 1962 and a record high of Rs. 11.46 lakhs in 1963. This steady improvement in profit has enabled the Company to declare progressively rising dividends to shareholders every year. Thus it entered the dividend list in 1955, five years after it was founded, with a 10 per cent distribution to shareholders. It declared a record dividend of 21.5 per cent two years later, that is, in 1957. The proposed dividend for the year ended 31st December 1963 is only fractionally lower than the 1957 record of 21 per cent, as compared with the 18.5 per cent distributed in 1962. It is noteworthy that this higher dividend has been proposed on the increased capital of Rs. 40 lakhs, as against Rs. 30 lakhs in the previous year. The following table summarises the salient features of the working of the Company during the year 1963, with figures for the previous two years given for purpose of comparison.

(In lakhs of rupees)

	Year ended 31st December		
	1963	1962	1961
Fire:			
Net premium	12.30	5.94	2.78
Claims	4.43	0.84	0.36
Commission and expenses (net)	2.05	0.05	—0.05
Fire fund	6.15	2.97	1.39
Marine:			
Net premium	3.47	2.17	1.31
Claims	1.57	1.13	0.70
Commission and expenses (net)	0.78	0.25	0.03
Marine fund	3.47	2.17	1.31
Miscellaneous:			
Net premium	68.30	62.17	53.02
Claims	27.15	27.36	18.99
Commission and expenses (net)	20.63	18.05	13.98
Miscellaneous fund	34.15	31.08	26.51
Net profit	11.46	10.95	10.24
Provision for taxation	13.85	9.60	8.00
Dividend	6.43	5.55	6.23
	(21%)	(18.50%)	(20.75%)
Carry forward	0.12	0.38	0.35

As will be seen from the above table, net premium in the fire department rose from Rs. 5.94 lakhs in 1962 to Rs. 12.30 lakhs in 1963. The underwriting profit, however, was lower at Rs. 2.64 lakhs, as against Rs. 3.47 lakhs, thanks to the higher claims and commission charges. Reserves for unexpired risks amounted to Rs. 6.15 lakhs, being 50 per cent of net premium. In the marine department, net premium increased to Rs. 3.47 lakhs. Underwriting profit was higher at Rs. 78,000, as against Rs. 25,000 in the previous year. This was because of better claims experience. Reserves for unexpired risks aggregated Rs. 3.47 lakhs, that is, 100 per cent of premium. Underwriting profit in the miscellaneous department increased from Rs. 12.20 lakhs in 1962 to Rs. 17.45 lakhs in 1963, following the rise in premium income and lower claims ratio. The reserve for unexpired risks amounted to 50 per cent of premium income at Rs. 34.15 lakhs, as against Rs. 31.08 lakhs.

The net underwriting profit credited to the profit and loss account, after offsetting the loss in the marine department, amounts to Rs. 19.91 lakhs, an increase of Rs. 4.31 lakhs over the previous year. The net profit, after taking into account interest, dividends, rents, other receipts and miscellaneous outgo, as well as the provision of Rs. 13.85 lakhs for taxation, comes to Rs. 11.46 lakhs, as against Rs. 10.95 lakhs for the previous year. This amount *plus* the amount brought in and *minus* Rs. 78,000 paid as donation, leaves a balance of Rs. 11.05 lakhs for distribution. Of this, a sum of Rs. 4.50 lakhs has been transferred to general reserves. The proposed dividend will absorb Rs. 6.43 lakhs, leaving Rs. 12,000 to be carried forward.

The Company had, as on 31st December 1963, capital and reserves aggregating Rs. 1.09 crore, as against Rs. 89.76 lakhs a year ago. Of this total, capital accounted for Rs. 40 lakhs, departmental funds for Rs. 43.77 lakhs and other reserves for Rs. 25.62 lakhs.

INDIAN MERCANTILE INSURANCE CO., LTD.

A small rise in the combined net premium income, an improvement in claims experience and a handsome increase in net profit are disclosed by the statement of accounts of the Indian Mercantile Insurance Co., Ltd. (Secretary: Mr. C. M. Telivala, Bombay) for the year ended 31st December 1963. The combined net premium in all the three departments has gone up during the year to Rs. 48.90 lakhs, a rise of Rs. 2.37 lakhs as compared with 1962. The higher premium is mainly accounted for by the miscellaneous department; the rise in premium in the other two departments (fire and marine) is only fractional. The overall claims ratio has declined from 43.2 per cent in 1962 to 42.7 per cent in 1963. Commission and expenses are substantially lower at 39.5 per cent, as compared with 43 per cent. Consequently, both the underwriting profit and the net profit after making provision for taxation are higher at Rs. 7.80 lakhs and 5.09 lakhs, respectively, as against Rs. 5.73 lakhs and Rs. 4.00 lakhs. Thanks to the improvement in net profit, the dividend has been stepped up by 1 per cent to 16 per cent (Rs. 8 per share of Rs. 50 paid-up) subject to tax. The following table summarises the working results of the Company for the year ended 31st December 1963, as compared with those for 1962 and 1961.

(In lakhs of rupees)

	Year ended 31st December		
	1963	1962	1961
Fire:			
Net premium	25.73	25.15	22.29
Claims	9.41	8.48	6.67
Commission and expenses	10.33	11.12	9.84
Underwriting profit or loss (+) or (—)	+5.88	+4.20	+4.34
Fire fund	12.87	12.57	11.15
Marine:			
Net premium	6.98	6.82	7.86
Claims	4.48	5.25	6.08
Commission and expenses	2.14	2.11	2.24
Underwriting profit or loss (+) or (—)	+0.30	+0.59	—0.05
Marine fund	6.98	6.82	7.86
Miscellaneous:			
Net premium	16.18	14.56	13.62
Claims	7.00	6.34	5.52
Commission and expenses	6.85	6.76	6.08
Underwriting profit or loss (+) or (—)	+1.62	+0.94	+0.66
Miscellaneous fund	8.09	7.28	6.81
Net profit	5.09	4.00	6.65
Provision for taxation	5.75	4.25	Nil
Dividend	3.88	3.17	2.54
	(16%)	(15%)	(15%)

The rise in underwriting profit in the fire department has been due to lower commission and expenses which have offset the higher claims ratio to yield a surplus of Rs. 5.88 lakhs, as against Rs. 4.20 lakhs in the previous year. In the marine department, claims as well as commission and expenses are lower. But as a result of the net increase of Rs. 16,168 in reserves, the accounts show only a smaller underwriting profit of Rs. 30,115, as against Rs. 58,773. Reserves for unexpired risks have been maintained at 100 per cent of premium. Net premium in the miscellaneous department as noted above recorded a sizable increase from Rs. 14.56 lakhs to Rs. 16.18 lakhs. The claims are a shade lower at 43.3 per cent, as against 43.5 per cent in 1962. Commission and expenses have declined by 4.2 per cent to 42.3 per cent. The underwriting profit, after maintaining the reserves for unexpired risks at 50 per cent of premium, amount to Rs. 1.62 lakh, as against Rs. 0.94 lakh.

The departmental contribution to the profit and loss account aggregates Rs. 7.80 lakhs, as against Rs. 5.73 lakhs in the previous year. After taking into account the income from interest dividends, rents and miscellaneous receipts and providing expenses not attributable to any particular account, the profit (before taxation) amounts to Rs. 10.84 lakhs. Of this, Rs. 5.75 lakhs have been transferred to the taxation reserve and Rs. .5 lakhs to the dividend reserve from which will be paid the dividend of 16 per cent which will absorb Rs. 5.75 lakhs.

As a result of the year's operations, the reserves and funds of the Company have increased by Rs. 5 lakhs to Rs. 77 lakhs as on 31st December 1963. The total comprises paid-up capital of Rs. 21.15 lakhs, departmental funds of Rs. 27.94 lakhs and reserves of Rs. 28 lakhs.

T.E.L.CO. TO ISSUE FURTHER CAPITAL

The Directors of the Tata Engineering and Locomotive Co., Ltd. have maintained the ordinary dividend for the year ended 31st March 1964 at the previous year's level of 14.5 per cent (subject to deduction of tax and subject to relief under Section 84 of the Indian Income-tax). But the dividend is on a higher capital. In January 1963, it will be recalled, the paid-up capital of the Company was raised by issuing right shares (in the ratio of one new share for every four held) at a premium of Rs. 50 per share. The Company's performance has been highly encouraging. The total turnover has spurted to Rs. 51.51 crores (including excise duty recovered amounting to Rs. 4.89 crores) from Rs. 43.64 crores (including excise duty recovered amounting to Rs. 3.76 crores) in the previous year. The gross profit amounts to Rs. 664.78 lakhs, against Rs. 550.03 lakhs. The provision for depreciation is Rs. 260.53 lakhs (Rs. 222.53 lakhs for 1962-63) and that for taxation (including surtax) is Rs. 200 lakhs, as against Rs. 184.50 lakhs. The net profit works out to Rs. 204.25 lakhs, as against Rs. 143.00 lakhs. A sum of Rs. 68.10 lakhs (Rs. 27.47 lakhs for 1962-63) has been transferred to development reserve. The balance of Rs. 136.15 lakhs, together with Rs. 8 lakhs drawn from General Reserve No. 1 and the balance of Rs. 15,000 brought in, gives a total of Rs. 144.30 lakhs available for distribution. Appropriation to dividend reserve is Rs. 144 lakhs, leaving Rs. 30,000 to be carried forward.

The Directors of the Company have recommended the issue of 200,000 ordinary shares of Rs. 100 each this year at such premium not exceeding Rs. 50 per share as the Controller of Capital Issues may prescribe and as may be agreed to by the Directors. They expect to maintain the dividend at 14.5 per cent on the increased capital.

A NEW NYLON PROJECT

The Bombay firm of Arthur Import-Export Company has concluded a collaboration agreement with the Invest Export of Berlin (East Germany) for the installation of a nylon manufacturing plant in Bombay. The licensed capacity of the proposed plant is 1.095 tons or 2.45 million lbs. per annum. The total capital outlay on the project is estimated at Rs. 4 crores. The East German government has agreed to supply the plant and equipment valued at Rs. 2 crores on long-term deferred payment basis. The balance of Rs. 2 crores will be met by contributions from promoters and their friends, as well as the various credit institutions, and proceeds from a public issue. A public limited company, called Bombay Nylon Spinners Limited, is being formed. The Company is expected to enter the capital market with a public issue for about Rs. 50-60 lakhs early next year.

The German firm has contracted to supply the latest plant and equipment for the nylon project. Shipments of machinery are likely to commence by the end of 1965 or early in 1966 and will be completed in six months. The factory is expected to go into commercial production by the end of 1966. The necessary technical know-how is being provided by the German firm and the services of their several engineers would be available for the running of the plant.

The proposed unit, which is the third one licensed so far, is bigger than the two existing plants. Large quantities of nylon yarns and fibres are presently being imported. But they are very much short of actual requirements. The Planning Commission had originally fixed a target for the production of nylon at 10 million lbs. per annum to be achieved by the end of the third Plan (March 1966). As against this, the capacity that has already come into existence is no more than 2-3 million lbs. The requirements of nylon for the manufacture of fabrics, hosiery goods, parachutes, automobile tyres, fishing nets, belting cords and ropes have now been re-estimated at 62 million lbs. by the end of the fourth Plan. Looking to the ever-increasing production of nylon in the highly developed countries of Europe and Japan, India's requirements of nylon may well exceed this quantity, what with the rising standards of living and increasing population.

INDIAN ENGINEERS LIMITED

The Government of India and the Bechtel, International Corporation of San Franscisco (U.S.A.) have agreed jointly to form an engineering company, to be known as Indian Engineers Limited, to design, undertake engineering construction and management services for a broad range of industrial projects in the public as well as private sectors. The memorandum of understanding was signed at New Delhi by Mr. K. R. Damle, Secretary of the Union Ministry of Petroleum and Chemicals, on behalf of the Government of India, and Mr. R. M. Dorman, on behalf of the Bechtel International Corporation.

The new Company will provide engineering services in connection with petroleum refineries, oil field development, oil and gas pipelines, petro-chemical facilities, chemical intermediates and other industrial programmes. Messrs. Bechtel International Corporation are engaged on a world-wide basis in performing engineering services for similar projects and are able to contribute to the new company a wide range of technical resources and personnel. The Indian Engineers Limited will employ engineers from India and the United States. The American firm has also undertaken to train selected Indian personnel of the Company at its offices in the U.S. and elsewhere.

Notices

RESERVE BANK OF INDIA

APPLICATIONS ARE INVITED FOR THE posts of Junior Officers Grade II (on probation) in the Bank in the scale of Rs. 375-20-535-25-560-EB-25-660-30-720.

Note: Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scale.

In addition to pay, the selected candidates will be eligible to draw local pay at 10 per cent of the pay rounded off to the next higher complete rupee when stationed at Bombay, Calcutta, Madras, New Delhi, Kanpur, Ahmedabad, Bangalore and Hyderabad and dearness allowance at prescribed rates. The present rate is 20 per cent of pay with a maximum of Rs. 100 *per mensem*. In addition they will be eligible for house rent allowance at 15 per cent of pay with a minimum of Rs. 60 per mensem.

QUALIFICATIONS:

Applicants should have a good academic record and possess a first or high second class Bachelor's or Master's degree in Science, Arts or Commerce of a recognised Indian or Foreign University. Practical banking experience in a commercial bank will be considered as an additional qualification. Preference will be given to those who have passed the Institute of Bankers' Examination.

THE SELECTION BOARD WILL INSIST ON A VERY HIGH STANDARD OF SUITABILITY IN MAKING SELECTIONS FOR THE ABOVE POSTS AND ONLY THOSE CANDIDATES WHO POSSESS HIGH ACADEMIC QUALIFICATIONS AND/OR ADEQUATE EXPERIENCE OF THE TYPE SPECIFIED ARE ADVISED TO APPLY.

AGE LIMIT AS ON 1st AUGUST 1964:

Between 21 and 25 years. The maximum age limit is relaxable but not beyond 30 years in the case of:—

(i) candidates possessing special qualifications and experience of value to the Bank;

(ii) ex-employees of banking institutions whose services had to be terminated for reasons of economy or as a result of the banks going into liquidation;

(iii) personnel retrenched from Government offices after at least one year's service applying through Employment Exchanges; and

(iv) candidates belonging to the Scheduled Castes or Scheduled Tribes.

2. Applicants for the above post must remit with their application a fee of Rs. 7.50 by cheque or bank draft on a *Scheduled Bank* payable at Bombay or by Postal Order. *The application fee is in no case refundable.* In the case of candidates belonging to Schedule Castes/Tribes, the fee will be reduced to one-fourth.

3. Applications in the candidate's own handwriting in the prescribed forms obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Hyderabad, Trivandrum, Lucknow, Patna and Jaipur accompanied by copies (originals should *not* be sent) of certificates regarding age and educational qualifications, statements of marks secured in the Graduate and Post-Graduate degree examinations and copies of two testimonials should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1, so as to reach him on or before the 1st August 1964.

4. Candidates already in service will be required to produce a proper discharge certificate from their employers in the event of their being selected at the time of their appointment in the Bank's service.

5. Candidates belonging to Scheduled Castes/Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

6. Candidates must be prepared to serve in any office of the Bank in India or group of departments to which they are posted, and to undertake tours when required.

7. Selected candidates will have to appear for interview/s before the Selection Board at any of the Bank's Offices.

8. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

9. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due." Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

10. Canvassing in any form will be regarded as disqualification.

THE BRITANNIA BISCUIT COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT THE Annual General Meeting (being the 73rd Ordinary General Meeting) of the Shareholders of the Britannia Biscuit Company, Limited, will be held at the registered office of the Company, 15, Taratola Road, Calcutta-53, on Thursday the 20th August, 1964, at 10 a.m. for the following purposes:

1. To receive and consider the Report of the Directors with Statement of Account and Balance Sheet, and to read the Report of the Auditors thereon.
2. To declare Dividends.
3. To elect Directors.
4. To appoint Auditors and fix their remuneration.

The Share Transfer Books of the Company will be closed from the 5th August to 20th August, 1964, both days inclusive, and warrants for such Dividends as may be declared will be issued directly to the Registered Shareholders or their mandatees whose names appear in the Company's Books on the 20th August, 1964, on or after the 31st August, 1964.

By Order of the Board,
A. P. CHANDA,
Director and Secretary.

15, TARATOLA ROAD,
CALCUTTA, *3rd July*, 1964.

Note: A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member of the Company.

DALMIA CEMENT (BHARAT) LIMITED

Registered Office: DALMIAPURAM

NOTICE IS HEREBY GIVEN THAT THE Board of Directors of the Company have decided to implement the Scheme for Conversion of the Deferred shares into Ordinaries in the ratio of 4:1, which has already been approved by the shareholders and Madras High Court, with effect from 1st July, 1964. For this purpose, the Registers of Members and Share Transfers of the Company will remain closed from 28th July to 8th August, 1964, both days inclusive. Ordinary shares in lieu of the Deferred shares of this Company will be issued in accordance with the provisions of the Scheme to the registered holders of the Deferred shares as on 8th August, 1964.

By Order of the Board,
S. C. AGGARWAL,
Secretary.

Dated: 1st *July* 1964.

THE BANK OF INDIA LIMITED

Registered Office:
70-80, Mahatma Gandhi Road, Bombay 1

NOTICE IS HEREBY GIVEN THAT THE Share Transfer Books and Register of Members of The Bank of India Ltd. will be closed from Tuesday, the 28th July, 1964, to Friday, the 14th August, 1964 (both days inclusive).

The Dividend will be payable on and after Tuesday, the 25th August, 1964.

By Order of the Board of Directors,
T. D. KANSARA,
General Manager.

To dividends (taxable) R.C. preference	18	18
,, ,, ordinary	4,50	5,40
	(15%)	(18%)
Carry forward	24	25

Extracts from the Directors' report: *General*: The total output during the year dropped to 95,083 tonnes from 98,789 tonnes produced during the previous year. The drop in Silica production by about 7,000 tonnes compared to last year was the main factor. As stated in the Directors' last report, due to technological changes in the Steel Industry, the demand for Silica is diminishing. The modernisation programme in the old firebrick section has not yet been completed but the Company has been able to achieve a higher production in the firebrick section. The total sale value has decreased from Rs. 2.26 crores in 1962 to 2.08 crores in 1963.

The Board has been exploring various avenues to diversify production and negotiations have reached an advanced stage for the acquisition of foreign collaboration and technical know-how.

The question of re-construction of Tunnel Kiln No. 1 will be finalised in accordance with plans to be formulated after the completion of these negotiations.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	34,00,000	Gross block	1,78,57,945

Low	126.00	125.00 161.00

† Upto 3rd July 1964.

Extracts from the Directors' report: The costs of production during the year under report have considerably risen for the textile industry as a whole on account of general increase in prices. An additional burden of Emergency Risk Insurance charges was imposed during 1963. The increase in prices of cloth has, however, resisted due to the voluntary price fixation scheme.

A large carry-over of stocks of finished products was brought from the year 1962 due to the unavoidable circumstances as reported last year. The stocks were effectively reduced only in the latter part of 1963. This added to the burden of interest and also brought strain on the working capital.

The machinery and some of the other entitlements accrued against exports have been retained by the Company for importing machinery for Bimal Mills. Hence the amount of export incentive shown in the profit and loss account is estimated on a conservative basis. This has also apparently effected the working results of the Company for the year under report.

The above factors reflected adversely on the working results of this Company. However, the Directors are of the opinion that having regard to the above circumstances the results have been satisfactory.

Loan from National Industrial Development Corporation: The last instalment of Rs. 2.18 lakhs out of the total loan of *Rs. 20* lakhs has been received from the said Corporation during the early part of 1964.

Progress of Bimal Mills: Since the Directors' last report, a loan of Rs. 98.33 lakhs from the Industrial *Finance Corporation* of India, New Delhi has been received, and also a sum of Rs. 58.93 lakhs has been raised by issue of shares for financing the Bimal Mills project. However as a consequence of increase in the cost of building materials, cement, iron and steel, import duty, central sales-tax, steamer and railway freight and the increase in prices of machinery and plant effected by the manufacturers, there is an overall increase in the cost of the scheme of Bimal Mills by approximately Rs. 44 lakhs. Such increase in cost of projects under construction has taken place in most cases in the country.

In order to meet the above shortfall the Company has applied to the Industrial Finance Corporation of India to grant an additional loan of Rs. 25 lakhs, and the Madhya Pradesh Financial Corporation, Indore, has also been approached for a loan of Rs. 20 lakhs. The Directors take pleasure in reporting that the M.P. Financial Corporation of Indore has consented to give the loan of Rs. 20 lakhs on certain conditions of which one is to obtain a guarantee for the loan from the Madhya Pradesh Government. The Company has already applied to the State Government and the matter is under active consideration of Hon'ble The Chief Minister and Hon'ble The Minister for Industries and Commerce. The Directors hope that the State Government will give consent to and expedite the guarantee for above loan, pursuant to their declared policy, and thus help one of the major new industrial undertakings in the State. In addition, some of the Directors have already agreed to advance by way of loan a sum of Rs. 4 lakhs for meeting the shortfall in the completion of the scheme of Bimal Mills.

The spinning section has partially commenced production from February 1964 and major part of spinning is already working two shifts. It is expected that the spinning section will go into full production in three shifts soon. It is proposed to market the yarn of Bimal Mills till the weaving section is commissioned. The weaving section buildings will be completed now, the delay mainly having occurred due to shortage of cement. All the weaving preparatory machinery and the 380 *Automatic Looms* have been received at site. It is expected that the entire weaving section will go into production by the end of this year.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	1,14,92,742	Gross block	2,45,57,288
Reserves and surplus	50,33,444	—Depreciation	1,45,01,268
Other liabilities	2,64,61,051		
		Net block	1,00,56,015
		Block in progress	6,88,786
		Expenditure for New Bimal Mills' unit	1,14,02,577
		Current assets	1,98,74,820
		Investments	4,86,210
		Cash	4,78,830
	Rs. 4,29,87,238		Rs. 4,29,87,238

* Paid-up capital consists of 60,000 ordinary shares of Rs. 100 each fully paid; 40,000 new equity shares of Rs. 100 each fully paid and 15,000—9¼ per cent. cumulative redeemable preference shares of Rs. 100 each. Calls unpaid on ordinary shares amount to Rs. 7,257.

Bharat Steel Tubes Ltd.

(*Managing Director*: Mr. Raunaq Singh.)

Registered Office: 14-15/F, Cannaught Place, New Delhi-1. *Works*: Ganaur, Punjab.

Fourth Annual General Meeting—Held on 30th June 1964.

Extracts from the Directors' report for the year ended 31st December 1963:

The Company has been engaged in the construction of the Factory and acquisition of necessary capital assets during the year under report. The statement of accounts disclose a loss of Rs. 1,649.

The authorised share capital of the Company was remodelled in so far as the equity capital was reduced to Rs. 1,60,00,000 from the original figure of Rs. 1,75,00,000 and the denomination was changed from Rs. 100 to Rs. 10 per share, while the preference capital was correspondingly increased to Rs. 40,00,000 from Rs. 25,00,000 as originally provided.

The Company, in order to raise the necessary funds, proposed to go for public issue. Although the Prospectus was signed on the 28th December, 1963, the shares were offered to the Public for subscription in the month of January, 1964.

The Company also arranged loans to the extent of Rs. 1,55,00,000 including Rs. 93.90 lakhs in U.S. currency, from Industrial Finance Corporation of India and U.S. Agency for International Development. The loan of Rs. 1,30,00,000 including dollar loan raised from Industrial Finance Corporation of India is repayable in 20 half-yearly instalments commencing from 20th December, 1966, whereas the loan of Rs. 25,00,000 from U.S. A.I.D. is repayable in five equated annual instalments commencing from 1st January, 1966.

The Company has acquired about 129 acres of land at Ganaur, (Punjab) for establishing its factory. The cost of the said land amounting to Rs. 2,42,460 has been deposited by the Company. The Company has also completed arrangements for the requirements of power and water for the Factory and its residential colony and the Directors are confident that the arrangements made are sufficient to meet present requirements of the Company.

A site office and godowns to facilitate the construction work have been built. The lay-out of the main factory buildings in accordance with the plans prepared by the Company's architects has also been taken in hand. Necessary technical staff required for the construction and operation has been engaged and posted at the factory site. The current year is witnessing the construction of the main factory buildings and good progress is being maintained.

The Company negotiated with M/s. Abbey Etna Machine Co., Perrysburg, Ohio, U.S.A. for technical and financial collaboration. The President of the said company together with his team of experts visited India in March 1963 to assess the feasibility of establishing the factory and to finalise the Collaboration Agreement.

The Company obtained clearance from the Capital Goods Committee of the Government of India for the import of *capital equipment* valued at Rs. 141 lakhs c.i.f. The necessary import licence for the import of this equipment has since been obtained. The order for the supply of complete plant, equipped with the world's latest manufacturing process of *Electric Resistance Weld* with *High Radio Frequency*, has been placed with M/s. Abbey Etna Machine Co., Perrysburg, Ohio, U.S.A. It is expected that the first lot of capital equipment would be received in time to enable the Company to have trial production in this very year.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	13,48,975	Gross block	4,85,907

,, ,, ,, equity	2,64	1,98
	(12½)	(9%)
Carry forward	4	9

Extracts from the Directors' report: *Production and sales*: The Company's production and sales reached new high levels in 1963. These were made possible by the integrated expansion, overall planning for production and careful adjustments in all spheres and directions. There was an all-round improvement in production operations. Taken together the total production reached a height of 81,000 tonnes as against that of 64,000 tonnes during 1962, marking an increase of approximately 17,000 tonnes or 26 per cent.

50 Years of Service: The year 1963 is significant in the history of the Company. It marks a period of half a century of services with aspirations and efforts, through hopes and frustrations, in troubles and turmoils, and finally, with profits and gains for progress and prosperity. To mark this golden jubilee the Company has launched another big project—Foundry unit No. 3 at Lohata (near Varanasi). It is again significant to point out that the activities of the Company spreads to another state—Uttar Pradesh.

Apart from other profitable considerations, creation of this additional capacity gives scope for larger production since the rated capacity of the existing two units has been reached.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	24,15,800	Gross block	22,85,407
Reserves and surplus	11,66,287	—Depreciation	9,04,048
Other liabilities	1,23,15,551		
		Net block	13,81,359
		Block-in-progress	97,631
		Current assets	1,36,45,696
		Investments	1,08,066
		Cash	9,84,881
	Rs. 1,58,97,638		Rs. 1,58,97,638

* Paid-up capital consists of 2,158—6 per cent. tax-free cumulative preference shares of Rs. 100 each and 2,20,000 equity shares of Rs. 10 each.

The annual installed newsprint capacity of the State-owned National Newsprint and Paper Mills is expected to be raised from 30,000 tons to 75,000 tons. The Government of Madhya Pradesh has sanctioned about Rs. 9 crores for carrying out the proposed expansion. With a view to improving the quality of paper, experiments are in progress for a new method of treating wood-pulp.

NEWS IN BRIEF

THERE has been a phenomenal increase in the number of advisory bodies to the Government of India since Independence. In 1947, there was only about a dozen of them whereas today their number is as large as 528.

India exported bicycles worth Rs. 51 lakhs during the financial year 1963-64, as against Rs. 10 lakhs in the preceding year. The export of bicycles constitute a third of the value of total exports of transport equipments. More than 40 countries imported Indian bicycles.

The Emergency Risks (Good) Insurance Scheme and the Emergency Risks (Factories) Insurance Scheme have been so modified as to provide for the automatic extension, by a further period of three months with effect from 1st July 1964, of the policies already issued under these two schemes. No premiums will be charged on these policies and no fresh applications will also be necessary for the renewal thereof.

The provisions of the Major Port Trusts Act, 1963, have been made applicable to the port of Mormugao with effect from the 1st inst. The first Board of Trustees under Section 4 of the Act has also been constituted. The Chairman of the Board of Trustees is Mr. L. M. Nadkarni. Besides the representatives of the various Central Government departments and the Union territory of Goa, Daman and Diu, there are also representatives connected with shipping, commercial and local interests on the Board.

The Union Government has appointed a Central Committee for Jute Development in the place of the Central Supervisory Body for Jute. The Committee will scrutinise the development programmes formulated by State Governments for jute and allied fibres, review progress of jute development and recommend measures to accelerate the tempo of development programmes. It will also suggest special schemes for improving quality of jute and other allied fibres, determining prices of jute and recommend steps to stabilise them.

The package plan district of Tanjore in Madras State may have its own seed production plant, if the scheme now before the Government of Madras, is sanctioned. The Ford Foundation has agreed to make an outright gift of the plant. The plant which is expected to be located at Tiruvarur, will turn out 30,000 mds. of seed per year. The Foundation has also agreed to set up seed production plants in the remaining 13 districts presently under the package programme of intensive cultivation in India.

Under an agreement signed at New Delhi on Monday this week between the Governments of India and Russia, the latter will provide financial and technical assistance for the sixth blast furnace complex at the Bhilai Steel Works. The furnace, which will have a capacity of 1,719 cubic metres, will manufacture foundry iron. The Soviet Union has also agreed to supply main equipment, besides assisting in the actual establishment of the furnace and coke battery. The foreign exchange component and technical assistance will be covered by the Indo-Soviet credit pact of February 1964.

The Governments of India and Japan have agreed to launch a joint programme to promote tourism in the two countries. The Union Minister for Transport has already held preliminary discussions with his counterpart in Japan. There is a plan to offer incentives to American tourists visiting Japan to induce them also to visit Thailand, Hong Kong and India. Similarly, European tourists visiting India will be induced, through proper incentives, to visit Japan and other Asian countries. The two coutries will also launch joint publicity campaigns in foreign countries to attract tourists.

The International Development Association has granted a loan equivalent to $33 million to India for the improvement of the telephone network. The credit will enable India to equip its telephone system to serve about 75 per cent more subscribers. Thus, the number of telephones will be increased from 460,000 to 810,000 and about 5,900 kilometres of coaxial cables will be added to the 470 km. that existed in 1961. The credit is for a 50-year period and carries no interest but a ¾ per cent service commission will be charged on unpaid amounts to cover administrative costs. Repayments of the principal will begin on 15th January 1975.

Anti-T.B. drugs for domiciliary treatment of patients are to be supplied free of charge to T.B. clinics throughout the country, set up with Central assistance under the second and third Five-year Plans. A provision of Rs. 25 lakhs was made for this purpose in the financial year 1963-64. A further amount of Rs. 50 lakhs is expected to be provided for 1964-65 and a like amount for 1965-66. T.B. clinics started outside the Plan provision are to be covered by another scheme under which the Union Health Ministry is expected to allocate Rs. 20 lakhs in each of the financial years 1964-65 and 1965-66 for a cost-free supply of drugs.

As many as 814 collieries were reported to have been working during the month of March 1964 with an average daily employment of 426,518 workers, the corresponding figures for the previous month being 808 and 437,010 (revised), respectively. Output of coal per man-shift was estimated at 1.35 tonnes for miners and loaders, .72 tonne for all workers below-ground and in opencast workings and at .52 tonne for all persons employed including above-ground workers as compared with 1.33, .71 and .51, respectively, for February 1964. The percentage of absenteeism was of the order of 13.11, as against 13.01. The overall cash earnings of the workers per week for the whole country was Rs. 26.73, the corresponding figures for Jharia and Raniganj fields being Rs. 26.35 and Rs. 26.90, respectively. The number of hours worked in a week in the whole country, Jharia and Raniganj fields are 48, 47 and 48, respectively, as against 48, 48 and 48 in the preceding month.

The Union Ministry of Steel and Mines is expected to place orders with two or three Indian technical consultant firms to carry out feasibility studies in a dozen selected areas for establishing blast furnaces to produce pig-iron, as part of a major programme drawn up by the Government to expand the production of pig-iron and steel in the fourth Plan period. The areas selected are in Maharashtra, Andhra Pradesh and the coal and steel belt of Eastern India. The proposed blast furnaces will, of course, be in the public sector, but the Government has also given licences to four private parties to set up similar furnaces with an aggregate capacity of nearly one million tons. One of the parties is believed to be the House of Birlas which has been given a licence for 300,000 tons and the remaining three parties being the iron-ore exporting firms of Goa.

With the arrival of new electronic data processing machines from the U.S. (the IBM 1401 system) at its headquarters in Baranagar, the Indian Statistical Institute now has one of the largest installations of electronic calculating machines in this country. As the total volume of survey and scientific data dealt with by the Institute has grown considerably during recent years, the IBM 1401 EDPM—with its modern transistorised high-speed system has been acquired to cope with the problem. The new machine is now being installed in the Research and Training School of the Indian Statistical Institute. The IBM 1401 EDPM will be used by the Institute for computer oriented training and research, processing of large-scale survey data, analysis of scientific experimental data, promoting operational research and other management techniques for increasing productivity by industries in private and public sectors, and also for economic studies relating to planning for national development.

* * * *

From Abroad

The number of unemployed in the U.S. jumped up by over one million to almost 4.7 million in the month of June 1964, owing to a large influx of students seeking summer work into the labour market. As a result, the seasonally adjusted unemployment rate rose by 2/5 per cent to 5.3 per cent.

Twenty-four out of 100 West Germans will "take another vacation—go travelling" if given a bonus of an extra month's pay (tax-free), according to a survey conducted by the EMNID Public-opinion-Polling Institute. About 20 out of every 100 persons will save the money, 13 will buy household appliances and 7 clothing.

The International Road Machine and Road Material Exhibition, organised by the Nordic Road Technical Association, will be held at Goteborg, in Sweden, from 11th to 18th June 1965. The prospective participants should apply before 1st February 1965 to The Secretary, "Vag 65," Kungsportsavenyn 2, Goteborg C, Sweden.

The U.S. House of Representatives has passed a $3,300-million Foreign Aid Appropriation Bill for the current fiscal year (July 1964-June 1965). The Appropriation voted by the House is, however, $200 million less than what had been sought by the President. The Bill has still to be finally voted in the Senate where it is currently being considered by the Foreign Relations Committee.

The total world production of rice (excluding Mainland China) touched a record of 159 million tons in 1963-64, as against the 153 million tons touched in the previous year, according to the Commonwealth Economic Committee. The rise is accounted for by Pakistan, Thailand, South Korea, Egypt and the U.S. There was, however, a slight decline in production in Japan, Indonesia and Brazil.

Insurance companies in Sweden are expected to raise their premium rates for motor vehicles from October next, following a heavy loss of well over Kr. 100 million suffered last year, due to an increase in the number of claims, higher cost per claim and rise in wages for staff. The actual increase will be 30 per cent in respect of compulsory third party liability and 20 per cent for motor vehicle insurance; it will be in addition to increases already effected but not fully operative.

The Government of the Republic of Mali has been authorised to draw from the International Monetary Fund a total amount equivalent to $9.9 million over the next twelve months. The arrangement is intended to support a comprehensive stabilisation programme which is being introduced by the Mali authorities. The Republic of Mali became a member of the Fund in September 1963, with a quota of $13 million. Up to now, it has not used the Fund's resources.

Japan's first major nuclear power station at Tokai Mura (150 MW plant), now being built for the Japan Atomic Power Company by the British General Electric Company of Japan, is in the last stages of construction work. The first nuclear chain reaction is expected before the end of the year. Fuel will be supplied by Britain under a £10-million contract to run initially for ten years. It consists of hollow rods of natural uranium metal sheathed in an alloy of magnesium.

Courtaulds of Britain will export to Soviet Russia viscose rayon, staple filament and tyre cord worth £6 million during the year 1965 under a contract signed between the Company and the Government of Russia. The contract represents only the first part of the Company's 1965 export programme. The second part is expected to be negotiated some time in October next. Courtaulds has sold in the past a number of fibre-making plants to the Soviet Union and other communist countries.

The Government of Pakistan has abolished the minimum export prices for jute during the 1964-65 season. An export prices check will, however, remain in operation, and the Government will watch the situation closely and, if necessary, it will not hesitate to reintroduce the minimum prices again. The quota system of exports will be maintained, linked to phase purchases in the internal market by shippers. The export price differential of Rs. 2 a ton in favour of the small shipper will be abolished. The Government has decided to set up a Committee in the Ministry of Commerce to make recommendations for the establishment of a jute price stabilisation fund.

The International Monetary Fund has approved a stand-by arrangement with the Government of Ecuador authorising drawings from the Fund of a total amount equivalent to $13 million over the next twelve months. The arrangement will provide continued support for the Government of Ecuador's financial programme, which is designed to consolidate internal and external stability and, at the same time, permit an acceleration in the pace of public investments. The new arrangement is the fourth successive arrangement which the Government of Ecuador has maintained with the Fund. It replaces a similar arrangement covering $6 million which expired unused on 30th June 1964. Ecuador's current outstanding drawings on the Fund amount to $2 million.

A decree issued by the Government of Spain—after many months of complaints from Spanish farmers and the steel industry—allows the simultaneous levy on goods dumped as well as countervailing duties on foreign subsidised exports to Spain. The decree follows the general lines of the G.A.T.T. agreement and defines dumping as imports "below normal value" in the country of origin while countervailing duties may be applied on products obtaining cash subsidies abroad, transport subsidies, unusually favourable production and export credits and special foreign exchange rates. However, no anti-dumping or countervailing levies will be applied unless dumping has a threatening effect on home industry or hinders the establishment of new industries. The Ministry of Commerce is to set up a special commission to handle each case individually.

The World Bank has granted a loan equivalent to $30 million to the Pakistan Industrial Credit and Investment Corporation Limited for providing medium and long-term finance for private industry. This is the Bank's fifth loan to the Corporation. It will provide the Corporation with about half the foreign exchange it will require until the end of 1965 for loans to new or expanding industries. The Bank loan does not have a fixed schedule for repayment or a fixed interest charge. Each part of the loan committed for a particular project will be repaid in semi-annual instalments according to a schedule determined at the time of the commitment. Interest will be applied to each portion of the loan at the Bank's rate prevailing when that portion is committed for one of the Corporation's projects. The loan is guaranteed by the Government of Pakistan.

PERSONAL

MR. Thomas E. Naughten of Washington has been appointed Deputy Director of the U.S. Agency for International Development in India.

Dr. D. R. Gadgil, Chairman, Maharashtra State Co-operative Bank Ltd., has been elected the first Chairman of the All-India State Co-operative Banks' Federation.

Mr. M. P. Pai, I.C.S., formerly Chief Secretary to the Government of Andhra Pradesh, assumed the Chairmanship of the Tariff Commission on the 1st inst.

Mr. K. M. Nanjappa, first Principal of the Staff Training College of the State Bank of India at Hyderabad, has taken over charge as General Manager of the Indian Overseas Bank Ltd.

Mr. T. T. Krishnamachari, Union Finance Minister, and Mrs. Indira Gandhi, Minister for Information and Broadcasting, left for London on Monday this week to attend the Commonwealth Prime Ministers' Conference.

Dr. B. K. Madan, until recently the Executive Director of the Reserve Bank of India, assumed charge as the Deputy Governor of the Bank on 1st July 1964. He has also been appointed Vice-Chairman of the Industrial Development Bank of India. Mr. P. C. Bhattacharyya, Governor of the Reserve Bank, is the Chairman of the Development Bank.

TREND OF MARKETS

TWO CASH LOANS

(From Our Own Correspondent)

BOMBAY, *8th July*

The notable event of the week insofar as the money market is concerned is the announcement of the second instalment of the Centre's borrowing programme for the current financial year. A further tranche of the following two loans has been offered:

4 per cent Loan 1970 at Rs. 99.00 per cent and repayable at par on 15th April 1970, and

4¾ per cent Loan 1989 at Rs. 100 per cent and repayable at par on 15th April 1989.

Subscriptions will be in the form of cash or cheque. They will be received from the 13th to 15th inst., but the subscription list may be closed earlier without notice as soon as the total subscriptions amount to Rs. 150 crores. The Government reserves the right to retain subscriptions upto ten per cent in excess of the notified amount.

The higher yield pattern of the new loans has been welcomed by market circles. The public response to the loans is expected to be quite good, the short-dated loan eliciting support from banks and the long-dated from institutional investors such as the L.I.C., Provident Fund and Trust. The announcement of the loan is well-timed. The money market is ruling distinctly easy. The market is flooded with funds, while the demand for credit is on a reduced scale. The inter-bank call rate (for both renewals and fresh money) is currently standing at as low as ½ per cent with lenders over, whereas, last week, it stood at 2½ per cent. The rate at Calcutta, too, has gone down in the past week from 1¾ per cent to ¾ per cent.

The distinctly easy trend of the money market is reflected in the sustained support elicited by the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 7th inst. The total amount offered was as large as that in the previous week, namely, Rs. 4.50 crores, as against Rs. 2 crores invited (and also accepted). The average rate of accepted tenders was lower at Rs. 2.500 per cent per annum, as against Rs. 2.995 per cent a week before. The Intermediate Treasury Bills also met with renewed support, though the amount of Bills actually sold from the 1st to 4th inst. was slightly lower at Rs. 6.70 crores, as against Rs. 7.60 crores a week before and Rs. 13.32 crores two weeks before.

In the context of the persistently comfortable money conditions, it is somewhat surprising that notes in circulation went up by Rs. 17.42 crores to Rs. 2,501.54 crores during the week ended 3rd July. There was practically no change in foreign exchange reserves which stood at Rs. 96.52 crores (as against Rs. 96.61 crores), balances held abroad accounting for Rs. 7.06 crores and foreign securities held in the Issue Department of the Reserve Bank for Rs. 89.46 crores. Loans and advances to scheduled banks declined by Rs. 83.95 lakhs to Rs. 30.50 lakhs. Their deposits with the Reserve Bank also declined by Rs. 5.60 crores to Rs. 92.07 crores.

There was a further drop of Rs. 10.74 crores (to Rs. 1,774.64 crores) in the total credit made available by scheduled banks to their clients during the week ended 26th June. Since, at the same time, deposits rose by a further Rs. 27.10 crores, the borrowings from the Reserve Bank fell by Rs. 3.56 crores to Rs. 1.23 crore, of which the share of those against usance bills was Rs. 56.15 lakhs (a fall of Rs. 2.06 crores). Total cash rose by Rs. 11.22 crores to Rs. 160.09 crores and investments by Rs. 21.57 crores to Rs. 655.03 crores.

Activity in the Gilt-edged market was considerably restricted during the week under review. Business put through was limited and values of both Central and State loans were unchanged.

In the foreign exchange market, the banks' buying rate for U.S. dollars rose by a further 25 nP to Rs. 476.25 per $100, while their selling rate was unaltered at Rs. 479.00. In New York, the pound sterling eased again *vis-a-vis* the dollar, the spot rate declining by 0.060 cent to 279.130-279.160 cents and the three months' forward by 0.50 cent to 278.770-278.800 cents.

GOLD RISES, SILVER FALLS

(From Our Own Correspondent)

BOMBAY, *8th July*

A divergent trend was witnessed in the bullion market during the week under review. While gold ruled firm, silver moved down due to resistance from buyers. Improved demand and lower arrivals helped gold to rise. Silver, which had elicited good support from buyers last week, shed its gains on larger arrivals. Over the week, it closed a rupee lower.

Fourteen-carat gold began the week 25 nP lower at Rs. 68, but steadily moved up to close at Rs. 69. Sovereign was fully steady at Rs. 92. Primary gold, in unofficial trading, moved between Rs. 118 and Rs. 121.

Silver opened slightly lower at Rs. 247.50 and gradually receded to close at Rs. 246.50. The daily average arrivals of silver were around 18 bars, as against 22 bars last week, but offtake was only about 6 bars.

At the London market, the international price for gold was a shade down at $35.07½ per fine ounce. The sterling price was also marked lower by ½*d.* at 251*s.* 3½*d.* Both ready and forward silver moved up by ½*d.* and ¼*d.* to 111¾*d.* and 112*d.* respectively. However, there was no change in New York silver which stood at 129.3 cents.

The Central Government has decided to allow exports of existing stocks of jewellery and other gold articles of over 14-carat purity abroad for six more months, that is, up to the end of December 1964, subject to the discretion of the Collectors of Central Excise. The Government has also permitted every certified goldsmith to possess primary gold worth 100 grammes, including unfinished forms of ornaments.

The Government-owned Hutti Gold Mines has announced that the price of gold of fineness 990 and above to be supplied to permit holders for industrial use would be Rs. 115 per 10 grammes plus sales tax. It is for the three-month period July to September 1964.

The following table shows the trend of prices during the week under review:

	8-7-64 (closing)	High	Low	1-7-1964 (closing)
SILVER				
Ready (996 fine) ..	Rs. 246.50	Rs. 247.50	Rs. 246.50	Rs. 248.00
GOLD				
Ready (14-carat) ..	69.00	69.00	68.00	68.25
Sovereign	92.00	—	—	92.00*
London—				
Gold	251*s.* 3½*d.*	251*s.*3½*d.*	251*s.*2*d.*	251*s.*3½*d.*
Silver Ready ..	111¼*d.*	—	—	111¼*d.*
Silver Forward ..	112*d.*	—	—	111¾*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

COTTON FUTURES DECLINE

(From Our Own Correspondent)

BOMBAY, *8th July*

The sagging tendency of cotton futures noted towards the close of last week persisted during the first half of the week under review, thanks to reports of clear weather in the cotton growing regions where there had been heavy rains in the last few days, weaker spot advices and persistent bull liquidation following the announcement regarding the early imports (about 360,000 bales) of additional cotton from the U.S. under P.L. 480. Values, as a consequence, continued their downward march. The fall in prices would have been more pronounced but for large-scale buying of fresh arrivals by some parties with a view to preventing a further sharp drop in prices. The downward trend was, however, halted on Monday when, on account of hectic bear-covering, cotton futures staged a recovery. The recovery gathered momentum in the subsequent sessions. Even so, the closing rates today were below those prevailing on Wednesday last week.

The Jarilla August contract began the week at Rs. 737.75, as against the previous close of Rs. 739.00, and drifted downwards to touch a low of Rs. 734 on the 3rd inst. After recovering on the same day to Rs. 741.15, the contract closed today, after alternate spells of buying and selling, at Rs. 738.25. The net loss over the week was 75 paise.

The spot market at Sewri remained listless. The removal of compulsory survey on Digvijay "A" cotton, though it was welcomed, did not have any perceptible effect on the market, as the total of only 100,000 bales of this variety (and also Surti) was said to have been unsold. These bales were reported to be of inferior types. Stray mill buying was confined as usual to selected lots of L. 147, 197-3, Laxmi and Jayadhar. Although there was demand from needy mills, there was some reluctance on their part to renew buying, since a good crop was anticipated next season following reports of satisfactory rains all round. The prices quoted for some of the popular varieties are as follows:

Anjangaon L.147 Rs. 1,365; 100 Hubli Laxmi Rs. 1,180; 100 Jagadia Rs. 1,200; 39 Khamgaon 0,394 Rs. 1,075; Bijapur Jayadhar Rs. 960; Dhulia CO2 Uncer Rs. 1,134; and Hubli Jayadhar Rs. 1,085.

This week was notable for two major developments; (*a*) announcement regarding the import of U.S. cotton (360,000 bales worth Rs. 21 crores), the first shipment of which was expected in the current month, and (*b*) the recommendations made by the Cotton Textiles Consultative Board, at its meeting held in Bombay on the 7th inst., for enforcing scheme of price and production control on popular varieties of cloth and decontrol of other varieties.

In the export section, there was no renewal of interest by Japan in the Bengal *Deshi* variety and the trade had been expecting a reduction in export duty on cotton, following a 50 per cent reduction by Pakistan on its cotton exports. But this expectation did not materialise. The only destinations which were showing moderate interest in this section included the United Kingdom and the Continental countries. It was felt in trade circles that, in the absence of any official decision concerning export duty, exports of Bengal *Deshi* might suffer. In the import section, the renewal of the rupee agreement with Egypt for imports at about 70,000 to 80,000 bales attracted attention. Local interests were understood to have sent bids for about 30,000 to 35,000 bales to be settled at any rate, due to an acute shortage of long-staple cotton in the country. It was believed that prices would be around Rs. 400 higher than in the previous season, in view of encouraging demand for these growths in Egypt.

The Committee of the Indian Cotton Mills Federation has proposed that the Federation should play an active role in promoting the grow-more-cotton campaign. A sum of Rs. 5 lakhs per year has been sanctioned, to begin with. The Committee has appointed a five-man Standing Committee to work out details of the Federation's Cotton Extension Scheme drawn up by a sub-Committee.

The Government of India (Ministry of Food and Agriculture, Directorate of Economics and Statistics) has announced the All-India final estimates of cotton for the season 1963-64. The area and production of cotton are put at 19.57 million acres and 5.49 million bales (of 392 lbs. each), respectively. As compared with the partially revised estimates of 19.38 million acres and 5.37 million bales for 1962-63, the estimates for 1963-64 show an increase of 184,000 acres, or 0.9 per cent in area and 119,000 bales, or 2.2 per cent in production. The current year's production of cotton is the highest on record.

PEPPER ADVANCES

(Messrs. Parekh and Co.)

BOMBAY, *8th July*

Malabar black pepper, which was otherwise languishing except for a period when there were purchases on account of East European countries, got inspiration during the week from the recent announcement by the Indonesian Government of the increase in the check price for Lampong A.S.T.A. quality at $0.38½ and for F.A.Q. quality at 28½*d.* As a consequence, ungarbled on the Coast rallied from Rs. 334 to Rs. 345 and garbled from Rs. 343 to Rs. 355. July delivery moved forward from Rs. 358 to Rs. 374 and August from Rs. 364 to Rs. 380. On the Bombay ring, *Shrawan* delivery improved to Rs. 383 from Rs. 362 and *Bhadrapad* to Rs. 388 from Rs. 369. The news from Indonesia acted as a short in the arm to grinders and traders who were haggling to buy even at the parity of $0.28. It is likely to act as a catalyst for the long awaited improvement in the tone of the market all over the world. The announcement regarding Lampong, seems to have been well advised and is so timely synchronised, when grinders' demand should generally start expanding. Autumn demand in the U.S.A. generally picks up after Independence day.

Despite the foregoing, it is very difficult to prognosticate the future trend of the market, as, owing to prolonged holidays in New York on account of Independence Day, no news as to its actual reaction on the market is available. It is, however, generally believed in the market that New York market will rally, as most of the pent-up demand is likely to come up as New York grinders and traders, as a rule, buy only on a rising market. They never buy in a declining one. When Indonesian exporters were pressing to sell at prices ranging from $0.28½ to $0.30 from June through August, there were no takers as the market was declining. As a result, there is every likelihood of small arrivals during July through August unless New York starts buying at the new price, as no sizable business is reported for June-July and July-August shipment with Indonesia except for speculative short sales. It is within the bounds of possibility that there will be shortage of spot material in New York, particularly when autumn demand is in the offing. The monthly average consumption during autumn in normal course exceeds 1,500 tons.

At the time of writing, however, spot in New York improved to $0.36, with trade awaiting development. Djakarta is reported to have been totally withdrawn as sellers. Only Singapore is reported offering small lots $0.36 for testing New York.

Singapore has improved for black from $M110 to $M115. London as far as Sarawak is concerned is nominally unchanged, but few sellers.

The future of pepper appears rosy for the coming couple of months, as the ready stock in New York is in strong hands. Left to themselves, they are likely to push up prices in expectation of good autumn demand and in view of the fact that replacing parity from India and Indonesia is comparatively higher.

Indonesia's pepper generally takes two months to arrive at New York. As such New York will have to look to India for its immediate requirements when necessary. The world's markets are caught by surprise by the action of the Indonesian Government. As bear positions all over the important markets are already created during the declining period, there are chances of development of short-covering by bears which will in all instances accelerate the world market sooner than expected.

WHOLE LEAF TEA STRONG

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, *2nd July*

A smaller quantity amounting to only 579,000 kgs. was offered in tea sale No. 26 held here on 30th June 1964. Nilgiri quality was often improved and from other districts it was maintained. There was good demand, but prices were irregular, particularly for the plainer kinds while competition for whole leaf grades was a strong feature. A limited selection of best liquoring Nilgiris was available and these came to a firm market, but the lesser kinds were dearer where quality was improved. Good medium brokens generally ruled firm as did their fannings, unless containing fibre. Medium brokens were irregular but generally about steady, although a few invoices were occasionally easier. There was less enquiry for their fannings when fibre was noticeable. Low medium brokens were irregular and sometimes tended lower, but their fannings encountered better support and were often a few paise dearer. Black leaf teas were sold well at around last rates whereas plainest descriptions were about steady. Whole leaf grades were a strong feature, particularly orange pekoes which were often very much dearer. Teas of unorthodox manufacture were barely steady.

The quotations (per kg.) were:—

	1964 Rs.	1963 Rs.
Low mediums	4.10-4.40	4.00-4.25
Mediums	4.30-4.60	4.25-4.45
Good mediums	4.60-5.10	4.45-5.20
Nilgiri B.O.P.	4.40-6.50	4.50-6.00

The average price realised in sale No. 26 was Rs. 4.35 per kilo, as against Rs. 4.31 a week ago and Rs. 4.24 in the corresponding sale last year.

In dust sale No. 26 held today, 312,000 kgs. came under the hammer. There was good general demand, Highgrowns came to a dearer market

where quality was improved. Good mediums were sold well, but mediums and low mediums were barely steady on last rates. Unorthodox descriptions were usually firm, but sometimes easier.

The average price realised in dust sale was Rs. 4.31 per kilo, as against Rs. 4.35 a week ago and Rs. 3.99 in the corresponding sale last year.

Colombo: In the sale this week just under 7½ million lbs. were offered and met with a good demand with best dimbulas and improved uvas dearer, but other highgrown brokens were firm. Best medium brokens eased 5 to 10 cents, but other medium descriptions and uvas were firm. Liquoring fannings were irregular and generally slightly lower whilst lowgrown types were steady.

London: North Indian and other growths: In Monday's auction, offerings mainly consisted of Africans which evoked good demand at fully firm prices.

Ceylon and South Indians: In Tuesday's sale, there was fairly good demand at irregular rates with plainest sorts easier.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire:

"*Sale No.* 27: 8,045,000 offered. Good general demand. Poorer low mediums and mediums 15 to 20 nP easier. Others slightly easier. Good mediums and highgrowns fully firm. Unorthodox tending easier. Whole leaf strongest feature."

MARGIN CURBS ON BANK ADVANCES AGAINST OILSEEDS

(From Our Own Correspondent)

BOMBAY, *8th July*

More than price movements and trends, interest in the oilseeds market was centred on the plea made by the Oilseeds Exchange and the Indian Oil and Produce Exporters' Association for an immediate ban on exports of edible oils and expeditious import of soyabean oil from the U.S. as a measure of checking the rise in prices. No one disputes the need to check the present trend of rising prices and everyone would welcome the import of soyabean oil, especially if the same could be got under P.L. 480; perhaps the U.S. is in a position to supply India as much oil as it wants, in view of a bumper soyabean harvest there. But the question is whether it is prudent to stop exports of oil completely and lose hold on our traditional markets, particularly at a time when rivals are trying to dislodge India from the position it has built for itself after years of strenuous efforts. One wonders if there are no other means by which a downward trend in prices could be effected.

Knowledgeable sources in the market assert that no useful purpose will be served by throwing away our overseas markets. Prices can be brought down, they point out, if the present incentives on exports are either done away with or suspended for some time. It is common knowledge that, with the facilities to import copra, palm oil and machinery against exports of oil and the enormous profit that can be made from these transactions, one would be ready and willing to pay any price for groundnut and other oils. These sources also say that the withdrawal of incentives will in no way affect exports of oil. Demand for oil from the U.K. and Continental markets is yet unfulfilled. They, therefore, argue that it would be good if incentives were withdrawn and the oils allowed to sell in world markets on their own merits.

While the market is awaiting the decision of the Union Government in this regard, the suggestion induced a nervous tendency in the market and prices, which were quoted at or a little below the ceilings, tended to sag. Marginal bulls liquidated their positions, with the result that castor futures which had shot up to Rs. 181.50 on Thursday eased to the week's low of Rs. 179.75 and closed at Rs. 180.25 on Wednesday. The Reserve Bank's directive that scheduled banks should impose margin restrictions on advances against the security of vegetable oils (including *vanaspati*) and raise the present margins on bank advances against other oilseeds also affected sentiment on Wednesday evening.

However, price movements in castor during the week were narrow indicating little interest on the part of operators. With the ceiling at its present level, there is unlikely to be any wide price movements, as no sensible operator would like to build up any short position worth the name.

The spot market was initially firm but reacted later in sympathy with futures. Sellers were eager to get rid of their stocks, but buyers were not ready to respond. Prices, as a consequence, generally shaded, with Madras Small at Rs. 36.12, Kanpur Bold at Rs. 35.12. Oil commercial ready and B.S.S. were very weak at Rs. 14.70 and Rs. 15.25, respectively.

Groundnuts were active in the beginning, but the volume of business here, too, tended to sag, as traders preferred to await the outcome of the plea for a ban on exports of oil before entering into fresh commitments. Prices eased with the decline in activity. Madras and Kanpur were quoted at Rs. 64 and Rs. 61.75, respectively. It is doubtful whether groundnuts can hold their levels if the Government imposes a ban on exports of oil.

Cottonseeds were extremely dull, as they have been for the past many days. At the time of writing, the September contract was quoted at Rs. 104. There were no transactions in the July contract today. Even on other days, turnover was negligible. The same was more or less true of linseeds and, with the contract hovering around the ceiling of Rs. 44.62, it was no wonder that the volume of trading was very small. In the maturing cottonseed July contract, tenders for 50 tonnes were issued. The market was dull and tenders had by no means been good.

The following table shows the closing prices of oilseeds and oils as on 8th July as compared with those of the two previous weeks.

	8-7-1964	1-7-1964	24-6-1964
	Rs.	Rs.	Rs.
Groundnuts			
Nizam bold	63 25	63 25	61 25
Khandesh quality	64 50	64 50	62 00
Oil ex-mill	25 25	25 25	24 25
Oil Rly. Receipt	24.50	24.80	23.80
Castorseed			
September 1964 contract	180 25	181 50	179.75
Ready Madras	36 12	36 75	35 12
Ready Kanpur	35 12	35 62	34.12
Oil B.S.S.	15 25	15 80	14.75
Oil commercial	14.70	15.30	14.15
Linseed			
September 1964 contract	44 62	44 75	44.62
Bold ready	47 75	47 50	46.25
Linseed oil	19.65	19.40	19.10
Cottonseed			
September 1964 contract	104.00	103.00	103.00

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

ART SILK YARNS EASY

(From Our Own Correspondent)

BOMBAY, *8th July*

Distinctly easy conditions prevailed in the yarn market during the week under review. The easiness of art silk yarns was due to improved supply position and poor offtake by mills. Cotton yarns encountered some selling and tended to look down. Staple fibre yarns were neglected. It was reported that the 19-day old power cut in South India had been lifted. But this report had no effect in the market.

Among art silk yarns, National Rayon 150D lots 6 nP to Rs. 11.18. 120D fell by 17 nP to Rs. 11.97. South India Viscose 150D dropped 26 nP to Rs. 14.17. Bright Century 75D receded by 35 nP to Rs. 18.70.

In the staple fibre yarn (2 x 34) season, Century was dull at Rs. 9.64. Kohinoor lost 18 nP to Rs. 9.90. However, City put on 22 nP to Rs. 9.42 on special support.

Cotton yarn 12s Modern was neglected at Rs. 24. 22s Madura fell by Re. 1.50 to Rs. 31.50. 68 Mahindras eased by a like amount to Rs. 90.

The plea of traders for the resumption of forward trading in staple fibre yarn was renewed by Mr. Kantilal Nahalchand, President of the Bombay Yarn Merchants Association, in his speech at its annual general meeting held recently. He said that the production of staple fibre yarn, which was 20,000 bales per month last year, had increased to 30,000 bales this year and production of raw staple fibre was also likely to increase from 90 tons per day of last year to 130 tons this year. On account of the ban on forward trading of staple fibre yarn and the blanket ban on the import of rayon yarn for the last five years, he added, many had been rendered unemployed and the trade in the market had dwindled to a considerable extent. He, therefore, urged the Central Government to lift the ban on forward trading without much delay.

SUSTAINED DEMAND FOR TEAS

(From Our Own Correspondent)

CALCUTTA, *7th July*

Good demand featured yesterday's export sales as well as the internal auctions last week. So far, the price trend has been below expectations, and is below last year's levels. The general belief that there would be more tea offering in world markets as compared with that in the last year has been strengthened by the estimate of the U. S. Department of Agriculture that world tea production this year would total 2,326 million lbs. representing a rise of 2 per cent as compared to that in 1963. This expectation rules out any possibility of prices rising at any rate above last year's levels, unless a significant spread of the tea drinking habit all the world over takes place. This prospect is difficult of materialisation as in the more advanced countries tea is being considered as the poor man's drink; the younger generation has been reported as preferring more stimulating and exciting drinks! U. S. imports of tea in 1963 fell to 126 million lbs. from 130 million lbs. in 1962. This points to a need for promotion campaigns in favour of tea in the United States. An encouraging sign of U. S. consumers' interest in tea is indicated in the huge order for tea strainers which India has received following India's participation in the World Fair recently held in New York, a reference to which was made by Mr. Manubhai Shah, the Union Commerce Minister. U. K. imports of tea in 1963 were 563 million lbs. as against 6 million lbs. in 1962 which shows that the British consumption has been just maintained.

An encouraging news this week has been the announcement by the Japanese Government of its decision to raise the import quota for black tea by the equivalent of 50 per cent of the annual increase in the domestic demand, to enable developing countries to increase their exports of primary products. This decision reverses the restrictive policy hitherto pursued by Japan in regard to black tea imports in order to accord protection to domestic growers.

In the internal auction held here in the last week, dusts on offer aggregated 8,011 chests. The early first flush Assam C.T.C. teas and plainest orthodox teas were easier, but the remainder of offerings met with a strong general demand. The best Assam C.T.C. teas were a strong feature, and prices recorded a liberal addition. No quotations were issued in view of the limited quantity on offer of representative teas. Offerings during yesterday's export sale aggregated 35,598 chests, which met with a fair demand. The quotations per kilogram (in rupees) inclusive of excise duty were: best Assam C.T.C. fannings Rs. 7.20 to 8.20; medium Assam C.T.C. B.P. 5.50 to 6.50: best Assam C.T.C. B.P. 7.20 to 8.20: medium Assam C.T.C. fannings 5.60 to 6.50; clean plain pekoe 5.20 to 5.40; plain fannings 4.30 to 4.40; and plain B.P. 4.40 to 4.60. Whole leaf grades were sold well, and the few tippy teas on offer met with better support than that last week. Keen competition was offered to the attractive flavoury Darjeelings, with prices recording higher levels. Other Darjeelings were steady and buyers followed quality. Plain orthodox teas gave to an easier trend, while "teas for price" were unchanged at around last levels. Doars and Assam orthodox varieties were quiet. In C.T.C. teas, the few selected brightest liquorings met with increased support, but others were irregular.

JUTE GOODS BETTER

(From Our Own Correspondent)

CALCUTTA, *7th July*

Increased support explained the slightly steadier conditions that were in evidence in jute goods during the week under review. Reports of heavy rains and the subsequent inundation, coupled with the expectation of the issuance of a purchase quota for the current month, lent a hardening tendency to new crop raw jute prices. It is expected that the new crop would arrive earlier than usual and, against the background of this expectation, the remainder of the crop still available in the market, about 420,000 bales of low-grade fibre, would be difficult to be disposed of. These would have to be channelled to other uses, that is, in the making of twines and ropes. The compulsory purchase quota issued by the Jute Commissioner for the period ended 27th June 1964 was 190,000 bales, and with this, mills have purchased 6.93 million bales from the last crop, estimated at 7½ million bales. In addition, the Jute Buffer Stock Association has lifted 150,000 bales. In view of the proximity of the new crop, jute dealers have been anxious for clearance sales to enable them to have adequate cash for new crop business.

The abolition of the minimum export prices for raw jute in Pakistan was announced earlier in the week. This has been done to step up fibre exports. The Pakistan Government has stated that this change in the jute policy for the 1964-65 season does not mean the abolition of control over export, as it is stated that the minimum export price would be reintroduced, if circumstances warranted the same. The Government would continue to maintain a check on export prices, and the quota system together with phased purchases for export as well as internal consumption will also continue. No export quota is fixed at this stage in view of the lack of a correct estimate of the new crop. The new Pakistani policy has fixed the internal minimum prices of loose jute, based on the lowest or bottom grades as follows: the *jats* Rs. 23 a maund, the districts Rs. 22 a maund, and the northern Rs. 20 a maund. The new policy is aimed at stepping up exports, as, in the last season, export offtake declined.

For reasons already explained, prices of the new crop rose as follows: Assam bottoms from Rs. 30.50 to Rs. 31.50 a maund and northern bottoms from Rs. 29.50 to Rs. 31.00, daisee bottoms being unchanged at Rs. 33.00. The new crop is expected to start arriving in liberal quantities by the end of this month, and although the proportion of the quality grades, it is believed, would be greater, the crop, is not expected to be larger than last year's. Pakistan expects a smaller crop this year, thanks to the difficult marketing conditions evidenced in the last season. In view of the abundance of the last crop, overseas buyers of Pakistani fibre were favourably placed. Further, India also began exporting fibre. Now that Pakistan has abolished the minimum export prices, Indian fibre would be subjected to stiffer competition from Pakistan in overseas markets. However, since, the Pakistani crop would be lower than last year's, that country may expect to realise higher prices, which in turn would be to India's advantage.

While there is satisfaction among the trade that in recent weeks India was able to do good business in heavy goods with Burma, Tanganyika and Chile, it was noted that an entire order for 70,000 bales of heavy cees from Cuba was annexed by Pakistan. There is evidence that Pakistan has started exporting hessian to Argentina, which is a substantial buyer of Indian hessian.

During the week, Government tenders for B. twills were again a feature and, on Wednesday last, short-covering raised ready B. twills from Rs. 115.60 to Rs. 116.00. In sympathy, ready hessian 40" 10 oz. hardened from Rs. 44.25 to Rs. 44.45. On Thursday, business in B. twills was done with Government involving a quantity of 4,600 bales against July-August delivery. As a result, B. twills were steadier at Rs. 116.40 and hessian 40" 10 oz. at Rs. 44.60. With prices at Rs. 116.20 and Rs. 44.60, conditions were unchanged on Friday, but over the week-end prices further rose to Rs. 116.40 and Rs. 44.65 respectively. Conditions in jute goods yesterday became steadier following a Government tender for 13,000 bales of B. twills for July-August delivery. As a result, B. twills rose to Rs. 117.00 and in sympathy, hessian 40" 10 oz. went up to Rs. 44.75.

COPPER SCRAP QUIET

(From Our Own Correspondent)

CALCUTTA, *7th July*

Tin, zinc and lead were steadily maintained at earlier levels during the week under review, while, copper scrap ruled quiet, in view of a further improvement in the supply position of the virgin metal. Advices from the London Metal Exchange were steady. Spot copper wire bars hardened from £291 a ton to £300 and closed at £298, and the three-months' metal from £278 to £287. Spot cathodes closed at £298 showing a net gain of £14, but spot fire-refined metal closed £1 lower on balance at £277. Utensil copper scrap in Calcutta was quiet at Rs. 660 per 100 kgs. It is noted that in recent weeks London quotations have moved irregularly, and the earlier anticipation that the price would move down to a more reasonable level is far from being realised. World output has been increased, but if in spite of this the price had not moved down, this has been because of the belief that world consumption of copper, despite competition from aluminium, has also increased.

Spot tin in London opened at £1,225 a ton and, after rising to £1,235, closed at £1,225. The three-months' position closed £13 higher on balance at £1,187. The rising trend can be arrested only if the U.S. would increase the quantity of releases, now fixed at 5,000 tons a quarter. Until recently, it had been believed that the gap between production and consumption was about 20,000 tons a year, and it was based on these estimates the General Services Administration of the U.S.A. decided that releases throughout the year should not total more than 20,000 tons. The continued rise in the price has led to the belief that the gap between output and consumption is now more than 20,000 tons, say about 30,000 tons. The U.S.A. has, therefore, been urged to take the revised estimate into consideration and increase the release quota. In Calcutta, tin price was steady but unchanged at Rs. 2,900 per 100 kgs.

Spot zinc on the L.M.E. gained from £136½ to £140 a ton, with the three-months' quotation rising from £123½ to £127½. It was reported that with the increased offerings of Russian zinc, its price would move down. In Calcutta, the price hardened to Rs. 324 since demand widened following the improvement in the supply position of copper. Virgin lead was steady here at Rs. 290 while the L.M.E. quotation at £93⅜ a ton added £2½. It is significant that the European Lead Development Committee has estimated higher world consumption this year as a result of the rapid expansion of the building construction industry and of such lead-based industries as batteries and tetraethyl and tetramethyl for petrol.

MIXED TREND IN FOODGRAINS

(From Our Own Correspondent)

HAPUR, *6th July*

Mixed trend continued in foodgrains prices during the past week. While wheat and gram prices were subdued, rice and coarse grains registered further gains due to poor supply position. While the food situation, in some districts of east U.P. is described as grave, the State Government opines that it was pulling out of the critical situation. About 2,000 tons of wheat have been daily moving to the State from the ports. With 40,000 tons of imported wheat promised to U.P. by the Centre and with the regular movement of the area's quota, the State Food Minister was hopeful of an improvement in the situation.

Wheat prices declined by Rs. 2 to Rs. 2.50 per quintal, according to quality during the week, due to slack demand. Average quality wheat was quoted at Rs. 56.25 to Rs. 58.25 and, farm produce between Rs. 60 and Rs. 62.50 per quintal. Daily arrivals are estimated around 373 quintals and stocks around 2,500 quintals. Firm trend was, however, witnessed in the rice market and prices improved by Re. 0.67 to Re. 1.34 per quintal due to brisk seasonal demand meagre supply and declining stocks. Local stocks with trade are estimated around 4,000 quintals. Week-end prices (in rupees) were:—Rice *basmati* superior 96.46 to 99.13; *sela* 93.77 to 96.45; *mainpuri* 77.70: *ramajwayan* 83.06, *raimunia* 85.74 and *gadda* 80.38 per quintal.

Gram prices were subdued during the week on poor buying support and prices were quoted at Rs. 58 per quintal for local produce and Rs. 56.50 for Punjab quality. Both arrivals and stocks were small. Barley and *bejhar* prices touched new heights in face of poor arrivals. Barley was quoted between Rs. 48.50 and Rs. 50 and *bejhar* between Rs. 50 and Rs. 51.50 per quintal. *Juwar* and *guwar* prices also hardened due to brisk demand for seed purposes and prices ranged between Rs. 48 and Rs. 50 and between Rs. 62.96 and Rs. 64.30 per quintal respectively. Maize and other coarse grains prices were unchanged. Week-end prices here were:—Maize Rs. 48 to Rs. 50; *methi* Rs. 52.50 to Rs. 55 and oats Rs. 57.50 to Rs. 58.50 per quintal.

TANNED KIPS STEADY

(From Our Own Correspondent)

MADRAS, *6th July*

Arrivals of tanned kips from the upcountry tanneries were on a moderate scale, and offtake by local dealers and exporters was halting. Prices ruled steady. There were large sales for export to U.K. in tanned cowhides, good marks light weight all selections, at firm levels, while ordinary tannages were not in demand except in 8/8½ lbs. fifths selection. Fourths in cowcalf—lights—were in demand, but stocks were short in this description. Buffcalf was neglected and there was no call from the traditional ports.

Export trading was meagre in the skins section. Importers viewed the Madras levels to be higher than in other countries and hence considered it to be not economical. There were patchy sales of good marks 8/9 lbs. Run and thirds and fourths at full prices; and on other lines, importers were bidding at low prices which prevented expansion of business. Light weights in secondary marks were wanted but sellers were few. As regards sheep skins, trading has been slow and the prices showed weakness all round.

In the German tanned skins public sales which commence on 6th July 1964, about 116,000 goat and 25,000 sheep skins will be on offer. In the London public sales, which take place the same day, 50,000 goat and 35,000 sheep skins will be available for sale. The results in both auctions are awaited with interest.

F.I.C.C.I. ON MAHALANOBIS REPORT

THE public controversy over the first part of the Mahalanobis Report on income distribution and concentration in the corporate sector seemed to have died down in the weeks following the demise of Mr. Jawaharlal Nehru. But, with the publication, this week, of a critical brochure thereon by the Federation of Indian Chambers of Commerce and Industry, the brief respite from controversy has just ended. Whether the debate can be usefully continued at all is the question here, for the Mahalanobis Committee itself has stated that, if the problems pertaining to income distribution and economic concentration are to be sized up in correct perspective, the second part of its report, which is to deal with the changes in the levels of living over the first decade of planning, would have to be read along with the first part. It may thus be a sensible thing to say, in fairness to the Committee, that critics should wait for the second part to study the Report as a whole, comprising both the parts. Such an approach may be deemed all the more necessary because the Committee itself has refrained from drawing any "firm" conclusions on the grounds that the available data on the distribution of income and wealth are extremely meagre and that statistics do not show any definite and significant trend in concentration ratios in the private corporate sector during the first ten years of planning. In a way the wisdom of such waiting has also been recognised by the Federation when it says that "it is not unlikely that at least some of the observations made in the present Report may well need change" in the light of the Committee's findings regarding the changes in levels of living during the Plan periods.

If still the Federation has chosen to direct its fire on the Mahalanobis Report, it is because the Committee has made "certain statements which are not devoid of doubts or controversy." These statements, in the opinion of the Federation, "require to be carefully gone into by the public as well as the authorities lest on wrong premises future policy should get formulated." But how "carefully" the Federation has examined and refuted the Committee's controversial observations is itself open to doubt. For instance, the Federation has broadly asserted that "statistics show that, in the last decade, the output of those commodities which enter the consumer budget of the less well-to-do classes has expanded more rapidly and must have secured a better distribution of income for the economy as a whole." And, in so-called substantiation of this statement, it has added that, "in the period 1951-61, the production of bicycles increased by eight times and of *vanaspati* and sugar nearly doubled," that, "apart from the increase in commodity consumption, there has simultaneously been expansion and improvement in (social) services provided by the State," and that "all these factors have tended to promote a more equitable distribution of real income." All this is presumably in refutation of the following observation of the Committee:

> "It should be noted that there is a general feeling, *though the Committee could not collect the required data to support it* (italics ours), that an average person, whether in urban or rural areas, is better fed, better clothed and even better housed in the 1960's than in the 1950's and that the working conditions have also improved generally over this period. On the other hand, since there is also some evidence that the rate of growth in income for certain high income groups has been as high as or higher than the rate of growth in income per employed person for the country as a whole, it has not been possible for the Committee to pronounce a definite judgment, *even of a broad nature* (italics ours), on the changes in income distribution. However, it can be stated that there is no clear indication of a significant change in income distribution over the Plan decade."

What a blissfully vague and ambivalent observation this is! It is this unenlightening statement that the Federation claims to have refuted. But how unenlightening, in its turn, the Federation's refutation is! One may be justified in asking whether the Federation could not have set its research department to work in this connection for calculating, albeit roughly, *per capita* consumption (production *plus* imports *minus* exports, divided by population) in 1950-51 (the year preceding the first Plan) and in 1960-61 (the end-year of the second Plan) of, say, cereals and pulses, sugar and *gur*, oils and fats, milk and milk products, biscuits and confectionery, salt, soap, matches, cloth, paper and pharmaceuticals. Comparative data could have been similarly assembled in respect of railway and bus passenger-miles, hospitals and dispensaries, educational institutions, roads, etc., per 1,000 or 10,000 of population. In view of the fact that more than 99 per cent of the people are earning less than Rs. 3,000 per year, *per capita* figures worked out in respect of articles of mass consumption may be taken to reflect almost fully the trends in distribution of real income. As the Federation has not sought to collect all possible data to support the general impression that an average person is better fed, better clothed, etc., its claim that "an attempt is made (in the brochure) to interpret or to explain the economic significance of important trends which can be statistically measured" does not seem to be quite a valid one at least insofar as the distribution of real income is concerned.

But the Federation's statistical analysis of trends in the money incomes of those subjected to income-tax is much better, for it has clearly brought out that the average post-tax incomes of individual assessees in the Rs. 25,001-50,000, Rs. 50,001-1,00,000 and above Rs. 1,00,000 brackets had decreased by 3.5 per cent, 9.0 per cent and 18.2 per cent, respectively, in 1961-62, as compared with 1953-54. It has also been found that the average income per assessee earning more than Rs. 5,000 per year had declined by eight per cent pre-tax and five per cent post-tax in the period 1953-62. Since during the same period the *per capita* income for the economy as a whole increased by about 21 per cent, the Federation has validly drawn the conclusion that the *per capita* income of persons earning less than Rs. 5,000 per year must have increased by more than 21 per cent. All in all, therefore, the distribution of money income in the non-agricultural and agricultural sectors alike should have become more equitable. In the non-agricultural sector, such a result has doubtless come about partly because of the levelling-down role of direct taxation and partly because of the levelling-up of the wages of workers and the salaries of lower middle class employees. The only omission in the Federation's analysis pertains to the agricultural sector. If the authors of the brochure had also studied the trends relating to land distribution, tenancy and rents, prices of foodgrains and commercial crops, land revenue, etc., they could have found data to show that a more equitable distribution of income had resulted from rent reduction and reforms in cultivating tenancy and land tenure, as well as from higher agricultural prices and virtually static land revenue.

While dealing with some of the observations of the Mahalanobis Committee on "concentration" in the private corporate sector, the Federation has made quite a few telling points. For instance, according to it, the growth of small-scale sector in industry cannot be considered to be an alternative to large-scale enterprise. A related point is that the large-scale sector in industry promotes social objectives by securing the maximum benefit of technology, management and economy of indivisible factors. Another point is that even our so-called "giant" companies are pygmies by international standards. Referring to the Committee's finding that big business complexes have grown more rapidly and come to control a substantial portion of industrial activity, the Federation has expressed the view that, if the concept of "decision-making authority" is defined with objective precision, "concentration" would not appear to pose a social problem. This view, however, has been presented in a rather feeble manner. It is, therefore, necessary to mention that the Committee's definition of "concentration," far from being a purely technical concept involving "concentration ratios" which give the share of the largest few (say, three) firms in the total gross output, net output or employment in a particular industry, has been deliberately stretched to mean something unreasonably wider.

The Mahalanobis Committee has preferred to define concentration "in the wider sense of a small number of individuals or groups having in their control significant volumes of economic power in terms of capital or income or employment or media of communication which, though not constituting a large percentage share of the national aggregate in each case, nevertheless sets them so much higher than any other individual or group in the relevant context that it gives them a disproportionately large influence and enables them to exercise economic power not measurable statistically by the mere ratios of concentration." This involved and long-winded definition is unjustifiably wide and patently loose. It could have been intended only as a sort of "interpretation" of the vague, confused and pre-

conceived ideas held by the Planning Commission and the ruling party on large-sized enterprise, monopoly, concentration and the like. In fact, the Committee itself has said that "apparently what the Planning Commission and the public have in mind is the latter (that is, the Committee's definition) rather than the former (that is, concentration ratios)." It is no wonder, therefore, that several untenable and exaggerated conclusions have flowed from the application of this wide definition—conclusions smacking of certain ideological considerations and thus liable to militate against higher production which alone can help reduce general poverty. That is not all, for there is also the Committee's arbitrary assumption that joint-stock companies "constitute economically the most significant form of property." To have singled out the private corporate sector (which accounts for only about a half of all industrial production in the private sector) for a study of "concentration of economic power" at a time when far greater concentration of such power is being effected by the State does not seem to be quite logical. That the Committee's terms of reference have precluded consideration of the State sector is beside the point.

OFFICE MANAGEMENT

PRODUCTIVITY is a term which is usually associated with workers and machines, the two important factors of production: it is expressed as a ratio of actual output to the input of these factors. It, therefore, follows that, if (*a*) the labour works hard and intelligently, (*b*) the machines employed are modern, and (*c*) the methods of manufacture are rationalised, the level of output will be much higher than otherwise. The responsibility for creating such conditions rests on management, that is, persons who take policy decisions about the operations of enterprises at one end and those who implement the decisions at the other. Management is aptly described as a group of persons which "manipulates and controls men, methods, machines and materials to achieve the best possible results with least expenditure in the shortest practicable time." Indeed, it is no exaggeration to say that the very existence of every factory and business depends on the efficiency of office management. But for the due importance attached to this vital subject and the series of steps taken to gear office management to handle the increasing complexity of business, the tempo of technological advance in Western countries would have been greatly arrested.

In India, too, office management development has been receiving attention lately. Much useful work has been, and is being, done by the All-India Management Association, the management institutes set up at Calcutta and Ahmedabad, the Administrative Staff Training College at Hyderabad, and the National Productivity Council, as well as by a few private industrial enterprises. But only the fringe of the problem has been touched. For so wide is the gap between the adequately trained managerial personnel available and the actual requirements. The gap will be wider still in the coming years, what with the expansion of existing enterprises and the establishment of new ones. Every thousand additional jobs created, according to one estimate, require at least twenty managers and twice the number of other managerial personnel. It is, therefore, just as well that the National Productivity Council should have sponsored, under the auspices of the U.S. Agency for International Development, the study tour of a productivity team on office management (leader: Mr. K. K. Dasgupta) covering Japan, the U.S. and Britain. Considering that these are the countries where the development of an efficient integrated office management has been remarkable, the findings of the team are of inestimable value. The team has made a general study of office management as developed and practised in the aforesaid countries and, in the light of this study, pinpointed certain deficiencies inherent in the Indian system and offered constructive solutions to the series of problems involved in office management.

The four basic weaknesses of office management in India to which the Dasgupta team has drawn pointed attention are administrative delays, hardening of the communication arteries, lack of co-ordination and meaningful administrative control, and a poor memory-cell to provide continuity. The team has rightly pointed out that the creation of an Organisation and Methods (O. and M.) department does not cure all administrative ills, because the organisational defects must be corrected to provide a sound basis for the O. and M. department to function effectively. The success of an O. and M. department depends, as the team has emphasised, on a definite plan of organisation based on functions *and not personalities*, clear demarcation of executive positions to control and direct each function, clear lines of vertical authority and decision-making process extended to all levels of management so as to bring them as close as possible to the point of initial action, and a management guide for all executive and supervisory personnel.

A notable finding of the team is that a programme of work simplification renders possible considerable economies in the operations of any organisation, be it industry, business, public utility or social service. Forming an essential part of this programme is mechanisation of office operation as is done extensively in Japan, the U.S. and Britain. Mechanisation of office work is regarded as the only means of solving the vast and complicated problem of collecting, analysing and processing the mass of data relating to the management of an enterprise. There are, however, two handicaps to such mechanisation, namely, paucity of foreign exchange which does not permit import of office machinery and apprehension of labour about possible displacement due to introduction of machines in office. The latter handicap is a more serious one. The Dasgupta team is, of course, fully aware of it, but it emphasises that the apprehension of workers has to be allayed. The industry, it says, must prove by demonstration that office mechanisation in an expanding economy actually promotes greater employment.

While mechanisation of office work helps greatly in reducing costs, proper work study ensures the effective performance of a specified office task. Sound techniques of work measurement are one thing; the way they are used is another. The Dasgupta team has done well, therefore, in urging the need for clearly specifying the method by which a task is carried out before work measurement takes place, remeasuring the work-content in case of any change in method, surveying regularly the work that has been measured and keeping work unit values up-to-date. "Management, supervisors and clerks, all have responsibility," to quote it, "for seeing that method changes are properly taken into account in any measured standards they may use. The outstanding features of the techniques of office work measurement are systematic approach and objective attitude." On no account should the high standards of fairness and impartiality inherent in the techniques be sacrificed to expediency. This is a responsibility which, as the team observes, always rests on management.

Simultaneously with efforts to ensure work simplification and proper work study, there is the urgent need for a rational procedure analysis and cost control in clerical operations (through the adoption of charting and analysis techniques), as well as an efficient records management system. Most of the advanced companies in the U.S. and the U.K., we are told, have determined work standards for clerical operations, and this has been made necessary because of the installation of expensive computers. The companies are keen to ensure maximum utilisation of machines. The team was impressed to note that some companies in Britain had programmed for 90 per cent utilisation of the machine time. The clerical budget, which is a corollary to the work standards, is determined by most of the large undertakings. But, generally, clerical budgets are not extensively used in any of the advanced countries, but management takes special care to control office expenses in a variety of ways without adopting the sophisticated methods of clerical budgeting. Since the subject of clerical budgeting is complicated, the team has naturally struck a note of caution. It should be approached, it says, carefully, securing the full confidence and co-operation of supervision in every phase of the task. After all, it has to be remembered that studies of this nature depend for their success on the integrity, knowledge and commonsense of both the supervisor and the analyst.

No less urgent is the need for improved office layout, working conditions, furniture, light and heat. In India, attention is sometimes given to the reception or to the directors' room, and the rest of the office is left to function haphazardly. Characteristically enough, the Dasgupta team calls this window-dressing which does not make an office efficient; rather the contrasting picture might create disharmony among staff members. Inasmuch as the efficiency and tone of administration is reflected at this point, either the Office Equipment Association or the Indian Standards Institution will do well to evolve standards for office equipment and supply. On its part, the Government should encourage manufacture of office equipment, and foreign collaboration for such project must be welcomed.

Whatever the improvements effected in the set-up of office *management*, they will not be of much avail unless the personnel problems of office workers are tackled satisfactorily. A lot has been done by way of research, training and governmental regulations for factory workers and middle management executives, but the office clerk remains neglected. Drawing attention to this disquieting trend, the Dasgupta team has clearly warned that this situation cannot continue for long; the situation has changed considerably now that there is a large number of graduate clerks who demand recognition and share in the opportunities for progress in the organisation. The personnel problems of office workers should be a subject of research and discussion, as is in vogue in the U.S., Britain and Japan. Special attention must needs be paid to education and training of office management personnel.

An interesting suggestion put forward by the Dasgupta team pertains to the establishment of an Institute of Office Management with the active support of industry, business and the Government. This Institute, which will have close liaison with office management associations abroad, should provide, according to the team, the following specific services to its members:

1. Training for the senior executives of member-companies in systems and procedures, so that "paper personality" is developed in them, and an atmosphere of efficiency is created in an organisation.

2. Exchange of information among the members in the country and also securing of information from advanced countries.

3. Standardisation of statements which are required to be submitted to Central and State Governments with regard to the various aspects of the operation of industry or business; efforts will be made to devise a system in case of each industry/business to collect relevant official data without unnecessarily adding to the clerical cost of paper work.

4. It will urge training in subjects of office management at post-graduate, graduate and under-graduate levels.

5. It will promote consciousness of office-cost among the high executives and top management through a series of seminars and discussions.

6. It will seek standardisation of certain office equipment and supplies for the benefit of manufacturers and consumers.

7. It will conduct research in certain fields of office activity and personnel.

Evidently, the Dasgupta team must have been prompted by the consideration that office management is as much a profession as medicine or law, requiring some specialised knowledge and skill which can be acquired only through a combination of formal education and practical training. Since adequate facilities for such education and training are not available in India at present, the team's suggestion for setting up an Institute of Office Management is worth considering. Only care must be taken to see that there is no duplication of effort. An Institute of this kind, if it is planned properly and run efficiently, will certainly go a long way towards the evolution and implementation of a sound office management development programme in the country.

MARKET GOSSIP

Just Rs. One Crore More

THE response to the two Central Government cash loans (further tranches of 4 per cent 1970 and 4½ per cent 1989) was not so encouraging as was expected. Actually, the response was limited. Although the loans were on tap for all the three days, that is, from Monday the 13th inst. till the close of business on Wednesday the 15th inst., the actual subscriptions aggregated no more than Rs. 151 crores. This amount is just Rs. 1 crore in excess of the total (Rs. 150 crores) sought by the Government. Such limited support may appear surprising in the context of the distinctly easy conditions prevailing just before the loan flotation, favourable terms of the loans and fairly attractive redemption yields. But the banks had earlier bought the two loans to the tune of Rs. 15.20 crores. Moreover, the banks must have limited their purchases of the loans with a view to conserving funds for subscribing to the forthcoming State loans. The banks, after all, cannot afford to ignore the pressure of State Governments for good support to their loans.

The bulk of the total subscriptions, as is only to be expected, has been for the short-dated loan (4 per cent 1970), the actual subscription amounting to Rs. 106 crores; the balance of Rs. 45 crores represents the share of 4½ per cent 1989 loan. The banks and the Life Insurance Corporation are reported to have contributed a total of about Rs. 90 crores to the two loans. A substantial portion of the remaining amount must have been subscribed by the Reserve Bank.

The aggregate subscriptions of Rs. 151 crores and the Rs. 141.52 crores obtained from the two Conversion Loans bring the total subscription to Rs. 292.52 crores. The shortfall in the Union Government's borrowing (Rs. 295 crores), as envisaged in the budget, is thus Rs. 2.48 crores.

Coal In The Doldrums

Coal continues to be in bad shape. Stocks at pitheads show no signs of declining to levels at which they could be regarded as reasonable. Meanwhile, there have been reports of a cut in production in many collieries and it is difficult to predict what the final outturn will be this year. Though it is likely that last year's output of 67 million tons may be exceeded this year, the country will still be far behind the third Plan target which has had the unenviable distinction of having been revised thrice in the current Plan period. From 104 million tons, to which it was raised from the earlier 97 million tons, the target was revised downwards to 98 million tons and then still further to 88 million tons; now there is talk of its being revised to 80 million tons. It is true that flexibility is a great virtue in planning. But this is a flexibility with a difference, almost with a vengeance.

Apparently the freeing of non-coking coal (grades 2 and 3) from controls with effect from the 1st inst. has not benefited the industry as a whole. The need for bringing the output of coal into balance with the demand is more urgent than ever. The Indian Chamber of Commerce has rightly urged that any fresh assessment of the problem should take into account the demand for different grades of coal, both coking and non-coking, and draw up the production schedules based on the demand for them. The Chamber feels that one of the factors that may be responsible for the constant fall in demand could be the change-over from coal to oil effected in some industries in the last three years. Perhaps the whole decision on change-over was hasty in that it was based less on the superior economy in the use of oil than on the non-availability of coal because of transport bottlenecks. Surely, there was little sense in urging the use of oil in place of coal without giving the industrial units an opportunity to assess more accurately the relative merits of the two forms of fuel. And it is ironical that, when the authorities found that coal was in surplus and the transport position had eased, they urged the industrial units to switch back to coal. This is hardly the way to plan for an industry of the size and importance of coal in the national economy. The Chamber, on its part, has suggested that the situation arising out of the change-over should be re-examined; as fuel oil has a large import component, the conversion from coal to oil should be avoided wherever possible.

The Chamber's two suggestions for relieving the glut in lower grade coal deserve urgent scrutiny. In the first place, the Chamber has suggested that, as the reserves of higher grade non-coking coal are limited, an attempt should be made to persuade the railways to use more lower grade coal and that the National Coal Development Corporation should confine itself to opening new mines yielding only higher grade coal. Secondly, it has pleaded for more energetic efforts designed to export more coal to Pakistan, Ceylon, Burma and other South-East Asian countries. To make such exports possible, it has suggested the provision of additional incentives by way of subsidy and concession in railway freight; the rebate in rail freight given for the movement of coal to southern and western India by coastal ships could be extended to exports. It is a moot point whether any policy intended to improve artificially the use of lower grade coals will work in actual practice. Surely, a more sensible method is to evolve a pattern of prices which will both compel consumers to economise the use of higher grade coals and induce them to use more lower grade coals.

It may well be that the glut in coal is a passing phase. It may not last long enough to do irreparable damage to the industry. On the other hand, it would be beneficial if it induced the planners to think harder on the right target for coal in the fourth Plan. It is imperative that the cavalier attitude towards planning for coal must yield place to a more realistic assessment. Perhaps the authorities have not been sufficiently aware of the gravity of the problem posed by frequent changes in targets. To ask units to cut production when they have advanced sufficiently far from the blueprint stage is to render their planning for coal as hazardous as its mining. It is time the Government of India woke up to the importance of sound planning for coal and took the necessary steps from now.

Tentative estimates are inclined to place the target for coal in the fourth Plan at about 154 million tons, which implies a large increase over the current levels of output. It is estimated that the achievement of the target would imply an investment of Rs. 500 crores, including a foreign exchange component of Rs. 168 crores. An outlay of this magnitude will mean that the industry is left with resources large enough to plough into new investments. The Chamber has done well to point out that, in the context of the high level of capital per tonne of new coal (about Rs. 200 per tonne), the notional gross profit of Rs. 1.75 per tonne awarded by the Coal Price Revision Committee in 1959 is unrealistic. Surely, in the absence of an adequate increase in coal prices, which will encourage the industry to put new money in opening up new mines and also enable it to return the loans it has taken from the World Bank and other specialised financial institutions, it is difficult to expect any large increase in coal output.

At the same time, it seems necessary to sound a note of caution. Trends in the coal industry the world over show that the days when coal could be raised at any cost have ended. The increasing competition from other fuels has underscored the need for utmost economy in production costs. Between 1957 and 1963 coal output in the U.K. declined from 224 million tons to 196 million tons, the decline being attributed to the authorities' keen desire to raise only as much coal as could be sold at competitive prices. If India is to raise coal that could be sold at prices, fair at once to the producer and the consumer, it would be necessary for the industry to mechanise its production. It is some comfort that there has of late been some improvement in the mechanisation of mines. Between 1951 and 1962 the number of coal cutting machines in use by the industry has increased from 374 to 696, mechanical loaders from 7 to 26 and mechanical conveyors from 23 to 135. Obviously the rate of progress in mechanisation as well as its level have to be raised. Moreover, if the foreign exchange component involved in the outlay on raising coal output is to be kept to a minimum, there is need for giving top priority to the programme designed to produce machinery for coal mining. Most of the current programmes are still in the blueprint stage, but they will need to be processed with vigour if they are to yield concrete results for use by the industry in its expansion programmes in the fourth Plan period.

Port Congestion And Food Scarcity

Acute congestion has developed at the ports of Bombay and Calcutta in recent weeks, following the arrival of a large number of ships, particularly foodships. This situation, resulting from the "bunching" of ships, has served to expose the inadequacy of port facilities and the slow progress of port development schemes. This is not the first time that such congestion has suddenly developed at the two leading ports. And this is also not the first time that the Government and the port authorities have taken frantic measures after allowing themselves to be overtaken by the event. It is indeed distressing to find that port development so far has not been fast enough to provide some elbow room for a contingency like the present one.

It is all the more distressing that port congestion, which delays loading and unloading operations further, should have arisen now, thereby worsening the ship-to-mouth food situation. The fact that wheat price in Bombay has steeply gone up of late may be noted in this connection. But the prompt measures adopted at the Bombay Port for unloading foodships may be shortly expected to ease the situation of wheat scarcity.

At Calcutta, where stevedore labour is partly to blame for the congestion, unloading operations have just been speeded up, following the visit of Mr. Raj Bahadur, Union Minister for Transport. A five-point plan of action, parts of which are also applicable to the Bombay Port, has just got under way there. Firstly, according to this plan, the Transport Ministry would henceforward directly regulate the despatch of foodships from foreign countries and their arrivals in India through a suitable chartering administration in the Ministry itself. The responsibility for chartering foodships, which has hitherto been handled by the Union Food Ministry, has thus been taken over by the Chief Controller of Chartering in the Food Ministry. Secondly, the Transport Ministry would divert the foodships to other suitable ports to avoid "bunching" of ships at one place. Thirdly, long-distance road transport trucks would be used by the Government to relieve wagon capacity and to ensure a quicker discharge of foodgrains from ports. Fourthly, efforts to modernise and mechanise the cargo handling work at ports would be expedited. And, lastly, in Calcutta in particular, the Government would introduce an incentive scheme for dock labour for better performance in discharging foodships. This five-point programme to deal with congestion has been evolved with a sense of urgency in the context of the critical food situation. The Transport Ministry has done well to deal with the congestion problem promptly and as realistically as possible in the circumstances.

BEHAVIOUR OF STERLING

By W. T. C. King

Editor, "The Banker," London

A NOTABLE feature of the past month ha been the easing of sterling on the inte national foreign exchange markets, but this mov ment seems to have been associated with inte national shifts of short-term funds, in part in re ponse to influences arising overseas, rather tha with any further change in the underlying tren of Britain's own balance of payments. At a events, neither the behaviour of sterling nor th confirmation of the assumption that the overa balance of payments had swung into considerabl deficit in the first quarter of this year has ha any discernible effect on business confidence a registered in the London stock markets.

The Gilt-edged market, usually the most sensi tive of all to any worries about sterling, has, in deed, just staged its first significant rally after a long downtrend. As measured by the Governmen securities index of the *Financial Times*, the mar ket had reached its lowest point for 1964 at 81.81 ir mid-June (when it was 7.4 per cent below the six year peak touched last October); in the ensuing fortnight it recovered to 82.45. In the industria share market the turnround has been still more pronounced. After sagging away from its post-Budget high point of 352.5 to only 334.6 by early June, the ordinary share index rose steeply in the next few weeks, touching 353.8 early in July—its highest since the major crack in the boom in May 1961 (the all-time peak reached then was 365.7).

Sterling, until quite recently, had been heartening and even a little unexpectedly firm. As I noted in this correspondence two months ago, soon after the Budget, the sterling-dollar rate had risen above parity, for the first time since last August. It hovered around this level until the last week of May, when it slipped back to $2.79¾, and then in early June it dipped more sharply, until in the last few days of the month it touched $2.79½, the lowest quotation for three years.

It was understood in the market that at least during the early stages of this pressure, the authorities were preferring to meet it by allowing the rate to move towards an equilibrium level rather than by giving support at the expense of the gold and exchange reserves. Over the month as a whole, however, these reserves dropped by $56,000,000, slightly more than offsetting their rise in May, and carrying the total down to a little over $2,700 million.

European Rediscount Rates

One of the major causes of this movement has been the repatriation of short-term balances by European holders as a consequence of the growing stringency in local money markets, and in response to the associated rise in money rates in a number of centres—tendencies that were accentuated last month by the shifting of balances for mid-year window-dressing. No fewer than four European countries have raised their official rediscount rates during the past month. The Netherlands Bank Rate went up from 4 to 4½ per cent on 4th June, the Danish from 5½ to 6½ per cent on 10th June, the Belgian from 4½ to 4½ per cent on 2nd July, and the Swiss from 2 to 2½ per cent on the following day. In each of the first three of these instances, this is the second increase to be made since last autumn. The Swiss move is interesting in the opposite sense—it is the first for a number of years.

There is, of course, no single or simple explanation of the rising trend of interest rates in Europe. In part it reflects tendencies of mainly domestic origin, and notably the effort to resist actual or apprehended inflationary pressures. But it also quite clearly reflects one international development of major importance that has been taking place during the past year—the success of the United States authorities in their efforts to cut down the overall deficit on the American balance of payments. Notably by restricting the access of oversea borrowers to the New York market, these policies have intensified the demands on European capital markets, in part by domestic borrowings within the countries concerned, and in part by international operations through the "Euro" currency markets that have been so greatly expanded in recent years.

As a result of this marked change in the pattern of international payments, one can already hear talk of the probability of a return to *conditions* of dollar shortage, and this trend in thinking is affecting international views about sterling, as the other international currency. It is being suggested that if the tensions within the European structure of international payments—and notably the tensions within that of the Six—lead to renewed repatriations of balances held overseas, sterling, rather than the dollar, may have to take the first strain.

In these circumstances, one does not need to look to the uncertainties of domestic politics in election year, or even to the apparent behaviour of Britain's own balance of payments, for the immediate explanation of the latest turnround in the exchange market. The most recent detailed estimates of Britain's balance of payments as a whole relate to the first quarter of this year, and became available on the last day of June—after sterling had touched its lowest point. They showed a continuation of the deteriorating trend in the current account that began in the second quarter of 1963, but this movement had been foreshadowed months ago. It has long been recognised that, when the economy is expanding at an above-average rate, this process must sooner or later put pressure on the balance of payments, if only because of the higher level of work-in-progress and the need at some stage to build up stocks to match the higher rate of output.

The first big strain from this source can now be traced in the estimates. In the first quarter of

TREND OF SHARES

EASY AT CLOSE

(From Our Own Correspondent)

BOMBAY, *16th July*

FOR want of fresh developments, industrials moved irregularly both ways in a narrow range with a distinctly easy tone at the close. Prices, wherever changed, showed small to moderate on-balance losses. Fears that the Government would implement the recommendations of the Bonus Panel and persistent reports of Pakistani firing on the Kashmir border induced bull operators to liquidate their holdings and cash the available profit. Rallies were due mainly to short-covering and scattered replacement buying and it was apparent that, although bulls were in no mood to extend their commitments, shorts were not ready either to bear the market.

Today (Thursday), however, sentiment turned easy following the news of Republican party nomination for Senator Barry Goldwater, who, it was feared, would adopt a tough policy with regard to foreign aid if he were elected President of the United States. There was also the question of Indian Iron dividend hanging over the market. The pessimistic reports about rayon prices turned out to be another disturbing factor. Further, it was said that one of the leading operators who had too many irons in the fire was eager to get out of the share market. The result was that the list closed on Thursday with all-round losses. Over the week, Tata Ordinary eased from Rs. 156.25 to Rs. 155.75 and Indian Iron from Rs. 25.60 to Rs. 25.50, and, among cotton textiles, Bombay Dyeing was down from Rs. 58.20 to Rs. 57.60, Century from Rs. 612.50 to Rs. 603, Standard from Rs. 653 to Rs. 638 and Kohinoor from Rs. 328 to Rs. 326.50.

The decline in rayon shares is not difficult to understand, in view of the plea on the part of spinners for relief following the continued lack of demand for yarn despite the cut in prices. Reports of the leading units having been able to sell just around 55 to 60 per cent of their current quarter's output caused considerable nervousness and National Rayon was quoted at the end of the week at Rs. 368.50, as against Rs. 376 last week. The rate in the kerb today evening was even lower at Rs. 366. Indian Rayon lost as many as 12 points to Rs. 54, due to distress selling, and Baroda Rayon lost three points to Rs. 76. On the whole, textile shares remained weak with sentiment clouded by persistent demand for a wage revision and threats of agitation by labour as well as uncertainty regarding cloth prices.

Automobile shares continued to look depressing. It is unfortunate that the industry should think of cutting down production to tide over its crisis of inadequate demand. Orders from the defence department are understood to have been cut and retreading has taken away a considerable part of the sales which should have accrued to manufacturers. Ceat was quoted at as low as Rs. 87 and Premier Tyres were done at Rs. 83. Something, it is said, must be done to help the tyre industry to its feet. To let manufacturers cut down their production is good neither for the country nor for the investor who has sunk his money in tyre shares.

Tata Loco, however, has been a shade better at Rs. 292, but this scrip has some special features which attracts investors. Among motor shares, Hindustan Motors was down from Rs. 18.76 to Rs. 18.28 and Premier Auto from Rs. 103 to Rs. 101.50.

A really disappointing note came from New Great Eastern Spinning and Weaving Mills which has skipped over its dividend for the year ended March 1964. After remaining out of the dividend list for four years, the Company resumed payment (12 per cent) in 1961 and stepped it up to 18 per cent in 1962. It is yet not known what affected the Company's working and the market is eagerly awaiting the Directors' report.

Scindia among shippings were down from Rs. 15.84 to Rs. 15.72.

Among companies which pleased their shareholders during the week was Larsen and Toubro which stepped up the dividend by 10 nP to Re. 1.50, which is also payable on the equity shares which became fully paid-up in August 1962. Sales of the Company are up by 41 per cent and the gross profit is Rs. 1.11 crore, as against Rs. 66.27 lakhs in the previous year. The shares were mentioned at Rs. 21.48 at the end of the week. New Standard Engineering has stepped up the dividend from 9 per cent to 10 per cent inclusive of a Cash Jubilee bonus of one per cent. At Rs 135, the shares yield 7.88 per cent gross.

A notable feature among the small counters was the firmness in B.B. Petrol which shot up to Rs. 3.72 on brisk support, though the quotation declined to Rs. 3.50 at the end of the week in line with the general trend of the market.

Indian Dyestuff was also weak, having declined from Rs. 282.50 to Rs. 278.75 and Voltas eased from Rs. 257 to Rs. 254.50. A.C.C. was fractionally lower at Rs. 152.25, but Belapur was up by three points at Rs. 218. Tata Chemicals was a shade easy at Rs. 18.68. The failure of this scrip as well as many others to look up despite excellent prospects ahead goes to sugggest that, once the market is set for a decline, no share, however strong individually, can pick up bull factors. Technical analysts now feel convinced that a correction has set in and they would not be surprised if the market were to stage a long pause before moving up again. True there have been strong bear factors this week, but the theory is that a declining market becomes extremely sensitive to these and may even look for them if they are not somewhere near around.

* * * *

The Calcutta market was guided more or less by the same factors which influenced Bombay and conditions were generally dull with a tendency for prices to sag. Jute shares lacked interest but Birla Jute managed to gain fractionally at Rs. 33.25. Howrah attracted demand, but the trend in this section was a mixed one. Paper shares were a shade easy with Orient at Rs. 34.30 and Shree Gopal at Rs. 24.87. Coal shares were dull, but the highlight of the week was provided by Kesoram Industries which announced a 2 per cent rise in the dividend to 15 per cent for the year to March. After fluctuating between Rs. 23.75 and Rs. 30.31 during the current year the scrip was quoted at Rs. 26.69 at the time of writing.

* * * *

In Madras, plantation shares were in the limelight with selected coffees and teas attracting investment demand. Industrials also maintained a firm tone. Among textiles, South India Viscose softened towards the week-end, but Bangalore Woollen were being asked for. The Miscellaneous section was active with many of the leaders coming in for good inquiry.

FIBREGLASS PILKINGTON LTD.

Fibreglass Pilkington Limited, whose public issue in November 1963 was 1½ times oversubscribed, has just announced its final call of Rs. 2.50 per share on 10,49,993 equity shares of Rs. 10, making them fully paid-up. This will provide the necessary finance for the Company's continuing programme of capital expenditure.

The construction of the Company's first factory at Thana, which began in February 1964, it is learnt, has been progressing to schedule, and roofing work on the main factory building is already in hand. Also taking shape on site are the office buildings, warehouse and staff accommodation. The purchase of machinery and equipment is under way and the first consignment of imported items is *en route* for Bombay. Commercial production is expected to begin in 12 to 15 months, when a full range of glass fibre products will be manufactured in India for the first time. It is heartening to find that the Company is expediting construction work and thereby seeking to live up to the promises held out in its prospectus.

The Government of India has granted the Company a licence to produce 2,500 tons of glass wool, 600 tons of glass textile fibre and 75 tons of glass staple tissue per annum. The three product types that will be manufactured at Thana are: (i) glasswool insulation for the preservation of heat or cold, and the reduction of noise—in boilers and industrial plant, cold storage and air-conditioning equipment, road, rail, sea and air transport, commercial and factory buildings and many other applications; (ii) glass staple tissue which is used as an anti-corrosive wrapping for pipelines, as a base for bituminous roofing felt, and as a spacer in electric batteries; and (iii) glass textile yarns, fabrics and mats for decorative textiles, the insulation of electrical equipment and for the manufacture of glass fibre reinforced plastics (translucent roof sheeting, boat and car bodies, building, panels, and 20,000 other products from sports goods to defence equipment).

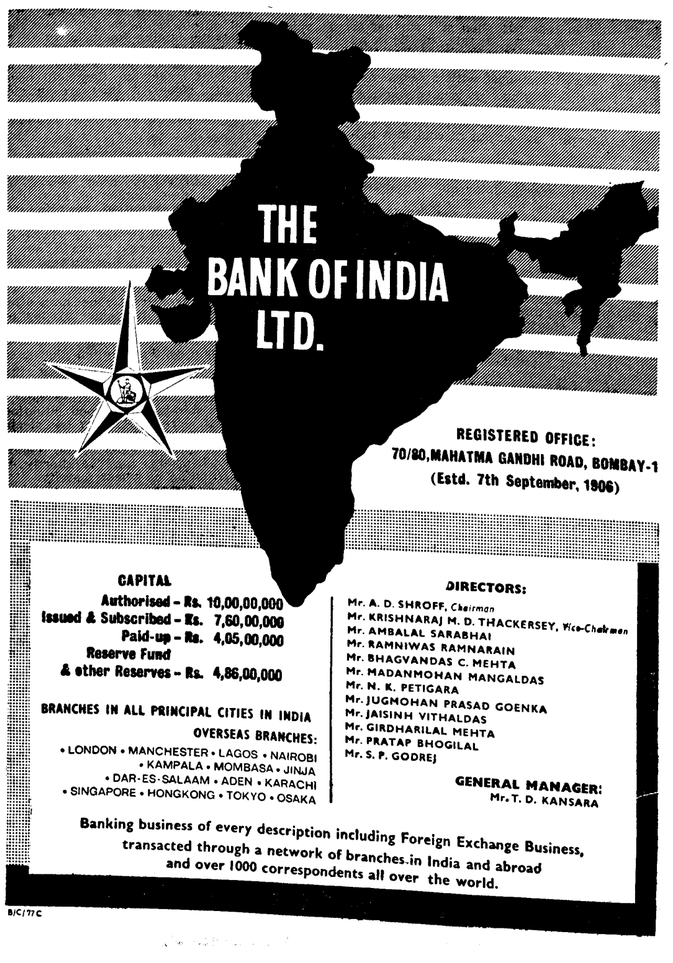
Technical collaborators and promoters of the Company are Fibreglass Limited, the leading manufacturers of glass fibres in the United Kingdom.

SOUTHERN GAS LTD.

The Southern Gas Ltd. is entering the market on 3rd August next with a public issue of Rs. 12.50 lakhs in 10,000 equity shares of Rs. 100 each. The whole issue has been underwritten. The Company has been licensed to put up a factory at Ernakulam in Kerala for the manufacture of 60 million c.ft. of oxygen and 12 million c.ft. of dissolved acetylene per annum. The factory is expected to commence operation by October-November this year. Full production capacity is likely to be attained in three years' time. The Fertilisers and Chemicals Travancore Ltd. (Alwaye) has agreed to supply the Company with oxygen in an uncompressed state at a cost of Rs. 10 per 1,000 c.ft. The machinery and necessary technical know-how will be supplied by an East German manufacturer. An import licence worth Rs. 25 lakhs for the import of machinery and cylinders from East Germany and Yugoslavia has already been granted by the Central Government.

The total cost of the project is put at Rs. 40 lakhs. This will be met by the share capital of Rs. 22.50 lakhs, bank loans amounting to Rs. 14.50 lakhs and deposits of Rs. 3 lakhs.

The authorised capital of the Company is Rs. 50 lakhs comprising 30,000 equity shares of Rs. 100 each and 20,000 unclassified shares of Rs. 100 each. Of this, the issued capital is Rs. 22.50 lakhs comprising 22,500 equity shares of Rs. 100 each. The promoters, directors and their friends have already subscribed Rs. 10 lakhs and the balance of Rs. 12.50 lakhs will be offered to the public.



Tokyo b

Facts you should know about KLM's reliable DC-8 jet flights to Bangkok, Manila, Tokyo, Singapore and about the attractive possibility to fly across the Pacific

KLM has had longer than any other airline to perfect its reliability—44 years. It was the first European airline to fly to the Far East. Today, for the convenience of passengers and air freight shippers, KLM maintains 17 offices east of Karachi. KLM's flights from India now serve Tokyo direct. Read on...

1. A KLM DC-8 jet leaves Calcutta every Monday afternoon and Delhi every Friday afternoon for Tokyo. Both these flights go via Bangkok and Manila.

2. Leaving from Bombay, you can easily fly up to Calcutta or Delhi or Bangkok on Mondays or Fridays to link with KLM's flights to Tokyo.

3. Japan, so gay and full of life, will be fun to visit during the Tokyo Olympic Games. Combine your business with pleasure and make your travel plans now.

4. You will find a Japanese stewardess on every KLM flight from Bangkok to Tokyo and over the Pole to Amsterdam. They add a delightful touch of the Orient, and guarantee that KLM's Japanese-speaking travellers feel right at home.

Polar Route

5. For Tokyo passengers interested in visiting Europe too, KLM offers a nice opportunity of going via the Polar route and returning via the South Asian route or vice versa.

6. KLM operates twice-weekly services each way between Tokyo and Amsterdam via Anchorage. From Tokyo to Amsterdam on Mondays and Thursdays. From Amsterdam to Tokyo on Wednesdays and Sundays.

To Singapore and Sydney

7. KLM's weekly flights to Singapore and Sydney can be linked at Bangkok on Tuesdays and Wednesdays respectively, by passengers from Calcutta, Delhi and Bombay.

8. The longest route flown by KLM is the DC-8 jet service between Amsterdam and Sydney—11,754 miles. KLM flies this stretch in less than 26 hours.

9. KLM has its own resthouse in Bangkok. It has spacious rooms with private bath and recreational facilities. KLM flies in fresh food and delicacies regularly from Holland. The service in this resthouse matches the standards of a good European hotel.

PAL to San Francisco

10. KLM, joining hands with Philippine Airlines (PAL), offers you an attractive possibility of flying to San Francisco via Honolulu, across the Pacific.

Serving all six continents

Every four minutes a KLM plane takes off or lands somewhere in the world. KLM flies to 104 cities in 68 countries, serving every continent and covering 44 cities in Europe alone. KLM's total route network is 144,000 unduplicated miles. KLM's twice-weekly flights from India now serve Athens direct on their way to Europe, and connect at Amsterdam with KLM services to many important cities in Europe and the U.S.A.

11. Twice-weekly services are operated by PAL from Manila to San Francisco via Honolulu, on Wednesdays and Saturdays. Both of these can be connected at Manila by KLM/Interline partners' flights from Calcutta, Delhi and Bombay. You can also visit Hongkong on your way to San Francisco at no extra fare.

12. Take this opportunity of visiting New York—so easy to reach from San Francisco!

See the World's Fair; go with KLM and Cinerama "To the Moon and Beyond"; sample the thrills and sensations of outer space at the Transportation and Travel Pavilion. Ask KLM for further details.

13. Every KLM intercontinental flight carries a travel information case full of tourist information.

There is a set of KLM Touris Information leaflets, covering mor than 100 countries. These leaflet are available at all KLM offices an can be had free of cost on request.

14. KLM prepares special die food for passengers who request i as they book their seats. KLM pursers are always briefed on thes special diets before passenger come aboard.

15. Travelling First Class on KLM DC-8 jet, you enjoy roya comfort. Among other thoughtfu features, you can have a soft foam rubber hassock to rest your fee as you relax in a reclining chair Hassocks are standard First Clas equipment on KLM jets.

16. When KLM DC-8 jets land i hot climates and passengers remai on board, KLM rolls special equip ment up to the plane to kee the air-conditioning going on th ground.

17. Domestic animals, accompa nied by you, have to be carried i a strong closed basket or kennel t be provided by you and to b approved by KLM. For particular please get in touch with KLM.

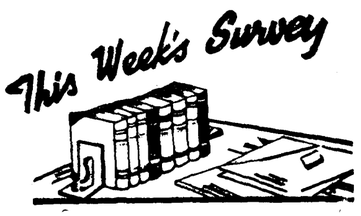
18. Your Travel Agent will b able to tell you more about th advantages of flying KLM. G in touch with him or contact th nearest KLM Office. Calcutta–7, Chowringhee Road; Delhi–9A, Connaught Place; Bombay–Taj Mahal Hotel.

Free Travel Information

For further information on KLM and its services to any of the cities on its Far Eastern and Australian network, please write to KLM, Calcutta.

KLM

ROYAL DUTCH AIRLINES



FOREIGN CAPITAL FOR INDIA

THE aggregate outlay on the fourth Five-year Plan will be pretty large, the estimate of the Perspective Planning Division being about Rs. 22,000 crores. A sizable part of this outlay represents foreign exchange expenditure. It is true that the Governments of the friendly countries abroad will continue to make available to India large-scale assistance in the form of loans. But such loans, it is common knowledge, also entail the heavy burden of repayment (principal and interest charges). Precisely for this reason, the Government of India is attaching great importance to the need for an accelerated inflow of private foreign capital into India. Only the other day, the Union Finance Minister, Mr. T. T. Krishnamachari, declared at London again that India would welcome foreign capital. Almost simultaneously with this statement came a news agency report from New Delhi suggesting that the Government of India would permit American firms to invest $300 million (about Rs. 143 crores) annually in 21 chosen key industries during the fourth Plan period (April 1966-March 1971). This, the report said, "is in line with the new thinking of the Finance Ministry that, besides friendly Governments, the private foreign investor should also have a role to play in the fourth Plan."

Some of the steps taken by the Government to attract foreign capital were impressively highlighted by Mr. G. L. Mehta, Chairman of the Indian Investment Centre, when he addressed the annual meeting of the Centre in Bombay last week. Mr. Mehta made special mention of the incentives provided in the last Budget, as well as of the reappraisal of Government's policies and procedures in a number of directions, and said that these were likely "to act as an impetus to the inflow of private foreign capital." And he hoped that the current year would be an encouraging and active one for the Centre in its efforts to attract private foreign investment for the economic development of the country. Emphasising that the Centre must play an increasingly important role so as to make an adequate contribution towards realising the objectives of the Plan, Mr. Mehta gave the following broad outline of the Centre's work in facilitating inflow of foreign private capital in industrial fields over the next few years:

In the course of the Centre's activities during the last three years, the emphasis has been rightly placed upon information, assistance and service aspects of work rather than on its stimulation and sales functions. For the Centre to succeed in the tasks ahead, it must now be in a position, in addition to its capabilities as an advisory service organisation, to carry out effectively the 'selling' of India's investment opportunities to foreign entrepreneurs. This would be possible only by planning the Centre's activities in India and abroad over a period of time. It is essential to set up a technical wing in the Centre which will not only advise Indian and foreign entrepreneurs on their projects but also assist them in framing them. A feasibility division and a field service should be established for this purpose. The latter would, among other things, maintain contacts with the new generation of Industrialists who are coming up in various parts of the country. Joint-venture companies, which come into being with the assistance of the Centre, should also be regularly visited in the initial stage of their operations. This liasion is important for the purpose of gaining experience in practical problems encountered by such concerns so as to enable the Centre to render assistance in solving them. The field service would eventually form the nucleus of the Centre's branch offices in places like Bombay, Calcutta and Madras.

The Investment Centre's activities abroad will have to be simultaneously enlarged. At present, we have an office only in New York and, while this office is in need of being strengthened in various directions, it is essential to set up a number of offices in other countries as well. Accordingly, it has been decided to establish a European office at Dusseldorf, which would start functioning by September this year.

Simultaneously with the setting up of the European office it is proposed to bring in a team of German industrialists to India sometime in October-November to enable them to study conditions and opportunities in the country, to discuss with appropriate authorities and establish contacts with Indian industrialists.

We also propose to invite a team of Japanese experts some time in August who would explore the possibilities of petro-chemicals in India and the prospects of participation in such development both technically and financially. It is the Centre's intention to bring in at a later stage similar teams from France and other countries.

While the Investment Centre will doubtless play a notable part under the able stewardship of Mr. G. L. Mehta, the pace of inflow of private foreign capital will be influenced essentially by the general attitude of foreign investors which, in turn, will depend on the overall climate for investment that obtains in the country. Investors abroad are no doubt generally satisfied with the climate for investment and they are also fully aware of the vast potentialities of the Indian market. But there is a widespread feeling among them that the fiscal and industrial policies of the Indian Government need certain adjustments if the pace of investment is to be accelerated. The Governments of some countries, too, feel the same way. Here is what Mr. Franklin D. Roosevelt, U.S. Under-Secretary of Commerce (Mr. Roosevelt accompanied the U.S. businessmen's mission to New Delhi in April last) said at Washington recently:

"A country as large as India has enormous problems. We do think foreign capital investment could help much in the development of India. This would require the elimination of some bottlenecks in the Indian economy, which are holding back private investments. This was the major purpose of the mission which went to India in April and which focussed the attention of the Indian Government on specific issues."

The specific fields in which the U.S. businessmen's mission wants adjustments were indicated in our Market Gossip columns only two weeks ago (*vide* page 3 of *Commerce* dated 4th July). In the light of these suggestions, the Government of India will do well to formulate definite guidelines for foreign investors as to the broad basis for collaborations and joint ventures, "so that the rules of the game are known in advance." Such guidelines, as Mr. Roosevelt has aptly remarked, would be of immense help to investors to understand their own position and thus encourage advance planning. If the guidelines are worked out, American capital, according to him, can associate itself in technical assistance, management, engineering and design, even if a plant is in the public sector. Surely, the formulation of definite guidelines will help attract foreign investments in India on a significantly large-scale in the coming years.

ROLE OF ROAD TRANSPORT

The Planning Commission's Committee on Transport Policy and Co-ordination is yet to finalise its report. The Government is, therefore, waiting for this report to evolve a suitable policy for co-ordinating various modes of transport during the fourth Plan period. That such co-ordination, which has not been attempted so far, is necessary has been generally recognised. It will be all the more necessary under the fourth Plan which may provide for an investment of as much as Rs. 4,000 crores in all forms of transport. But what is so very necessary is, at the same time, difficult to achieve, for, as in the field of food policy, the State Governments, with their divergent interests, are very much in the picture. It will be something of an achievement if a co-ordinated all-India transport policy comes to be evolved. As of today, one can only hope for the best in the belief that the Committee on Transport Policy and Co-ordination will show the way.

Whatever be the policy that is ultimately formulated for transport co-ordination, there can be no doubt that the road transport sector will have a bigger role to play in the years to come. This should be evident from the fact that roads and road transport will have a larger *absolute* share of investment in the next Plan period. It may be that this role will also be relatively more effective, considering that the Planning Commission proposes to adopt "a design for regional development that will make it much easier to remove restrictions on road transport that might have been considered unavoidable in the past, to secure the planned development of road transport and to co-ordinate it effectively with road construction, railway development and with regional economic development plans" (*vide*: Mr. Asoka Mehta's speech at the I.R.T.D.A. meeting on 27th June 1964). The clear indication by the Deputy Chairman of the Planning Commission that road transport will have an "enormous contribution to make . . . . in terms of the growth of regional economies in the country and, on long-distance routes, as a secondary supporting service to the railways" is also an encouraging pointer to the final shape of the Transport Policy Committee's report.

That a more promising field awaits the road transport industry could also be inferred from some of the observations made by the Union Transport Minister, Mr. Raj Bahadur, at the meeting of the Road and Inland Water Transport Advisory Committee last week. Mr. Raj Bahadur had this to say, namely, that the Motor Vehicles Act would require further drastic amendments (besides the ones proposed in a Bill to be presented to Parliament shortly) in the light of the recommendations of the Committee on Transport Policy and Co-ordination. That was not all, for he also referred to the possibility of prompt action on the recommendations of the study group which was examining the divergent taxation policies and licensing procedures of State Governments with a view to rationalising them. Another information given by him was to the effect that a working group set up by the Reserve Bank had advised the State Finance Corporations "to finance road transport at a rate not exceeding that of the Reserve Bank by more than 4½ per cent." The Minister's recognition of the need for a thorough study of the existing system of hire-purchase financing for motor vehicles with reference to the requirements of the fourth Plan is also noteworthy in this context. All in all, therefore, the Union Ministry of Transport is fully seized of the problem of how best to ensure the development of road transport as "an efficient and economic service." If the Government is earnest about this objective, it should expedite the various transport studies, so that practical measures could be devised at the earliest for dealing with the organisational and financial aspects of road transport.

IMBALANCE IN WORLD TRADE

At the United Nations Conference on Trade and Development held at Geneva recently, it will be recalled, the spokesman of practically every developing country expressed wide fears about the persistently growing imbalance in world trade. That these fears were not at all exaggerated is clearly borne out by a U.N. study as well as by a F.A.O. survey. The findings of the U.N. study are contained in Part II of the *World Economic Survey* 1963, a brief summary of which has just been released. The findings reveal that the export earnings of developing countries rose by only 4-5 per cent during the year 1963 as compared with 1962, while those of industrial market-economies went up by 6-7 per cent and of the centrally planned economies by 7-8 per cent. The aggregate value of world trade in 1963 is estimated at about $153 billion, representing an increase of $12.2 billion or nine per cent over 1962. Almost two-thirds of this increase is accounted for by the industrial countries of North America, Western Europe, and Japan, the actual exports from which rose by $8.0 billion. Exports from primary producing economy went up by $2.9 billion and those from the centrally planned economies by $1.3 billion.

The combined trade deficit of developing countries was no doubt smaller in 1963 than in any year since 1954, as the rise in their spending for imports lagged behind the upswing in export earnings. Even so, the need for sustaining the increase in the export earnings of many developing countries is urgent to a degree. The world demand for their export products will necessarily have to rise at an accelerated pace, for the margin of safety achieved under the generally market conditions of 1963 is a small one in relation to the longer-term growth needs

The persistently heavy deficit in the trade of developing countries with the developed countries ought to be reduced drastically if the world economy as a whole is to expand on a sound and healthy footing.

The F.A.O. has clearly warned that the developing countries' trade deficit will be wider still if their agricultural production fails to keep up to the targets laid down. At constant prices and assuming no major policy changes, the total net exports of developing countries are expected to increase by no more than 3.5 per cent a year during the 'sixties, while their imports of manufactured goods will continue to be on a large scale. The actual imports have risen in recent years by about six per cent a year and any reduction in these imports is bound to affect the economic growth of developing countries. Viewed thus, the need for an improvement in the terms of trade cannot be stressed too strongly. It is only such an improvement that can reduce the trade deficit of developing countries. Besides the widening trade deficit, the heavy deficit in invisibles is also a matter for concern. The deficit, according to U.N. estimates, may increase from $4 billion in 1959 to as much as $8 billion by 1970.

Judged against this background, the F.A.O. has done well, indeed, in urging (1) removal of barriers to trade in non-competing commodities, (2) more liberal import policies for competing commodities (particularly sugar), (3) an increase in the prices of some tropical export crops for which import demand is inelastic, (4) expansion of processing industries in developing countries through reduction of trade barriers in developed countries and regional arrangements among developing countries, and (5) a more rapid rise in the imports of centrally planned economies. The implementation of these measures, in keeping with the spirit of the Geneva Conference, should merit the serious consideration of the Governments of both the developed and developing countries. Though the task is formidable, what is needed is greater international co-operation in order to bring about an equitable structure of world trade, so that the share of developing nations in the expanding world trade will be much larger than at present.

A NON-OFFICIAL REPORT ON KANDLA

Kandla Port and Gandhidham area in Kutch, Gujarat, have developed considerably in the last few years. The volume of traffic handled at the port has increased from 11.24 lakh tons in 1959-60 to 17.43 lakh tons in 1962-63, and its revenue, too, has gone up substantially from Rs. 66.4 lakhs to Rs. 110.7 lakhs. Some industries, too, have come up in the area, the achievements todate being a formaldehyde plant, a fish canning factory, a small industrial estate and some salt works. Even so, the delegation of the Gujarat Chamber of Commerce (Leader: Mr. Premchand Gokaldas, President of the Chamber), which visited the region recently, has found the progress to be pretty slow and tardy, lacking the basic momentum for economic growth. It is indeed surprising that several sheds in the industrial estate constructed at Gandhidham are lying vacant. Even the industries already set up in the estate continue to experience a crop of difficulties in obtaining plant and machinery, raw materials, licence and quota certificates and financial assistance. All this is not surprising, for the area is deficient in many of the basic amenities for economic development like transport, power, water and housing. As if to add to these shortages, the Kutch district does not produce enough foodgrains owing to inadequate rainfall. The vast desert tracts of the region have remained unexplored for years and cannot be put to productive use because of adverse climatic conditions.

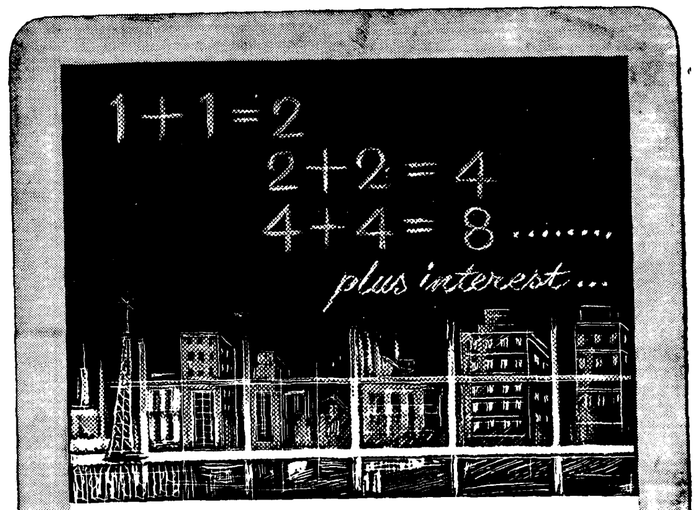
The region as a whole, therefore, stands in need of planned development. The delegation has suggested, in this connection, that the Gujarat Government should set up immediately a Desert Development Board to convert Kutch into a rich, fertile agricultural belt with the help of the Union Government and the technical assistance of the Food and Agriculture Organisation and other relevant affiliated agencies of the United Nations. Further, the construction of the Zund-Kandla railway link should be taken up and completed within a reasonable time to increase the movement of goods. The delegation has also suggested that the Kandla-Ahmedabad Highway and the fair-weather road between the two centres should be completed very soon with a view to increase the transport facilities. Another suggestion is that Kandla should be linked by air with Ahmedabad, Delhi and other places for its speedy development.

The team has rightly stressed the need for proper planning in regard to power generation and supply, for if the proposed oil refinery comes to be established in the region, the present 3,000-kw. power generator would become inadequate. A kind of preference would also have to be given to Kandla area in fixing electricity rates for its rapid growth. Further, the Government's efforts to augment the supply of water from 20 lakh gallons to 50 lakh gallons per day would need to be speeded up to meet the ever-rising needs of industries. In view of the comparative backwardness of Kutch, the State Government should accord priority to small-scale and other industries in the allotment of raw materials and provision of financial assistance. To step up building activity in the area, the L.I.C. and the Gujarat Housing Board should draw up and assist appropriate programmes. For rapidly urbanising the area, the Union Government should also consider the shifting of some of the scattered Central Government offices to the vicinity of Kandla.

The delegation's report is particularly valuable for its treatment of questions relating to the proposed creation of a free trade zone at Kandla. While welcoming this move as a unique experiment in the field of sea customs in India, it has requested the Government to provide incentives and facilities of the kind available in other free trade areas of the world so as to stimulate the establishment of new industries and thereby the foreign trade. There should be no ambiguity in the rules and, if controls are to be imposed on the activities in the zone, they should be announced in advance. Further, no limitation of time for the re-export of goods should be fixed. As a lot of delay has already occurred between the announcement of the scheme and its implementation, the delegation has urged that it should come into operation as expeditiously as possible. Its further plea is that the list of industries, for which there is scope for development, should be announced sufficiently in advance so as to enable the parties concerned to plan things well in time. At the same time, it has also called upon the enterprising mercantile community of the State to come forward and establish new industries in the area. The delegation's appeal to the Government and entrepreneurs alike has come not a day too soon. It is realistic too, for it is based on on-the-spot studies.

* * * *

The income of the Kandla port rose by Rs. 27.61 lakhs during 1962-63, according to the administration report. This was due mainly to increase in the trade handled at the port. The revenue receipts, excluding pilotage account, during the year were Rs. 110.70 lakhs, as compared with Rs. 83.09 lakhs in 1961-62. The total trade handled at the port was 17.43 lakh tonnes as against 18.87 lakh tonnes. The expenditure, excluding that charged to the pilotage account and contribution to the depreciation fund, was Rs. 63.35 lakhs, as against Rs. 50.23 lakhs. The percentage of working expenses, excluding debt charges and special expenditure, to income under the general account was 57, as against 60 in 1961-62. Contribution made as usual to the depreciation fund during the year was Rs. 8.36 lakhs. A sum of Rs. 15 lakhs was also paid towards part payment of interest charges on the cost of assets transferred from the capital to the revenue side. The outstanding debt of the port at the close of the financial year was Rs. 12.61 crores due to the Government of India on account of assets transferred to the port and those taken over from the former Government of Kutch. Imports during 1962-63 registered an increase of 2.95 lakh tonnes or about 21 per cent more than the previous year. This was mainly due to greater imports of foodgrains, iron and steel, oil and other miscellaneous items. The exports also showed a rise of 61,000 tonnes as compared with the previous year because of greater traffic in cotton, ores, salt, sugar and mineral oils. Excluding sailing vessels, 311 vessels with a gross tonnage of 25.25 lakhs entered the port during the year under review as against 230 vessels with a gross tonnage of 17.30 lakhs.



It started simply on a slate, but when you calculate your blessings, they all add up to tremendous industrial growth in this country. Behind all these developments is the banking industry in India. The Allahabad Bank Ltd. was established in 1865 when the country was just awakening. For the fulfilment of your personal plans and the plans of the nation the Allahabad Bank Ltd. is at your service.

CHANGES IN ADMINISTRATION

MR. SHASTRI INITIATES THE FIRST STEPS

From Our Special Correspondent

NEW DELHI, *14th July*

MR. Lal Bahadur Shastri has lost little time in initiating changes which will lead to a slight shift in the seat of administrative power at the Centre. Mr. L. K. Jha, Secretary to the Department of Economic Affairs, has been moved to the post of Secretary to the Prime Minister. Under Mr. Nehru, the Prime Minister had a personal secretariat and a Personal Private Secretary, an Indian Civil Service man, but the Cabinet Secretariat formed the clearing house for communications from the highest level to various Ministries and departments. The Cabinet Secretary, in effect, was the kingpin of the administration.

For several months past Mr. Jha has been rated as among those in the nucleus of an I.C.S. group which lobbied on its own and theorised on administration, public-sector industries and procedures when the hold of ailing Mr. Nehru was on the wane. Prominent among this group were Cabinet Secretary Khera and Co-ordination Secretary Bhoothalingam. This group had also begun to look upon Finance Minister T. T. Krishnamachari, whose mastery of technocracy made him one of the group's mentors. Until one of the former Cabinet Secretaries writes his memoirs or reminiscences, it will be difficult to know in detail how far the Cabinet Secretary, from his commanding position, became an influencing element in the Nehru era. Mr. Shastri is known not to have undiluted admiration for the civil service whose contributions are inflated almost as a matter of principle by British commentators. The Prime Ministers' secretariat under Mr. Jha will now be Mr. Shastri's listening post and Mr. Jha his chief of staff for administrative operations.

Mr. Jha is familiar with the numerous economic problems which will dominate governmental activities for some time to come. As a negotiator for foreign assistance, Mr. Jha's face is also familiar to numerous foreign dignitaries, but if Mr. Shastri hopes to retain the Foreign Ministry in his hands, Mr. Jha will not be of much help to him in that field. Mr. Shastri hopes to add to the Prime Minister's secretariat some junior secretaries from other departments.

Future Role of Planning Commission

Mr. Shastri has made it plain to Yojana Bhavan that the Planning Commission will have a much reduced role—merely the task of being advisers and thinkers. Mr. Asoka Mehta himself had started his innings at Yojana Bhavan in November on the assumption that he would seek to make the Planning Commission more of brains trust and less of an action wing. There had been considerable agitation among planners and administrators over the dialogue earlier this year between Mr. Krishnamachari and Mr. Mehta on the status of the Planning Commission; Mr. Nehru had not the time to pass final judgment on the issue except for remarking that the Planning Commission had overgrown. According to Mr. Shastri's trend of thinking, the Planning Commission should divest itself of all executive functions. Before the National Development Council meets, probably in August, the Planning Commission would have processed numerous reports of working groups concerned with specific sectors.

Agriculture, no doubt, has been the sector in which the greatest attention has been devoted in the past few weeks. The decision after the Chief Ministers' conference is to move forward with measured steps instead of plunging headlong into a radically new food policy. Mr. Shastri wants economic programmes which will yield quick results, for a change, fruits of which are visible to the people at large. Some of the economists who have concentrated on huge perspectives naturally may be somewhat disheartened by the trend of the new administration towards emphasis on short-term projects. Among the bigger projects, it would appear that the erection of the public-sector plant at Bokaro, expansion of other steel plants and a crash programme for fertiliser factories are among the few which will be pressed forward. These will be among the "core projects" in the fourth Plan. When the National Development Council meets, it will be presented a consensus of the Central Cabinet and the Planning Commission on the targets necessary in the agricultural field in the fourth Plan. Talks between the Food Minister, the Community Development Minister and the Irrigation and Power Minister, on the one hand, and the Planning Commission, on the other, have resulted in the perspective target of 120 million tonnes of foodgrains by 1970-71 being the one to be placed before the National Development Council. Among other targets are 8.5 million bales of cotton and more than 32 million tonnes of milk and milk products.

Food Policy

The Chief Ministers endorsed Mr. Subramaniam's idea for a food trading corporation and a decision on when to start the corporation and whether to have one or two will be taken by the Cabinet after the Finance Minister returns from the Commonwealth Prime Ministers' Conference. After examining the economics of importing rice milling machinery—for the 2,000 units the Government wants to erect by the end of the fourth Plan—it has now been decided to plan for large-scale manufacture within the country. Thailand, Burma and Pakistan have responded with offers to sell rice to meet some immediate needs. But these supplies are anyway marginal to the requirements and the terms of payment have also to be ironed out—Burma and Thailand still want sterling. Mr. Subramaniam's strategic sales programmes can make a real start only after another P.L. 480 deal with the United States is consummated.

In the matter of prices, a technical committee will try to find a formula which can satisfy the consumer and the producer. Mr. Subramaniam has had talks with the Planning Commission on the subject, but the Planning Commission does not want to take any active role in the matter although the Home Minister, Mr. G. L. Nanda, has been pressing the planners to revive the price intelligence machinery which Yojana Bhavan evolved when Mr. Nanda was Planning Minister and Deputy Chairman of the Planning Commission. Mr. Nanda will have to bear the major responsibility if there are breaches of law and order as a result of prices spiralling further upwards. Scattered incidents have already been reported. Mr. Mehta is clear in his mind that the measures to tackle the price problem are to be left wholly in the hands of the executive ministries.

A group in the Planning Commission is also against hints of major reductions in developmental expenditure as a disinflationary policy; according to those who favour a forced pace of development, any slowing of developmental efforts now will merely postpone the aggravation of economic problems.

Chavan's Moscow Mission

Although Mr. Shastri has accepted an invitation to visit the Soviet Union, his health does not permit him as yet to fix a definite date. Mr. Shastri is likely to attend the non-aligned powers' meeting in Cairo in October. The first senior Indian Minister to visit the Soviet Union after the change of Government will be the Defence Minister, Mr. Y. B. Chavan, who will be in Russia for a fortnight from 28th August. Mr. Anastas Mikoyan, Soviet Vice-Premier, on a short visit to Delhi in June, promised to take steps to speed the project to make MIG 21 supersonic fighter planes in India. Mr. Mikoyan cold-shouldered the idea of an early visit by Mr. Krishnamachari because Russia is not willing to discuss commitments for the fourth Plan now. Mr. Chavan's visit to Britain for defence aid talks is likely now only after the British elections and the formation of a new Government there. To the demand for quicker action on the MIG project (which Soviet lobbyists in Delhi say is delayed due to Indian inaction) is proposed to be added a new item to Chavan's Moscow shopping list—assistance in the manufacture of military tanks. (See Delhi Letter in *Commerce*, dated 27th June, page 1096.)

Foreign Investment

In the three years it has been active, the Indian Investment Centre has been able to push through 66 deals with a capital cost of Rs. 55.6 crores and foreign equity participation of Rs. 6.5 crores. Of the 66 deals, 22 have been technical collaboration agreements. As a sounding board, the Centre has begun to become more prestigious—as many as 750 inquiries were received by it in its third year of operation. Nearly half of the deals which have gone through with the Investment Centre's help are from the United States and now the Centre is spreading its wings to other countries with an office in Germany. The Centre plans to bring a team of West German businessmen for a visit to India, probably in November. This trip by Germans will be on the same lines as that of American businessmen in May. Incidentally, even an East European communist country has made use of the Centre's services in entering into a collaboration deal with an Indian firm.

New Lines of Production

One factor which is often lost sight of by critics examining the flow of foreign investment into the country is the significance of the new lines of production; the easiest way to analyse foreign investments is to compare the amounts invested. In the past few weeks some collaboration deals have been made in crucial sectors. The most glamorous perhaps is the arrangement between the Government and the Bechtel International Corporation to form a new firm, Indian Engineers Limited, which will make a large variety of industrial machinery, particularly those needed for the oil industry. A second noteworthy agreement will ultimately enable a firm in Coimbatore to manufacture a wide range of sophisticated textile machinery. The World Bank, an American bank and the Swiss firm of Reiter Machine Works Limited are associated in the provision of money and technical aid to Lakshmi Machine Works. The Indian Investment Centre was associated with some of the negotiations for the Coimbatore project. Progress is also being made in getting foreign firms' interest in petro-chemical units. Mafatlals' arrangements with Shell, Dutch and German firms will perhaps mark the beginning of the Indian petrochemical era on a big scale; for the Gujarat complex the Government hopes to negotiate several collaboration deals soon. A petro-chemical team from Japan will be visiting the country in a few weeks.

Much work remains to be done to pursue the interest evinced by the American businessmen during their visit to Delhi; some of the openings made by Mr. Krishnamachari during his last U.S. visit are beginning to yield results. In the arrangement with Philips for the Cochin refinery and the recent deal for Indian Engineers Limited, Delhi has made a dent in a barrier built by American companies in their reluctance to join in partnership with the Government.

Leylands' decision to invest an additional £2.5 million in its subsidiary in Madras again is a short in the arm for the Indian automobile industry. If the Indian automobile industry fails to move near to the targets set in the third Plan, it cannot now be said to be for want of foreign exchange. In addition to the British investment in Ashok Leylands' expansion, Hindustan Motors, T.E.L.C.O. and Premier Automobiles have all received American assistance. The latest U.S. allotment of $37.8 million will permit the second big expansion of T.E.L.C.O. and Hindustan Motors; both these firms, as well as Premier Automobiles, already have been recipients of a total of U.S. $40 million which is helping their current expansion programme. The World Bank's assistance for the automobile industry in 1964-65 is $47 million. A similar amount is being sought for the industry from the World Bank for the next financial year. The automobile industry's production in 1963-64 showed a slight improvement on the previous year's.

LONDON LETTER

THE CO-OPERATIVE COMMONWEALTH

T.T.K. MAKES EXCELLENT IMPRESSION

From Our Own Correspondent

LONDON, *11th July*

THUS far—though at the time of writing it is only a beginning—the eighteen Commonwealth countries here assembled have shown an ability to confer without fireworks, yet at the same time getting down to brass tacks. Maybe this is because some of the most difficult issues are being gently withdrawn from the publicity of the Conference room into quieter spheres—Southern Rhodesia, for instance, which yesterday provided matter for completely frank statements from all members, is today being talked about in an entirely practical way in the seclusion of the Prime Minister's country house Chequers. Similarly Mr. Krishnamachari is talking about Kashmir over lunch with President Ayub Khan, something both statesmen might find difficult nearer home.

Incidentally, Mr. Krishnamachari made an excellent impression of combined diffidence and strength of purpose when he met the whole corps of London journalists at lunch on his arrival from India at the beginning of the week. Mr. Maudling was another guest of honour and replied to Mr. Krishnamachari's affirmation that he proposed to seek more aid with a tribute to the Finance Minister's qualities: he related that, as a junior Treasury Minister, he had occasion to make a request to Mr. Krishnamachari in Delhi and was greatly impressed by the attention and courtesy with what amounted to his complaint was received. It was only after he had left the Minister that he realised the answer had been "No"!

Perhaps an unexpected reason for the manner in which difficult problems are being discussed is because the British Prime Minister, as Chairman, acts the self-effacing chairman to an astonishing degree. Sometimes it is as if he wasn't really interested, sometimes as if he was merely weak, but the effect is to let the conference debate very freely, without this necessarily implying that if it comes to the point Britain will give anything away.

Overseas Aid

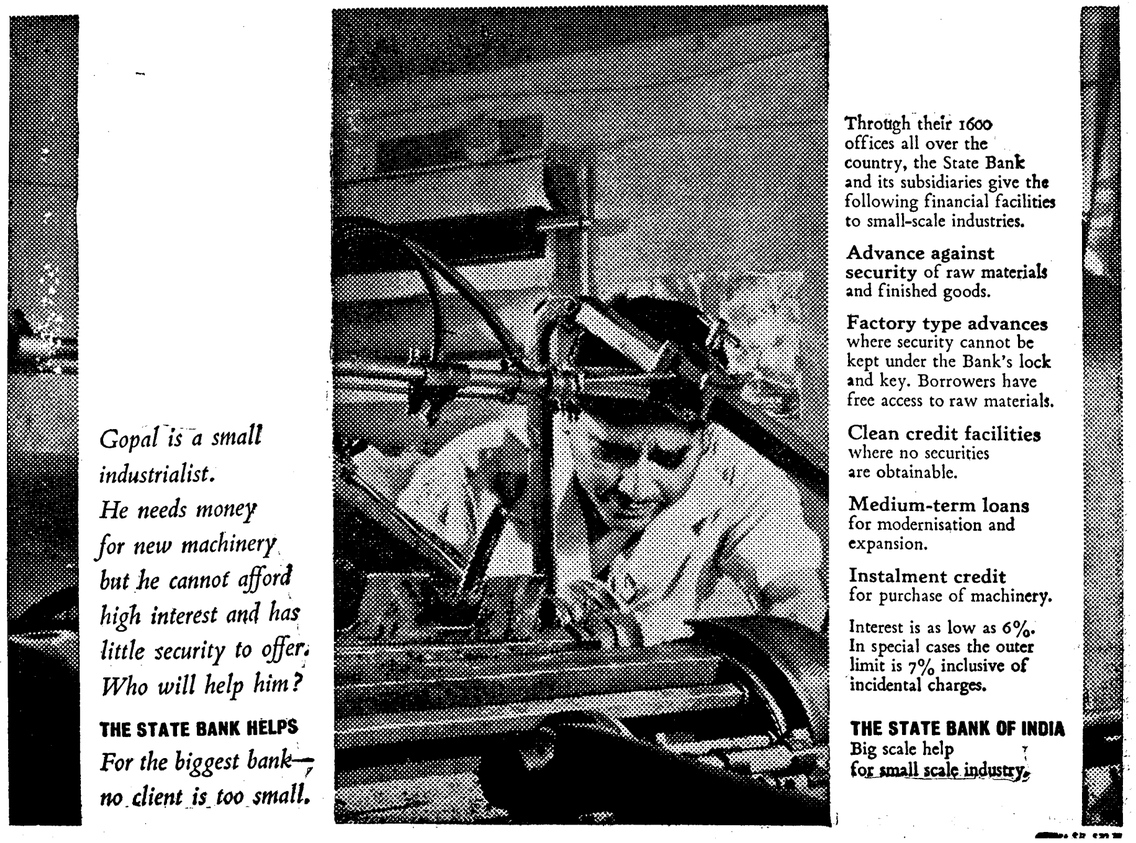
The Overseas Development Institute has now produced a study to show that overseas aid does not really strain the U.K's Balance of Payments. The argument is, first, that a loan represents an overseas asset. This only makes sense if the asset is realisable—that is, can be sold to someone else. But even if the asset were realisable, and few loans can be so regarded, the point is irrelevant: the strain on the balance of payments is no less real because an asset has been acquired. Of course, if such an asset could be accepted by the I.M.F. or by the World Bank as collateral for exchange, then the resources used would be effectively made up—but this does not happen yet, though it is an excellent idea.

The second part of the argument is that whether aid is tied or untied in practice, it goes out in exports. If this were 100 per cent true, then the adverse effect of a loan on the balance of payments would be offset fully by exports, that is, if the loan had not been made, then the exports would not have been made and the balance of payments would have been exactly the same. But this implies that the exports themselves require no imports of materials or other goods and that the productive capacity which they take up could not have been diverted to other exports which would have been paid for instead of being loaned for. Aid loans do not represent a burden to anything like their full extent, but neither can they be glibly dismissed as being without effect on the balance of payments. The truth lies between the two extremes—and somewhat in favour of the loans.

But there are ways in which the balance of payments burden could be eliminated. They have been proposed to the I.M.F. and their general principle is indicated above. If one takes the simplest argument, that a loan is an unpaid export, then if that export can be paid for, countries would tumble over each other to give loans in aid. Therefore, the loan-export must be monetised and under one plan the I.M.F. should issue to the developing countries loan receipts which they could use to pay for development imports. Such loan receipts received by the country making the export would go to the credit of that country at the I.M.F. A credit structure with an international basis will have been created. These are the lines of international monetary progress which could transform the rate of development of the emergent countries.

A Secretariat in London?

One way in which the Commonwealth countries could explore such suggestions for their mutual advantage would be by the creation of a Secretariat in London. This has been on the Conference agenda this week, and, though it is not a new idea, it now has much more general support. It would do for the Commonwealth what the Secretariat of the U.N. does for the world and what the British Government's Commonwealth Relations Office cannot do. If the present Government does not do anything about this suggestion, it is likely that the next one will advocate it warmly to the other Commonwealth countries. Such a secretariat—no one has this week spoken against the idea, which was first mooted by Australia—would explore all the ways by which the Commonwealth countries could assist one another. It would, like U.N.O., be staffed with representatives (Civil servants primarily but also specially appointed ministers) from all the countries and, perhaps, they would have to take an oath of allegiance (the civil servants anyway) to the Commonwealth as opposed to their individual countries! And the Secretariat might even be located in Delhi instead of in London (that is, where Mr. George Brown, Mr. Wilson's deputy, would put it anyway). The essence of the idea would be to develop the concept of the new form Commonwealth as an expanding force; it will be opposed only by those who are prepared to see it wither away on the pretext that it is an unnecessary supplement to the U.N.O.



TRENDS IN BRITISH BANKING—I

CHANGING STRUCTURE AND POLICIES

THE slow growth of banking (as compared with the phenomenal growth of building societies and hire-purchase companies during the last several years) and the falling share of bank deposits in national income have come in for widespread criticism. In the face of such criticism, the banking system in Britain appears to have developed a sort of "automatic defence mechanism." Bankers know that their customers can hardly find a better service in the world and, since they offer a rare combination of an entirely personal relationship, a nation-wide grid of apparently limitless financial resources, and a well-knitted branch network, the customers rarely complain. Even when they complain in rare cases about "unimaginative" branch managers who are "insufficiently informed" and who are "unable to take real trouble and initiative," they have nothing but praise for the clerical efficiency of banks. The main complaints against banks, their ways and, the most important of all, their policies come from the public, that is, newspapers, financial journalists and economic commentators. There are, however, some bankers even at the top executive levels who have precise and aggressive ideas, who are efficient and energetic, and who are, above all, knowledgeable. They, too, think deeply about the fundamentals of British banking which are fast changing. In the present stir, what is being challenged and changing is not merely the outward form or internal procedures of banks; the roots of change go deeper into their structure and organisation, into their ways and policies. Since it is the very existence of British banking that is being challenged, the bankers are worried about their own future. The paragraphs that follow attempt to give an outline of the trends and currents of the winds of change-over in British banking.

The inherent limitations of the British bankers' individual and collective set-up which prevent them from thinking about banking innovations were highlighted in the course of a survey published recently by the *Economist* of London. Administratively, there is considerable over-centralisation of the decision-making process in banks, and the head-office management is too much overburdened with detail to be able to think about fundamentals and policies. There may be more of rhetoric than truth in the gibe that general managers know too much about banking and the directors too little, but it is nevertheless a reflection upon the decision-making process in British banks. The managers in the second rank are all so busy with individual accounting, accommodation or advances problems that they are unable to see the wood as a whole. The bankers' collective arrangements also reflect this inadequacy in their thinking ahead for the entire banking sector. Bankers who are busy with their own problems have hardly the time, the equipment or the facilities to evolve policies for the future growth and development of banking. Most of the time, they are busy sorting out the difficulties in an *ad hoc* manner. They are hardly able to agree on positive possibilities of change in the number of business hours in a day, although they could agree on a negative decision on the number of business days in a week.

Five-day Week

The extraordinary decision to close on Saturdays had preceded the decision (or is it indecision?) to remain open on Friday night in order to attract wage earners into the banking system. The bankers announced their decision on Saturday closing soon after the bank chairmen had all made their annual homilies, none of which contained any indication of the decision to come: either they were not aware, or they were not agreed, or it may be that they did not want to tell. But the staff rightly regards the decision on Saturday closing as a victory for one of their long overdue demands. The Committee of London Clearing Banks has already announced that the decision may be implemented soon—which may mean with effect from 1st January 1965. There was some talk of a five-day week for the staff and six-day week for customers, but only the first half seems to have found some favour. Whether in the bargain the bankers will be able to persuade the staff to stagger holidays and provide a skeleton service on Saturdays or whether business hours on all week days or only on Fridays will be increased—there is no knowing.

As things are, bankers have attempted to rationalise their decision by referring to the many banks abroad, particularly in Europe, who operate five-day week without disrupting the national economy or driving the customers into the giro. But, as pointed out in the *Bankers' Magazine* by Mr. George Norman, who describes the chaotic conditions regarding holidays and regarding days and hours of opening in which the European banks keep on going, banking is so hopelessly *casual* in Europe and the banking hours there display a lack of balance and order as compared with the "pathetic little six bank holidays" a year in the U.K.; there are official, semi-official, unofficial, national, religious and civic holidays in Europe: and it is a wonder, he remarks caustically, that any ledgers get posted at all! But he doubts if Britain could live with banking that way!

Popular Banking

The question of Saturday closing is intimately connected with the much wider question of popular banking. The inordinate delay in liberalising the banking hours to make them more suitable for factory wage earners has led many to believe that enthusiasts for more popular banking are to be found in greater numbers outside the banks than within. It is realised by many others that any attempt to make banking more popular requires several innovations and changes, or even break from past habits. To those who have begun to think that the bankers may have lost their enthusiasm for popular banking, a "correspondent of no account" reminds, that the banks have spent £1 million in 1963 in advertising, which reflects their desire to enlarge the circle of banking public. Nevertheless, rightly or wrongly, hardly any doubt is left in the public mind that banks are not doing anything to break the barrier of indifference of the wage earners, inappropriate public image of banks and the mutual distrust of each other. Above all, at a wage-earner's income and standard of living, if the entire credit of the weekly wage packet is to be withdrawn on the pay day itself, or in two instalments at the best, the additional inconvenience to the wage earner of going to the bank and withdrawing cash is hardly an attraction. And in any case, for those who want to save a part of their weekly income, the post office or a building society offers much the same liquidity as a bank does. What is important is that they have far more liberal business hours and they pay interest on current accounts too!

Banks have hardly given much thought to the innovations to make themselves more competitive; no doubt there have been interminable negotiations, but they have hardly produced any results in time. Before Lord Cromer's bold bid for more competitive banking could awaken the banks, for example, the slumbering Treasury was roused with its narrow-minded and restrictive views. If the banks had kept pace with the changing needs and times and done the thinking about new banking innovations themselves, they could have acted before the Treasury was even aware.

In Defence of Bankers

Things are, however, changing: banks no longer despair and resign themselves to a dependence upon the Government for obtaining their liquid assets from a fixed pool of savings. They no longer accept complaints about the failure of bank deposits and advances to keep pace with the trend of national income and of the growth of other financial intermediaries. Contrary to all traditions, the Chairman of Lloyds Bank, Mr. Heral Peake, has openly challenged in a *Guardian* survey, the generally held and long discussed pessimistic implication that banks are not holding their own, with a brand new set of arguments. For the first time in the last several years, a banker has shown that the banks, too, have a perspective on their problems. He analyses the view of the investing public that banks possess greater growth potential (so far, at any rate, as dividend-earning capacity is concerned) than British industry as a whole. This no doubt is a very effective argument, but the banks themselves do not regard the investing public as rational, for, otherwise, they would not be so reluctant about revealing their true profits and reserves in their accounts. Moreover, the public has no real means of obtaining any information about the accumulated secret reserves and, even if they had, the stock market reports at best represent short-term prospects on the basis of past performance and strength, and future economic conditions. They do not in any way justify the conclusion regarding the growth potential or prospects which Mr. Peake has drawn. But the value of Mr. Peake's analysis lies in the fact that banks are not yet convinced that they are losing ground. It is true that there are some trends, so well published which the bankers would like to see altered, but there are at least some respects in which the banks have been keeping up with or running ahead of national economic growth.

To illustrate his powerful arguments, Mr. Peake shows that the money total of London clearings alone has been rising much faster than the national total money incomes. He also shows that even the number of items passing through the clearing has been expanding faster than national income in real terms (adjusted for price rise). This argument can, of course, be countered by saying that the growth in the number or amount of London clearings do not represent real economic growth, but only reflects the equities boom of the fifties.

Mr. Peake concedes that the growth in national income has out-stripped the growth in bank deposits, but he does not agree that this represents banks' failure to extend banking to the wider, wage-earning classes of people. What this overlooks is that the net personal deposits of the banks in recent years have actually been growing faster than the total of personal incomes. Yes, slightly of course. But personal *savings* or personal *investments in financial assets* have far outgrown the growth of personal deposits. And it is hardly possible to judge banks' performance in the face of their unwillingness to disclose information regarding the growth in the number of accounts. Only recently has a sketchy beginning been made by some banks in revealing this information.

A Real Challenge

The failure of banks advances to grow with national income is, of course, a real challenge to banks, for the growth of other financial intermediaries and institutions which also provide finance to entrepreneurs and enterprises has been offering tough competition to banks. But the bankers are prone to attribute their failure to grow in this direction to the various official controls, directives and requests during the period between 1939 and 1958. The impressive growth in clearing bank advances since 1958 when the banks earned freedom from control in comparison with the moderate growth in the building societies' outstanding mortgages, or with the almost stationary hire-purchase debt outstanding, seems to illustrate the bankers' point. The growth of near-banks and non-banks is, moreover, a world-wide phenomenon and banks everywhere must learn to live with them.

A more important consequence of this growth in clearing bank advances during the last five years is that, for the first time in thirty years, the banks have run out of their liquidity. Sometime ago, the Bank of England was forced to grant them additional liquidity by allowing the liquid assets ratio to be reduced from the traditional 30 per cent to 29 per cent at first and 28 per cent later, with the further promise from Lord Cromer that the Bank might agree to an even lower ratio, say 25 per cent if that became necessary in future.

Evidence is growing that the British bankers are willing to modify their traditional practices and to embark upon new departures, even if they may be unwilling to shed their cartel for fixing deposit and advances rates. Introduction of credit transfers and joint advertising for them by the "Eleven Clearing Banks" (even if that was prompted by the bankers' fear that the Radcliffe Committee might introduce a postal giro in Britain), the adoption of many new forms of lending, increase in medium-term loans to industries and exports, installation of electronic equipment and computers, the opening of hundreds of other branches—these are not the only changes. In addition, the relations of clearing banks with their staff and with their new competitors like trustee savings banks and merchant banks are also changing. The impact of these changes will be considered in the second part of this article.

(To be continued)

AMERICAN LETTER

FOREIGN AID BILL IN CONGRESS

SENTIMENT IN FAVOUR OF MULTILATERALISM NOT QUITE STRONG

By N. Pattabhi Raman

MARSHFIELD (VERMONT), 11*th July*

TWO facts stand out in regard to the passage of the Foreign Assistance Act of 1964 in the U.S. Congress this month. Firstly, unlike in previous years, Congress authorised virtually the entire amount of funds requested by the President for the foreign aid programme. This was due largely to President Johnson. He refused to go along with the usual practice of padding up the budget proposal in the expectation that the lawmakers would prune it anyhow to demonstrate their concern for economy and that the figure finally approved by them would approximate to what was actually required. Instead, he requested only $3.4 billion (as compared to President Kennedy's request for $4.9 billion last year), stating that it was the leanest budget he could propose for the programme on hand. Having taken this approach, he insisted that Congress authorise this amount and warned that he would come back to Capitol Hill for more if it should fail to comply with his request. Moreover, he brought into play the immense influence he had accumulated in the past as a Senator. The combination of his statesmanlike approach and political backplay worked. In fact, it worked so well that Representative Otto Passman of Louisiana, who has had widening support in recent years in cutting down foreign aid authorisations and appropriations, stomped out of a sub-committee hearing in rage, cursing President Johnson.

Secondly, the debate in Congress over the Aid Bill was quite sedate and short. Criticism there was, but it was muted. There was none of the excitement and tension that followed the publication of the Clay Committee report last year, none of the fiery opposition of the band of liberals led by Senator Wayne Morse—erstwhile supporters of aid—which burned a big hole in the fabric of foreign aid last winter. Besides Johnson's approach, the preoccupation of the lawmakers with the Civil Rights Bill perhaps also contributed to the reduction in Congressional verbiage.

History of Aid Programme

Impressive as these facts are, they should not delude anyone into thinking that foreign aid is now out of trouble. The controversy surrounding it is far from over. This controversy, it is worth noting, is as old as the programme itself. From the beginning, the programme has meant different things to different people. Though in recent years, there have been criticisms of waste, inefficiency or corruption in the programme's administration, the basic cause of the controversy has been the purpose of the programme itself. The attendant cross-fire has generated more heat and noise than light.

In its early days, foreign aid was aimed primarily at containing the spread of Communism and at the defence of threatened nations. Hence the military and economic assistance to Greece and Turkey in 1947 and the launching of the Marshall Plan in 1948. The accent was on "mutual security"—as reflected in the Mutual Security Act of 1951 which lumped together both military and economic programmes. This accent grew heavier in the years when the late John Foster Dulles was Secretary of State. He employed aid as an instrument in developing a ring of bases or strong points around the Communist bloc nations.

The concept of assisting the economic progress of the poorer nations emerged only later. President Truman's Point Four programme pointed the way. Consequent upon the economic resurgence and military strengthening of Western Europe and Japan, the threat to American security and welfare posed by the social and political conflicts within the underdeveloped areas came to be recognised more fully. Greater emphasis than before thus came to be placed on America's contribution to the global war on poverty.

Other purposes, too, emerged in the course of the 17-year history of the aid programme. At least three of these can be identified today. One, foreign aid has become directly involved in financing exports and developing overseas markets for American products, through such devices as Public Law 480 and the "Buy American" stipulation. Two, humanitarianism has provided the motive sometimes, as evidenced in gifts of food products for famine relief, etc. And three, aid has been used repeatedly as a bribe. For example, loans and grants, or favours to Government leaders and politicians of recipient nations, have been given in exchange for military bases and political services.

In short, foreign aid has emerged as a handy multi-purpose instrument of U.S. foreign policy, used in an increasingly wide variety of ways for an increasing broad range of purposes. As a result, attempts to develop a single doctrine of foreign aid have not been quite successful. Even efforts to de-emphasise the negative, anti-communist element and accent the positive, world-building aspect of the programme have never quite come off. In 1961, for example, the late President John F. Kennedy sought to educate the public about the positive, constructive aspects of foreign aid, but he too had to fall back on the anti-communist dogma in order to secure Congressional approval of his aid proposals.

President Johnson's Approach

Now, President Johnson is making a fresh attempt to educate the public on why America should spend millions of dollars of taxpayers' money in assisting the less developed countries. Appealing for the support of newspaper publishers and editors in this task, Mr. Johnson said in April:

"We are waging an all-out war against poverty here at home. We are committed to pursue that war to final victory. But we are also engaged in that same battle on 100 different fronts around the world, in 100 or more nations.

"We do this for two reasons. First, for the first time in history, man has the real power to overcome poverty. . . The determined labour of skilled men and women can ultimately produce enough food and clothing and shelter for all mankind. The possession of new abilities gives us new responsibilities and we want to live up to those responsibilities. That is our Christian duty.

"Second, we now know that the progress which others make in satisfying their own desire for a better life will ultimately affect our own future and our own prospects, for we are now part of a single world community. . . ."

The President further warned that if a peaceful revolution in the less developed lands is not given proper assistance, "a violent revolution is inevitable." "The people of the developing world are on the march, and we want to be beside them on that march," the President declared.

If President Johnson is keen on doing a better job than has been done till now in explaining "why our children's welfare and the welfare of our country may well depend on the wisdom and the foresight we show in working with the people of other lands," foreign aid's foes are as adept as ever on creating confusion. Even though the many achievements of the programme recorded over the past 17 years stare them in their faces, they prefer not to see them, but continue to describe foreign aid as a "gigantic giveaway," or a swindle of the American taxpayer or the throwing away of good money after bad people (such as neutralist, socialist or communist governments and independent nations), or as a vast bureaucratic boondoggle that has done no good to anybody.

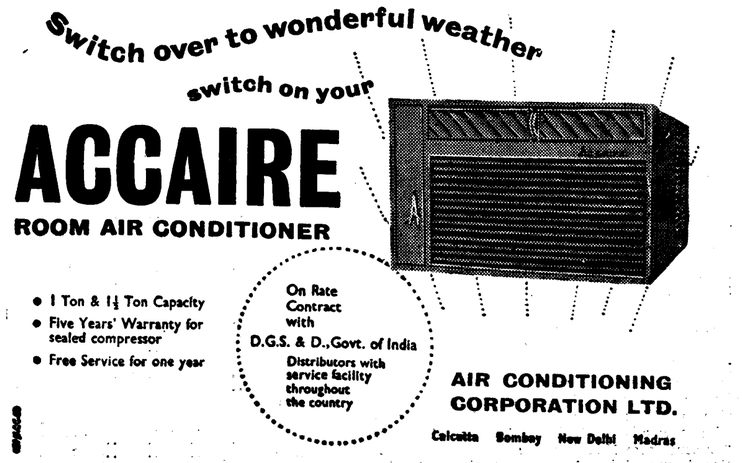
Multilateral Aid

Perhaps, the controversy over foreign aid will never abate. It is recognition of this possibility that impelled some people like Eugene R. Black, former President of the World Bank, to advocate multilateralism in aid-giving. Multilateral aid, in their view, would free this important task from the influence of national politics and domestic controversies and enable the formulation and implementation of orderly, internationally co-ordinated and economically effective development programmes.

There is some sentiment in U.S. Government and political circles in favour of multilateralism. But there is no disposition to give up the concept of bilateral aid. In this context, some remarks on foreign aid included in a recent statement by a panel of Republican leaders constitute constructive criticism. The panel said that the U.S. must discontinue the use of foreign aid as "a multi-purpose gadgets to be taken out of the kit as found convenient—a kind of bribe or bludgeon to accomplish any and all kinds of foreign policy purposes." Such use, it said, "has led to confusion regarding its real purposes and helped defeat them." The panel stated further: "This is not to say the United States should abandon efforts to achieve short-range political objectives. It is to say that the use of foreign aid for such purposes is not the way. In cases where short-run financial assistance is deemed necessary in the national interest, the money should be made available out of a special fund at the disposal of the President, appropriated for that specific purpose. This fund should be labelled for what it is and not be confused with economic and technical assistance directed towards what we believe is foreign aid's appropriate role in achieving constructive longer-range purposes."

FUND AND BANK REVIEW

The first issue of a new quarterly, entitled *The Fund and Bank Review: Finance and Development*, sponsored jointly by the International Monetary Fund and the World Bank, and reflects the wish of the two institutions to make both their own work, and the sphere in which they operate, more comprehensible to non-specialists, has just been published. In a foreword, the Managing Director of the Fund and the President of the World Bank explain their particular hope that the publication will be read in the developing countries and elaborate on its field of interest as being "the nature and development of the international monetary system, the purposes and techniques of development assistance, and the vital relation between monetary processes and economic growth." The new publication appears in three identical editions in English, French and Spanish. The Editor of the new review is Mr. J. D. Scott, a British writer and journalist, who has come from London to take up the appointment.



INTERNATIONAL FIBRE SITUATION

MAN-MADE FIBRES OFFERING KEEN COMPETITION TO COTTON

THE most striking feature of development in the international fibre situation in recent years is the marked inroads made by man-made fibres in apparel making *vis-a-vis* natural fibres (cotton and wool). Thus, between 1958 and 1963, the share of man-made fibres has gone up from 20.4 per cent to 27.9 per cent, while that of cotton has receded from 70.2 per cent to 62.8 per cent and wool from 9.4 per cent to 9.3 per cent. So keen is the competition from man-made fibres lately that there is no exaggeration whatever in the statement of the International Cotton Advisory Committee (Washington) that the most serious problem facing the cotton industry at the present time is without doubt "the constant erosion" of cotton's market. The Committee, in its May-June 1964 issue of Cotton, points to the deterioration in cotton's position in the U.S., the equally unfavourable situation to cotton in Western Europe, the possibility of a further increase in the production and consumption of man-made fibres this year, the expanding man-made fibre capacity in several countries, the sharp reduction in prices of synthetic fibres, and the widespread acceptance of blended fabrics containing a much higher proportion of man-made fibres than either cotton or wool.

Rayon Production

The world production of man-made fibres, according to the Review, has continued to expand at an accelerated rate in many countries. In terms of cotton equivalents, world rayon consumption in 1963 was over four million bales higher than in 1959. Four years ago, rayon production was only about 25 per cent of the total consumption of raw cotton, but now the percentage has risen to over 30 per cent. Relatively the advance made by synthetic fibres has been more pronounced, with consumption now well over double the 1959 level and equivalent to about 15 per cent of cotton consumption. In contrast to the static situation in raw cotton, therefore, the total production of man-made fibres over the period 1959 to 1963 has risen by more than 45 per cent. Competition from other fibres existed in the 'fifties, particularly from rayon, but, even so, cotton registered considerable gains. There was almost uninterrupted upward trend of cotton consumption in that period, the average annual rate of increase being about four per cent. But the growth in rayon was more marked: an average of six per cent per year. Synthetic fibre production was, for the most part, still relatively small. This stands in contrast to the situation prevailing today. Absolutely as well as relatively, the competitive position of cotton has deteriorated rapidly. If the growth rate of the 'fifties had continued, the world cotton consumption would have been several million bales higher than it is, and the surplus problem would be greatly alleviated. In fact, the current rate of world cotton consumption is below than in 1959, notwithstanding the fact that the rehabilitation of cotton textiles industries in Western Europe has been completed and that the establishment and expansion of textile manufacturing in many primary producing countries have proceeded to the point where these countries are more or less self-sufficient in cotton textiles in relation to effective demand. The inability of cotton consumption to expand at all in recent years has been due to the intensified competition from man-made fibres as will be seen from the table at the end.

Cotton's Position

The decrease in the relative consumption of cotton has been marked in Japan and the United States. The deterioration in cotton's position is very apparent in the U.S., where cotton consumption is now at one of the lowest levels for the entire post-war period. In a matter of only three years, the share of cotton in the total market for textile fibres in that country has fallen from 66 per cent to the all-time low of 57 per cent. It is reported that the cumulative effect of competitive losses over this period has reduced the annual rate of cotton consumption by 1.8 millon bales. The total production of man-made fibre industry in that country is now equivalent to nearly nine million bales, or even higher than cotton consumption. In 1963, man-made fibre production reached a new all-time high, an increase of eleven per cent from 1962. Rayon and acetate production increased by six per cent, the entire increase being in staple fibre. Non-cellulosic fibre output was up by eighteen per cent.

The situation in Western Europe, as already stated, is just as unfavourable to cotton. Mill consumption of rayon (production plus imports minus exports) went up by about four per cent in 1963. Western Europe is a large net exporter of rayon and, so, if production data alone are considered, the increase was much more than this. For the six major rayon producing countries the aggregate increase in production comes to over nine per cent. Here again, virtually the whole of the increase has been in staple fibre, the only significant rise in continuous filament yarn being in the United Kingdom. This is of significance in the sense that cotton comes into direct competition with staple fibre on the spinning system. The rate of growth in consumption of synthetic fibres in Western Europe, though it slowed down in 1963, was still of the order of eleven per cent.

In Japan, cotton consumption increased last year but proportionately the increase in respect of other fibres was more significant, particularly in the case of synthetics. Japan is one of the countries where the growth of synthetic fibres has been spectacular and the development of this industry has progressed as a part of Japanese textile industry. Rayon consumption was still far short of its 1957 peak, while the output of synthetic fibres reached a new high in 1963.

In India, though the development of the man-made fibre industry has been rapid, the share of cotton in the total consumption of all fibres has gone down only slightly from 94.3 per cent in 1958 to 92.4 per cent in 1963. Between 1958 and 1963, actual consumption of cotton has risen by 15 per cent, while that of rayon and acetate by 47 per cent and of other man-made fibres by as much as 260 per cent.

Planned Expansion

In certain countries, policy is now directed to a planned expansion of synthetic fibre production and there is relatively less emphasis on raw cotton. International trade in rayon and synthetic fibres is moving in the same direction and the market for man-made textiles in cotton producing countries, though it is still small in relation to total consumption of all fibres, is growing continuously. Alluding to this phenomenon, the Review observes:

"It is difficult to summarise the reasons for the advance made by man-made fibres and the losses that have occurred in cotton's markets. Price is one of the factors, though it is more important in some of the countries than in others. Technological developments and improvements have rejuvenated the rayon industry and are certainly factors in the growth of synthetic fibres. Finally, in view of the much greater expenditures, promotion and researches have also been more effective for the man-made fibres than for cotton, and marketing and distribution practices have been more aggressive."

The upward trend in the production and consumption of man-made fibres is expected to gather further momentum in the current year. The continued upswing in the economies of the major industrial countries, it is said, should react favourably on the demand for textiles and the tendency is for the man-made fibres to take an increased share of the total market. Within the industry itself, rise in capacity is indicative of the potential demand. The world rayon production is scheduled to have only modest increases, but, by the end of 1964, the production capacity in the non-cellulosics in the world is expected to be over 1.8 million metric tons annually or roughly 40 per cent more than actual production in 1963. The man-made fibre industry is expanding not only in more traditional manufacturing countries but also in many cotton producing countries, as for instance, in the U.S.S.R. and Brazil. The other favourable factors for the growth of this industry are the sharp reductions in prices of synthetic fibres over the last year and the widespread acceptance of the blended fabrics containing a much higher proportion of man-made fibres than either cotton or wool. The *per capita* world consumption of all fibres is estimated at 10.6 lbs., of which the man-made fibres alone account for 2.5 lbs.

The table below indicates the trend of man-made fibres production in the past two years (1962 and 1963), as compared with 1956 and 1951:

(In thousand metric tons)

	1951	1956	1962	1963
Rayon and acetate:				
Yarn	963	1,026	1,203	1,220
Staple	855	1,359	1,662	1,833
Total ..	1,818	2,385	2,865	3,053
Non-cellulosics:				
Yarn	76	198	634	751
Staple	27	109	445	547
Textile glass fibre ..	16	49	115	130
Total ..	119	356	1,194	1,428
Grand Total ..	1,937	2,741	4,059	4,481

It will be seen from the above figures that the world production of rayon filament yarn and staple in 1963 established a new record of 3,053,000 metric tons, which was about eleven per cent more than in the previous year. The rise was mostly accounted for by the important producing countries, particularly in the United States, West Germany, the Soviet Union, the United Kingdom, Japan, Italy and Spain. In some cases, the increase in output was mainly the result of larger export commitments in respect of both yarn and staple, the Soviet Union and China being the main markets. The United States remained the single largest producer. After reaching a peak in 1951, output of rayon and acetate in the United States subsequently experienced a marked decline, but, in the last two years, serious attention has been given to the construction of additional cellulosic capacity as a result of renewed interest in their fibres for end-uses hitherto dominated by other synthetic or natural fibres, particularly cotton. Japan has retained its place as the world's second largest producer of yarn. Filament yarn production in Japan has been curtailed since mid-1957 when a joint government industry committee limited output to 30 per cent below the industry's capacity level. In March 1963, however, this limit was removed, following announcements by the two large rayon manufacturers that each was planning to reduce its filament yarn output. The aggregate world exports of rayon and acetate staple rose to a new peak in 1962 at about 337,000 metric tons, 19 per cent more than in 1961. Aggregate exports from the Common Market countries were 13 per cent more than

MANCHESTER LETTER

FOREIGN TRADE IN TEXTILES

IMPORTS RISE AGAIN—EXPORTS DECLINE

From Our Special Correspondent

MANCHESTER, *7th July*

AT the end of five months of the current year, the import-export ratio so far as cotton goods alone were concerned had widened still further in favour of arrivals. Cloth imports at 344,491,000 square yards were, in fact, little more than 8 million yards below the peak level of 1961. Nor did the substantial purchases show any sign of subsiding, in view of the strong call for supplies generally. Exports of cotton fabrics, on the other hand, still drifted downwards, the quantity of shipments to the end of May being 88,067,000 yards, as against 96,140,000 yards in the same period of 1963. Corresponding exports of man-made fibre piecegoods, however, continued their progress, amounting to 37,986,000 square yards, as against 32,723,000 square yards last year.

Very little change was noticeable in the movement of cotton yarn and thread abroad, the five-month total being 9,280,000 lbs., as against 9,455,000 lbs., but, again, the man-made fibre sector kept up its sustained improvement. The weight of yarn shipped abroad increased from 33,725,000 lbs. to 41,470,000 lbs.

Imports of cotton yarn and thread in the five months were only slightly higher than last year, at 17,426,000 lbs., as against 16,836,000 lbs., but the similar products in the man-made fibre branch were sharply higher at 10,533,000 lbs., as against 5,919,000 lbs. Arrivals of man-made fibre cloth also show a broadening tendency, having risen from 24,510,000 square yards to 38,941,000 yards.

Arrivals of Yarn

Detailed figures of imports of cotton yarn are not as immediately obtainable as those for cloth, which are published regularly in the Trade and Navigation Accounts of the Board of Trade. It is known, however, that, at the end of the first quarter this year, arrivals of yarn had exceeded the 1963 level by 676,000 lbs., being around 10,400,000 lbs. This compared with imports for the whole of last year of 35,500,000 lbs.

In the first quarter, the bulk of the supplies from individual markets came from India, which sent nearly 3 million lbs., as against 9,696,000 lbs. in the whole of 1963 and the annual ceiling of 11,470,000 lbs. The other two major suppliers were Spain, with 1,832,000 lbs., as against 6,916,000 lbs. in the whole of last year and an annual ceiling of 8,400,000 lbs., and Hong Kong with 1,672,000 lbs., as against 4,813,000 lbs. in 1963 and a ceiling of 6,340,000 lbs.

Somewhat remarkable is the fact that, in the first three months of this year, imports of cotton yarn from Pakistan were quite negligible at barely 1,000 lbs., as against last year's full total of 717,000 lbs. and an annual ceiling of 600,000 lbs. Several European countries have maintained their 1963 level of exports to Britain, including the Irish Republic with 615,000 lbs., Italy 633,0000 lbs., Portugal 385,000 lbs., Switzerland 329,000 lbs., and Belgium 322,000 lbs. Arrivals of cotton yarn from Israel accounted for 495 000 lbs. in the three months, while imports of 325,000 lbs. from Egypt represented more than half the total of purchases from that country last year. Greece supplied 238,000 lbs., as against 506,000 lbs. throughout 1963.

"One World"—In Textiles

No more forthright answer to those people, generally outside the Lancashire textile industry, who persist in referring to the "cotton" trade can be given than that provided by Mr. W. T. Winterbottom in his current statement with the accounts of Fine Spinners and Doublers Ltd. "The introduction of new fibres, as well as the continuing popularity of other older established fibres such as viscose and cotton, continue to demonstrate the subtle values of the machinery system which we use," he says. The emphasis must undoubtedly be on the drafting system, which Mr. Winterbottom declares is paramount, not the raw material. "Our machinery can handle literally any fibre up to a staple length of 2½", with only minor adjustments and refinements to suit particular fibres," he adds.

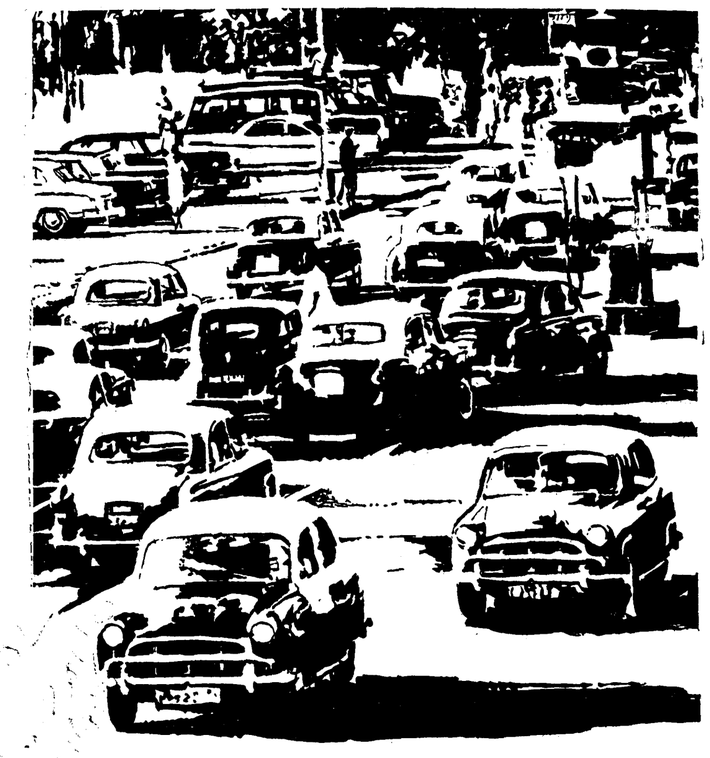
This inability to accept the well recognised fact among textile men that most of the fibres are now almost completely interchangeable, encourages misguided comment. Even in this scientific age, such criticism receives more publicity than it warrants in semi-technical journals which cast aspersions on an industry which, for all its failings, has struggled hard in the past 20 years against a number of discouraging outside factors.

Basic Adaptability

The basic adaptability of the drafting system of spinning, along with far-reaching developments in fibre chemistry, have been responsible for the growth in the sources of supply of yarn and cloth for a wide range of end-uses, according to Mr. Winterbottom. No longer is there a limit to the products which can be supplied to customers such as that once apparently created by the processing of shorter stapled natural fibres. Nor is this feature of recent origin, as he points out. It has been going on for over 30 years.

Always keen to propagate the theory of price support, particularly during a period of keen competition, when sellers have to face considerable pressure from customers, Mr. Winterbottom makes his point in commenting on the trade revival which began towards the end of September last. "Unfortunately, after a long period of desultory trading, with its attendant evils of lack of continuity and hand-to-mouth production in direct opposition to the basic requirements of re-equipped mills, firms in the industry succumbed to the temptation of increasing their orderbooks to a size which would ensure a long period of full activity before they felt strong enough to make determined attempts to obtain worthwhile margins," he says.

As a result, spinners and weavers derived no benefit from the greatly increased activity until the first quarter of the current year when margins at last began to improve. Still optimistic about the outlook, Mr. Winterbottom predicts a bright future for textiles provided the industry's problems are more sympathetically regarded in quarters where remedial action can be taken, and if those concerned follow a rational pricing policy. Then, he feels, the remaining firms would show results more in keeping with what should be obtained from a highly capital-intensive industry.



Dunlop Gold Seal tyres are being bought by car owners in unprecedented numbers. There are good reasons. They give the highest mileage. Their proven grip on wet roads means that they are the safest tyres. Further, the strength of the casing assures maximum retreadability. You too can have these advantages by fitting a set of Dunlop Gold Seal car tyres.

CAPITAL ISSUES IN PRIVATE SECTOR

INVESTORS MORE SELECTIVE—UNDERWRITERS' LIABILITY RISES

IN our first leading article last week, we emphasised how urgent was the need for keeping the capital market buoyant. For a stagnant capital market always adversely affects the flow of funds to industry. The veracity of this statement is clearly borne out by the comparison of the capital market situation during the calendar year 1963 with that in the three previous years (1960-62) as given in an interesting article on capital issues in private sector during the period 1960-63 published in the June 1964 issue of the Reserve Bank of India's monthly *Bulletin*. The total amount of fresh capital raised by non-Government companies (both public and private limited companies) during 1963 was no more than Rs. 81 crores, as against over Rs. 105 crores raised in 1962, Rs. 99 crores in 1961 and less than Rs. 90 crores in 1960. The decline was accounted for by both initial issues and further issues, the amounts actually raised falling from Rs. 30.94 crores in 1962 to Rs. 27.63 crores in 1963 in the case of the former and from Rs. 74.32 crores to Rs. 53.07 crores in the case of the latter. New issue activity suffered a sharp setback in 1963, the total amount of new issues being just Rs. 51 crores, as against Rs. 98 crores in 1962. Even if the giant debenture issue for Rs. 30 crores by Oil India Ltd.—an undertaking jointly owned by the Central Government and a private sector company—is not taken into account, there was a fall of Rs. 17 crores in new issues during 1963. The public response to most of the issues made during the year was reported to have been unsatisfactory with only a few selected good issues being met with favourable response. The proportion of issues underwritten to the total number of issues made through prospectus also increased from 71 per cent in 1962 to 77 per cent in 1963, while the amount underwritten in relation to the net amount offered to the public was 81 per cent, as against 84 per cent in 1962. A large proportion of the amount underwritten reportedly devolved on the underwriters, owing to unsatisfactory response to a large number of issues.

Table A: Capital Raised by Non-Government Companies
(In crores of rupees)

Capital raised	1963	1962	1961	1960	Total
Initial	27.64	30.94	37.27	29.80	125.65
Of which:					
Ordinary shares	27.01	30.03	35.52	29.33	121.89
Preference shares	0.63	0.91	1.75	0.47	3.76
Further	53.07	74.32	61.65	59.95	248.99
Of which:					
Ordinary shares	28.91	43.11	45.64	43.12	160.78
Preference shares	1.82	1.33	3.92	7.44	14.51
Debentures	22.34	29.88	12.09	9.39	73.70
Grand Total	80.70	105.27	98.92	89.75	374.64

The sluggishness of the capital market during 1963 actually began towards the close of 1962, reflecting the market's reaction to Chinese aggression on the northern borders. The number of capital issues through prospectus declined from 85 in 1961 to 77 in 1962. The total amount offered no doubt increased from Rs. 16.36 crores to Rs. 26.48 crores, but, since the shortfall in public response was heavy, the underwriters had to take up quite a bit of the unsubscribed amount: Rs. 5.77 crores (26.0 per cent of the amount offered) in 1962, as against Rs. 2.94 crores (23.9 per cent of the total) in 1961.

The Reserve Bank's analysis of the recent trends in new issue activity shows that the period 1959 to 1962 (until the declaration of the Emergency in October 1962) was a boom phase for capital issues, as the investment climate remained favourable as a result of the growth prospects of industries in an era of planned development and prospects of capital appreciation in the context of the continued bullish trend in stock markets. The Reserve Bank's index of variable dividend industrial securities rose by 30 per cent in the two years 1958 and 1959 and by another 24 per cent between 1960 and mid-1962, the total rise in the boom phase in the stock markets—this phase lasted for about 4½ years from early January 1958 to mid-June 1962—being of the order of 60 per cent.

A security-wise classification of new capital issued by different industries shows that, with the exception of electricity generation and supply and mineral oils, all other industries which had substantial recourse to capital market resorted largely to ordinary shares. Thus, out of the total capital issue of Rs. 264.88 crores during the period from 1960 to 1963, ordinary shares accounted for Rs. 203.30 crores, preference shares for Rs. 15.43 crores and debentures for Rs. 46.16 crores. The market for securities yielding a fixed return, that is, preference shares and debentures, remained generally limited as indicated by the trends in the issue of these securities during these years. Preference issues, after an initial rise from Rs. 2.0 crores in 1957 to Rs. 9.7 crores in 1959, dropped continuously to Rs. 2.6 crores in 1962 while debenture issues fell from Rs. 5.3 crores in 1958 to Rs. 1.1 crore in 1961 before increasing to Rs. 38 crores in 1962, mainly on account of the Rs. 30-crore debenture issue by Oil India Ltd. The details of capital raised by non-Government companies in the past four years are given in Table A. The industry-wise distribution of the total for the period 1960-63 is given below:

Engineering 99.51; mineral oils 30.00; chemicals 24.13: cotton textiles 15.57; paper 15.34; rubber and tyres 14.64; banking and finance 8.69: "other" textiles 8.14; sugar 6.71; electricity generation 6.33; cement 5.95; coal 2.43; jute textiles 1.74; plantations 1.28; shipping 0.25; and miscellaneous 24.18.

The boom phase in capital issues during the years 1961 and 1962 was characterised by an increase in the number of issues made at a premium, from 10 in 1960 to 24 in 1961 and 39 in 1962, the majority carrying a premium upto 50 per cent of the face value of the issue. The number of such issues, however, fell significantly to 19 in 1963, reflecting a change in the capital market situation. The fixation of premium on issues quoting substantially above par, it may be noted here, has been one of the measures adopted by the Controller of Capital Issues to curb speculative tendencies in the market.

A larger proportion of the capital issues was made through prospectus which accounted for about 58 to 67 per cent of the total amount issued during 1960-62, the balance being through rights. As between capital issues by new companies (initial issues) and issues by existing companies (further issues), a substantially larger proportion was in respect of the latter category during 1961 and 1962; in 1960, however, the amount of the "initial" issues was somewhat higher. An analysis of the size-wise classification of capital issues made during the period reveals that a larger proportion (59 to 78 per cent) of the capital issues comprised big issues, that is, issues for over Rs. 50 lakhs.

The preference and debenture capital issues made since 1960 have been at higher rates of dividend and interest reflecting the rise in the cost of capital during the period in conformity with the uptrend in the interest rate structure in the economy in recent years. The dividend rate for preference shares during 1963 remained unchanged at the 1962 levels (9-9½ per cent), while the rate of interest offered on all the debenture issues was higher at 7 per cent, as compared with 6½ per cent on a majority of issues in 1962.

Of the capital issues (through prospectuses) aggregating Rs. 32.79 crores in 1963 (as against Rs. 65.42 crores in 1962), the share of public subscriptions was Rs. 17.19 crores (Rs. 28.02 crores in 1962). The balance was contributed by promoters, directors' friends, etc. Rs. 8.41 crores (Rs. 7.61 crores in 1962), foreign investors Rs. 6.26 crores (Rs. 4.87 crores), Indian financial institutions Rs. 77 lakhs (Rs. 11.53 crores), and existing shareholders Rs. 16 lakhs (Rs. 69 lakhs). There was no contribution by Central and State Governments in 1963, whereas, in 1962, such contribution amounted to Rs. 12.71 crores.

Although both the number and the amount of issues involving foreign participation went up (the former rose from 17 in 1962 to 30 in 1963 and the latter from Rs. 13.08 crores to Rs. 18.70 crores) and the amount of foreign participation, too, increased (from Rs. 4.87 crores to Rs. 6.26 crores), the proportion of such participation in the total declined from 37.3 per cent in 1962 to 33.5 per cent in 1963. The latter figure is, however, well above that (23.5 per cent) for the year 1960. Country-wise, the share of the U.S. in the total foreign participation is predominant, followed by the U.K., Sweden, Italy, Japan, W. Germany, France, Austria, Switzerland and Canada (*vide* Table B).

The Indian financial institutions (I.F.C., I.C.I.C.I., L.I.C., etc.) evinced increasing interest through direct participation in industrial securities during the years 1961 and 1962. Indicative of such interest was the rise in the share of these institutions (representing firm allotments) from 7 per cent in 1960 to 12 per cent in 1961 and 17.6 per cent in 1962. The proportion, however, fell to 2.3 per cent in 1963.

As for underwriting support, the role of brokers, banks and the Life Insurance Corporation continued to be generally predominant during the year 1963. But there was also evidence of larger amounts being underwritten by specialised financial institutions, namely, the Industrial Finance Corporation of India (I.F.C.), the Industrial Credit and Investment Corporation of India (I.C.I.C.I.) and the State Financial Corporations (S.F.Cs.), as will be seen from Table C.

A striking feature of growth in the corporate (joint-stock) sector since the beginning of the second Plan is that despite a substantial reduction in the number of companies between 1956 and 1963 (as a result of the process of elimination of *moribund* and inactive companies from the register of live companies by the Company Law Administration), the paid-up capital continuously increased from year to year (*vide* Table D). The data indicate an increase of Rs. 311 crores in paid-up capital during the second Plan period (April 1956-March 1961) and a further Rs. 130 crores was added in the first two years of the third Plan (1961-63). There has thus been an average annual increase of Rs. 62.65 crores since the beginning of the second Plan. The total paid-up capital of non-Government companies at Rs. 1,399 crores at the end of March 1963 constituted about 64 per cent of the total paid-up capital of both Government and non-Government companies (Rs. 2,185 crores). As between public and private limited companies in the private sector, the former accounted for about three-fourths of the total paid-up capital of non-Government companies, although, in numerical strength, they constituted less than one-fourth of the total number of non-Government companies. The data relating to consents for capital issues to non-Government companies, which roughly indicate the investment intentions of the private sector, also show a substantial increase in the total consents (including bonus and miscellaneous issues), the annual average moving up from Rs. 139 crores during 1956-60 (roughly corresponding to the second Plan period) to Rs. 214 crores during the three years 1961 to 1963.

Table B: Foreign Participation in Capital Issues

Country of origin	Number of issues with participation	Amount (Rs. crores)	Percentage to total foreign participation
U.S.A.	25	11.09	53.4
U.K.	27	4.44	21.4
Sweden	5	2.65	12.8
Italy	3	1.27	6.1
Japan	4	0.40	1.9
W. Germany	8	0.32	1.6
France	2	0.32	1.5
Austria	2	0.13	0.6
Switzerland	1	0.10	0.5
Canada	1	0.05	0.2
Norway	1	—	—
Total	76*	20.77	100.0

* In the case of 3 issues, there were participant from two different countries. — Negligible.

As a substantially large proportion of the total consents comprises consents for the issue of shares (other than bonus) and debentures, they also provide a rough index of the possible magnitude of new issue activity, as the period stipulated for the utilisation of such consents is generally one year. Such consents, too, have shown a substantial increase, the annual average moving up from Rs. 96 crores during 1956-60 to Rs. 146 crores during 1961-63. The data pertaining to capital actually raised by the private sector companies through the issue of shares other than bonus) and debentures available from 1957 onwards also show a rising trend over the years. The annual average for 1961-63 was higher at Rs. 95 crores, as against Rs. 71 crores in the preceding four years (1957-60). The major part of the capital raised represented equity capital, the public limited companies accounting for a predominant share.

Table C: Underwriting—Institution-wise
(In crores of rupees)

	1963	1962	1961	1960	Total
L.I.C.	2.08	8.65	1.91	1.30	13.93
	(14.06)	(33.1)	(11.7)	(11.2)	(20.4)
I.F.C.	1.41	2.41	1.41	0.30	5.52
	(9.80)	(9.2)	(8.6)	(2.6)	(8.1)
I.C.I.C.I.	1.38	2.42	0.60	1.42	5.81
	(9.6)	(9.3)	(3.7)	(12.2)	(8.5)
Banks	2.42	4.09	1.85	4.38	12.74
	(17.0)	(15.6)	(11.3)	(37.8)	(18.7)
Investment companies	0.25	0.79	0.84	1.12	2.99
	(1.8)	(3.0)	(5.1)	(9.7)	(4.4)
Brokers	4.43	5.92	6.24	2.59	19.18
	(31.0)	(22.6)	(38.3)	(22.4)	(28.1)
S.F.Cs	1.45	0.39	2.10	0.15	4.08
	(10.1)	(1.5)	(12.9)	(1.3)	(6.0)
Others	0.87	1.48	1.36	0.32	4.08
	(6.1)	(5.7)	(8.3)	(2.8)	(5.9)
Total	14.28	26.14	16.30	11.57	68.28

Figures in brackets indicate percentage to total.

The bulk of the increase of Rs. 1,111 crores in the total paid-up capital over the period March 1956-March 1963 has been in the Government sector, the paid-up capital of which has gone up by Rs. 720 crores (to Rs. 786 crores), whereas that of the non-Government sector has risen by Rs. 441 crores (to Rs. 1,399 crores). Consequently, the share of Government companies in the aggregate paid-up capital of the entire joint-stock sector in 1963 was as high as 36 per cent, as against a bare 6 per cent in 1956. And indications are that this share is bound to rise further in the coming years. It is thus clear that economic power is getting relatively more and more concentrated in the State sector.

Table D: Joint-stock Companies At Work

End of March	Companies	Public limited companies: Number	Public limited companies: Paid-up capital (Rs. crores)	Private limited companies: Number	Private limited companies: Paid-up capital (Rs. crores)	Total: Number	Total: Paid-up capital (Rs. crores)
1956	Non-Government	..	..	..	..	29,813	9,58
	Government	..	..	..	..	61	66

	Government	41	23	113	6,04	154	6,28
	Total	5,971	10,05	18,881	9,69	24,852	19,74
1963	Non-Government	5,952	10,60	19,412	3,40	25,364	13,99
	Government	42	27	118	7,59	160	7,86
	Total	5,994	10.87	19,530	10,98	25,524	21,85

deposits amounting to Rs. 1.30 lakh were received from the public during the year; the term of deposits which earn 4¾ per cent is five years. The total of such deposits at the end of the year was Rs. 2.41 lakhs. Further, the Corporation has also obtained borrowing limits of Rs. 20.70 lakhs and Rs. 31.50 lakhs with the Refinance Corporation and the Reserve Bank of India, respectively. Applications for an additional limit of Rs. 93.15 lakhs were still pending with the Refinance Corporation.

A sum of Rs. 1.40 lakh on account of dividends payable to the Reserve Bank and the State Government was forgone by them in accordance with the recommendations of the Working Group on State Finance Corporations; the amount has been credited to a special reserve account. They have further agreed to forgo dividends till the special reserve is equal to 10 per cent of the paid-up capital of the Corporation.

The Corporation earned during the year a gross income of Rs. 15.76 lakhs, as against Rs. 11.96 lakhs in the previous year. Expenses also rose from Rs. 3.89 lakhs to Rs. 5.57 lakhs, with the result that net profits went up from Rs. 8.07 lakhs to Rs. 10.19 lakhs. After transferring more than Rs. 95,000 to reserves and providing Rs. 4.63 lakhs for taxation, the balance of Rs. 4.61 lakhs was available for meeting the 3¾ per cent guaranteed dividend liability of Rs. 5.25 lakhs. The shortfall of Rs. 64,000 was proposed to be withdrawn from reserves for the purpose of meeting the liability. If the 7½ per cent tax on dividends introduced this year is also to be paid by the Corporation, it would necessitate drawing a subvention of about Rs. 40,000 from the State Government, bringing the total of subvention liability of the Corporation to the State Government to Rs. 20.38 lakhs.

The presentation of details relating to industry-wise and amount-wise classification of loans sanctioned leaves much to be desired in some cases. The table on industry-wise and year-wise classification, for example, would have been more useful, if another column giving totals for all the years since the inception of the Corporation were given.

MYSORE STATE FINANCIAL CORPORATION

The tempo of progress maintained by the Mysore State Financial Corporation in recent years has not only been maintained but has been accelerated during the year ended March 1964. In that year, the Corporation received 52 applications for Rs. 111.21 lakhs, including 40 applications for Rs. 102.72 lakhs from new concerns. The number of applications sanctioned was 38 covering a total of Rs. 73.23 lakhs. Since the inception of the Corporation on 31st March 1959, financial assistance has been granted to 149 applicants, the total amount involved being Rs. 223.05 lakhs. The actual disbursements against sanctions at the end of 31st March 1964 stood at Rs. 180.06 lakhs inclusive of 89 loans amounting to Rs. 125.96 lakhs which have been fully availed of. The total disbursements were 82 per cent of the sanctions. Financial assistance has been sanctioned for the establishment of five new units, namely, paper, pulp and paper board, manufacture of allied transport equipment, plastic goods manufactures, gas manufacture and storage batteries. The Corporation has also continued to render financial assistance to small-scale industries in an increasing measure; about 80 per cent of the applications received during the year was from this sector.

One disturbing feature of the Corporation's working in 1963-64 was that, out of the 105 instalments either of principal and/or interest, as many as 31 instalments from 26 parties covering over Rs. 2.23 lakhs were overdue at the end of the year. Six parties have since paid about Rs. 65,000, but, in some other cases, the Board of Directors has had to take recourse to legal proceedings.

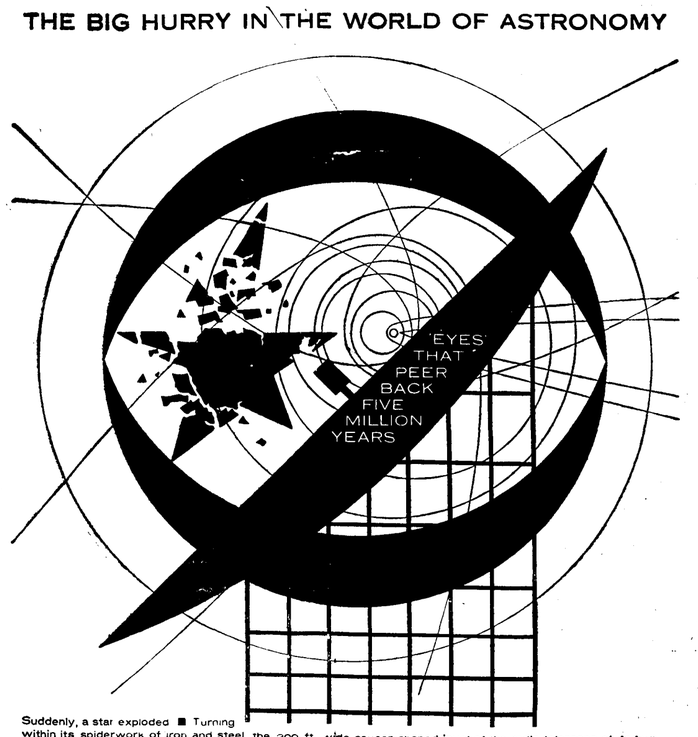
The profit of the Corporation has increased by 29 per cent to Rs. 6,27,156 during the year, as against Rs. 4,85,098 in the previous year. The profits do reflect the increasing pace of disbursements, but the rate of disbursements is largely beyond the control of the Corporation, for it depends partly on the extent to which machinery, equipment and raw materials are obtained by the borrowers and partly on the progress they are able to make. The profits are nevertheless inadequate to meet the guaranteed dividend liability, even though the State Government and the Reserve Bank of India have agreed to forgo its own share of dividends. The amount of subvention received from the State Government during the current year is Rs. 1.50 lakh, as against Rs. 2.14 lakhs in the previous year. The total subvention liability to the Government now stands at Rs. 9.87 lakhs. The total provision of taxation made by the Corporation since its inception amounts to over Rs. 9.96 lakhs and the amount of dividends paid to State Government and the Reserve Bank of India comes to over Rs. 7.67 lakhs, of which they have so far forgone a sum of Rs. 1.32 lakh.

The business of the Corporation is steadily rising and the amount of subvention required is declining and is less than the amount of dividend due to the Government and the Reserve Bank of India: even the percentage of the subvention to total dividend liability has come down from 54 in 1962-63 to 38 in 1963-64. It may be expected that the Corporation will soon be able to stand on its own and the Government subventions may no longer be necessary.

ANDHRA PRADESH STATE FINANCIAL CORPORATION

During the year ended 31st March 1964, the Andhra Pradesh State Financial Corporation received 61 applications for financial assistance aggregating Rs. 3.67 crores, of which 40 applications for Rs. 2.38 crores were sanctioned, bringing the total sanctions since the inception of the Corporation to Rs. 6.57 crores to 389 concerns. Disbursements have been made to 293 concerns covering a total of Rs. 4.54 crores. Besides sanctioning loans, the Corporation has lately been issuing deferred payment guarantees for inland machinery purchases; a beginning was actually made in 1963-64 when guarantees for over Rs. 86 lakhs (six applications) were approved, the amount disbursed on two applications being more than Rs. 30 lakhs.

For augmenting its resources, the Corporation issued during the year 12-year 4½ per cent bonds for Rs. 50 lakhs at par, carrying the guarantee of the State Government regarding the repayment both of principal and interest. In addition, fixed



PRUNING PUBLIC EXPENDITURE

IS T.T.K. SERIOUS ABOUT IT?

By A Special Correspondent

THE announcement by Mr. T. T. Krishnamachari of the Government's intention to cut down public expenditure by about Rs. 70 crores is an indirect admission of the fact that the authorities have not been very careful in avoiding extravagance. It may be recalled that Dr. John Matthai, free India's second Finance Minister, resigned from the Cabinet because, apart from his differences over the status and functions of the Planning Commission, he did not get the wholehearted co-operation from his colleagues in enforcing economy in expenditure. The Taxation Enquiry Commission, in its report submitted in 1955, strongly stressed the need for a thorough enquiry into the pattern of public expenditure. The report said:

"The need for utmost restraint on the growth of non-development expenditure can hardly be overemphasised. Besides, during a phase of intensive development effort when targets in terms of expenditure also assume a certain degree of significance, there is likely to be, even within the development sector of expenditure, some loss in effectiveness and possible room for economy and avoidance of waste. We are ourselves impressed with the need for thorough and careful enquiry both in the Central Government and the States into the whole question of public expenditure and suggest that such enquiries should be undertaken and entrusted to sufficiently high-powered bodies."

Effective Efforts Absent

However, there have been no such enquiries on the lines suggested by the Taxation Commission. Successive Finance Ministers have no doubt emphasised in their budget speeches the importance of economy in expenditure, but, by and large, the efforts in this direction have not been effective. Mr. Morarji Desai, for instance, in his budget speech in February 1963, admirably summed up the problem thus:

"By far the largest expenditure in the country is incurred by Governments at the Centre and the States. There cannot be any question that economy and efficiency in public expenditure are the very heart of the matter in mobilising resources. We have taken a number of steps at the Centre to effect economies in several directions. But, essentially, the task of achieving the utmost economy in public expenditure is not merely a question of cutting or reducing some items of expenditure or of laying down this or that rule of procedure. What we need is more performance with less expenditure of resources in every sphere of public activity; and what such economy through efficiency requires is an attitude of mind—a spirit of vigilance and responsibility—on the part of all those who are entrusted with the expenditure of the people's money, be they engineers, army officers, contractors, workers, civil servants or indeed Ministers. Here again, the task is one which is for all of us to perform incessantly and not just that which anyone of us can lay down once and for all."

Mr. Krishnamachari, in his last budget, observed that the Government should set an example by economising in expenditure and by not investing in less essential fields. "Economy in administration," he said, "is fully compatible with efficiency; and it shall be my constant endeavour to ensure that the administrative machinery of the Government is reorganised so that it is fully responsive to this need."

Though Finance Ministers in the past have given expression to noble sentiments in regard to economy, in practice, they have been unable or unwilling to put them into practice. The reports of the Auditor-General and the Estimates Committees of Parliament have from time to time drawn attention to the waste of money in different departments, but these "irregularities" are hardly taken serious notice of by the Government, although the amounts involved are colossal. It is gratifying to find, however, that, now at least, the Government, faced with ever-increasing level of prices, has realised the danger of indulging in reckless expenditure.

Unnecessary Interference

But the question to be considered is how far the Government will actually be able to carry out its intention in this regard. The solution does not consist merely in suspending further recruitment of staff for sometime. That is only a small part of the problem. The real issue is whether the Government is prepared to reconsider its policy of socialism. There can, of course, be no quarrel with the objective of socialism if all that it implies is only an attempt to achieve a welfare State which will work for the prosperity of all people. But the policies being adopted in recent years are hardly calculated to hasten the advent of a welfare State. What has happened is that, in the name of socialism, the sphere of the public sector has been rapidly expanded and that of the private sector deliberately restricted. Expansion of the public sector is desirable provided its activities relate to fields beyond the scope of the private sector. But, in recent years, the Government has been increasingly and actively participating in trading operations which only displace the private individuals and disturb the normal trade channels. The decision of the Government of India to set up rice mills in the public sector at an estimated cost of Rs. 160 crores is another example of unnecessary interference with the private trade.

The Real Solution

If the Government of India, therefore, is serious in its attempts to check the rising trend in prices and halt the phenomenon of too much money chasing too few goods, then it is not enough if a token cut of Rs. 70 crores is made in Government expenditure. Other measures are necessary and, among them, the following are more important:

One, there should be no further expansion of the public sector in industry or trade merely on ideological grounds. Serious efforts must be made to improve the profitability of the existing units of the public sector. The third Five-year Plan had assumed that about Rs. 300 crores would be available by way of surplus from the public sector undertakings of the Central Government, but this target is not at all going to be reached, since their contribution in the first three years of the current Plan was only about Rs. 70 to Rs. 80 crores.

Two, the State Governments should be urged by pressure and persuasion to set their finances in order. While the irregularities at the Centre receive some publicity, those in the States generally do not. In this connection, the following remarks by Mr. T. T. Krishnamachari in his last budget speech are revealing. He said:

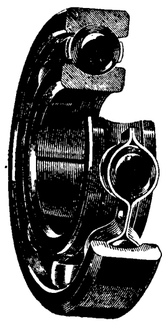
"The financial position of most of the States has been causing me a good deal of concern. The total amount due to the Centre by the States at the end of the current financial year will be of the order of Rs. 3,000 crores. In addition, the State's liability on account of market loans at present amounts to Rs. 656 crores. Both in terms of loans from the Centre and market borrowings, the States have been receiving more than what was originally contemplated in the Plan. Their share of Central taxes and duties has also been increasing. Yet most of them are constantly facing ways and means difficulties of a disturbing nature."

Three, the industrial and fiscal policy needs to be geared to dynamic growth. The private sector is subjected to far too many restrictions, most of them arising from ideological bias, which, by holding up production, tend to aggravate inflationary forces. The capital market should be revived by a series of suitable adjustments in the tax system so that the stock exchanges can once again perform efficiently their role in mobilising the savings of the community.

The problem of checking the rising trend in prices cannot be solved in piecemeal fashion. It has to be tackled in a bold and comprehensive manner with the full and enthusiastic co-operation between the Government and the private sector, if the third Plan is to be saved from failure and the fourth Plan is to be launched successfully.

NEWS from SKF

Here is a preview of some of the SKF specialities which will be manufactured in India, when the new plant at Chinchwad goes into operation. Meantime, part manufacture and assembly has already commenced in Bombay — maintaining all the technical skill and know-how which has made the name SKF world famous.



SKF BALL & ROLLER BEARINGS

BUSINESS NEWS FROM EUROPE

I.M.F.: SEARCHING FOR MORE LIQUIDITY

CINEMA INDUSTRY CHECKS DECLINE

SWITZERLAND'S admission to the Paris Club of the International Monetary Fund, the group of 10 advanced countries that have undertaken to supplement the Fund's finances, has given the cause of international liquidity a boost. Although the months of negotiations that preceded the Swiss entry, made longer by the fact that Switzerland is not a member of the I.M.F., resulted in an addition to the Club of only 200 million dollars, the contribution is in effect greater because it will be used only to aid other members of the Club.

The Paris Club's funds are now 6,200 million dollars and have become a more than useful addition to the I.M.F. funds. The I.M.F. has funds from the more advanced nations of 10,000 million dollars, so that the Paris Club has contributed some 60 per cent more. The I.M.F's funds are, in practice, much larger than 10,000 million dollars, but the holdings of the minor currencies are of relatively little account. Almost any country will take the German Deutschemark in exchange; few (if any) will accept the Burmese kyat or the Brazilian cruzeiro.

Behind the moves to get the Swiss into the Paris Club is the long-acknowledged need to expand world liquidity. Many bankers and financiers are worried by the prospect that unless something is done to change the international monetary system in the next two or three years expansion in world trade will be held up by a shortage of international money. This is all the more likely as the United States balance of payments rights itself, thus reducing the international supply of dollars.

Increasing the Quotas

What is not nearly so easily settled is how to bring about increased liquidity. The Paris Club is going to recommend the I.M.F. at its September meeting in Tokyo to increase the quotas of national funds. It is also going to publish its own liquidity study by August, look further into the long-term issues of world liquidity and (on the instigation of the Germans) think about a code of good behaviour in monetary matters.

There is by no means unanimity on the question of quotas. Under the Bretton Woods agreement, which set up the Fund in 1944, each country is given a quota which it must deposit or make available to the Fund. A quarter of the quota must be deposited with the Fund in gold—this is the gold tranche—and the rest made available on call in its own currency.

Both Britain and the United States would like to see larger quotas and a lower gold tranche. Britain feels that the Fund's resources should be given more automatically than now, that loans should be for a longer period and that quotas should be changed according to the current trading and reserve strength of a country rather than the criterion approved of in 1944 and 1945. The United States goes so far as to say that there should be a 50 per cent increase in quotas, only a small part of which should be in the gold tranche. Opposition to this comes principally from the French, Dutch and Germans.

Yet the need to bring quotas up to date is acknowledged to be urgent. It is absurd that a country like Italy, which has a trade as great as France's, should contribute only 40 per cent of the French quota to the Fund. Or that Germany, with a trade substantially greater than Britain's, should contribute only 40 per cent as great a quota.

To bring about increased international liquidity the Fund wants more capital for the larger members. This can only be provided by countries which are underpaying now. To make matters worse, the Fund's present gold holding, 3,100 million dollars, is largely immobilised. The I.M.F. refuses to use this except in extreme emergencies: thus just under a quarter of its resources are never used.

The failure of Governments to overhaul Bretton Woods has led to a number of *ad hoc* alterations; the American swop credits, Britain's gold pool, and the Bank of International Settlements' credits. But the result, it is thought, will still be paralysis if the Fund does nothing at Tokyo to aid more liquidity through bold measures.

The almost continuous decline in cinema admissions and film making which has been a characteristic of the industry since 1946 may be coming to an end. Although the portents are slight, both Britain and America have noticed the first reversals in the trend. Last year the American film industry, according to the Motion Picture Association, increased its revenue by about 5 per cent. And gross cinema box-office takings in Britain in April, at £1.31 million a week, were the highest since last August and equal to the average last recorded in 1959. Average weekly admissions (7.5 million) also resumed an upward trend. The rest of the European industry—largely consisting of Germany, Italy, France and Sweden—is still very much depressed.

Outside Britain, total European cinema attendances increased till 1956 (in Britain they have been falling since 1946) to a peak of 2,200 million a year but had dropped to 1,640 million by 1962. The drop was most severe in West Germany (one-third) and least severe in Italy where there is still a large population in the south unaffected by the spread of television.

Feature-film production in Europe has remained fairly stable during the past few years and has averaged between 400 and 500 a year. Of this total, the British contribution is around 75. This stability masks divergent trends, though. In Italy and Spain film-making has continued to increase (aided by a large influx of American film makers), whereas in Germany it has been cut by half. French production has also declined in spite of the artistic advances made by the *nouvelle vague*.

The reasons for the fall in cinema attendance, and its consequent effect on film making, are fairly well documented. Television has been the major cause but changes in taste as affluence has spread throughout Europe have also contributed. Proof of this can be seen from the maintenance of admission figures in areas where television has not established a strong hold. The growth of car ownership and the increasing amounts of money being spent on consumer durables and drinks have also been influences.

State Assistance

Most European film industries are Government supported. Italy provides £7 million, France £5.5 million, and Germany, the Netherlands and Belgium small amounts under £1 million. But the Governments also take from the cinema trade more than they give back to the film makers. Italy raises £16 million *via* taxation, France £11 million and Germany just over £7 million a year.

The liberalisation measures adopted by the Common Market should help to stimulate an exchange of films, at least between Italy, France and Germany But in spite of progress between 1958 and 1961 the share of films from other Common Market countries is only 5 per cent in Italy, 9 per cent in France and 16.7 per cent in Germany.

British film imports, which in any case have to overcome the language barrier, are not very great from Europe. Forty per cent of the films shown in Britain are British (30 per cent have to be under a quota system); most of the rest come from the United States.

The cinema and film industries have been taking energetic steps to turn the tide. Wide screen, stereo sound and other technical improvements have been introduced. Production has turned to the epic, with considerable success. Americans have been encouraged to film in Europe, which has least given employment to the technicians. With the exception of France, the film makers have also turned their attention to producing for television though they have not been as enthusiastic on the continent in this as in Britain. To protect the cinema trade admission prices have been raised frequently, though this is a double-edged weapon. None of these palliatives is thought to be as good, though, as the one basic ingredient that has too often been missing: good films.

Thaw in U.S.-Communist Trade?

Although the visit of Mr. Robert Kennedy, the American Attorney-General, to Poland was a private one, it is one more indication of the thaw that is occurring between the United States and the Soviet bloc countries. The thaw is especially marked in the field of trade where the United States is reconsidering its basic situation *vis-a-vis* the Eastern European countries. The only countries still really "frozen" are Cuba and China.

Reason for the American moves, which have been heralded by Secretary of State, Mr. Dean Rusk as well as Mr. Averill Harriman, are political as well as economic. Politically, America is no doubt anxious to make the most of the splits which have occurred inside the bloc on national attitudes to Comecon, the trading community which Russia wants to superimpose on the satellites. If Rumania could be loosened from the strict hold Moscow exerts it would represent a considerable weakening of the eastern bloc. Economically, America is thought to be considerably worried at the progress the Western European nations are having in trading with the Soviet bloc. West Germany and Britain have captured most of the market, but nearly all countries have a flourishing, if small, trade with the Soviets.

America, it is thought, would dearly like to capture part of this market. And following the long negotiations over the wheat deal with Russia she realises not only how much is to be gained from direct trading but also how her balance of payments can benefit from the attendant invisible earnings, such as insurance and shipping receipts. Until the November election, progress in trade liberalisation may well be slow, particularly if an extremist like Goldwater opposes President Johnson. After that most-favoured-nation treatment may be offered to the Soviets, it is thought.

German Reserves: Up and Up

The West German financial authorities now believe there will be a rise in the balance of payments surplus this year, reversing a forecast made at the end of last year that 1964 should be a stable period. Although the authorities make no forecasts at the size of the surplus German economists believe it may reach about £800 million, half as large again as last year. In the first five months of this year the surplus rose to £355 million, compared with £164 million in the same period of 1963. And inside the Common Market the German surplus in the first quarter of the year reached £154 million compared with £57 million in the same quarter of 1962.

A rise in exports has contributed largely to the surplus. Exports increased by 19.5 per cent in the first four months of the year compared with 9.2 per cent more imports. And worse is still to come because all orders to industry, including those for export, this year are 18 per cent higher (consumer goods' orders being up by a quarter). With an election 15 months away it is thought that measures to stop this boom, which would cut into German prosperity, will become increasingly more difficult to take. The most obvious step, revaluation, would be the most difficult of all.

Other possible solutions are thought to fall foul of the Common Market authorities. Increased imports, for instance, could only be brought about by lowering tariffs. However, Germany could withdraw the turnover tax rebates on exports, or take measures to limit Government expenditure. But it is thought that, at least for the next 15 months, all that will be done will be a series of palliatives.

Progress Report on Austria

The rise in prices in Austria this year should be more moderate than in 1963, the balance of payments should remain strong and disparities between the performances of different sectors of the economy should be less pronounced, says the Organisation for Economic Co-operation and Development.

Gross national product is expected to go up by at least five per cent, as compared with 4.4 per cent last year and just 2.1 per cent in 1962. A rise in demand, particularly for exports, helped to raise G.N.P. last autumn and the movement has continued into this year. Private consumption rose by six to seven per cent in the second half of last year, the biggest increase (22.3 per cent) being in education, entertainment and recreation. Other big increases were recorded in heating and lighting (13.2 per cent) and furniture and household goods (11 per cent).

FUTURE OF BRITISH STEEL INDUSTRY

B.I.S.F. PRESENTS CASE AGAINST NATIONALISATION

FIFTEEN months ago Mr. Harold Wilson, Leader of the British Labour Party, reaffirmed his Party's intention to nationalise the steel industry if it came to power. But the Labour Party itself has chosen to remain silent up till now, for it has not explained authoritatively and in detail *why*, if at all, steel would be nationalised. Its very silence has been intriguing and so the industry's fears have not been set at rest. A controversy has, therefore, emerged in recent months and the industry, to its great regret, has again been brought into the political arena. And the British Iron and Steel Federation, too, has just launched an anti-nationalisation campaign on behalf of the industry. As part of this campaign, the Federation has brought out two booklets—*Steel: Leave Well Alone* and *Steel: The Facts*—which describe the structure of the industry and its national importance, examine the charges made against it in recent years and present the main lines of its case against nationalisation.

The Federation's description of the structure of the steel industry and its national importance provides a fitting background to its cogent case against nationalisation. This industry, which is so central to the whole working of Britain's steel-based economy, covers three main groups of operations, namely, (i) the making of iron, (ii) the making of steel and (iii) the shaping of steel into a variety of finished steel products—plates, sheets, bars, rails and so on—which then form the raw material for a hundred or more metal-using industries. In all, there are 262 companies engaged in these operations, in 310 works, employing about 300,000 people. But the pattern is one of great diversity, for 23 big "integrated" works cover all three operations, 37 smaller and usually more specialised producers cover only two (that is, steel making and shaping) and the remaining 250 works cover only one operation apiece, often with a high degree of specialisation. So, according to the Federation, "this is far from being an industry with standardised production units which would fit tidily into a single nationalised mould."

Two Complexities

The complexity thus arises from the fact that steel-works do not make one thing, "steel", but many things—from tinplate to heavy beams and from bars to massive forgings. The industry is "much less homogeneous in its output—and so in its wide range of commercial policies—than already-nationalised industries such as coal and electricity." And it "has at all times to hold a careful balance between the commercial pressures fostering greater diversity among the supplying works and the technical pressures largely favouring concentration." Another complexity arises from the fact that many steel companies have wide interests outside steel—for instance, in constructional engineering, basic chemicals and town gas supply, to name only a few. In view of this complexity, the Federation argues, nationalisers would either have to break up sucessfully intertwined groups or else surreptitiously nationalise important parts of other industries as well as steel.

The Federation has next highlighted the industry's national importance by a reference to some facts regarding its performance. In the first place, the industry's outputs since the war have risen sharply in line with Britain's overall economic expansion, as will be seen from the following figures:

(Million tons)

	1937	1946	1953	1960	1963	1964*
Pig iron	6.6	7.8	11.2	15.8	14.6	17.4
Crude steel	13.0	12.7	17.6	24.3	22.5	26.0†
Heavy products	4.2	3.8	5.8	6.3	5.2	..
Thin flat products ..	2.2	1.7	1.5	4.0	4.7	..
Light-rolled products ..	2.8	3.3	4.3	6.3	5.6	..

* Estimated.
† According to latest reports from London (9th July 1964), actual steel output in the first half of this year was 13.1 million tons.

About three-fifths of Britain's steel output are retained for ultimate use at home. The other two-fifths go abroad in one way or another, half of these being fabricated at home into goods for export (for instance, motor cars) and the other half being exported directly as finished steel products (for instance, tinplate). British steel exports, incidentally, have nearly doubled since the war, rising from 2.3 million ingot tons to the record level of 4.4 million ingot tons in 1963. In the highly competitive markets of Western Europe, U.K. sales have risen by 45 per cent over the past two years. On a broad reckoning, therefore, the steel industry has worked well for the British people and the British economy.

But the Federation has not contented itself with such a broad appraisal. On the other hand, it has dealt with the issue in a more detailed manner. In this connection, it has identified four emerging areas of debate—whether (i) the industry has provided enough steel, (ii) this steel is produced efficiently, (iii) the industry is staffed effectively and (iv) enough effort is being put into selling. Regarding the first, the Federation has sought to refute the longstanding Labour charge that the steelmakers have not provided enough steel to sustain rapid economic growth. This is a baseless charge, for the industry, having invested £1,500 million in new plant since the war, is today able to supply all the steel that Britain needs. This fact has been publicly acknowledged by the National Economic Development Council itself in its report on the implications of a four per cent growth rate upto 1966. The industry's dual process of forecasting demand and recruiting matching capacity has worked reasonably well since the war, with the result that there is enough steel capacity now. What is more, nearly all that capacity is of modern and cost-reducing kind. Even the Labour Party seems to be acknowledging nowadays that steel capacity is fully adequate.

Question of Efficiency

The second area of debate is related to the question of "efficiency" in the industry. Here Labour critics allege that the industry is "inefficient". But the Federation believes that the industry's operating efficiency is high and that "the vast irrelevance of nationalisation would add nothing to it." In a science-based industry such as steel, the Federation argues, efficiency begins with research. The industry's record in this respect is good, for between 1955 and 1963 research spending by the companies and the British Iron and Steel Research Association rose nearly threefold, from £3.5 million to £9.0 million. The industry has not been slow, as alleged by Mr. Harold Wilson, in exploiting new technological processes either. For instance, the use of oxygen in steel making has advanced so fast that well over half of all British steel is made today with its help. Again, the new oxygen converter processes of steelmaking will cover as much as 25 per cent of capacity in Britain by 1965, as compared with 17.5 per cent in West Germany, 11.5 per cent in France and 15.2 per cent in the United States. In the field of continuous casting, too, Britain leads, for the steel so cast accounts for 1.7 per cent of overall capacity, as compared with 0.8 per cent in the European Economic Community and also in the world as a whole. The vacuum treatment of steel and the application of automation are also advancing fast in Britain. Besides referring to these facts regarding research and technological advance in the industry, the Federation has argued that "efficiency," as measured by both "productivity" and "comparative costs," has increased. Its arguments, in this connection, are as follows:

"*Productivity* is one test of efficiency. But it is a tricky one to handle in any industry: and this is certainly so in steel, where fuel and capital account for as much or more of total costs as does labour, and 'true' movements of labour productivity get swamped by short-term fluctuations in demand and output. For what they are worth, however, the figures are encouraging. *Fuel productivity* has risen sharply; over 1948-63, total thermal consumption per ton of hot finished steel was cut by 18 per cent and coke usage per ton of iron was cut by 33 per cent. *Capital productivity* has also done well: taking the productivity of two big 'lumps' of capital as indicators, output per blast furnace rose 188 per cent and output per steel furnace rose 159 per cent over 1946-63. *Labour productivity* rose by 2.8 per cent a year on average over 1946-63: and, with a 16 per cent jump between the fourth quarter of 1962 and the fourth quarter of 1963 and a further 3.1 per cent jump on into the first quarter of 1964, is now running at an all-time record. Comparing increases in labour productivity in steel with increases in the economy as a whole, British steel did 52 per cent better than Britain generally in the 'fifties, whereas both the U.S. and the German steel industries lagged behind their economies: and Neddy has reported that since 1961, labour productivity in steel (+4.4 per cent a year) has continued to run ahead of the national average (+2.7 per cent).

"Partial tests of efficiency in physical terms are, however, less useful a guide than the overall test of comparative costs. British steel costs are probably below American on almost all products. As regards the Continental industries, Britain leads on costs in sheets and tinplate, and more narrowly in heavy steels, and is broadly competitive for similar qualities of steel as regards light products. Recent detailed evidence suggests that U.K. and Japanese costs are very similar overall. Thus on this crucial test of efficiency, the British steel industry comes out well."

As for the third issue pertaining to manpower, the Federation has argued that the industry's record in making arrangements to deal with redundancy has been quite good. In this context, it has recalled Labour's past promises about the security, which nationalisation was expected to bring to the workers in the industries concerned, and drawn attention to the following actual results in the nationalised coal industry and railways, as compared with those in the private iron and steel industry:

Number of Men Employed
(In thousands)

Industry	1953	1966	Change
Iron and steel	298	311*	+ 13
Coal	784	580*	—204
Railways	594	350†	—244

* N.E.D.C. estimates.
† *Report on the Reshaping of British Railways.*

The fourth issue relating to "selling," in the opinion of the Federation, should be viewed in the context of the emergence of a world-wide surplus of steel and the growth of competition from alternative channels. The Federation's arguments, in this connection, are quoted below:

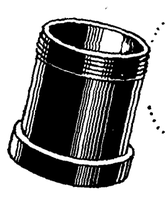
"If the steel industry is to serve Britain well in this new situation, its organisational structure must be one which is well-adjusted to a highly competitive market, that is, a selling-centred organisation. If steel were nationalised, the new organisation would be one in which greater power was vested in the central body and less with those most directly in contact with steel's customers. The consequences in today's immensely competitive steel market could not be other than wholly bad."

The Federation has also discussed some directly political aspects of the debate on steel's future. Referring to the Labour Party's thesis that ownership in the industry is concentrated in the hands of a very few "steel barons," the Federation has pointed out that 11 major steel companies, accounting for 75 per cent of aggregate steel capacity, have as many as 276,005 shareholders—rather more shareholders than workers (just under 200,000). The average shareholding is only £885 a head nominal value; and the "average shareholder" is also the typical one since 92.5 per cent of all shareholders have less than 1,000 shares. Moreover, a large part of the remaining shares are held by institutional investors, such as the insurance companies and pension funds, who draw their finance largely from "the small man." This indicates how very many small investors would be affected, directly or at one remove, by a State take-over of the industry. A wide spread of ownership may, of course, be compatible with effective control by a minority of very large shareholders. But this is not the case in steel, for the 10 largest shareholders in each of the 11 sample companies together own 17.4 per cent of the shares, far from a dominant position, and they are virtually all institutional rather than individual investors.

Key Issue of Control

Some Labour critics, however, argue that the key issue is "control" and not "formal ownership." According to them, control in steel is concentrated in a few powerful, inter-connected hands. But the Federation has effectively refuted this charge in the light of a recent survey which showed that, in 12 major companies together accounting for 85 per cent of privately owned steel capacity, the 132 directorships available were held in all by 124 people. And of those 124 people, 114 (92 per cent) held only one steel directorship. In fact, within the sample group of companies, there were effectively only nine cross-linking directorships involving eight people. More telling still is the fact that, although these interlocking directorships are supposedly designed to limit competition between steel companies, in practice none of the nine cross-links join companies making the same products: thus, there are no interlocking directorships between the main heavy steel producers, nor between the four strip mill companies. The main explanation of these nine cross-links is, in fact, simply the quality of the men involved. Above all, four other circumstances have ensured the industry's accountability to the public. These are: (i) the ever-present power of the shareholders, (ii) the possibility that the industry's policies and performance can be exposed annually to a searching Parliamentary debate, (iii) the control exercised by the public-as-buyers in the market place, and (iv) the existence of the Iron and Steel Board which has been exercising *public supervision* over *privately-owned companies* in such a way as to secure the benefits both of private dynamism and of central guidance.

The Federation has finally posed some 20 practical questions to the Labour Party. These are: (1) Would all steel be nationalised? (2) Would only steel be nationalised? (3) How strong would the central body be? (4) Would the steel companies keep their identities? (5) How would the whole industry be controlled? (6) What compensation would be paid? (7) Who would pay the bills? (8) Would the customer be free to choose? (9) Would there be price competition? (10) Would users be free to import? (11) Would development policy be shaped aright? (12) Would obsolete plants be closed? (13) Would iron ore policy be sensible? (14) How would efficiency be raised? (15) Would research be well directed? (16) What would be done about labour efficiency? (17) Who would run steel? (18) What would be done about selling? (19) What would happen to exports? (20) What would be done about world steel co-operation? Unless the Labour Party provides satisfactory answers to these questions, it would not carry conviction. For the relevant issue here is whether nationalisation would do better than the existing organisation in steel. Of course, for its part, the Federation is convinced that the consequences of nationalisation would be bad—bad for the steel industry itself, for all work in it and for all who sustain it with their savings, bad for the British steel-using industries and bad for the British economy as a whole.



Superior Quality Salt Glazed Stone-Ware Pipes

Other Manufactures:

- High Grade Refractory Materials
- Glass Tank Blocks & Pot Mixtures
- Detric 'DETRED' Tiles for industrial furnaces
- Burnite Air-setting Refractory Cements
- Unifil Insulating Products for cold storage and industrial furnaces
- Acid-resisting Wares
- Vitri-Chlorinators
- Light calcined Magnesia Cement
- Magnesia Assay Cupels
- Graded Magnesia Chips for mosaic floors

NEW PRODUCTS AND PROCESSES

Cathode-ray Display Tube

A NEW cathode ray tube capable of displaying information at a speed to match the fastest computer was shown at the International Instruments, Electronics and Automation Exhibition held at Olympia, London, in May last. It generates a character sufficiently bright for output printing at the rate of one character per millionth of a second. Its speed and brightness factor are about 30 times greater than those of present equipment, which has to use an ordinary cathode ray tube with the character traced out by dots and segments. The new tube produces the whole character simultaneously at the same current density, with the result that a character need be exposed for only one microsecond, 50 times a second, to produce a steady image visible in daylight ambient light. It will find applications in space research and space communications, and will be particularly valuable for annotating radar displays, head-up displays for aircraft, tabulator displays for various electrical systems, and so forth. Their agents in India are: Machine Tools (India) Pvt. Ltd., Winet House, Russel Street, Calcutta-16.

Concentrated Ozone

A process has been developed by The British Oxygen Company, England, for the production on an industrial scale of a more concentrated form of ozone that can be stored for long period. Applications are expected to be found in the field of water treatment, in chemical manufacture, and in the neutralising of harmful industrial effluents, such as cyanides and sulphides. Their agents in India are: Indian Oxygen Ltd., 46/1 Diamond Harbour Road, Calcutta-27.

Automatic Bandsaw

The Mebamat model 250A, the first automatic bandsawing machine to be sold by the Startrite Machine Tool Company, London, is designed to speed up the production of blanks and offcuts from bars, tubes and other sections in several materials, including steel, brass, aluminium, and nylon. It is said to be between 10 and 20 times as fast as a manually-operated machine and it relieves the operator of the task of accurately positioning unwieldy pieces of stock, which are handled after loading by a hydraulic feeder unit. The machine will automatically turn out a preset number of finished pieces while the operator has only to remove them and feed it with fresh stock. The machine, which is electrically powered, is capable of cutting stock up to 10 in. thick.

Asbestos-reinforced Plastic

A thermoplastic PVC reinforced with asbestos and used in laminated form has been introduced by the Turner Brothers Asbestos Company, Spotland, Rochdale. It has been given the name "Duraform." The PVC, supplied by British Geon, is resistant to weather, many acids, alkalis, solvents and grease. Duraform is the first thermoplastic material to get a Class 1 certificate for the surface spread of flame according to list BS476. The material can have a matt or polished finish. It is made in four sizes and over a thickness range of one sixteenth to half an inch. A fabricator can make his own laminate and so incorporate printed PVC film. The material can thus be made suitable for builders, architects and chemical engineers.

Electronic Calculators

Fully electronic desk calculators giving their results on a cathode ray tube, instead of mechanically, are now offered by Friden Incorporated, of San Leandro, California. The Company says the machine has no moving parts and is completely silent and far faster than mechanical calculators. The keyboard is like that of an ordinary machine, but above it is the result screen, appearing like a miniature TV tube. Results flash on to this screen instead of appearing on a row of numbered counters.

Cheap Petrol Engines

Low-speed petrol engines, cheap enough to throw away instead of having them repaired, are under development by the Janoil Corporation, of San Gabriel, California. Janoil hopes to sell a 5-h.p. engine for $25. The Janoil is a rotary engine with the low shaft speed of 200 r.p.m. The only moving parts are the rotor, which has triangular pockets cut in it, and a rocking lever. This drops into the pockets to compress the charge and takes the reaction of the three explosions per revolution. As the rotor turns, movement of the rocking lever out of the previous pocket pumps petrol gas into the incoming one. The lever then drops into the charged pocket which passes by a sparking plug. The resulting explosion drives the rotor further, a cam on it retracting the rocking lever and charging the next pocket with gas.

Throat Microphone

A new throat microphone is said to be the most comfortable so far produced. Two small magnetic capsules in a one-piece assembly rest on either side of the larynx, and with the minimum of contact pressure transmit speech clearly. The microphone, developed by Amphero Ltd., Beresford Avenue, Wembley, Middlesex, England, in collaboration with the Royal Aircraft Establishment, Farnborough, England, is fully tropicalised.

Iron without Coke

I. Y. Murakarni, of 1-7, 1-Chome, Umayabashi, Sumidaku, Tokyo, has patented a way of making iron in a blast furnace without using separately prepared coke as fuel. Small, dense briquettes of coal are used instead. The briquettes are fed into the furnace along with the usual lumps of iron ore and limestone and the heat there converts the coal into coke *in situ*. Hydrogen and carbon monoxide are released to provide more heat for refining the ore. The briquettes are said not to coagulate nor to be crushed by the weight of the charge as they soften.

Finger or Toe Switch

Night lights which can be turned on or off with a touch of the elbow or toe are now being made by the Eagle Electric Manufacturing Company, of 23-10, Bridge Plaza, Long Island City, 1, New York. The small bulb and touch switch come as a unit which can be plugged into any power point. If the point is in the skirting, the switch can be operated with the toe, without bending. If set higher a woman with a load of laundry in her arms, for instance, can turn it off with her elbow.

Small Holes in Diamonds

A U.K. patent has been taken out by a Russian organisation for a machine tool which makes holes of less than 2,000ths of an inch in diameter in diamonds and hard metallic carbides. Nauchno-Issledovatelsky Institute Kabelnoi Promyshlennosti, of Moscow, E-20. 2450, says that holes of great accuracy are produced by a tool vibrating under the action of a transducer at an ultrasonic frequency in an abrasive suspension. High speeds are claimed and the applications are expected to cover the tool-making, aircraft and hydraulic fields as well as the jewellery industry.

More Sugar from Beet

By crushing washed and frozen sugar beet to a fine pulp and simultaneously removing the juice by centrifugal separation, a German firm claims that far greater yields of sugar are possible. "Elfa" Apparate Vertriebs G.m.b.H., of 52a, Friedrichstr., Muelheim, Rhuhr, says that the machine it has developed will separate as much as 99 per cent of the sugar content of beet in a few minutes.

Titanium Pigments

The largest manufacturer of titanium pigments outside the U.S. is British Titan Products, 10, Stratton Street, London, W.1. It has a capacity of some 150,000 tons per annum. The Company has now produced a review of its scientific and technical work under the title: "The Technical Resources of B.T.P.," chiefly concerned with the new central laboratories at Stockton-on-Tees, Pigments, paper-coating, ceramics, textiles and the search for customer-requested products are illustrated and described.

Softer Leather

Leather that is softer and more supple than usual is said to result from treating semi-raw hide with an aqueous solution formulated by Farbenfabriken Bayer A.G., of Leverkusen-Bayerwerk, Germany. The solution contains chemical compounds that react with one another to provide a good foundation for dyes and gloss-producing chemicals. The treated leather is suitable for gloves, belts, shoes and handbags.

New Ideas in Brief

An all-purpose mould-release material in aerosol form has been produced by Rocol, Swillington, Leeds, Yorkshire, England.

A rapid and efficient way of covering large and small irregularly shaped objects with a plastic (epoxy resin) that sets hard and resists chemicals has been produced by Shell International Research, 30 Carel van Bylandtlaan, The Hague, Netherlands.

A new lubricant for use when cold rolling, drawing, stamping, and extruding metals has been developed by Montecatini, 1-2 Largo Guido Donegani, Milan, Italy. It is stated to leave the metal surfaces glossy, to be easily removable and to burn without leaving carbon deposits during annealing.

An unconventional way of coating steel strip with phosphate or synthetic resin so that it will not rust in storage and can be painted or galvanised easily later has been devised by Societe Anonyme Metallurgique d'Esperance-Longdoz, 60 rue d'Harscamp, Liege, Belgium.

A new steam boiler runs on oil or gas but will simultaneously burn any kind of solid fuel or waste refuse. It is meant primarily for hotels and factories and is produced by Gebruder Mittelmann Fabrik Moderner Badeofen, Laasphe-Westphalia, West Germany.

Complex profiles previously requiring a battery of milling machines to carry out facing operations can be quickly and economically machined in one operation on a horizontal surface broaching machine. It is devised by Mandrin, Erlach, Switzerland.

A new lathe produced by Etablissements Sim, Route de Lausanne, Morges, Switzerland, is claimed to be an economical purchase for the motor engineer who has to machine the skirts of pistons in small lots.

A quick method of making railway sleepers from sheets of laminated cement and asbestos by compressing them lightly in a mould is reported from Italy, developed by Eternit, Piazza della Vittoria 11, Genoa, Italy.

Equipment has been developed which counts the number of road vehicles passing a given point and also classifies them into vehicle types by Telefon AB L.M. Ericsson Fack, Stockholm 32, Sweden.

A way of rapidly melting and reshaping a sample of pure metal prevents it from touching any other substance so that it cannot become contaminated. It is developed by the Institute fur Angewandte Physik der Reinststoffe, 28 Winterbergstrasse, Dresden A 20, East Germany.

TRADE UNIONS IN INDIA

POLITICAL PARTIES MUST STAY OUT

By Dr. R. M. Goil

IN the Budget session of the Lok Sabha, Mr. C. Subramaniam, who was then Union Minister for Steel, Mines and Heavy Engineering, blamed the Government's labour policy for the labour trouble in public sector undertakings and said that the Congress was as much at fault as other political parties. More specifically, he stated that the party base of our trade unions was the 'original sin' to which all the parties, including the Congress, subscribed and which led to multiplicity of union organisations. Prescribing his remedy for the evil, again, he said: "Unless we take away the political attachments of trade unions, no progress will be possible in the public sector."

Other than anything else, such an utterance on the part of a person of the stature of a Central Cabinet Minister warrants a re-examination of the rather familiar and not very new questions: Should the trade unions indulge in political activities or not? Should they be 'party-based' or 'self-based'? And, given the party-base of our unions, what can, if any, be done about it? Further, exceptions apart, can we really draw a line between the public and the private sectors from the point of view of their trade union organisations so that the unions might maintain their party base in the private sector and give it up in the public sector?

The Facts

The party base and the political nature of our trade unions can hardly be denied. Even a cursory look at the history of the trade union movement in India would bring home to the reader that, right from its real beginnings after the First World War, the trade union movement in India has continued to be subjected to the dominating influence of the country's political parties. The politicians entered the Indian labour movement for the first time, perhaps, in 1918 when the Madras Labour Union was organised by patriots who regarded the struggle with employers as secondary to winning Home Rule. In 1920, the Indian National Congress stepped into the labour movement and, at its Nagpur session, passed a resolution urging its provincial committees and other affiliated associations to promote labour unions throughout the country. During the same year, despite Gandhiji's opposition,* the Congress leadership worked towards the formation of a national federation of trade unions to co-ordinate the activities of trade unions in the country and to speak for the Indian labour movement both inside and outside the country. As a result, the All-India Trade Union Congress (A.I.T.U.C.) was formed in July 1920. In the years to follow, so close was the association of the Congress Party with the A.I.T.U.C. that it led some observers to conclude that the latter was merely an offshoot of the former.

Right from the formation of the A.I.T.U.C. in 1920 to the formation of the fourth major trade union federation (the United Trade Union Congress—U.T.U.C.) in 1949, the numerous splits, re-unions and formation of new bodies within the labour movement in India, have closely followed the ideological variations, the destinies, and the splits and re-unions in the major political parties of the country. The result is that there is a sort of regular struggle between the major political parties of India for the allegiance of the small but crucial industrial labour population. And the parties to this struggle are represented by the four major labour federations—the Indian National Trade Union Congress (I.N.T.U.C.), the A.I.T.U.C., the *Hind Mazdoor Sabha* (H.M.S.) and the U.T.U.C.—in the country. A fifth federation—the *Akhil Bhartiya Mazdoor Sangh*—was formed by Jan Sangh in 1955. But it does not seem to have made any significant mark on the Indian labour movement. The *Indian Labour Year Book* has taken no notice of this body.

Every new federation owes its origin to, and continues to be nurtured and dominated by, a definite political group in the country. Mr. Jagjiwan Ram, Mr. V. V. Giri, Dr Kannappan, and other noted authorities in the field have testified to this state of affairs.

Political unionism, divided mainly on political party lines, is not something unique to India. Rather, it appears to be a general pattern of unionism in most newly emerged developing nations. In fact, it seems to be inevitable. The main reasons for such a tendency appear to be three: (1) The association and use of trade unions in the liberation movements of the respective countries, (2) the absence of conditions for the viability of business unionism in most such countries, and (3) the role that the trade unions are called upon to play in the countries' development under an economic set up largely controlled and regulated by Governments.

In Ghana, several countries of Latin America and India, among others, the labour movement has been closely associated with the countries' independence movement and their leaders. These links, once established and utilised to win political freedom, are, later on, sought to secure economic freedom. The ruling parties, in particular, are keen on channelising worker support to the economic policies of their Governments through their influences in the labour movement. For opposition parties, likewise, trade unions provide a platform to spread their own ideologies and viewpoints.

Conditions for Viability

Galenson, while discussing the characteristics of trade unions in developing societies, points out that the conditions necessary for the viability of business unionism are not likely to be realised in underdeveloped countries except in a few special cases. These conditions are: high average incomes of the workers, a fair degree of employment stability, and sufficiently strong trade unions to maintain an independent bargaining position. The last condition, among others, implies large membership, adequate funds and strong internal leadership in the unions. In India, even after an increase of about 37 per cent in the average money earnings of factory workers during the period 1951-61, their average annual earnings in 1961 were only around Rs. 1,400, collective bargaining is not very much likely to appeal to workers and they are likely to look elsewhere for quick gains in their economic position. Low worker earnings and unstable employment are also partly responsible for weak unions. Low membership (an average membership of 561 per union in 1961), weak finances (an average income per trade union of Rs. 2,176 in 1961), and domination of outside leadership are well-known and oft-repeated failings of Indian trade unions.

Outside leadership in the Indian trade unions, which, in the early stages of their development, was necessitated by a variety of reasons including lack of funds, lack of capable leadership (particularly English-knowing educated persons) among the rank and file, and need to escape victimisation, and which was made possible by the enabling legislation, has also tended to perpetuate itself. It has rather been a kind of vicious circle. Unquestionably, the importance of the contribution of outside leaders, coming mostly from political parties and, in many cases, providing honorary services, in the development of the movement in its formative years cannot be overemphasised. However, preoccupied with their party work, they could not and did not pay adequate attention to the development of a proper structural, administrative and financial set-up in the movement. Nor have they made adequate efforts to develop internal leadership. And so, continued financial and administrative weaknesses and absence of adequate internal leadership call for leadership from without; the latter, in turn, tends to perpetuate and reinforce the former weaknesses.

The Dual Role

The changing role that the unions in many of the newly developing countries are called upon to play and the set-up in which they have to operate also account, in a large measure, for their emphasis on politicking. Known by different names, a trade union, in general, has to play a dual role: a 'consumptionist' role and a 'productionist' role. In so far as it represents the interests of its members and seeks to secure higher wages and better working conditions for them, it is its consumptionist (the 'combative' or the 'responsive') function; having made the bargain, it is also obliged to abide by its terms to maintain discipline and to 'co-operate' in production. This is its 'productionist' (the 'constructive' or the 'responsible') function. The difference, however, lies in the varying degrees of emphasis given to one or other of these two functions in different countries at different times and by different unions. In all the socialist and in most of the developing countries, the Governments seek to emphasise the productionist and to suppress the consumptionist role of the unions.

Our Five-year Plans have also emphasised the need for promoting "constructive co-operation" between the management and labour and have indicated the wide powers assumed by the Government to ensure it. Thus, the third Plan says: ". . . the State has, over a decade, taken upon itself the responsibility of providing facilities for promoting the amicable settlement of industrial disputes and has assumed powers of intervention for the purpose of maintaining industrial peace."

Collective Bargaining

In a set-up where the Government has overwhelming regulatory powers, where the productionist function of the trade union is given greater emphasis, and where, as noted earlier, the trade unions are weak, collective bargaining assumes a different form. It is more between the workers and the Government rather than between the workers and the employers. The unions know that most of the improvements in their wages, hours and working conditions are going to come through the Government and the legislature and not through bargaining with employers. Success in collective bargaining itself seems to depend on the political influence of the union. And hence their natural inclination towards politics.

There is nothing wrong and undesirable, however, in the political activities of the trade unions as such. Even in the developed countries, both in their early stages of their trade union development and at present, politicking was and continues to be an important part of union activities. The difference, however, lies in "that in most Western countries all or most unions are interested in one party and it is the unions which exert major influence on the party, whereas in India unions have divided political interests and it is the parties which exert major influence on the unions." In the U.S.A., for instance, towards the close of the 19th century, Samuel Gompers fought for ten years to win laws that would curb the use of injunction and exempt the unions from the Sherman Act. Even today almost every important union in the U.S. has a separate political action department headed by men of high stature within the union.

Absence of broad ideological differences, among others, may be said to have contributed in the West to a labour movement not sharply divided on party lines. In Great Britain, for instance, "since 1926, specially since the downfall of the second Labour Government in 1931, official trade unionism has endeavoured not to challenge capitalism but to make terms with it; and it has regarded its worst enemies not the employers but those trade unionists who have endeavoured to recall it to a more militant policy." Very much similar is the situation in the U.S.

In India and many underdeveloped countries, it is not so. The sharp ideological differences between the political parties in India with regard to their 'vision' of the country's political and economic set-up are directly transplanted in the form of rival unionism in the field of labour and are reflected in the 'objectives' of the four major trade union groups in the country.

Three-pronged Approach

What is needed, in the present circumstances, therefore, can be outlined in the form of a three-pronged approach. First, some kind of ideological understanding within the ranks of labour is essential. The goal of establishing a socialist State through a process of democratic planning accepted by the country should broadly provide this understanding. Instead of being rigid, this goal and the detail approaches within it are flexible enough to permit lively discussions over the varied alternatives and to call for decisions acceptable to the majority. Such discussions and decisions, however, will be within a group of people with the same broad objective and ideology, instead of

* Gandhiji believed that it was a most dangerous thing to make political use of labour until labourers understood the political conditions of a country and were prepared to work for the common good. It was under his influence that the Textile Labour Association of Ahmedabad stayed away from the A.I.T.U.C. Also see, in this connection, Subbiah Kannappan, "The Gandhian Model of Unionism in a Developing Economy: The T.L.A. in India," *Industrial and Labour Relations Review*, Oct. 62, pp. 87-110.

apart from each other and clung to their respective ideologies.

Secondly, the political parties should voluntarily undertake a 'hands off' policy through some kind of explicit or implicit 'code.' No doubt, the parties nutured and brought the unions up in their formative years. But it is high time now that the unions were left on their own, so that they may develop capacity for an independent 'adult' existence.

Chances Dim

The chances are rather dim for the above kind of approach on the part of the parties themselves. And hence, thirdly, and also most importantly, the unions must themselves seriously seek to achieve and assert their own 'adulthood and independence. It is they who have to realise the futility and harmfulness of their continued party-based rivalries. It is true that each of the four labour federations has spelled out different objectives for itself. The necessity for every union to be 'responsive' to its membership, on the one hand, and the overall Government control and regulation, on the other, have, however, tended to minimise differences in their actual operations. With all their emphasis on class collaboration (as opposed to class-conflict) and on peaceful methods of settling industrial disputes, and with a full realisation of the 'productionist' function of the trade unions, the I.N.T.U.C. could not afford to completely neglect its 'consumptionist' function and, quite often, its demands have not been much different and less vigorously put forward than the demands by other unions. On the other hand, with all their emphasis on class conflict and the militant consumptionist role of the trade unions, the A.I.T.U.C. have had to subject itself to the moderating influence of the law. Some of the common demands by our trade unions in general have been the gradually increasing public ownership of industry, increased regulation of private sector, abolition of managing agency, workers' participation in management (except by A.I.T.U.C.), and, most recently, the matching dearness allowance to neutralise rising cost of living.

Once these actual and practical 'similarities' are realised and emphasised and the differences undermined, it would not be difficult for the unions to realise that politicking and lobbying (as well as bargaining with the employers for that matter) on the part of a united labour movement will carry a greater force than when it is divided. To my mind the "Code of Conduct," the "Code of Discipline," the numerous tripartite decisions to which all the four labour federations had been parties, the merged federations in a number of national services such as the Post and Telegraph, the Railways, and the banks, and the alliances (even though temporary and *ad hoc*) of several rival unions on specific questions like the one of rationalisation at Kanpur, Nagpur, etc., should provide reasonable starters for such re-thinking.

Government's Policy

A word about the Government's policy in the matter is also necessary. Given the democratic set-up in the country, progress on the above lines will depend much on the unions and the political parties themselves. Yet the Government can significantly contribute in the realisation of the above objectives and in the reduction of tensions of rival unionism so long as the present situation continues in a number of ways. The scheme of workers' education in general, and of trade unionists in particular has to be more vigorously pursued. Some kind of legislative measure to provide for recognition of a single 'representative' union in an industry and area, either on the lines of similar measure in Bombay or in Madhya Pradesh, has to be adopted for the whole country. Government's persuasion and honest lead by the ruling party have to be explored to initiate efforts for a 'hands-off' policy on the part of the political parties. Once this is done there will, no more, remain any need to emphasise the differences between the public and the private sector from the point of view of their labour troubles.

To conclude, instead of being unique, politicking and party base of our trade unions is only an indication of general pattern of unionism in most newly emerged developing countries. Association of labour movement with the respective countries' liberation movement and the emphasised 'productionist' role of trade unions in their economies combined with the unions' own weaknesses have largely been the causes for such a pattern. It is phasise the actual and practical 'similarities' of their approaches and undermine their theoretical and ideological differences, develop and claim independent adulthood, and seek strength in unity. This, combined with a more vigorous pursuit of workers' education scheme and Government's persuasion for a 'hands-off' policy on the part of the political parties will go a long way in improving the situation in India. In the meantime, legislative measures might be adopted for the recognition of a single 'representative' union in an industry and area for the whole country as it is, for

BUSINESS NEWS FROM EUROPE

(*Concluded from page* 105)

It is expected that the lower cost of bank credit and other long-term finance should ensure that the growth of private, as well as public building and construction, consumption will continue. Housing construction is especially expected to expand steeply.

Trade: The balance of payments is expected to remain in surplus. Although Austria has a visible deficit (£122 million, 341 million dollars last year) invisibles, especially tourist earnings, more than cover this.

Economic Policy: Although there is thought to be no immediate danger that demand will become excessive, even when stimulated by an expansionary budget and easy money, an O.E.C.D. report has queried the advisability of a budget deficit. However, the deficit is expected to be smaller than last year's.

Israel Feels a Cold Trade Breeze

Israel's determination to allow more consumer goods into the country after 15 years of semi-austerity is having serious repercussions on her balance of payments. In the first four months of this year imports increased by £26 million compared with the same period of last year. As a result the trade gap more than doubled to £47.5 million. There were signs that this rise was slowing down in April and the Government must hope that an influx of tourists in the European summer months will help to offset the visible trade deficit. The Israeli State Tourist Board has been undertaking a vigorous advertising campaign in Europe to attract visitors.

The trade balance is slightly less serious than it seems because part was due to a fall in citrus fruit exports, one of the country's main sources of foreign earnings. The fall of £7 million in the four months more than offset a rise in industrial exports worth £5 million. However, total exports fell slightly compared with 1963.

Israel has been equivocal on its import liberalisation policy. While wishing to stimulate local industry it has not wanted to undercut it altogether. Quite high import duties have therefore been set at the same time. Duty on a pair of shoes, for instance, is over £2. Furniture is the main consumer-durable import so far and the Scandinavian furniture firms have been busy setting up showrooms in the country. Swiss chocolate manufacturers have also benefited from the liberalisation.

Eggs: Output Up, Trade Down

The trend towards self-sufficiency or oversupply in eggs in most northern hemisphere countries will continue this year, according to the Food and Agriculture Organisation. As a result, the decline in the world egg trade in recent years is likely to go on.

F.A.O. sees output exceeding by a fair margin that of 1963, when 194.9 million cases were produced in North America and 172.8 million cases in Western Europe. The sharpest increase in 1964 is likely in North America, which produces about one-third of the world's hen eggs, and in the main importing countries of Western Europe.

Already last year world exports of eggs were 25 per cent lower than the peak of 25.9 million cases shipped in 1960. Declining import demand and smaller exportable supplies in Western Europe led to a 22 per cent decline last year in both Dutch and Danish exports, while Polish shipments fell by 35 per cent.

A report from Copenhagen suggests that Danish output in 1964 will continue the steady decline—averaging five per cent annually—registered since 1961. Production is likely to decline even further next year, following a curtailment of laying flocks by some eight per cent expected during the course of 1964. At the last census in April, there were some eight million Danish layers—already about one million birds less than a year earlier. As a result, Danish egg output next year may drop to son 4.1 million cases, compared with 4.8 millic cases expected this year. Exports in 1964 a likely to be no more than 1.4 million case against 2.1 million last year and 3.4 millic in 1961.

The trend of increased home productic was not shared by Austria or, until this yea by Britain. Austria's imports rose by 12 p cent and Britain's by six per cent last yea F.A.O. says that two of the main continent suppliers, the Netherlands and Belgium, bo Common Market members, were notable la year for selling more eggs to countries outsic the market. The Netherlands increased expor to Britain and Austria, and Belgium replace Poland in the Swiss market.

U.S. Beef Exports in Doubt

The United States Department of Agr culture and the Meat Institute are keeping wary eye on new developments which ma upset their plan to ship between 100,000 an 200,000 tons of surplus beef to Europe. Sor meat traders fear that exploitation of the bee hungry European market, for the first time i 45 years, may come up against adverse pric movements, quality standard difficulties an excessive competition from established sup pliers.

The Agriculture Department expects Amer can beef output to go on rising this year, bu at a slower pace than in the first quarte This may have the effect of firming America prices just at a time when values in Europ were slaughter herds are building up, see likely to move down from their recent peak.

The narrowing of the differential whic would have induced European buyers to go fc American beef is already showing up. Heav continental demand for instance, has failed t raise Irish prices above Chicago ones. Similarly Argentina sides at Smithfield are still cheape than corresponding American values, despit the tight position of shipments from Argentin

The Meat Institute is believed to b pleased with the results of its beef sample di plays at Smithfield and its trial shipments t Paris. Trial consignments have certainly bee praised in both centres; but the hard fact re mains that the quality standards and notation demanded in both Britain and continenta Europe are different from (not necessaril higher than) those accepted in the Unite States.

Finally, there is the commanding positio of suppliers which already have a firm foo hold in the market. At the moment this mear Australia, which is finding ready markets fc beef shut out from America; Uruguay, know to have plenty; and smaller supplies from Ir land, which has the advantge of proximity.

Topical Briefs

Three of the world's leading oil companie have agreed to adopt techniques on their shi to avoid the amount of oil waste discharge at sea. Oil-polluted beaches are the despair c both Governments and holidaymakers. If th system operated by the three is successfu there should be a lot less to cause distress t swimmers and sunbathers. The companies- Shell, British Petroleum and Esso—contr about two-thirds of the crude-oil carrying tanl ers and their new system is based on clear ing out the oil tanks in a different way. O has been jettisoned when a ship cleans out it tanks after discharging its cargo and the re sultant mixture of sea water and oil poure overboard. The three companies now propos to run the discharged oil into one tank on to of a base of sea water and then mix it wit the new cargo when it is pumped into the shi Such a system may prove difficult to exten to the other third of the world's tanker flee because it would depend on voluntary ac ceptance. But it is thought that the oil com panies themselves could put strong pressure o the tanker lines.

Crude steel production in the Commo Market, running higher this year than las may level off in the second half. Output i the first five months reached 6.75 million ton 11 per cent higher than in the same period o last year. Only Italy has not shown a rise i production this year, output having fallen by 6. per cent because of lower demand from th rest of industry. Of the rest, the Netherland had the fastest rate of growth (17.3 per cent and France the slowest (10.2 per cent). Pro duction in May dropped a little, because of th greater number of holidays in the month. Nev orders for rolled products have dropped slightly The order book for the steel industry is boom ing healthily and in 22.6 per cent higher

CONDITIONS FOR ECONOMIC GROWTH—II

INFLATIONARY POLICY MUST BE RENOUNCED

By Professor W. H. Hutt

[This article, the first instalment of which appeared in our last issue, is being published by the Forum of Free Enterprise in the form of a booklet. It is reproduced here with the kind permission of the Forum. The author is one of the leading world economists. He is a member of the well-known Mont Pelerin Society with which leading economists who believe in a free market economy are associated.—ED.*]*

ONE of the chief obstacles to the speedier modernisation of the industrial and commercial system of India is believed by some authorities to have been the absence there of an influence, sometimes called "the Christian ethic," which prevailed during the revolutionary growth in industrial output and trade in the western world during the eighteenth and nineteenth centuries.[9] There are sociologists who hold that this phenomenon was ultimately attributable to attitudes towards thrift, interest, profits and ambition which grew out of the Protestant reformation—particularly among the Puritans. The moral approach of Protestants and Puritans towards trade and thrift has been somewhat misrepresented by certain historians and sociologists.[10] But it is true that the religious convictions of the Protestants tended to justify the normally altruistic virtue of thrift,[11] and did not frown on the incentive to excel and win respect—the personal ambition which promotes self-improvement and diligence.

Nevertheless, in the present writer's view, doctrinal teachings tend more often to support and propagate the morals of any era than inspire those morals; and the religious traditions of countries like India (however different from those of the West) need form no *lasting* obstacle to the development of a system which rewards persons whose providence, initiative and wisdom succeed in raising the material standards and broadening the economic life of the people.

Profit reward (insofar as it is truly profit[12]) is always small in relation to the social benefit for which it is the recompense. And rigorously envisaged, "profit" is merely a realised yield in excess of the rate of interest upon the value of replaced or accumulatd assets, just as "loss" is a realised yield which falls short of the interest return. In seeking to avoid losses (and this is the same thing as seeking profits) to the investors on whose behalf they act, business managements are responding to production objectives set by the people as consumers; for consumers have the power to buy or refuse to buy any product offered. The form of replacement of inventories consumed and equipment worn out (or otherwise depreciated) or of their net accumulation is determined, under the free market system, by society's democratically expressed preferences.

The rate of material progress of any underdeveloped area is likely to be closely related to the degree of economic democracy achieved. By "economic democracy" is meant *the vesting in the people, in their consumer role, of ultimate power to command and control the productive process.* Through the consumers' expression of their wishes in the market (in buying or refraining from buying), the possessors of skills and the owners of physical resources are disciplined, not by a few strong and privileged persons or groups (as under "central economic planning") but by the whole community. And the consumers' discipline is then exercised with the greatest direct force upon the business managers who most commonly—in the modern world of free enterprise—administer limited liability corporations. The managers act as intermediaries, entering into contracts with investors (as risk-takers) on the one hand and the suppliers of effort or skill ("labour") on the other.

The profits with which consumers remunerate wise prediction and action in business accrue, almost universally, to shareholders—those investors who are prepared to bear the risks of the managers making wise or unwise, lucky or unlucky decisions on their behalf. Investors contract to accept such risks when they acquire what are known as "equities" or "ordinary shares." There are social advantages in this sort of arrangement. *The suppliers of capital* cannot themselves have the detailed market and technical knowledge to make the necessary decisions with success, yet it is appropriate that they should bear the risk, thereby earning risk-remuneration (profit) as well as interest; for individual managers can seldom possess sufficient capital to justify their shouldering the essential risk-bearing function. Moreover, it is difficult, although by no means impossible, for "labour"—*the suppliers of effort and skill*—to bear the risk by paying interest to the providers of capital and sharing profits, in addition to wages, as their remuneration.[13]

It is important to perceive the democratic nature of the authority which business managers—ultimately subject to consumers' will—must wield on behalf of the risk-takers to whom they are legally responsible; for backward communities may be expected to advance in proportion to the extent to which the reasons for the responsibilities of the managers—in commanding and directing the productive process—are understood and respected. The orders of "employers," as it is usual to describe the managements of companies,[14] are democratic because, as we have seen, those orders are, properly observed, the interpreted dictates of the whole people in their consumer role.

Economic Democracy

Economic democracy is most likely to be achieved under political democracy. By political democracy is meant a society in which the rulers are elected, but accorded strictly defined, limited rights to make and administer laws. In every *true* democracy, it is not only possible to change rulers without force, but to subject them to enforce enforceable "rules for making rules." In a perfectly democratic society, a rigid constitution would strictly restrain the powers of the small groups of private persons who form successive Governments. Thus, if political democracy has really been won, majorities will have no right to enrich themselves (through the governments which they have elected) at the expense of minorities,[15] or to discriminate in other ways, for instance on grounds of race, colour, creed, caste or social class.

There is, in fact, no such *perfectly* democratic governmental system in existence anywhere. But independently enforced constitutions, like that of the United States, provide examples of the machinery through which true democracy would be obtainable if societies ever did wish to free themselves from State tutelage and vest sovereignty in the people. British democracy evolved on a foundation of strong traditions or "conventions," which limited the powers of the legislature and the executive. But political philosophers have now perceived that the constitutional effectiveness of those "conventions" has been quite inadequate against the forces of acquisitiveness and envy.

The virtues of democracy are, indeed, derived less from the franchise (the right of citizens to qualify, by educational achievement or other proof of competency, for the responsible duty of choosing legislators) than from independently enforced constitutional entrenchments which limit governmental power by invalidating discriminatory laws. Such constitutional entrenchments do not stand in the way of the assumption by the State of any truly co-ordinative functions. The difference between liberal[16] and totalitarian planning by the State is that, in the former, *firstly*, the democratic rights of the people as consumers (expressed through the market) are regarded as sacrosanct: and *secondly*, that no power to discriminate is conferred. But under totalitarian planning (as is found under what Mises has termed "omnipotent government"), not only is the market expression of consumers' preference overruled but the government (a smal group of private people, we must always remember), through its officials, claims the right to discriminate in favour of one industry against another, or one district against another, one firm or person against another, and one class, caste, or race against another.

Tariff Protection

Most countries of which the industrial development is only just beginning assume that tariff protection of young industries is essential for their emergence or survival. There is an element of validity in this assumption; for foreign suppliers of goods which compete with domestic industries that are in process of establishing themselves may try to kill the infant industry at birth by price-cutting in that region alone. But legitimate protection in this case should do no more than prevent the price of the local product from being forced below, say, nine-tenths of the previously ruling price. This is because the justification for establishing any local industry is that, by reason of cheaper labour—or other relatively underdeveloped resources—it is possible to produce the protected commodity substantially cheaper than the foreigner can, given his high costs of transport, insurance, interest and marketing. If you can establish a new industry at home only by raising the price which your people have to pay for its product, by doing so you will be holding back your country's development, not fostering it.

What misleads so many people is the fact that it is often possible to create prosperity for any industry, *considered in isolation*, by means of a tariff which excludes or restrains competing imports. But in each case *all other, non-competing industries are burdened;* for when people have to pay more for one commodity they have less income left with which to demand other commodities.

Even in developed countries, the overwhelming majority of industrialists *believe* that the emergence of industrial activity, as well as its survival, depends upon protective tariffs. But the arguments by means of which, in the 18th century, Adam Smith exposed the fallacies in such ideas have never been refuted. No economist denies that import tariffs can benefit the people of a country if they enable them to exploit some monopolistic power which they happen to possess (either as sellers or as buyers). The use of such powers *can certainly improve what we call the "term of trade"* of a country; but this simply means obtaining a given volume of imports with a smaller volume of exports; and as no tariff protection programme has ever been designed to increase the volume of imports in relation to the volume of exports, the theoretically conceivable gain (through the exploitation of foreign suppliers or purchasers) is hardly likely to be realised in practice.

An illustration from the United States may be helpful. Over the last four decades, the southern states have been enjoying a phenomenal industrial progress. Now if these states had happened to possess sovereign independence, they would almost certainly have been forced to protect their "infant industries" against competition from the highly developed industries in the North. Under protection, because the forces tending to spread industry are extremely powerful, the southern states would still have developed *some* industries; indeed, they would have been very proud of them; and they would have been convinced that they were the result of tariff protection. But because the American Constitution has denied these states unqualified political freedom, by forbidding the erection of import tariffs, their industries have grown and have diversified at a rate which has seldom, if ever, been surpassed anywhere.

The case of South Africa, which has also experienced remarkable industrial progress over the last four decades, provides another illustration. In spite of protective tariffs which have slowed down the development tempo, rapidly increasing utilisation of Coloured, Indian and African labour in factory employments has engendered an industrial boom. Yet the writer has for many years told his students that every time he sees a factory in South Africa, he seems to see next to it a "ghost factory," that is, a factory which would have been there had not industrial growth been burdened by tariff protection.

It is sometimes argued that industry can be stimulated at the expense of agriculture. But although industrial protection undoubtedly does impose a burden on farming activity, in the long run it does not imply a redistribution of national income in favour of those engaged in industry and against those engaged in farming. It reduces all incomes, more or less in the same proportion.

Industrialisation of Agriculture

Not only is it impossible to stimulate industry by any transfer of income from farmers to industrial investors, but a vigorous development of factory production nearly always requires a parallel development of agriculture. There is a certain complementarity in economic progress under which the growth of output in one sector creates demand for the growing output of another sector. It seems that what is wanted in India is a process which has been called "the industrialisation of agriculture" (i.e., its gradual mechanisation), accompanied by concurrent investment in modern methods of factory production.

But the technological improvement of agriculture is *likely* to mean that many small farmers will find that they can earn more as skilled farm workers than as small farm owners. One can well understand the feelings of those who would resist the sociological changes which such a revolution in agricultural methods and land tenure would cause. But if the Indian community are to be better fed (as well as better clothed, better housed, and better supplied with secondary industrial products), large-scale farms must supersede smallholders. On the other hand, Indians as a whole may wish to give a high priority to the preservation of peasant farming. If so, they must be prepared to sacrifice the possibility of a rapid development tempo in both agriculture and industry.

Although wise leadership by the State is essential for the progress of underdeveloped areas to economic maturity, there is always the danger that spectacular, grandiose schemes will be given priority; for Governments are, we know, tempted to choose projects for which they can claim early credit and prestige. Whereas private investors have obvious motives for avoiding any squandering of their capital, and equally strong motives for careful prediction and risk-taking, the people who form Governments are actuated by quite different motives. They do not personally bear the losses nor reap the rewards, as do private investors. That is partly the reason why certain critics believe that the large sums invested in the Indian steel industry have not represented the most productive use to which the savings of the Indian people could have been put, at the present stage of their economic development. There is a certain time sequence in successfully programmed growth—a sequence normally secured through the simple operation of the loss-avoidance, profit-seeking incentives.

It is futile, for instance, to direct the people's savings into heavy industry before the secondary industrial activities it can serve are emerging, the transport and communications system (roads, railways, harbours etc.) is being developed, marketing machinery is evolving, and the appropriate education and training of labour is proceeding.

Wage Determination

There is another way in which India may foster its industrial development, and that is by avoiding the blunders of the "developed countries" in the matter of labour's remuneration. In the western world, the course of politics has encouraged State action, or permitted private coercive action, continuously to reduce the flow of wages and other income. To understand this problem we must never forget that wages are paid by the consumers of the product, and neither by the owners of the businesses which employ labour nor by the managements of those businesses. Every increase in wage-rates which is enforced by privately-exercised coercive power (as through strikes) or by the State (in order to get the support of particular groups of voters) leads to the community having to pay more for the product. There are some exceptions to this principle but they are of negligible importance. The effect of such price increases is always "regressive," by which we mean that they tend to burden the poorer consumer relatively more than the well-to-do. Hence, in a society which wishes as rapidly as possible to raise its standards of living, and especially those of its poorest classes, wage-rates should be determined by free market forces. The flow of income and wages will then be maximised and its distribution rendered as equitable as possible.

The functions of labour unions should, in an equalitarian and economically democratic society, be confined (*a*) to preventing the "exploitation" of their members by firms which might rely upon ignorance about what the labour market is offering, or (*b*) to breaking down agreements to remunerate any group of workers by wage-rates which are less than the true free market value of the labour. In case (*a*) labour unions could search out better paid opportunities for members whom they felt were being under-paid through their unawareness of these opportunities; and in case (*b*), they could bring Court actions for the dissolution of combinations designed to force wage-rates below their competitive level. But the right to strike means the right to use coercive power for private aims: and when the countries of the western world tolerate private coercion (whether in the form of strikes, boycotts or otherwise) they are submitting to a regime of right is might. Their ability to use and develop their physical resources and the powers of their people for the common good is obviously reduced thereby.

The great economic advantage which communist countries have in comparison with those of the West is that they do not permit strikes. This virtue of the totalitarian communities has naturally to be set against (*i*) their marked inferiority in the realm of management, (*ii*) the extraordinary clumsiness of their market machinery, and (*iii*) the absence of freedom of thought and expression under their system. But the peoples of the free world could have outstripped the communists in *every* direction if they had followed the Russian example in just this one respect, namely, denying the right of private coercion. If, say, the United States had, in this way, protected their working classes from the labour union activities which have all along been growing stronger, and forcing the flow of wages and income well below what it could otherwise have been (as well as destroying the *security* of distributive justice), not only would the prosperity and material standards of Americans have been even more impressive than at present, but those benefits would have been shared much more justly with the Negroes in all parts of the country.

The Sphere of Money

Some of the most serious weaknesses of the western powers' contemporary economic policies are to be found in the sphere of money, and unfortunately these weaknesses have been copied by the Governments of underdeveloped countries. Inflation, either in the sense of the depreciation of a nation's currency unit in terms of currencies in general, or in the sense of its depreciation in terms of purchasing power, is proof of monetary inefficiency; for (to simplify the issue for expositional purposes), the purchasing power of the money unit is wholly a matter of discretion, determined chiefly by the relation between the volume of bank deposits *plus* currency in circulation (which volume can easily be controlled by treasuries and central banks) on the one hand and the flow of output on the other hand.

It is true that, if the performance of the State's role in the economic system is defective—prices and wage-rates coming to be fixed beyond the reach of the people's income, or out of harmony with their expectations so that unemployment emerges—inflation *can* serve as a crude way of bringing the economy into better co-ordination. But it has a debilitating effect, through penalising those who have been innocent of the pricing activities which have disco-ordinated the economy and encouraging those who have been responsible. Governments do not "fight inflation," as they universally claim. They engineer it, however reluctantly, because it is often the politically easiest way out of their difficulties. And inflation will continue until electorates become sufficiently well-informed to throw out Governments which resort to the debasement of their money.

Admittedly, the *political* difficulties of non-inflationary policies are real, and it would be too much to expect that an underdeveloped country should refuse to follow the depreciation of, say, the American dollar, which is today the tacitly accepted monetary standard of the world. Nevertheless, a community such as India ought to realise that a continuously rising cost of living is a phenomenon which strong, wise and truly democratic Governments could prevent; and they should reject the currently fashionable argument that "moderate inflation" is a tolerable method of boosting a flagging economy. That argument becomes plausible only when Governments are failing in their duty to protect society from collusively or politically motivated sectionalist actions which are disco-ordinating the economic system.

Not least of the evils for which inflationary policy must bear the blame is that, in attempts to prevent costs from increasing ahead of and in anticipation of price increases, resort to a porliferation of "controls" becomes unavoidable. The people's right to protect their interests through the free market is withdrawn, and a socially neutral market is replaced by the arbitrary decisions of officials. "Controllers" allocate foreign exchange, import permits and licences; and they dictate prices, rents and outputs. Now when officials thus acquire the power to create or destroy private fortunes, an inevitable inducement to bribery with a consequent weakening of business morale must follow. The fear or fact of public corruption can, indeed, provoke a malignant debilitation of the business incentives which can build up a healthy expanding economy.

Population Growth

Mention has been postponed of one matter of overriding importance which, the author feels, may already be sufficiently understood by Indian leaders. The most successful achievements of economic policy can remain unrecognised if expanding real income is balanced, or more than balanced, by population growth. To win more satisfactory living standards demands not merely the accumulation of income-producing assets and the better utilisation of those assets: it requires that the number of mouths to feed and the number of bodies to clothe and house must decline, remain stationary, or increase less than proportionally to growing outputs. It is necessary to make this rather obvious point for the sake of completeness of exposition.

To sum up, the achievement in India of a rapid development tempo will, in the author's opinion, depend upon the success with which (*i*) thrift can be encouraged by a taxation system which does not discriminate against the provident; (*ii*) the foreign capital needed can be attracted by the creation of faith that nationalisation or confiscatory taxation will be avoided and by official acknowledgement of the reasonableness of foreign control of foreign capital accepted; (*iii*) enterprise generally can be fostered by explicit official recognition of profit as the reward for wise and responsible direction of productive activity; (*iv*) a climate of economic justice can be created through constitutional entrenchments whereby legislation or private agreements which discriminate on grounds of race, caste or income will be unconstitutional and void; (*v*) the temptation to distort the form of development by tariff or quota restraints on imports can be overcome; (*vi*) the mechanisation of agriculture can be hastened, so that the economies of large-scale cultivation can be won side by side with industrialisation; (*vii*) the political incentive to invest public capital in spectacular, grandiose schemes can be resisted and an appropriate time sequence in development permitted; (*viii*) the determination of prices, wage-rates and outputs by private coercion (as through strikes or boycotts) can be forbidden; (*ix*) inflationary policy can be renounced, a major incentive to corruption (which accompanies the repressed form of inflation) being thereby eliminated; and (*x*) unbridled population growth can be prevented.

(Concluded)

---

[9] The industrial and commercial revolutions effected under *laissez-faire* capitalism brought not only rapidly improving health and living standards (better food, clothing and shelter) but greater scope for leisure, the elimination of the child labour which had characterised the pre-capitalistic age, and greater economic equality. These proud achievements were secured in spite of restraints from misconceived legislation and labour unions seeking sectional benefits. See Hayek (Ed.), *Capitalism and the Historians.*

[10] The historians and sociologists in question are, on the whole those who have been actively allied to the political parties of the Left. A dispassionate and scholarly treatment of the issue is H. M. Robertson's *Aspects of the Rise of Economic Individualism.*

[11] Thrift is normally altruistic because the saver wishes to protect himself from becoming a burden on others in old age, or in the event of some unforeseen misfortune, and to provide for those near and dear to him—his family and successors. It is politicians appealing to mass envy and cupidity who have tended to represent thrift as mere greed or acquisitiveness.

[12] If the free market is overruled through collusive action to fix prices or wage-rates (or to limit particular outputs), the remuneration (in dividends or wages) of certain sections of the community may be raised. But the increase of dividends, or wages achieved for the benefit of such privileged sections is enjoyed at the expense of other recipients of wages and dividends. The share of "profits" in aggregate income is not increased thereby.

[13] Or sharing losses as a deduction from wages.

[14] The term "employers," as usually used, is extremely misleading. The true "employers" are the consumers. Corporations, administered by managers, are the employees most directly subject to the discipline of the market.

[15] When political power happens to be the monopoly of a minority the right of the minority to discriminate, against the majority is, of course equally indefensible.

[16] The term "liberal" is here used in its old, traditional meaning. But by reason of the many virtues which liberalism (in the sense of economic democracy, as I have described it) has manifestly brought the world, the totalitarians have found it expedient to appropriate the term. To such an extent has this tactic succeeded that, in the U.S.A. today, the word "liberal" has almost come to mean a mildly totalitarian-minded reformer. The so-called "liberals" hope to preserve the benefits which true liberalism has won whilst allowing the State the right to suppress the freedom of consumer preference and entrepreneurial judgment which has been the source of these benefits.

PATENTS AND DRUG PRICES IN INDIA

ABROGATION OF PATENTS NO SOLUTION TO HIGH COST OF PRODUCTION

"FEW subjects have more popular appeal than medicines and the economics of the manufacture of pharmaceuticals and drugs has a fascination even to the layman." This observation of the Development Council for Drugs and Pharmaceuticals, Government of India, explains why drugs and the drug industry are so often in the news. And in a country like India, where inflationary pressures pose a serious threat to the standard of living of the people and the entire planning process, prices are the focalpoint of all economic discussions, debates in Parliament and agitation by trade unions. In the case of drugs and medicines, in particular, the question is so surcharged with emotion that economics and objectivity tend to get lost in the swamp of emotional upsurge. This is not altogether inexplicable because the mixture of diseases, doctors and drugs sparks emotional reactions as violent as those of any chemical combination. But an emotional approach, however, justifiable on other grounds, will not help in understanding the real nature of a problem or in finding solutions for it.

The Pharmaceutical and Allied Manufacturers' and Distributors' Association (P.A.M.D.A.L.), Bombay, has attempted to raise the question of drug prices from the purely emotional plane to that of objective study. It has just published a brochure entitled *Facts on the Pharmaceutical Industry* which seeks to answer, with facts and figures, the various charges and allegations levelled against the industry and to present what it considers to be the facts about drug prices, patents, research and a host of other related questions of vital interest to the public. It is a commendable effort inasmuch as the need to inform and educate the public is nowhere more urgent than in the case of the pharmaceutical industry because, as noted above, the question of drugs and medicines has an emotional appeal such as no other necessities of life possess.

Strong Criticism

It may be noted here that criticism of the pharmaceutical industry for the 'high' price of drugs is not confined to this country only. In fact, throughout the world the industry is facing heavy fire on this score. This critical attitude can be traced to an investigation conducted by Senator Kefauver in the U.S. a few years ago and the sensational report on its hearings. It is important to note here that the Kefauver report was *not* an official report of the U.S. Government, nor was it endorsed by the U.S. Government or the Congress. In fact, the U.S. Congress and the Administration completely rejected Senator Kefauver's proposal for legislation to shorten the duration of drug patents and to provide for compulsory licensing at fixed maximum royalty. Nevertheless, by unnecessarily dramatising it, Senator Kefauver's investigation received wide publicity, out of all proportion to the importance or authority of the investigation, while, as is usual in such cases, the defence put up on behalf of the industry by its leaders, world-renowned scientists, leading physicians and economists was overshadowed by the sensational headlines of the Kefauver hearings. The Kefauver investigation had its repercussions in other parts of the world, too. It provided ample ammunition for critics of the industry who promptly mounted their attack. Thus the international pharmaceutical industry came under fire as never before.

Anti-climax

The emergence of such an adverse climate came as a dramatic anti-climax to what is called the "heyday" of the industry, namely, the period between 1945 and 1958 when pharmaceutical advance was raised to an entirely new and spectacular plane. The industry during this period rode on the crest of a sweeping wave of prestige and popularity set in motion by the discovery of penicillin, streptomycin, the broad spectrum antibiotics, corticosteroids, antihistamines, tranquillizers and new vaccines which saved the lives of millions of people and took away much of the fear of what were previously killing diseases. Apart from saving millions of lives, the new chemotherapy, which the pharmaceutical industry made available to the medical practitioner, enabled thousands of beds to be freed in hospitals and saved patients, hospital authorities and Governments enormous sums of money. So rapid and so intense was this advance that, out of all the prescriptions written today, more than 80 per cent could not have been filled just two decades ago. Indeed, such was the rate of progress and so spectacular were the discoveries that it seemed almost as if the final conquest of disease was at hand. The Kefauver inquiry, however, changed all this and put an unprepared industry into disarray and on the defensive.

It is against this background that the criticisms levelled against the industry in India and abroad has to be examined. The main points of criticism centres round drug prices and its alleged cause, namely, patents on drugs. The answer to this criticism and the facts relating thereto form the main theme of the booklet published by P.A.M.D.A.L.

Trend of Drug Prices

Answering the charge that drug prices are exorbitant, P.A.M.D.A.L. points out that, in virtually all countries, drug prices to the consumer, in distinct contrast to the continually rising cost of food, clothing and other essential items, have remained the same or declined in recent years or, where all consumer prices have risen universally, the price of medicines has risen much less. This is the case in India too. Thus, while the general index of prices (base: 1952-53=100) has risen to 127 in 1962, index of drug prices, with the same base, has increased only to 102. This two per cent rise over a period of ten years is lower than the percentage rise of any chemical product, except fertilisers, and compares with the 14-point rise in the index for all chemicals taken together. The two per cent rise in the index of drugs conceals certain significant price falls registered in respect of some important medicines, such as antibiotics. For instance, the wholesale price of tetracycline capsules has dropped by 51 per cent between 1957 and 1962. Similarly, there has been a 33 per cent fall in the price of chloramphenicol. Both these drugs are of major importance in treating severe infectious diseases. Take the case of vitamin C. There has been, on an average, a 30 per cent decline in its price since 1954, in spite of the fact that there has been a substantial increase in manufacturing costs—cost of raw materials, packing material, wages, freight, taxes, etc.

It is true that, when the industry was dependent on imports, prices of imported finished preparations used to be higher than those prevailing in countries from which they were imported. This was because of the 50 per cent import duty on finished preparations. Subsequently, however, when manufacture was undertaken in India, first by establishing formulation activity and finished product manufacture, later followed by more basic manufacture, prices of these drugs progressively declined and imports of drugs in finished form have been reduced to a negligible extent.

High Costs

In comparing drug prices in India with those in other countries, it should not be forgotten that essential raw materials available locally cost 50 to 100 per cent more than in most foreign countries. In addition, productivity per worker is low and goods have to be transported over large distances at considerable cost. Furthermore, the higher temperature and the absence of cooling facilities make it impossible to control solvent losses to the extent it is possible in more temperate climates. Extreme climatic variations also shorten the life-span of drugs.

As for the charge that patents are detrimental and that patents do not encourage invention but only add to the cost of drugs, P.A.M.D.A.L. argues, with considerable force, that India, far from being a victim of drug patents, as is alleged, has benefited immeasurably from modern, patented drugs. Patents bring to the people of the country the benefits of the gigantic research efforts of the international pharmaceutical industry. During the last few years all leading manufacturers of the world have established units for the production of most modern drugs and medicines in this country, usually in collaboration with Indian entrepreneurs. These and the units that already exist and the ones that are under way will produce a wide range of drugs and medicines to meet the needs of internal consumption and exports. The growth of the pharmaceutical industry in India in the past decade or so has been tremendous. What was only a Rs. 10-crore industry a decade ago is today a Rs. 100-crore industry. And the industry bids fair to grow at even a much faster rate in future.

Development Council's View

But for the existence of patent protection the major drug manufacturers of the world, who have set up units in this country, and the local industry, of which they are a part, would not have progressed as fast as they did in the past few years. It is this realisation that has prompted the highest advisory body for the industry in the country, namely, the Development Council for Drugs and Pharmaceuticals, Government of India, to make the following observation in its latest (1962-63) report:

"The Council, however, feels that the abuses of the patent system have sometimes led to an exaggerated picture of the profits made by private companies on discoveries of drugs and medicines that were aimed at amelioration of human sufferings. The view has sometimes been supported by Indian scientists that it would greatly help the growth of research as well as utilisation of research carried out in the country in the field of pharmaceuticals if the patent system were abolished so far as this country is concerned. The Council feels that this view is based on an incomplete appreciation of the factors that contribute to the healthy development of the pharmaceutical industry."

Abrogation or suspension of patents, according to the Council, will greatly harm the industry. It says:

".... The Council feels that, if, at this crucial juncture, Government resort to drastic steps like suspension of patents so far as drugs and medicines are concerned, it might do immense harm to this industry. Modern pharmaceutical industry evolves the use of very complicated techniques and equipment which it would take years for any country to develop on its own. It is desirable, if not essential, that the complexities of such processes should be seen personally by those who are to take a decision on this very vital subject."

No Evidence

The contention that drug prices tend to be substantially higher in countries which award patents on drugs, as compared with those which do not, is not true. For the Kefauver Committee's data on a number of major antibiotics, anti-diabetic drugs and tranquillizers show that prices are higher in Italy, which do not have patents on drugs, than in countries like the U.K., Germany and France, all of which provide patent protection. In fact, analysing the Kefauver Committee's data, Mr. George E. Frost, a renowned patent expert, demonstrated that there was no evidence to indicate that patent rights increased drug prices. Factors other than patents, he proved, far outweighed whatever influence patents had on prices.

Equally unfounded is the argument that drug discoveries in countries without product patents outnumber those discovered in countries with patents. The opposite is the case. The Kefauver Committee's own data revealed that not one of the major drug discoveries since 1940 was made in Italy, whereas the U.S., with strong patents, accounted for the majority and Britain, France, Germany, Switzerland, etc. with medium patents were responsible for the rest. In fact, drug discoveries in countries providing patent protection for pharmacentical products outnumber those in countries without patents in the ratio of 13 : 1. It is not without reason that almost all countries in the free world, with the exception of Italy and Turkey, provide some measure of patent protection for drugs. Even in Italy, there is now a Pharmaceutical Patent Bill pending before Parliament which is certain to be passed in the course of the next two years when that country brings its commercial laws into conformity with those of the other countries of the European Common Market.

Determinant of Price

Patents have no significant influence on prices. As economists testified before the Kefauver Committee, it is competition, not the alleged monopoly, that follows a patent which determines the price of the drug—competition between manufacturers of different drugs which can be used for more or less the same purpose. That patents do not stand in the way of reducing drug prices is borne out by the experience of the U.S. where wholesale prices for patented pharmaceuticals declined by 23.9 per cent since 1949, as compared with the fall of 1.9 per cent during the same period in the price of non-patented products. Similarly, in 1962-63, the price of patented drugs declined by one per cent, as against 0.1 per cent fall in the non-patented groups. To believe that abrogation of patents would lead to reduced drug prices is to indulge in wishful thinking because patent and royalty fees represent only a very small fraction of the total cost of drugs.

Profits, Research and Prices

The "excessive" profits of pharmaceutical companies are said to be another cause of the "high" price of drugs. That this is not true was testified by economist after economist at the Kefauver hearings. Suffice it to quote only one of them, namely, Dr. Fredrick L. Thomson: "If the entire profits of the drug manufacturers were wiped out completely, buyers of consumer drugs, on the average, would hardly notice the difference in prices."

Critics of the industry who make much of patents and "excessive profits" as responsible for the "high" price of drugs forget the enormous amount of money that goes into research which *does* affect the cost of drugs. An idea of the research expenses of the pharmaceutical industry may be had from a few facts. In the U.S. alone, the pharmaceutical industry spent $1,000 million (Rs. 500 crores) on research during the period 1958-62. In 1963, as much as $257 million (Rs. 125 crores) was spent by the industry, a more than sixfold increase over the 1950 figure of $39 million (Rs. 20 crores). In the past decade, while drug sales have increased by 96 per cent, research expenditures increased almost 300 per cent. In fact, in the U.S., the pharmaceutical industry spends nearly three times as much of its sales income on research as do other industries and on fundamental research four times more of its total research budget than do other industries. It is estimated that behind every new drug of consequence that has reached the public in the past decade the industry has spent some $4 million (about Rs. 2 crores) in research and development cost. Whereas private industry as a whole in the U.S. finances only 42 per cent of its research (with the balance 56 per cent financed by the Government), the pharmaceutical industry itself pays for 98 per cent of drugs and medical research cost, only two per cent being provided by the Government. In the U.K., the pharmaceutical industry spent £7.8 million (Rs. 10.4 crores) on research in the year 1961-62. In addition to these, tens of millions of dollars are spent by the pharmaceutical industry in Switzerland, Germany, France, etc.

Research in India

It is true that expenses on this scale is not incurred on research in India. But, then, the pharmaceutical industry in India is as yet small in size and is comparatively of recent origin. The industry has to go through the various stages of development, such as the start-up of secondary production, the creation of basic manufacturing facilities, the investigation of the medical properties of Indian plants, etc. The indigenous industry has just entered the third stage of development. Basic research centres to carry out co-ordinated research in various branches are being set up, the most outstanding example being the Rs. 2-crore Research Centre recently opened at Bombay by CIBA. More such centres will be established in future, *provided* the industrial climate in the country is favourable for it.

In conclusion, P.A.M.D.A.L. points out that neither complete elimination of profit nor abolition of royalty payments would reduce drug prices significantly, nor bring them within the reach of all those who need them in India or in any other country. Indeed, economist Dr. Fredrick L. Thomson observed before the Kefauver Committee as follows:

"Only a very small reduction in the level of drug prices and an even smaller percentage reduction in the total cost of a cure would result if all profits of all the drug companies were wiped out.

"The price that society has paid in the form of drug industry profits is, in the aggregate, very low. The consumers' alternatives of longer hospitalisation, more time lost from work and more medical services would have been far more costly than the aggregate profits of the drug industry.

"Even if all drug manufacturers' profits were wiped out, the problem presented by the low-income consumer and the chronically ill would remain and costs of the ordinary in-and-out user of prescription drugs would not be reduced enough to pay for his daily newspaper."

Finally, it should not be forgotten that the most expensive drugs in the world are those which could save lives and alleviate pain, if only they existed. The most expensive drugs today are those which would cure cancer, heart disease and other unconquered illness. It may be a long, long time before they become available if, unfortunately, the research efforts of the pharmaceutical industry are impeded or halted because of patent limitation and other restrictive measures that discourage research.

It is evident from the foregoing that the case against abrogation of patents is indeed very strong. The only argument advanced for abolition of patents is that it *may* help to reduce drug prices. In the light of the facts presented by P.A.M.D.A.L. and of the experience of other countries, especially those without drug patents, it is highly doubtful whether this argument is correct. The cost of production of almost all industries is higher in India and this is true of the pharmaceutical industry too. Unless efforts are made to reduce the cost of production, by making available raw materials of good quality at reasonable prices and by giving incentives to higher production, prices of drugs or of any other commodity cannot be brought down. This is admittedly a difficult task. The temptation to follow the line of least resistance and to resort to palliatives and short-term measures in the hope that they may produce the desired results should be resisted. Revision of patent law on drugs is a subject that calls for the most careful consideration of its possible effects on the development and growth of the pharmaceutical and other allied industries. It is to be hoped that the Government of India will examine the issue in all its ramifications before taking a decision thereon.

ADVANCE INSURANCE COMPANY LTD.

RESERVES FOR UNEXPIRED RISKS MUST BE RAISED

SPEECH OF CHAIRMAN, MR. B. SOMANI

ADDRESSING the Twenty-first Annual General Meeting of the Advance Insurance Company Limited held at Bombay on Wednesday, 8th July 1964, Mr. Basudev Somani, Chairman of the Company, reiterated the suggestion that the percentage of reserves for unexpired liabilities should be doubled for stabilising the general insurance trade in the country. With a view to attracting foreigners and creating greater confidence among the public, he urged the Government to sanction the request of insurance companies to raise their paid-up capital. Referring to the L.I.C.'s entry into general insurance as a non-tariff insurer, he hoped that both the insurance companies and the L.I.C. would work in close co-operation and impart strength to the insurance business.

The following is the full text of Mr. Basudev Somani's speech:

GENTLEMEN,

It is with great pleasure that I welcome you to this twenty-first ordinary general meeting of the Company.

I must at the outset express, on behalf of you all and my own, the deep sorrow at the passing away of Pandit Jawaharlal Nehru who ably guided the affairs of our motherland for well over sixteen years. It was Pandit Nehru who made India what it is today. Destiny has taken him away from our midst at this critical hour, but I have no doubt whatsoever, that the Prime Minister, Shri Lal Bahadur Shastri, and his competent team will lead the country to prosperity.

The Directors' report on the working of the Company for the year ended 31st December 1963 and the audited accounts for the period have been in your hands for some time now and, with your permission, I shall take them as read.

L.I.C.'s Entry

You perhaps know that the Life Insurance Corporation of India has entered into the field of general insurance business and started doing general insurance business with effect from 1st April 1964. The Life Insurance Corporation of India has been registered as a non-tariff insurer but, it is understood that for the present they will charge the same rate as laid down by the tariff. It is hoped that the Life Insurance Corporation of India and the tariff insurers will work in close co-operation with each other and thereby would lend greater strength and stability to the general insurance trade in India.

Coming to the affairs of the Company, I am, indeed, happy to report that notwithstanding the impact of the national emergency on the economy and, through it on general insurance and the reduction in fire premium rates, the total net premium of the Company has risen quite markedly from Rs. 33.60 lakhs in 1962 to Rs. 39.40 lakhs in 1963, representing an increase of Rs. 5.80 lakhs or 17 per cent. The rise in premium income is accounted for mainly by the fire department. Expenses of management shows a satisfactory reduction over the previous year. Expense ratio to gross premium in the year 1963 was 23.54 per cent as against 29.14 per cent in the year 1962 which means a reduction of 5.60 per cent. The gross earnings of the Company for the year 1963 was Rs. 5,77,447 as against Rs. 5,09,998 in the year 1962.

The reserve for unexpired risks have been kept at 50 per cent of net premium in the fire, miscellaneous and workmen's compensation department, and at 100 per cent in the marine department. In this connection, I would like to reiterate the suggestion which we have been making in past years, viz., that, with a view to further stabilising and strengthening insurance companies, the percentage of reserves for unexpired liabilities should be increased till it reaches 100 per cent in fire and miscellaneous business and 200 per cent in the marine business, instead of the present 50 per cent and 100 per cent respectively.

Premium Reserves

It was in the year 1950 that the companies were allowed to increase their premium reserves for the purpose of taxation from 40 per cent to 50 per cent in the fire and miscellaneous business. Thereafter, there had been heavy reductions thrice in the fire insurance rates, first in 1957 by 10 per cent, second time in 1960 by 15 per cent and third time in 1962 by 15 per cent on the average. The present average rate is about 60 per cent of what it was in 1950. Thus the present reserve at 50 per cent would actually mean 30 per cent on the basis of the premium of the year 1950. With the reduction in premium rate, a higher percentage of reserve should be maintained. Thus, in my humble opinion, reserve for unexpired risks should, as stated above, be increased to 100 per cent in fire and miscellaneous business and to 200 per cent in marine business to enable the companies to meet any unforeseen catastrophe any time.

Besides keeping increased reserves for unexpired liabilities in view of low premium rates, it will be in the interest of the trade to create special reserve similar to development reserve in other trades. The amount of this special reserve should be invested only in Government of India securities. It should be made free of Income-tax as well.

Paid-up Capital

Whenever insurance companies want to increase their paid-up capital, the Government should sanction their application for increasing their paid-up capital which would not only strengthen the stability of such insurance companies but would also create great confidence in the public and also attract foreigners and would be real assets of the country.

Considering the satisfactory performance in the last few years and the sound financial position of the Company, I feel encouraged to say that the Company can look forward to a period of sustained progress in future.

I take this opportunity of thanking my colleagues on the Board for their co-operation. I also wish to express the appreciation of the good work done by the staff.

Note—This does not purport to be a report of the proceedings of the A[illegible] ing.

BURN AND COMPANY FARES BADLY

PROFIT RECEDES—DIVIDEND CUT AFTER BONUS ISSUE

COMING on top of what was but a slight reduction of 3.5 per cent in the previous year, the rather big slash of 10 points to 15 per cent per annum in Burn and Company's (Managing Agents: Messrs. Martin Burn Ltd., Calcutta) dividend on the 100-rupee ordinary shares for the year ended 30th April 1964 has been made after the Company issued during the year 84,000 bonus shares to double the equity capital to Rs. 168 lakhs. Essentially, this further reduction has followed a decline in gross profit from Rs. 194.40 lakhs to Rs. 163.64 lakhs, in spite of higher sale proceeds of Rs. 12.74 crores, as compared with Rs. 11.41 crores a year before. But, whereas gross profit is down by approximately Rs. 31 lakhs, the net profit is lower by less than Rs. 5 lakhs at Rs. 47.59 lakhs, as against Rs. 52.16 lakhs. The setback in profit has narrowed down at the net level, because the tax provision is lower at Rs. 64.50 lakhs, as compared with Rs. 98.25 lakhs which included Rs. 25.75 lakhs towards S.P.T. for 1961-62. With the net profit not much below the previous year's figure, the Directors could have chosen not to cut the dividend, the bonus issue notwithstanding. But that would have attracted more dividend tax and reduced substantially the amount of profit retained in business, which, even after slashing the dividend by 10 points, is lower by more than Rs. 7 lakhs at Rs. 14.73 lakhs, as against Rs. 22.18 lakhs a year before. The footnote explaining the year's tax provision says that it includes Rs. 3.25 lakhs on account of the previous year but does not show the amount of dividend tax or sur-tax, if any. It will be seen thus that the cut in dividend has been necessitated largely by the bonus issue during the year. Significantly, even at the reduced rate of 15 per cent, the dividend absorbs Rs. 4.20 lakhs more at Rs. 25.20 lakhs.

The following comparative table mirrors the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 30th April			
	1964	1963	1962	1961
Sale proceeds	12,73.96	11,40.72	11,23.04	947.12
Other income	89.93	100.82	89.20	90.14
Stocks of finished goods and goods-in-progress	654.42	531.39	447.46	364.53
Materials and stores consumed	725.19	631.64	638.49	543.58
Other expenses	598.09	490.43	457.02	420.90
Gross profit	163.64	194.40	199.66	149.88
Managing Agents' commission	8.61	11.53	11.34	9.64
Provision for—Depreciation	42.94	32.46	24.26	23.73
Taxation	64.50	98.25	92.50	57.75
Net profit	47.59	52.16	71.58	58.76
Provision for retiring gratuity	5.24	7.71	24.40	10.22
To reserves	14.73	22.18	20.99	22.25
Dividends—Preference	2.35	2.35	2.35	2.39
Ordinary	25.20 (15%)	21.00 (25%)	23.94 (28.5%)	23.94 (28.5%)
Carry forward	..	..	1.09	1.21

Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	326.00	710.00	743.00	538.00	540.00
Low	260.00	305.00	519.00	437.00	425.00

The Directors write that the year's results have been obscured by the additional payments made to the staff for profit sharing bonus in respect of previous years. The amount of such additional payments is not specified. But the total of staff expenses excluding gratuity provision (this total has been included in other expenses shown in the foregoing table) has risen sharply from Rs. 336.43 lakhs to Rs. 425.68 lakhs. It is due partly to such a marked rise in staff expenses and partly to the appreciable increase in closing stocks (Rs. 654.42 lakhs, as compared with Rs. 531.39 lakhs) that the profit has suffered a distinct setback. The increase in stock position, it may be noted here, is entirely on account of work-in-progress which is valued at Rs. 476.12 lakhs, as against Rs. 387.72 lakhs a year before.

A significant development during the year was that Reyrolle Burn Ltd., a new company formed in 50-50 collaboration with Messrs. A. Reyrolle and Company Ltd. of the U.K. for manufacturing the latter's electrical products in India, went into production immediately after the construction of its factory, which became possible because the initial operatives were trained in the Company's Howrah iron works. A progressive increase in the new Company's production is planned.

The Howrah works continue to achieve reasonable results and the order book remains satisfactory. For the past few months, the supply of matched steel has been better. The various mines and refractory works of the Company continue in production, but sufficient remunerative work is extremely difficult to secure. Exports of magnesite increased slightly during the year from Rs. 35.35 lakhs to Rs. 37.93 lakhs.

Out of the Company's total paid-up capital of Rs. 196 lakhs, Rs. 168 lakhs are in equity shares and the rest is divided in three types of preference shares. Reserves and surplus amount to Rs. 229.82 lakhs. As against these "own" funds aggregating Rs. 425.82 lakhs, the gross block, which has appreciated during the year from Rs. 688.27 lakhs to Rs. 765.67 lakhs, has been written down to Rs. 372.24 lakhs. Current assets, loans and advances shown at Rs. 12.30 crores exceed the total indebtedness of Rs. 12 crores, comprising Rs. 11.46 crores in current liabilities and provisions and Rs. 53.63 lakhs in bank borrowings. Investments of Rs. 23.51 lakhs include Rs. 8.16 lakhs quoted at Rs. 12.11 lakhs.

The net yield on the Company's 100-rupee ordinary shares at their current market value of Rs. 277 *cum-div.* works out to 4.5 per cent per annum.

The Republic Forge Company, Ltd. of Hyderabad is to issue capital (for cash at par) of Rs. 1,47,60,000, consisting of equity shares of Rs. 100 each of the total value of Rs. 112.60 lakhs and 35,000 cumulative redeemable preference shares of Rs. 100 each carrying dividend at 9.3 per cent free of Company's tax but subject to deduction of taxes at source at prescribed rates. The money will be used for the establishment of a forge plant in collaboration with the Renault Engineering Company of Paris. This consent is in supersession of the earlier consent dated 9th February 1962 and is valid for 12 months.

The Aluminium Corporation of India Ltd., Calcutta, has secured official consent to issue further capital of Rs. 42,81,250 (for cash at par), consisting of Rs. 17,81,250 in equity shares of Rs. 10 each and Rs. 25 lakhs in 25,000 9.3 per cent cumulative redeemable preference shares of Rs. 100 each. The money will be utilised for financing the expansion involved in the manufacture of virgin aluminium ingots, sheets, circles, etc.

Bonus shares of the value of Rs. 35,28,000 divided into 3,52,800 equity shares of Rs. 10 each are being issued by the Indian Paper Pulp Company, Ltd. on capitalisation of the share premium account to a like extent. The bonus shares will be offered at the ratio of two shares for every five shares held.

(*Concluded from next column*)

maintained by the mills in their production of cloth as well as yarn.

The development programme of the Company proceeded satisfactorily during the year. Mercerising plant and hot air stenter, both of which were received last year, have been erected and commissioned into service. The back filling machine is also being utilised for manufacturing certain qualities which are meant for the same. The beaterless scutcher, though erected, is not working as it is required only for fine and superfine qualities which are not being manufactured at the moment on account of shortage of foreign cotton. The continuous dyeing plant is almost ready for final test and is likely to go into production in the course of another month or so. The erection of the semi-continuous plant has also been completed during the year and is giving regular production.

Import licences have been obtained for waste plant, along with rag tearing machine and a firm order has been placed. Firm orders for import of one felt calender, after purchasing import entitlement certificates of corresponding value, have also been placed. Orders for indigenous machinery pertaining to 10,000 spindles are still pending for execution and delivery of the same is expected sometime after March 1965. Import licences for some of the preparatory machinery meant for expansion have also been received and firm orders placed. Orders for printing plant along with curing machine too, has been placed. The I.F.C. has been approached for a foreign exchange loan of Rs. 46 lakhs so as to enable import from West Germany and the U.S.A. of the latest type of automatic machinery and the application is being considered by the I.F.C.

The Rs. 20 paid ordinary shares of the Company are currently being quoted at Rs. 16.87 *cum-div.* On an *ex-div.* basis, the net annual return on fresh investment works out to 7.7 per cent.

JAGATJIT COTTON MILLS

DIVIDEND SAME ON HIGHER CAPITAL

THE Jagatjit Cotton Mills Ltd. (Managing Agents: Messrs. Karamchand Thapar & Brothers Private Ltd., Calcutta) has reported satisfactory working results for the year ended 31st January 1964. Thus, net sales realisation (that is, excluding excise duty and export promotion loss) has advanced by about 12.5 per cent from Rs. 370.20 lakhs to Rs. 416.01 lakhs, notwithstanding the virtual freezing of cloth prices since January 1961. With trading conditions remaining fairly steady, closing stocks of finished goods have also nearly halved from Rs. 37.86 lakhs to Rs. 19.08 lakhs or what the Directors refer to in their report as a "normal" level. If, despite these favourable factors, the gross profit has remained practically unchanged at Rs. 76.71 lakhs (as against Rs. 76.53 lakhs for 1962-63), it is mainly because of the all-round increase in wages and rise in cost of stores, raw materials, etc. The profit margin has, therefore, declined, for the second year in succession, to 18.5 per cent from 20.7 per cent which itself was lower by 1.6 points than the record level attained in 1961-62.

Consequent on the decrease in profit margin, the Managing Agents' remuneration has declined from Rs. 4.90 lakhs to Rs. 4.62 lakhs, but the provision for depreciation has been raised by Rs. 5.66 lakhs to Rs. 23.34 lakhs. This increase has been necessitated by the third-shift allowance introduced by the last budget and full benefit being available on the machinery installed during the preceding year. Luckily, the provision for taxation has gone down substantially from Rs. 33.00 lakhs to Rs. 25.36 lakhs, including surtax and dividends tax. The net profit, as a result, has increased by Rs. 5.44 lakhs to Rs. 26.39 lakhs. After setting aside from this Rs. 1.32 lakh for payment of preference dividend in respect of the year, the Directors have proposed an ordinary dividend of 15 per cent, subject to deduction of tax. Although this is the same as that for the preceding three years, it is payable on an enlarged capital and hence claims Rs. 11.79 lakhs, as against Rs. 6.25 lakhs the year before. This has naturally affected the ploughback which is lower at Rs. 13.69 lakhs, as against Rs. 15.30 lakhs, including Rs. 2.90 lakhs (Rs. 3.30 lakhs) credited to the development rebate reserve.

The working results of the Company for the past four years are set forth in the following comparative table:

(In lakhs of rupees)

	For the year ended 31st January			
	1964	1963	1962	1961
Sales (less excise duty, rebate etc.)	416.01	370.20	378.02	278.75
Other income	12.07	8.60	7.30	3.81
Closing stock of finished goods	19.08	37.86	25.48	29.40
Raw materials and stores consumed	226.47	218.14	214.04	164.83
Staff expenses	60.74	57.07	53.85	44.59
Other expenses	45.38	39.44	39.32	28.87
Gross profit	76.71	76.53	84.19	56.12
Managing Agents' commission	4.62	4.90	5.24	4.44
Provision for—Depreciation	23.34	17.68	17.52	15.78
Taxation	25.36	33.00	30.00	10.50
Net profit	26.39	20.05	31.43	25.40
Excess provisions written back	..	2.00	..	..
To reserves	13.69	15.30	24.40	18.60
Dividends—Preference	1.32	1.32	1.32	1.32
Ordinary	11.79 (15%)	6.25 (15%)	5.84 (15%)	5.84 (15%)
Carry forward	0.30	0.71	0.63	0.75

Financially the Company is in fairly good shape. Own funds as at 31st January 1964 aggregate Rs. 220.29 lakhs, comprising Rs. 16.50 lakhs in preference shares of Rs. 100 each, Rs. 78.60 lakhs in ordinary shares of Rs. 10 each and the balance in reserves. As against these, outside interest amounts to Rs. 290.36 lakhs, made up of Rs. 134.30 lakhs as secured and unsecured loans and Rs. 156.06 lakhs as current liabilities and provisions, but both these are more than fully covered by current assets and loans and advances which altogether amount to Rs. 329.67 lakhs. Besides, investments are carried in the books at a cost of Rs. 28.27 lakhs. Including the additions worth Rs. 24.11 lakhs, the block account stands raised to Rs. 333.83 lakhs but has been well written down to a net block of Rs. 152.72 lakhs, including Rs. 15.23 lakhs as the cost of capital work-in-progress and Rs. 4.25 lakhs as advances and payments against supply of machinery.

There was a further improvement in the operation efficiency of the mills during the year under review. Yarn production improved from 52.90 lakh kgs. to 53.27 lakh kgs. and cloth production from 284.31 lakh metres to 313.61 lakh metres. High standards of quality were

(*Continued in previous column*)

TATA OIL'S SALES UP, PROFIT DOWN

LOWER DIVIDEND COMPENSATED BY BONUS ISSUE

SQUEEZED between rising costs and taxation, on the one hand, and a limitation on the prices of its products, on the other, the Tata Oil Mills Company Ltd. [Managing Agents: Messrs. Tata Industries (Private) Ltd., Bombay] has reported for the year ended 31st March 1964 a substantially lower gross profit of Rs. 49.76 lakhs, as against Rs. 70.82 lakhs for the previous year. Such a sharp fall has occurred despite a further sizable improvement in net sales proceeds (that is, excluding excise duty paid) from Rs. 11.95 crores to Rs. 12.44 crores. The tax provision has no doubt been reduced considerably from Rs. 23.03 lakhs to Rs. 9.87 lakhs because of (*a*) lower gross profit, (*b*) increase in depreciation provision from Rs. 15.26 lakhs to Rs. 18.07 lakhs and also in the appropriation to development rebate reserve from Rs. 3.15 lakhs to Rs. 5 lakhs, and (*c*) inclusion of Rs. 2.43 lakhs for S.P.T. in the previous year's provision, whereas the provision for the year under review includes Rs. 1.34 lakh for tax on dividends declared out of profits of 1962-63. Even so, the setback in net profit is reduced by Rs. 8.46 lakhs to Rs. 19.25 lakhs. After transferring Rs. 5 lakhs to development rebate reserve (which is all the amount retained in business, as against Rs. 8.30 lakhs in the previous year) and after allowing other adjustments, the profit available for dividends is only Rs. 13.98 lakhs, as against Rs. 19.51 lakhs in the previous year. The Directors have, therefore, been obliged to cut the dividend on the 25-rupee ordinary shares from 22 per cent to 12 per cent per annum. The dividend is payable on 420,392 shares, same as in 1962-63, but, since it is a full year's return on the 139,920 new shares issued in the previous year, it has increased on these shares to Rs. 3 per share from Re. 1.73 a year before. The total amount absorbed by ordinary dividend is, however, lower by Rs. 5.23 lakhs at Rs. 12.61 lakhs. Considering the present an opportune moment to issue bonus shares for reducing the disparity between the Company's block account and share capital, the Directors have proposed a one-for-three bonus issue by capitalising Rs. 35.04 lakhs from the share premium account. This bonus issue will naturally compensate the shareholders for the lower dividend.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sale proceeds, less excise	12,43.81	11,94.82	10,35.51	936.99
Stocks of finished goods and goods-in-process	153.74	100.46	121.42	107.34
Other income	50.77	41.40	37.08	42.39
Materials and stores consumed	829.93	776.39	652.34	595.11
Staff expenses	147.76	148.47	136.54	120.02

Carry forward	0.01	0.01	0.10	0.29

Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	71.00	75.00	87.50 XR	86.80	89.00
Low	56.00	54.70	50.00	67.00	58.00

The Directors have listed three main factors resulting from Government policies or actions which have adversely affected profit for the year under review. One is the considerable rise in the cost of raw materials owing to a further increase in the price of Indian oils but mainly because of the loss suffered on the larger tonnage of groundnut oil exported for earning import entitlements for raw materials. Out of an increase of Rs. 80 lakhs to Rs. 240 lakhs in the Company's total exports, Rs. 70 lakhs were on account of groundnut oil. The quantity of groundnut oil exported increased from 5,747 tonnes to 10,333 tonnes, with every tonne sold abroad resulting in a heavy loss of Rs. 550. This had the effect of increasing the cost of imported raw materials during the year by Rs. 25 lakhs. While in the previous year Rs. 6 lakhs were carried forward to the accounts of the following year, an amount of Rs. 11 lakhs has been carried to the financial year 1964-65 in respect of import entitlements which have not been availed of during the year under review. The second adverse factor is the increase of Rs. 82.50 per tonne in the excise duty on laundry soap which the Company had to bear for the full year, as against only for one month in the previous year. The extra cost to the Company on account of this increase was Rs. 21 lakhs. The third factor is the inability of the Company to raise prices, in view of the restrictions imposed by the Government under price control until December 1963.

Production of both laundry and toilet soap was maintained at the previous year's level, but the total sales of branded products recorded a nominal increase of about Rs. 7 lakhs over the previous year. This was despite an increase of 23 per cent in the sales value of toilet soap. Laundry soap, constituting about 55 per cent of the Company's total sales of branded products, and glycerine recorded major declines. Quantitatively, toilet soap sales rose by 15 per cent, while soap and glycerine sales dropped by 8 per cent each. The setback in laundry soap sales was due to growing competition, absence of Defence orders and shortfall in production at Tatapuram for several months, initially on account of power shortage and subsequently due to the prolonged slow-down resorted to by the daily-rated employees. For increasing consumption of indigenous oils, crushing activities at both Tatapuram and Bombay were expanded and the actual quantity of seeds crushed exceeded the previous year's tonnage by 12 per cent. The solvent extraction plants at Bombay were worked satisfactorily and the bulk of the deoiled groundnut meal was exported, fetching approximately the same realisation as in the previous year. Sales of *vanaspati* increased by about 5 per cent, but a large portion of the hydrogenation capacity at Tatapuram and Bombay was utilised for manufacturing soap.

Capital projects on hand have progressed well. The erection of the new solvent extraction plant commenced in October last and the plant is expected to be commissioned shortly. Major extensions were made to the building for housing the factory of Industrial Perfumes Ltd. A sum of Rs. 4 lakhs was spent on providing a new package boiler an additional equipment for the hydrogenation plant and on the renovation of gas cells. An Italian synthetic detergent plant is expected to be in operation early next year. Inordinate delay in the delivery of new boilers has delayed the start-up of the Ghaziabad factory.

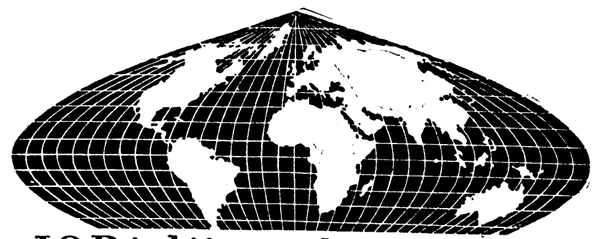
Discussing future prospects the Chairman, Mr. J. R. D. Tata, says that the Company's present efforts are mainly concentrated in the direction of reducing costs without lowering the product-quality. This is done through constant modernisation of equipment and use of improved processes. An increase in profit-margin is expected to result from this. Continuing, Mr. Tata observes:

"I have every hope of being able to report better results next year which will permit an increased dividend, or at least the maintenance of the present dividend on a capital which will then be larger by one-third than today, if the shareholders approve of the bonus issue." However, Mr. Tata cautions: "The next two or three years are going to be a testing and difficult time for all industries in the country. I expect from all our staff and workers to put special zeal and effort into their work."

As sanctioned by the shareholders, the Company subscribed Rs. 31.25 lakhs to the share capital of Tata-Finlay Ltd. It was appointed the sole selling agent for distributing the latter's packet tea which was put on the market towards the end of February 1964. According to the terms of the agreement, which will be in force for five years, the Company will not charge any selling commission for the first two years, during which period the entire expense on establishing the new sales organisation will be borne by Tata-Finlay. Production of instant tea for the American market has been delayed, but it is expected to commence in time for introducing tea in the U.S. in the spring of 1965. The retail marketing in the U.S. will naturally involve millions of dollars on promotional and advertising campaign and also a good deal of risk. But this expense will be borne by a new company to be jointly formed in the U.S. by Tatas, Finlays and a leading American corporation. It is hoped that the venture will be a profitable one.

The Company's subscribed capital of Rs. 135 lakhs, including Rs. 29.89 lakhs in 4.5 per cent 100-rupee cumulative preference shares, is backed by reserves and surplus (excluding Rs. 13.96 lakhs from dividend reserve required for meeting the year's dividend liability) amounting to Rs. 111.34 lakhs. A second series of Rs. 50 lakhs 6 per cent debentures—the first series of a like amount and bearing the same rate of interest matures between 1969 and 1974—were created towards the close of the year and have been pledged during the current year with the State Bank of India as security against additional cash credit facilities. Secured bank loans of Rs. 352.10 lakhs (Rs. 243.90 lakhs a year before), unsecured borrowings of Rs. 73.65 lakhs (Rs. 38.68 lakhs) and current liabilities and provisions of Rs. 278.11 lakhs (including Rs. 13.96 lakhs being the year's dividend liability) bring the total short-term indebtedness to Rs. 653.86 lakhs, as against which current assets, loans and advances aggregate Rs. 669.13 lakhs. The gross block of Rs. 474.41 lakhs (Rs. 410.15 lakhs a year before) has been written down to Rs. 270.07 lakhs.

Currently quoted at Rs. 62.50 *cum-div.*, *cum-bonus*, the Rs. 25 fully paid ordinary shares of the Company offer a net yield of 5.7 per cent per annum.



I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

M. Ct. Muthiah, Chairman — K. M. Naniappa, General Manager

SYNOPSES OF COMPANY REPORTS

Bengal Potteries Ltd.

(*Managing Agents*: Messrs. Bharat Ram Bhagat & Co., Calcutta.)

Fifty-second Annual General Meeting—Held on 22nd June 1964.

Working Results:

	For the year ended 31st December (In thousand rupees)	
	1963	1962
Sales	2,33,78	2,16,18
Closing stock	51,37	45,87
Gross profit	25,79	26,83
Transfer to Managing Agents' commission	1,33	1,57
,, ,, depreciation	12,14	10,51
,, ,, development rebate reserve	53	2,01
,, ,, provision for taxation	5,50	5,50
Net profit	6,29	7,24
Appropriations:		
Transfer to general reserve	Nil	60
,, ,, dividend reserve	6,30	Nil
Proposed dividend (taxable) ordinary	*	6,63
	(11%)	(10%)
Carry forward	2	3

* The dividend for 1963 will be paid out of the dividend reserve.

Extracts from the Directors' report: *Sales and Production*: The production of the Company registered an increase of 10 per cent during the year. The total sales increased from Rs. 2.16 crores to Rs. 2.33 crores.

Dinnerware: In last year's report it was stated that the Company's Factory No. 1 would be producing only Dinnerware. This was achieved in the beginning of 1963. The *Dinnerware* production increased by 13 per cent as compared to the previous year.

Fine China: The production of *Fine China* has been started and efforts are being made to increase its production. The present production is being taken up without foreign collaboration.

Insulators: The production of *High Tension Insulators* has been diversified and *Insulators* upto 33,000 volts have been developed and are in production. New types of *High Tension Insulators* have been produced and the production is being increased further to meet the very large demand in the country. These new items upto 33,000 volts have been produced for the first time by the Company.

With regard to *Low Tension Insulators*, almost the entire requirements of the Posts and Telegraphs Department for telegraph and telephone lines have been met and production is being increased to meet their increased requirements.

Costs: The costs of production continued to rise on account of increase in prices of raw materials, power, fuel, transport charges and increase in statutory impositions like import duty, freight, etc. While these costs which are beyond the control of management continued to rise, the prices of finished products have not been increased proportionately and this naturally affected the profits.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	55,23,548	Gross block	1,94,48,115
Reserves and surplus	30,28,183	—Depreciation	96,49,200

High	162.00	172.00 169.00
Low	151.00	149.00 147.00

* Upto 10th July 1964.

Extracts from the Directors' report: Trading results for 1963 season show an appreciable decline as compared to those of the previous year and this is attributable mainly to less favourable market conditions.

The total *crop* harvested in 1963 was 6,79,448 kgs. as compared with Rs. 6,69,958 kgs in the previous year, while the average price realised was Rs. 4.71 per kg. in 1963, as against Rs. 5.01 per kg. in 1962. *The planted area*, including seed reserve, is now 586 hectares.

Estimates for 1964 provide for a crop of 6,70,000 kgs., at an outlay of Rs. 27,90,000 including inland freight and sale charges as well as depreciation and all administrative expenses. The start of the new season has been not unsatisfactory although drought and red spider have caused some damage and loss of crop.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	10,00,000	Gross block	38,28,370
Reserves and surplus	23,55,143	—Depreciation	12,86,024

Low	260.00 280.50	325.00

* After making provision for Managing Agents' remuneration, depreciation and development rebate reserve.
† Upto 3rd July 1964.

Extracts from the Directors' report: The results upto now during this year are, however, better than the results of previous year though the year under review was most difficult for the Company in view of the process of implementation of a scheme of modernisation and rehabilitation of the Mills which involved writing off large sums towards development rebate and depreciation. In respect of the same, orders have been placed for the purchase of machineries etc., such orders as are remaining to be executed on 31st December, 1963, are to the extent of about Rs. 7,64,791. Further orders as have been placed during the period from 1st January, 1964 till the date of this report are to the extent of about Rs. 2,75,083.

The Company paid bonus to employees upto the year 1961 to the extent of Rs. 8,08,950 and further provision has been made in the accounts for the year 1962, amounting to Rs. 1,22,881.

Looking to the market trend, the Board of Directors have deferred for the time being the implementation of the special resolution passed at the last annual general meeting in respect of issue of 5,000 9.3 per cent taxable redeemable cumulative preference shares of Rs. 200 each.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	34,00,000	Gross block	1,61,62,117
Reserves†	16,37,278	—Depreciation	91,09,291
Other liabilities	1,14,11,847		
		Net block	70,52,826
		Block in progress	2,574
		Current assets	92,47,923
		Investments	75,597
		Cash	70,205
	Rs. 1,64,49,125		Rs. 1,64,49,125

* Paid-up capital consists of 17,000 ordinary shares of Rs. 200 each. Of the above 8,500 ordinary shares of Rs. 200 each are allotted as fully paid-up bonus shares by capitalisation of reserves.
† Reserves are shown after deducting the debit balance of Rs. 22,82,468 in the profit and loss account.

Testeels Ltd.

(*Chairman*: Mr. H. M. Patel, Ahmedabad.)

Seventh Annual General Meeting—4th August 1964.

Working Results:

	For the year ended 31st March (In thousand rupees)	
	1964	1963
Sales	71,54	47,49
Closing stock	20,77	15,35
Gross profit	13,05	8,09
Transfer to depreciation	3,61	1,35
,, ,, statutory development rebate reserve	27	Nil
,, ,, provision for taxation	3,65	Nil
Net profit	5,52	6,74
Appropriations:		
To deferred revenue expenditure written off	41	41
To arrears of depreciation upto 31-3-1961	96	80
To provision for statutory development rebate reserve for 1962 63	14	Nil
To last year's balance transferred	Nil	5,52
Transfer to general reserve	4,01	Nil
Carry forward	1	1

Extracts from the Directors' report: The Directors recommend that the cumulative dividend on 6 per cent tax-free Redeemable cumulative preference shares for the period up to 31st March 1964 amounting to Rs. 3,78,604 be paid out of the general Reserve after sanction has been accorded by the seventh annual general meeting. The Directors regret their inability to recommend payment of any dividend to the equity shareholders.

It is, however, relevant and important in this connection to observe in the first place that the Company has now been able to provide for entire arrears of depreciation and statutory development rebate and has also been able to write off the remaining balance of deferred revenue expenditure, and secondly, that the working of the plant so far has been satisfactory and having regard to the orders already obtained, the working during the rest of the year promises to be no less satisfactory.

The order book of the Company shows unexecuted contracts worth Rs. 72,26,338. Of these, contracts of the value of Rs. 37,05,376 are only for labour charges, materials of the value of Rs. 36,67,321 being supplied by the customers. In effect, therefore, the Company has unexecuted orders on its books of the value of Rs. 1,08,33,559. With this value of orders on hand, the Company's plate and structural shops will be adequately employed during the current year. The foundry shop, which it has not been possible to start so far, the Company hopes to commission at an early date, as it has now at last been given an allotment of *pig Iron*.

During the year, raw materials like steel and electrodes of right specifications were difficult to be procured and their prices showed a rising trend.

The process of improving the plant continues. During the year a sum of Rs. 3,45,071 has been spent on the installation of a *Stress Relieving Furnace*, a *Welding Jig* and extension of Structural and Stainless Steel Shops. The Directors further contemplate the import of various equipment designed to ensure increased production while maintaining the highest standard in terms of quality.

The Company has received the Industrial Licence for the manufacture of *Electric Hoists* and *Light Cranes* and steps are in hand for exploiting it as quickly as possible.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	34,84,875	Gross block	36,14,064
Reserves and surplus	7,20,428	—Depreciation	10,59,385

	15	24
Market value of Ordinary shares (in rupees)	1964† 1963	1962
High	108.00 122.00	136.00
Low	100.00 99.00	102.00

† Upto 26th June 1964.

Extracts from the Directors' report: *Amalgamation*: The scheme of arrangement between this Company and Birpara Tea Co., Ltd., as approved by shareholders at the General Meeting, was later sanctioned by the Hon'ble High Court to take effect from 1st January, 1964. Accordingly, all the properties, rights and liabilities etc., except for a sum of Rs. 2,74,540 retained against payment of dividend have now been transferred to Birpara Tea Co., Ltd. The Company will stand dissolved immediately after the conclusion of the annual general meeting.

The total *crop* harvested in 1963 was 14,23,297 kgs. as compared with 13,74,053 kgs. in the previous year, while the average price realised was Rs. 4.52 per kg. in 1963 as against Rs. 4.76 per kg. in 1962. The *planted area*, including seed reserve, is now 1,051 hectares.

Estimates for 1964 provide for a crop of 14,00,000 kgs. at an outlay of Rs. 59,77,000 including inland freight and sale charges as well as depreciation and all administrative expenses. The start of the new season has not been unsatisfactory although drought and red spider have caused loss of crop at Hantapara division.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	36,50,000	Gross block	88,46,170
Reserves and surplus	43,06,255	—Depreciation	32,94,578

		Block in progress	1,35,312
		Current assets	46,14,618
		Investments	4,00,375
		Cash	4,65,571
	Rs. 1,09,67,468		Rs. 1,09,67,468

* Paid-up capital consists of 500—8 per cent cumulative preference shares of Rs. 100 each and 38,000 Ordinary shares of Rs. 100 each. Of the above, 24,000 Ordinary shares of Rs. 100 each are allotted as fully paid up Bonus shares by way of Capitalisation of reserve.

NEWS IN BRIEF

THE total resources of the highest grade coal with ash content up to 17 per cent at present are estimated at 661.78 million tonnes in Jharia, 418.71 million tonnes in Raniganj and 23.01 million tonnes in East Bokaro fields.

The total value of goods seized by customs authorities in India during the month of May 1964 amounted to about Rs. 24.11 lakhs, as against Rs. 25.89 lakhs in the same month last year. Of this, the share of gold alone was Rs. 7.44 lakhs (at international rate) as against Rs. 11.32 lakhs.

A mechanised coal cutter, called the "continuous miner," has been put into operation in the Chalkari mines by the National Coal Development Corporation. The cutter is capable of producing an output equivalent to 1,000 miners. It is fitted with an automatic loader. Its cost is placed at Rs. 10 lakhs.

The stores purchased by the Director-General of Supplies and Disposals reached a record of Rs. 520 crores, during the year 1963-64, as against Rs. 405.15 crores in the previous year. The indigenous content of the purchases is estimated at Rs. 420 crores, representing about 81 per cent of the total purchases.

It is proposed to issue shortly three paise coins. The face of the coin will have the Lion Capital of the Asoka Pillar with the words *Bharat* in Hindi and "India" in English. On the reverse side, the coin will bear its value in international numeral and the Hindi rendering of the value. The standard weight of the aluminium coin will be 1.25 gramme.

About 500,000 labourers employed in Assam tea gardens will soon be covered by a pension scheme initiated by the Government of Assam. This scheme is claimed to be the first of this kind to be introduced in this country. It will be financed from out of tea garden labourers' provident fund where the quantum of contribution has now been raised from 6¼ per cent to 8⅓ per cent to be contributed equally by labourers and managements.

The Union Government has exempted raw naphtha from payment of excise duty leviable thereon when used within a refinery as fuel for the manufacture of other products. It has also been exempted from payment of duty as is in excess of five per cent *ad valorem* when used elsewhere as fuel in blast furnaces, whether used directly or mixed with coke oven gas. A partial exemption will also be provided for naphtha used in the manufacture of petro-chemicals.

The Government of India has contributed $100,000 (Rs. 475,000) to the John Fitzgerald Kennedy Memorial Library and Institute. Proceeds from the Library fund will be used to build a museum, an archive, and an institute in Boston, Massachusetts. The museum will house personal mementos of the late President. The archive will contain his personal papers and public records of his administration. The institute will provide scholarships, research material, lectures, seminars, and programmes on public affairs and the practice of democratic political life.

Air-India has decided to book two delivery positions for the Anglo-French Concorde supersonic airliner. The agreement is expected to be signed shortly. The Anglo-French manufacturers who are producing the Concorde are guaranteeing a non-stop operation over the Atlantic both ways between New York on the one hand and London/Paris on the other. This meet Air-India's requirements. The minimum pay-load of the Concorde aircraft is 20,000 lbs., but it is expected to be 26,000 lbs or more. The cruise speed is Mach 2.2 and the expected price is well below that of the American S.S.T.

The State-owned Heavy Electricals factory at Bhopal has undertaken the manufacture, for the first time in India, of large size industrial motors in sizes ranging from 600 H.P. to 2,000 H.P. for the Associated Cement Company of Bombay. Thirteen such motors with a total rating of 21,800 H.P. and of the value of over Rs. 30 lakhs will be supplied to the A.C.C. Hitherto such large size motors were being imported from abroad. The Bhopal factory is equipped for the manufacture of industrial motors of even higher ranges upto 5,500 H.P. Each one of the thirteen industrial motors to be supplied for cement mills of the A.C.C. will have its own control equipment consisting of liquid rotor starters, stator switches and field control cubicles which will also be manufactured in the Bhopal factory.

The Board of Trade, which was set up in May 1962, has been reconstituted with 22 members. Mr. Manubhai Shah, Minister of Commerce, will continue to be its Chairman. Mr. S. V. Ramaswamy, Deputy Minister of Commerce, will be its Vice-Chairman. The members will be: Presidents of the Federation of Indian Chambers of Commerce and Industry (ex-officio); Associated Chamber of Commerce of India (ex-officio); non-official members not exceeding 12 nominated by the Government representing trade, industry economists and others; Secretary-General, Ministry of External Affairs; Secretaries of the Union Ministries of Commerce; Finance (Department of Economic Affairs); Planning Commission; Food and Agriculture (Department of Agriculture); and a Joint Secretary in the Ministry of Commerce (Member-Secretary).

The Governments of India and the U.S. have concluded eight new agreements aggregating Rs. 78.4 crores on the 10th anniversary of the U.S. Food for Peace Programme. These Public Law 480 funds will help to finance projects in agriculture industry, health and education. Under the agreements, grants are being extended to India's malaria eradication programme (Rs. 16.3 crores); the training of teachers for medical colleges (Rs. 2 crores); soil and water conservation (Rs. 2.6 crores); craftsmen training (Rs. 18.4 crores); primary health centres (Rs. 2.8) crores); and smallpox eradication (Rs. 7.7 crores). Recipients of loans are the Refinance Corporation for Industry (Rs. 10 crores) and five irrigation and water power projects (Rs. 18.6 crores). The irrigation and power undertakings are Nagarjunasagar, Kosi, Tungabhadra, Mahanadi and Koyna.

Some places of tourists interest have been selected for the provision of facilities for landing of aircraft. These are Khajuraho, Hassan, Konarak, Bijapur, Hospet and Periyar Lake (Thekadi Game Sanctuary) in Kerala. It is expected that during the current Plan, fair weather aerodromes at Khajuraho and Hassan will be completed. Steps will also be taken to start work on construction of fair-weather strips at Bijapur/Badami and Hospet during the current Plan period. Provision to construct *pucca* runways at most of these places is proposed to be made in the fourth Plan. There is a provision of Rs. 35 lakhs in the third Plan, for the construction of aerodromes or airstrips at or near places of tourist attraction. India's income from foreign tourists is expected to go up in the fourth Plan period, from an annual average of Rs. 16.7 crores to Rs. 23 crores. More and more tourists from the U.S., the U.K., and West Europe, it is said, will visit India owing to relaxations in travel payments, promotional efforts through publicity and improvement of facilities for tourists in India.

The first modern oil refinery built in India by the Esso during the early 'fifties completes a decade of successful operation this month. Meeting approximately one-fourth of the country's petroleum needs, the Esso Refinery has in recent years doubled the range of products manufactured initially at the time of start-up. Two of the important additional products are asphalt and solvents. The solvent unit which was entirely designed by Indian engineers and built by local contractors in 1962 now supplies products used by textile, rubber and vegetable oil extraction industries. When the refinery started operation it had 66 Americans on its staff. By sending Indian personnel overseas to receive training in higher skills, the number of American engineers and technicians has been reduced to five. Besides creating new job positions and assisting in the development of advanced skills, the refinery has also helped to save and earn Rs. 46 crores in foreign exchange for India over the last decade. The emergence of the Esso Refinery at Trombay—15 miles from Bombay city—has helped to transform an area once large desolate into a thriving industrial township. Apart from several chemical plants, a thermal power generating station and a Government sponsored fertiliser unit, the area has attracted hundreds of smaller entrepreneurs.

From Abroad

The U.S. Export-Import Bank has given a loan equivalent of $4.1 million to a Mexican automobile Company for the purchase of U.S. machinery, tooling and related services.

The trade between Communist China and West Germany has been declining year after year since 1958. The actual trade (imports and exports) in 1963 was no more than DM. 223 million.

Almost one out of the five (numbering 55,000) weekly-paid payroll employees of the Imperial Chemical Industries of Britain is having his wages paid through a bank of their own choosing; the scheme started five years ago.

Four U.S. Shipping Companies are contemplating to build commercial nuclear-powered ships by 1967. They will probably use one of two reactor systems, namely, the Consolidated Nuclear Steam Generator, made by Babcock and Wilcox, or the 630A made by the U.S. General Electric Company.

Although the number of companies registered in Britain during 1963 was higher at 42,173 as against 34,852 in the previous year, the nominal capital was less by 26 per cent at £111 million. The total number of companies on the register at the end of last year was 476,080, of which 16,080 were public companies.

Supplemental labour costs in West Germany came to about 50 per cent of straight wages and salaries. The typical West German employer pays out about two-thirds of his labour costs for work performed, while the remaining one-third goes for supplemental work-connected expenses, such as social-security benefits. The figures emerge from a survey made by the Federal Office of Statistics of 14 selected industrial branches based on costs in 1962.

As many as 4.5 million Britons took holidays abroad during the year 1963, spending about £225 million, including fare payments, according to the British Travel and Holidays Association. More than 80 per cent of all holidays abroad last year were spent on the continent, 10 per cent in Ireland, 3 per cent in North America, 2 per cent in Africa and Middle East and one per cent elsewhere. About one-fifth of the holiday-makers came from households with a combined family income of less than £950 a year.

The New Orleans Cotton Exchange, second largest cotton exchange in the U.S., has ceased trading in cotton futures with effect from the 9th inst., after 93 years of existence. The end is a sequal to the new agricultural law which extends to domestic mills a 6.5 cents a pound subsidy already available on exported cotton. In view of this new law, the Exchange considered that both exporters and domestic mills had no longer any reason to see the futures market as a safeguard against price fluctuations. The New York Cotton Exchange, however, continues to remain open though it suspended trading some weeks ago in the 1965-66 cotton crop to allow itself an opportunity to work out arrangement for accommodating the new farm law.

The Bundesbank Council has tightened the credit squeeze in a bid to curb the boom without altering the discount rate which has remained unchanged at 3 per cent since the last three years. About DM1,200 million of bank liquidity are to be "sterilised" by a 10 per cent increase in the minimum reserve requirements made on the banks in respect of deposit made by residents, with effect from 1st August next. In order to reinforce the measures against capital imports, the Council has decided to penalise banks taking up foreign credits by reducing the quotas allowed for rediscounting bills with the Central bank system. The quota is to be cut by the amount by which the credit taken up abroad by any bank exceeds the average level of these credits during the first six months of this year.

A single synthetic product superior to natural rubber in each of its five basic characteristics has been tested recently by Goodyear for the first time in Detroit (U.S.A.). The new rubber, it is claimed, will not get as hot as natural rubber in a running tyre. In addition, it is stronger and will make a longer wearing trend than natural rubber. It is called "Super Natsyn," and is superior to natural and its synthetic equivalent, polyisoprene. "Super Natsyn," however, is still a laboratory product, but quantities of it have been tested repeadedly with the same outstanding results. These tests confirmed the superiority of the new synthetic in tensile strength and in the dynamic qualities of modulus, resilience, internal friction and heat rise—which, combined, represent the five basic characteristics of rubber.

A £32-million steel plant—Britain's largest single steel industry project to be completed this year—was officially opened near Rotherham in northern England, last week. The plant, which includes a steel-making department and a continuous narrow hot strip mill, is situated at the works of the Park Gate Iron and Steel Co., Ltd. The new works will increase Park Gate's annual output of steel from 425,000 ingot tons to 800,000 ingot tons. Much of the new output will be used for tube-making by the firm's parent Company, Tube Investments Ltd., which exports 20 per cent of the production. The new plant will also produce carbon and other steels for engineering use, and increase the firm's range of alloy steel production.

The Special Fund of the United Nations has earmarked $336,300 to assist the Government of Thailand in the establishment of an experimental and demonstration farm for irrigated agriculture at Kalasin. Spread over a period of four years, the allocation will supplement the Government's own contribution of about $400,000. An experimental station of ten hectares and a demonstration area of 300 hectares will be irrigated from an existing tank nearby. Under the supervision of project personnel, the demonstration area will be cultivated under irrigation by the farmers owning the land. They will be taught the use of better implements, seeds and fertilisers, soil management and the organisation of marketing and credit facilities. The Food and Agriculture Organisation acts as the executing agency for this project which will be of four years' duration. The Fund assistance will then cease and the pilot station will become the responsibility of the Government's Department of Agriculture.

PERSONAL

MR. Herbert Baumgartner assumed charge this week as Director of the U.S. Information Service in Bombay in the place of Mr. Donald T. Shea.

Mr. G. V. Swaika, a prominent Calcutta industrialist, has been appointed a member of the Indian Central Oilseeds Committee representing the exporters of oilseeds and oilseed products.

Mr. N. L. Gadkari, Chief Inspector of Factories, Maharashtra, has left for London to attend the fourth World Congress on Prevention of Occupational Accidents and Diseases now in session there.

Mr. P. N. Talukdar, Managing Director, Hindustan Pilkington Glass Works Ltd., has been elected the first President of the All-India Sheet Glass Manufacturers' Association and the All-India Rolled Plate Glass Manufacturers' Association.

Mr. L. K. Jha, Secretary, Department of Economic Affairs, Union Ministry of Finance, assumed charge on Monday this week as Secretary to the Prime Minister. He will, however, also continue to be Secretary in the Finance Ministry till a new successor is appointed.

Notices

THE TATA OIL MILLS COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT THE FORTY-SIXTH ANNUAL GENERAL MEETING of THE TATA OIL MILLS COMPANY LIMITED, will be held at the Registered Office of the Company, Bombay House, 24, Bruce Street, Fort, Bombay, on Tuesday, the 4th August 1964, at 4-30 p.m. (S.T.), to transact the following business:—

1. To receive and adopt the Directors' Report and Audited Profit and Loss Account and Balance Sheet for the year ended 31st March 1964.

2. To declare dividends on Preference and Ordinary Shares.

3. To appoint a Director in place of Sir Chunilal V. Mehta, who has attained the age of 83 years and who retires by rotation and to consider and, if thought fit, to pass the following resolution of which a special notice as required by Section 281 of the Companies Act, 1956, has been received by the Company:—

"RESOLVED that pursuant to the provisions of Section 281 and other applicable provisions (if any) of the Companies Act, 1956, Sir Chunilal V. Mehta, who has attained the age of 83 years and who retires by rotation, be and is hereby re-appointed a Director of the Company and it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the said Act shall not apply to him."

4. To appoint a Director in place of Mr. D. M. Ghia, who retires by rotation under Article 151 of the Company's Articles of Association and is eligible for re-appointment.

5. To consider and, if thought fit, to pass, with or without modification, the following resolution as an ordinary resolution:—

"RESOLVED that—

(a) 1,40,000 shares out of 2,75,000 unclassified shares of Rs. 25 each be and are hereby classified as Ordinary Shares of Rs. 25 each.

(b) (i) Subject to the consent of the Controller of Capital Issues being obtained in that behalf, and subject to the conditions, if any, prescribed by him, the sum of Rs. 35,03,750 (Rupees Thirty-five lakhs three thousand seven hundred fifty) being part of the amount standing to the credit of the Share Premium Account of the Company be and the same is hereby capitalised, and that accordingly the said sum of Rs. 35,03,750 be transferred from the Share Premium Account to Share Capital and that such capital sum of Rs. 35,03,750 be applied on behalf of the persons who on a date to be hereafter fixed by the Directors shall be the holders of the existing 4,20,449 Ordinary Shares of the Company in payment in full for 1,40,150 new Ordinary Shares of the Company of Rs. 25 each (out of the 1,44,551 Unissued Ordinary Shares of the Company) to be issued as fully paid up bonus shares and that such 1,40,150 New Ordinary Shares credited as fully paid be accordingly allotted as Bonus Shares to such holders respectively as aforesaid in the proportion of one such new share for every three of the said existing Ordinary Shares then held by such holders respectively upon the footing that they become entitled thereto for all purposes as capital.

(ii) No fractional certificates shall be issued in respect of any holding of less than 3 existing Ordinary Shares or in respect of a holding which is not 3 existing Ordinary Shares or a multiple thereof but that the New Ordinary Shares allotable in respect of such holdings of fractions of 3 existing Ordinary Shares shall be consolidated and in respect of each set of 3 fractions so consolidated the Board of Directors shall on behalf of the members entitled to such fractional certificates, allot one New Ordinary Share to such person or persons (including one or more of themselves or the Managing Agents Tata Industries Private Limited or the holding company of the Managing Agents Tata Sons Private Limited or one or more of the officers or employees of the Company) as the Board of Directors may in their absolute discretion select for the purpose of holding and selling on behalf of the members entitled to such fractional certificates, such shares at such time or times and at such price or prices as may be approved by the Board of Directors provided that the Board of Directors may without making an allotment of all or some of such New Ordinary Shares direct on behalf of the members entitled to such fractional certificates, the sale of all or any of such New Ordinary Shares at such price or prices as may be approved by it and upon receipt of the purchase price for each such share, provided the Board of Directors approves of the transferee, the Board of Directors may allot the share to the approved transferee. The aggregate sale proceeds of all such New Ordinary Shares left over after defraying thereout all costs, charges and expenses of the sale or sales shall be distributed and divided *pro rata* amongst such holders as would otherwise have been entitled to such fractions of such New Ordinary Shares.

(iii) The said 1,40,150 New Ordinary Shares to be issued and allotted as fully paid up Bonus Shares shall be subject to the Memorandum and Articles of Association of the Company and shall subject thereto rank for dividend and in all other respects *pari passu* with the existing Ordinary Shares and shall be entitled to participate in any ordinary dividend declared or to be declared for the financial year 1964-65 as if the full amount of the capital paid up or deemed to be paid up thereon had been paid up as on the first day of April 1964.

(iv) No allotment letters be issued but that the certificates in respect of the New Ordinary Shares to be allotted as fully paid Bonus Shares as aforesaid shall be completed and ready for delivery within 9 months of the allotments thereof respectively.

(v) For the purpose of giving effect to this resolution the Board of Directors be and are hereby authorised to give such directions as may be necessary or desirable and settle any questions or difficulties whatsoever (including a question or difficulty in connection with any deceased or insolvent shareholder or a shareholder suffering from any disability) as they may think fit."

6. To consider and, if thought fit, to pass, with or without modification, the following resolution as a special resolution:—

"RESOLVED that the Articles of Association of the Company be altered in the manner following:

(i) For Article 4, substitute the following Article:—

'4. The present capital of the Company is Rs. 2,50,00,000 divided into 30,000 cumulative preference shares of Rs. 100 each, 5,65,000 ordinary shares of Rs. 25 each, 45,000 unclassified shares of Rs. 100 each, and 1,35,000 unclassified shares of Rs. 25 each.'

(ii) For Article 70, substitute the following Article:

'70. The Directors may from time to time fix a fee not exceeding 25 paise per share in respect of the transfer or transmission to the same party of any number of shares of any class or denomination subject to such maximum on any one transfer or transmission as may from time to time be fixed by the Directors. Such maximum may be a single fee payable on any one transfer or on transmission of any number of shares of one class or denomination or may be on a graduated scale varying with the number of shares of any one class comprised in one transfer or transmission or may be fixed in any other manner as the Directors may in their discretion determine. The Directors may in their discretion waive the payment of any transfer or transmission fee either generally or in any particular case or cases'."

7. To appoint Auditors and to fix their remuneration.

8. To authorise the Board of Directors to appoint in consultation with the Company's Auditors, persons other than the Company's Auditors to audit the accounts of the Sales Offices of the Company, which are its Branch Offices and to fix their remuneration, and, if thought fit, to pass the following resolution with or without modification as an ordinary resolution:—

"RESOLVED that the Board of Directors be and are hereby authorised to appoint in consultation with the Company's Auditors, any person or persons qualified for appointment as auditor or auditors of the Company under Section 226 of the Companies Act, 1956, to audit the accounts for the year 1964-65 of such of the Company's branch offices as are or may be its Sales Offices, and to fix their remuneration and the terms and conditions on which they shall carry out the audits."

Notes:—(a) The relative explanatory statements, pursuant to Section 173 of the Companies Act, 1956, in respect of the special business under items 3, 5, 6 and 8 set out above are being posted to the shareholders with the notice.

(b) *A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.*

(c) The Transfer Books of the Company will be closed from Monday, the 29th June 1964 to Friday, the 17th July 1964, both days inclusive.

(d) If dividends on shares, as recommended by the Directors, are passed at the meeting, payment of such dividends will be made at the State Bank of India on and after the 5th August 1964, to those members whose names were on the Company's register on 17th July 1964.

By Order of the Board of Directors,
TATA INDUSTRIES PRIVATE LIMITED,
Managing Agents.
N. H. TATA,
Director.

Bombay, 23rd June, 1964.
Registered Office:

NOTICE TO SHAREHOLDERS

NOTICE IS HEREBY GIVEN THAT THE Twenty-fourth Annual General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company, Tennur, Tiruchirapalli, on Friday the 14th August, 1964 at 4 p.m. to transact the ordinary business, viz., (i) the consideration of the Accounts, Balance Sheet and the Report of the Board of Directors, (ii) the declaration of a dividend, (iii) the appointment of Directors in place of those retiring and (iv) the appointment of and the fixing of the remuneration of the Auditors.

Certain items of special business will also be transacted at the said Annual General Meeting in accordance with details furnished in notices served to individual shareholders and among these items are included resolutions to:

(i) To approve the re-appointment and continuance of Messrs. Seshasayee Brothers (Private) Limited as Managing Agents and Chief Engineers of the Company for a further period of 10 years from 1-4-1965 on revised terms of remuneration according to the provisions of the Electricity Supply Act but subject to certain limitations in the event of a shortfall in "Clear Profit" of the Company in any year below "Reasonable Return" and on other terms and conditions set out in the draft agreement, subject to the approval of Central Government; and (ii) To approve amendments to the Articles 5, 99 and 118 of the Articles of Association of the Company (The amendments to Articles 5 and 99 are for the purpose of referring to the re-appointment of the Managing Agents and Chief Engineers from 1-4-1965; amendment to Article 118 is for enhancing the limit for charitable contributions within the limit set by Section 293 of the Companies Act).

Detailed notice with the Explanatory Statement as required by Section 173(2) of the Companies Act, 1956, in respect of the Special Business is being posted to the Members individually at their Registered addresses.

A MEMBER ENTITLED TO ATTEND AND VOTE AT THE MEETING IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER.

The transfer books of the Company and the Register of Members will be closed from 22-7-1964 to 14-8-1964 (both days inclusive). The dividends when declared will be made payable on and after 14-8-1964 to those shareholders whose names stand on the Register of Members on 14-8-1964 or to holders of dividend mandates.

(By Order of the Board of Directors)
SESHASAYEE BROTHERS (PRIVATE) LIMITED,
Managing Agents and Chief Engineers.
TIRUCHIRAPALLI,
Dated: 25-6-1964.

RESERVE BANK OF INDIA

APPLICATIONS ARE INVITED FOR THE following posts in the Bank:—

(A) **POSTS AND SCALES OF PAY:**

(i) Statistical Assistants in the Department of Statistics (ii) Economic Assistants in the Economic Department	Rs. 255-15-270-16-398-21-419 EB 21-482-22-570

In addition to pay, the selected candidates will be eligible to draw house allowance and dearness allowance.

(B) **QUALIFICATIONS:**

(i) *Statistical Assistants*: Applicants should have obtained at least 50 per cent marks or its equivalent in the Master's degree of a recognised University in Statistics or Mathematics/Commerce with Statistics as a special subject.

(ii) *Economic Assistants*: Applicants should have obtained at least 50 per cent marks or its equivalent in the M.A. or M.Com. degree of a recognised University with specialisation in any of the following subjects:—Economic Analysis, Monetary Theory, Banking, International Economics, Theory of Growth or Rural Economics. Preference will be given to those who have practical experience of research in Economics.

(C) **AGE LIMITS AS ON 1st JULY 1964:**

Between 18 and 24 years.

The maximum age limit is relaxable but not beyond 30 years in the case of:—

(i) applicants possessing special qualifications and experience of value to the Bank;

(ii) ex-employees of banking institutions whose services had to be terminated for reasons of economy or as a result of the banks going into liquidation;

(iii) personnel retrenched from Government offices after at least one year's service applying through Employment Exchanges; and

(iv) candidates belonging to the Scheduled Castes or Scheduled Tribes.

2. Candidates who wish to apply for more than one category of posts must submit *separate* applications accompanied by separate application fees and *should clearly indicate the post for which they have applied.*

3. Applicants must remit with their applications a fee of Rs. 2.00 for each post. *The application fee is in no case refundable.* In the case of candidates belonging to Scheduled Castes/Tribes, the fee will be reduced to one-fourth.

4. Applications in the candidate's own handwriting in the prescribed forms obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Hyderabad, Trivandrum, Lucknow, Patna and Jaipur accompanied by copies (originals should not be sent) of certificates regarding age and educational qualifications, statements of marks secured in the Graduate and Post-Graduate degree examinations and copies of two testimonials should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1, so as to reach him on or before the 8th August 1964.

5. Candidates already in service will be required to produce a proper discharge certificate from their employers in the event of their being selected, at the time of their appointment in the Bank's service.

6. Candidates belonging to Scheduled Castes/Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

7. Candidates must be prepared to serve in any office of the Bank in India and to undertake tours when required.

8. Selected candidates will be required to appear for a written test which will be held at the abovementioned offices of the Bank. Candidates should clearly state on the top of their applications, the office of the Reserve Bank at which they desire to appear for the test, if called. Those successful in the test will have to appear for an interview at Bombay.

9. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

10. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due." Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

11. Canvassing in any form will be regarded as disqualification.

A revised proposal to set up *Panchayati Raj* Finance Corporations at State levels will be considered at the Annual Conference on Community Development and *Panchayati Raj*, to be held at New Delhi in the third week of this month. The Santhanam Committee on *Panchayati Raj* finances recommended the establishment of these corporations, with participation in share capital by the Reserve Bank. The State Bank, the Life Insurance Corporation or other financial institutions. As these institutions are not keen, it is now proposed to limit share capital participation to the Central and State Governments and *Panchayati Raj* institutions. Another proposal is to have a Central *Panchayati Raj* Finance Corporation at a later stage. At the recent meeting of the *Panchayati Raj* Consultative Council in New Delhi, it was felt that financial resources of *panchayats* and *panchayat samitis* should be augmented with Governmental assistance on a *per capita* basis.

UNION CO-OPERATIVE INSURANCE SOCIETY LIMITED

SPEECH OF CHAIRMAN

MR. J. L. Mehta, the Chairman of the Union Co-operative Insurance Society, Ltd., while presiding over the Fifteenth Annual General Meeting held in Bombay on 4th inst., was happy to disclose to the shareholders that the Society had crossed the Rs. 1,00,00,000 premium mark and had underwritten a premium income of Rs. 1,05,30,000.

He also informed that the major rise in premium was in the fire department which had proved to be the most profitable branch to the Society.

Claims

The claims experience of the Society was satisfactory. He attributed adverse experience in foreign treaty acceptances as the main cause for higher claims experience in fire department.

He also informed the shareholders that various actions taken to conserve resources of the Society had not only built up profitable reciprocity but also reduced net cost substantially.

The net profits earned amount to Rs. 4,57,000 after adding Rs. 8,60,000 to reserve for unexpired risks on a net premium income of Rs. 57,00,000.

L.I.C.

Mr. Mehta expressed a feeling that the decision of the Life Insurance Corporation to follow the tariffs for the present is likely to help the private insurance sector to adjust itself with the changed circumstances that may arise due to entry of Life Insurance Corporation in the general insurance market.

He expressed a feeling that, in view of the heavy competition in the rating structure of non-tariff business, profitability in this section is likely to go down.

Mr. Mehta informed the members that he was awaiting the recommendations of the study group which was appointed by the Government of India for recommending structure of co-operative insurance sector.

He also expressed his gratitude to the staff for a reasonable attitude taken for settlement of labour problems.

TREND OF MARKETS

CASH LOANS FETCH RS. 151 CRORES

(From Our Own Correspondent)

BOMBAY, 15*th July*

The total subscriptions to the further tranches of 4 per cent 1970 loan and 4½ per cent 1989 loan, which were closed at the close of business today, amounted to about Rs. 151 crores. Of this total, the amount subscribed to the 4 per cent 1970 loan was Rs. 106 crores, the balance of Rs. 45 crores being the share of the other loan. All subscribers, it is said, will receive full allotment.

With the opening of the subscription list on Monday the 13th inst., demand for funds in the short-term money market increased considerably. The pressure of demand was so much that borrowers had to look around for accommodation. The inter-bank call rate for both renewals and fresh money, as a consequence, climbed up from ½ per cent to 3-3½ per cent.

India's foreign exchange reserves improved by Rs. 93 lakhs to Rs. 97.45 crores during the week ended 10th July 1964. The whole of this improvement was in balances held abroad which rose from Rs. 7.06 crores to Rs. 7.99 crores. The foreign securities held in the Issue Department of the Reserve Bank of India were unchanged at Rs. 89.46 crores. Loans and advances to scheduled banks were negligible, being Rs. 47.70 lakhs, and their deposits with the Reserve Bank spurted by Rs. 14.71 crores to Rs. 106.77 crores. Notes in circulation increased by Rs. 6.44 crores to Rs. 2,507.98 crores.

The total credit made available by scheduled banks to their clients rose by Rs. 5.55 crores to Rs. 1,780.19 crores during the week ended 3rd July. Since, at the same time, deposits advanced by Rs. 23.93 crores to Rs. 2,587.35 crores, borrowings from the Reserve Bank declined by Rs. 1 crore to Rs. 22 lakhs. Total cash improved by Rs. 32.54 lakhs to Rs. 160.09 crores and investments by Rs. 19.44 crores to Rs. 674.47 crores.

In the gilt-edged market, activity was restricted during the week under review. Business put through was limited and values of both Central and State loans were unaltered.

In the foreign exchange market, the banks' buying rate for U.S. dollars was unchanged at Rs. 476.25 per $100, while their selling rate rose by 25 nP to Rs. 479.75. In New York, the pound sterling eased further *vis-a-vis* the dollar, the spot rate declining by 0.090 cent to 279.040-279.070 cents and the three months' forward by 0.050 cent to 278.720-278.750 cents.

SILVER RECOVERS

(From Our Own Correspondent)

BOMBAY, 15*th July*

The bullion market ruled distinctly firm during the week under review. Silver met with good support induced by sustained demand from upcounrty centres and sellers resistance to dispose of their stocks at lower levels. Gold elicited persistent demand.

Silver began the week 50 nP higher at Rs. 247 and increased gradually to Rs. 250.50 today. The daily average arrivals of the metal were practically unchanged at 18 bars, while the offtake was larger at 11 bars as against 6 bars.

Fourteen carat gold moved up from Rs. 69 to Rs. 69.50. Sovereign was quiet at Rs. 92. Primary gold, in unofficial trading, rise from Rs. 118-121 to Rs. 122 on reports of the seizure of unauthorised gold.

The international price for gold at the London market was marked down at $35.06¼ per fine ounce. The sterling price, however, gained 3*d.* to 251*s.* 4*d.* Both ready and forward silver remained unchanged at 111¼*d.* and 112*d.*, respectively, as also silver in New York at 129.3 cents.

The Government of India has regulated the manufacture of liquid gold from 1st July. No manufacture of liquid is now permitted except under an authorisation by the Gold Control Administrator. The authorisation, which is valid for three months, will have to be obtained from the office of the Gold Control Administrator. The producer will have to conduct his manufacturing process in the presence of a supervising officer and store the liquid gold in his presence. The manufacturer will also have to maintain his stock of the metal in the prescribed forms and keep them ready for inspection.

According to Mr. B. D. Pande, Gold Control Administrator, nearly 200.000 out of the total 280,000 goldsmiths affected by the Gold Control Order have already taken or applied for certificates to work as self-employed goldsmiths. Of the remaining 80,000, about 25.000 persons have been given loans for taking to other professions, and some 10.000 have secured jobs in Government and semi-Government institutions. The reamining applications will be disposed of before next September.

The All-India Sarafa Association has suggested that gold could be imported against exports of precious stones and platinum jewellery to bring down its price and check sumggling effectively. The price of gold, according to the Association, is likely to rise further because gold is not coming to the market in the form of ornaments. Addressing a press Conference in Bombay on Tuesday this week, the Secretary of the Association said that the exports of precious stones, handicrafts and jewellery had fetched in about Rs. 30 crores last year. If 15 to 20 per cent of this sum was given as an export incentive and gold was allowed to be imported under it, then smuggling activity would come down and prices ease. The Secretary added that the Gold Control had been a "dismal failure." It had neither stopped smuggling nor weaned people away from the lure of gold. If the new Bill was passed, the Secretary warned, it would compel people to declare their gold ornaments. The price of gold had been at Rs. 130 per 10 grams last month. This was higher than the rate prevailing before the Gold Control was introduced. He felt that this was likely to go up further, because gold, in the form of ornaments, was not coming into the market. A sample survey of about 10 jewellers and bullion dealers in Bombay had disclosed that the sale of old ornaments which amounted to Rs. 5 crores in 1962 fell to Rs. 10 lakhs in 1963. He also added that the people were reluctant to sell their old ornaments for fear of not being able to buy new ones, exceeding 14-carat purity.

The following table shows the trend of prices during the week under review:

	15-7-1964 (closing)	High	Low	8-7-64 (closing)
SILVER	Rs.	Rs.	Rs.	Rs.
Ready (996 fine) ..	250 50	250 50	247 00	246.50

New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

COTTON FUTURES FIRM

(From Our Own Correspondent)

BOMBAY, 15*th July*

Starting on a quiet note, cotton futures staged a smart recovery during the week under review. Tightening of bull grip and hectic short-covering pushed up prices. The undertone was distinctly firm, in spite of reports about favourable weather conditions and bright prospects for the new crop. The Zalawar, Ahmedabad, Rajasthan, Uttar Pradesh and Punjab operators who were reported to have a total outstanding holdings of more than 3.5 lakh bales, made a determined bid to squeeze the shorts. The bulls' readiness to accept tenders forced the shorts to cover their position. The bulls were inspired greatly by the firmness of the spot market.

The Jarilla August contract began the week at Rs. 738.50 as against the previous close of Rs. 738.25 and moved upwards swiftly and touched a new high of Rs. 744.75 today before closing at Rs. 744.50. The net gain over the week was Rs. 6.25. There were indications during the week that trading in the new hedge contract for March 1965 delivery might be allowed to commence sometime later this month. Further, it was learnt that the Board of the East India Cotton Association had suggested to the Forward Markets Commission to fix the ceiling price for the new crop Jarilla March contract at Rs. 775 till February-end and Rs. 798 during the tender period.

In the spot market at Sewri, there was brisk activity, as spinners rushed to buy Egyptian cotton. Business to the tune of 35,000 bales was reported. Mills sought popular varieties like Khandesh, Digvijay, L147 and Co2 in moderate lots daily. Since the finer qualities were in short supply, interest was naturally evinced in inferior varieties. The quotations for some of the popular varieties are as follows:

Hingloi Rs. 1,225, Anjangaon L.147 Rs. 1,235, Bagalkot Laxmi Rs. 1,070, Manavdar Kala Rs. 852, Malegaon Co2 Rs. 1,690, Chopda Rs. 1,090, Aurangabad Buri Rs. 1,110, Moga Rs. 761 K, Ganganagar Rs. 760 K, Hubli Laxmi Rs. 1,175 and Gadag Laxmi Rs. 1,150.

In the foreign section, Egyptian cotton met with good support, following the announcement by the Egyptian Cotton Commission of fixation of export selling prices for the new crop. A surprising feature of this announcement was that the prices notified for Giza 45 and Menoufi turned out to be much lower than the offers which the Indian importers submitted to the shippers in Egypt on behalf of their mill clients here. The offers received from Alexandria which were cheaper by Rs. 75 to Rs. 100 per candy and were quoted in sterling, could be transferred in rupees after the finalisation of the special rupee agreement between India and Egypt. The trade looked forward to an early finalisation of the agreement. In the export side, trading in Bengal *Deshi* remained dull due to the Government's silence over the revision of export duty on this variety. There was stray demand from the U.K. and the Continent but no revival of interest from Japan was in evidence. The market was thick with rumours that the Government's decision on export duty and other concessions urged by the trade would be notified along with the next season's export policy towards the end of this month.

TIPPY TEAS DEARER

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, 9*th July*

A total of 845,000 kgs. was offered in tea sale No. 27 held here on the 7th inst. Quality was generally well maintained with some of the Nilgiri teas showing further slight improvement. The market met with good general demand. Plainer low mediums and mediums elicited fair support, but prices for these declined irregularly by 15 to 20 paise, with others in this category came to a slightly lower market. Good mediums received good support and were sold at fully firm rates with occasional invoices being dearer with quality. Highgrowns also evoked good demand and were fully firm. Buyers were prepared to pay more wherever quality showed improvement. Unorthodox descriptions were sold readily, but at rates below last. Whole leaf grades continued strong and dearer, particularly O.Ps. which advanced by 20 to 30 paise. Tippy teas received good enquiry and were dearer.

The quotations (per kg.) were:

	1964 Rs.	1963 Rs.
Low mediums	4.05-4.40	4.05-4.35
Mediums	4.30-4.60	4.35-4.55
Good mediums	4.55-5.20	4.55-5.15
Nilgiri B.O.P.	4.60-6.10	4.60-6.50

The average price realised in sale No. 27 was Rs. 4.38 per kilo, as against Rs. 4.35 a week ago and Rs. 4.27 in the corresponding sale last year.

In dust sale No. 27 held today, 303,000 kgs. were offered. There was good general demand. Highgrowns were dearer with improved quality. Mediums and low mediums were steady on last rates and colourv mediums fully firm to dearer. Unorthodox descriptions were firm and sometimes dearer.

The average price realised in dust sale No. 27 was Rs. 4.36 per kilo, as against Rs. 4.36 a week ago and Rs. 4.15 in the corresponding sale last year.

Colombo: The market opened to good demand but slackened as the sale progressed. Improved Uvas were, however, dearer throughout the sale.

London: *North Indian and other growths*: In Monday's sale, there was good demand for the new season's dooars on offer. Brighter African teas were fully firm to dearer, while others were steady.

Ceylon and South Indians: In Tuesday's auction, the market received good demand for all descriptions at firm prices with the exception of plain and light liquoring kinds which were easier.

As we go to press, Messrs, Forbes, Ewart and Figgis (Private) Ltd. wire us as follows:

"*Sale No.* 28: 710,000 kgs. offered. Good general demand. Low mediums and mediums little easier. Good mediums steady. Highgrowns firmer, others irregular. Unorthodox irregularly dearer."

RESTRICTIONS ON VEGETABLE OIL EXPORTS

(From Our Own Correspondent)

BOMBAY, 15*th July*

This week is notable for the decision of the Government of India to impose restrictions on exports of vegetable oils, including *vanaspati*, and to send a delegation to the United States for negotiating the purchase under P.L. 480 of one lakh tonnes of soyabean oil and 50,000 tonnes of tallow. These measures have been taken apparently in conformity with the Government's policy of effecting a downward trend in prices. The decision to restrict exports means, in effect, that they are subject to licensing.

The oilseeds market brushed aside the aforesaid announcement on the ground that the restrictions did not have much of a meaning so long as exporters were already under contractual obligations to sell oil to their overseas customers. Prices, therefore, continued to be firm, although a section of oil interests was maintaining that no exporter had any long-term contracts on hand and that, at least in one case, exporters were stopped from loading oil despite the fact that goods had been got through the customs. Groundnuts Madras Quality was mentioned at Rs. 64.75 and Kanpur at Rs. 61.75. Demand was good. The firm trend was also induced by better advices from Delhi and Saurashtra. Sellers were reserved. In oils, ready was mentioned at Rs. 25.25 per 10 kgs., as against the week's opening rate of Rs. 23.90. The news of the soyabean oil delegation, however, was generally well-received and was taken as proof of the Government's recognition of the urgent need to bring down prices here. The landed cost of soyabean oil is expected to be around Rs. 1,500 per tonne, as against the current price of Rs. 2,500-Rs. 2,600 for groundnut oil.

The *vanaspati* industry's annual needs of vegetable oils average about 450.000 tonnes and 100,000 tonnes of soyabean oil will take care of about 2½ months's requirements. But the oil, if it should help, must arrive here in September or latest in October, for these are the two lean months here and the new crop groundnut will be out only in November. But P.L. 480 is a rather slow affair involving as it does many formalities, but the industry circles here hope that, in view of India's urgent need to curb the rising trend of prices, the U.S. Government would expedite the sale.

It appears that the United States will find itself in a comfortable position to give us the oil we need. Crop reports point to a good harvest and private estimates are for a crop of 721.5 million bushels of soyabean, as against 701 million bushels of last year. Only recently, the United States sold 8,000 tons of soyabean oil to Tunisia and the G.S.A. is to sell about 5.5 million lb. of Sumatran and Congolese crude palm oil at the end of the month.

But even the soyabean oil report fell flat on the market. Otherwise, the market could not have been bid up to fresh high levels. On Wednesday evening, groundnut Coromondel was quoted at Rs. 65.75 and ready oil at Rs. 25.75 to Rs. 26. Stocks in Bombay were reported to be just enough to last for a day or two, while Delhi was an aggressive buyer. The undertone in both groundnuts and groundnut oil remained firm. The soyabean oil factor had already been discounted by the market.

Castor futures maintained a firm tone in keeping with the general trend in oilseeds. The September contract crossed the official upper limit of 180.25 in late deals, once on Tuesday when it was quoted at Rs. 182.25 and again on Wednesday when, after being firm at Rs. 181.50, it shot up in the evening to Rs. 183.25 on heavy short covering and firm spot advices. Sentiment was helped by talk of a barter deal—castor oil from India against soyabean oil from Africa.

In the spot section, Madras small was quoted at Rs. 37.75, Bihar Bold at Rs. 36.75, commercial oil at Rs. 15.50 and B.S.S. at Rs. 16.20. In the beginning of the week, the corresponding rates were Rs. 36 for Madras small, Rs. 14.65 for commercial oil and Rs. 15.30 for B.S.S.

Linseeds continued to be firm and was quoted only fractionally below the ceiling. Price movements in linseeds were narrow, but this was understandable, as operators were absolutely reluctant to go short in a market which is basically strong, while bull operators could not take the market up on account of the ceiling.

Linseeds September was mentioned at around Rs. 45 on Wednesday *evening*, while, in the spot section, bold was mentioned at Rs. 47.75 to Rs. 48. Cottonseeds were more or less neglected and on many a day, there were no transactions. At the close of the week, the September contract was mentioned at Rs. 44.78.

In the context of the market's firmness, there is some force in the plea for an upward revision of ceilings, though it is difficult to see how it conforms with the policy of lowering the price levels. The Oilseeds Exchange is said to be moving in the matter and is understood to have recommended to the Forward Markets Commission that the ceiling in castor be raised to Rs. 211 and that of linseeds from Rs. 45 to Rs. 52. The ceiling on cottonseeds suggested is Rs. 125. The question will come up for discussion at a meeting of the presidents of the various oilseeds and oil exchanges.

Extractions staged a notable recovery during the week. They had decline to Rs. 408 from their earlier high of Rs. 430 but lower levels attracted fresh buying and at the time of writing the market was quoted at around Rs. 424-Rs. 425.

East European countries were again active in the market and it was said that purchases by East Germany during the last few days aggregated about 27,000 tonnes. Poland was also a fairly active buyer.

The temper of the market suggests that prices will remain firm so long as basic factors support a rise. Bulls are, therefore, sitting tight and restrictions on exports and imports of soyabean oils may not affect the market in any significant way. This seems to be the reading today. The next factor is the domestic harvest, but it is rather too soon in the season to talk of it.

The following table shows the closing prices of oilseeds and oils as on 15th July as compared with those of the two previous weeks.

	15-7-1964	8-7-1964	1-7-1964
Groundnuts	Rs.	Rs.	Rs.
Nizam bold	63.75	63.25	63.25
Khandesh quality	65 50	64.50	64.50
Oil ex-mill	25.25	25.25	25.25
Oil Rly. Receipt	25.15	24.50	24.50
Castorseed			
September 1964 contract.. ..	181.50	180.25	181.50
Ready Madras	37.25	36.12	36.75
Ready Kanpur	36.00	35.12	35.62
Oil B.S.S.	15 80	15.25	15.50
Oil commercial	15.30	14.70	15.50
Linseed			
September 1964 contract.. ..	44.78	44.62	44.75
Bold ready	47.50	47.75	47.50
Linseed oil	19.75	19.65	19.40
Cottonseed			
September 1964 contract.. ..	104.00	104.00	103.00

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

YARNS EASY

(From Our Own Correspondent)

BOMBAY, 15*th July*

In the absence of any fresh development, the yarn market put on an easy appearance during the week under review. Trading was dull throughout the week, thanks to absence of satisfactory buying interest. Art silk yarns tended to look down as spinners were eager to sell, while demand from weavers and dealers at a low ebb on hopes of a further fall in prices. A section of traders, however, discounted the possibility of the downward trend gathering momentum. In their opinion, owing to the improvement in export demand for rayon textiles, buying interest would stimulate in the coming weeks. Staple fibre yarns encountered selling on large-scale offers by the South India mills. Cotton yarns were dull.

Amongst art silk yarns, National Rayon 150D and 120D were neglected at Rs. 11.18 and Rs. 11.97, respectively. South India Viscose 150D dropped 16 nP to Rs. 14.01. Bright Century 75D, however, gathered 13 nP to Rs. 18.83 on special support.

In the staple fibre yarns (2 x 34 French Count and 2 x 40 British Count) section, Kohinoor was dull at Rs. 9.90. Century shed 9 nP to Rs. 9.55, and City lost 5 nP to Rs. 9.37.

Cotton yarns 12*s* Modern and 22*s* Madura were unchanged, the former at Rs. 24 and the latter at Rs. 31.50. 68*s* Mahindra was subdued at Rs. 90.

There was a distinct improvement in exports of rayon textiles during the month of June 1964. From the low of 244 lakh metres valued at Rs. 30.40 lakhs in May 1964 actual shipments went up to 45.98 lakh metres valued at Rs. 50.30 lakhs in June 1964.

The Government of India has applied Section 15 of the Forward Contracts (Regulation) Act, 1952, as recommended by the Forward Markets Commission, to *kapas* and staple fibre yarn throughout the country with immediate effect. Recognition under Section 6 of the Act has been granted to the Bombay Yarn Merchants' Association and Exchange Limited, Bombay, for a period of two years to conduct forward contracts (other than non-transferable specific delivery contracts) in staple fibre yarn. However, forward contracts can be entered into only between or through or with the members of the Association. The Association has been asked to carry out the necessary modifications in its constitution and trading by-laws. Recognition has also been granted to (1) the Punjab Company Ltd., Bhatinda; (2) the Mahesh Beopar Bhandar Company Ltd., Dhuri; (3) the Saurashtra Oil and Oilseeds Association Ltd., Rajkot (for Surendranagar ring only) and (4) the Jalna Merchants' Association Ltd., Jalna, in respect of *kapas* for a period of three years.

BRISK DEMAND FOR FOODGRAINS

(From Our Own Correspondent)

HAPUR, 13*th July*

Firmness in foodgrain prices continued unabated. Poor arrivals in face of brisk local and east U.P. buying support were the main influencing factors. Conditions in some districts of U.P. were alarming but U.P. Food Minister, Mr. Negi, assured that every effort was being made to tide over the difficult food situation. Imported wheat began to arrive from Bombay and the coming weeks are expected to mark further improvement. Continued untimely heavy rains in the last ten days, marred the prospects of good *kharif* crops already sown and delayed large-scale *kharif* sowings. Unfavourable weather conditions have added to the bullish conditions in foodgrains market.

Wheat prices crossed the ceiling fixed by the trade during the week and advanced by Rs. 2 to Rs. 4 per quintal according to quality. The average quality was quoted between Rs. 62 to Rs. 64.50 and farm produce between Rs. 65 to Rs. 67.50 per quintal as against Rs. 43, the controlled price. Daily arrivals were affected due to rains and local stocks were estimated around 2,000 quintals. It was learnt that wheat and flour released through fair price shops were being sold in the open market at higher prices and wheat was also being sent outside the district. Rice also moved up during the week and prices of the inferior quality advanced on good demand as against dwindling stocks. Week-end prices were:—Rice *basmati* superior Rs. 96.45 to Rs. 102.50, *sela* Rs. 93.77 to Rs. 96.45, *mainpuri* Rs. 78.37, *ramajwayan* Rs. 83.06, *raimunia* Rs. 85.74 and *gadda* Rs. 80.38 per quintal.

After an early setback, gram improved sharply to Rs. 3 per quintal on good demand against short supply due to meagre stocks. Local produce was quoted at Rs. 61.50 and Punjab quality at Rs. 60 per quintal. Arrivals were poor and stocks left with the trade were negligible. Barley and *bejhar* prices further hardened on brisk enquiries from the consuming areas of east U.P. and prices ranged between Rs. 49 to Rs. 50 and Rs. 50 to Rs. 51 per quintal respectively. *Juwar*, *guwar* and maize prices improved on good demand for seed purposes as against poor stocks. Week-end prices were:—*Juwar* Rs. 48.50 to Rs. 51.50, *guwar* Rs. 62.96 to Rs. 64.30, maize Rs. 48 to Rs. 51, *methi* Rs. 55 to Rs. 57.50 and oats Rs. 57.50 to Rs. 60 per quintal.

In the pulses section, peas improved on good outside buying enquiry in face of smaller stocks. Peas *dara* was quoted between Rs. 57.50 to Rs. 58.50 and farm quality between Rs. 60.50 to Rs. 61.50 per quintal. Daily arrivals were negligible due to rains and local peas stocks were put around 4,000 quintals. Peas *dal* prices also hardened to Rs. 63.50 per quintal. *Arhar* prices were stationary while *arhar dal* is attracting good demand and prices of *arhar* ranged between Rs. 72.50 to Rs. 75 per quintal. *Urd* and *moong* prices stayed steady while other *dal* prices sought higher levels due to meagre stocks. *Masoor* prices also ruled firm. Week-end prices were:—*Arhar dal* Rs. 95 to Rs. 105, *urd* Rs. 67.50 to Rs. 73.68, *urd dal* Rs. 85.74, *moong* Rs. 83.06 to Rs. 101.81, *moong dal* Rs. 105, *masoor* Rs. 70 to Rs. 75. *masoor dal* Rs. 85.74 and gram *dal* Rs. 68 per quintal.

SUGAR SUPPLIES SCARCE

(From Our Own Correspondent)

HAPUR, 13*th July*

The steadier trend witnessed in the sugar market last week continued during the week under review, as supplies remained scarce. The supply position was further adversely affected due to the non-availability of *desi khandsari*. Prices in non-official dealings, therefore, improved by Rs. 5 to Rs. 190 a quintal, as against the controlled price of Rs. 135 to Rs. 140 a quintal.

Trading in *khandsari* continue to remain at standstill for the fifth successive week following the seizure of stocks by the State Government in all markets of U.P. On persistent demand by traders and producers and on the expert committee advice, the U.P. Government has revised prices of different qualities of *khandsari* which now were: sulphitation superior Rs. 127, white Rs. 124, yellow Rs. 117 and brown Rs. 106 a quintal. Further, yellow and brown quality stocks have been released for open sale in the market at controlled prices. Traders, however, were anxiously awaiting the decision of the Allahabad High Court on the writ filed by some traders regarding prices fixed by the Government initially.

Ready *gur* turned steadier during the week, thanks to brisk buying enquiry against import permits from Rajasthan and Gujarat. The daily arrivals were nominal due to heavy rains throughout the week. As the stocks have become wet, dealers are now anxious to sell. Cane crop prospects have very much improved during the week following heavy rains. The week-end prices (in rupees per 40 kilogram) were: *gur pansera* 29.50 to 30, average 29.37, *dara* 29.25 to 29, *kotha* selected 29.25, dry-wet 27 to 28, wet 26.50 and *shaker* 31 to 33.

After an early fall, *gur* and *shakker* regained a part of the losses on the revival of upcountry demand. *Gur chaku* wet quality prices lost Rs. 2 per 40 kilogram, as demand was lacking. Dry quality prices, however, improved by Re. 1 to Rs. 31.50/32.50 per 40 kilogram on brisk buying enquiries from Rajasthan and West Bengal. *Gur khurpapar* gained Re. 1 to Rs. 2 per 40 kilogram on the support from Madhya Pradesh, Gujarat and Rajasthan and was now quoted from Rs. 30.50 to Rs. 32 per 40 kilogram. The *rusket* varieties attracted good enquiry from Rajasthan, M.P., West Bengal and Assam, and prices fluctuated between Rs. 12 to Rs. 16 per 40 kilogram. *Shakker* ruled both ways in the absence of new urges.

KIPS QUIET

(From Our Own Correspondent)

MADRAS, 13*th July*

The kip market remained quiet as it was last week. Export trading was selective with emphasis on light weight cowhides, all selections and medium weight fifths, and light cowcalf fourths. Turnover was small. In the tanned skins section also, sales were patchy. Medium weight goat skins were in demand but enquiries for other averages were meagre, and the market ruled weak. As regards sheep skins, prices remained easy; and despite offers at lower prices by the tanners, importers were not keen to make purchases.

The impending August holidays and the Paris Leather Fair in September this year tend to mitigate long-term buying by the dressers overseas. It is feared that the tone will be bearish for some weeks more. Shipments during June 1964 were:—2.115 bales tanned cowhides, 239 cowcalf, 5 buffhides, 502 buffcalf, 467 goat and 435 sheep skins to U.K. ports; 5 cowhides. 21 cowcalf, 2 buffcalf, 838 goat, 404 sheep skins and 7 cases chrome goat to the Continental ports; 10 buffhides, 65 buffcalf, 245 goat skins and 39 cases pickled goat skins to American ports; 7 goat and 44 sheep skins to Japan.

In the German public sales held last week, 40 per cent of the goat skins were sold at prices ranging from 6 to 12 pence per lb., above the current expectations. Clearance of sheep was poor. In the London public sales, clearance of goat and sheep was meagre.

JUTE GOODS FIRM

(From Our Own Correspondent)

CALCUTTA, 14*th July*

The report that stocks of raw jute with mills as at the beginning of last month at 2 million bales represented a fall of 230.000 bales as compared with the corresponding period last year led to steadier conditions in new crop raw jute during the week under review. The publication of figures relating to goods in stock with mills at the end of last month, which at 126,100 tonnes were higher by only 1,900 tonnes as compared with the previous month, despite shipping difficulties, led to firmness of jute goods. There was a further deterioration in port conditions. Due to heavy rains, loading and unloading operations were severely affected, and the number of ships waiting at the Sandheads for entry into the harbour increased. The continuance of tidal bores, coupled with shortage of loading boats, caused anxiety. These conditions naturally attracted the attention of the Central authorities. Both the Union Deputy Minister and the Minister of Shipping were in Calcutta to examine the problem at firsthand and recommend remedial measures in the same way as was done in Bombay following the visit there of the Union Food Minister. It was stated that jute goods exported in May 1964 aggregated only Rs. 1.1 crore.

The Union Commerce Ministry has drawn attention to the fact that jute goods are facing severe lowering of prices and undercutting by Pakistan. Shippers are naturally relieved to note that the deterioration in the shipping conditions at Calcutta port has caught the Central Government's attention, as in the context of the existence of buyers' markets overseas for the traditional exports from India such as jute goods and tea, the trade is naturally anxious that it should not provoke the ire of overseas consumers for the former's failure to keep up to the schedule of deliveries. It is time that a permanent solution to such difficulties as lack of adequate number of lighters was arrived at. The trade has pointed out that, due to no fault of its own, it could not complete several shipments by the 10th of this month and thus avail the benefit of lower freight rate. Goods in stock with mills as at the end of June showed that, while hessian at 45,100 tonnes and miscellaneous items at 14,500 tonnes fell by 1,900 tonnes and 1,100 tonnes, respectively, as compared with the end of May 1964, sacking and carpet backing at 45,100 tonnes 21,400 tonnes rose by 4,700 tonnes and 200 tonnes. The rise in heavy goods occurred despite large purchases against internal consumption. In other words, exports fell visibly last month. The better statistical position in hessian has been due to purchases by the United States and Argentina; however, the report that Argentina may not be able to proceed with its purchasing programme in view of foreign exchange difficulties is causing concern.

Both the industry and the trade are one with the Government of India in the latter's measures

to enforce rigorous quality and inspection control on jute goods. Even before Parliament passed the Export (Quality Control and Inspection) Act, which came into force from the beginning of this year and which will be made effective to jute goods exports as from 1st December 1964, the industry had finalised a system of sampling, quality control and inspection. With this end in view, the Indian Jute Mills Association set up the I.J.M.A. Quality and Inspection Control Organisation. This Organisation, with headquarters at the Research Institute of the Association, has five zonal branches in important mill centres. It is learnt that the Central Government is considering to make this Organisation responsible for the statutory provision in the Act referred to. The standards issued by the Indian Standards Institution in 1963 in respect of jute goods are now being revised in the light of comments received from overseas buyers. After this revision, the final standards are expected to be issued before 1st December. Licences for the I.S.I. certification mark on goods will be issued to mills on the recommendation of the I.J.M.A.Q.I.C. Under the I.S.I. certification mark system, each mill, licensed by the I.S.I. will be responsible to stamp their goods with the I.S.I. mark after ensuring themselves that the goods are in conformity with the relevant I.S.I. standard. The I.J.M.A.Q.I.C. will do the periodic checking as is now being done by the I.S.I. with regard to other industries. Quality control at different stages of processing is also aimed. The introduction of quality and pre-shipment inspection will no doubt add to costs of mills, and it is realised that such addition to costs is essential in order to expand India's markets abroad. However, against the background of the stiff competition in foreign countries from Pakistani mills and the tendency in foreign countries to set up more jute mills with a view to achieving self-sufficiency, mills would once again urge the need for lowering raw material prices.

Weather this season has been so far uniformly good, and farmers will also benefit from official action in the provision of clean retting water and other facilities. The yield per acre is expected to show a rise, and a small lowering of fibre prices will not affect the fortunes of the farmer, but will mean much to the mills' industry which is already groaning under the heavy weight of expenditure. Expenses have only risen since the past one year as a result of taxation and the implementation by the industry of the Wage Board's recommendations and the generally rising price trend for jute mills' stores.

New crop arrivals this week were estimated at about 11,000 maunds a day. Quality was uniformly good and that was the reason for the mills to show keen interest in offerings. Although their fibre stocks were lower as compared with the last season, they had ample fibre to maintain production at the existing enhanced rate until the new crop arrivals touched fairer proportions. The fact that mills showed keen interest in new crop arrivals this week was mistakenly interpreted as springing from their anxiety to build up stocks. The Jute Commissioner was expected to issue the first compulsory purchase quota for this season. He was reported to be watching the trend of arrivals before deciding as to the quantum of the quota to be issued. Heavy rains in most jute districts were again a feature in this week, but, in contrast with last week, spells of sunshine had been less often. Some damage to the crop in the lower Assam and north Bengal was again reported. The quotations for new crop were firm as follows: northern bottoms Rs. 31.50, Assam bottoms Rs. 32.00, and daissee bottoms Rs. 33.50. Prices in agencies were above Calcutta's parity, and the discounting tendency, a feature pertaining to the remaining portion of the old crop, was conspicuous by its absence.

Jute goods maintained a firm trend during the week under review. The steadiness in prices of new crop as well as more business in heavy goods against internal consumption, both Government and commercial, boosted sentiment for a time, despite the deterioration in shipping conditions. Dull reports from the New York burlap market continued to be received, and the report of Argentina's inability to lift hessian from Calcutta as planned in view of foreign exchange shortage encouraged buyers in New York to go slow. Further, plant shut-downs for inventory taking in the U.S.A. were also a factor in buyers' favour. Covering business was a feature in the Calcutta goods market on Tuesday last. However, overseas business was lacking, and that explained for the fall in ready B. twills from Rs. 117.00 to Rs. 116.65 and of ready hessian 40" 10 oz. from Rs. 44.75 to Rs. 44.70 on that day. At this stage, details of figures of goods in stock with mills were announced and the belief that in June exports had fallen led B. twills to fall to Rs. 115.65 and hessian 40" 10 oz. to Rs. 44.60 on Wednesday. Business in B. twills for July-August delivery with Government involving 10,000 bales was a feature on Thursday, and this led B. twills to harden to Rs. 116.20. However, in the absence of support, hessian 40" 10 oz. eased to Rs. 44.55. These rates were unchanged on Friday. Over the week-end, B. twills shed to Rs. 116.00, hessian 40" 10 oz. remaining unchanged at Rs. 44.55. Very little business was done yesterday, and prices were fractionally lower at Rs. 115.45 and Rs. 42.20, respectively. It was noted that the rise in stocks of goods with mills was much lower than the rise in output in June.

METALS WELL SUPPORTED

(From Our Own Correspondent)

CALCUTTA, 14*th July*

Following good support, firmer conditions were in evidence in the Calcutta metal market during the week under review. On the London Metal Exchange, values recorded further gains. The world shortage in the principal metals is now believed to be more firmly based than hitherto thought.

It has been urged on behalf of the producing countries that the gap between consumption and availability of tin could be closed only by the medium of a free market price and thereby increase its output. At present, the existence of the International Tin Agreement, it is represented, is preventing the price to rise to such a level as to cover fully the increased cost of production. Drawing attention of all concerned to these representations of the Malaysian tin industry, Mr. G. Simms, Chairman of the Tronoh Mines Ltd., recently stated that with the rising tempo of industrial development in several countries, in particular in India, the U.S.S.R. and China, world consumption of tin is bound to go up rapidly, and that if the producing countries failed to step up their output, it would result in substitution. He said that Malaysian membership of the International Tin Agreement meant a loss of £1.25 million a year for that country. He advocated the scrapping of the Agreement, and return of the funds blocked in London for the buffer stock purchases, as these funds could be of assistance to producing countries in developing new low-grade properties. On the London Metal Exchange, spot tin eased from £1,250 a ton to £1,237½ and the three-months from £1,209 to £1,204. The fall in Continental inquiries explained the decline. In Calcutta, tin was unchanged at Rs. 3,000 per 100 kgs. Consumer demand was steady.

Good demand was in evidence for copper scrap, and the price of the utensil scrap was firm at Rs. 660 per 100 kgs. With more arrivals of the virgin metal, actual users were in a comfortable position and this explained the unaltered price for scrap despite good demand. It was good news to hear that a copper smelter unit, based on imported concentrates, was to be set up in the private sector in Bombay. The capacity of the unit would be about 18,000 tonnes a year. India's only smelter unit at Ghatsila was allowed to be expanded. Now that copper ores have been located in Kashmir and other places, there is the need to increase smelting capacity in India. It may be recalled that the Planning Commission's working group for non-ferrous metals had recommended the setting up of one or two copper smelters based on imported concentrates having regard to the rapidly increasing demand for copper. The group had referred to the desirability of long-term arrangements for importing copper concentrates as processing of these, like the crude oil imports, would lead to a great saving in foreign exchange. On the L.M.E., spot copper wire-bars rose from £302 to £309½ a ton, spot cathodes from £296 to £300, and spot fire-refined copper from £275 to £280½. Spot zinc went up from £138 to £140½, but closed lower on balance at £137. Spot lead was, however, unchanged at £94½ a ton. In Calcutta, both lead and zinc were unchanged at Rs. 290.00 and Rs. 322.00 respectively per 100 kgs.

HEAVY ARRIVALS OF TEA

(From Our Own Correspondent)

CALCUTTA, 14*th July*

Demand during the export sale held yesterday was good, and the improvement in quality of dusts offered during the internal sale last week explained the bidders' added interest. The heavy arrivals of tea showed that the season had commenced in full swing, and that floods in Assam had not yet disturbed river transport. Had it not been for congestion at the port, shipments this week would have been higher. Foreign buyers are paying more attention to North Indian tea. The fall in South Indian production—up to the end of May production at 65 million lbs. was lower by 18 million lbs.—is significant.

While the Wage Board for the tea industry is reported to have recommended a second interim increase in dearness allowance and its final recommendations are awaited, it is disturbing that labour agitation in the areas of Dooars and Darjeeling is threatening production. Their demands include higher wages to neutralise the increase in the cost-of-living index, pension and gratuity benefits, and the fixation of retiring age. Agitation for higher bonus having regard to the Bonus Commission's recommendations is reported gathering momentum in the Dooars area. At a time when the Wage Board is deliberating on the needs of the tea garden labours and the capacity of the industry to shoulder additional burdens, labour unrest is causing anxiety to managements of several gardens.

The tea industry is also concerned with the rising prices of essential commodities. While prompt measures of the Government are praiseworthy, labour has exploited the situation to put up demands. The keen competition which Indian tea is facing in foreign markets, prohibits the industry to add to costs. All the same, the final recommendations of the Wage Board are bound to raise costs, but such loads cannot be shifted to the consumer. The industry will itself have to bear the additional burden, and this means a further lowering of the margin of profit. Already, in comparison with other industries such as engineering and consumer goods, investments in the tea industry are giving a much lower return, and this is one of the reasons why tea gardens have to look to their own resources and loans for financing acreage expansion programmes. Loans granted by the Government of India through the Tea Board are not popular with the tea industry since interest and other charges are higher than the return that the investments are expected to yield. Hence, tea industry has pleaded for consideration in this regard and has urged the need for measures to improve its own resources position. This can be done by revision of excise duties, which should be refunded in the case of exports. This will cheapen prices for the foreign consumer, and strengthen Indian tea in foreign markets.

Dusts on offer during last week's internal sale aggregated 13,947 chests which met with a strong demand. In particular, all bright and powdery teas were bidders' favourites. A strong feature was provided by C.T.C. teas, prices of which went up. While plain orthodox teas were firm at previous levels, all Assam teas, particularly the bright ones, gained in values. Legg-cut teas, however, eased, but the small powdery sorts were taken by bidders with enthusiasm. The quotations per kg inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.90 to Rs. 7.40, medium Assam C.T.C. dust Rs. 5.80 to Rs. 6.50, medium Assam dust Rs. 5.20 to Rs. 6.00, legg-cut dust Rs. 4.90 to Rs. 5.30, and plain orthodox dust Rs. 4.20 to Rs. 4.50.

Leaf on offer during yesterday's export sale aggregated 35,795 chests which met with a fair demand. Buyers followed quality. Keen competition was offered to flavoury Darjeelings and higher prices were realised. A dearer tendency was also recorded in medium C.T.C. teas with improved liquors, with the best Assam C.T.C. teas receiving better attention. The balance of C.T.C. teas were irregular. Whole leaf grades met with ready demand although at slightly easier rates, but tippy teas sold well. Plain liquoring orthodox teas eased in an irregular trend, with fannings becoming difficult to be pushed. Medium Assam and Dooars also eased. Prices for the bright liquoring teas gained, however, with O.F. teas recording a strong tendency. Quotations per kg. inclusive of excise duty were: best Assam C.T.C. fannings Rs. 7.00 to Rs. 8.20, medium Assam C.T.C. B.P. Rs. 6.00 to Rs. 6.80, best Assam C.T.C. B.P. Rs. 7.00 to Rs. 8.20, medium Assam C.T.C. fannings Rs. 6.00 to Rs. 6.80, clean plain pekoe Rs. 5.10 to Rs. 5.30, plain B.P. Rs. 4.30 to Rs. 4.50, and plain fannings Rs. 4.00 to Rs. 4.20.

TEXTILES

(Concluded from page 100)

the previous year. Japan showed the largest increase in exports between 1961 and 1962; as much as 70 per cent. Most of the E.F.T.A. countries (especially Norway) and the United States recorded significant increases. The world exports of non-cellulosic yarns and staple showed a rise of 46 per cent in 1962 as compared with 1961, the actual exports aggregating about 144,000 metric tons.

In general, the prices of rayon and acetate, as well as of the wholly synthetic fibres such as nylon are much more stable than those of natural fibres. As a factory-made product the supply of these materials is more easily controlled and the policy of the large manufacturing companies has been to keep prices steady for long periods. In certain exports markets, however, prices have been more flexible than in the domestic markets of major producing countries, due to more competitive conditions prevailing there. The prices of non-cellulosics are generally more than either rayon and acetate or the natural fibres. Manufacturers normally hold these prices in the short run, but, in the longer run, reductions have tended to follow expansion in production or when competition for specific end-uses has intensified.

Note.—Outstandings relate to end of period and do not include Indian Union's share of pre-partition liabilities; repayments, however, include those from the pre-partition holdings of Indian investors. A—Discontinued from July 1, 1953. B—Discontinued from June 1, 1957. C—Issued from May 16, 1954 to May 30, 1957. E—Including Defence Savings Banks Deposits upto 1954-55. F—No sales from June 1, 1957. G—1st series issued from July 1954 to 1957 and 2nd series issued from January 1958. H—Outstandings in respect of items in column 9 marked 'E' are not included. J—Commenced from 2nd January 1959. N.B.—Five-year prize bonds were issued from 1st April 1960 and the total outstandings amount to Rs. 20 crores. Fifteen-year Cumulative Time Deposits commenced from June 1962—the outstandings at the end of Mar., 1964 amount to Rs. 62 lakhs. Twelve-year National Defence Savings Certificates commenced from 16th November 1962 and the end of Mar., 1964 amount to Rs. 160.51 crores. Ten-year Defence Deposit Certificates were issued from 10th November 1962 — the outstandings at the end of Mar., 1964 amount to Rs. 31.66 crores. Premium Prize Bonds were issued from 1st January 1963 and outstandings at the end of Dec., 1963 amount to Rs. 5.75 crores.

A new series of Premium Prize Bonds, 1964 was issued since 1st January 1964. The outstandings at the end of March 1964 was Rs. 6.66 crores including cashholdings of the previous series.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. I—Interim Dividend. C.R.—Cum. Right. XR.—Ex. Right.

Shares :—If a company has different classes of shares—as for example : ' A ' shares and ' B ' shares—these are indicated by the same letters ' A ' and ' B ' under the columns ' Paid-up Ordinary Capital ' and ' Paid-up ' per share.

Accounts :—Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

BEHAVIOUR OF STERLING

(Concluded from page 91)

this year, Britain's balance on current transactions as a whole, seasonally adjusted, slipped into deficit to the extent of £62,000,000—the largest deficit since the end of 1960. This compared with surpluses of £6,000,000 and £14,000,000 in the fourth and third quarters of last year respectively, and with a peak surplus of £71,000,000 in the first quarter.

The deterioration was wholly attributable to visible trade and, specifically, to the growth in imports. These rose between the two quarters by £82,000,000, or seven per cent, whereas exports rose by only £8,000,000, or one per cent. The rise in imports, however, occurred entirely at the turn of the year; after January, there was no further rise. The official commentary points out that this increase, whilst partly due to higher prices, was mainly a reflection of the very violent turnround in stock-building that occurred between the six months to end-September last and the subsequent six months.

In the first of these periods, the stocks held by manufacturing industry and by distributors fell by £50,000,000 (after seasonal adjustment, and valued at 1958 prices as a basis for measurement of volume changes), whereas in the second period they rose by no less than £238,000,000. Between the same two periods, imports of industrial materials rose by 15 per cent. There has also been a sharp increase in the latest quarter in imports of semi-manufactures, as well as a notable rise in finished manufactures, some of which may be associated with the upturn in fixed investment outlays.

The overall deficit, representing the identified current balance together with estimated net outgoings on long-term capital account, deteriorated more sharply still, but there is some reason to think that this movement, like that in the current balance alone, may not be fairly indicative of the trend ahead. Net outgoings of long-term capital during the quarter totalled £91,000,000, as compared with £71,000,000 in the preceding quarter and an average of only £38,000,000 a quarter in 1963 as a whole. One reason for this increased strain was that new lending by the British Government as part of the programme of oversea aid was above average and it amounted to £27,000,000, more than double the amount provided in the first quarter of 1963. The annual rate in recent years has been between £60,000,000 and £70,000,000.

More significant still, as a guide to the underlying trend, is the fact that the so-called balance of monetary movements (representing the net change in reserves and external liabilities, claims and other capital movements of a short-term nature) was adverse during the quarter to the extent of only £69,000,000—or by little more than half, indeed, of the deterioration recorded in the final quarter of 1963.

The disparity between that movement and the deterioration of the overall balance from a deficit of £68,000,000 to one of £158,000,000 is represented by items not identified in the estimates, items which in the latest quarter have an indicated net credit value of £89,000,000 in contrast with a net debit value of £59,000,000 for similar unrecorded items in the preceding quarter. The identified deficit comprises the net outcome of known and recorded current transactions and long-term capital movements. The balance of monetary movements is a firm figure showing what has happened to the cash in the till, so to speak, and short-term indebtedness. When the identified deterioration under the first head exceeds the known deterioration under the second head, the "balancing" items needed to reconcile the accounts consists of a net balance of unidentified receipts—whether unrecorded current earnings and/or a net inflow on capital account. When this balancing item is large and positive, it raises a strong presumption that the overall deficit is overstated.

It should be noted, too, that sterling benefited substantially during the quarter from the net receipts of the overseas Sterling Area in transactions with the non-sterling world. In this seasonally favourable quarter, the current account deficit of the oversea sterling countries dropped to £35,000,000, whilst the net inflow on long-term capital account rose to £150,000,000. After allowing for repayments to the International Monetary Fund and other monetary movements in currencies other than sterling, there remained a net credit of £90,000,000 to be retained in the central reserves pool in London. However, Britain's short-term liabilities to the oversea Sterling Area rose by considerably less than this—by £53,000,000 to £251 millions—principally because Britain's current surplus with the oversea Sterling Area was substantially exceeded by its net lendings to the oversea Sterling Area on long-term capital account.

The most recent indicators of the trend of Britain's external accounts are somewhat more heartening than those of the first quarter. Imports, after their leap from an average of £422,000,000 a month (c.i.f.) and seasonally adjusted in the fourth quarter of 1963 to £457,000,000 in January, have since fluctuated between that figure and £450,000,000, whilst exports in May, as in February, recovered smartly from their sharp dip in the preceding month. The average for the latest three months shows a gain of £8,000,000 on the preceding quarter, whilst the corresponding rise in imports has been no more than £3,000,000.

* * *

The provisionally estimated deficit on visible trade (with both imports and exports valued f.o.b.) averaged £30,000,000 a month in March-May, compared with £34,000,000 in the previous three months. Meanwhile, the Chancellor of the Exchequer, in a recent speech, has indicated that the strain on the balance of payments up-to-date was regarded as within the bounds envisaged earlier in the year, when it was deliberately decided that it would be right for Britain to lean on the cushion of reserves or international credit to some extent at this stage in the business expansion—on the assumption that the strain would prove to be only temporary.

BANK PROFITS

The Punjab National Bank Ltd. has reported a handsome profit of Rs. 69.26 lakhs (subject to audit and after making provision for taxes and other usual provisions) for the half-year ended June 1964, as against Rs. 50.15 lakhs for the corresponding half of last year, representing an increase of Rs. 19.11 lakhs. This profit, together with Rs. 2.27 lakhs (Rs. 15.25 lakhs a year before) brought in gives a total amount available for distribution of Rs. 71.53 lakhs (Rs. 65.40 lakhs a year before). The Directors have decided to maintain the interim dividend on the 10-rupee shares at Re. 1 per share or 20 per cent per annum, subject to tax, which will absorb Rs. 20 lakhs, leaving the balance of Rs. 51.13 lakhs to be carried forward to the second half-year's account.

* * * *

The performance of the Bank of Baroda Ltd. for the half-year ended 30th June 1964 is quite satisfactory. The net profit earned was higher at Rs. 35.55 lakhs, as against Rs. 26.10 lakhs for the first half of last year. The Directors have maintained the interim dividend at 16 per cent per annum or Rs. 4 per ordinary share which will absorb Rs. 16 lakhs. The remaining balance of Rs. 19.55 lakhs and Rs. 2.97 lakhs brought in have been carried forward to the next half-year.

BANK OF AMERICA

The net operating profits of the Bank of America for the first half of 1964 amounted to $46,416,915. The average profit per share on the 28.48 million shares comes to $1.63, as compared with $1.49 for the corresponding period last year. The marked rise in average per share profit is attributed to the substantial increase in earnings. The total resources at $14,809.91 million were $1,122.50 million higher than a year before. The total loans granted by the Bank touched a record of $8,852.84 million representing an increase of $995.01 million over the corresponding half of last year. Deposits amounted to $13,374.82 million ($12,354.79 million as on 30th June 1963). Investments in securities were $3,104.28 million, as against $3,188.15 million.

WEEK'S STOCK EXCHANGE TREND

THE following quotations indicate the trend of transactions on the Bombay Stock Exchange during the week ended 16th July 1964.

CONSERVATIVE UPSURGE IN U.S.

TO a world accustomed to think of the United States in terms of Roosevelt's 'New Deal' and Kennedy's 'New Frontiers' and of its mature liberalism as an alternative to socialism and communism alike, the present conservative upsurge in that country has come as a disconcerting surprise. Not that the world is wholly dismayed by conservatism as such, for, in its best sense, this school of political and economic philosophy stands for conservation of all that is good and time-tested in the established order. But it is the particular brand of conservatism, brought to the surface and galvanised into a tremendous force by Mr. Goldwater, that charismatic Senator from Arizona, that is viewed with alarm by thoughtful people everywhere. Perhaps, this alarm, as expressed in India and in several European capitals, is a little hysterical and exaggerated. But it is not entirely unwarranted, for, as a dyed-in-the-wool type of conservatism, Goldwaterism has its disquieting undertones of intolerance, demagogy and racism. No wonder, therefore, that it has been described as an irony of history that the Republican Party—the party of Abraham Lincoln—has nominated Mr. Goldwater as its candidate for the forthcoming Presidential election even after he had cast his vote against the historic Civil Rights Bill in the U.S. Senate the other day.

Of course, winning the Republican nomination is one thing, winning the Presidential election quite another, and Goldwater's victory at the hustings in November next is generally considered unlikely. But insofar as his election to the U.S. Presidency is quite possible, both Republican and Democratic liberals and their sympathisers round the world have logically subjected his pronouncements and the party platform evolved by his supporters to a critical scrutiny. In particular, his acceptance speech following the nomination—a speech which was brutally blunt on some points and concealed more than it revealed on some others—has come under a withering fire. Quite a few observations in this speech have been rightly invested with a certain significance bordering on the sinister. For instance, Mr. Goldwater's dictum that "extremism in the defence of liberty is no vice" and that "moderation in the pursuit of justice is no virtue" has been roundly condemned by no less a person than General Eisenhower himself—the former President who, more than anybody else, gave a strongly liberal and modern orientation to the Republican Party during the period 1952-60. The ex-President's comment on that highly controversial dictum is that "it would seem to imply that the end always justifies the means, and the whole American system refutes that idea and that concept." While this comment speaks for itself, Governor Rockefeller's description of the Goldwater dictum as "dangerous, irresponsible and frightening" is even more eloquent. Here, in India, one may be justified in asking what material difference there can be between Goldwaterite anti-communists and the communists who swear by the same doctrine of "end justifying the means." If fanaticism and extremism are condoned in the name of 'liberty,' even as violence and subversion are justified by communists in the name of 'equality' and 'social justice,' it is these laudable ends that will be distorted, decimated or destroyed in the process. The writing on the wall is there for all to see, whether in the East or in the West.

It is a thousand pities that the Republican Convention, ignoring this writing on the wall, has rejected the just liberal demand for a formal denunciation of the John Birch Society and other extremist groups which have been backing Mr. Goldwater. The rejection, incidentally, is of a piece with some other cryptic observations in the Senator's acceptance speech. The substance of these remarks is that the mistaken course (of liberals) "stems from false notions of equality," that equality, "wrongly understood, as it has been so tragically in our time, leads first to conformity and then to despotism," and that "it is the cause of republicanism to resist concentrations of power, private or public, which enforce such conformity and inflict such despotism." It is quite obvious that Mr. Goldwater has thus condemned, in the name of liberty, the goals of racial equality and of greater economic equality as between the various classes, to which American liberals (both within and outside the Republican Party) have been dedicated. It defies one's intelligence why Mr. Goldwater has conceived of a dichotomy between 'liberty' and 'equality,' although both of them are equally valid democratic ideals. Is it because communists are cynically exploiting the concept of 'equality' and denying it, as well as liberty, in actual practice that Goldwaterite conservatives wish to go to the other extreme of exploiting the concept of 'liberty' and denying 'equality' and, ultimately, liberty itself?

It may be that this is a far-fetched question, if it turns out that the authentic credo of Goldwaterite conservatism is to be found in the following passage:

"We must assure a society here which, while never abandoning the needy or forsaking the helpless, nurtures incentives and opportunities for the creative and the productive.

"We see in private property and an economy based upon and fostering private property, the one way to make Government a durable ally of the whole man, rather than his determined enemy...

"And beyond that, we see and cherish diversity of ways, diversity of thoughts, of motives and accomplishments...

"We seek a Government that attends to its inherent responsibilities of maintaining a stable monetary and fiscal climate—encouraging a free and competitive economy, and enforcing law and order.

"Thus do we seek inventiveness, diversity and creative difference within a stable order...

"Our towns and cities, then our counties and states, then our regional compacts—and only then the national Government—that is the ladder of liberty built by decentralised power. On it, also, we must have balance between branches of Government at every level.

"Balance, diversity, creative difference—these are the elements on the Republican equation."

That 'equality' is conspicuous by its absence from this equation is not surprising in the context of the repeated accent on 'diversity,' almost in the sense of 'inequality,' in Mr. Goldwater's speech. His entire conservative credo, like the curate's egg, is good in parts, for the kind of stability sought within the framework of private property, *laissez faire*, decentralisation and fiscal orthodoxy, though logical and desirable in a way, may neither be wholly consistent with the Welfare State nor be easily attainable. If anything, the aggressive manner in which Mr. Goldwater, the conservative symbol, is appealing to the combative individualistic instincts of the American character and asking the people to rebel against the conditions of the present may have the unintended effect of undermining whatever stability there is. That perspicacious commentator, Mr. James Reston of *The New York Times*, seems to be right in saying that President Johnson's greater strength derives from the fact that he is appealing to the co-operative attitudes of the American character and asking not only his liberal supporters but his conservative opponents to conserve the comparative peace and prosperity they now enjoy. It is this formidable opponent that Mr. Goldwater has set out to beat. The entire civilised world has a vital stake in the outcome of the U.S. Presidential election. For, if Mr. Goldwater happens, by any chance, to be elected, it would mean that the American people oppose the reconciliation of the races and the allies, an honourable accommodation with the Soviet Union, and the continuation of that imaginative bi-partisan foreign aid programme.

EDUCATION COMMISSION

BY undertaking the long-delayed probe into education, the Government of India has fulfilled the most urgent need of the post-independence era. It has long been recognised that education has progressed by fits and starts in the last few years without anything like even the limited planning that has characterised the growth of our economy. This is particularly unfortunate because education is far more important than any other activity taken in isolation. And to deny it the consideration it deserves and, at the same time, to attempt to build the nation in other directions is bound to lead to lopsided development. Education is and ought to remain the basis on which the national superstructure incorporating every facet of national life must rest.

It is not as if the three Five-year Plans have not devoted any attention to education at all. But what one misses is the real spirit of adventure which alone can give education a meaning and a significance. A mere addition of a chapter or two on education to the reports on Five-year Plans cannot by any stretch of imagination be called a plan for the education of the people. In the final analysis, educational reconstruction implies a missionary zeal in the cause of raising peoples' mental and moral standards. And in so far as the educational sphere in this country has lacked men with the creative spirit in the post-independence era, it should be readily admitted that we have lost sight of the nation's primary need. It is, therefore, just as well that the Government has set no rigid limits of reference for the new Commission (Chairman: Dr. D. S. Kothari). The Commission's terms of reference are broadly conceived. The Government's resolution rightly insists that education is the most powerful instrument for social transformation and economic progress and that the attempt to create a new social order based on freedom,

equality and justice can only succeed if the traditional educational system is revolutionised in both content and extent. The chief aim in appointing this Commission, it is stated, is to survey and examine the entire field of education in order to realise, within the shortest possible period, a well-balanced, integrated and adequate system of national education capable of making a powerful contribution to all spheres of national life.

From this, it should be clear that the tasks ahead of the Commission are as intricate and complex as those the country faces on all its fronts—the human, the political, the social and the economic. It would do nobody any good to minimise the gravity of these problems. Few countries have had to face as many problems as India and also to face them at the same time. In the first place, there is need to weld the Indian people and communities into a closely-knit nation. It is the problem of the integration of a people torn asunder by religious, regional and caste prejudices. Secondly, there is need to inculcate in the people the spirit of democracy; this has to be done in a country which for long ages has never had much of a democratic tradition. Democracy will not be practised merely because the constitution prescribes it. It is a way of life, rooted in the respect by each individual for a point of view other than his own. Thirdly, there is need to inculcate a secular outlook among the people based on religious tolerance and, even more, on mutual respect for all religions. Finally, there is need to inculcate in the people the spirit of self-help, hard work and thrift which alone are the determinants of social and economic progress. Economic revolution is basically a human revolution. It implies a change in the attitude of the people towards work and savings.

It is true that the achievement of these tasks is a continuing process. At no point of time can the nation sit back and pretend that it has accomplished its tasks. The battle for national integration, for a democratic way of life and for changing people's attitude towards work must be continually waged. And yet, the fact is that we have so far done little on these fronts. Regional loyalties continue to clash with national loyalties. Caste prejudices continue to distort political elections. Religious intolerance continues to take its toll of innocent lives; as Dr. Radhakrishnan has said, we have "enough religion to hate one another but not enough religion to love one another."

It will be all to the good if the Kothari Commission succeeds in dispelling the notion that the mere spread of literacy constitutes the whole of education. It is essential that it should strive to drive home the point that the mere ability to read and write cannot enable a citizen to take an intelligent part in national reconstruction. Literacy is at best a key to unlock the treasures of knowledge. Unless men are taught to use the key to open the right treasures, it is a valueless tool in their possession. The Government of India, on its part, has done well to recognise that qualitative improvements in education have not kept pace with quantitative expansion. The dismal fact about the educational expansion is that nearly all our schools could only be described as "knowledge shops" where pupils barter money for undigestible scraps of information. Much of the student indiscipline in schools and colleges could be traced directly to the inadequate participation by students in the educational process.

All this needs to be changed. A new spirit of adventure must permeate all our programmes for educational reform. There must be a wider appreciation of the basic value of education which is best summed up in the words of the official resolution: that no improvement is likely to yield greater returns than investment in human resources, of which the most important component is education. Moreover, the nation must be prepared, if necessary, to go slow in other directions, so that the educational basis of our national life is strengthened. The official resolution has done well to declare that the nation must be prepared to pay for quality in education.

More specifically, educational reform implies the reconstruction of the curriculum and the adoption of better methods of teaching. There is urgent need to gear the curricular studies to reflect the changes taking place in science and technology and our knowledge of the outside world. Better methods of teaching in their turn imply not only the wider use of educational aids but also more trained teachers, better equipped not to teach their subjects but to inspire their pupils. The Commission's work will be judged not by what it recommends for changing the externals of education such as more and better buildings and more and better laboratories but by what it proposes for improving the content and methods of instruction in our schools and colleges. Its tasks are the nation's tasks and they pose a challenge and an opportunity as much for the Commission as for the nation.

COMMONWEALTH AID

BEFORE the Commonwealth Prime Ministers' Conference began its eight-day session at London on the 8th instant, some had expressed serious misgivings about its outcome. There were a few pessimists who had even forecast that the Conference would end in a fiasco. The forecast gained currency from reports which suggested wide disagreements on the situation in Southern Rhodesia and British Guiana. Indeed, there were talks of a possible walk-out by the African statesmen as a protest against the U.K. Government's stand on the issue. Happily, however, not only these fears were belied but the Conference actually turned out to be a great success. There is clear evidence of this success in the final *communique* issued at the conclusion of the Conference on Thursday last week. The *communique* reflects the spirit of understanding and purpose that permeated the discussions in the Conference and the broad agreement reached on certain vital issues of importance to the Commonwealth as a whole. The Conference recognised the need for seeking long-term solutions to some basic evils that contribute to racial and international conflicts. Among these solutions, particular stress was laid on (*a*) the patient building up of experience in mediation and conciliation and (*b*) improvement of the means for economic betterment. Well could the British Prime Minister, Sir Alec Douglas-Home, claim that, "for all those who have the interests of the Commonwealth at heart, this is a most encouraging meeting" especially when "one considers the diversity of interests, peoples and culture represented round the table."

Considering that the majority of the 18 Commonwealth countries are underdeveloped—the developed nations are only Australia, Britain, Canada and New Zealand—the problem of raising the living standards of the masses in these countries is naturally a basic concern of the Commonwealth. If this problem were not tackled, the Commonwealth would, as Mr. H. Alan Walker, Chairman of the Federation of Commonwealth Chambers of Commerce, aptly remarked recently, clearly be in danger of disintegration. It was, therefore, just as well that the London Conference emphasised the need of developing countries for improved and more remunerative outlets for their trade, increased financial aid on easier terms and on a continuing basis, and larger inflow of private investment. There was agreement on the importance for all Commonwealth countries of following up the work of the United Nations Conference on Trade and Development with regard to expanding international trade in primary products through freer access to markets and, in appropriate cases, through commodity agreements and stabilised prices at equitable levels; working out arrangements for increasing access by preferences or otherwise to markets in developed countries for manufactured goods from developing countries; and elaborating proposals for supplementary finance to assist countries whose development might be threatened by adverse movements in their export earnings. The Prime Ministers affirmed their intention of working for a solution of these and other problems of the developing countries through the new institutions resulting from the Conference as well as through existing international bodies such as the G.A.T.T.

No concrete plans envisaging much larger Commonwealth assistance for the rapid development of the poorer member-countries did, of course, emerge from the deliberations of the London Conference. And it is possible that the aid potential of the Commonwealth may be limited. But it would be wrong to belittle the contribution that the Commonwealth could make to the speedier economic growth of the developing countries. Indeed, the Commonwealth, as Mr. T. T. Krishnamachari, who attended the Conference since Mr. Lal Bahadur Shastri was ill, has potentialities for the future. Certain fields of action in which the practice of Commonwealth might be extended were selected in the Conference, thanks to the initiative taken by the British Prime Minister. One of the specific schemes proposed, in this connection, relates to the launching of "Commonwealth development projects" in individual countries by pooling together men, money, materials and technical expertise. The projects, it is said, can cover improvement of agricultural production, development of natural resources through extension services, training and research, enlargement of professional and technical training, development of new industries, and so forth. It is certainly gratifying that the British Government has assured a substantial contribution to such projects and that the other member-Governments have lent support to the proposal.

The objective behind the proposal is no doubt laudable, but the projects of the kind described above, if they are to succeed, will have to be planned carefully and thoroughly at every stage of execution. The London Conference did well, therefore, to underline the need for supplementing the present arrangements for promoting the study of the techniques of administration and development planning throughout the Commonwealth. The suggestion for forming a new institute to provide facilities for such study is certainly a valuable one and deserves due consideration. Meanwhile, the British Government's offer to step up its present capital assistance for higher education in the developing Commonwealth countries to an annual average of £5 million over the five years beginning from 1965-66 is commendable.

The health standards in practically all the developing countries are very poor. Efforts have no doubt been made, and continue to be made, to improve these standards. But the progress actually achieved has not been as encouraging as one would wish, due to the inadequate attention paid to the pooling of medical knowledge. Viewed thus, the decision taken in the Prime Ministers' Conference to convene a Commonwealth medical conference some time next year must be widely welcomed. Such a conference will surely enable the member-countries to discuss mutual assistance in medical education, including links between institutions, provision of ancillary staffs, development and planning of health services, supply of medical equipment, and facilities for research.

The links among the countries of the Commonwealth will be strengthened not only by co-operation among their Governments in the initiatives mentioned above but even more by frequent personal contacts among individuals who share common professional interests. This aspect found due recognition in the London Conference. The Prime Ministers recorded their support for the valuable work which the Commonwealth Parliamentary Association performs in bringing together members of the parliaments of all Commonwealth countries. The British Government stated that it would be prepared, if other Commonwealth Governments would do the same, to increase its contribution to the Association. The Prime Ministers considered that further steps should be taken to promote contacts in other fields and that it might be desirable to establish a Commonwealth Foundation to administer a fund for increasing interchanges among Commonwealth organisations in professional fields.

Along with a Commonwealth Foundation, it is proposed to set up a Commonwealth Secretariat which will, *inter alia*, disseminate factual information to all member-countries on matters of common concern, assist existing agencies (both official and non-official) in the promotion of Commonwealth links in all fields, and help co-ordinate preparations for the future meetings of Commonwealth heads of Governments and, where appropriate, for meetings of other Commonwealth Ministers. The significance of the proposed Secretariat is that it will provide some continuing machinery which will ensure a closer and more informed understanding among Governments on the many issues that engage their attention. Appropriately enough, this Secretariat is described as a visible symbol of the spirit of co-operation among the member-countries of the Commonwealth.

The sensible proposals that have emerged from the London Conference and the keen anxiety of Britain to help accelerate the tempo of economic progress in the developing countries (as expressed in the speeches of the various British Government spokesmen) engender optimism in one's mind regarding the future of the Commonwealth. With its population (about 730 million) accounting for nearly a quarter of the total world population, the Commonwealth is bound to make a unique contribution to the promotion of peaceful world development, provided the spirit of compromise demonstrated towards the end of the Prime Ministers' Conference, as Mr. Krishnamachari has rightly remarked, endures.

MARKET GOSSIP

Finance Ministry's Firm 'No'

IT looks as though the efforts of the Stock Exchange Presidents to get the margins on forward scrips relaxed have failed, at any rate for the present. The Union Finance Ministry, it is reported, has firmly said 'No' to the plea of these Presidents for relaxing the system of margins, especially the suggestion for abolishing the two per cent margin on carry-over business. Apparently the Ministry must have thought that any relaxation in margin rules, by reviving a speculative tendency in the market, may do more harm than good to genuine investors. It must have also felt that, once the margin is reduced, it would not be easy to restore the cut, if a change in the situation were to warrant such a step, without seriously upsetting the trend of the market. As for the argument that, in view of the curbs on forward trading resulting from margins, the market is not attracting genuine long-term investment, the Finance Ministry's answer seems to be this: Long-term investment cannot be influenced by margins, inasmuch as a broker buying for a long-term investor, as distinguished from a speculator, is not concerned with margins.

Whatever be the official explanation, it is rather difficult to deny that what is deterring the share markets from recovering is not the existence of margin system but the crushing burden of taxation, enactment of laws and imposition of restrictions. It is these factors that have reduced the attraction for investment in industrial securities and resulted in a diversion of investible funds to durable goods and commodities, thereby contributing to inflation. Drawing attention to this disquieting trend once again, the *Annual Market Review* (1963) of Messrs. Premchand Roychand and Sons of Bombay points out that, despite selective reductions in tax incidence on some key industries, the general impact of the 1964-65 budget has been depressing; the investing classes have been unnerved by the dividend tax, the tax on unrealised bonus shares, higher corporate taxes, and steep increases in estate duty and gifts tax. Describing the state of the capital market at present, the *Review* observes:

"There is little activity in the capital market. New issues get hardly any public response and, in recent flotations, the underwriters have been left with a very large proportion of each issue. It is difficult to guess how long this situation will last. It is obvious that, while the domestic capital market is in a depressed state, it is hardly likely that foreign investors would be attracted to set up joint ventures which require matching rupee resources. A fiscal policy which offers 'candy' to the foreign investor and wields the 'big stick' against the nationals of the country is bound to be looked at with grave misgivings by those to whom tax concessions are offered."

Comment on these observations is superfluous. The note of warning struck by the *Review* to the effect that enactment of laws and imposition of restrictions and taxes, which the Government is unable to administer, can only lead to progressive growth of anti-social elements in the country and to inflation and corruption, the two major enemies of any system of democratic socialism. The *Review* is quite right in saying that the crying need of the country at the moment is increased production in all spheres, particularly agriculture, and simplification or removal of many restrictions or regulations that are not enforceable and yet are retained in the statute book for purely ideological reasons. Political pressures on making any changes which appear to be in favour of the 'haves' are, of course, very strong, but, unless the reality of the situation is faced squarely, as the *Review* avers, there is little hope of increasing productivity and eliminating tax evasion, corruption and inflation.

Foreign Private Capital For Steel?

The new Union Minister for Steel and Mines, Mr. Sanjiva Reddy, is reported to be of the view that foreign capital could be associated with future steel development. His idea seems to be that this association could take the form of equity investment, provided foreign capital is willing to come in as a minority partner. As even such minority participation, if accepted, will represent a major shift in the Government's policy regarding steel, the Minister has taken the precaution of adding that the idea represents only his personal view. But there is reason to believe that rethinking on the erstwhile policy had started in the Ministry even before Mr. Reddy took over from Mr. C. Subramaniam. In fact, the former Minister for Steel did, at one stage, welcome private foreign aid in some form or other for the Bokaro Project which the U.S. Government finally declined to finance. And, before he moved over to the Food and Agriculture Ministry, Mr. Subramaniam was actually considering how best India could utilise the aid that a private Anglo-American consortium had proposed to arrange for the Bokaro Project before the Soviet Union moved in with its offer to build it.

This Anglo-American consortium is now stated to have conveyed its continuing interest in building any new steel project. But the Government has yet to take firm decisions on the number of new steel plants to be taken up during the fourth Plan period and their possible locations. Incidentally, the locations under consideration are Goa-Hospet, Visakhapatnam-Bailadilla and Salem-Neyveli. If joint ventures on the lines of the Cochin Refinery Project and other proposed refineries are under contemplation for a couple of steel projects, too, and if American, British or German firms are willing to take a minority share in them, there is every possibility that the heavy foreign exchange requirements (estimated at more than Rs. 500 crores) of steel expansion in the fourth Plan will be more easily, albeit partially, met. It is to be hoped that the desirable shift in policy for associating foreign private capital will come about soon in the form of a Cabinet decision.

I.I.S.Co., Too, Raises Dividend

The shareholders of the Indian Iron and Steel Co., Ltd. must have felt quite gratified at the highly encouraging working results of the Company for the year ended March 1964, though they may be somewhat disappointed at the small increase in dividend (subject to tax) from 16 per cent to 17 per cent; even this increase is to be by way of a cash bonus of one per cent. The total dividend absorption will be higher by Rs. 19.90 lakhs at Rs. 2.19 crores. The disappointment is apparently because the rise in dividend is not commensurate with the substantial improvement in gross profit (after providing for Managing Agents' commission) which for the year under review stands at the all-time peak level of Rs. 15.91 crores, representing a rise of as much as Rs. 3.39 crores as compared with the profit for 1962-63. But a large part of the improvement in gross profit has been taken up by markedly higher provision for depreciation (Rs. 4.40 crores, as against Rs. 3.40 crores) and enhanced tax provision (Rs. 3.87 crores, as against Rs. 3.56 crores). It is true that, even after these higher provisions, the net profit has gone up by Rs. 2.08 crores to Rs. 7.64 crores. But it would appear that the Directors, instead of deciding to pay a much higher dividend than what they have proposed, have considered it prudent to utilise a sizable part of the net profit to strengthen the ploughback profit, the addition to reserves having been raised to Rs. 5.35 crores from Rs. 3.64 crores.

The substantial improvement in the gross profit of the Company has followed the distinct rise in the production and despatches of steel. The total quantity of saleable steel actually produced in 1963-64 was 810,000 metric tonnes, as against 795,000 tonnes in the previous year, and the quantity despatched amounted to 815,000 tonnes, as against 798,000 tonnes.

Engineering Exports

At the meeting of the Engineering Export Promotion Council the other day at Calcutta, the export outlook was discussed with particular anxiety in the context of two persistent factors, namely, rising prices and chronic shortages of raw materials. The first factor, it was pointed out by Mr. S. L. Kirloskar, Chairman of the Council, was upsetting cost stability and thus coming in the way of export continuity. He emphasised, in this connection, the point that exporters, after all, executed orders on forward contract. Secondly, shortages of power, iron and steel, coke, non-ferrous metals and other raw materials have become chronic, hampering production, economic expansion and thus cost reduction.

It is no wonder, therefore, that engineering industries could export only Rs. 13 crores worth of goods in 1963-64, although they were assigned an export target of Rs. 25 crores for that year. Of course, in the current year (that is, 1964-65), despite the expected fall in exports of electric fans and sewing machines due to the four-month strike in the Jay Engineering factories, the export earnings as a whole are likely to be of the order of Rs. 18 crores. Good though this export performance will be, it will not be much to boast of in the context of even the present level of production and export potentialities. If this performance is to be bettered in the coming years, the engineering industries should not only diversify their production for export but also develop service links with the engineering industries abroad. Such links, it will be recalled, were recommended by the Council's Trade Delegation to Western Europe and the U.K. in 1963. No progress in this direction seems to have been made so far, although it has been recognised that, without developing service contacts with big firms in Europe, it would be difficult for Indian engineering units to modernise themselves and to upgrade their own services.

As far as export promotion is concerned, much will depend on how imaginatively the Government's revolving scheme for foreign exchange (announced in May 1963) in respect of exports of non-traditional items like engineering goods and chemicals is worked in actual practice. The object of this scheme, incidentally, is to provide foreign exchange facilities to manufacturers/exporters for the import of raw materials, components and spares required by them for the production of goods for exports. According to the details of the scheme now available, the Export Credit and Guarantee Corporation will function as the co-ordinating agency, through which banks will have to route applications on behalf of their clients for import licences against lines of credit in foreign exchange raised by them abroad. The E.C.G.C. will bring up these cases before a screening committee consisting of representatives of the Ministries of International Trade and Finance, the Reserve Bank of India, the Chief Controller of Imports and Exports and the D.G.T.D. On the basis of the recommendations of this committee, an import licence will be granted to the sponsored exporter for the requisite raw materials, components and spares. The exporters will be required to execute a bond undertaking to effect specified exports within a stipulated period, and the import licence will be issued only for the value of raw materials and components permissible under the appropriate export promotion scheme and required for the production of goods to be exported. Whether this scheme is being worked imaginatively and to good purpose is in some doubt, for Mr. Kirloskar has referred to the recent reduction in drawbacks and import entitlements and the general inadequacy of promotional incentives in a rather critical vein.

But the situation is not without some heartening features. One of these is that much of the foreign investments in India have been used for the expansion and diversification of the country's engineering capacity. Another is that the economies of scale are being increasingly recognised for purposes of expansion, although it is difficult to say how far implementation is in accord with that recognition. Yet another is that foreign know-how is becoming available, albeit slowly, through collaboration, and this augurs well for product diversification, technical upgrading and export performance. But all these will not be of much avail, if shortfalls in the production targets set for mild steel, pig iron and special steels slow down the rate of growth—growth of current production as well as of expansion of processing capacity. In sum, the growth of engineering industries will be primarily determined by the growth of iron and steel industry and, to a considerable extent, of non-ferrous metals industry.

Monopolies Commission

The recently-appointed Monopolies Inquiry Commission, it will be recalled, has been asked to probe into (1) the extent and effect of concentration of economic power in private hands and the prevalence of monopolistic and restrictive practices in important sectors of economic activity other than agriculture, (2) the new legislative measures that could be introduced to prevent malpractices and (3) any other matter bearing on the functioning of the private sector and financial institutions. The terms of reference themselves have come in for comment in industrial and commercial circles. The Bharat Chamber of Commerce of Calcutta, for instance, has just formulated its views on the subject and submitted a memorandum to the Commission. In the note, the Chamber has urged the Commission to study the problem of growth of monopolies in the country objectively and not be biassed by any ideological considerations. For the Chamber feels that the concepts "concentration", "monopolistic and restrictive practices," etc., would need to be defined precisely before any concrete diagnosis of the malady is made.

In an effort to prove that the scope of the enquiry is very limited, the Chamber refers to the Central Statistical Organisations' estimates of national income for 1962-63 and adds that the contribution of the chief sectors other than agriculture to the national income are mining, manufacturing and small enterprises 20.1 per cent; commerce, transport and communications 17.0 per cent and other services 18.1 per cent. As regards commerce and transport, the entire pattern of development is in the nascent stages and the Government, through various institutions like the State Trading Corporation, is guiding it. In the first category, small enterprises account for 7.8 per cent. Hence mining and manufacturing business constitutes only 12.3 per cent of the national income. Even in this category, the Government has set up its own projects and thus further limited the scope of possible findings. The share of the corporate sector as a whole is only 10-11 per cent of the national income, and that of the large-sized firms a meagre 4 per cent. Considering the small periphery of this growth sector, the Chamber feels that the imperative need is to prop up the economy and not to scan the nascent segments of development.

The memorandum then deals with the extent of concentration of economic power in the country. It points out that the concentration ratio in India during the period 1953-54 to 1956-57 has been only 0.34 as against West Germany's 0.45, Ceylon's 0.42 and U.S.A.'s 0.35. According to the Chamber, there has been some apparent confusion in regard to the emergence of administrative control in groups for certain advantages in the early phases of the economy; this control has been mistaken for "concentration of power." Similarly, the note indicates the broad-based character of shareholdings in companies and adds that the trend is towards expansion of ownership and not concentration. It further states that a mere growth in the size of private companies does not lead to a monopoly condition. The fall in the value of the rupee and the increased requirements of capital are mainly responsible for the increase in the capital-size of private companies. Hence the note suggests that the "overall" dimension of growth within specific ranges has possibly created a misapprehension in regard to monopoly or economic concentration.

Coming to the legislative and other measures, the Chamber, in its memorandum, sounds a note of warning to the Commission that any fresh statutes and controls would only result in "drying up" the already scarce entrepreneurial element in the country. For it feels that there is already a plethora of legal measures to prevent the emergence of monopoly or concentration like the Industrial (Development and Regulation) Act, the Capital Issues Control Act and the Companies Act. In fact, the Chamber fails to visualise what further scope is left to legislate upon when the industrial structure is already saddled by controls from head to foot.

As regards the third item of reference, namely, any other matter bearing on the working of the private sector, the Chamber has suggested that the Commission should study and assess the sectoral pattern of development in the country. It has felt that a proper balance should be struck between heavy industries and consumer goods industries and between the public and private sectors. With the incentive to work and save at a low ebb among the entrepreneurs owing to excessive taxation of income, the need for an objective study of the tax structure is felt imperative. Any scheme of broad-basing the economy must provide for a downward revision of direct taxes on the individuals to encourage savings and investment in venture capital.

TREND OF SHARES

DOWNWARD DRIFT

(From Our Own Correspondent)

BOMBAY, *23rd July*

IT was another week of irregular price movements under alternate spells of bull liquidation and short-covering, together with scattered replacement buying with a tendency for the market to drift downwards at the close. As compared with last week, the price pattern was a mixed one, but the list showed generally good to moderate losses over the week. The sentiment of operators was adversely affected by the reported decision of the Government of India not to permit any relaxation of restrictions on the margin system. In particular, the Government was said to have rejected outright the plea for abolishing the 2 per cent margin on carryover business.

Among market leaders, Tata Steel eased from Rs. 155.75 to Rs. 154 this week and Indian Iron was placed fractionally down at Rs. 25.40, as against Rs. 25.50. Century was down from Rs. 603 to Rs. 600 and Standard from Rs. 638 to Rs. 626. National Rayon was another weak counter which was marked down to Rs. 358 from Rs. 368.50 last week, and so was Telco from Rs. 293 to Rs. 286.50. Scindia was also weak at Rs. 15.44, as against Rs. 15.72.

Sentiment on Thursday, when equities suffered a sharp recession, was induced mainly by reports that the public sector units had been directed to revise their banking arrangements which in effect means that they should do their banking with the State Bank of India and its subsidiaries. Besides public sector units, the Government is also understood to have made this directive applicable to local bodies in the Centrally-administered territories, statutory authorities and Government corporations. It is true that some of these institutions are transacting their business already with the State Bank, but the latest directive means that, hereafter, the State Bank will completely dominate the scene reducing the role of private banking to naught. Thursday's trading did suggest that the market had understood the implications of this order and thoughtful operators were of the opinion that the move was bound to have far-reaching repercussions on the private banking and industrial sectors.

The picture presented by the market suggests, on the whole, that the consolidation process is still on and technical analysts point out that this will take some time yet to be completed. The market is yet unable to sustain its rallies and analysts do not, therefore, foresee any big upward move in the near future. The latest directive to corporations and public sector units could be a strong bear factor and, if the market were to pick it up in its full measure, as a declining market ought to, prices might drift further next week. However, it would be interesting to wait and see whether any equally strong bull factor presents itself in the meantime.

A notable factor this week was the spurt in automobile shares following the excellent interim report put up by Premier Auto. The substantial rise in the turnover of the Company has raised hopes that it might return to the dividend list. The shares were bid up to Rs. 103.25, though they reacted later to close at Rs. 101.50. The firmness in these shares induced support to Hindustan Motors which were bid up to Rs. 18.36, before finishing at Rs. 18.16. That Calcutta was a consistent supporter of these shares was taken as a significant point.

But insurance shares were a depressing feature. The general withdrawal of support to these was based on fears that business on public sector and allied account might pass on sooner or later to the Life Insurance Corporation which has started underwriting general insurance. Market people comment that, one fine morning, they may wake up to find the Government having ordered its organisations to put their fire and other general business only with the State-owned organisation. Currently very little trading in insurance shares is passing on the Stock Exchange with New India hovering around Rs. 45.75.

In the face of uncertainties before cotton textiles, the easiness in this section is not hard to understand. The Government seems to be determined in its mind to keep controls as well as the system of price stamping and would have the trade suggest ways and means of successful implementation of controls. The additional problem for companies like Century and National Rayon is that of rayon yarn prices. The market is very dull at present, but investors are not prepared to throw away their textile shares, though the position at present is not, after all, quite encouraging.

Another depressing counter this week was Permanent Magnets which were quoted below par. Some distress selling induced by the feeling that dividends were still a long way off was reported. Dhrangadhra has come out with excellent results. There is a 50 per cent rise in gross profit and the dividend has been stepped up by 2 per cent to 10 per cent. Current year's prospects are considered to be even better. Polychem has pleased its shareholders by issuing three bonus shares for every seven held, besides maintaining the dividend. The issue is to be made from out of the share premium and is subject to the sanction of the Controller of Capital Issues.

Among other popular counters, Tata Chemicals closed the week on a slightly better note, though the quotation was sizably down on the week before last. Voltas was quiet at Rs. 251, while A.C.C. maintained a steady tone at Rs. 152.25.

Delivery figures released by the Stock Exchange for the 23th July clearing showed a sizable rise from 503,622 to 814,111 in the number of shares.

This obviously induced a hesitant trend. At the close of the week, cash shares remained quiet except for shares like Dhrangadhra and Star Textiles which attracted investors' attention. Miscellaneous and engineering shares were a shade easy on disinvestment.

* * * *

At the time of writing, Calcutta was devoid of active interest. Operators were reluctant for fresh commitments in the absence of incentives. Motor shares attracted profit-taking while Textile Machinery and Guest, Keen were active. Trading in coal shares was selective, while in teas. Brooke Bond, Darjeeling and Patrakola were among those that were active. Paper shares were steady.

* * * *

In Madras, plantings attracted attention, but business was confined to selected counters. Mettur Chemicals attracted attention whereas textile shares were generally dull. Bank shares were neglected and interest in Sugar shares was scattered.

DHRANGADHRA CHEMICAL PAYS MORE

The Directors of the Dhrangadhra Chemical Works Ltd., have proposed a higher dividend of 10 per cent (subject to tax) for the year ended March 1964, as compared with the 8 per cent distributed in the previous year. The rise in dividend has been rendered possible by the notable expansion in the gross profit earned by the Company which for the year is Rs. 131.8 lakhs, as against Rs. 90.3 lakhs for 1962-63. The profit would, indeed, have been much higher but for the production loss in the caustic soda plant due to breakdown and trippings, as well as frequent power restrictions and shut-offs imposed by the Madras State Electricity Board. The quantity of caustic soda actually produced in 1963-64 was about 34,500 tonnes, as against 27,000 tonnes in 1962-63. The improvement in production has been accompanied by a corresponding increase in sales from Rs. 4.34 crores to Rs. 4.94 crores.

Provisions for depreciation and managing agency commission are, of course, higher, the former by Rs. 19.91 lakhs at Rs. 54.61 lakhs and the latter by Rs. 1.94 lakh at Rs. 3.93 lakhs. Even so, the net profit is substantially higher at Rs. 77.41 lakhs, as against Rs. 55.47 lakhs. A large part (Rs. 40.00 lakhs, as against Rs. 1.06 lakh in 1962-63) of the profit has been set apart as development rebate reserve, while transfer to general reserves has been reduced from Rs. 46 lakhs to Rs. 23 lakhs.

The working results of the company for the current year (1964-65) are expected to be much better. The production of caustic soda, according to Mr. P. C. Jain, a Director of the Company, is likely to rise to 42,000 tonnes and sales to Rs. 5.75 crores, as compared with 34,500 tonnes and Rs. 4.94 crores, respectively, in 1963-64. The programme of expanding the installed capacity of the caustic soda plant from 80 tonnes to 140 tonnes a day was completed during 1963-64 and it is proposed to raise the capacity by another 40 tonnes. Meanwhile, the Company has applied for an industrial licence to put up another caustic soda plant with a daily capacity of 300 tonnes. This plant is estimated to entail a capital outlay of about Rs. 10-12 crores, half of which will represent foreign exchange component. The Company's scheme for putting up the liquid chlorine plant made further progress during the year. A letter of credit under yen credit from Japan has been opened and the deliveries of plant and machinery cover a period of 10 to 16 months. This plant is expected to go into production by the end of next year.

MYSORE ELECTRO CHEMICAL WORKS LTD.

The Mysore Electro Chemical Works Ltd., Bangalore, manufacturers of automotive batteries, heavy duty tractors, stationery, aircraft, motor cycle and scooter batteries, has proposed to increase its paid-up capital by Rs. 25 lakhs in order to finance its expansion programme. Of this total, a sum of Rs. 10 lakhs has been reserved for subscription by the directors and their friends and Rs. 5 lakhs (in preference shares) will be subscribed by the Company's West German collaborators (Messrs. Accumulatorenfabrik Sonnenschein). The balance of Rs. 10 lakhs will be offered for public subscription. The entire public issue is being underwritten by the Industrial Finance Corporation of India. The Mysore State F nancial Corporation has sanctioned a loan of Rs. 14.30 lakhs for completion of the expansion programme. Besides batteries, the Company will manufacture special types of batteries for electronic flashes and other electronic equipment and transistorised units. The Company has secured the approval of the Central Government for collaboration arrangement with Messrs. Semperit of Austria for the manufacture of hard rubber containers for batteries and permission for the import of capital goods worth Rs. 12 lakhs.

MAJOR CONTRACTS FOR SIMON-CARVES

The Simon-Carves India Ltd. has secured four important contracts valued at approximately Rs. 3.75 crores. Three of these are in the public sector for the alloy steels plant of Hindustan Steel Limited and one in the private sector for Cominco Binani Zinc Ltd. The work comprises the complete water supply system and the distribution systems for coke oven gas, compressed air, fuel oil, steam, oxygen, acetylene and argon for the alloy steels plant. A zinc refinery, together with the associated sulphuric acid plant for Cominco Binani Zinc Ltd., is to be constructed under the supervision of the well known Canadian firm. Consolidated M'ning and Smelting Company of Canada Ltd. of Trail.

RUMANIAN - MADE REFRIGERATING EQUIPMENT

REFRIGERATING COMPRESSORS with ammonia, methyl chloride or freon from 3000 to 6000,000 kcal/h.

COMPLETE REFRIGERATING PLANTS for refrigerating stores of any capacity and purposes.

—food industry
—chemical industry
—slaughter-houses, etc.

—Factories producing ice in blocks or small-sized (crushed) with a capacity of 3 to 100 tons in 24 hours
Up-to-date construction, safe operation.

COMMUNITY DEVELOPMENT

IN sheer quantitative terms, the official claim that in a "brief" period of 12 years the whole country has been covered by extension services, and a major part of it by popular institutions like *panchayats* and co-operatives, is no doubt very impressive. But, in terms of physical achievement and quality of performance, has this rural reconstruction movement come up to expectations? The Union Minister for Community Development and Co-operation, Mr. S. K. Dey, who addressed the Annual Conference on Community Development and *Panchayati Raj* at New Delhi this week, has not, of course, answered the question in a direct manner. But it is possible to infer indirectly from his address that Community Development, as of today, is not what it could be and should be. It is indeed distressing, in this connection, to hear from Mr. Dey that "there is need also for an integrated approach to the problem of mobilising the (rural) people and getting them properly oriented for the task of maximum production." One will be justified in asking why such an "integrated approach," which was always thought of as an integral feature of the very conception of Community Development, has not been much in evidence all along.

Another candid admission by Mr. Dey is that, although agriculture is the main occupation of rural people and rural industrialisation could flow only from the growth of agriculture, much remains to be done in bringing it into focus so far as the Community Development programme is concerned. So, the impartation of an agricultural bias to community development is still marking time. Why this is so it is not difficult to infer. The admitted absence of co-ordination between community development and co-operation at the village, block and district levels, as also the lack of co-ordination between the Agriculture Department and the C. D. agency, seems to have been largely responsible for the failure to make community development agriculture-oriented. The Union Minister's further admission that joint farming has not made progress is, of course, not surprising. But, in the context of the proposed agricultural orientation to community development, it would be a good thing to bring the smallholders, who are now patently unwilling to pool their lands for joint farming, more fully and actively into service co-operatives. Incidentally, Mr. Dey's idea, also endorsed by Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, that landholders could possibly be persuaded to pool all their resources, except land, in a kind of co-operative farming may be less objectionable if he has not sought to make out that it "could be an intermediate stage in joint farming." The idea may be acceptable to the large body of smallholders only if it strictly connotes co-operative endeavour for betterment farming, well-irrigation and, if possible, joint utilisation of bullocks and implements at the time of ploughing alone. In any case, as this idea of *limited* co-operative farming was originally canvassed by the Ford Foundation's Agricultural Team, its revival at the present time is significant in the context of the proposed extension of the package programme (partly aided by the Ford Foundation) and the American offer of aid for "the second stage in India's rural development."

PLANNING AND PRICE POLICIES

A lower voice for the Planning Commission and more power to the elbow of the executive ministries and the State Governments: this seems to be an immediate objective of the reorientation operations just begun by the Prime Minister, Mr. Lal Bahadur Shastri. The Planning Commission is stated to have been forcefully told by the new chief executive that it will have to confine itself to formulating general programmes rather than get itself bogged down into details and controversies. In other words, the Planning Commission should progressively get itself less and less involved in the fortunes of individual projects. The Prime Minister is keen to see the evolution of a short-term strategy which will be effective in buoying up essential sectors like agriculture and also in improving the opportunities for increased employment. Unless there is substantial improvement in the fortunes on the food front in the last two years of the current Plan, the next Plan will have to be of much smaller size than what the perspective experts have envisaged.

In the next few weeks—before the meeting of the National Development Council now expected in August—a series of working groups' reports on various sectors will be ready. These reports will be dealt with speedily by the Planning Commission and a clear picture of possibilities and perspectives for the fourth Plan painted for the N.D.C. meeting. The image of planned progress to be presented may not be in the shape of too many heavy projects but through steps for expansion of agricultural production and control of prices. Incidentally, the primary task which Mr. Shastri has assigned for the administration is, no doubt, the evolution of a national price policy; there was considerable groping about during the meeting of State Chief Ministers. But any firm administrative measure has to await the flow of grains after the harvests and the assurance of continued supplies over the next few years from the United States.

ALCOHOL INDUSTRY

For two important reasons, the need for maintaining a high level of alcohol production assumes significance. In the first place, the demand for vital items, such as synthetic rubber, polystyrene, organic chemicals and solvents produced from alcohol has gone up quite markedly in recent years, a trend that is bound to gather momentum in the accelerated tempo of industrial development under the fourth and fifth Plans. Secondly, increase in alcohol output means the profitable utilisation of molasses, a by-product of sugar industry which would otherwise go waste. Viewed thus, it is unfortunate that a large part of the alcohol industry's installed capacity continues to remain idle for want of regular and adequate supply of molasses, thanks to the distinct setback in sugar production.

While the alcohol industry has thus unused capacity, the Government has been obliged to permit imports in order to meet the sharp rise in the industrial usage of alcohol. This situation, as Mr. Humayum Kabir, Union Minister for Petroleum and Chemicals, stated, while inaugurating the twentieth annual general meeting of the All-India Distillers' Association last week-end, is an anomaly. Such an anomalous situation cannot be allowed to persist for long, but much will depend on the trend of sugar production which, in turn, will be influenced by the official sugar policy. We wish Mr. Kabir's hope that, with larger sugar output in the 1964-65 and 1965-66 seasons the production of alcohol will again catch up with demand, will prove correct. Meanwhile, the Government of India has done well in imposing a virtual ban on exports of both molasses and alcohol.

The alcohol industry has reason to feel gratified at the sympathetic and helpful attitude displayed by Mr. Kabir. There was, for instance the welcome assurance in Mr. Kabir's speech that the Government would be prepared to give every consideration to the industry's plea for a higher price to alcohol, though he qualified the assurance by the proviso "short of putting a premium on inefficiency when fixing or reviewing the price structure of ethyl alcohol." In this connection, the Minister revealed that a further study of the factors affecting the cost of production was being undertaken and that the Government would consider appropriate action in the light of this study. As for some of the other factors which influence the production cost of distilleries, Mr. Kabir felt that the octroi and other charges on molasses as mentioned by the President of the Association were high and observed: "I am aware that several States have still not agreed to forgo the excise establishment charges on distilleries. To the extent that these additional charges reflect on production costs, I can appreciate that there may be a case for adjustments in the selling prices of alcohol." The speech of Mr. Kabir also contained the following assurances:

> The Government of India has already discussed the matter with State Governments and arranged for suitable adjustments in the production and distribution of alcohol, so that the increasing demand for this basic chemical is met to the maximum possible extent.
>
> Any specific suggestion from the Association for the planning of production and distribution of alcohol from different units would be welcome and will be examined sympathetically by the Government technical officers.
>
> No production from distilleries in any region will remain unutilised; if some consumers have failed to lift earmarked quantities, these will be diverted without delay elsewhere. The U.P. Government has agreed to release another 2.35 million gallons for users outside the State and this should to some extent help the industry.
>
> As for revision of excise regulations and streamlining of administrative procedure, this matter will surely be looked into by the State Governments which are primarily concerned with control of distilleries. Several useful suggestions and principles have been laid down by the Government of India's Alcohol Committee and these can certainly form the basis for simplifying excise procedures which govern the production and use of alcohol under modern conditions.
>
> The problems faced by distilleries producing potable alcohol are largely a matter for State Governments and they will surely look into the matter keeping in view the overall national objectives.

These assurances are quite welcome, but a heavy responsibility rests on the alcohol industry itself. One of the most important problems which the industry has to face relates to attainment of maximum efficiency of operation. Mr. Kabir did well to emphasise this aspect which is especially important, considering that alcohol from molasses will have to remain a competitive raw material *vis-a-vis* petro-chemical production. Characterising this as a new challenge, Mr. Kabir rightly pointed out that efficiency and cost-consciousness should be the guiding principles, if the industry was to compete with the new petro-chemical technology that was fast taking shape. It was, indeed, a timely and wholesome advice that he gave when he asked the Distillers' Association to organise, besides arranging technical meetings or symposia at frequent intervals, active technical assistance in appropriate cases where some members are unable to operate at reasonable levels of efficiency. Equally timely and wholesome was his advice that the Association might also enrol consumers of alcohol as members or associate members. Such a move will doubtless help develop closer co-operation between the producers and consumers of alcohol.

TOURIST TRADE

A certain gap between precept and practice is clearly evident in the field of tourism, the fifth biggest earner of foreign exchange for this country. Though the year 1963 has registered an all-time record in tourist traffic to India, representing an increase of about five per cent over the previous year in the number of tourists, it is painful to observe that the earnings from this source have not been able to cross the figure of Rs. 20 crores. This is all the more deplorable, when viewed against the booming tourist trade throughout the world. The fact that, as against India's meagre earnings, Austria garnered Rs. 136 crores, Italy Rs. 400 crores and Spain Rs. 210 crores during the last year is telling in this connection. It may be that there is some leakage of foreign exchange, for, although the number of tourists per year has gone up by 75 per cent since 1957, the earnings have increased by only 15 per cent. Even after making allowance for this leakage (which, incidentally, needs to be plugged by the Reserve Bank of India), one will find the annual earnings from tourism to be relatively meagre.

It would be no exaggeration to say that tourist industry has been the Cinderella of our economic planning. The allocation made for the development of tourism in India during the third Plan is just Rs. 8 crores (Rs. 3.5 crores at the Centre and Rs. 4.5 crores in the States) which can only be regarded as too meagre in relation to the importance of the industry. Superimposed on this meagre allocation is the lack of initiative and enterprise on the part of the bureaucracy, for it has not been possible for the Central Tourist Department to spend even half of the allotted amount for the promotion of tourism. During the first three years of the current Plan, the total expenditure by the Centre was only Rs. 84 lakhs. Although the relevant data are not available for the States, their performance during the period could not have been better than this.

It is against this depressing background of performance in the field of tourism that the deliberations at the meeting of the Tourist Development Council at Srinagar last week should be viewed. The Council, incidentally, has taken a welcome decision to set up two corporations to undertake commercial enterprises in the field of tourism. One corporation will build hotels and the other will take up the responsibility of organising special transport services, produce and distribute tourist publicity material and make arrangements to entertain tourists. An allocation of Rs. 50 crores has also been proposed for the development of tourism during the fourth Plan period. All these proposals, which are a sequel to the recommendations of the Jha Committee on tourism, are indicative of the recognition that is being accorded to the industry. Better late than never.

India has been described by some as a sleeping giant insofar as the tourist industry is concerned. True, it has been emphasised at the Council meeting that efforts should be made to develop new tourist resorts. But it will be appropriate to state, in this context, that the immediate need is not so much for opening new tourist resorts as for providing more facilities to tourists on the existing tourist spots. It is not because of the lack of excellent tourist centres that we are not able to compete with other countries in tourist trade but because of the lack of decent hotel accommodation at moderate rates and the absence of proper transport facilities. Underdeveloped as this country is, there is no need to provide luxury standards comparable to those of Tokyo, Hong Kong, Rome, Paris or Washington. What an average tourist expects are liberalisation of travel rules, decent hotel accommodation and reasonably good entertainment, food, automobiles and roads. But judging from the present standards, the country is far behind this desirable and feasible objective.

It is, however, heartening to find from the latest report of the Union Ministry of Transport that the Jha Committee's recommendations regarding simplification of procedures, opening new tourist offices, etc. have been recently brought into practice. According to the report, the Government has decided that landing permits for a period of 72 hours should be issued liberally and speedily to tourists who arrive without visas for any reason. It has also been decided that, if applicants for Indian visas hold return/onward tickets, bank guarantees should not be insisted upon. The monetary limit on travel souvenirs purchased in other countries and imported by tourists has been raised from Rs. 250 to Rs. 500. Travel souvenirs purchased in India (excluding certain prohibited articles) can now be taken out by tourists without any monetary limit or export control formalities. Above all, tourists will also be able to get liquor permits quickly and early. These liberalisation measures, it need hardly be added, are in the right direction.

A STRATEGY FOR BIRTH CONTROL

Population explosion, as Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, so aptly described it in his inaugural address at the Conference of Honorary Family Planning Education Leaders held at New Delhi on the 17th instant, is the "enemy within the gate." "Like a thief in the night," he continued, "population growth can rob us of all that we achieve, day after day, in economic growth." And he also grimly warned: "If unchecked population continues with the death rate declining, as it will, we cannot escape social explosions, political upheavals and the re-assertion of Malthusian checks. The terrible years of 1891-1921 are not necessarily over; they can recur with renewed vengeance." If such calamities are not to happen, a determined war against population growth, in his view, will have to be waged and won. Incidentally, the "objective-oriented and time-bound" war-like strategy indicated by him has the laudable aim of halving the birth rate over the next decade.

It is good to find that Mr. Mehta is thus importing into his campaign for population control not a little missionary fervour and that he is of the emphatic view that family planning efforts should not be restricted by financial considerations. His call for greater effort is particularly timely, for even the modest expenditure target of Rs. 27 crores under the third Plan's family planning programme remains 70 per cent unfulfilled after three years. As the present scale of the programme (covering family planning clinics, sterilisation operations, production and use of contraceptives, etc.), according to his own admission, "appears pitiful," few can disagree with his plea for reactivating it with a sense of urgency. But the question is whether the mass-scale male sterilisation advocated by Mr. Mehta would be a feasible proposition in the immediate future, considering the voluntary character of family planning and the irreversible character of surgical operations. So long as an individual is free to choose one of several methods of birth control and the claim that restoration operations are possible in view of the advance in surgical techniques lacks substantiation, the optimism displayed by Mr. Mehta in the following observations of his may seem to be rather excessive:

> "While ideally it would be wise to be discriminatory, in practice, if we are to achieve results with a sense of urgency, or on a 'war-footing,' is it not time to tell the State Governments to 'go ahead' with their schemes and plans for mass-scale vasectomy operations? It may not be possible to reach 2.5 million operations straightaway, but half a million to a million operations a year are possible almost immediately."

But Mr. Mehta's optimism, in fact, is of a restrained character in comparison with that of the family planning education leaders who have urged, in their New Delhi Conference, 100 per cent governmental assistance for achieving a 2.5-million sterilisation target per year. There can, however, be no two opinions on their finding that "sterilisation is the immediate method of putting an effective check on the birth rate," provided, of course, 2.5 million people come forward *voluntarily* every year for such sterilisation. If they don't what is to be done? It is in this context that two other methods suggested by the New Delhi Conference may have to be given simultaneous attention. Possible legal permission for abortion after three children, provided it is followed by the sterilisation of either the male or the female, is one of them. The other is encouragement for the widespread use of intra-uterine device. Given mass manufacture of standardised and reliable rubber contraceptives and, if possible, chemical contraceptives, it may be possible to make up for any partial failure in the sterilisation programme. If, at the same time, the fourth Plan provides for Rs. 101 crores (besides the outlay on the likely public-sector project for the manufacture of contraceptives) for the family planning programme in pursuance of the relevant working group's recommendation, the campaign for population control is bound to gather momentum in the not-too-distant future. It is only a combination of several methods, along with the ready availability of facilities for adopting them, that will ensure freedom of choice for individuals and thereby reinforce the democratic and voluntary character of family planning.

CHANGING THE INTELLECTUAL DIET

PROBLEMS OF EXPANSION IN EDUCATION

From Our Special Correspondent

NEW DELHI, 21st *July*

SIR Charles Snow's thesis on the conflict of cultures may become relevant to India only after the country has reached the take-off stage with an educational system geared to technological speeds. Macaulay's concept of tutoring the native to become a penpusher was resented by later-day nationalists; but hitherto the Macaulay concept has perhaps merely been promoted with some finesse to produce penpushing snobs of higher-level administrators who continue to retain the commanding jobs, causing widespread frustration among the technically qualified emerging class. The country has far to go before falling in line with the modern concept of Bertrand Russell who says that, while the classics man was considered well-educated in medieval and pre-industrial revolution Europe, the "modern educated person" is one who has knowledge of mathematics, physics, chemistry, biology, etc.

Both in the administration and in education, the rearrangement of patterns has lagged behind industrial and economic development programmes. Earlier Education Commissions and Committees, although headed by men distinguished in the academic field, probably exhibited a philosophical approach rather than technological. The Commission, which has now been appointed to suggest reforms to cover all aspects of the problem, is science-oriented in its terms of reference and is headed by a scientist. Dr. D. S. Kothari was reluctant to accept a Ministerial post in the Centre—reportedly offered to him some weeks ago—but agreed to head the Commission. Among the foreign experts to be associated with the Commission, three are representative of the modern intellectual class—Professor Blackett, eminent physicist, Sir Willis Jackson, electrical engineering professor and Dr. Fredrick Seitz, President of the U.S. National Academy of Sciences.

For some time past, the Prime Minister, Mr. Lal Bahadur Shastri, has taken an interest in the problems of science education; educational backwardness is an acute problem in his home State of Uttar Pradesh. Waywardness in school policies in many States affected a whole generation of students, and even in a comparatively progressive State like Bombay in the fifties. Morarji and Dinkerrao Desais combined to push programmes against the wishes of many parents and educationalists. In recent months, as Chairman of the Indian Parliamentary and Scientific Committee, Mr. Shastri has had occasion to focus attention on the details of the problem. Among the suggestions of the Parliamentary Committee headed by Mr. Shastri are: (1) Science education should be introduced in primary schools in the form of nature study—story telling, visits to zoos, botanical gardens and visual aids; (2) general science courses should be started in the middle schools, classes VI, VII and VIII; (3) at the high school stage science should be compulsory for all students, but in the form of separate subjects as mathematics, physics, chemistry, biological sciences, and certain guidance could be offered by the way in which courses have been prescribed in the Soviet Union; (4) specialisation at an early stage should be avoided; the tendency in some States to offer options at an early age of fourteen years is "unbalanced and uneducational"; (5) the syllabus today in a number of States is out of date and the curriculum needs modernisation—the process of making these courses up-to-date should be continuous, as "periodical revisions of the intellectual diet" are needed. (Although the Commission has more or less been asked to evolve the methods needed for science orientation, the drafting of the resolution announcing the appointment of the Commission contains the verbosity of a non-scientific administrative mind!)

Outlay on Education
(In crores of rupees)

	First plan	Second plan	Third plan (estimated)	Fourth plan (suggested)
Elementary	85	87	209	339
Secondary	20	48	88	511
University and higher	14	45	82	306
Social education	*	4	6	100
Physical education and youth welfare	*	10	12	44
Scholarships	*	*	*	142
Others	14	10	11	48
Total	133	204	408	1,990

* Included under other heads. Fourth Plan suggestions by working group on education.

A problem raised in the Government resolution is the maladjustment of the educational system in a society trying to transform itself into one based on modern technology. While there are shortages of trained men for industrial plants, there is an increase of unemployed among the educated who have had no functional training. The *Report on the Pattern of Graduate Employment*, recently published by the Directorate-General of Employment and Training in the Ministry of Labour, says that those who have passed professional courses like engineering and medicine are in the best position in the employment ladder. The incidence of unemployment among them is low or rather insignificant—the proportion of unemployed being 0.7 per cent among engineers and 4.9 per cent among doctors. The overwhelming majority of those who have passed specialised courses are in occupations within their field of study. The study is based on the experience of those who graduated in 1954 and it is found that within six years about one-fourth of the medical and engineering graduates were earning more than Rs. 500 a month while the proportion of such earnings among all graduates taken together was only four per cent. The engineers are in a slightly better position than graduates in medicine in that their waiting period for initial employment was shorter and incidence of unemployment is insignificant. An incidental conclusion from the study is that, contrary to popular impressions, 84 per cent of the medical graduates were in salaried employment as opposed to private practice.

Estimates of Number of Teachers Needed
(In lakhs)

	Teachers in position	Additions needed in 5-year period	Annual additional need
PRIMARY			
1961	9.7	....	....
1966	13.0	....	....
1971	18.0	7.4	148,000
1976	22.7	8.0	160,000
1981	28.8	10.3	206,000
MIDDLE			
1961	2.2	....	....
1966	3.6	....	....
1971	7.0	4.1	82,000
1976	14.4	8.6	172,000
1981	19.8	7.9	158,000
SECONDARY GENERAL			
1961	1.2	....	....
1966	2.1	....	....
1971	4.1	2.5	50,000
1976	6.0	2.9	58,000
1981	10.0	5.5	110,000
SECONDARY VOCATIONAL			
1961	0.25	....	....
1966	0.31	....	....
1971	1.25	0.98	19,600
1976	3.75	2.69	53,800
1981	6.25	3.00	61,000
HIGHER EDUCATION			
1961	0.62	....	....
1966	0.72	....	....
1971	1.37	0.76	15,000
1976	3.00	1.83	36,600
1981	5.00	2.45	49,000

Among graduates in agriculture and veterinary sciences also the incidence of unemployment was low—about two per cent. Unemployment among law graduates was only six per cent from among the graduates of 1954, but 59 per cent of them were in salaried posts, although a law course is generally aimed at preparing them for private practice. One out of six law graduates were in administrative jobs and an equal number in clerical jobs. For quite a number of the law graduates their legal background had no relationship to their employment. Among graduates in teaching, 91 per cent were employed as teachers, and only about one per cent as clerks. The most disconcerting feature of the teaching profession was that six years after graduation seven out of ten were earning less than Rs. 200 a month. Among science graduates the incidence of unemployment is described in the Government study as "moderate"—about seven per cent. Three-fourths of the M.Scs and one-third of the B.Scs were drawing between Rs. 200 and Rs. 500 a month. While 20 per cent of the B.Scs were in clerical jobs, only one per cent of the M.Scs were employed as clerks. For the graduates and post-graduates in commerce clerical jobs are the main source of livelihood. More than 40 per cent of the B.Coms and 25 per cent of M.Coms were employed in clerical jobs six years after getting their degrees. Thirty-one per cent of those who passed B.Com in 1954 and 44 per cent of those who got their M.Com. degree in that year were earning between Rs. 200 and Rs. 500 a month. Fifteen per cent of the graduates in arts and nine per cent of the post-graduates in arts subjects were unemployed six years after passing out of college. Thirty-eight per cent of the arts graduates took up teaching jobs and one-fourth of them were in clerical jobs. The persons with Ph.D. degrees reported the highest level of earnings—more than half of them were getting more than Rs. 500 a month six years after finishing their education.

Enrolment of Students: Actual and Perspective
(In lakhs)

Year	Primary	Middle	Secondary	Higher stage (arts, science & commerce)
1961	350	67	33	9
1966	520	110	57	18
1971	720	190	102	19
1976	910	360	180	30
1981	1,010	495	300	50

According to an estimate by an expert in Yojana Bhavan, the Government spends about Rs. 2,000 on each graduate on an average. A study group appointed by the Planning Commission in September 1955 said that 550,000 educated persons (having a qualification of matriculation or above) were unemployed in the country. Of these 120,000 were graduates. In March 1956 the number of unemployed graduates on the live registers of employment exchanges was 23,000; their number rose to 51,000 in March 1962. According to the *Report on the Pattern of Graduate Employment*, only 22 per cent of fo the unemployed graduates were on the registers of the exchanges. This gives a projection of a total of 230,000 unemployed graduates in March 1962, or nearly a doubling of the number of unemployed graduates between 1955 and 1962. In 1955-56 the number of students enrolled in universities and other higher educational institutions was 6.8 lakhs; by 1960-61 their number had grown to nearly ten lakhs.

Following a directive from the Planning Commission in May last year, a working group on education has prepared a draft programme for educational expansion during the fourth Plan as well as a perspective programme for the 15 years from 1966 to 1971. (The accompanying tables show some of the assumptions made by the working group.) According to the working group, which has just prepared its report, one of the weakest links is the shortage of teachers for educational expansion. In the fourth Plan period alone additional teachers needed in secondary schools in the main subjects are as follows: languages 67,000; science 40,000; social studies 61,000; mathematics 18,000; others 4,000. The working group suggests an allocation of nearly Rs. 2,000 crores for education in the fourth Plan, as compared with Rs. 133 crores in the first Plan, Rs. 204 crores in the second Plan and Rs. 408 crores in the third Plan—in other words, quintupling the allocation from the level in the current Plan.

The targets sought to be set in the fourth Plan period are: additional enrolment of 200 lakhs in the primary stage, 80 lakhs in the middle stage, 30 lakhs in the secondary general stage, three lakhs in secondary vocational schools and six lakhs in universities. Post-graduate output is sought to be doubled to 60,000 and ten new universities are to be established. The number of universities rose from 27 in 1950-51 to 54 in 1962-63 and the number of arts, science and commerce colleges from 542 to 1,283. Third Plan targets are for 1,400 colleges.

In the perspective plan for 1966-71, the enrolment of students is sought to be raised from 520 lakhs to 1,010 lakhs in the primary stage, from 110 lakhs to 495 lakhs in the middle stage, from 57 lakhs to 300 lakhs in the secondary stage (general and vocational, with a third of the pupils being in vocational schools) and from 13 lakhs to 50 lakhs in arts, science and commerce colleges.

For this type of expansion, teachers in position needed in 1981 will be nearly 29 lakhs for primary schools, 20 lakhs for middle schools, ten lakhs for secondary general schools, six lakhs for secondary vocational schools, and five lakhs for arts, science and commerce colleges.

Tailpiece: Average salary of primary school teachers was Rs. 70 a month in 1960 and of middle school teachers Rs. 83 a month. In 1950 the salaries were Rs. 41 and Rs. 57 respectively.

RIPE FOR INVASION

By Questor

THE consumer credit business in Britain is at an interesting stage—interesting enough, according to market gossip, to have caused several American institutions to toy with the idea of taking a hand in its future development.

The bulk of credit sales of consumer durables, from cars to television sets, are made here on the hire-purchase system. This was evolved to comply with the requirements of legislation strictly controlling the behaviour of moneylenders passed at the end of the nineteenth century. The customer nominally hires his purchase from a finance company, acquiring it for a trivial sum when the requisite number of instalments have been paid, but the finance company retains the ownership and the security until completion. Repossession of the goods has been allowed in the past in case of default on the hiring payments.

This system has not been altogether satisfactory from the point of view of the finance houses, because the second-hand value of cars drops so rapidly that repossession often provides less security than it should in theory. A few years ago, in fact, when there was stiff competition and a good deal of organised fraud by small car dealers, even the biggest finance houses ran into serious trouble.

But a number of them made use of the law at that time in a way which was regarded as being intolerably unfair to the hirer who had run into temporary financial difficulty, and new legislation is being introduced which will make repossession more difficult. A a result the security of the finance house in a hire-purchase transaction will be even more precarious than before.

Competition in the business is sufficiently keen to make it unlikely that the new conditions will make credit more difficult to obtain except for the customer who cannot afford to borrow in any case. Competition should also, one might have supposed, prevent the greater risk from being reflected in higher charges to the public.

But the fact is that consumer credit is a fairly recent growth in Britain and that the larger part of the borrowing public is more interested in its availability and in the size of the minimum down-payment than in its cost. Where the cost is advertised at all, it is in terms of a nominal percentage charge which is usually only about half the true rate of interest. And since the new hire-purchase legislation requires that where a rate is mentioned in advertisements it should be a true rate, reckoned according to a given formula, finance houses are likely to be even more coy than before about this side of the affair.

Dealers' Commissions

This insensitivity of the borrowing public to the cost of credit has enabled competition to assume a perverse share. Instead of competing on price, the finance houses compete by offering larger commissions to car dealers for the exclusive right to their business. This is very pleasant for the dealer, who has merely to sit back and be wooed. It is hard on his customer, who in the end, however unconsciously, will have to meet the cost.

The larger finance houses belong to a trade association which attempts to limit, by agreement, the size of these dealers' commissions. Yet competition from houses which do not belong to the association has caused the agreement to break down in the past; it is in jeopardy again at the moment, largely because Ford Motor, now wholly-owned by Ford of Detroit, has decided to provide its own hire-purchase finance on Ford cars and has been wooing the dealers with offers which are naturally regarded as unfair. The finance houses are reluctant to drop their rules and risk experiencing again the bad debts of a few years ago, particularly since the risk is increased by the new legislation. But they may be forced to. The final result would be that the average creditworthy borrower was subsidising car dealers, cheats, and those who insist on borrowing beyond their means.

The situation may correct itself in time as the public becomes more sophisticated and more aware of the cost of credit. Already the banks are taking a larger share of the business in consumer credit, either allowing overdrafts at the usual favourable rates to established customers (usually against security) or personal loans at a rate not much below that usual on hire-purchase to their newer or less secure customers. Their advantage is enhanced, in the eyes of the conscious few, by the fact that bank interest is allowable as a charge against income-tax whereas hire-purchase costs are not usually allowable.

Yet there is obviously room for somebody to make a profit out of hurrying up a natural development. Only three out of the five big British branch banks provide personal loans at the moment, and none of them are in the habit of going out of their way to attract this type of business: they wait for the customer to ask.

The finance houses, though admitting that the hire-purchase system is becoming more and more cumbrous, have no tradition of personal contact with their customers and of making loans on the basis of individual credit-rating. An invasion into this field from the United States, or for that matter from other countries—particularly if made in conjunction with a British finance house—would be both profitable to the invader and a boon to that large part of the British public which is more reliable than the hire-purchase system allows for but too shy as yet to penetrate the ordinary banks.

INDIAN TUBE TO EXPAND ITS SEAMLESS TUBE MILL

The Indian Tube Company, pioneers in the manufacture of seamless tubes in India, have been granted an Import Licence for additional plant and machinery which will enable them to raise their annual capacity for these tubes from 24,000 to 40,000 tonnes.

Existing technical and service facilities at the Company's Works in Jamshedpur will enable speedy execution of the expansion programme, which is expected to be completed in 1965. INDIAN TUBE will then meet the bulk of India's requirements of seamless tubes for the oil and chemical industries, power generation and transmission and other essential demands which are still being partly met by imports. This will mean an annual saving of Rs. 6 crores in foreign exchange.

TRENDS IN BRITISH BANKING—II

GROWING COMPETITORS AND STAFF RELATIONS

THE impressive progress and growing diversification of Britain's dynamic merchant banks, and the bid of the livelier and effective trustee savings banks to offer their services to a wider public by introducing cheque-drawing facilities, make both the sets of institutions competitors of the clearing banks. However loudly they may protest that they do not intend to compete with clearing banks, they cannot help themselves and the clearing banks, on their part, have no doubts and illusions about the challenges that they face.

From their narrow specialisation in some kind of acceptance credit business during the late forties and early fifties, the merchant banks have steadily marched towards a greater diversification of their business. The fact that many of London's merchant bankers have broken their century-old traditions by opening branches in the northern cities like Manchester and Birmingham clearly shows that they are looking not only for new customers to serve and new business to transact but also for new ways of serving the customers: they seek deposits and new openings for acceptance credits, as well as new opportunities for business, the nature, character and emphasis of which are different from the traditional lines of their activities.

The progress of merchant banks in increasing their deposits and advances last year is remarkable, particularly in the face of two developments that should have, in fact, restrained them. They are: (*a*) the freedom of clearing banks to lend without any restrictions and (b) the increasing resistance to and restrictions on the movement and import of Euro-dollar balances. Both these could have so operated as to curtail the custom and business of merchant banks. But, actually, they have marched ahead domestically and progressed in building overseas connections and business.

Functions of Merchant Banks

In a way, the merchant banks are all different. Each has its own special line of activity and methods of working. Moreover, the functions of merchant banks are in no way unique, for there is always some other financial institution which is also performing one or other of the functions performed by merchant bankers. Their most serious challenge to clearing bankers, however, comes from the fact that they provide a *complete* service which covers almost all the financial affairs of their customers. The clearing banks still largely accept only first class quality of self-liquidating business which could be covered in a half per cent interest differential; they are unwilling to differentiate between the extent, degree and quality of risks in the business offered by various customers and to charge different borrowers differently. Thus, while the banks are satisfied with their large overdraft business and some personal loan business, the merchant banks go all out and their main lines of business are advising, managing and underwriting new issues, banking and financial advice, advising on and arranging mergers, and management of investments. They make special efforts to assist business and enterprises which are small, which need finance and which face difficulties today, but which will grow big tomorrow and compensate the merchant banks several times for their present efforts. Some of them have their own unit trusts—at a time when the clearing bankers have turned their heads away, with great indifference, from the proposal of starting a bankers' unit trust. Others have combined to start an institution of their own to provide a factoring service so popular in the U.S.A. Still others have turned their attention towards the Common Market and joined a Continental consortium for property development and investment in the E.E.C.

For depositors, the attraction of merchant banks lies in the fact that, while the clearing banks at present pay 3 per cent per annum for fixed deposits beyond seven days, the merchant banks offer as much as 4½ to 4¾ per cent per annum depending on the period of the deposit. Moreover, a merchant banker seems to possess more flexibility and is able to maintain the personal touch more than a branch bank manager. Although the deposit resources of merchant banks are an insignificant proportion of the funds of clearing banks and although they do not possess any branch network at all, the clearing banks are acutely aware of the new competition they are facing from the merchant bankers but are unable to do anything about it, in view of the loss of their freedom as a result of the agreed rates of interest on deposits and advances which they all quote and of their rigid traditional ideas of what constitutes banking and what does not.

Many would like to know whether Britain's 80 trustee savings banks with almost 1,400 branches are progressing faster than clearing banks. No comparisons are possible at all, since the clearing banks do not publish any statistics of the number of their accounts, but it can certainly be said that, behind the trustee savings banks, there is the zeal of a *movement*, whereas the clearing banks are, at their best, business concerns. Further, the importance and effectiveness of trustee savings banks depend on two factors. Firstly, unlike clearing bankers, they have clearly been impressed by the power of the interest rates in attracting deposits and have found that it is through increased turnover of larger resources obtained by paying higher interest rates that the problem of mounting operating costs can ultimately be solved. Secondly, the range and quality of the service of trustee savings banks remain unique in their own way. In many ways, the role of trustee savings banks which provide a "relatively simple" service is unique. There are many clearing bank customers who once began first as trustee savings bank account holders: the trustee savings banks are quite proud of their role as promoters and pioneers, and are convinced that their own liveliness and effectiveness flow from this role. In their move to attract wage earners and to popularise banking, too, the trustee savings banks offer more liberal hours than the clearing banks as regards both the early morning and the late evening opening and Saturday opening. Even as regards drawing facilities at branches other than those where the depositor has an account, the trustee savings banks offer more facilities than clearing bankers. Above all, interest earned on trustee savings bank accounts (which itself is higher than on the clearing bank deposit accounts) enjoys a limited income-tax exemption.

Cheque Book Scheme

As if all this were not enough, the trustee savings banks are now likely to intensify their competition with clearing banks by providing cheque-drawing facilities to those of their customers who are willing to forgo interest. The clearing banks never relished the idea of further competition from this most unexpected source, and the Treasury refused to take sides in this controversy. Nevertheless, there is no doubt that their endeavours to introduce a cheque book scheme will soon succeed. Such a competition may then give a fresh momentum to the move for more popular banking, and could easily show how serious the clearing banks are for popular banking.

In the face of these competitive forces, the banks have been forced to have a fresh look at the realities of the staff situation as disclosed by the Cameron Inquiry. Some of the clearing banks have for years refused recognition to the claims of the National Union of Bank Employees (N.U.B.E.) to represent bank staffs. Even those banks which were prepared to talk and discuss staff problems, salary scales and working conditions with them gave greater importance to the internal staff associations. It was in 1963 that Lord Cameron held an inquiry into the complaint of the N.U.B.E. to the International Labour Organisation that the banks, through internal staff associations under their domination, were preventing the N.U.B.E. from performing its functions as a trade union. A bitter past experience of joint-tripartite negotiating machinery consisting of N.U.B.E., staff associations and banks, which failed because some of the staff associations walked out of it, has forced the N.U.B.E. to refuse the olive branch offered by the Cameron Inquiry. The restrained report had suggested that, while there was no substance in the N.U.B.E. complaint, which was drafted without any sense of responsibility, the N.U.B.E. commanded a substantial following and efforts should be made by the banks to establish peace and to evolve a joint negotiating machinery. It must be recognised that, even if the N.U.B.E. and staff associations do not have an *identity* of interest, they do have a *community* of interest in the wealth and welfare of bankmen. But the Cameron plea for peace and joint action appears to be doomed to failure, for the hostility of staff associations is matched only by the vehemence of the N.U.B.E. propaganda against internal organisations.

The tug-of-war between the N.U.B.E. and staff associations is based not merely on a principle of representation, although it provides a convenient point of debate; the N.U.B.E. feels that no association of employees can argue as effectively with the employers about the service conditions of employees as an outsider can, but the staff associations argue that no outsider can ever understand those conditions as well as an internal organisation. But even more than this divergence in the matter of a principle, the N.U.B.E. insists that bank salaries are a national issue which must be negotiated nationally. The staff associations have a very weak case here, for, in spite of their argument that problems in each bank are unique, they have their Central Council of Bank Staff Associations (C.C.B.S.A.) a counterpart to the Committee of London Clearing Bankers (C.L.C.B.). Even the banks themselves have made an unprecedented move last month, when 11 clearing banks announced a simultaneous pay rise of 7 per cent (back dated to 1st April, 1963) for their 120,000 employees. Banks so far tried to avoid giving an impression that they take joint action in such matters, but they do not mind now that they are agreeable to establish a joint negotiating machinery.

The N.U.B.E., however, holds strong views. Before any such machinery can be established, it wants C.C.S.B.A. to be dissolved and each staff association to affiliate to and function as a committee of the N.U.B.E. The staff associations on their side try hard to create an impression that even the latest national settlement is negotiated by each association individually. The N.U.B.E. is not worried about criticisms of its membership strength or concrete achievements, for, since it has had no opportunities to function properly, these matters are not comparable at all with those of staff associations. Its successes in obtaining recognition from the trustee savings banks and Irish banks have emboldened it further. Moves and counter-moves are being made in this direction. While the clearing banks as a whole are willing to establish the joint negotiating machinery on a basis of equality for the N.U.B.E. and staff associations, one clearing bank at least has made the offer conditional upon the agreement of its staff association. Further, while the Barclays Bank Staff Association has aligned itself with the N.U.B.E. in supporting the idea of national negotiating machinery, the Chairman of at least one staff association has demanded an apology from the N.U.B.E. for bringing about the Cameron Inquiry.

And so the moves and counter-moves go on. In this tug-of-war, the real losers are the bank staffs, whether they belong to the union or the associations.

(Concluded)

ASSAM STATE FINANCIAL CORPORATION

Although the improvement in earnings enabled the Assam State Financial Corporation to pay the guaranteed dividend amounting to Rs. 3,50,000 during the year ended March 1964 without any subvention from the Government and although both the number and amount of applications sanctioned were the highest for any year since the inception of the Corporation, the worries of the Corporation are not yet over. For the Corporation continues to face two disquieting problems, namely, shortage of resources and considerable increase in defaults in payment of principal and interest.

The gross earnings of the Corporation have gone up from Rs. 16.18 lakhs in 1962-63 to Rs. 19.39 lakhs in 1963-64 reflecting the growing tempo of the Corporation's activities. At the same time, the operating expenses also have risen from Rs. 8.71 lakhs to Rs. 10.05 lakhs. Even so, the net profit (subject to taxation) has risen from Rs. 7.47 lakhs to Rs. 9.34 lakhs. After providing Rs. 4.85 lakhs for taxation and transferring about Rs. one lakh to statutory and special reserves, a balance of Rs. 3.50 lakhs is available for distribution as dividend. The amount of dividends foregone by the State Government or the Reserve Bank of India this year is not known. The total subvention liability to the State Government amounts to Rs. 10.30 lakhs.

The Corporation received during the year 70 new applications for Rs. 227.94 lakhs; the total number of applications received since the inception of the Corporation in 1954 is 467 covering in all Rs. 1,242.16 lakhs. But only 47 applications for Rs. 118.91 lakhs were sanctioned during the year, bringing the aggregate sanctions to Rs. 551.81 lakhs in 244 applications.

The total bonds issued by the Corporation till the end of March 1964 amounted to Rs. 182 lakhs, including a fresh issue of 4½ per cent 1975 bonds which was oversubscribed. The demand for finance are substantial while the resources of the Corporation are limited. With a view to augmenting its resources the Corporation is expected to issue further bonds towards the end of 1964. Out of a borrowing limit of Rs. 60 lakhs with the Reserve Bank of India, the Corporation has already borrowed Rs. 50 lakhs during the three months

INFLATION AND ECONOMIC GROWTH

CAN INFLATION EASE THE PROBLEMS OF A DEVELOPING COUNTRY?

By Graeme S. Dorrance

[One of the most serious problems confronting the developing countries pertain to inflation. Some degree of inflation is, of course, inevitable in a developing economy. Only steps must be taken to restrain inflation, for, otherwise, not only will the pace of development be slowed down but the social fabric will also be severely strained. This aspect has been impressively highlighted by Mr. Graeme S. Dorrance, Chief of the Finance Division of the International Monetary Fund, in an article appearing in the inaugural quarterly issue of The Fund-Bank Review: Finance and Development, *published by the I.M.F. and the World Bank. The views expressed by the author are of importance to India in the present context of inflationary trends.—*ED.]

IN a developing economy, the Government has a grave responsibility to make certain that its financial policies are directed primarily toward overcoming the basic problems which are likely to face a less developed country. These structural problems—so-called because they appear rather as elements in the structure of the economy than as incidents in its history—are often very serious. In most less developed countries, the vast majority of the people are not as yet educated to take their place in a modern technological society. In fact, the most serious problem in many of them is the problem of illiteracy. An inability to take advantage of simple opportunities to fight disease and to overcome poor nutrition is often almost as serious a social problem. Government institutions are frequently inadequate to meet the problems of a rapidly changing society. As populations grow and gather in cities, the basic sanitary facilities become inadequate, and more expensive housing is required than may be the minimum necessary in country districts. In many of the countries where progress has been slow in the past, businesses are not used to taking the risks which must be faced in the development of new products and new methods of distribution. There is also the need to develop basic community requirements, such as roads, bridges, power and other public utilities.

Faced with these and other serious problems, the Government of a developing country should consider the basic question of its financial policy so that victory over the fundamental structural difficulties may be made more likely. About inflation itself, various questions may be asked:

Does inflation help ease the problems of a developing country?

Is inflation an inevitable result of rapid development?

Or: Are the effects of inflation so harmful that the Government of a developing country should fight it with enthusiasm?

The Background

In a country which is trying to develop rapidly, there are always fewer resources (of goods or skilled workers) than are wanted. If development is to be rapid, there is a tendency for the community as a whole (including the Government as well as individuals and businesses) to try to spend more than is currently produced by home industries or available as imports. If a community tries to do this, inflation becomes likely. This happens most frequently when Governments have committed themselves to spend more than they receive from taxes, or can borrow from the genuine savings of the population. The competition resulting from the attempt to buy more goods and services than are available raises the prices of goods, and the competition for the services of skilled workers raises wages. Then the Government itself, however reluctantly and belatedly, also has to pay higher prices and wages and so has to spend even more beyond its means. As long as people in general—which includes the Government—try to spend more money than the production costs of the goods and services available at a particular time, so long will prices tend to rise and an inflation will be present.

Not all price rises are signs of dangerous inflation. Food prices may rise because of a bad harvest, for instance, but, if a good harvest follows, the situation corrects itself. The inflation that causes concern is a continuing rapid inflation; in this, there are increases in prices which increase incomes but do not correspondingly increase supplies. In that case, prices tend to continue rising. Common sense suggests and experience shows that the problems created by such an inflation may be so great that they make it impossible for a Government to speed development. In fact, if a country embarks on a rapid development programme without taking steps to restrain inflation, the end result of the programme may be progress less rapid than it would have been if the programme had not been attempted. If a severe inflation continues, and prices rise rapidly year after year, not only will development slow down, but the social fabric will be severely strained. In recent years, there have been many such occurrences and, even at the present time, there are a number of countries where these tensions are apparent. Thus, at the moment, prices are more than doubling every year in Brazil and Indonesia, and rising at a rate which would result in their doubling in less than two years in the Congo, and every three years in Argentina, Chile, Colombia, Korea and Uruguay, to name only a few such countries. It is not unlikely that similar price rises will appear in other developing countries which are trying to catch up with the more fortunate parts of the world, unless their Governments stand firmly resolved to fight inflation with enthusiasm.

Two Danger Signals

There are two danger signals that inflation has gone too far. One is the appearance of a wage-price spiral. When the cost of living is rising rapidly, wage earners and pensioners justifiably refuse to be satisfied with their lot unless they receive frequent large increases in their incomes. Yet large wage increases raise costs, and hence lead inevitably to further upward price changes. The second danger signal is a distrust of money. Once people lose faith in their money because they see that money savings held in bank deposits, insurance policies, social security funds, Government securities, or similar forms, melt away in terms of what they can buy, they cease to hold such things and the entire financial structure of the country is strained. Further, they cease to have faith in the real meaning of money promises; workers fight not for wages high enough to meet the present increase in the cost of living but for wages high enough to meet the expected *future* increases in the cost of living. Strikes become widespread and prolonged, and struggles between employers and workers embitter the political scene.

Diversion of Investment

In these circumstances, people see that it is foolish to hold money in bank accounts, savings deposits, life insurance, Government securities, or similar forms. Rather than trying to work for a better future for themselves and their families by saving in these forms, they will use in other ways what savings they may already have. It must be remembered, however, that, for the vast majority of people in every country, there are relatively few ways in which they can hold savings. They can hold such things as savings deposits and insurance policies, gold and foreign currencies, or real estate. Unless they own their own businesses, it is difficult for them to buy other assets which are likely to rise in price.

One of the important roles of banks and savings banks (including Government development banks) and insurance companies is to gather the relatively small savings of individuals and enable them to be used in the relatively large blocks that are required for productive investment, while providing protection to the small individual which he can use at a time of family crisis or can build up in the hope of providing a better future for himself and his family. However, if prices are going to rise, he will not entrust his money to such institutions. He may feel that the future is so uncertain that he might as well spend his money now and let the future take care of itself—in which event, savings will fall. Or, if he saves, he can protect his future by buying gold or foreign currencies. As the Fund said in its *Annual Report* for 1962: "A particularly unfortunate feature of the international scene in the last decade has been the large flow of private capital from those less developed countries which have tolerated inflation to countries, frequently wealthy, which have maintained monetary stability."

These same reasons which lead people to wish to buy foreign currency when they expect prices to rise will lead foreigners to be less anxious to invest in the inflating country, because they are running the risk of their investment losing value through deterioration of the exchange rate. The net result of this two-way process is a loss of capital in the inflating country. A developing country wants the rest of the world to invest in it; but an inflating country tends to be a net investor in the rest of the world.

A private individual may also build up his savings by buying real estate. Insofar as he merely buys land from someone else, there is no serious problem. It is the use made by the former landowner of the receipts from the sale of his land that raises problems. However, in cities, the purchase of real estate usually means the purchase of a house or an apartment. An individual can see a house or an apartment not only as a place to live in but also as a possession which is likely to rise in price as long as inflation continues. He may well buy a house or an apartment as much to provide protection for his future as to provide shelter for his family. In doing so, he will try to buy the biggest house or apartment that he thinks he can possibly afford. That is, he is likely to buy a house or an apartment larger than that which would fit his needs if there were other forms of saving which he trusted. Thus, with an inflation, resources will go into the building of houses and apartments on a greater scale than would otherwise happen. Resources which could have been used to increase the community's capacity to meet its wants will be wasted on the building of houses and apartments larger and more luxurious than people really want. The real satisfaction of the community will be less than it would have been if price increases had not been expected. It might be thought that, instead of building a larger house than he desired, a small individual might put his savings in a house or apartment which he could rent. However, in modern societies, when inflation occurs, Governments quite rightly try to protect the small individual from the worst effects of the inflation. It is common for the Government to impose rent controls in an attempt to protect individuals from profiteers. Unfortunately, one of the effects of these controls is that they treat the small individual who buys a house to rent in fact as a "profiteer" and, as a result, such houses or apartments become no better than bonds or insurance policies as protection against the future.

Hoarding of Stocks

In the business world, there is a parallel to the accumulation of real estate by individuals. The businessman will expect that prices and wages are going to rise in the future. However, he cannot be certain whether they will rise more in the immediate future than they have in the recent past, or whether they will rise somewhat less rapidly; and there is always the ever present chance that the Government will have the courage to stop inflation. It must be remembered that Governments universally view inflation in the same way that people view sin: they are opposed to it and never do more than accept it as an "inevitable evil."

Further, the businessman will be most uncertain about the rate of increase in the prices at which he can sell his products as compared with the rate of increase in the prices he must pay for his supplies, and also about the rate of increase in the wages he must pay, or the bonuses he must grant, to his workers to keep them in his employment or to satisfy Government decrees intended to protect workers from the worst effects of inflation. While he may be certain that prices will rise, he may be most uncertain as to what his immediate prospects are. As a result, he will be hesitant regarding the future, but will wish to hold some things which he expects to rise in price. He can do this by accumulating stocks of goods, either by buying raw materials which he is likely to need at some time in the future, or by being unenthusiastic about selling all the goods which he produces, in the expectation that he can get a better price for them than their present price. Thus resources which might be used to provide goods to satisfy the desires of the people will

be used to build up hoards by businesses, and the general welfare of the community will be worsened.

In addition to controlling rents, the Government may seek to limit the inflation by fixing the prices of socially important goods and services. These expedients deal with symptoms, not with the root trouble. Unless the Government subsidises the production of these controlled goods and services, businessmen will be frightened away from their production, and will strive to produce those goods and services which are not controlled—usually the least important. At the same time, the very fact that the prices of some goods are controlled when the prices of others are rising makes the controlled goods more attractive; people will try to buy more of them. Unless they are subsidised, lines will form in front of shops when small deliveries arrive, black markets will develop, and social dissatisfaction will be common when people are unable to obtain goods that they think should be theirs by right. Some of these problems are most evident in countries where transport and public utility services have deteriorated because fares and rates have been held down while costs have risen. In these circumstances, the economic structure becomes distorted in such a way as to necessitate painful adjustments when inflation is eventually brought to an end. If the Government subsidises the production of essential goods, the problems are avoided. However, equally severe ones take their place. The payment of subsidies will eat up the Government's revenues and leave less available to finance development, or lead to further inflationary financing.

International Consequences

Serious inflation does not limit its ravages to those on the home economy. It also leads to a worsening of a country's international position. It has already been pointed out that constantly rising prices lead to a flight of money abroad and discourage an inflow of capital. This is bad enough, but inflation also encourages people to import goods from abroad and discourages them from exporting. Because domestic prices are rising, imports available from countries with stable prices will become more attractive. Hence people will buy them, rather than goods produced at home. At the same time, a country's exports will suffer when prices are rising, partly because home demand is diverted to them and partly because they become too expensive to be sold in foreign markets.

The only way to avoid these trading disadvantages is to let the exchange rate worsen as rapidly as, or more rapidly than, prices rise. However, a worsening exchange rate tends to encourage the export of capital, so that the Government of an inflating country finds itself in a dilemma. If it allows the exchange rate to fall, capital will flee the country; if it does not, the country will sell fewer exports and buy more imports. What often happens in practice is that the exchange rate is supported for a time, and then allowed to deteriorate sharply to a lower level, where it is pegged again. This tends to combine the two disadvantages. As long as the exchange rate is better than is appropriate for prices, the balance of payments will be under pressure. The fact that it has once been altered will induce wary owners of capital to expect it to be changed again.

As long as the exchange rate is pegged at the wrong level, it is necessary to cut down imports as far as possible. Restrictions of various kinds are accordingly placed upon them. This exclusion results in yet another misdirection of effort within the country. In order to replace the goods which formerly were imported, facilities have to be created or diverted. Clearly this must be costly to the inflating country, since, if it had been economic to produce the goods at home, this would already have been done. The goods which are substituted for the former imports accordingly rise in price.

When all the worst factors combine, an inflation may move very rapidly. Developments combine to depress the exchange rate; and as it declines, fresh pressures develop at home, since imports now cost more and this adds to the forces raising domestic prices.

It Can Be Stopped

Though an inflation tends to be cumulative, and may eventually move with great rapidity, it can be stopped, although the task of stopping it is always difficult and even in the earlier stages is liable to cause a temporary fresh dislocation. Suppose, however, that, by one means or another, the excess of purchasing power over current prices is eliminated—whether by equating Government expenditures with revenues, or by borrowing abroad enough to purchase imports sufficient to fill the gap between demand and supply. What might be called the mechanical result will then have been achieved: there will be no pressures left to raise prices. But the psychological result will not have been achieved until people are convinced that the mechanical one has been, and here there is a gap. For some time to come, people will expect prices to continue to rise, and they will continue to act as though prices were going to do so, which in itself may prove an obstacle to price stability. To instill a conviction that the end of price increases has really come is one of the Government's most difficult and most important tasks.

The Second Step

What adds to the difficulty is that some prices—of food, of transportation, and of public services (such as electricity)—will have to be raised from the artificially low level at which they have been held. But a firm declaration of intent, backed up by effective steps to prevent prices from rising—by avoidance of wage increases and probably by changing the exchange rate sufficiently to close the gap in the balance of payments—will sooner or later achieve the desired results. The inflation is brought to a standstill—or at any rate near enough to a standstill to be no longer a threat to development. There is still an aftermath. All the effort that has been misdirected throughout the inflation has now to be redirected.

This second step is difficult. For the immediate result of instilling a conviction that prices will stop rising is to discourage all those types of investment which have expanded as a result of the inflation. However quickly people realise that, in the new conditions, there will be a growing demand for production appropriate to stable incomes, it takes time to organise the production of such goods; meanwhile, there will be a shortage both of the goods and of jobs. Moreover, those who have been holding stocks of goods as a safe form of investment realise that the prospect of continuing profits from increases in their prices has now been brought to an end, and as the storing of these goods is a costly matter they try to dispose of them, at the expense of current production of the same goods. In the same way, those who have been producing exportable goods and selling them at home, find that the demand for them is much lessened. They withdrew from the exports market, because they found it difficult in comparison with the home market, and markets which are fairly difficult to retain are naturally exceedingly difficult to re-enter. These are some of the dislocations which hamper and embarrass a Government that is trying to stabilise its economy.

The only alternative is to let the inflation continue, and this is worse. Only in a stable economy can effort be effectively directed to the kinds of long-run investments which are needed for economic growth. It is, therefore, a matter of the most vital importance for Governments to persevere in the measures that will end inflation and maintain stability. The measures themselves depend to some extent on the country concerned. But the avoidance of a Government deficit, the encouragement of savings, and the control of bank credit will most certainly all be necessary. None of these is easy to administer, but economic growth is a difficult objective which becomes a mere mirage without stability from which to grow. Once the initial difficulties of stabilising are overcome, true growth can begin, and investors will not be long in taking advantage of the new opportunities which stability affords, provided they are convinced that the Government is resolved to push forward resolutely with programmes designed to foster development in an atmosphere of financial stability.

TRADE MARKS

CAUTION

Notice is hereby given that the word 'Terylene' *per se* and the 'Terylene' symbols in English and in Hindi illustrated below this paragraph are registered trade marks in India, the property of Imperial Chemical Industries Ltd., London. They can be used only on or in relation to polyester fibre manufactured by Imperial Chemical Industries Ltd., London, or their associated company, Canadian Industries Ltd., Canada, and in the manner authorised on the goods made from or containing this polyester fibre.

'TERYLENE' Polyester ICI Fibre

'टेरिलीन' पॉलिएस्टर ICI फ़ाइबर

Instances have come to our notice where the 'Terylene' Trade Mark is being applied by certain manufacturers to garments or fabrics not containing the polyester fibre manufactured by Imperial Chemical Industries Ltd., or Canadian Industries Ltd., and also to fabrics containing polyester fibre waste in appreciable quantities, and that such garments and fabrics are sold or offered for sale as garments or fabrics containing genuine 'Terylene'.

Such manufacturers and the dealers concerned are hereby warned against such improper use of these trade marks and the public is also hereby cautioned against buying such garments and fabrics.

Neither of these trade marks can be applied to any articles or used in advertisements for their sale except with the authority from and under conditions prescribed by Imperial Chemical Industries Ltd., London, or by Imperial Chemical Industries (India) Private Limited.

Any unauthorised use of these marks on the goods or in advertisements will be regarded as infringements thereof and liable to legal action. Any imitation, infringement or fraudulent use of the said Trade Marks will also be dealt with according to law.

MANCHESTER LETTER

COTTON MILLS' PRODUCTIVITY RISES

RESULT OF CONCENTRATION AND MODERNISATION

From Our Special Correspondent

MANCHESTER, 14*th July*

NO outward signals marked the conclusion last week of the cotton textile industry's most ambitious programme of rehabilitation when the final date for eligibility for the Government grant against re-equipment projects was reached. Flags were not flying on the Royal Exchange, nor were there any special celebrations at the mills, where the machinery was running at full speed to complete the numerous orders held by producers.

Yet the occasion was of considerable psychological importance, representing as it did the end of nearly five years of sustained efforts by individuals and groups to instil fresh ideas and new confidence into an industry which had been sadly lacking in versatility and drive during a phase of retrogression after reaching its post-war peak a decade before. The streamlining operation was carried out in an efficient manner, so that the results of the concentration and modernisation are now being widely welcomed in the shape of much increased productivity.

Some idea of the reduction in the number of actual units now operating in the industry can be gauged from the fact that, whereas before the scheme was launched about 1,000 weaving firms were supplying cloth to their customers, the number has now shrunk to rather less than 500. In the case of spinning mills, the figure has decreased to little more than 100, although a similar number of doubling concerns are active, many in conjunction with spinning processes.

Phase of Consolidation

There should be no need to elaborate on the very strong financial ties which have lately been effected through vertical groupings, backed in most instances by the major man-made fibre producers. This has been a phase of consolidation sparked off by the absorption of the Tootal group little more than 12 months ago, while new aspects of the same theme have followed at regular intervals ever since.

To forecast that this process of closer integration will continue, and may even gain momentum in the course of the next year or two is scarcely doing more than state the obvious. There are many companies whose administration and outlook would derive benefit from an infusion of fresh animation, and a glance at the "Business Opportunities" section of any influential paper these days shows how widely the net is being cast to absorb the smaller firms into larger organisations. Nor is there any shortage of advisers ready to advertise the facilities they can provide to link companies in suitable "marriages."

The market, meanwhile, has only slowed down its rate of activity by virtue of the holiday season. When whole areas are standing idle, output quickly comes to a standstill, but the sustained pressure for supplies which has continued for some nine months shows little sign of diminishing for the moment. The needs of both domestic and industrial consumers at home represent a major proportion of the offtake; however much customers may grumble at the long waits necessary before completion of deliveries, the scale of forward buying is still appreciably strong.

In this connection, the recent wage deals offering a forward-looking approach to the industry's labour force should make a notable contribution to the stability of the trade in the years ahead. Salesmen have quickly grasped the idea that overheads can be more accurately gauged; coupled with the progressive improvement in output through the use of modernised machinery, the past fluctuations in trading through successive booms and slumps may well be ironed out.

Stocks and Sales

From the statistical department of the Cotton Board a cold, clinical approach to the immediate and distant problems of the industry can always be anticipated. To a trade somewhat prone to excesses of optimism and despair, such an attitude is all to the good. In its latest quarterly review of the situation, the Board describes the short-term prospects as "good"; in the slightly longer run, however, it points out, the outlook depends essentially on the behaviour of retail offtake and of stocks. Retail sales of clothing so far this year, according to official figures, have been rather smaller than in the second half of 1963, but remain comfortably greater than in the earlier part of last year.

Significantly enough for the weaving industry, the report adds: "The share of knitted goods in the total has continued to increase." Stocks of cloth held by weavers, converters and grey cloth importers have fallen by 75 million yards in the year ended March, but evidence suggests that stocks beyond the converting stage have been increasing for the last 12 months.

Higher Productivity

So much for estimates and glimpses of the future. Facts to substantiate the pronounced progress made in modernising the industry and its more efficient working get due prominence in the report. The fall in the labour force has been substantially halted, while production has continued to rise. The number of operatives in spinning and weaving on the books of employers at the end of April was 3 per cent lower than a year previously, but a considerable improvement in productivity has occurred—of the order of 6 or 7 per cent during the year, according to the statisticians. It is estimated that output per head in spinning is now about 22 per cent greater than before the reorganisation scheme, and a similar improvement in weaving has also taken place.

Such facts, and others like them, need to be constantly repeated by as many spokesmen the industry can muster, if the grim image which still persists in the minds of some commentators is ever to be eradicated. It can be done—steady high-pressure "prestige" advertising has proved it—if incontrovertible truths are pressed home at every available opportunity.

Plant Well Utilised

Within the maze of figures presented in each quarterly survey, several interesting facts emerge—again to the benefit of the trade. Machine activity in spinning, for instance, remained at 91 per cent of capacity, the same as in the last quarter of 1963, and against 84½ per cent in the first three months last year. The current level is the highest rate since 1961, while, in 1958-59, the plant was only running at about 66 per cent of capacity.

One milestone which should be mentioned is that in the first quarter of 1964 the number of running mule spindles in Lancashire fell below 1,000,000. Since the final quarter of 1962, the number of mule spindles in place has been reduced from 2,090,000 to 1,120,000 and the number running from 1,610,000 to 980,000.

The party's over! This was a party of minds. Rather than men. There was plenty of food—for thought! The leftovers were, in short, used-up pencils and pads. And blades and clips. The venue: The Research and Development Department of the West Coast Paper Mills Limited.

Today's party is over. But there will be one tomorrow. And the days after. At the same place. And, all the time. So that more—better—paper may be produced. For writing. For printing. For packaging. By the West Coast Paper Mills Limited, at Dandeli.

THE WEST COAST PAPER MILLS LTD. Shreeniwas House, Waudby Road, Bombay 1.

SUGAR PRICE FIXING LACKS RATIONALE

A PLEA FOR COMPLETE DECONTROL

By Mahavirprasad R. Morarka

IN its anxiety to bring down the soaring prices of sugar, the Government of India, it will be recalled, clamped down controls on sugar prices and distribution by an order issued under the Defence of India Rules on 17th April 1963. By this order, ex-factory prices of sugar were fixed as shown in the accompanying table. The order also provided for an extra charge of one naya paisa per quintal in the case of factories situated at a distance exceeding five kilometres from the nearest railway station and permitted the State Governments to prescribe the margin of profits for wholesale and retail trade. It was stipulated that the profit margin should not exceed Rs. 2.68 per quintal. This price control was extended to the whole country.

Sugar prices were revised on 18th November 1963. Earlier, a deputation of the Indian Sugar Mills Association had waited upon the Secretary to the Union Ministry of Food and Agriculture on 7th November and had urged for an increase in ex-factory prices for the 1963-64 season. This plea was made on the basis of the need for meeting the increase in cane prices and the rising cost of production. The delegation was told that the Government's decision in the matter would come in December 1963. But, surprisingly, the ex-factory prices for sugar were increased by a notification issued on 18th November 1963.

The rise in the prices announced in November 1963 as compared with those fixed in April 1963 varied from Rs. 2.65 in the case of Assam to Rs. 12.15 in respect of some mills in South Bihar. In between these ranges, the price was raised by Rs. 5.15 for Maharashtra, Rs. 8.65 for the Punjab, Rs. 8 for certain mills in the U.P. and only Rs. 3.80 for sugar mills in Mysore, Madras, Kerala and Pondicherry.

No Justifiable Basis

There was a further upward revision of prices in the notification dated 22nd May 1964 issued by the Ministry of Food and Agriculture. Whereas the prices announced on 18th November 1963 varied between Rs. 111.25 and Rs. 122.00 (a range of Rs. 10.75), in the revision made on 22nd May 1964, we have a much wider range of ex-factory prices of Rs. 113.25 and Rs. 138.00, the difference being as wide as Rs. 24.75. The main purpose of this article is to discuss whether there is any basis for such widely differing ex-factory prices being fixed for factories in the different areas of the country. It may be stated at the outset that there appears to be no justifiable rationale or basis for this quixotic fixation of prices, nor does it appear to have any beneficial result for the consumer whose interest should normally be the basis for the control of prices or distribution of any commodity of everyday use, especially that which is in short supply.

A comparison of prices fixed in November last year with those fixed in May this year will show that the sugar factories in the Meerut Division for which the ex-factory prices were fixed at Rs. 116.50 at the time of last revision in November 1963 are now as high as Rs. 131 per quintal. There is thus a difference of Rs. 14.50. In the case of factories in Rajasthan, whereas the ex-factory price was fixed at Rs. 116 per quintal in November 1963, the price fixed now is as high as Rs. 138. In contrast, we have sugar mills in Maharashtra which have been given a rise of Re. 1 only. Similarly, in regard to factories in Mysore, Madras, Kerala and Pondicherry, the present increase is just Re. 1. The hardest hit units are the six mills of Western U.P. in Part D of Schedule III which have been given an ex-factory price of a bare Rs. 113.25.

It is apparent, therefore, that certain units of the industry had made representations, drawing attention of the Government to the high cost of sugarcane and high manufacturing cost incurred by them during the year because of cane shortage in particular areas. The general result has been that, in a delicate and important matter like the control of a commodity of everyday use, we have a situation where a blatant injustice has been inflicted on mills in certain areas, whereas a generous subsidy of Government favour has been bestowed upon mills in certain other areas. So glaring is this disparity in the prices fixed for different areas that it cannot be gainsaid that a stepmotherly treatment has been meted out to certain areas and official favour distributed to certain others. In the absence of any control on the prices of sugar and in spite of reduced production, no factory in the Meerut Division of U.P. would have secured Rs. 15 per bag more than the factories in the South. Today, because of fixation of sugar prices, mills in West U.P. would get Rs. 131 per bag, while the factories in Maharashtra, Gujarat, Mysore, Kerala and Pondicherry get only Rs. 116.

Since these controls are instituted under the all-pervading powers of the Defence of India Rules, it is probably not necessary for the Government to state the reason behind this very objectionable kind of price fixation and the administration of control. The reasons for the disparity outlined above have not been forthcoming either from the representatives of the sugar manufacturers in the country, that is, the Indian Sugar Mills Association, or from the Government of India. In fact, the presidential address at the Indian Sugar Mills Association's Annual General Meeting on 27th April 1964 is conspicuous by the absence of any mention of this problem. No doubt, the speech refers to an economic price structure and makes a plea for the Government to take into account the

Ex-factory Prices of Sugar
(In Rs. per quintal)

Region	Notification dated		
	22nd May 1964	18th Nov. 1963	17th April 1963
Maharashtra	116.00	115.00	109.85
Punjab	132.50	118.50	109.85
Rajasthan	138.00	116.00	109.85
Madhya Pradesh	124.50	118.00	109.85
Mysore, Madras, Kerala and Pondicherry	116.00	115.00	111.20
Gujarat	116.00	118.00	112.50
West Bengal	119.00	116.50	111.20
Assam	127.00	116.50	113.85
Orissa	114.00	116.50	110.50
Andhra Pradesh	118.00	115.00—117.00*	109.85
Bihar	120.00—134.00	118.00—122.00†	108.50—109.85‡
Uttar Pradesh, East	120.25		
Uttar Pradesh, West:			
(i) Factories mentioned in Part 'A' to Schedule III	131.00		
(ii) Factories mentioned in Part 'B'	123.00	111.25—116.50§	108.50
(iii) Factories mentioned in Part 'C'	120.50		
(iv) Factories mentioned in Part 'D'	113.25		

* Rs. 115 for eleven mills and Rs. 117 for six mills.

† Rs. 118 for 24 mills in North Bihar and Rs. 122 for four mills in South Bihar.

‡ Rs. 108.50 for 24 mills in North Bihar and Rs. 109.85 for four mills in South Bihar.

§ Rs. 111.25 for 30 mills and Rs. 116.00 for two mills in East U.P. and Rs. 115.25 for 21 mills and Rs. 116.50 for 19 mills in West U.P.

various cost increases and to examine the data furnished by the Association expeditiously and to provide for it in the price finally to be fixed for the current season. The speech does not indicate any foreboding of the things to come. One wonders whether even the Association had expected such a wide range of price fixation which is neither in the interest of fair competition nor to the benefit of the consumer.

In spite of the Defence of India Rules, in a democracy, questions are bound to be asked in parliament, and sugar has been a very popular subject of discussion there. For a long time, the reasons for this very strange type of price fixation was not apparent and it was very rarely that any questions were asked by members regarding ex-factory prices. At least some members of the Lok Sabha are aware of this problem. On 2nd June 1964, the question was asked whether there had been a steep rise in the prices of sugar during the month of May in some States and, if so, to what extent; the reasons for the same; and the steps taken by the Government to check it. It is from an answer to this question given by Mr. A. M. Thomas, Minister for Food, that we get a glimpse of the reasons for the fixation of ex-factory prices. The Minister said that there had been some rise in the price of sugar in some areas during the second fortnight of May, the actual rise ranging from 2 nP to 15 nP per kilo, as a result of the revision of ex-factory prices. He said further that, since the increase in prices was due to revision of cost figures based on duration and recovery figures, no such step was called for. He also said that, if the position regarding duration and recovery improved next year, as was expected, costs should come down and consequently the prices.

From this reply, we know for the first time that the ex-factory prices have been revised on the basis of duration and recovery figures. Even considering these reasons to be true, we find that there is no justification for such wide disparity in the prices fixed for the different regions. There is not such a wide difference in the duration of crushing season as well as in the recovery percentage in the different regions to justify a premium to certain areas and almost what would appear a discount to other areas in this important question of fixation of ex-factory prices. On the basis of the figures for 1961-62, we find that mills in Western U.P. worked for 159 days, whereas mills in Maharashtra worked for 156 days, Gujarat 116 days, Andhra Pradesh 126 days, Madras 154 days, Mysore 173 days, Kerala 162 days and Pondicherry 164 days. Similarly, in the matter of recovery also, we find that the average recovery per cent for the abovementioned areas are: Maharashtra 11.84, Gujarat 10.90, Madras 9.39, Andhra Pradesh 9.90, U.P. 9.32, Mysore 10.54, Rajasthan 9.31 and Kerala 8.62. Thus, taking into account the duration of season and recovery per cent of sugar, one fails to understand as to why a price as low as Rs. 116 is fixed for sugar mills in Maharashtra, Gujarat, Madras, Mysore and Kerala, as against the Rs. 131 fixed for certain factories in West U.P., Rs. 138 for factories in Rajasthan and Rs. 134 for factories in South Bihar. The result of this iniquitous price fixation would mean, in the case of a factory producing, say, 200,000 bags in Southern India, a clear loss of Rs. 2 lakhs and a similar gain for a factory producing the same quantity in the Meerut Division of U.P.

A Vital Point Ignored

The sugar industry has gone through several ups and downs during its lifetime and has also seen controls. But, formerly when controls were imposed, the prices fixed were uniform except that there were certain deficit zones and certain surplus zones. The difference in control prices, if any, would be based on the principle of a freight advantage being given to factories in the deficit zones. In fact, factories in the surplus zones made a grievance about this that there should be a uniform ex-factory price and locality advantage should not be given to any factory or any particular area. Again, we find that there are certain areas where the cane cess or the purchase tax is higher than in other areas and, in spite of this, no advantage whatever has been given to factories in those areas where the cane cess or purchase tax is higher. Thus we find that, in U.P., the purchase tax levied is Rs. 5.17 per ton and the ex-factory price for certain areas in U.P. has been fixed at Rs. 131. As against this, the factories in Mysore, where the purchase tax is the highest in India, namely, about Rs. 8 per ton, the ex-factory price fixed is only Rs. 116. This important factor in the cost of sugar production has not been taken into account when fixing the ex-factory prices.

Low recovery is stated to be one of the reasons given in justification of fixing high ex-factory prices in certain areas. But, here again, the whole purpose of the control appears to be not to encourage more efficient units but actually to pay a premium on inefficiency. While sugar manufacturers in some areas may not complain much about helping the industry as a whole, it is certainly very exceptionable that the Government should employ their all-pervading powers to mar the more efficient units whose cost of production is low and which may have shown enterprise in the proper location and organisation of their units.

In fact, the sugar industry in the South, besides evincing enterprise and foresight in locational planning and organisation, has been consistently helping our agriculturist by giving him the much needed assistance in procuring manures and fertilisers, agricultural implements, and good and new seed from Government research institutes. The sugar industry in the South has had all along the record of supervising the agricultural operations minutely. The same, however, cannot be said of the sugar industry in U.P. and Bihar. For one thing, sugarcane is a tropical plant and, therefore the yield and recovery have always been, and will always be, poor in these areas. For another thing, no concentrated effort has been made by the sugar industry in general in U.P. and Bihar to improve the lot of the cultivator. And here we now find the Government actually coming to the help of a sector of the industry which has done very little to ameliorate the condition of the poor cultivator.

If the Government has at heart the interest of consumers at large, it should actually

BUILT-IN STABILISER FOR COMMODITIES

OUTLINE OF A NON-OFFICIAL BRITISH SUGGESTION

NO other economic subject has engaged so much attention in international discussions as that pertaining to stabilisation of commodity prices. This is both a national and a world problem, affecting as it does practically every country, be it a producing or exporting or importing country. Violent fluctuations in the prices of commodities, especially basic commodities, have a serious impact on the economy of countries. Attempts at international level to prevent such fluctuations in prices through the conclusion of commodity agreements and the like have continued to be made for a number of years now, more particularly since the end of the Second World War, but they have not met with due success, thanks to the conflicting interests of the producing, exporting and importing countries. It is not surprising, therefore, that the subject of commodity prices evoked a considerable amount of time and attention at the recent United Nations Conference on Trade and Development held at Geneva from 23rd March to 16th June. Indeed, a special committee (First Committee) was constituted, with Mr. Bernard Grinspun of Argentina as Chairman, to discuss the problems pertaining to international commodity problems. The recommendations submitted directly by this Committee and approved by the Conference covered promotional measures, synthetics and substitutes, the World Food Programme, and trade among the developing countries. The Conference approved a proposal on commodities submitted by the President of the Conference, Dr. Abdel Moneim El-Kaissouni (of the United Arab Republic). Part one of this proposal formulates the objectives, principles and scope of international commodity arrangements and envisages the establishment of a Commission on Commodity Arrangements and Policies. Part two lists the recommended action to be taken by developed countries, both those with market economies and those with centrally planned economies, as well as by both categories of developed countries together.

While the primary producers in certain countries are safeguarded against unremunerative prices by means of subsidies, there is no system operating effectively to safeguard the corresponding interests of overseas producers of those basic commodities on the import of which many secondary industries depend largely, if not wholly. This problem is now being actively discussed in Britain. One of the questions raised in these discussions is whether it is practicable to put into operation a comprehensive price-stabilising system as applicable to a very wide range of basic commodities. This question has been thoroughly examined by Mr. L. St. Clare Grondona, in the course of an interesting article published in the latest issue of the *Westminster Bank Review*, the quarterly publication of the Westminster Bank of London. The article is entitled "A Built-in Stabiliser for Commodities."

Price Stabilising Corporation

The proposal put forward by Mr. Clare Grondona envisages the setting up of a Treasury-financed British Price Stabilising Corporation (P.S.C.), having within its scope many commodities on the continued supply of which depends the secondary industry. The two primary objects of this Corporation, it is said, should be the following:

1. The Corporation will put a floor price in British markets for each basic product under its ægis. It will be ready to buy at that floor price, to be known as a commodity's low point. In effect, this will then be a world floor price (at sites of production, less freight costs to Britain), because no producer, unless coerced by an export tax, will accept a lower price anywhere for any substantial volume of his product than that assured to him as a minimum (in terms of his own currency) if he consigns to Britain and, as a last resort, sold to the P.S.C. The P.S.C. will publicise all its purchases and hold these in accessible reserve. The low point will not be fixed, in the usual sense of that word. It can fall automatically but only by prescribed small percentages—in inverse ratio to pre-specified large accumulations of any commodity; or it can rise (predictably), if, after a prescribed period, the P.S.C. does not acquire any reserves of one or other product within its scope. Of such accumulations, or their absence, all will be aware.

2. The P.S.C.'s second purpose, the achievement of which will be conditional, is to provide a ceiling price in British markets (in effect in world markets) for each 'eligible' product. But this can occur only if and when the fulfilment of its first purpose leads to its holding reserves of any such commodity. From such reserves, the P.S.C. will sell on demand, but only at a price higher by a prescribed percentage than what it has paid—its selling price being termed the commodity's high point. At this stage, it will have become a 'commodities bank'. Like the low point, the high point can fall, but only to predictable, prescribed extents—in inverse ratio to specified accumulations of any commodity.

This Corporation, according to Mr. Clare Grondona, will never 'enter' markets. It will be solely of their own volition that either sellers or, later, purchasers will have recourse to it. It will buy, after satisfactory appraisal at seller's cost, only in pre-specified large 'standard' units of volume—with the seller delivering to one of the Corporation's reception depots, which will all be sited to suit the convenience of the trade concerned; and it will sell only in similar large units of volume—with the buyer collecting. It will not bargain in the sense of negotiating prices other than those at the relevant 'points.' Commercial trading in the commodities within its scope will continue in the normal process of market dealing. Thus, there will be no compulsion or coercion involved in its functioning. The P.S.C. will buy without national or other discrimination solely on a product's merits; and it will sell with the same impartiality. Its reception depots for dutiable products will be bonded stores, whereby its operations will neither hamper, nor be hampered by, tariffs either existing or in prospect.

Average of Prices

The P.S.C.'s determination of its initial buying price (the low point) and its conditional selling price (the high point) can be based on the average of prices for any product over the immediately preceding period of, say, five years as giving a reasonable indication of the state of supply and demand. Such an average of prices will be that commodity's datum; and it is to this that the P.S.C.'s buying and selling prices for that product will be related, in terms readily understandable by everybody. The reasoning behind this formulation of the initial index and points is that, in broad terms, the economies of the chief commodity-exporting nations will have been largely geared to the averages of their receipts from sales of such exports in recent years and, although to a less extent, the economy of any commodity-importing nation (with Britain as an outstanding example) will likewise, have been geared to the averages of prices it has had to pay for such imports during the same preceding years.

The functioning of the system suggested by Mr. Clare Grondona, it is claimed, will accord with the law of supply and demand, while eliminating many of the uncertainties which have always been patently disconcerting to both producers and users. It is also claimed that there will be safeguards against any possibility of the P.S.C.'s becoming burdened with unwieldy surpluses. For the Corporation's index and points will remain at their initial levels only until a prescribed aggregate tonnage of any commodity is accumulated.

The author has laid special emphasis on the need for the P.S.C. to do its utmost to foster the establishment of commercially owned reserves. To this end, the Corporation, he says, would stand ready to provide storage, at the net cost of the space occupied, for commercial owners, but only after satisfactory appraisal and in the prescribed units of volume which it would be prepared to buy. Depositors will receive the P.S.C.'s warrant for each lodgment; and this will be an absolutely firm security for bank loans upto the level at which any such deposit can be sold *in situ* to the P.S.C. at any time. However, should the price of any deposited product rise in any recognised British market to above the level of the relevant high point, the warrant would have to be surrendered—when the P.S.C. would pay the depositor at the level of the then low point and then stand ready to sell at the high point. This proviso is designed to prevent any attempt to 'corner' a commodity; but it will not apply to any *bona fide* industrialists who has prudently established reserves exclusively for his own use, and not to 'play the market.'

The financing of the P.S.C. can be arranged so as to enable all possible commitments not only to be accurately measured in advance but also to be kept within statutorily prescribed limits which, at their maximum, is unlikely to impose any appreciable strain on this nation's internal economy or on its balance of payments. The following method, it is said, will ensure this:

The P.S.C. will pay cash sterling for all its purchases at the relevant initial low points, that is, until it acquires a first block of each eligible commodity. But, thereafter, unless 'specifically' authorised to do so, it will not make any further payments in cash for its purchases. Instead, it will pay in the form of non-negotiable three-year Bonds bearing, say, 3½ per cent interest (not compounded) to provide a 10 per cent premium on redemption. These Bonds will not be transferable except to the holders' national Treasury in exchange for local currency. The names of the payee and of the appropriate national Treasury will be inscribed on each Bond which will carry a warning that, in the possession of any person or corporate body other than the payee, or the named national Treasury, it will be void. That will effectively prevent these Bonds being traded at a discount.

Four Distinct Advantages

The four distinct advantages accruing the establishment of the proposed British Price Stabilisation Corporation, to which Mr. Clare Grondona has drawn special attention, are the following:

(i) The provision of the premium-free underwriting implicit in this system will greatly strengthen the administration of existing commodity price-maintenance schemes; and, equally important, it will go far to stimulate the setting up of other similar commodity agreements, each of which will take over much of the financial responsibility that may otherwise need to be assumed by the P.S.C.

(ii) Once the H.M. Government has blazed the trail, it will almost certainly be followed by other great trading nations. If, in due course, there are a number of nations each with its own Price Stabilising Corporation, the highest of the low points then offering for any commodity will represent its world floor price in terms of the relevant currency; and the lowest for any effective high points (that is, in countries then holding reserves under their P.S.C.'s auspices) will represent the world ceiling price in terms of the relevant currency.

(iii) The proposed system will stimulate the question of international liquidity in proportion to the extent to which it is required to operate.

(iv) British inauguration of the suggested Corporation—especially if soon followed by other national P.S.Cs—will be of outstanding importance in enabling backward countries to be assisted more effectively to develop their potentials as producers of basic materials, with the assurance that prices for these will not fall unexpectedly to unremunerative levels.

The price-stabilising system suggested by Mr. Clare Grondona is quite an interesting one. The system does not, of course, seek to ensure "absolute" stability of prices for commodities. For such stability, as Mr. Clare Grondona, points out, is not just possible even if it is desirable. But it can ensure, provided it is operated properly, a much more satisfactory measure of price steadiness than has thus far been achieved for the very wide range of essential commodities which have two attributes. One of these attributes is durability (in the sense that they can be held at negligible cost in modern storage without significant deterioration) and the other is convertibility into an extensive range of capital and consumer goods in widespread, and generally increasing, demand throughout the world.

SUGAR

(Concluded from previous page)

try to find out how best this interest could be served by compelling the inefficient units to reorganise themselves, produce more and bring down prices. Instead, we have here an example of the Government following a very strange control policy which helps neither the consumer nor the industry. In effect, the Government's policy threatens the very existence of the more efficient units and, as far as prices are concerned, by allowing such wide differences for reasons best known to themselves, the Government is driving the under-privileged units to losses, not of their own making. I think there is a justifiable grievance of those units which have been allocated low ex-factory prices and the earlier the Government alters its policy and revises its unwise decision, the better it would be for the consumer as well as the industry.

The controls have helped no one. The consumer has actually been hard hit. Before the imposition of controls, he was getting sugar at a price ranging between Re. 1.15 and Re. 1.40 per kg. In several areas, he has now to pay more than Rs. 3.50 per kg. The meagre ration that one gets also costs him about Re. 1.30 to Re. 1.70 per kg., according to different areas. There is, therefore, a strong case for scrapping the controls altogether.

RUBBER SITUATION IN INDIA

PROSPECTS FOR NATURAL RUBBER BRIGHT

THE problems facing the rubber industry in India differ widely from those pertaining to the world rubber economy. Whereas the world rubber economy is characterised mainly by competition between natural and synthetic rubbers, the problem in India is one of bridging the wide gap that exists between the demand for and production of rubber. The total production of rubber (both natural and synthetic) has no doubt increased quite markedly in recent years, but the consumption has grown at a much faster rate, so much so the annual deficit in supply is pretty huge, being of the order of about 35,000 tonnes. Thanks to such a huge deficit, the country continues to spend much precious foreign exchange on imports of natural and synthetic rubber. The aggregate value of imports (of natural, synthetic and reclaimed rubber) during the financial year 1963-64 amounted to Rs. 9.75 crores. Considering the large-scale dependence on imports and in the context of the persistently expanding capacities in the rubber goods manufacturing industries, the need for sustained effort to step up domestic production by replanting, adoption of better cultural practices (including effective plant protection measures), etc., cannot be stressed too strongly.

That the prospects for natural rubber are thus very bright, notwithstanding the manufacture within the country of synthetic rubber, has been most forcefully brought out by Dr. Rama Varma, the retiring Chairman of the Rubber Board. Here is what he said while addressing the members of the Board recently:

"It is estimated that there are more than 52,000 uses of rubber. In an automobile alone, there are 280 to 330 rubber parts, and new uses of rubber are being regularly found. In India, the potential demand for rubber is large. We are on the threshold of an industrial revolution. The *per capita* consumption of rubber in an industrially advanced country like the U.S.A. is 18 lbs. while in India it is as low as 0.3 per cent. Still in India, the gap between demand and the domestic production of natural rubber is at present about 35,000 tonnes. By 1970, the demand is estimated to increase to 167,000 tonnes, while the domestic production of natural rubber may reach 62,000 tonnes. By adopting better cultural practices including effective plant protection measures, it may, perhaps, be possible to step up the production by 8,000 tonnes more. Still the gap between demand and domestic production of natural rubber will remain large. To meet this gap only one synthetic plant with a capacity of 30,000 tonnes has been established so far. A letter of consent has been issued to a party to explore the possibilities of establishing another plant with a capacity of 25,000 tonnes. The details of technical collaboration, foreign exchange requirements, etc., of this project have not been finalised. This plant is not likely to go into full production before 1968 by which time the demand is expected to increase to 148 thousand tonnes and the natural production to 57 thousand tonnes. Even if both these synthetic plants are in full production in 1968, the gap between demand and the production of synthetic rubber will be 93,000 tonnes, whereas the domestic production of natural rubber would only be 57 thousand tonnes. There is, therefore, no need to get concerned about the market for natural rubber in the country."

Technical Angle

Even from a technical angle, natural rubber, as Dr. Rama Varma rightly stated, has certain advantages over the types of synthetic rubber that would be available in India. The Bareilly plant is engaged in the manufacture of S.B.R. and the new unit expected to be licensed is to produce polybutadiene. The tyre industry accounts for about 65 per cent of the total consumption of rubber. In India, the ratio of car tyres to truck tyres is 33:67, whereas in the U.S.A., it is 90:10. Since S.B.R. is used mostly for passenger car tyres, it has a relatively lesser use in this country. It is estimated that the potential displacement of natural rubber by polybutadiene may not exceed 13 per cent of the total natural rubber consumption. With the high ratio of truck tyre production in this country, neither S.B.R. nor polybutadiene at their present state of development is going to be a real threat to natural rubber.

Cost Aspect

There is also the cost angle. Dr. Rama Varma alluded to certain handicaps for the manufacture of synthetic rubber in this country, mainly because of the huge costs involved. India does not possess necessary technical know-how. Large foreign capital may be required to import plant and machinery and the refining capacity is also limited to undertake large-scale expansion of petro-chemical-complex. As long as these handicaps are there, any new synthetic plant which is likely to be put up, is going to have high capital cost as compared with similar plants in the industrially advanced countries. This would reflect on the cost. In this context, it is appropriate to mention that the Indian price of natural rubber itself is 50 to 60 per cent higher than the price in Malaysia and Ceylon. As the economy of the South East Asian countries is largely dependent on rubber, it may be difficult to stop imports from these countries completely without repercussions on our exports to those countries, particularly when natural rubber prices in those countries are gradually declining.

No Cause for Complacency

The foregoing analysis will show that, either from the demand side or from the technical point of view or from the cost angle, the market for natural rubber would appear to be assured in the foreseeable future. There is, however, no cause for complacency. Indeed, the natural rubber producer must remain on the alert. Emphasising this aspect, Dr. Rama Varma recalled the meeting of the International Rubber Study Group's Development and Trade Committee held at Tokyo in May last and drew pointed attention to the considerable expenditure on research and development in the synthetic rubber industry. Though it has not significantly changed the present competitive relationship between natural rubber and synthetic rubber, it has served to consolidate an enhanced acceptability of synthetic rubber in many usages. To a consumer, the synthetic rubber offers two advantages. First, he can get his raw material at a uniform quality. Further, the synthetic rubber producer sells his product direct to the consumers and offers better technical service. Secondly, synthetic rubber prices are not subject to wide fluctuations due to speculative buying and selling.

Rubber Fabricators

Another point that has to be borne in mind, according to Dr. Rama Varma, is that the rubber fabricators are getting directly interested in the manufacture of synthetic rubber and today 38 per cent of the world capacity for the production of synthetic rubber is owned by rubber fabricators. The plant which has been established in India is in collaboration with a tyre company. To quote him:

"The close tie up between producers of synthetic rubber and the rubber fabricators will give synthetic rubber an edge over natural rubber when keen competition starts. It is also possible that, when there is no strong competition, synthetic rubber producer may be able to adopt a price policy by which he can depreciate his assets in a shorter period than at the normal rate, and later bring down his price to meet any competition which may eventually arise. In the natural rubber industry as labour cost constitutes 46 per cent of the total cost of production, writing down of capital cannot have the same effect on prices as in a capital intensive industry. In an industry like rubber where there is such a large number of smallholders, it is not reasonable to expect that depreciation will be provided and such amounts set apart for replanting when prices are highly favourable. High prices will only help to raise the standard of living of smallholders."

The bulk of the natural rubber output in India comes from Kerala, where the climate is considered to be ideal for rubber cultivation. Any major effort to boost production is, therefore, to be concentrated in this region. The two serious impediments that lie in the way are the existence of numerous small holdings and lack of finance. The accompanying table shows how the non-corporate sector is gaining in importance creating a problem for the rubber industry, that is, fragmentation of holdings.

Rubber Estates and Holdings in India

Classification	1959		1963		Rise (+) or fall (—) in area (per cent)
	No. of estates	Area in acres	No. of estates	Area in acres	
ESTATES (Above 50 acres)					
Public Limited Cos.	129	74,753	132	74,143	(—) 0.8
Private Limited Cos.	9	2,013	19	4,324	(+)114.8
Individual	359	47,440	449	61,938	(+) 30.5
HOLDINGS (50 acres and below)					
11-50 acres	2,537	52,291	3,410	69,698	(+) 33.3
6-10 acres	3,843	27,920	5,428	40,041	(+) 43.4
5 acres and below ..	43,405	82,150	57,524	110,998	(+) 35.1
Total ..	50,282	286,567	66,962	361,142	(+) 26.0
Production (in metric tons) ..	—	23,772	—	37,200	(+) 56.5
Yield per acre (in lbs.)	—	183	—	230	(+) 25.6

Thus, the entire rise of 26 per cent in area under rubber between 1959 and 1963 has taken place in the non-corporate sector, while the area under the corporate sector has actually declined. Very little attention, according to Dr. Rama Varma, has been devoted to the economic consequences of this development. In 1963, there were 57,524 small holdings, of five acres and below, the average size of which was less than two acres. The presence of this fragmentation rules out the possibility of any organised effort to raise output by improved and scientific methods. How to keep the non-corporate sector together is a basic problem facing the rubber industry. "The solution to the problem," to quote Dr. Rama Varma, "cannot be found by mere legislation. Here is a human problem arising out of the pressure of population on land. Elucidating this point, Dr. Varma made the following interesting observations:

"We are passing from a feudal to an industrial economy. The impact of large-scale industrialisation on the basic values of life will have to be faced. In a labour-intensive industry like plantations, employer-employee relationship is most important. The joltings of transition are already being felt. In an industrial society which we are trying to build up, the progress of this industry like that of all other industries will depend on how science could be brought to its aid. For that, a new outlook is necessary."

Dr. Rama Varma has just stated the problem. He has not offered any constructive solution. We wish he had given some details as to how this problem could be tackled in the light of his own experience as the Chairman of the Board. He was, however, candid enough to admit that the replanting programme had not progressed satisfactorily, though he said that the programme was now getting momentum and that the actual output was likely to exceed even the target fixed for each year after 1965. A disconcerting feature about the programme, we are told, is that, while some estates replant at a fast rate others hardly do any replanting. This tendency, if allowed to persist, will, as Dr. Rama Varma rightly pointed out, give rise to certain peculiar problems. For instance, after some time, either the units that are not falling in line will have to go out of production or prices will have to be fixed on the basis of their costs. If costs are to be kept down, it is necessary through persuasion or other means to make every rubber producer join hands in the replanting programme.

Yield Per Acre

It is true that the per-acre yield of rubber in India has gone up in recent years, but the average yield continues to be poor *vis-a-vis* that obtained in other countries, especially Malaya. Referring to this issue, Dr. Rama Varma said:

"Considerable progress has been made in developing high yielding plants. There are clones which could yield as high as 3,000 lbs an acre. To reach an average estate yield of 1,500 lbs. is not a difficult thing with the different planting materials available at present. In India itself, we have instances of getting more than 1,500 lbs. per acre where high yielding planting material is used. One medium size estate of about 300 acres which is maintaining its records properly has reported an average estate yield of 1,300 lbs. There are small holdings who have replanted under the Board's subsidy scheme getting a yield of 800 lbs. in the second year of tapping. If a 1,000 lbs. yield could be obtained in an estate, it should be possible to bring down the cost to about Re. 1.10 nP per kg. On the basis of that cost, if natural rubber could be sold at Rs. 2 per kg., there is no possibility of synthetic rubber competing with natural rubber."

The scope for raising per-acre yield of rubber is pretty vast. It may not be possible to attain the high yields obtained in Malaya at any rate in the next few years. But significantly larger yields can be obtained if replanting is done systematically and new planting developed with high-yielding material.

RUBBER IN MALAYSIA

The Malaysian Minister for Commerce and Industry, Dr. Lim Swee Aun revealed at Kuala Lampur the other day that every pound of natural rubber produced in Malaysia had been sold. He, however, cautioned by saying that, in view of competition from synthetic rubber, the country could no longer afford to adopt the attitude of "take it or leave it." He emphasised the need for some positive steps to stem the tide of synthetic rubber, and suggested the introduction of a new method of grading natural rubber as a first measure. Referring to the disease in rubber trees, he said that, when the trees suffer from root diseases, however well manured and well planted a clone might be, it was useless. This, he declared, should be cured by proper research so that knowledge and foresight could replace labour and expense. Mr. Aun urged the natural rubber industry to undertake research and development programmes in order to exploit fully the high potentialities of the product. If the research programme was well planned, he said, it would unquestionably prove to be one of the soundest investments made.

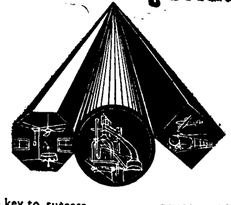
SYMBOL OF QUALITY



Quality is the key to success and development of industries. Use of quality products reduces cost of production, maintenance and overhead charges. That is why, the demand for N.P.T. products are growing more and more every day. This increasing demand surely proves that N.P.T. stands as a symbol of quality.

RANGE OF PRODUCTS:
Bars—Rounds, Hexagonals, Squares & Flats, Sections, Pipes and Tubes of Brass & Copper including Arsenical Copper, Copper Bus Bars, Strips and various other non-ferrous Semis.
N.P.T also roll pure Lead and Electrolytic Zinc Sheets.

DEPRECIATION ON BUSINESS BUILDINGS—I

SOME PROBLEMS IN INCOME-TAX ASSESSMENT

By Premjus Roy

AN interesting matter recently came up before the Delhi Bench of the Income-tax Appellate Tribunal. The appellant was Kailash Motors of Dehra Dun. The firm was a dealer in Tata-Mercedes Benz trucks and their spare parts and accessories, and also maintained a factory for repairing and servicing the trucks sold. The assessee claimed depreciation on the cost of the buildings, which were shown by the assessee in its balance-sheet as Rs. 2,80,356, including the cost of land amounting to Rs. 1,01,254. In making the firm's assessment to income-tax, the Income-tax Officer excluded the cost of the land and allowed depreciation only on the cost of the superstructure amounting to Rs. 1,79,102. As the assessee's claim on this point was rejected in the first appeal, the matter was brought before the Income-tax Appellate Tribunal in a further appeal. The two members of the Tribunal having differed, the matter was referred to the President of the Tribunal who has allowed the assessee's claim.

It is proposed to discuss in this article the various arguments for and against the allowance of depreciation under Section 32 of the Income Tax Act, 1961 (old Section 10(2) (vi) of the Income Tax Act 1922) on buildings inclusive of the cost of land. It will be seen that for deducing taxable income from business Section 32 of the Income Tax Act, 1961, permits deduction for depreciation on certain assets as under:

"32. *Depreciation.*—(1) In respect of depreciation of buildings, machinery, plant or furniture owned by the assessee and used for the purposes of the business or profession, the following deductions shall, subject to the provisions of Section 34, be allowed:

(i) * * * *

(ii) in the case of buildings, machinery, plant or furniture, other than ships covered by clause (i), such percentage on the written down value thereof as may in any case or class of cases be prescribed;"

The words used are "Depreciation of buildings, machinery, plant or furniture owned by the assessee and used for the purposes of the business or profession." If the buildings are not owned by the assessee, depreciation is not allowable. Also, if the buildings are not in fact used for the purposes of the business, again no depreciation will be allowable. Of course, Section 38(2) of the Act prescribes that where any building, machinery, plant or furniture is not exclusively use for the purposes of the business or profession, but is only partly used for business, depreciation allowable will be restricted to a fair proportional part of the depreciation which was otherwise allowable under the Rules.

What is Meant by "Building"?

The point for consideration is, what is the plain grammatical meaning of the word 'building,' that is, whether it means only the superstructure or whether it includes also the land attached to the superstructure. In common parlance 'building' means not only the superstructure but also the land which such superstructure encompasses or encloses. When one says he has bought a building, he obviously means, and will be understood to mean, that he has bought the building including land. If the legislature desired to restrict the allowance for depreciation, it would have used the words 'superstructure' or 'edifice,' instead of the word 'building.' In Webster's New International Dictionary (1949) Edition, the meaning of the word 'building' is given as follows:

"That which is built specf: A. As now generally used. a fabric or edifice, framed or constructed, designed to stand more or less permanently, and covering a space of land, for use as a dwelling. store-house, factory, shelter for beasts, or some other useful purpose."

The interpretation of the word 'building' directly arose in the case of *Corporation of the City of Victoria* vs. *Bishop of Vancouver*, reported as A.I.R. 1921 E.C. 249. The Corporation sought to impose municipal tax on the land on which a church stood, on the ground that the exemption granted to church building applied to the superstructure and not to the land on which the superstructure was erected. The Privy Council held that the exemption applied to the church building, including the superstructure and the land. Lord Atkinson, who delivered the judgment, observed that the word 'building' as used in ordinary language comprises not only the fabric of the building but also the land on which it stands. He further stated as under:

"The thing most necessary for the use of the Cathedral as a place for public worship is that the congregation which frequents it should be able to stand or kneel upon the ground embraced within its walls and forming the floor of it, or sit upon chairs resting upon that floor. The use of the floor is infinitely more essential than the use of a roof. In fact, it is as impossible to conceive the public worship of God being carried on in a building without the use of the land which it embraces within its walls, as it is impossible to conceive walls existing without the support, direct or indirect, of the soil of the earth."

Rule of Interpretation

It is the primary rule of interpretation of statutes that the meaning of the legislature is to be sought in the actual words used by it, which are to be interpreted in their ordinary and natural meaning. It is not within the province of the court to depart from the plain meaning of the expression used in the statute and to interpose contrary views of its own as to what is just and expedient. In *Gurmukh Singh* vs. *Intizima Gurudwara Bhai Sewa Singh*, A.I.R. 1942, Lahore 19 F.B., it was observed by the court that, when the words used in the statute are plain and unambiguous and admit of one meaning, a court is not at liberty to speculate on the intention of the legislature and to construe them according to its own notion of what ought to have been enacted. Lord Fiend in *Cok* vs. *Hakes* (1890) 15 A.C. 506, states thus: "Now the admitted rules of construction, from which I am not at liberty to depart, lay down that I cannot infer an intention contrary to the liberal meanings of the words of a statute unless the context or consequences, which would ensue from a liberal interpretation, justify the inference that the legislature has not expressed something which it intended to express, or unless such interpretation leads to any manifest absurdity or repugnance." Again, in *Commissioner of Sales Tax U.P.* vs. *Modi Sugar Mills*, A.I.R. 1961, S.C. 1047, it was observed that, in interpreting a taxing statute, equitable considerations are entirely out of place. Nor can taxing statutes be interpreted on any presumptions or assumptions. The courts must look squarely at the words of a statute and interpret them. It must interpret a taxing statute in the light of what is clearly expressed; it cannot imply anything which is not expressed; it cannot import provisions in the statute so as to supply any assumed deficiency. But where the words of a statute are precise and unambiguous in themselves, these words should be expounded in their natural and ordinary sense.

It would thus appear that having regard to the plain ordinary meaning of the word 'building,' if a businessman owns a building and uses it for his business, he will be entitled to depreciation under Section 32 in respect of that building, the value of the building comprising the value of the superstructure and the land thereunder. But the further question is whether this interpretation of the word 'building' is repugnant to anything either in this section or in the Act. As observed in *Badsha Mia* vs. *Rajab Ali*, A.I.R. 1946, Cal. 348 F.B., in interpreting statutes the words of a statute are always supreme and effect must be given to them when the meaning is plain, whatever the consequences, except in one case. The one exception is the case of repugnance to another part such as makes that part void or frustration of the very part where the words occur. But mere injustice or inconvenience will not justify departure from the plain meaning, for such matters are for the legislature, and not the court, to consider; nor can other parts of a statute be drawn upon to the same extent as in days when statutes were not expressed in a number of separate sections.

Income from House Property

To examine this question of possible repugnance of the word 'building' as meaning superstructure and land, a number of other provisions in the Income Tax Act might be examined. The first provision to examine is Section 22 of the Income Tax Act, 1961, which reads as under:

"22. *Income from house property.*—The annual value of property consisting of any buildings or lands appurtenant thereto of which the assessee is the owner, other than such portions of such property as he may occupy for the purposes of any business or profession carried on by him the profits of which are chargeable to income-tax, shall be chargeable to income-tax under the head 'Income from house property.'"

What is chargeable to income-tax under this section is "annual value of property consisting of any buildings or land appurtenant thereto," and exception is made for "such portions of such property as he may occupy for the purposes of any business." Now, the words "such property" mean, as defined earlier in that section, "property consisting of any buildings or lands appurtenant thereto" and this is the only meaning these words are capable of. In other words, buildings (including land appurtenant thereto) which the assessee occupies for purposes of his business fall to be taxed under Section D of Chapter IV styled "profits and gains of business or profession," while all other buildings (including land appurtenant thereto) are chargeable under Section 22 under the head "income from house property." It is thus clear that property to be charged, whether under Section 22 in the case of non-business property, or under Section 28 in the case of business property, means buildings or lands appurtenant thereto. It is not that property for the purpose of chargeability under Section 22 means buildings and lands appurtenant thereto, and for the purpose of Section 28 means buildings, excluding lands appurtenant thereto.

The next relevant provision to be examined is clause (iii) of sub-section (2) of Section 56 of the Income Tax Act, which states that "income from other sources" includes—

"(iii) where on assessee lets on hire machinery, plant or furniture belonging to him and also buildings, and the letting of the buildings is inseparable from the letting of the said machinery, plant or furniture, the income from such letting, if it is not chargeable to income-tax under the head 'profits and gains of business or profession.'"

What this provision states is that in the case of composite letting of buildings along with plant and machinery or furniture, the rent received for the use of both buildings and other assets will be taxable under Section 56 as "income from other sources." There is no provision for separating the rent of the land, which inevitably goes with the building. Where such composite letting does not amount to business, even the rent from a building belonging to the assessee is not treated under Section 22, but is to be treated under Section 56, and all allowances and deductions permissible under Section 56 have to be allowed, including allowance for depreciation under Section 57(ii) read with Section 32(i) of the Income Tax Act.

Permissible Deductions

We may next examine Section 30 of the Income Tax Act, which permits all deductions for rent, rates, taxes, repairs and insurance for premises used for the purposes of the business or profession. The heading of Section 30 is "Rent, rates, taxes, repairs and insurance for buildings" while this section itself uses the words 'premises.' It is obvious that 'premises' and 'buildings' are used as interchangeable terms, as in fact they are interchangeable. The word 'building' is specifically used in Section 32, because in Rule 5 of the Income Tax Rules, 1962, which relates to depreciation, the word used is 'buildings.' It is obvious that the allowance under Section 30 for rents, rates, taxes, repairs and insurance for buildings, used for the purposes of the business or profession, would be available for buildings including not only the superstructure but also the land appurtenant thereto, and it is inconceivable that the Income-tax Officer would try to argue that buildings mean only the superstructure and hence any rent or taxes pertaining to land attached to the building will not be treated as an allowable deduction under that section. In fact, "land revenue" which is a specific deduction under clause (b) of Section 30 can refer to land alone, and not to the superstructure. It would be useful in this connection to refer to the case of *Commissioner of Income Tax* vs. *Ranjit Singh* (1955), 28 I.T.R. 14, in which it was argued on behalf of the Commissioner that for the purposes of claiming repairs to roadways, roadways cannot be regarded as buildings. This argument was not allowed by the High Court to be raised, as it was not so raised before the Tribunal. Justice Falshaw observed (at p. 21): "The use of the words 'hotel premises' in the question framed by the Tribunal confirms that there was no dispute between the parties before it that the roadways were regarded as being attached to or forming (posessing) a part of the buildings, and it certainly cannot be denied that in the case of a business of the nature of the hotel and restaurant business roadways and spaces for the parking of cars are an essential part of the business."

It would also be helpful to quote the following extracts, stating the meaning of 'premises' in Law Lexicon by P. Ramanatha Aiyar (1940) Edition:—'Premises' includes land and everything appertenant thereto. 'Premises' is commonly used as comprising land, houses and other matter. Either 'tenements' or 'premises' will be sufficient to include land .... 'Premises' .... is used both in law and in common speech to indicate lands and tenements .... 'Premises' in popular language, frequently means, Buildings (Section 4 Bombay 168 (F.B.) .... The popular acceptation of the word 'premises', according to Sweet's Law Dictionary, and Wharton's Law Lexicon, is that it includes land. The same definition is given in Johnson's Dictionary, 12 Bom. L.R. 669.

It would thus appear that, as the word 'premises' includes the superstructure as well as the land, so does the word 'building'.

(To be continued)

CASES AGAINST MANAGERIAL PERSONNEL OF COMPANIES

The Government of India has, under Section 10A of the Companies Act, 1956, constituted a tribunal, with Mr. B. N. Gokhale, a retired High Court Judge, as Chairman and Mr. G. Mathias, a senior officer of the Indian Audit and Accounts Service, as member, to enquire into the cases against managerial personnel of companies which may be referred to it by the Central Government, and also exercise and discharge all or any of the powers and functions conferred on the courts by or under Section 155, Section 203 insofar as it relates to the granting of leave under that section, Section 240 and Sections 397 to 407 of the Act. The powers and functions mentioned above have been transferred to the tribunal with effect from the 1st inst. These powers and functions relate to the following matters:

Rectification of the register of members and the register of debenture-holders of a company;

granting of leave to persons to manage companies in cases where they have been restrained from doing so by orders of the court;

compelling certain persons to produce documents and requiring them to appear before an Inspector appointed by the Central Government to investigate into the affairs of a company, and ordering examination on oath of a person whom the inspector has no power to examine on oath; and

granting relief in cases of oppression of any member or members of a company or mismanagement of the affairs of a company or where the affairs of a company are being conducted in a manner prejudicial to public interest.

The district courts or the high courts, as the case may be, shall not exercise the powers and functions conferred on them in relation to the above matters with effect from the 1st inst. By virtue, however, of sub-section (5) of Section 10A of the Act, these courts shall continue to exercise the powers and functions in relation to any proceedings arising out of these matters pending before them immediately before the said date.

SOVIET BLOC'S FOREIGN OPERATIONS IN OIL

UNDERDEVELOPED COUNTRIES RECEIVING PRIORITY ATTENTION

NOT surprisingly perhaps, Western attention has recently been focussed on the spectacle of the Soviet Bloc's rising exports of crude and products, rather than on their exports of techniques and equipment. Now at an annual rate of well over 30 million tons, deliveries of oil to the free world from the U.S.S.R. and other Communist countries have played a decisive part in increasing the intensity of competition in many markets. And they will no doubt expand still further, albeit at a smaller pace than a few years ago.

Exports of techniques and equipment are, by comparison, hampered by the urgent need to develop the highly promising indigenous oil and gas reserves in the U.S.S.R., and to set up transport, refining and distribution facilities all over the Soviet Bloc. Indeed, the Communist countries have recently endeavoured to supplement their own output of steel piping, tankers and various types of oil industry equipment with imports from a variety of Western sources. But these developments cannot hide the fact that the U.S.S.R. and its East European satellites are now also participating to an increasing extent in the build-up of oil industries in the less developed areas of the non-Communist world.

The U.S. National Petroleum Council, in its latest survey of Soviet Bloc oil, estimates that between 1959 and 1961 the Soviet Union gave credits to various underdeveloped countries for the purchase of 55 complete drilling rigs, while over 700 Soviet geologists have recently been active in the non-Communist world, not counting more than 200 in Cuba. Furthermore, as is shown in the accompanying table, the U.S.S.R. and other East European countries have in recent years completed refineries in three developing countries, with a combined annual capacity of 2,750,000 tons, and they are presently engaged on orders for five further refineries, with prospective capacity of 7,000,000 tons. Also, a number of nationals in the developing countries are being trained for work in the oil industry.

The Russians, and the other East Europeans, do not, as a rule, engage in foreign operations on their own account. Instead, they usually grant highly favourable loans to local State organisations for the purchase of the appropriate equipment or services. The loans are mostly for periods from 12 years upward; the normal interest rate is as low as 2½ per cent annually; and repayment can be made in convenient forms —often through the export of local produce. These terms are obviously attractive to the recipients, although the scale of this aid is in most cases inadequate, and much smaller than the amounts that might be available, in the form of risk captial, from Western oil companies.

One territory where recent Russian operations do not comply with this general pattern is the Arctic island of Spitsbergen. The island is, of course, under Norwegian sovereignty, but is geographically close to the U.S.S.R., and a Soviet State organisation, Arktik Ugol, is locally engaged in coal mining under a special licence. In the past two years, Arktik Ugol has also carried out fairly exetnsive preliminary search operations for oil and other minerals, but Norway has now for the second time rejected a request for the grant of a formal oil search concession.

Another special type of agreement has recently been made with Afghanistan, where the U.S.S.R. will provide technical assistance to the State in the development of natural gas. The gas had been discovered by Soviet crews working for the Afghan Government in the north of the country. A production of 2,000 million cu. m. a year is foreseen by the end of 1966, to be expanded later, and a large part of this output—initially about three-quarters—will be exported to the U.S.S.R. through a new pipeline. Some oil has also been discovered in the north, and exploration with Russian technical assistance is continuing.

Elsewhere, the Russians do not seem to be motivated by the prospect of obtaining oil and gas for themselves but rather by a desire to gain local goodwill and to demonstrate that they can be as effective in international oil operations as the Western oil companies. Their efforts have met with a fair measure of success, above all, in India where oil has been designed as a sphere in which the public sector should have a controlling interest, and where exploration over most of the country has been reserved for many years to the Government's Oil and Natural Gas Commission. The Commission operates largely with the help of equipment and technicians from the U.S.S.R., and with Russian-trained Indian technicians; it has discovered an important oilfield at Ankleshwar in Gujarat (with a potential production of 2,000,000 tons a year), but even with Russian aid, it lacks the resources for an intensive search effort in the whole of its vast territory.

The Indian Government has also purchased three refineries from Russia and Rumania, the first of which is already on stream, while the others are nearing completion. Their combined capacity by the end of 1965 will be close on 5,000,000 tons, and later extensions are envisaged. However, there have lately been complaints about defective workmanship and excessive construction costs, and it is perhaps significant that the Government has now decided to erect further refineries in partnership with Western companies instead of relying on Russian or other East European assistance.

Also in the Indian sub-continent, the U.S.S.R. early in 1961 made an aid agreement with Pakistan, which provided for an oil exploration loan of over £10 million, giving the Russians their first economic foothold in that country. The Pakistan Government's Oil and Gas Development Corporation, with Russian assistance, is now in fact carrying out surveys in both East and West Pakistan.

Refineries Built with Soviet Bloc Financial and Technical Aid

(All the refineries are owned and operated by local Government Entities)

Location	Assisted by:	Crude capacity (Thousand metric tons p.a.)	Completion
I. *Refineries in operation:*			
Syria—Homs	Czechoslovakia	1,000	1959
India—Gauhati, Assam	Rumania	750 (a)	1963
Egypt—Alexandria	U.S.S.R.	1,000	1963
		2,750	
II. *Under construction or firm projects:*			
Egypt—Suez	U.S.S.R.	1,000	1964
India—Barauni, Bihar	U.S.S.R.	2,000 (b)	1964
India—Koyali, Gujarat	U.S.S.R.	2,000 (b)	1964-65
Indonesia—Tjepu, Central Java	Rumania	1,500	Uncertain
Ethiopia—Assab, Red Sea	U.S.S.R.	500	Uncertain
		7,000	
Grand Total		9,750	

(a) Later extension to 1,000,000 has p.a. envisaged.
(b) Completion in two stages; later extension to 3,000,000 tons p.a. envisaged.

In Burma, Rumanian teams started exploratory work last year, and the nationalised People's Oil Industry is now understood to have made arrangements for drilling with Rumanian esuipment, helped by Rumanian crews.

In Ceylon, where a Government agency has recently assumed sole responsibility for inland sales of all major petroleum products, it is understood that Czechoslovak and Rumanian Govment organisations are among the bidders for a contract to erect the country's first, Government-owned, refinery.

Farther east, Rumania in October 1962 agreed to grant a $50 million credit to Indonesia, most of which will be used for a 1½ million ton refinery at Tjepu in central Java, and for the rehabilitation and exploration of oilfields, also in Java.

There have been various Russian-sponsored development projects in the sensitive area of the Middle East, some of them directly concerned with oil. Russian crews have in recent years been carrying out a certain amount of exploratory work, for local State organisations, in North-Eastern Syria, as well as in the Khanaqin area (i.e., outside the I.P.C. concessions) in Iraq, and also in Egyptian territorial waters where, however, the State has since awarded exploration concessions to Western interests. The Syrian venture is in the remote area of the country where there were previous discoveries by American and German interests; it is understood that the Russian-assisted search has resulted in more discoveries, but no decision has so far been made on the exploitation of these various finds.

As to refineries, the Russians completed, over a year ago, a 1,000,000 ton distillation unit at Alexandria in Egypt, and a unit of similar size is nearing completion at Suez. Syria's first refinery, built by a Czechoslovak State organisation, was completed at Homs nearly five years ago and is stated to be operating well, though there are complaints about long delays in the delivery of spare parts from Czechoslovakia. Another Czechoslovak project, for a 2,000,000 ton refinery at Basra in Iraq, has been shelved as it is regarded as economically unnecessary until about 1970.

In Africa, outside Egypt, the main Russian oil venture is the planned erection of Ethiopia's first refinery—a 500,000 ton State-owned plant at Assab on the Red Sea. Construction was to start early last year, but it has recently been stated that work on the blueprints has only just begun. There have also been geological surveys by Russian crews in Ethiopia, as well as in Mali, chiefly in the North-East. From Ghana it is reported that Rumanian crews have located oil showings both in the West and the North of the country.

The Russians and their satellites are not taking any direct part in oil industry operations in Algeria, but the U.S.S.R. has recently promised, *inter alia*, to build a local institute of petroleum and a technical college for 2,000 students. This arrangement is no doubt designed to strengthen the hands of the Algerians in their dealings with the French.

In the Western Hemisphere, Soviet geologists have recently surveyed the oil possibilities of Brazil (under a contract with Petrobrás) and of British Guiana (under United Nations auspices). In both cases they seem to have made highly optimistic, perhaps overoptimistic, assessments. In Brazil, they actually recommended further exploration in the coastal belt from Sergipe to Rio Grande do Sul, pointing out that crude oil production could be quadrupled with improved techniques, to as much as 20 million tons annually in five years' time. In British Guiana, according to Radio Moscow, they found evidence of the presence of extensive oilfields, and the local Government has now applied for United Nations aid towards the cost of an offshore survey. The Argentine Y.P.F. has in recent years obtained drilling equipment from the U.S.S.R., while Petrobrás has recently arranged for the purchase of 14 rigs from Rumania.

The significance of the Soviet Bloc's economic penetration, skilfully directed towards a few selected areas, lies primarily in the fact that it may strengthen the inherent economic nationalism in the countries concerned: the illusion is created that the state, with Soviet assistance, can develop the national resources without any interference from Western capital. The terms offered by the Russians for their development aid may often sound generous, but, by fostering this type of illusion, Russian aid may acutally become a factor hampering rather than furthering the rapid development of a country's native resources.—*By Special Arrangement with Petroleum Press Service.*

O.E.C.D.'S NEW REPORT ON OIL

The proved world oil reserves of 45 billion tons would last for about 36 years at the present rate of oil consumption. Moreover, in the past, proved reserves have never failed to grow at a rate at least matching the growth of consumption. There is no reason to fear that exhaustion of world reserves will lead to a physical shortage of oil in the period for which reasonably accurate forecasts can be made. This is one of the important conclusions reached by the O.E.C.D. Special Committee for Oil in its new report "Oil Today (1964)," just published. The report reviews the main features of oil consumption and supplies in the O.E.C.D. Area from 1959 to 1962 and discusses a number of questions which are relevant to the future.

World crude oil consumption increased from 1,000 million tons in 1959 to 1,200 million in 1962, a rise of 20 per cent. In the same period, natural gas consumption rose by 30 per cent, from 430 billion cubic metres to 560 billion. In the O.E.C.D. European Area, the consumption of oil products rose by 54 per cent between 1959 and 1962, from 157 to 241 million tons, that is, a rate of increase twice as large as the world rate. The share of liquid fuels in the total consumption of energy rose from 31 to 39 per cent. In the United States, the consumption of oil products was 438 million tons in 1959 and 478 million in 1962. In Japan, whre energy consumption more than doubled over the decade 1950-60, the share of oil increased enormously, from 5 to 34 per cent.

North America remains the largest single oil-producing area but the rising production of other areas continues to reduce its share of world production (from 38 per cent in 1959 to 32 per cent in 1962). The Middle-East now accounts for 25 per cent of world production, as compared with 22 per cent in 1959. The U.S.S.R., with its associated nations, has continued to increase its share of world production.. Over the period from 1959 to 1962, its share rose from 15 to 16 per cent. Although Africa contributed in 1962 only three per cent of total world crude oil supplies, it is increasingly important as a supplier to Europe.

At the end of 1959 the European refinery capacity was 194 million tons, and 271 million at the end of 1962; by the end of 1965, it is expected to rise to at least 390 million tons. In North America refining capacity, like consumption, has increased at a slower rate than in Europe. The amount of oil transported by sea rose throughout the world by 40 per cent between 1959 and 1962 (640 million tons in 1962); Europe and North America account for well over half of this trade.

The capital requirements in the domain of oil are extremely large. The gross capital investment per employee is close to $87,000, higher than for any other major industry. During the decade ending in 1962, the world's capital and exploration expenditures for oil (exclusive of the Sino-Soviet Area) totalled $106 billion. The oil industry has demonstrated that it can generate internally and finance externally the capital necessary to supply the world's oil needs. As long as the investment climate remains favourable, the industry should be able to supply the capital necessary to finance the growth of the coming decade, concludes the report.

ECONOMICS OF MAJOR IRRIGATION

Apropos Mr. S. Ramayya's article entitled "Economics of Big Irrigation Projects," published on page 1066 of *Commerce* dated 20th June 1964, Mr. R. A. Deshpande writes from Bangalore as follows:

"While one can agree with Mr. Ramayya's conclusions that all big irrigation projects costing above Rs. 10 crores should be financed by the Centre, one cannot accept his social cost analysis of major irrigation projects or the capital-output ratio as worked out by him. I would like to question some of the basic assumptions made by him.

"The assumption that a major irrigation project costing Rs. 150 crores can be a single irrigation project is not correct. Invariably it would be an irrigation-*cum*-hydro-electric project or irrigation-*cum*-flood protection scheme. Hence, while assessing the economics of major irrigation projects, the social costs and benefits under all its aspects will have to be taken into account.

"Secondly, when irrigation has been introduced to any area, there would generally be two crops either of the same type or of two different types. In the example given by Mr. Ramayya, he has estimated that the net output of one crop of rice would be about Rs. 50 crores in the region. Along with this one crop, one should be able to raise another crop of rice or some other cereals and the net return if not double, would at least be increased by 60 per cent, granting that the other crop is not rice but some other cereal. Hence, the return would not be just Rs. 50 crores. It would not be less than Rs. 80 crores in any event, if full and positive irrigation facilities are availed of.

"The cost of improvement of lands to make them fit for irrigation at Rs. 750 per acre as assumed by Mr. Ramayya appears to be too high. Normally it is estimated that about Rs. 200-250 would be enough per acre to improve it for taking advantage of irrigation facilities. Thus the extra cost would not be Rs. 150 crores as assumed by Mr. Ramayya, but at best it would be only Rs. 50 crores.

"While assessing the irrigation benefits, one should not ignore the other all-round benefits of the irrigated area and the all-round economic development of the area. With the improvement in agriculture, the other subsidiary services like transport and communications, housing and commerce would improve and thus facilitate the all-round development.

"It is not correct to compare the investment in agriculture and industries in abstract terms. Both have their places. It should be remembered that, without a sound agricultural base, a sound industrial base cannot be built up. Both are necessary and the aim will have to be a balanced development of both sectors. If agriculture is neglected and the State depends on the imports of foodgrains, as advocated by Mr. Ramayya, that would create a dangerous situation in times of international tension. These cold facts should not be ignored while making an economic assessment.

"The application of capital-output formula for the irrigation projects is explained below by means of an illustration:

(i) Cost of the land 'A' $= x$
(ii) Cost of the annual cultivation $= y$
(iii) Annual value of crops raised $= z$
(iv) Annual rate of return on the land $= \frac{z}{x+y}$

Land 'A' after the introduction of irrigation.

(i) Cost of the land 'A' $= x$
(ii) Cost of the normal cultivation per year $= y$
(iii) Additional cost of cultivation due to introduction of irrigation $= y^1$
(iv) Annual cost of burden of irrigation including that of maintenance $= p$
(v) Annual value of crops raised $= z^1$
(vi) Rate of return on land $= \frac{z^1}{x+y+y^1+p}$
(vii) Rate of return on capital cost of irrigation $= \frac{z^1}{x+y+y^1+p} - \frac{z}{x+y}$

"If this rate of return is more than 5 per cent within a period of 15-20 years, then the project can be termed as 'productive' or remunerative.

"In view of the all-round importance of major irrigation projects for the country, I have felt it necessary to express these opinions on the adverse and unfavourable analysis made by Mr. Ramayya."

NEW PRODUCTS AND PROCESSES

Dry-Tea Sorter

NISSEN N.V., 21, Industrieweg, Kampen in Holland, has manufactured a new tea sorter machine. The feature of this sorter is that the best grades are directly separated from the coarser teas on the main sieve. It is achieved by a completely level, rotary motion, free of vibrations and incidental components. The machine comprises of two sections, namely, a conveyor mechanism and a siever with two rotating sieve trays reciprocally balanced. The speed of the rotating sieves can be regulated and stroke adjusted, and it renders the sorter suitable for a variety of products. Driven by two electric motors, this sorting machine is of robust construction, runs smoothly and needs little maintenance.

Nitrogen-filled Tyres

Special metallic carcass tyres for the Paris Public Transport Network (R.A.T.P.) have been developed by the Societe Michelin of Paris. The tyre pressure for the bearing tyres is 9 atmospheres on the driving carriages, and 6.5 atmospheres on the coupled carriages, while the steering tyres are inflated to 10 atmospheres. Nitrogen is chosen due to its being an inert gas. It is non-inflammable and will not support combustion. It diffuses less than the oxygen in the air and because of this requires less frequent inflation. Further, a gas with no oxygen content is a guarantee against aging of the rubber, which would be a drawback for tyres which have to be used for several hundred thousand kilometres and must therefore last several years.

Refined Maize

From waste resulting from the production of maize starch, a firm in Dolni Krupa of Czechoslovakia, produces a highly concentrated protein, indispensable to the human organism, called 'glutten.' The firm supplies the refined maize containing 80 per cent proteins as a semi-finished product to the foodstuffs industry and even export it abroad to Latin American countries and Great Britain. All enquiries about this product are to be made with the Czechoslovak Embassy in India.

Wool Scouring Machine

A new wool scouring machine is being produced at G.H. Michell & Sons (P) Ltd., one of Australia's largest manufacturers of wool-tops and scoured wool. It is at the Hindmarsh plant of the Company in Adelaide. The company claims that in the new machine, wool spends considerably less time in the scouring solution. This virtually eliminates fibre entanglement, which in turn means less breakage of wool in later processes such as carding and combing.

Self-serve Cigarette Machines

"Auto-serve," coin-in-the-slot cigarette vending machine, capable of holding some 700 cardboard flip-top and flat packets is being manufactured by the Electronic Industries Ltd., 161-173 Sturt Street, South Melbourne, Victoria, Australia. The machine has 22 columns and can dispense many different brands of cigarettes. It is non-electric and mechanically operated. The company says that the machine can be easily modified to take coins of other countries.

Better Greases

Improved heavy-duty greases which retain their properties even when subjected to extreme pressures and immersed in water, have been developed by Shel International Research, of 30 Carel van Bylandtlaan, The Hague, Netherlands. Consisting essentially of clay, lubricating oil and molybdenum disulphide, plus small amounts of chalk and a lead compound, they are said to be particularly suitable for use in steelworks' rolling mills, mining machinery and submerged pumps.

Use for Old Newspapers

Old newspapers are pounded up and used for house insulation in a system developed by the U.S. Insulating Sales Company, of 2,306, Edwards Street, Houston, Texas. The powdered newspaper stock is first treated to make it fireproof, then sprayed on and between walls through a mist of adhesive which makes it stick in place. A special spray gun must be used for application.

Insect-free Pools

Insects can be driven away from swimming pools, it is claimed, with repellant poured into the water. The repellant, made by Perry-Austen Manufacturing Company, of 250, Parkinson Avenue, Staten Island 5, New York, is stated to be odourless and harmless to swimmers, but gives off a vapour which drives away mosquitos, flies and other insects. Its action is said to last 24 hours.

Liquid Electrolyte Capacitors

A new range of liquid electrolyte tantalum capacitors covering the complete range of values from 33 to 470 microfarals has been announced. They have working voltages up to 75 and are of high stability while impedance at room temperatures is less than 1 ohm. Parameter changes with orientation have been greatly reduced and the design is able to withstand reverse voltages up to 3 volts and continuous operation at 150° C. Dielectric and Magnetic Division of Plessy-U.K., Wood Burcote Way, Towcester, Northants, will give any additional information required.

Light-sensitive Plastic Sheets

Plastic sheets which darken temporarily when exposed to light are said to act more quickly than glass with similar properties. They are being developed by the Space Technology Laboratories, Redondo Beach, California. The sheet is said to become opaque within a few thousandths of a second after exposure to a bright light. It recovers its transparency in a matter of seconds after the end of the flash. Tests up to 700 exposures showed no failing off in the darkening power.

Magnifying Glass

An illuminated magnifier, adjustable to any position, has been designed for intricate assembly and inspection work in the laboratory and on industrial production lines. It is also suggested for difficult examinations in medical and dental work. Glare-free, shadowless light is provided and three interchangeable lenses of varying strengths are available. Manufacturers are: Thousand and One Lamps, 386, Lee High Road, London, S.E.12.

Flaked Ice Unit

A compact, economical refrigerator that makes flaked ice automatically is saving money for many Australian restaurants, hotels, hospitals and food processors. The unit called the "Scotsman" super ice flaker, makes ice flakes (between 150 lb. and 450 lb. a day) only when they are needed. "Scotsman" units, made by the Industrial Refrigeration Division of Email Limited, 54, Burnley Street, Richmond, Victoria, Australia, are available with daily output capacities of up to 12 tons. The most popular model uses a heavy-duty ½-horse-power compressor and single-phase 240 volt A.C. power. The "Scotsman" can be installed immediately wherever there is standard plumbing and electrical power. And because it is not bulky (less than 4 ft. wide, 3½ ft. high and 2 ft. deep) it can be located exactly where needed.

Plating Solution

With a new plating solution, developed by the International Nickel Company Ltd. of U.K., nickel can be deposited at speeds far greater than those normally achieved in conventional sulphamate solutions. Deposits obtained at a current density of 400 amps./sq. ft. are soft and ductile, with moderate or low tensile stresses. At 200 amps./sq. ft., the deposits are stress-free, and therefore particularly suitable for the production of electroforms such as gramophone record stampers, and moulds and dies for the plastics industry. It is said that the new solution will in fact facilitate fuller and more rapid development of the electro-forming technique as a manufacturing process. At conventional current densities—around 50 amps./sq. ft.—the solution yields lustrous, hard, yet ductile deposits that have high compressive stress and are especially useful for the reclamation of worn engineering components. It is possible, in the same solution, to put a hard facing on a softer deposit obtained at high speed, by reducing the current density. A composite deposit achieved in this way is useful for coating engineering components that will be required to resist fatigue. Since no addition of other agents is made to the solution, control and maintenance of its composition are simple. Their agents in India are Greaves Cotton and Company Ltd., 1 Forbes Street, Bombay-1.

Material from Waste

A new material made from waste products, so tough that in some applications it can be used in place of steel, has been developed by E. A. Chamberlain Ltd., Nailsworth, Gloucestershire, England. Its main constituents are old paper bags—the type used for packing fertilisers and so forth—fibres, and plastic resins that are a waste by-product of oil refining. The material can be formed, after heating, into any shape. It has a high impact strength and good acoustic properties. It is also water-resistant. An hour's immersion in water at 50 degrees C increases its weight by only four per cent, and this resistance can, of course, be considerably increased by coatings. It takes any kind of paint, varnish, or lacquer, and a number of other types of finish. It is claimed that with the new material, moulded articles can be produced more cheaply than with metal, polythene or PVC. The new material is already being used by some British car firms, by the packaging industry, and by makers of luggage, filing cabinets, jewellery cases, trays and toys.

Sheet-metal Thickness Gauge

A new electronic device for measuring without contact the thickness of metal coatings and non-magnetic sheet metal whose thickness ranges from 30 millimicrons to 20 mm., is developed by A. S. Popov Tele-communications Research Institute, Prague. It is able to measure the decrements of the wall-thickness of pipes and boilers suffering from corrosion, the metal coatings of electron tubes, transistors, printed circuits etc. The design of the device is original; by its accuracy and speed of measurement it belongs among the most efficient instruments of this kind in the world.

New Trailer for Liquid Hydrogen

Liquid hydrogen deliveries are now travelling via new 13,200-gallon (500 hectoliters) semi-trailers built by Union Carbide Corporation. These are the largest over-the-road trailers for liquid hydrogen use in the U.S. They are intended primarily for delivering product to N.A.S.A. prime contractors in the western states from the 60-ton-per-day liquid hydrogen plant that recently started up at Sacramento, California. Gross capacity of the new semi-trailer is nearly 1,000 gallons (3,785 liters) greater than that of any other over-the-road trailers for liquid hydrogen use, and almost double that of the 7,800-gallon (29,525 liters) trailers which make up Union Carbide's initial liquid hydrogen highway transport fleet. Despite its increased size, the Unit's full-load weight of about 50,000 pounds (22,680 kg.) will be less than that of smaller-capacity cryogenic transportation equipment. Liquid hydrogen, weighing only about 0.6 pound (272 grams) per gallon, is the lightest of all cryogenic fluids. Further information available from: Union Carbide International Company, Division of Union Carbide Corporation, 270 Park Avenue, New York, N.Y., U.S.A., 10017.

U. P. LETTER

RISING PRICES: A SERIOUS MENACE

INDUSTRIAL RELATIONS STRAINED

From Our Special Correspondent

LUCKNOW, 23rd *July*

THE rising prices, especially of foodgrains, have created a serious hardship for consumers in U.P. The Chief Minister, Mrs. Sucheta Kripalani, told pressmen earlier this month that the food situation is "difficult but not alarming." Since then it has deteriorated still further. The ration-card holders are entitled to eight kilograms of wheat or rice per unit and one kilogram of sugar per unit per month. The fair-price shops in most places are without supplies and are unable to provide the ration quota to those who are entitled to get it. Persons belonging to higher income groups who are also allowed to purchase from these fair-price shops, although they do not have ration cards, are unable to get wheat or rice from these shops and have to buy it from the open market.

The controlled price of wheat *atta* is 2½ seers per rupee but the prices in the market are 1¼ to 1½ seers per rupee. The traders have voluntarily fixed wheat prices from Rs. 23 to Rs. 25 per maund in the different *mandis* but in some places good quality wheat is available only at Rs. 30 to Rs. 35 per maund. The prices of rice, pulses, coarser grains, vegetables, milk and other food products are also rising. With their limited income most consumers are finding it exceedingly difficult to feed the family. This has resulted in the looting of some shops and an all-round demand for higher wages and an increase in dear food allowance.

There is some truth in the explanation which the Government's spokesmen have been giving for the food scarcity and the rise in prices. We are told that the cultivator is busy with the sowing of his crops and is not bringing his surplus stocks to the market. Another explanation is the slow arrival of imported wheat and rice. There are 28 flour mills in U.P. which were allotted nearly 60,000 tons of wheat every month. In view of the slow arrival of imported wheat the flour mills have not received their quota of wheat and some have closed down altogether and others are working partially.

"Ghost" Ration Cards

Another official explanation for food shortage is the existence of a large number of 'ghost' ration cards. It has been estimated that the number of ghost ration cards is nearly 50 to 75 per cent of the genuine ration cards, with the consequence that the offtake from the ration shops is much higher than was officially estimated and hence the shortage. But the checking of ration cards has been going on and is expected to be completed by the end of this month—although the officially fixed time limit is 25th July—and quite a large proportion of the 'ghost' ration cards have already been cancelled. In spite of this, the food scarcity continues and there is no relief from the rising prices which continue to rise still higher.

There are many causes for the present food crisis in U.P. But probably the most important single cause is official neglect, inefficiency and bungling. Government officials at the village level, belonging to half a dozen different departments, have in fact pulled in opposite directions in the implementation of policies for increasing food production. The inevitable consequence has been a failure of Government's policies and programmes for securing the desired increase in the output of foodgrains. But even if food production in U.P. was below target, the situation would not have deteriorated to the point to which it has actually deteriorated, if the officials had correctly estimated the shortfall in supply and had tried to get imported wheat and rice for U.P. The fact is that the officials did not realise the full intensity of the problem before they were actually faced with it, and then it was too late to solve it. We are now told by no less a person than the U.P. Food and Civil Supplies Minister, Mr. Jagmohan Singh Negi, after his tour of six worst-affected districts, that it was with the connivance of the personnel of the Civil Supplies Department that persons who were not 'needy' drew the ration from the fair-price shops at the cost of the poor and 'needy' persons. There might or might not be much substance in this statement but the fact remains that the Civil Supplies Department of the U.P. Government is responsible for "faulty distribution" of the available supplies and for having failed to prevent hoarding of foodgrains by the cultivators, middlemen and consumers.

Khandsari Prices

On the basis of the recommendations of a four-man export committee the U.P. Government has revised the prices of various grades of *khandsari* sugar which now range between Rs. 106 and Rs. 127 per quintal at the production point including the cost of bag—Rs. 106 for the brown variety, Rs. 117 for the yellow variety, Rs. 124 for the white and creamish variety and Rs. 127 for the white crystalline variety produced by the sulphitation process—as against the earlier prices fixed by the Government which ranged between Rs. 106 and Rs. 119.75 per quintal. The margin of profits of the wholesalers have been fixed at two per cent *plus* actual transport charges and local taxes. The retailers have been allowed a further margin of profit of two per cent. These *khandsari* prices are more fair than those fixed at the time of freezing the stocks, but the dealers are not satisfied as some of them actually purchased their stocks at much higher prices. Mr. Jagdish Saran Agarwal, President of the U.P. *Gur* and *Khandsari* Association, has pointed out in a statement that the revised prices are not based on any scientific calculation and proper data and are unfair. Moreover, the quality of yellow and brown variety of *khandsari*, which is consumed mostly outside U.P., is fast deteriorating and, unless the Government permits its export and gives all the facilities for this purpose, dealers would suffer heavy losses.

Advisory Committee Meets

Although industrial relations in U.P. in recent months have not been bad, the rising prices and the high incidence of unemployment in U.P. are a cause of anxiety for the future. The State Joint Advisory Committee, which recently held its fourth meeting at Nainital, emphasised the need of establishing consumer's stores and fair-price shops for industrial workers in all establishments by October 1964. The employers' and workers' unions were exhorted to organise such stores without further loss of time so that the necessities of life would be made available to workers at reasonable prices. An official of the Labour Department will now be in-charge of seeing that the stores and fair-price shops are expeditiously set up and would seek the co-operation of the Civil Supplies and Co-operative Departments for this purpose. If these stores and fair-price shops work satisfactorily, it is possible that the edge might be taken off the demand for higher dear food allowance voiced by the workers' unions in the State. The meeting decided that the question of dear food allowance should be settled by mutual discussion between employers and employees. It also set up a committee of workers, industrialists and Labour Department officials to examine all petitions pending before the High Court and to persuade both parties to settle the matter mutually and withdraw all such writ petitions. It was decided to constitute works committees in all industrial undertakings in order to facilitate the settling of disputes through mutual discussions. In the past reliance was placed on voluntary arbitration but the committee suggested that in the future each case in which conciliation failed should be referred to arbitration by the Government, if the Conciliation Officer recommended such a course.

Arbitration

An official survey shows that whereas the number of cases referred to adjudication in U.P. in 1961, 1962 and 1963 was 752, 884 and 773, respectively, the corresponding number of cases referred to arbitration was only 29, 40 and 81, respectively. But from this it is not possible to come to the conclusion, as the officials appear to do, that the employers fight shy of arbitration. There is no denying the fact that arbitration is an extreme measure and it is always better if industrial disputes are settled through mutual negotiations and conciliation and are referred to arbitration only in extreme cases. If compulsory arbitration is introduced, as the officials seem to prefer, the resulting 'agreements' might not have long life and might lose flexibility and good faith.

The survey shows that the scheme for the formation of joint management councils has made little progress. In U.P. seven undertakings in the private sector and 17 in the public sector, including the Precision Instrument Factory and the Government Press, were selected for this scheme. But no progress has been made. The Labour Department has suggested that, where a council is already functioning, it should be allowed to function as a joint management council. The State Joint Advisory Committee has constituted a committee to study the working of the scheme of workers' participation in management and to make suggestions for making it effective. The main reason for the failure of this scheme is not so much the reluctance on the part of employers as the difference of opinion between the different workers' unions and the lack of suitable persons to represent labour in such councils. It would take a considerable time to overcome these difficulties.

Government Employees

The U.P Government has set up a seven-man Pay Committee under the chairmanship of Mr. B. Mukerji, a retired Judge of the Allahabad High Court, to consider the existing structure of emoluments of State Government's employees and to reduce the multiplicity in pay scales and to ensure, as far as possible, that equal emoluments are paid for identical nature of duties and responsibilities. The Committee will also consider the question of amenities and other benefits permissible to Government's employees with a view to increase their efficiency. Although the present inordinate rise in prices has not been specifically mentioned in the Government's *communique*, the Committee would undoubtedly consider the impact of higher prices on the cost of living of Government servants. There is not only an undue multiplicity in the pay scales of Government employees in U.P. but the scales of pay for equivalent work do not compare favourably with pay scales in some of the other States and in private employment. While it might not be possible to bring the pay scales of Government employees at par with those of employees in industrial units in the private sector, every effort should be made to bring the pay scales in U.P. into line with those of Government employees in the other States.

THE CENTRAL BANK OF INDIA LIMITED

Profit for the Half-year ended 30th June, 1964

The Net Profit of The Centra Bank of India, Limited, for the half-year ended 30th June 1964, subject to audit, including the sum of Rs. 91,510.36 brought forward (as against Rs. 93,249.88 brought forward last year), amounts to Rs. 99,45,189.97 which the Directors have resolved to dispose of as follows :—

	Rs. P.
To pay in terms of Resolution No. 11 passed at the Annual General Meeting held on 28th April 1964, the final dividend for 1962, interim dividend for 1963 and final dividend for 1963 to the former Shareholders of the Jodhpur Commercial Bank Ltd., to whom the shares of the Central Bank of India, Ltd., have been allotted after the date of the said Annual General Meeting.. ..	1,400.70
To pay an *ad-interim* dividend at the rate of Rs. 2.40 per share, subject to tax (i.s., Rs. 1.92 net) for the half-year ended 30th June 1964 which is equal to 19.2% p.a. gross	30,35,028.00
To Carry Forward to next half-year's account, subject to taxation	69,08,761.27
	Rs. 99,45,189.97

Note :—Interim Dividend in respect of new Shares offered to Shareholders by Letter of Offer dated 1st February 1964 will be declared *pro-rata* with effect from 1st May 1964 after the said new Shares are allotted.

BUSINESS ETHICS OF CORPORATE SECTOR

MORE EFFECTIVE AUDITING NEEDED

By F. R. Ginwalla

GROWTH of corporate sector poses its problems, some of them very complex and confusing. Such growth, which can be qualitative or quantitative or both, is the very nature of healthy business that produces wealth for the country. Generally speaking, the expectations of the people in our country have changed since independence and are constantly changing. As the corporate sector grows, the expectancy of the people *vis-a-vis* the accelerated growth of the corporate sector changes in a big way. Business must have a directed growth. If the growth just happens, there will be imbalance and lopsidedness and, to that extent, the company's economy will be impaired. This raises the question of business ethics and morality. It will be well if those in business and those in Government to do all that is in their power to encourage the orderly and healthy growth of corporate sector.

In keeping with the social objectives as accepted by our country, the Companies Act, 1956, was intended to regulate the actions of company managements. The changes brought about by this enactment were not, however, matched by any corresponding change in the prevailing attitude of some company managements. The existing Act was amended by the Companies (Amendment) Act, 1963, in order to facilitate quick action against persons involved in cases of fraud, misfeasance and other such malpractices and irregularities in the management of companies. Under the Act as now amended, a Tribunal has been set up and the powers and functions conferred on the courts under certain sections have been transferred to the Company Law Tribunal under a Government notification issued recently. This Tribunal will also enquire into cases against managerial personnel which may be referred to it by the Central Government.

War on anti-social elements in company management is beginning to gather momentum. Despite strong criticism by a large section of the public and the press, there is not much improvement in the attitude of a few in the management towards standards of propriety and business morality and they remain the victims of firmly-fixed and deep-rooted habits. They are rooted in the deep belief that business need have nothing to do with morality and are completely without conscience and never feel the slightest twinge of guilt. It is time they realised that such an attitude can prove treacherous in terms of both business and the business system as a whole.

Assistance to Authorities

Company Law has now been amended to protect employees who assist the authority in the probe of companies. The amendment has been necessitated by the establishment of the Company Law Tribunal. Those who work in the corporate sector know much more about the corrupt practices than persons in authority. Such practices have many forms. In order to ensure that the Government continues to get information in regard to anti-social elements in the company managements, there would be some justification in affording protection to employees who break away from the chain and report with an honest motive. It is, however, hoped that the Company Law Board will exercise the power with caution and restraint and will ensure that it does not amount to a diminution of the administrative control of company management.

Companies in the U.S.A. have for many years led the world in the disclosure of information of the activities of companies. Company reports in that country are comprehensive, frank and understandable. Although the philosophy of disclosure of facts is the underlying principle of the existing Company Law in India, we normally see in the reports that they do not contain much information about the company's activities. The two important financial statements—balance-sheet and profit and loss account give inadequate information to the shareholders—present or prospective—who look forward to the profit and profit-making capacity of the company as a basis for their investments. These are the basic weaknesses in the existing law and need early attention.

There have been cases where those in the management have tried to ward off the auditors against cunningly perpetuated frauds and withhold from them information on questions of the illegality of expense account abuses, extravagant and ostentatious company entertainments and losses which could have been avoided. Indeed, uneconomic operation of business enterprise does not serve the sacred cause of public interest. News affecting shareholders' interests travel fast on the stock exchange and a company can quickly get a bad name. Few things can more rapidly impair a company's status. And few things, let it be said, can do more damage to the reputation of a management as a whole in the eyes of the public. A wise management does not look for excuses for withholding information from the shareholders, but rather for opportunities to increase their knowledge of the company's working and to give them the maximum permissible amount of information about what is happening to the company.

Nationalisation of Audit

While commending the proposed nationalisation of audit in order to check undesirable practices in companies by taking over of some big auditing firms initially and making it compulsory for large and medium-size companies to have their accounts audited by the nationalised audit firms, it is necessary to caution against the implementation of the proposal on account of the considerable shortage of trained chartered accountants. Apart from the question of shortage, the responsibilities of company audit have increased in recent years to such an enormous extent that most auditing firms have to employ a large number of qualified personnel to carry out these audits. The salary and allowances which have to be paid to such qualified personnel go on increasing from yea to year. If the need to nationalise the audit i recognised, one wonders whether it will serv the purpose in view.

An examination of some companies' account audited by the auditors would disclose tha there is yet no adequate realisation of thei obligations by a majority of the auditors t comment on all material violations of the law or sound accountancy practices as might b reasonably expected to affect directly or in directly the fortunes of the company's account

Under the existing law, the object of audi is recognised as the expression of an indepen dent expert opinion on the financial state ments prepared by the management. An audi tor would not be responsible for the non-detec tion of fraud, unless the extent and characte of fraud is such that, on account thereof, the financial statements do not show a true and fair view of the affairs, and application of the accepted auditing practices would have reveal ed the fraud during the course of audit. Various judicial pronouncements have restricted the sphere of auditor's duties. The need of the hour is to take effective steps to ensure that the management exercises adequate internal checks to prevent fraud by those employed by it and to make the auditor responsible to detect and to report the fraud committed by the management itself. The Government for the good of the people can ill afford to delay much longer in making suitable amendments in the existing law. And it is time that the Government did not hesitate to order special audit when it has reason to believe that the affairs of a company are not being managed in accordance with sound business principles or prudent commercial practices or they are being managed in a way likely to cause serious injury or damage to the interest of the trade, industry or business to which it pertains, or the financial position of the company is such as to endanger its solvency.

EUROPEAN INSURANCE BUSINESS

O.E.C.D.'S EFFORTS TO BRING ABOUT LIBERALISATION

INSURANCE is one of those few industries with widespread international ramifications. The risks covered, whether they involve certain forms of personal insurance or the insurance of goods in international trade and of vehicles, ships and aircraft, move all over the world. And such risks are internationally shared through a highly-developed system of re-insurance. In view of such international implications, insurance has attracted the attention of Governments and caused them to lay down rules for its proper supervision. These rules fall into two categories, namely, (i) those through which the activities of the insurers are supervised and (ii) those which restrict the freedom of the "buyer" of insurance to choose his insurer. Both these categories are the subject of international consultations and negotiations. For instance, the O.E.C.D. (Organisation for Economic Co-operation and Development) countries, recognising the danger of conflicting or overlapping regulations which may hamper insurance transactions on the international plane, have been moving of late towards international co-operation in the matter. But they have still a long way to go. It is in this context that a detailed comparison of the methods employed in Europe for the supervision of insurance has been recently made in a study by the O.E.C.D. Insurance Committee. The Chairman of this Committee, Mr. J. Basyn, has just highlighted the findings of this study in an article in the O.E.C.D. *Observer* (June 1964). It is his hope that the study will help to accelerate efforts for liberalising the insurance business in Europe and thus for rendering better service to the insured.

It is economically and politically essential, writes Mr. Basyn, that insurers should always be in a position to meet their obligations; the very large sums received from the public, and which are accumulated in the form of reserves, must hence be adequately safeguarded. Though in a number of sea-faring nations, intervention in insurance matters existed as far back as the thirteenth century, organised insurance supervision began in the European O.E.C.D. member-countries only in the late nineteenth and early twentieth centuries. The scope of present-day supervision embraces legal, financial and technical matters and such economic factors as rules of competition. While in some countries like France, Spain and Turkey the manner in which supervision is exercised is very precisely defined by law, in other nations like Austria, Belgium, Denmark, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, Norway, Sweden, Switzerland and the United Kingdom, a certain amount of discretion is given to the authorities. Again, while in some countries like Denmark and Italy, supervision is extended to all classes of insurance business, in some others like Netherlands it applies to only life assurance. In most countries, supervision covers all private insurance transactions, whether carried out by domestic concerns or by branches of foreign companies. However, reinsurance business is not supervised when run by specialised concerns in countries like France, Belgium, Greece, Ireland and Luxembourg.

Supervision

Supervision, according to Mr. Basyn, is exercised in a variety of forms. Some of them are: (1) by requiring the company to have an establishment in the country concerned; (2) by prohibiting other forms of business to insurance firms; (3) by licensing or registration; (4) by the examination of returns submitted to the supervisory authorities; and (5) by inspection at the firm's place of business. Each country, Mr. Basyn points out, has its own individual approach to the problem of supervision, and methods differ widely. It is generally agreed that efficient safeguards are necessary for the protection both of the public and possibly also of the well-run insurance firm which might otherwise lose business to less responsible companies offering cheaper rates and meretricious types and contracts. But the danger exists of such controls assuming an exaggerated form in the desire of supervisory authorities to make doubly sure; each such authority naturally believes that it has found the perfect answer to insurance supervision, and cases may occur of a too meticulous application of the rules and hence of handicaps to trade.

The Chairman of the O.E.C.D. Insurance Committee has next dealt with the question of restrictions on the freedom of the buyers of insurance. He has referred to two forms of restrictions on the buyer's freedom of insurance which are generally imposed: the liberty to take out insurance and the choice of the insurer. Though, in principle, insurance is purely voluntary, most countries have compulsory insurance in certain sectors like employers' liability for industrial injury. This insurance is provided to protect against certain hazards which might lead to personal ruin, and to make sure that persons do not through their own improvidence become a charge on the community. Freedom to take out insurance abroad is usually subject to certain restrictions. In all countries except the Netherlands, compulsory insurance is normally effected in the home country and in certain other nations like France, Ireland, Italy and Portugal, all insurances in the supervised classes are forbidden to be placed abroad. Other countries tacitly allow foreign insurance, on condition that insurers should not seek business indirectly without supervision.

Reasons for Restrictions

Mr. Basyn has identified three reasons for the restrictions on the freedom to take out insurance abroad. These are: (1) protection of the insured, (2) protection of the insurer, and (3) protection of foreign exchange reserves. As insurance is a very complex business, the average person is not in a position to know that the insurer will promptly meet his obligations under all circumstances. Hence protection of the insured is essential. Compulsory liability insurance, like motor third-party cover, is designed to protect third parties who have had no say in the selection of the insurer; and for that reason the State must assure that the insurer can honour his commitments. Adequate protection of the insurer is found necessary because of the desire of the State to shield an infant industry from powerful outside competition, or pressure from a powerful domestic industry during its growth period. The third reason advanced for the restrictions on the freedom to take out insurance abroad, namely, protection of foreign exchange reserves, is, however, no longer valid today in most O.E.C.D. countries. The author observes, in this connection, that only a few O.E.C.D. member-countries experience any balance of payments difficulties and that the only sector where they can claim that they must maintain restriction on that account is life assurance, which could involve substantial movements of capital across their frontiers.

Doubts About State Tutelage

While not questioning the excellent motives of Governments in protecting their citizens against any risks of faulty insurance, Mr. Basyn refers to the doubts entertained in some circles as to whether the State tutelage is over-zealous. He questions the keenness of the States to protect their citizens in the matter of insurance when, at the same time, these people are free, within limits of exchange control regulations, to deposit their money in a foreign bank over which they have no control. Again, the same citizens, Mr. Basyn argues, are free to travel in foreign airlines and ships and entrust their health and lives to foreign doctors and hospitals. The consideration arises as to whether it would not be possible for a citizen to insure himself with an insurer who does not come under domestic supervision, provided that the latter is also subject to equivalent supervision in another country. This, he argues, would only be falling into line with normal arrangements accepted for travel by sea, air and rail. If the strict controls applied to insurance were applied to other forms of commercial activities, international trade would be reduced to a minimum.

Again, while compulsory third-party insurance for motorists is most reasonable, if the State insisted in all cases on insurance being taken out with domestic firms, a serious obstacle would result to the growing tourist industry, in the face of the reluctance of foreign motorists to comply with the complex and irritating regulations. A clear proof that international co-operation and compromise can, however, find the answer to such a clash of interests is the general acceptance of the "green card" as guarantee of adequate cover while travelling abroad by car. This "card" assures the car owner, the driver and the authorities of the foreign country he is visiting that he is sufficiently covered to comply with the laws of that country, whatever the conditions of his own insurance policy. Mr. Basyn then proceeds to argue that the attitude of the State to protect the insurer, because of its desire to set up a "national" insurance industry will lead in the long run to increased costs, to lack of balance in insurance transactions and to complications in international markets. Hs refers to the tendency to forget that, if insurance is to be profitable, it must have substantial resources and wide markets available to it.

O.E.C.D. Code

The author has also referred to the step taken by the O.E.C.D. to overcome the conflicting regulations which hamper insurance transactions on the international plane. This step is by way of an Annex on Insurance to the Code of Liberalisation of Current Invisible Operations, first published in 1951. This Code lays down common rules for the transfer of amounts relating to insurance crossing national frontiers, for the establishment of guarantee deposits by foreign insurers operating in member-States, and for the choice and valuation of insurers' investments. As all European member-countries of the O.E.C.D. have subscribed to the Code, it is reasonable to hope for a degree of harmonisation of such rules, so as to establish an equivalence between methods of supervision which would afford the citizens of each country the same sort of protection, if they were to conclude a contract with a foreign insurer. To achieve this kind of harmony, all concerned must think alike in that direction. The O.E.C.D. and other bodies are seized of the problem of aiming at a proper balance between maximum protection of those insured and maximum freedom of choice for the responsible buyer of insurance. The various knotty problems of civil, public, fiscal and commercial law arising from the necessity of the insurance trade to work within national legal frameworks of approximately the same shape have to be tackled. The O.E.C.D. Insurance Committee is working towards their solution, notwithstanding the fact that of all the problems affecting invisible transactions dealt with by the O.E.C.D., those of international insurance business have proved to be the most intractable.

ORIENTAL FIRE AND GENERAL INSURANCE

PROFIT LOWER, BUT DIVIDEND HIGHER

IN spite of a small setback in net profit from Rs. 19.39 lakhs to Rs. 17.11 lakhs, the Oriental Fire and General Insurance Company Ltd. (General Manager: Mr. B. C. Rakshit, Bombay) has raised the dividend for the year ended 31st December 1963 by two points to 8 per cent per annum. The setback in profit, which is in contrast with the spurt of 137.5 per cent from Rs. 8.20 lakhs to Rs. 19.39 lakhs noted in the previous year, occurred despite a substantial growth of Rs. 92 lakhs to Rs. 5.84 crores in the combined net premium, as compared with the increase of Rs. 58 lakhs to Rs. 4.92 crores a year before. The profit has declined essentially because the underwriting profit from fire insurance, which had continued to rise in the past few years, has dwindled to Rs. 15.33 lakhs from Rs. 36.68 lakhs, at which level it was up by Rs. 9.30 lakhs. Further, miscellaneous insurance which had brought in a much bigger underwriting profit of Rs. 13.39 lakhs in the previous year as compared with only Rs. 2.63 lakhs the year before that, has resulted in a loss of Rs. 1.84 lakh during the year under review. There is some welcome relief in marine insurance resulting in an underwriting profit of Rs. 6.03 lakhs, in contrast with the continuous loss—in the previous year, the loss was Rs. 14.75 lakhs—for quite a few years. Even so, the aggregate underwriting profit has dropped from Rs. 35.32 lakhs to Rs. 19.52 lakhs. Added to this underwriting profit is a sum of Rs. 9.49 lakhs (Rs. 9.17 lakhs a year before) being interest and dividends earned on funds not apportioned to any department, which, together with the Rs. 6,301 (Rs. 29,464) brought in, brings the total profit to Rs. 29.67 lakhs, as against as much as Rs. 44.69 lakhs in the previous year. The net profit, however, shows only a minor setback of Rs. 2.28 lakhs, because the tax provision has been reduced by half to Rs. 12.50 lakhs.

The increase in dividend, in spite of this setback in net profit, has become possible by cutting down the transfer to general reserve from Rs. 8.75 lakhs to Rs. 3.75 lakhs and by taking nothing (as against Rs. 3.52 lakhs in the previous year) to investment reserve, though, at the same time, the amount carried to reserve for doubtful debts has been raised from Rs. 76,000 to Rs 4.58 lakhs. It will interest the readers to know that most of the dividend of this second largest general insurance company in the country but the largest in the public sector goes to the Life Insurance Corporation of India, of which it is a subsidiary; the L.I.C. holds 14,983 out of its total 15,000 Rs. 500 paid 1,000-rupee equity shares and also 673,722 out of its total 700,000 Rs. 5 fully paid 'A' equity shares. The total dividend amount has increased by Rs. 2.20 lakhs to Rs. 8.80 lakhs and is to be obtained from dividend reserve to which a like amount has been transferred from the year's profit.

The following table compares the Company's results for the past four years:

(In lakhs of rupees)

	Year ended 31st December			
	1963	1962	1961	1960
Fire :				
Net premium	179.03	135.35	120.77	93.79
Net claims	82.90	47.14	34.99	27.24
Commission and expenses ..	63.60	70.68	63.38	46.41
Underwriting profit/loss (+).	+15.33	+36.68	+27.38	+21.32
Fire fund	92.51	70.68	63.38	46.41
Marine :				
Net premium	61.51	64.02	53.84	51.02
Net claims	55.57	59.72	51.93	43.03
Commission and expenses ..	6.11	11.82	8.97	11.75
Underwriting profit/loss (+).	+6.03	—14.75	—16.97	—15.58
Miscellaneous :				
Net premium	343.34	292.92	259.69	170.94
Net claims	210.19	169.30	126.12	87.68
Commission and expenses ..	119.55	101.08	87.78	55.10
Underwriting profit/loss (+).	—1.84	+13.39	+2.63	—5.99
Miscellaneous fund	174.65	149.46	132.84	84.59
Net profit	17.11	19.39	8.20	7.75
Provision for taxation	12.50	25.00	12.00	1.83
Dividend	8.80 (8%)	6.60 (6%)	6.60 (6%)	4.50 (6%)

Net premium in the fire department has increased by Rs. 43.68 lakhs. The bulk of the Company's fire business—Rs. 1.67 crore out of a total of Rs. 1.79 crore—is Indian and the balance —Rs. 11.90 lakhs, as against Rs. 16.76 lakhs a year before—has been effected outside India. But with net claims rising sharply from Rs. 47.14 lakhs to Rs. 82.90 lakhs, the underwriting profit, after maintaining the reserve for unexpired risks at 50 per cent of premium income and providing for an additional reserve of Rs. 3 lakhs—has dropped from Rs. 36.68 lakhs to Rs. 15.33 lakhs.

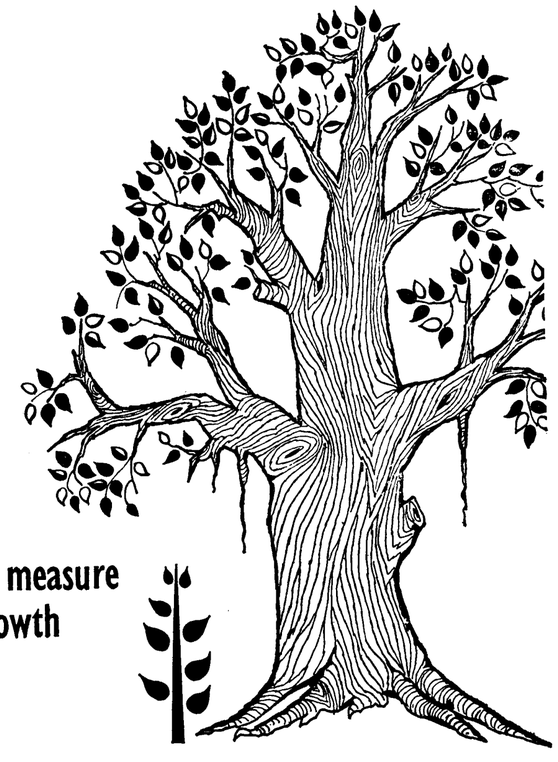
The change from the position of continuous loss to that of profit in the marine insurance account, in spite of a lower net premium of Rs. 61.51 lakhs (as compared with Rs. 64.02 lakhs in the previous year), is explained by the decline in net claims from Rs. 59.72 lakhs to Rs. 55.57 lakhs and also in commission and expenses from Rs. 11.82 lakhs to Rs. 6.11 lakhs. Out of the total premium, a sum of Rs. 49.95 lakhs is shown to have been effected in India and Rs. 11.56 lakhs outside India, as against Rs. 54.79 lakhs and Rs. 9.23 lakhs, respectively, in the previous year.

In the miscellaneous insurance business, the net premium has risen sizably by Rs. 50.42 lakhs to Rs. 343.34 lakhs, as against the increase of Rs. 33.23 lakhs (to Rs. 292.92 lakhs) noted in the previous year. But net claims, up by Rs. 43.18 lakhs in the previous year, have risen further by Rs. 40.89 lakhs to Rs. 210.19 lakhs. The amount of commission and expenses has also increased again from Rs. 101.08 lakhs to Rs. 119.55 lakhs. As a result, as against the profit of Rs. 13.39 lakhs in the previous year, the department has shown a loss of Rs. 1.84 lakh.

The Company has closed the year with capital and reserves aggregating Rs. 5.05 crores, as against Rs. 4.54 crores on the corresponding date of the previous year, comprising a paid-up capital of Rs. 1.10 crore, reserves amounting to Rs. 65.91 lakhs and departmental funds (reserves for unexpired risks) aggregating Rs. 3.29 crores.

ANIL HARDBOARDS TO PRODUCE MINERAL WOOL

Anil Hardboards Ltd. has been granted a licence to manufacture granulated rock wool (mineral wool), with a capacity of 12,000 tonnes per annum, to be used as raw material, instead of bagasse, for the manufacture of fibreboards (insulation boards), acoustic tiles and ceiling boards. The Company has entered into an agreement with the Conversion Development Corporation of the U.S., a sister concern of the Wood Conversion Company of St. Paul, Minnesota (U.S.A.), for the patents rights and the manufacture of fireproof fibreboards, acoustic tiles and ceiling boards. It has also entered into an agreement with Messrs. Baldwin-Ehret-Hill of Trenton, New Jersey (U.S.A.) for the manufacture of granulated rock wool. Both the collaboration agreements have already been approved by the Government of India. The board so manufactured will be completely fireproof, durable, safe and decorative. This will be the only factory of its kind in this part of the world and it will have an export market extending right upto the U.K. in the west and Singapore and Australia in the east. The Company has already received firm orders from the Middle East countries, with advance of Rs. 3,50,000, supplies against which are to be made from November 1964 onwards.



How to measure Growth

All things grow in age—but only *some* grow in size and stature. A young sapling shoots up—sprouts new leaves and branches. But how does one measure the growth of a bank? Take the Bank of Baroda, for instance.

One way would be to compare figures. The Bank of Baroda began in 1908 with a single office in Baroda. Now it has as many as 210 branches in India and abroad. And deposits exceed Rs. 140 crores.

A strong and progressive institution with 55 years of experience, the Bank of Baroda has had a successful programme of branch expansion. It has also aimed at an ever-widening pattern of service. Indeed the Bank's chief goal has been to widen the range and scope of its banking services for the convenience of its customers.

THE BANK OF BARODA LTD.

(Estd. 1908) Head Office: Baroda

now has over 210 branches all over India and abroad with deposits totalling over Rs. 140 crores

INDIA'S FOREIGN TRADE IN THIRD PLAN

EXPORTS PICK UP—IMPORTS SLIGHTLY HIGHER

FOREIGN trade figures for the first three years of the current Plan period (April 1961-April 1964) show that exports aggregated more than Rs. 2,187 crores and imports nearly Rs. 3,367 crores, and the trade deficit added up to around Rs. 1,180 crores. For the Plan period as a whole, the export target set by the Planning Commission was Rs. 3,700 crores, but to this must now be added the exports from Goa, exports to Nepal and postal packages which have been included in official export figures. These additions would bring the export target to about Rs. 3,850-3,900 crores. The tally for the first three years of the Plan, therefore, leaves about Rs. 1,700 crores to be exported in the remaining two years, if the targets are to be fulfilled. For the five-year period, the Planning Commission had originally projected an import need of goods worth Rs. 2,100 crores for development projects and Rs. 3,650 crores for maintenance. In addition, Rs. 600 crores worth of commodities were envisaged under P.L. 480. The import needs for maintenance were later revised upwards to Rs. 3,800 crores; all these made up the grand total of import needs to around Rs. 6,500 crores. In the first three years of the Plan, imports amounted to Rs. 3,367 crores. The tied nature of foreign aid made the level of imports less than sufficient to meet growth and production needs.

Shifts in foreign trade direction are also noticeable in the provisional import-export figures for 1963-64. The American region has now displaced Western Europe (including Britain) as the biggest supplier of goods to India. In 1963-64, imports from America (the U.S., Canada and Latin America) aggregated more than Rs. 416 crores, as compared with Rs. 340 crores from West Europe. The comparable figures for 1961-62 and 1962-63 were Rs. 280 crores and Rs. 367 crores from the American region and Rs. 433 crores and Rs. 373 crores from West Europe. Between 1961-62 and 1963-64, imports from the American region increased by more than Rs. 136 crores, while imports from West Europe fell by Rs. 93 crores. The United States alone increased its supplies from Rs. 256 crores to Rs. 390 crores. Britain's supplies fell from Rs. 200 crores to Rs. 169 crores and West German supplies fell from Rs. 123 crores to Rs. 89 crores. While Britain continued to be the biggest single buyer of Indian goods (Rs. 161 crores worth in 1963-64), the United States, which replaced Britain as India's biggest trade partner in 1960-61, increased its total trade with India; the total trade between India and the U.S. in 1963-64 crossed the Rs. 500-crore mark to a provisional figure of Rs. 519 crores.

The Rs. 14-crore increase in exports to Japan was the biggest rise in exports to Asian countries which bought substantially more from India. West Germany was India's No. 3 trade partner in 1962-63 with a total turnover of Rs. 117 crores, but Indo-West German trade fell to Rs. 108 crores in 1963-64. West Germany's position as trade partner receded to No. 5 position, with Japan taking third place and the Soviet Union fourth. Indo-Japanese trade rose by more than Rs. 12 crores to more than Rs. 121 crores and Indo-Soviet trade rose by nearly Rs. 20 crores to more than Rs. 116 crores. The Japanese purchases will increase, mainly in iron ore, and the planned programme for expansion of Indo-Soviet trade is likely to bring the Soviet Union into the No. 3 position as trade partner in the current year. The expansion of the Bhilai plant and the supply of equipment for oil refineries and power projects are likely to give an extraordinary spurt to imports from the Soviet Union.

Commodity-wise, exports of jute manufactures have increased from Rs. 115 crores in the first year of the Plan to more than Rs. 157 crores in 1963-64. In the case of tea, the 1963-64 exports were back to the level of 1961-62 after a Rs. 6-crore increase in 1962-63. Although the quantity of iron ore exported has increased there has been little rise in the earnings as compared with 1961-62. The other major increases in earnings from exports between 1961-62 and 1963-64 are: non-essential oils from Rs. 6.49 crores to Rs. 20.6 crores, sugar from Rs. 15 crores to Rs. 27 crores, tobacco from Rs. 14.97 crores to Rs. 22.52 crores, and miscellaneous manufactures from Rs. 10 crores to nearly Rs. 18 crores.

Notice

INDIAN ALUMINIUM COMPANY LIMITED

31 Chowringhee Road, Calcutta-16

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of Indian Aluminium Company, Limited will be held at its registered office, 31 Chowringhee Road, Calcutta-16, on Friday, 28th August 1964, at 11.30 a.m., for the purpose of considering and, if thought fit, passing the following two special resolutions:

"1. That subject to the sanction of the High Court at Calcutta being obtained the Registered Office of the Company at present situate in the State of West Bengal shall be removed to and be situate in the State of Mysore.

2. That subject to the sanction of the High Court at Calcutta being obtained the Memorandum of Association of the Company be altered by the substitution of the words 'State of Mysore' in place of the word 'Bengal' in Clause II of the Memorandum of Association."

Any member of the Company entitled to attend and vote at this meeting is entitled to appoint a proxy to attend and vote instead of himself and such proxy need not be a member of the Company.

By Order of the Board,

T. D. SINHA,
Secretary.

13*th July* 1964.

Explanatory Statement as Required by Section 173 of the Companies Act 1956

Your Company has submitted an application to the Government of India under the Industries (Development and Regulation) Act 1951 for a licence to build the first stage of a large integrated aluminium industry, starting with a 30,000-tonne per annum smelter together with related alumina and bauxite facilities. The proposed smelter will draw power from the Sharavathi project in Mysore State and is expected to be located as close to the source of power as possible. A separate application has been submitted for establishing a rolling mill in Maharashtra State.

When these industrial undertakings have been completed a large integrated aluminium industry will have been established by the Company with its principal units in Mysore State. In the circumstance, and as the construction and operation of the abovementioned projects will, in your Directors' opinion, be facilitated if the registered office of your Company is transferred from Calcutta to a suitable location in Mysore State, your Directors have decided to place before you the resolutions set out in the above notice for your consideration and they recommend their adoption.

Under the provisions of the Companies Act 1956, the change in the location of the Company's registered office will be subject to confirmation by the High Court at Calcutta and the necessary steps in this connection will be taken if the special resolutions now placed before you are passed.

The International Development Association has extended a credit equivalent to $24 million to Turkey to help finance an expansion programme being carried out by the Cukurova Electric Company. The I.D.A. credit is for a term of 50 years. Repayment of principal will begin on 1st August 1974 after a 10-year period of grace. Thereafter 1 per cent of the principal will be repayable annually for 10 years and 3 per cent will be repayable annually for the final 30 years. The credit is free of interest but a service charge of ¾ per cent per annum on the amount withdrawn and outstanding will be made to meet I.D.A.'s administrative costs. The Turkish Government will relend the proceeds of the credit to the Cukurova Electric Company for a term of 25 years, including a five-year period of grace, with interest at 5½ per cent.

BRITANNIA BISCUIT HITS NEW RECORDS

BREAD BAKERY AT DELHI TO BEGIN OPERATIONS NEXT YEAR

NEW records in sales and profit have been established by the Britannia Biscuit Company Ltd. (Chairman: Mr. A. C. Khanna, Calcutta) during the year ended 31st March 1964. The proceeds of sales after excluding returns have expanded from Rs. 507.90 lakhs to Rs. 623.36 lakhs and gross profit has moved up from Rs. 96.51 lakhs to Rs. 104.21 lakhs. Signifying increased demand, the improvement in sales exceeds the previous year's figure of approximately Rs. 80 lakhs by more than Rs. 35 lakhs and has been attained, as the Directors state, with a higher production. Against the rise of Rs. 115.46 lakhs in turnover, the profit has gone up by less than Rs. 8 lakhs. The increase in profit has been only slight in relation to the increased growth in turnover because of steadily rising costs and irregular supplies of essential ingredients and materials, the burdens arising from which were, however, partly offset by economies and greater efficiencies.

Net profit at Rs. 31.56 lakhs is up by only Rs. 4 lakhs, because the provision for depreciation has been raised from Rs. 9.99 lakhs to Rs. 12.05 lakhs and so is that for taxation (including Rs. 12.50 lakhs for Sur-tax, as against Rs. 15.20 lakhs for S.P.T. in the previous year) from Rs. 59 lakhs to Rs. 60.60 lakhs. Further, with only Rs. 6,999 available as the surplus from the previous year, as against Rs. 2 84 lakhs obtained in the previous year from 1961-62, the total for distribution amounting to Rs. 31.63 lakhs is higher by only a little more than Rs. 1 lakh as compared with Rs. 30.36 lakhs. This entire increase in the distributable surplus has been absorbed in appropriations to reserves amounting to Rs. 17.13 lakhs, as against Rs. 15.79 lakhs a year before, while the dividend on the Rs. 10 fully paid ordinary shares, including the 4 per cent interim, has been maintained at 21 per cent per annum.

Tabulated below are the salient features of the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961

The Research Department of the Company has established that it is possible to increase operational efficiency and effect savings in materials costs without impairing quality. This is all the more important in the field of exports where the Company has made conspicuous headway by introducing new products and packaging and increasingly participating in overseas trade fairs. But with all its plants working to a high rate of capacity, the Company is faced with a serious problem of rehabilitation, especially when the required equipment is not yet manufactured in the country. The Directors state that it is essential for the Company to obtain modern plant and equipment, so that it can utilise to the utmost its technical skills and resources. Elucidating this point, the Directors observe:

"Over the years, we have repeatedly emphasised the need for a realistic understanding of the difficulties confronting manufacturers working multiple shifts without replacements for equipment not yet manufactured in India. All our plants are working to a high rate of capacity and rehabilitation of the units poses a serious problem. If your Company is to make progressive contributions to the development of the processed food industry, it is essential for us to obtain modern plant and equipment which will enable us to utilise to the utmost our technical skills and resources. It is already apparent that the installed capacity of the industry is inadequate to satisfy expanding consumer needs and we believe there is a growing realisation that an increase in all spheres of industrial production is required to stimulate economic growth and national development.

In recent months, the Company has commenced production of several new products and plans to pursue actively the scope for further diversification during the coming year. An important capital project in progress is the construction of a bread bakery on a recently acquired site at a new industrial estate. The bakery is expected to start operations early next year. In this connection, the Directors say: "We are a vigorous organisation with the habit of growth and we propose to work still closer with the Government in the exciting task of advancing the industrial development of the nation. In this manner, we shall try to provide both our stockholders and customers with full satisfaction in the years ahead."

The financial position of the Company is satisfactory. The paid-up capital, including Rs. 15,450 in 8 per cent 10-rupee cumulative preference shares, is unchanged at Rs. 69.11 lakhs. It is supplemented with reserves and surplus amounting to Rs. 100.96 lakhs. The 5.25 per cent (1963-68) debenture stock has been redeemed by a further sum of Rs. 1.50 lakh, reducing the outstanding stock to Rs. 6 lakhs. But other secured loans from banks have increased from Rs. 9.58 lakhs to Rs. 17.93 lakhs. These, together with current liabilities and provisions shown at Rs. 101.79 lakhs, bring the total short-term indebtedness to Rs. 119.72 lakhs, as against which current assets, book debts and investments aggregate Rs. 160.66 lakhs. The gross block, which has expanded during the year from Rs. 194.30 lakhs to Rs. 216.07 lakhs, has been written down to Rs. 126.14 lakhs and, together with capital work-in-progress, the net block is shown at Rs. 133.47 lakhs.

Currently quoted at Rs. 37.75 *cum-div.* (final), the Rs. 10 fully paid ordinary shares of the Company fetch a net yield of 4.6 per cent per annum.

NEW STANDARD ENGINEERING CO., LTD.

The working results of the New Standard Engineering Company Ltd., for the year ended 31st March 1964 are quite satisfactory. The total sales and gross profit have improved, the former by Rs. 54 lakhs to Rs. 234.13 lakhs and the latter by Rs. 3.99 lakhs to Rs. 26.88 lakhs. The shareholders of the Company have benefited from the improvement in working results. For the Directors have, besides maintaining the dividend (subject to tax) at the previous year's level of 9 per cent, proposed the payment of a bonus of one per cent. The Company celebrated its silver jubilee during the year under review.

(*Concluded from next column*)

now September 1964. Despite the most strenuous efforts, no licence for import of blister copper was issued during the year.

The year witnessed an improvement in the quantity of metal despatched for sale. The total tonnage was 14,029, as against 12,653, and included 3,057 tonnes of refined copper ingots, as against 3,019 tonnes a year before. The sale of kyanite, on the other hand, declined heavily by 11,587 tonnes to 21,597 tonnes due largely to the slump in world markets caused by a recession in the steel industry.

It will be recalled that, during the year under review, the Company capitalised a sum of £685,650 from the reserve and issued bonus shares to the then existing shareholders in the ratio of one bonus share for every two shares held. This has raised the paid-up share capital of the Corporation as at 31st December 1963 to £2,057,000, all in equity shares of 2s. each. This, together with the £2,305,000 standing to the credit of various reserves, bring the total 'own' funds to £4,362,000. As against these, outside interest aggregates £3,305,000, made up of £336,000 as secured and unsecured loans and £2,969,000 as current liabilities and provisions. These are amply covered on the assets side by loans and advances altogether amounting to £4,991,000. The net block is worth £2,676,000, including £82,695 as the cost of running rights and permanent works; this has been arrived at by reducing the gross block of £5,254,000 by £2,578 being the accumulated amount of depreciation.

The ordinary shares of the Company are currently quoted at Rs. 3.26 *cum-div.* and fetch a net annual return of 3.9 per cent in fresh investment.

INDIAN COPPER CORPORATION

DIVIDEND CUT AFTER BONUS ISSUE

IT is indeed difficult to comment on the working results of the Indian Copper Corporation Ltd. (Managing Agents: Messrs. Gillanders Arbuthnot and Company Ltd., Calcutta) for the year ended 31st December 1964. With the quantity of ore milled declining from 478,014 tonnes to 464,420 tonnes, the production of refined copper has fallen by about 200 tonnes to 9,582 tonnes, even though copper content has risen from 2.137 per cent to 2.225 per cent. Total despatches (including those of refined copper), however, have risen from 12,653 tonnes to 14,029 tonnes, thanks chiefly to the increased output of rolled products (10,598 tonnes, as against 9,739 tonnes) and much larger closing stocks of finished goods brought in from the previous year. Owing to a slump in world markets caused by a recession in the steel industry, sales of kyanite has also declined by almost a third and the average selling price of the Company's products have eased to some extent.

Apparently the favourable factors have scored over the unfavourable ones. Turnover, therefore, has advanced by about six per cent from £4,023,000 to £4,027,000 and the gross profit from £1,406,000 to £1,442,000. The profit margin (ratio of gross profit to net sales), however, has declined by a point to 34 per cent, due mainly to the increase in the overall operating costs to produce one tonne of refined copper to £179-11-4 from £172-15-6 in 1962.

Notwithstanding a higher gross profit, provision for Managing Agents' remuneration is lower at £71,000, as against £83,000 a year before, while that for depreciation has remained unchanged at £170,000. The profit (subject to taxation), therefore, has advanced by £48,000 to £1,201,000, but, since taxation is higher at £822,000, as against £742,000, the resulting net profit shows a decline of £32,000 to £379,000. Adding to this the £14,000 as provisions no longer required and transferring £147,000 (as against £264,000 in 1962) to reserves and provisions, the Directors have proposed the payment of 12 per cent, as against 18 per cent previously. Although the rate of distribution is lower, the dividend for the year is payable in full on the capital enlarged by a bonus issue and consequently claims the same amount as before, namely, £247,000. No amount is being carried forward, as during the preceding year.

The vicissitude in the fortunes of the Company during the past four years are well brought out in the following table:

(In thousands of £ sterlings)

	For the year ended 31st December			
	1963	1962	1961	1960
Net sale proceeds	4,247	4,023	3,321	3,467
Other Income	56	55	62	74
Closing stocks	916	954	895	707
Expenses	2,710	2,843	2,324	2,389

Dividend	247 (12%)	247 (18%)	370 (27½)	370 (27½)
Carry forward			72	119
Ore reserves (in tonnes)	3,929,789	3,927,687	4,004,534	3,898,868
Ore milled (in tonnes)	464,420	478,014	412,986	435,728
Copper content (%)	2.225	2.137	2.192	2.083
Refined copper (in tonnes)	9,582	9,781	8,336	8,912
Rolled products (in tonnes)	10,598	9,739	9,966	10,923

Market price of ordinary shares (in rupees):	1964	1963	1962	1961	1960
High	3.88	5.48 C.R.	5.28	5.88	5.40
Low	3.06	3.34 X.R.	3.96	4.44	3.74

During the year, the ore mill treated 464,420 dry tonnes of ore averaging 2.225 per cent copper, as against 478,014 tonnes averaging 2.137 per cent a year before. A total of 38,712 dry tonnes of concentrate (as against 37,647 tonnes) was produced, but the average value of copper declined from 26.121 per cent to 25.716 per cent. The production of copper, therefore, fell from 9,781 tonnes to 9,582 tonnes, the overall recovery from ore to virgin metal declining by 0.497 point to 92.403 per cent. The output of rolled products (including 1,222 tonnes of copper sheets and strips), however, was higher at 10,598 tonnes, as compared with 9,739 tonnes in the previous year. The construction of the new electrolytic refinery proceeded but it is said to be eight months behind schedule, due to delays in the issue of import licence and in the supply of cement, steel and roofing materials. The anticipated date for completion is

§ Loss after providing for depreciation, taxation and development rebate reserve.
‡ High and low upto 3rd July 1964.

Extracts from the Directors' report: **Production**: The Company's factory buildings at Vatva have been ready and the Company has started production at Vatva from 15th October 1963. Consequently the manufacturing activity of the Company at Bombay under arrangement with Messrs. T. Maneklal Mfg. Co. Ltd., has been discontinued with effect from 1st April 1964 and the entire manufacturing programme will now be implemented at the Company's works at Vatva. The Laboratory block, other ancillary buildings and one block of staff quarters have been completed.

The Company has erected and commissioned machine tools of the value of Rs. 36,00 000 by now and the balance machine tools on order worth about Rs. 15,00,000 are also expected to be received and installed by the end of this year.

Finance: The paid-up capital of the Company is Rs. 79,85,075. A substantial portion of it has been utilised towards acquiring land, machinery and various other fixed assets. The Company has spent more amount on land, buildings and machinery than originally envisaged. An administration building of 6 storeys with a basement is also being built to accommodate the administrative staff and to bring all the departments under one roof, to ensure efficiency and co-ordination. Machine tools also have been ordered out to meet the increased requirements of the Company. All these have necessitated additional finance for which the Company has arranged with the Bank of Baroda Ltd., Bombay, for a medium-term loan of Rs. 50 lakhs under the Refinance Scheme of the Government of India. Under the above arrangement, a sum of Rs. 35 lakhs has been utilised till 24th June 1964.

The Company has applied for expansion licence for *Water Ring Vacuum Pumps* and *Rotary Air Compressors*. The increase in capacity sought is 860 units of *Water Ring Pumps* and 500 units of *Rotary Air Compressors* per annum from the present licenced capacity of 100 units each per annum.

The Company has also received expansion licence for *Roots Blowers* and the capacity is now 300 units instead of 100 units per annum.

Accounts in brief as at 31st March 1964 are as under:—

Carry forward	3	33

Extracts from the Directors' report: Trading results for 1963 season show a substantial decline as compared to those of the previous year and this is attributable mainly to less favourable market conditions.

The total crop harvested in 1963 was 7,89,297 kgs. as compared with 8,24,799 kgs. in the previous year, while the average price realised was Rs. 4.47 per kg. in 1963 as against Rs. 4.59 per kg. in 1962. The *planted area*, including seed reserve, is now 598 hectares.

Estimates for 1964 provide for a crop of 8,00,000 kgs. at an outlay of Rs. 33,30,000 including inland freight and sale charges as well as depreciation and all administrative expenses. The start of the new season has been not unsatisfactory although the equivalent of 33,869 kgs. of tea has had to be sold from Killcott division as green leaf owing to the extensive factory alterations not having been completed on schedule.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	13,50,000	Gross block	47,30,594

Extracts from the Directors' report: The blow room machines, cone winders and travelling cleaners referred to in the last report have been brought into use. In addition, six more cards were also installed in the year.

An application submitted by the Company to the Government of India, for a licence to install 9,500 spindles to increase the spindlage of 'B' Mills to 25,000 is being considered favourably by the Government and the Company is expecting the licence at any time now. Further, the Company has been permitted to expand the spindlage of 'A' Mills by 3,500 spindles, i.e., 10 per cent of the installed capacity. The Bankers of the Company have agreed to advance a medium-term loan of Rs. 50 lakhs, repayable in ten years, for financing this expansion.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.

Universal Electrics Ltd.

(*Secretary*: Mr. S. S. Banthia, Calcutta.)

Third Annual General Meeting—7th August 1964.

Extracts from the Directors' report for the year ended 31st March 1964: The construction of the house service meter factory was completed and the factory went into production from May, 1963. During the year under report, the plant not only achieved its rated capacity but, due to improvement in efficiency, was also able to exceed it. The number of meters produced during the year was 95,201. Working of the plant since the close of the year is satisfactory.

Several new plants for manufacture of electric meters have come into operation within a very short space of time recently and this has, therefore, caused a surplus in the supply position of electric meters in the country. The Directors, however, expect this to be only a temporary phenomenon, as with the planned increase of power generating capacity in the country, the demand would again come up. The quality of the meters produced has been found to be satisfactory and the Company has secured orders from the D.G.S. & D. and several State Electricity Boards and power supply companies.

During the year, the Company earned a profit of Rs. 3.14,527. After deducting Rs. 2,734 being income-tax for financial year ending 31st March, 1962, and Rs. 25,840 being the debit balance brought in from the previous year, there is a credit balance of Rs. 2,85,953 to be carried forward.

During the year, as per the Company's agreement, preference shares to the value of Rs. 1,50,000 have been issued to the collaborators, Messrs. Mitsubishi Electric Corporation, for consideration other than cash.

Equity shares of a face value of Rs. 29,150 were forfeited during the year under review as the allotment and/or call money due on them was not paid in. However, since the close of the year forfeiture of 900 equity shares of a total face value of Rs. 9,000 has been annulled.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.

		Cash	26,015
		Miscellaneous expenditure ..	1,40,224
	Rs. 93,67,146		Rs. 93,67,146

* Paid-up capital consists of 3,47,085 equity shares of Rs. 10 each and 8,100—6½ per cent. cumulative non-redeemable preference shares of Rs. 100 each. The amount paid up on equity shares forfeited is Rs. 14,200.

Nav Bharat Refrigeration and Industries Ltd.

(*Chairman*: Mr. S. R. Damani, Bombay.)

Registered Office and Factory: 22, Najafgarh Road, Industrial Area, New Delhi-15.

Thirteenth Annual General Meeting—Held on 20th July 1964.

Working Results:

	For the year end 31st December (In thousand rupees)	
	1963	1962
Sales—potatoes and ice	4,38	4,37
Rent received from cold storage	3,03	1,71
Gross profit	2,70	1,22
Transfer to depreciation	1,32	99
,, ,, provision for taxation	55	8
Net profit	83	15
Transfer from current reserve	Nil	40
Appropriations:		
Transfer to development rebate reserve ..	36	7
To income-tax paid for 1961	14	Nil
Transfer to dividend reserve	41	Nil
Proposed dividend (taxable) equity	•	40
	(4%)	(4%)
Carry forward	†	8

* Dividend for 1963 will be paid out of dividend reserve.
† A small sum of Rs. 410.23.

Extracts from the Directors' report: The plant and machinery were well maintained during the year under report. Various measures like adequate up-keep, repairs and overhauling of the machinery and the consequential economies effected resulted in efficient running of the plant and machinery, and this accounts for no small share in the improved results.

During the year under review additions to the fixed assets amounted to Rs. 1,57,662. The Directors report that a 18-Ton Plant capacity was added to the Ice Plant during the current year in order to meet the higher demand for ice as a result of ever increasing population and requirement for trade and industry. Fortunately the additional 18-Ton Plant capacity was accomplished in record time to take advantage of the summer, as a result whereof Ice Plant could now be run to suit the demand from public and other sections.

Prospects: New fiscal measures outlined in the Finance Act, 1964, would increase the incidence of corporation taxation, as a result whereof the Company shall be subjected to higher taxes.

The current year did not make a good beginning. Potato crop failed in U.P. and other potato growing areas and consequently the arrivals in cold storages were less. However, the potato from Punjab side is expected to arrive in the cold storages and then the situation is expected to improve. Besides the Company is continuously watching the possibilities of storing items other than potatoes like fruits, etc. which could take care of extra capacity available.

The management is trying to plan the ice sales in such a way that it is hoped that the same may be stabilised. Unfortunately, the Company operations are chiefly dependent on various factors, primarily the nature. However, the Directors hope that the Company would fare well during the current year.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	10,00,000	Gross block	21,36,445
Reserves and surplus..	1,26,490	—Depreciation ..	11,80,002
Other liabilities ..	1,13,620	Net block	9,49,993
		Telephone installation.	983
		Current assets ..	2,44 453
		Investments	600
		Cash	35,081
		Miscellaneous expenditure ..	9,000
	Rs. 12,40,110		Rs. 12,40,110

* Paid-up capital consists of 10,000 ordinary shares of Rs. 100 each.

NEWS IN BRIEF

ALL shipments of mica will be subjected to pre-shipment inspection with effect from 1st August next. The inspecting authority will be the Mica Export Promotion Council.

The Government of East Germany has given India a credit of about Rs. 20 crores (200 million marks). An East German delegation is expected to arrive in India next August or early in September to discuss how best this credit can be utilised for various development projects.

An outlay of Rs. 20 crores for soil conservation schemes in the fourth Plan has been proposed by the working group on irrigation and power. The group has estimated that the outlay would cover the treatment of 1,560 sq. m. in the river valley catchments in the country.

The twenty-second session of the Indian Labour Conference will be held at Bangalore on the 29th and 30th inst. This will be preceded by an informal meeting of the State Labour Ministers on the 28th inst. and the third meeting of the heads of public sectors undertakings on the 27th inst.

Six aerial ropeways—three for Raniganj and three for Jharia coal belts—which are now being erected by the Coal Board at an estimated cost of Rs. 19 crores, are expected to be commissioned by the end of the third Plan period. The ropeways will have a capacity to supply every year 10 million tons of sand to collieries in the area.

Two modern radio aids to air navigation have been installed at the Palam Airport in New Delhi by the Civil Aviation Department. One of them is called instrument landing system; also known as blind landing system. This aid, to be used for landing on the new jet runway at the airport facilitates the aircraft to land even under very poor visibility conditions.

The first regional programme of a training course in farm management conducted by the Indian Society of Agricultural Economics, began on Monday this week at Vallabh Vidyanagar in Anand (Gujarat). This programme, along with the three other similar programmes to be conducted in different centres, is financed from an *ad hoc* grant of the Agricultural Development Council Inc., New York.

Cement production in the 19 private sector factories during the first half of the calendar year touched a record of 4.50 million tonnes, according to the Cement Manufacturers' Association. Of this production, the share of the Associated Cement Company alone was 1.95 million tonnes. The Jaipur Udyog Ltd. accounted for 380,000 tonnes, India Cements for 310.000 tonnes and the Shree Digvijay Cement Companies for 270,000 tonnes.

The Bihar Government is reported to have decided to introduce food rationing in the State. Preparations to issue ration cards in rural and urban areas are already under way. It is proposed to direct all foodgrain dealers holding a stock of 25 maunds and above to obtain licences under the Bihar State Foodgrain Dealers' Licensing Order of 1963. The licensed dealers will be required to submit to the Government a return of their stock position every fortnight.

The Governments of Pakistan and India have concluded an agreement under which Pakistan will supply *Kangni* and *Joshi* rice to India valued at Rs. 365 lakhs during the next six months. In exchange, India will supply to Pakistan coal, railway equipment and other specified commodities over the next 12 months. The two Governments have also concluded another protocol providing for the exchange of fresh fruits to the value of Rs. 50 lakhs each way during the next 12 months.

The Union Government will soon appoint a five-man Committee, comprising representatives of both the Central and Punjab Governments to go into the complaints of small hosiery makers of Ludhiana and to devise ways for a more rational distribution of woollen hosiery yarn. The Committee will be asked to submit its report by 15th September next and its recommendations will be implemented from 1st October when the next wool season starts.

Nearly 40 million rubber contraceptive pieces have been put into the market annually during the last three years, according to the latest report on family planning programme published by the Union Ministry of Health. The licensed annual production capacity of rubber contraceptives in the country is 81.98 million pieces but the actual production is very small, being less than four million pieces, and the quality is said to be unsatisfactory. The bulk of the pieces sold is mostly imported.

A three-member Nepali delegation is expected to arrive in New Delhi next week for talks with Indian Government on an air agreement between the two countries. The agreement, when concluded, will be the first air pact between the two countries. India has offered Nepal unlimited training facilities for its pilots, engineers and technicians at various establishments of the Indian Airlines Corporation. The I.A.C. has also offered to help the Royal Nepal Airlines Corporation in setting up an aircraft repair and maintenance workshop in the kingdom.

A committee under the chairmanship of Mr. V. V. Chari, Additional Secretary, Ministry of Finance, has been appointed by the Union Government to examine the financial needs of the tea industry and the assistance which should be given to the industry with a view to stepping up its exports. The Committee will review the financial assistance at present available to the industry from the Tea Board and the banking institutions and suggest simplification of procedure relating to its utilisation. It will also examine the structure of taxes on tea and recommend appropriate measures for giving tax relief where necessary.

A grain silo with a capacity of 50,000 tons is proposed to be constructed at a cost of Rs. 3 crores in Bombay docks. Tenders have already been received from about 15 foreign firms. The Union Food Ministry is expected to take a decision on the tenders sometime next month. The construction of this silo, it will be recalled, was proposed eight years ago as part of the dock expansion scheme, but the proposal had to be kept in cold storage owing to labour opposition to mechanisation. Even now, the Transport and Dock Workers' Union is said to be opposing the construction on the ground that it will lead to unemployment.

An Indian delegation led by Mr. S. N. Kalra, Director-General, Overseas Communications Service, left on the 20th inst. for Tokyo to attend the second working party of telecommunication experts in Tokyo. The meeting is being held under the auspices of the Economic Commission for Asia and Far East and will be in session from the 22nd to 29th inst. The experts of the South-East Asia region and Australia meeting in Tokyo, will review the telecommunications networks of the various countries in this area in order to assess its adequacy and discuss possible ways and means for further expansion and improvement. The first meeting of the experts was held in Tokyo in 1959.

The Government of Maharashtra promulgated on Wednesday this week the Maharashtra Foodgrains Declaration of Stocks Order, 1964 in order to curb the hoarding tendencies in foodgrains. Under this Order, which has come into effect immediately and which will remain in force till 15th December next, any person who holds foodgrains at any place in the State whether on his own account or in partnership with another person to furnish a full and correct statement in writing of the stocks held by him to the Controller of Foodgrains Distribution in Bombay or the appropriate revenue officials in the districts. Every person holding more than 10 quintals of foodgrains must make such a declaration before the fifth of every month. In case of cultivators, however, such a declaration would be necessary if he holds 25 quintals or more.

From Abroad

Under a long-term trade agreement signed between the Benelux countries (Belgium, Holland and Luxembourg) and Czechoslovakia, the former will import mainly engineering products, lorries, cars, textiles, footwear, hops and malt in exchange for chemicals, fats and oils, fish, engineering products and non-ferrous metals.

The corporate sector in Canada paid a total dividend of $595.2 million during the first seven months of the current year, representing a rise of 8.2 per cent, as compared with the peak of $549.7 million distributed in the whole of last year. This total includes $103.8 million expected to be paid in the current month, as against $79.1 million in the same month last year.

The International Finance Corporation has agreed to join with Sudanese and Japanese interests in providing loan and share capital to the Khartoum Spinning and Weaving Company, which will operate an integrated cotton-textile mills in Khartoum. The total cost of erecting the mill and providing it with initial working capital is estimated at $6 million. The I.F.C.'s loan and share investment amounts to the equivalent of $690,000. This is the I.F.C.'s first investment in Sudan.

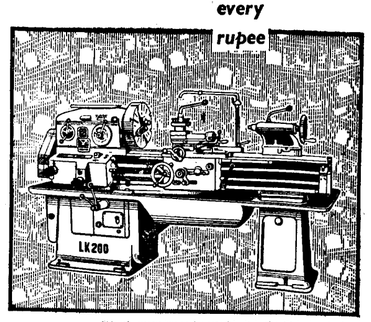
The Norwegian Storting (Parliament) has unanimously endorsed the Government proposed rules barring officials in the central administration from appointment or election as board members in industrial or mining corporations that are purely State enterprises. The same prohibition applies to companies where the State can appoint or elect at least half of the board members. In some cases, however, an official may be appointed to the board of a company whose affairs are not under the jurisdiction of the Ministry with which the appointee is connected.

In a windowless, dust-free and vibration-proof laboratory built at a cost of $2 million by the Lockheed Corporation in Burbank, California, U.S.A., calibration standards accurate to one-millionth of an inch in size, one-millionth of a gram in weight and one part in 100 million in radio frequency are now maintained. The new laboratory houses 30,000 measurement instruments which will be used to produce the present and future generation of aircraft. This new laboratory is also ably equipped to shoulder the giant quality assurance task required for America's 2,000-mile-an-hour supersonic transport.

The U.S. has invited foreign scientists to propose research experiments for American space flights beginning in 1966. Participating scientists in universities, industry and Government installations will be able to place scientific experiments in available space on Gemini and Apollo manned orbital flights scheduled to begin in 1966. Priority will be given to proposed projects of importance for the three-man Apollo moon-landing missions, the first of which is scheduled before 1970. Scientists have also been invited to prepare experiments for the X-15, a research rocket plane, the Tiros and Nimbus weather satellites, balloons orbitting observatories, and five types of sounding rockets used in atmospheric and ionospheric tests.

The Air-Pakistan Consortium at its sixth meeting held in Washington on the 16th inst. undertook to make an additional aid of $431 million available for commitment during the fifth year of the Plan subject to appropriate legislative action or other necessary authorisation. The members of the Consortium considered it important that a substantial part of the aid to be extended to Pakistan during the coming year should be in the form of non-project aid which could be used to finance imports of industrial raw materials and equipment, particularly for the private sector, in order to obtain a fuller use of Pakistan's present industrial capacity. Approximately $200 million of the aid pledged at the meeting are expected to be in this form.

The New York Stock Exchange members have been asked to approve a plan for providing up to $25 million to assist customers in the event of the possible future insolvency of any member-organisation. The plan, which is an outgrowth from the Exchange's initiative last November in helping customers affected by the failure of Ira Haupt and Co., calls for the creation of a $10 million special trust fund to be built up within five years by payments from the Exchange's pre-tax income. The fund would be supplemented by a standby credit or indemnity bond so that a total of $25 million might be available if needed. The sums made available to the special fund would be additional to the $10 million blanket bond which the Exchange already maintains to cover fraud by employees, officers or partners of member-firms. The fund would enable the Exchange to act in the case of any future insolvency regardless of the cause.



Worth every rupee invested in it is the Kirloskar Lathe LK-200. In design, construction, performance, LK-200 Lathe is incomparable in its range. Mark the exclusive features of this Lathe: Height of Centres 200mm. Admits between Centres 1500mm.

PERSONAL

MR. S. L. N. Simha, until recently India's alternate Director to the International Monetary Fund, has been appointed Economic Adviser to the Industrial Development Bank of India.

Mr. S. K. Kooka, Commercial Director, Air-India, has been elected the President of the Indian Tourist Trade for the current year.

Mr. H. Sitarama Reddy, Chairman, Coffee Board, will attend the meeting of the International Coffee Council due to begin at London on the 27th instant.

Mr. T. N. Singh, a Member of the Planning Commission, has been appointed Union Minister of State in the Ministry of Industry and Supply. He will be in charge of heavy engineering.

Gen. K. S. Thimayya has resigned from the post of Deputy President of the United Planters' Association of Southern India with effect from the 1st inst. He has taken over charge as the Commander of the U.N. Forces in Cyprus.

Mr. C. Subramaniam, Union Minister for Food and Agriculture, will exercise overall supervision over the work of the Ministry of Community Development and Co-operation so as to concentrate its activities on increased agricultural production.

Mr. R. C. Sachdev of the Reserve Bank of India has been appointed Executive Trustee of the Unit Trust of India. Mr. V. G. Pendarkar, Economic Adviser to the Reserve Bank, was the Executive Trustee hitherto.

The President has approved of the changes in the portfolios of the following Ministers:

Sardar Swaran Singh, Minister of Industry and Supply, to be Minister of External Affairs.

Mr. H. C. Dasappa, Minister of Irrigation and Power, to be Minister of Industry and Supply.

Dr. K. L. Rao, Minister of State in the Ministry of Irrigation and Power, to be Minister of Irrigation and Power as Minister of State.

TREND OF MARKETS

CALL RATE JUST ½ PER CENT

(From Our Own Correspondent)

BOMBAY, 22nd July

Conditions in the short-term money maket were distinctly easy during the week under review. There was a surfeit of funds available, while demand was restricted. The inter-bank call rate for both renewals and fresh money, as a consequence, climbed down to just ½ per cent from 3½ per cent to which level it had risen from ¾ per cent following subscriptions to the two Central Government's cash loans. Even at ½ per cent, it was said, demand for credit was at a low ebb. Calcutta also depicted distinctly easy trend, the call rate declining from 3½ per cent to ¼ per cent.

Thanks to plentiful supply of money, the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 21st inst., evoked excellent support. The total amount offered was as high as Rs. 7.58 crores, whereas the amount invited (and also accepted) was only Rs. 2 crores. The average rate of accepted tenders was lower at Rs. 2.400 per cent per annum, as against Rs. 2.500 per cent. It was announced yesterday that the Intermediate Treasury Bills would be sold from the 22nd to 28th inst. at Rs. 99.416 per cent.

There was a drop of Rs. 1.99 crore to Rs. 95.46 crores in India's foreign exchange reserves during the week ended 17th July. The drop was accounted for entirely by balances held abroad which declined from Rs. 7.99 crores to Rs. 6.00 crores. The foreign securities held in the Issue Department of the Reserve Bank were unchanged at Rs. 89.46 crores. Loans and advances to scheduled banks were small, being Rs. 85.70 lakhs. Their deposits receded by Rs. 2.60 crores to Rs. 104.17 crores. Notes in circulation fell by Rs. 29.11 crores to Rs. 2,478.87 crores.

The total credit made available by scheduled banks to their clients fell by Rs. 12.83 crores to Rs. 1,767.36 crores during the week ended 10th July. The fall was accompanied by a rise of Rs. 11.16 crores to Rs. 2,598.51 crores in deposits, with the result that borrowings from the Reserve Bank were negligible, being no more than Rs. 45.45 lakhs. Total cash improved by Rs. 6.15 crores to Rs. 165.92 crores and investments by Rs. 1.06 crore to Rs. 675.53 crores.

On Monday the 20th inst., the Reserve Bank of India resumed its open market operations in Government securities but only in the two new Central loans (4 per cent 1970 and 4½ per cent 1989); the operations had been suspended on 29th June as a prelude to the announcement of Central loans. The selling prices of these loans are the same as the issue prices, namely, Rs. 99 and Rs. 100, respectively. The resumption of sales did not, however, have any effect on the Gilt-edged market which put on a dull appearance during the week. Fresh buying support was lacking. Offerings also were scarce. The volume of transactions was, therefore, small, with values showing no change whatever over the week.

In the foreign exchange market, the banks' selling rate for U.S. dollars rose by 25 nP to Rs. 480 per $100. Their buying rate went up by 50 nP to Rs. 476.75. In New York, the pound sterling weakened *vis-a-vis* the dollar, the spot rate declining by 0.210 cent to 278.830—278.860 cents and the three months' forward by 0.330 cent to 278.390—278.420 cents.

COTTON FUTURES RECOVER

(From Our Own Correspondent)

BOMBAY, 22nd July

Cotton futures, which had touched a new high last week-end, nose-dived in the first three sessions of the week under review following persistent selling. Bears, it was reported, joined hands with spot houses in offering large tenders. In fact, there were rumours that the bears were willing to offer tenders even at a loss. Several bull operators were naturally anxious to liquidate as large a part of their holdings as possible. Prices, as a consequence, suffered a distinct setback. The declining trend was, however, halted on Tuesday, when, thanks to the re-emergence of bull support, a recovery was in evidence. The recovery gathered further momentum today. But the recovery was not marked enough to make up for the earlier losses, so that today's closing quotes were lower than those at the end of last week. The undertone of the market at the time of writing was distinctly firm. The question whether the firmness will persist in future will depend on the respective strength of bulls and bears, as the current contract is nearing maturity. A characteristic feature of the prevailing market situation is that, while higher rates are meeting with bear-selling, lower rates are attracting marked resistance. This position is likely to continue till the commencement of the delivery period. Meanwhile, trading in the new March contract is expected to start by the first week of next month. Indications are that tendering differences will not be fixed much before maturity. The East India Cotton Association is being approached in this connection with the suggestion that the terms of the new contract should be the same as those governing the current one, excepting for the fixation of tendering differences at around maturity. It is felt that pre-fixing of tendering does not truly reflect the spot position at maturity.

The Jarilla August contract moved down from Rs. 744.50 on Wednesday last week to Rs. 741 when it began this week on Thursday the 16th inst. It declined again in subsequent session and touched a low of Rs. 732.75 on Saturday. After recovering to Rs. 743.25, the contract closed at Rs. 472.75 today.

In the spot market at Sewri, activity was restricted during the week. Only sporadic demand on the part of needy mills for quality cotton was witnessed. Interest was shown as usual in Laxmi, Co2 and 197/3 varieties. The following are the latest available quotations for some popular varieties:

Bhagalkot Laxmi Rs. 1,040, Dhulia Co2 Rs. 1,078, Ganganagar Rs. 777, Gadgag Laxmi Rs. 1,135, Jalna Rs. 905, Jagraon Rs. 750, Nagar Co2 Uncer Rs. 1,089 and Raisinagar 320F Rs. 1,095.

It is understood that the Textile Commissioner has decided to cancel his previous notification regarding the survey of Digvijay 'A' cotton by *ad hoc* Committee in case the contract price exceeded Rs. 1,270 per candy. An official notification giving effect to this decision is expected to be issued separately.

In the foreign section, vague reports emanating from Egypt suggested that further sales of Menoufi and Giza 47 in particular might not be resumed until the beginning of October. The reports also indicated that there were no chances of removal of ban on the sale of Giza 45. Commenting on the Government's marketing policy for 1964-65 season, the U.A.R. Minister for Economy indicated that the special trade agreement with India was under discussion and that it would probably be signed this month. In the meantime, it is learnt that, out of the total Egyptian crop, India has taken up about 80,000-100,000 bales, the bulk being in Giza 45 type which is suitable for defence purposes.

East African cottons ruled easy due to limited quota allocations from India and selling by shippers in Kampala. Among exportable styles, Bengal *Deshi* was subdued. It is reported that the Union Commerce Ministry is not opposed to the shippers' plea for a reduction in export duty on this variety, though it is admitted that relief, if granted, would entail a revenue loss of about Rs. 75 lakhs on exports of about 300,000 bales. It is felt that prices of cotton should come down to strengthen the competitive position of India. Japan, the principal buyer, has curtailed its purchases of Bengal *Deshi* cotton by about 25,000 to 30,000 bales, while other countries like France and Germany have come in for purchases and the United States, too, has also been increasing its offtake. It is further understood that stocks of Bengal *Deshi* with Pakistan are very meagre and may not be sufficient to meet the Japanese demand. Accordingly, Japan may revive its interest in Bengal *Deshi* from India in the near future.

SILVER FORGES AHEAD

(From Our Own Correspondent)

BOMBAY, 22nd July

A hardening tendency in prices was noted in the bullion market during the week under review. Sustained demand from upcountry dealers and reluctance of stockist to offer large quantities helped silver to forge ahead. In sympathy, gold tended to move up.

Silver opened the week 50 paise higher at Rs. 251 and steadily rose to touch Rs. 254.50 today. Heavy buying from dealers in Akola was mainly responsible for this uptrend. While the daily average arrivals were unchanged at 18 bars, offtake was larger at 13 bars, as against 11 bars.

Fourteen-carat gold, after declining from Rs. 69.50 to Rs. 69.25 recovered to Rs. 70.50 on improved demand. Primary gold, in unofficial trading, was quoted a rupee higher at Rs. 123. Sovereign was firm at Rs. 92.50.

The international price for gold at the London market rose from $35.06¾ to $35.07¼ per five ounce. The sterling price spurted from 251s. 4*d.* to 251s. 7¼*d.* Ready and forward silver increased by ¼*d.* each to 112*d.* and 112¾*d.*, respectively. Silver at New York was unchanged at 129.3 cents.

The Union Government is reported to have taken a very serious view of the Punjab Government's failure to submit regular and detailed progress reports about the rehabilitation of unemployed goldsmiths in the State. It has asked the district officers, through the State's Gold Control Officer, to make an overall assessment of the unemployment situation and grant relief to goldsmiths after taking into consideration their educational qualifications and normal income levels. The Union Government has further ordered the expeditious disposal of applications for loans from goldsmiths in distress.

The following table shows the trend of prices during the week under review:

	22-7-64 (closing)	High	Low	15-7-1964 (closing)
SILVER				
Ready (996 fine) ..	Rs. 254.50	Rs. 254.50	Rs. 251.00	Rs. 250.50
GOLD				
Ready (14-carat) ..	70.50	70.50	69.25	69.50
Sovereign ..	92.50*	—	—	92.00*
London—				
Gold ..	251*s.* 3½*d.*	251*s.* 7¼*d.*	251*s.* 3½*d.*	251*s.* 4*d.*
Silver Ready ..	112*d.*	—	—	111¾*d.*
Silver Forward ..	112¾*d.*	—	—	112*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

PEPPER RISES

(Messrs. Parekh and Co.)

BOMBAY, 21st July

Malabar black pepper during the week greeted the news of Indonesia having increased the check price to $0.40 from the lowest of $0.30 by hoisting ungarbled and garbled at Rs. 343.50 and Rs. 353, respectively. But the improvement proved short-lived for want of new development and, in view of the news that second-hands from Indonesia are offering to New York at round about $0.36. Singapore is also reported to have sold some quantity at about $0.35. There was some buying of Malabar by Canada and Italy at $0.39 after the increase in the rate of Lampong pepper. Some buying of Malabar by San Francisco interests is also reported at $0.39. The picture from Indonesia is not clear and exporters there are confused, as the Indonesian Government are not allowing the export of lower priced contracts unless there are enough proofs for the genuineness of the contracts.

Technical position of Malabar is reported to be sound. But it being out of world parity, it will take some time before there are marked improvements, as traders are not sure when Indonesia will stage a somersault. Malabar values are steadily held and there is no disposition on the part of Indian exporters to sell at anything less than full price. Ungarbled improved from Rs. 336 to Rs. 343 and garbled from Rs. 348 to Rs. 353. July delivery on Cochin ring went out of the board at Rs. 359. August and October are quoted at Rs. 368 and Rs. 378, respectively. Ready goods in Bombay encountered good demand. As such spot material improved to Rs. 185. *Shrawan* and *Bhadrapad*, after improving to Rs. 383 and Rs. 389, respectively, remained subdued under pressure of bear sales at Rs. 373 and Rs. 383.

Calicut also is reported better at Rs. 340.

Spot in New York, after rallying to $0.36, is now quoted at $0.35½, with grinders refusing to follow the advance. Pressure of arrivals in New York for April-May-June commitments from Indonesia may also be responsible for such a stalemate.

Singapore market appears uncertain. Prices are increased and decreased according to alternate bouts of buyings and sellings. Pressure of arrivals of Sarawak and uncertain political situation in South East Asia are also responsible for such uncertain trend. Future of world's pepper depends upon the selling policy of Indonesia.

There is some deficiency of rain in pepper growing area on the Coast, but it is too early to forecast the size of new crop Malabar black pepper except that the arrival of new crop may be delayed. Garbled quality may not arrive before early January. However, this is all hypothetical. Crop of ginger in the area is reported to have been affected because of present drought conditions prevailing on the Coast.

YARNS IRREGULAR

(From Our Own Correspondent)

BOMBAY, 22nd July

An irregular trend was in evidence in the yarn market during the week under review. Thus, art silk yarns ruled easy, as demand from upcountry centres was poor, while staple fibre yarns tended to move up on some buying from Surat and cotton yarns were steady due to buying support at lower levels.

The Government of India's decision to allow the Bombay Yarn Merchants' Association and Exchange Ltd. to resume forward trading in staple fibre yarns, announced last week, has been widely welcomed by traders. The hedging facility, it is said, will not only lead to increased activity but also help stabilise prices. Actual trading is expected to be resumed in about two months time. At present, the Board of the Association is busy drafting the necessary modifications in bye-laws and seeking necessary instructions from the Forward Markets Commission. Traders feel that there is a very strong case for the resumption of forward trading in art silk yarn too. In fact, forward trading, according to them, should have been allowed first in the art silk yarn section, as there is surplus production and accumulation of stocks. Hope is, however, expressed that hedge trading in art silk yarn will soon be resumed.

Among art silk yarns, National Rayon 150D was neglected at Rs. 11.18. 120D shed 5P to Rs. 11.92. South India Viscose 150D dropped 6P to Rs. 13.95. Bright Century 75D, however, gathered 16P to Rs. 18.96 on special support.

In the staple fibre yarns (2 x 34 French Count) section, Citys put on 18P to Rs. 9.55. Srirams gathered 13P to Rs. 9.06. Pioneer picked up 10P to Rs. 4.22.

Cotton yarns 12s modern and 52s Kasturi were firm at Rs. 24 and Rs. 50, respectively. 34s Madura strengthened by Rs. 3 to Rs. 39. 68s Mahindras were fully maintained at Rs. 90.

OILSEEDS DULL

(From Our Own Correspondent)

BOMBAY, 22nd July

Trading in the oilseeds market was dull and without any significance during the week under review. Under the existing conditions, no activity seems possible. The ceiling in castor bears absolutely no relation to the intrinsic value of the commodity and the ban on futures trading in groundnuts has taken away the fun from the market. What is true of castor is true of linseeds too. And no one is interested in cottonseeds.

For almost the whole of this week, there was virtually no transaction in linseeds, but, in unofficial dealings, the contract was consistently quoted above the ceiling and was bid up to as high as Rs. 183.50. No operator would like to bear the market, for, even at present prices, castor is comparatively much cheaper than groundnuts. Moreover, castor is not easily perishable. At any rate, it can be stored for much longer periods than groundnuts. On top of all this is the effort on the part of the Oilseeds Exchange to persuade the Government to fix a higher ceiling of Rs. 211 for the new crop contract. In these circumstances, operators would like to go rather long than short.

The spot section in castor was also firm. Madras Small and Kanpur Bold were quoted at Rs. 39 and Rs. 37.75, respectively. Commercial oil was bid up to Rs. 16.85 to 17 and B.S.S. to Rs. 17.60 to 17.80. On the export front, Russia was understood to have purchased about 4,000 tonnes of castor oil for August-October shipments and some East European countries bought 600 to 1,000 tonnes. These purchases were apparently

the reason for covering by shippers and the consequent rise in prices.

With the ban on exports, activity in groundnut oil was limited, but the trend of the market was firm with ready oil bid up to Rs. 25.75 to 26. The increase in the selling prices of *vanaspati* also aided sentiment. Groundnuts firmed up further. Nizam Bold was quoted at Rs. 64.50 and Khandesh at Rs. 65.50. The market has taken note of the plea by oilseeds interests in Gujarat for a ban on exports of oil from the State. The trade in Bombay has not at all appreciated this move which, they say, may lead to fissiparous tendencies and provoke retaliatory action on the part of other States. The opinion here favours a uniform all-India policy governing oilseeds and oils. Meanwhile, the Delhi market is very firm and prices have shot up by as much as Rs. 125 per ton in just one week.

It still remains to be seen whether the measures announced by the Government will succeed in inducing a downward trend in prices. There is a view in the market that the Government should impose a ban on exports of H.P.S. groundnuts. At present, exports of these are regulated, but it is felt that a complete ban, together with a categorical statement by the Government that groundnut oil should not be quoted above a certain level (which should be much below the existing rate), will help. Meanwhile, all eyes are on Gujarat, for this State supplies 75 per cent of the country's total requirements of edible oils.

Trading in linseeds was pointless. The September contract remained more or less stationary at Rs. 44.75 which is only a shade below the ceiling. Fluctuations were extremely narrow, for neither bears nor bulls were in a position to extend their commitments, the former because of factors and the latter because of the ceiling. Cottonseeds remained unquoted for almost the whole of the week. The contract is divested from realities and spot prices are much higher. Moreover, the contract permits the tendering of poor quailty seeds to the extent of 40 per cent and as such no sensible crusher would like to take delivery of shrivelled seeds.

Groundnut extractions were dull and the market was quiet with prices for July-August at Rs. 415 a ton. Shippers were aloof and the feeling was that, unless the East European countries came forth to buy, the market would not look up. On the other hand, prices, it is felt, might even decline. United Kingdom advices indicated £38-2-6 for July-August, £37-15 for September, £37 for October-December, £36-10, for November-January and £35-7-6 for January-March. The trend in expeller cakes was also quiet with the price at Rs. 497-Rs. 498 per ton. The feeling was that expeller cakes might have to remain quiet in line with the trend in extractions.

The market is eagerly awaiting the outcome of the talks between the trade and the Forward Markets Commission regarding futures trading in new crop oilseeds. The main plea is for a resumption of trading in groundnuts futures, while it has been contended that the present ceilings had better be raised. A memorandum is expected to be presented soon to the Government setting out the trade's case.

The following table shows the closing prices of oilseeds and oils as on 22nd July as compared with those of the two previous weeks.

	22-7-1964	15-7-1964	8-7-1964
Groundnuts	Rs.	Rs.	Rs.
Nizam bold	64.50	65.75	62.25
Khandesh quality	65.50	65.50	64.50
Oil ex-mill	26.00	25.25	25.25
Oil Rly. Receipt	25.70	25.15	24.50
Castorseed			
September 1964 contract.. ..	181.50	181.50	180.25
Ready Madras	39.00	37.25	36.12
Ready Kanpur	37.75	36.00	35.12
Oil B.S.S.	17.80	16.80	15.25
Oil commercial	17.00	15.30	14.70
Linseed			
September 1964 contract.. ..	44.75	44.78	44.62
Bold ready	47.50	47.50	47.75
Linseed oil	19.90	19.75	19.65
Cottonseed			
September 1964 contract.. ..	104.00	104.00	104.00

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

* * * *

Since writing the above, the Government of Gujarat has announced the imposition, with immediate effect (Wednesday), of a ban on the movement of groundnut (shelled or unshelled) and groundnut oil outside the limits of the State by road, sea or air. All persons possessing stocks of groundnut (shelled or unshelled) in excess of 150 kgs. and oil in excess of 50 kg. have been asked to declare their stocks within 24 hours. Those who violate the regulations are liable to be punished severely and the vehicles carrying the commodities across the State border will be confiscated along with the goods.

SPURT IN JUTE GOODS

(From Our Own Correspondent)

CALCUTTA, 21st July

The visible improvement in port conditions—marred by last Sunday's collision of an incoming vessel in ballast with an outgoing ship loaded with jute products—meant satisfactory offtake in jute goods for export during the week under review. At the same time, the Government of India's interest in heavy gods continued unabated, and there had been a steady flow of orders for heavy goods from other internal buyers too. This explained this week's uptrend in prices of heavy goods. In sympathy, hessian prices were also steady. Although heavy rains continued to disrupt loading and unloading operations in the port, the waiting time for incoming ships at the Sandheads has been considerably reduced, and there had been days in the week when the Sandheads had no ships awaiting entry to the river. It was noted that, although the total output of mills in June at 107,000 tonnes rose by 5,600 tonnes, stocks at the end of June at 126,100 tonnes rose by only 1,900 tonnes. In early June, total stocks were 124,200 tonnes, and, therefore, total availability in the month was 231,200 tonnes. Total stocks at the end of June being 126,100 tonnes, total demand in the month aggregated to 105,100 tonnes, which fell short of production by only 1,900 tonnes. The fact that demand almost equalled production emphasises the sound statistical position. That explains the steadier conditions in evidence during the week under review. Had only normal conditions prevailed at the port, it stands to reason that offtake in June should have been higher. It should also be noted that stocks of goods at the end of June were higher than output in the month by only 19,100 tonnes. Although this position is not entirely unsound, it should be stated that stocks in recent months began to increase as buyers slowed down entering into commitments in anticipation of a fall in prices. The abrogation of the working time agreement by the industry only encouraged buyers in adopting such a tendency. Even the Government of India has postponed its placement of orders, and overseas buyers are now buying more to meet immediate needs than against forward deliveries.

Although the mills were cautious in entering into commitments in the new crop, sellers refrained from discounting rates.. Subsequently, a gradual hardening tendency set in in the fibre market during the week, and it was realised that the fibre supply position would not be as smooth as last year. At this time of last year, the new crop had started arriving in the mills' agencies in liberal quantities, and the Jute Commissioner had already released the first compulsory purchase quota for that season. So far this year, new arrivals have been in driblets, and in as much as prices have actually hardened to quote above the minimum rates, the Jute Commissioner has not yet issued a quota. Rates in agencies are above Calcutta's parity, and sellers have been encouraged to note that in the Pakistani markets, prices have advanced despite the abolition of the minimum export price scheme and the reduction of export duty on fibre by 50 per cent. Pakistan expects a smaller crop and a deterioration in quality is also apprehended. In India, the crop is likely to be near last year's level with an increase in the proportion of output of the superior grades.

Generally, jute goods were steady during the week under review. The steadiness in heavy goods is attributed to the increased purchases by the Government of India. The increased production in industries consuming jute packaging materials has led to more interest in heavy goods by such industries as cement, fertiliser, and cotton and woollen textiles. Now that it is months since overseas consumers have got accustomed to buy against immediate needs, and their stocks have been depleted, their offtake has become normal once again. It has been unfortunate that purchases by Argentina have had to be slowed down as a result of financial difficulties in that country. U.S. buyers are yet slow in their activities, and the Argentine news has only encouraged the New York burlap market to continue the dull phase for another week also. For these reasons, the immediate outlook for hessian can be assessed only cautiously despite the encouraging statistical position. On Tuesday last, the Government of India's tender for 11,000 bales of B. twills broke the earlier dullness of the day, and ready B. twills gained from Rs. 115.45 to Rs. 115.75. However, hessian 40″ 10 oz. eased from Rs. 44.20 to Rs. 44.10 At this stage, reports of strike in some jute mills in Pakistan were received, and these aided B. twills to rise to Rs. 116.35 on Wednesday, but hessian 40″ 10 oz. was unchanged at Rs. 44.10. The news that earlier apprehensions of a fall in jute goods exports were belied by the publication of statistics in this regard lent force to recovery on Thursday, when B. twills went up to Rs. 117.00 and hessian 40″ 10 oz. to Rs. 44.15. With prices at Rs. 117.35 and Rs. 44.30 respectively, the upward tendency was maintained on Friday, although business that took place was small. Over the week-end, B. twills at Rs. 117.60 and hessian 40″ 10 oz. at Rs. 44.50 added further gains. As a result of selling pressure in the futures market, prices eased during yesterday. Ready B. twills quoted at Rs. 116.75 and hessian 40″ 10 oz. at Rs. 44.35.

EXPORT TEA IN GOOD DEMAND

(From Our Own Correspondent)

CALCUTTA, 21st July

Following quality, the export sale held yesterday drew more attention, while the report of rising output this year in North East India lulled activity in the internal sale last week. The average price realised so far this season for dust is only Rs. 4.91 per kg., as against Rs. 5.23 for the corresponding previous period. The average price of leaf is also lower at Rs. 5.95 per kg. as against Rs. 6.03. With the improvement in quality as noticed in fresh arrivals, it is hoped that the gap in the average price of leaf would soon be closed. Considering the increased costs of production, this would not enable gardens to reach the same stage of profitability as last year. As regards dusts, it is difficult to say how soon the gap would be closed. It is believed that in view of the absence of internal propaganda, domestic consumption of

J.K. PAPERS

JK

tea has not increased by to same degree as the increase in the standard of living. The industry has already urged the revival of internal campaigns, so that the apprehension of a possible glut in supplies, as the one which developed in the recent past and which caused serious difficulties for gardens producing low quality teas, can be removed, and the industry enabled to raise production.

Although prices realised in auctions are lower than last year, the tea industry is now being called upon for yet another increase in its wage bills. For, the Central Wage Board has unanimously recommended a second interim increase in wages. Since the recommendation is unanimous, the Government of India is expected to issue orders for implementing the same. According to the recommendation, tea garden workers in the Northern region including Darjeeling, the Dooars and the Terai, will receive an increase of 6 to 10 paise a day, while monthly paid staff will receive an increase in salary varying from Rs. 3 to Rs. 10 a month. Dealing with the industry's complaints of increased absenteeism by workers, the Wage Board is reported to have called upon unions to induce workers to reduce this and improve their productivity. The Board has at the same time said that work loads can be revised by mutual agreement. At a time when the industry fears marketing problems and keener competition in overseas markets, it finds itself its costs have increased. Its case for reduction in tax load needs sympathetic consideration.

In the internal sale held in the last week, dusts on offer aggregated 14,265 chests. Demand was good but less than usual, and, therefore, prices shed. C.T.C. teas met with good demand at discounted rates. The brighter Assam orthodox teas were firm, while balance of this category eased. Legg-cut teas were accorded fair support, but the leaf teas eased. The quotations per kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.80 to Rs. 7.20, medium Assam C.T.C. dust Rs. 5.80 to Rs. 6.40, medium Assam dust Rs. 5.00 to Rs. 5.80 (nominal), legg-cut dust Rs. 4.80 to Rs. 5.30, and plain orthodox dust Rs. 4.10 to Rs. 4.50.

Following quality, demand improved during yesterday's export sale when leaf on offer aggregated 33,370 chests. The strongest feature was provided by the appreciable advance in prices of bright liquoring Assam orthodox teas. B.O.P. teas received more attention. However, plain orthodox teas eased in an irregular trend, with fannings meeting with an improved inquiry. Whole leaf grades also eased but tippy teas sold well. Flavoury Darjeelings were sold at higher rates but the remainder of this category recorded an irregular trend. The best Assam C.T.C. teas met with support at lower rates, but a few selected lots recorded liberal gain in price. Medium C.T.C. teas shed in an irregular trend. The quotations per kg. inclusive of excise duty were: best Assam C.T.C. fannings Rs. 7.00 to Rs. 8.00, medium Assam C.T.C. B.P. Rs. 6.00 to Rs. 6.80, best Assam C.T.C. B.P. Rs. 7.00 to Rs. 8.00, medium Assam C.T.C. fannings Rs. 6.00 to Rs. 6.80, clean plain pekoe Rs. 5.10 to Rs. 5.30, plain B.P. Rs. 4.30 to Rs. 4.50 and plain fannings Rs. 4.00 to Rs. 4.30.

SUSTAINED SUPPORT FOR METALS

(From Our Own Correspondent)

CALCUTTA, 21*st July*

An unchanged firm price trend was the feature in the Calcutta metal market during the week under review. With tin touching a new high and lead forging ahead, prices on the London Metal Exchange continued to rise.

The deep concern of the industry and the apprehension of a setback in the industry's export promotional efforts as a result of the Government's decision to revise the import entitlement of the exporters of some non-ferrous items from 100 per cent to 75 per cent f.o.b. value of exports have been conveyed to the Government of India in a communication addressed to it by the Indian Non-ferrous Metals Manufacturers' Association, Calcutta. The proposal to cut the import entitlement on exports of bare copper conductors, non-ferrous alloys and semis, insulated cables, winding wires, etc., is also a grave matter for the industry. The N.F.M.M.A. has represented that several manufacturers of non-ferrous semis, alloys, cables and conducotrs have already entered into export commitments on the basis of their original import entitlements, and that as such these manufacturers should be allowed to fulfil their commitments.

The industry is also disappointed in regard to the reported decision of the Government to discontinue the allocation of copper and zinc to major sheet rollers. The decision of the Government is reported to be to allocate the supplies thus saved to the small-scale units. This reduction in the supplies of raw material to the major rollers will mean adding to their idle capacity, and thus increase their working expenses. Particular concern has been caused in as much as units among the big rollers have been allocated quotas on the specific condition that the materials would be used to make industrial quality sheets only. Both hot and cold rolled sheets are required by the industry, and the industrial quality sheets naturally signify both types. A proper definition of the term 'industrial quality sheet' is needed. Whatever the definition, there is no point in an official action which leads to blocking of capacity in units already set up, and which at the same time leads to the installation of more capacity, whether it be small-scale or minor units.

Against the background of an acute scarcity for non-ferrous metals and inadequate imports having regard to the country's foreign exchange earnings falling much below requirements, India has been making strenuous attempts to locate non-ferrous ores. In recent years, copper ores have been located in several places including the Kashmir valley and Sikkim. The existing copper refinery based on ore deposits of Singhbhum is already being expanded, while the setting up of a second refinery in Bombay based on imported concentrates is being considered. Bihar has also a lead smelter. The only place where zinc ores are found is Zawar in Rajasthan, where the first smelter is being set up. At present India is exporting zinc ores to Japan. It is good to hear that the Government is stepping up its efforts to locate ore deposits, and with this end in view, is seeking U.S. help to undertake electro-magnetic surveys.

On the London Metal Exchange, spot tin rose to quote a new high of £1,295 a ton after opening at £1,242½ early in the week under review. Towards closure, the quotation at £1,285 lost a portion of the week's gain. It is now believed that the gap between demand and consumption is nearly 30,000 tons a year. Earlier estimates had placed the figure at 24,000 tons. There is no surprise that the price is continually rising in tune with the rising world consumption. An acute world shortage is only postponed as a result of the periodical releases by the U.S.A. from its national stockpiles. The excess stock will last for about six years if the present rate of release, that is, 20,000 to 24,000 tons is continued. In Calcutta, tin was firm at Rs. 2,050 per 100 kgs. while utensil copper scrap hardened from Rs. 650 per 100 kgs. to Rs. 660. Spot copper wire-bars on the L.M.E. eased from £307 to £300 a ton, but soon recovered to £304½. Spot cathodes shed from £299 to £296 and spot fire-refined copper from £280 to £279. On the other hand, spot lead rose from £96½ a ton to £99½. The rise followed a keen demand against the background of fast depleting stocks. In Calcutta, lead rose from Rs. 290 per 100 kgs. to Rs. 292, while zinc was firm at Rs. 322 per 100 kgs. After weeks of buoyancy, the L.M.E. quotation for spot zinc gave way from £139½ a ton to £134.

KIPS LIVELY

(From Our Own Correspondent)

MADRAS, 20*th July*

The hides and skins market wore a lively look, following more overseas demand for shipment. Inquiries from the U.K. for cowhides were insistant for light and medium weights and prices were a shade firmer than last week. Demand for cow calf was selective and restricted. Arrivals of tanned stocks of kips from the tanneries were moderate in volume and clearance for local trade and for shipment was small. Prices ruled steady.

Importers of tanned goat skins from the traditional ports showed more interest especially in averages below 11-12 lbs. Higher weights were a drug on the market. As regards sheep skins, buyers did not evince interest except in lower selections of middle class sheep; and the market was weak in consequence. The following were the ruling quotations per lb. for all round parcels:— Tanned cow hides 8-8½ lbs. average Rs. 2 to Rs. 2.06, tanned buff 12-14 lbs. average Re. 1.80 to Re. 1.86, and tanned buffcalf 1½-2 lbs. average Rs. 2.50 to Rs. 2.62.

HEAVY DEMAND FOR FOODGRAINS

(From Our Own Correspondent)

HAPUR, 20*th July*

Bullish trend continued unabated during the week under review and prices of all foodgrain and pulses touched an all-time high levels. Poor stocks position and scanty arrivals from rural areas coupled with an all-round buying support were the main influencing factors. Stocks with State Government to feed fair price shops were also not adequate. Towards the week-end however it was gathered that large quantity of imported wheat is being rushed from the ports to U.P. to meet the deficit. After active monsoonish conditions in last two weeks, weather is now sunny which would enable sowings of kharif crops on an extensive scale.

Wheat prices recorded a sharp rise of Rs. 3 to Rs. 7.50 per quintal, according to quality during the week and prices touched a new high level. The rise in prices was due to poor arrivals because of rains and brisk local and east U.P. demand. The average quality was quoted between Rs. 70 and Rs. 72.50 and farm produce between Rs. 73 and Rs. 75 per quintal. Wheat prices on the corresponding date last year had ranged between Rs. 42.50 and Rs. 48.50 per quintal Firm conditions continued in rice market also and prices hardened by 67 paisa to Rs. 2 per quintal. Stocks here declined to 3,000 quintals because of brisk outside enquiry and poor arrivals. Week-end prices were: Rice *basmati* superior Rs. 97.50 to Rs. 102.50, *sela* Rs. 93.77 to Rs. 96.35, *mainpuri* Rs. 81.72, *ramajwayan* Rs. 84.40, *raimunia* Rs. 86.40 and *gadda* Rs. 83.06 per quintal.

Gram prices ruled steadier and advanced sharply by Rs. 2 to Rs. 3.75 per quintal according to quality and touched new high level at Rs. 66 for local produce and Rs. 65 per quintal for the Punjab variety. The prices on the corresponding date last year were much lower at Rs. 42.53 per quintal for the Punjab quality. Local arrivals in the week were negligible and stocks were meagre. Barley and *bejhar* prices were also steadier in sympathy with wheat, rice and *gram* coupled with nominal arrivals and prices ranged between Rs. 54 and Rs. 55 and Rs. 55 and Rs. 56.25 per quintal respectively. Stocks were nominal. *Juwar* and *guwar* prices also rose due to poor supply position and were quoted at Rs. 51 to Rs. 53 for *juwar* and between Rs. 64.30 and Rs. 65.64 per quintal for *guwar*. *Methi*, oats and maize prices also advanced as stocks of these commodities were small. Week-end prices were: maize Rs. 50 to Rs. 52.50, *methi* Rs. 56.75 to Rs. 60 and oats Rs. 60 to Rs. 62.50 per quintal.

SUGAR SUBDUED

(From Our Own Correspondent)

HAPUR, 20*th July*

Despite the tight supply position, the sugar market was subdued during the week. For, its demand was not so heavy as in the past weeks because of the end of the marriage season. Prices in the open market declined by Rs. 10 per quintal at Rs. 175 per quintal, as against the controlled rate of about Rs. 140 per quintal. The sugar ration quota has been reduced by 25 per cent to ¾ per kilo a unit per month.

Trading in *khandsari* continues to be at standstill as the stocks frozen by the State Government has not yet been released despite the Government's decision early this month to release yellow and brown quality stocks for sale in the open market at revised rates. In the week-end, however, some releases were made upto 10 per cent which the traders considered to be very low, and requested the Government to release at least fifty per cent immediately as the goods were becoming wet due to heavy rains. In unofficial trading, *khandsari* prices suffered a loss of Rs. 15 a quintal due to slack demand following the end of the marriage season. Stocks of *khandsari* in the Muzaffarnagar market were placed around 2,00,000 maunds, the corresponding figure last year being about 20,000 maunds.

Ready *gur* here was subdued during the week owing to slack demand following the non-receipt of import permits from the consuming states. Stockists were anxious sellers as the quality of *gur* and *shakker* stocks left with them was fast deteriorating due to heavy rains. Arrivals from the rural centres were negligible and stocks of *gur* here was placed around 12,000 quintals. Heavy rains in the last two weeks have proved beneficial to standing cane crops, and a bumper cane crop is expected this time. The week-end prices here (in rupees per 40 kilogram) were: *Gur pansera* 29.25, *dara* 28.25 to 28.50, *balti* 28 to 28.25, *kotha* dry-wet 27 to 27.75, *shakker* 30 to 32.50.

MEDIUM TEA FIRM

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 16*th July*

A total of 710,000 kgs. was offered in tea sale No. 28 held here on the 14th inst. Quality of teas from Nilgiris was often improved, while teas from other districts were irregular. The market opened to good general demand which lessened in the latter part of the sale. There was good support for low mediums and mediums, but prices for these were irregular and often easier. Good mediums met with strong support and were sold at firm rates. Improved highgrowns, meeting good enquiry, were dearer, but others in this category were irregularly lower with quality. Clean black leaf types were steady, whereas plainest descriptions came to an easier market. Teas of unorthodox manufacture were well supported at irregularly dearer rates. O.Ps. elicited keen competition and were dearer, these being the strongest feature of the sale, but pekoe types came to a lower market. Tippy teas were sold at around last rates.

The quotations (per kg.) were:

	1964 Rs.	1963 Rs.
Low mediums	4.00-4.30	4.10-4.40
Mediums	4.20-4.50	4.40-4.65
Good mediums ...	4.55-5.30	4.65-5.25
Nilgiris B.O.P.	4.60-6.80	4.60-6.60

The average price realised in sale No. 28 was Rs. 4.38 per kilo, as against Rs. 3.38 a week ago and Rs. 4.41 in the corresponding sale last year.

A smaller quantity of 249,000 kgs. was offered in dust sale No. 28 held today. There was a strong general demand throughout the sale. Plainer mediums evoked fair support and prices may be quoted barely steady. Others in this category received useful enquiry and were firm with more emphasis on colourey mediums. There was good demand for highgrowns which were sold at fully firm rates. Unorthodox dusts encountered strong competition and were sold at rates above last.

The average price realised in dust sale No. 28 was Rs. 4.36 per kilo, as against Rs. 4.36 a week ago and Rs. 4.18 in the corresponding sale last year.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire:

"*Sale No.* 29: 725,000 kgs. offered. Fair demand. Low mediums and mediums irregularly 10 Highgrowns irregular with quality. Unorthodox fully firm."

Notices

ZENITH STEEL PIPES LIMITED

Registered Office:

"Moti Mahal", Churchgate Reclamation
Bombay 1

NOTICE OF MEETING

NOTICE IS HEREBY GIVEN THAT THE Fourth Annual General Meeting of the Shareholders of Zenith Steel Pipes Limited will be held at "Industry House," 159, Churchgate Reclamation, Bombay-1, on Friday, the 21st August 1964, at 4-30 p.m., to transact the following business:—

(1) To consider and adopt the Directors' Report, the audited Balance Sheet and the audited Profit and Loss Account for the year ended 30th April, 1964.

(2) To declare a dividend.

(3) To appoint a Director in place of Shri K. M. Premchand, who retires by rotation and, being eligible, offers himself for re-appointment.

(4) To appoint a Director in place of Shri S. G. Nevatia, who retires by rotation and, being eligible, offers himself for re-appointment.

(5) To appoint Auditors to hold office from the conclusion of this meeting until the conclusion of the next Annual General Meeting and to fix their remuneration.

AS SPECIAL BUSINESS:

(6) To appoint a Director in place of Shri A. V. Birla, who was appointed as additional Director of the Company by the Board of Directors and who ceases to hold office under Section 260 of the Companies Act, 1956, and in respect of whom the Company has received a notice in writing proposing his re-appointment as a Director.

(7) To consider and, if thought fit, to pass, with or without modification, the following Resolution as an Ordinary Resolution:

"RESOLVED that pursuant to Section 293 (1) (e) of the Companies Act, 1956, the Board of Directors be and is hereby authorised to contribute and/or subscribe on behalf of the Company in any financial year to charitable and other funds not directly relating to the business of the Company or to the welfare of its employees (excluding any contributions to any political party or for any political purpose to any individual or body as provided for in Section 293A of the Act) in excess of the limit prescribed by the said Section 293 (1) (e) but so that the aggregate of the contributions in excess of the said limit shall not exceed the sum of Rs. 1,00,000 (Rupees one lakh) in any year."

(8) To consider and, if thought fit, to pass, with or without modification, the following Resolution as Special Resolution:

"RESOLVED that Article 56 of the Articles of Association of the Company dealing with 'Fee on Transfer' be amended by adding the following proviso to the existing Article: Provided that the Directors may at any time in their absolute discretion waive payment of the fee aforesaid for transfer or transmission of shares."

For and on behalf of the Board,

S. G. NEVATIA,
Director.

BOMBAY, *6th July*, 1964.

Notes:

(1) A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and to vote instead of himself and such a proxy need not be a member of the Company.

(2) The relative explanatory statement pursuant to Section 173 of the Companies Act, 1956, in respect of items 6 to 8 is being posted to Shareholders along with notice.

(3) NOTICE IS HEREBY ALSO GIVEN UNDER SECTION 154 OF COMPANIES ACT, 1956, THAT THE REGISTERS OF MEMBERS AND SHARE TRANSFER BOOKS OF THE COMPANY WILL REMAIN CLOSED FROM 3RD AUGUST, 1964 TO 21ST AUGUST, 1964, BOTH DAYS INCLUSIVE.

(4) The dividend when sanctioned will be made payable at the United Commercial Bank Limited, Dadabhoy Naoroji Road, Bombay-1, from 26th August, 1964 to those shareholders whose names stand on the Register on 21st August, 1964, to whom dividend warrants will be posted.

THE INDIAN IRON AND STEEL COMPANY, LIMITED

NOTICE

AT A MEETING OF THE BOARD OF Directors held today the Directors have recommended in respect of the Ordinary Share Capital payment of a dividend for the year ended 31st March, 1964, of Rs. 1/60 per share together with a special cash bonus of 10 paise per share, making a total distribution of Rs. 1/70 per share subject to deduction of tax in accordance with the provisions of the Income Tax Act. This distribution awaits sanction by the shareholders at the Annual General Meeting to be convened for Tuesday, the 8th September, 1964.

The net profit after provision of Rs. 4,40,25,006 for depreciation, Rs. 3,87,00,000 for taxation and net transfer of Rs. 5,35,17,685 to Appropriation Reserves is Rs. 2,29,04,228. For the previous year the net profit was Rs. 1,91,87,975 after provision of Rs. 3,40,18,269 for depreciation, Rs. 356,00,000 for taxation and net transfer of Rs. 3,64,01,226 to Appropriation Reserves.

The Ordinary Share Register and Transfer Books of the Company, as already announced, will be closed from the 1st to the 22nd August 1964, both dates inclusive, and the dividend and cash bonus if sanctioned will be paid on or after the 9th September 1964 to those shareholders whose names appear on the Register of Members on the 22nd August, 1964.

By Order of the Board,

MARTIN BURN LIMITED,
F. G. LIVERSEDGE,
Managing Director,
Managing Agents.

Registered Office:
12, MISSION ROW, CALCUTTA, 1.
17th July, 1964.

HOWRAH MILLS COMPANY, LIMITED

NOTICE OF ANNUAL GENERAL MEETING

NOTICE IS HEREBY GIVEN THAT THE one hundred and thirty-ninth Annual General Meeting of the Members of the above-named Company will be held at the registered office of the Company, No. 4, Clive Row, Calcutta-1, on Friday, the 21st day of August, 1964 at 12.15 p.m. for the following purposes:—

1) To receive and consider the Audited Accounts for the year ended 31st March, 1964, the Balance Sheet as at that date and the Reports of the Board of Directors and the Auditors thereon.

2) To confirm interim dividends already paid and to declare final dividends.

3) To appoint a Director in place of one retiring.

4) To appoint Auditors and to fix their remuneration.

NOTICE is also given that the Share Transfer Books of the Company will be closed from 7th August, 1964 to 21st August 1964, both days inclusive.

A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself on a poll and a proxy need not be a member of the Company.

By Order of the Board,

JARDINE HENDERSON, LTD.,
(Sd.) C. EVANS,
Secretary.
Managing Agent.

4, CLIVE ROW,
CALCUTTA-1.
17th July, 1964.

Note: The dividends, if approved, will be payable on and after 7th September, 1964 to those members whose names are registered in the books of the Company on 21st August, 1964.

BANKING

(*Concluded from page* 142)

ended June 1964. The borrowing is, however, in the nature of temporary accommodation repayable by the end of the year. It has also been able to attract deposits aggregating Rs. 13 lakhs, of which Rs. 10 lakhs have been provided by a scheduled bank and the balance by a local authority. Refinance will also be obtained from the Refinance Corporation for Industry.

The most disturbing feature of the Corporation's working has been the increase in arrears. The total outstanding as at the end of March 1964 amounted to Rs. 26.76 lakhs, principal accounting for Rs. 18.59 lakhs and interest for Rs. 8.17 lakhs. The Board does not view this with anxiety in view of the underdeveloped conditions of Assam and the various handicaps faced by the entrepreneurs. Nevertheless, it has decided to take legal steps against at least 15 concerns.

MADHYA PRADESH FINANCIAL CORPORATION

The Chairman of the Madhya Pradesh Financial Corporation has been forthright in enumerating the difficulties created for it by the State Government. The acute financial stringency as a result of shortage of resources has adversely affected the policy of "quick sanctions and early disbursements" followed by the Corporation. During the year ended March 1964, the Corporation could sanction only 28 applications for Rs. 47 lakhs, as against 77 applications for Rs. 275 lakhs in the previous year. Although the number of applications received was less than in the previous year, the loan operations of the Corporation had to be restricted largely due to lack of funds owing to circumstances beyond its control. The position at the end of last year (with 92 per cent of its resources already lent out) was a shade easier than a year before when 98 per cent of resources were lent out, but these high proportions reflect the urgent need for augmenting the resources of the Corporation.

It is not clear why the Government of Madhya Pradesh has refused to give its gurantee for flotation of bonds worth Rs. one crore; the total amount borrowed by the Corporation so far through bond issues is Rs. 55 lakhs, which is much less than what many other Corporations have obtained and there is considerable scope for increasing its resources in this direction. It is to be hoped that, during the current year, the Corporation will not only be able to persuade the Government to give gurantee to its bond-issues but also obtain exemption from paying stamp duty in its bond issues which absorbed more than Rs. 1.5 lakh last year. By borrowing Rs. 56 lakhs from the Reserve Bank, the Corporation has nearly reached the limit of this temporary borrowing facility, and the State Government can no longer overlook the need for increasing the resources of the Corporation.

Although the disbursements of loan during 1963-64 were lower and administration charges higher, the Corporation has been able to increase its net profit (subject to taxation) from Rs. 4.19 lakhs to Rs. 4.79 lakhs. After transferring Rs. 72,000 to statury and special Reserve Funds and providing Rs. 2.80 lakhs for taxation, only Rs. 1.27 lakh is available for distribution of the guaranteed dividend amounting to Rs. 3.50 lakhs. The State Government has to meet the balance of Rs. 2.23 lakhs by way of subvention, bringing the total subvention liability of the Corporation to the Government to over Rs. 15 lakhs.

BANK PROFITS

Central Bank of India

The profit (subject to audit) of the Central Bank of India Ltd. for the half-year ended 30th June 1964 has risen by 9.7 per cent to Rs. 98.54 lakhs as compared with the corresponding half of last year. An interim dividend of Rs. 2.40 per share, subject to tax, or 19.2 per cent per annum has been proposed. Since the new right shares issued in 1964 will also be eligible for a *pro rata* dividend for the two months May and June and in view of the provision of Rs. 1.401 in respect of final dividend for 1962 and interim and final dividends for 1963 to the former shareholders of Jodhpur Commercial Bank Ltd. who received the shares of the Central Bank, the interim dividend absorption is slightly higher at Rs. 30.35 lakhs as against Rs. 30.28 lakhs for the first half of 1963. The balance of profit, together with the surplus of Rs. 91.510 brought in from 1963, brings the total to Rs. 69.09 lakhs (subject to tax) which has been carried forward to the next half-year.

Bank of India

The working results of the Bank of India Ltd. for the half-year ended 30th June 1964 show a higher profit (subject to tax) of Rs. 55.95 lakhs, as compared with Rs. 47.01 lakhs for the corresponding half of 1963. Together with the Rs. 4.20 lakhs brought in from last year's account, the total comes to Rs. 60.15 lakhs. The Directors have maintained the interim dividend at 16 per cent per annum or Rs. 4 per share, subject to deduction of tax, which will absorb Rs. 32.40 lakhs. The balance of Rs. 27.75 lakhs has been carried forward to the next half-year.

Indian Bank

The Indian Bank Ltd. has reported a slightly higher net profit of Rs. 10.39 lakhs for the half-year ended 30th June 1964 as against Rs. 9 lakhs for the corresponding half of 1963. The Directors have recommended an interim dividend of 7½ per cent (including a bonus of 2 per cent) as against 7 per cent (including a bonus of 2.5 per cent) distributed for the first half of 1963. In view of higher interim dividend, the total absorption is larger at Rs. 6.63 lakhs, a rise of Rs. 41,000 as compared with the same period in 1963. A sum of Rs. 2.08 lakhs has been transferred to the reserve fund. The balance of Rs. 1.66 lakh and the surplus of Rs. 1.62 lakh brought in from the previous account have been carried forward.

COMMERCE

"For Commerce, though the child of Agriculture, fosters his parent
Who else must sweat and toil and gain but scanty fare."
William Blake.

VOL. CIX. No. 2780 BOMBAY, 1st AUGUST 1964 PRICE Rs. 2

INDIAN LABOUR CONFERENCE

THE alarming price situation dominated the deliberations at the twenty-second session of the Indian Labour Conference held at Bangalore this week, although the subject was not on the agenda. This is not surprising, for it is the persistent rising trend of prices, more than anything else, that is agitating the minds of everybody. All official spokesmen, labour leaders and employer-representatives who participated in the discussions at the session expressed utmost concern over the steep rise in prices, albeit for different reasons. The official spokesmen sought to emphasise the fact that, if prices were not held in check, the pace of economic development would be slowed down considerably; the labour leaders pointed to the miseries of workers; and the employer-representatives struck the note of warning that a continuous upward pressure of prices, by inflating production costs, would adversely affect the interests of workers, as well as the consuming public at large. The Conference as such did not, of course, give any clear-cut indication as to how the problem of prices could be solved to the satisfaction of all. But it did serve to highlight the important point, that, since the price question was a national problem having many ramifications, both workers and employers should desist from seeing problems in terms of immediate gain or loss to either sector. Mr. D. Sanjivayya, Union Minister for Labour and Employment, did well, therefore, to urge, in his presidential address at the Conference, that the workers, in particular, should not be tempted to take a shortsighted view of things. It is possible that the workers, in their anxiety over the severe strain caused by rising prices, may lend their ears to any advice of despair and that there may be people to give such advice. But desperate remedies, as Mr. Sanjivayya rightly remarked, do not solve the problem; acting in panic or in anger will certainly not take us out of our troubles.

In the short run, prices can be held under manageable limits, if the food distribution problem is handled properly, if there is a substantial pruning of non-development and highly unproductive expenditure, and if the heavy incidence of taxes on consumer goods is reduced straightaway. But, from the long-term point of view, the solution to the problem of high prices lies in a determined bid to maintain production at as high a level as possible. The rate of industrial output can certainly be stepped up provided conditions are congenial for utilising the capacities of industries more intensively than at present. One such condition is harmony in industrial relations. The Industrial Truce Resolution, solemnly adopted by the representatives of the central organisations of workers and employers in November 1962 in the wake of the Chinese aggression, called for, among others, the total elimination of work stoppages and mutual settlement of disputes. Thanks to the encouraging—though not fully encouraging—response to the Resolution, there was a welcome decline in the number of man-days lost during the calendar year 1963, the actual number being 3.27 million, as against 6.10 million in 1962. It is, however, depressing that this happy trend has lately been reversed. Even incomplete returns which Mr. Sanjivayya cited in his speech show that, during the first five months of 1964 alone, over 2.59 million man-days were lost as a result of work stoppages.

Not a day passes without threats of direct action from workers in some industry or other. Describing direct action (in the sense of work stoppage) as absolutely illogical in the present situation, the Labour Minister observed: "What we need today and now is an ampler flow of goods, and I cannot for a moment understand how prices can be brought down by stopping the wheels of production." Holding up production, he went on to say, would cause great hardship and suffering not only to workers but to all other sections of the community. He, therefore, pleaded with labour that resort to work stoppages must be avoided by all means. A great responsibility is cast on trade union leaders, for it is their word that always influences workers. These leaders, whatever be their political ideology or economic belief, ought to remember that workers alone are not passing through stress and strain; all others, too, are subjected to the same stress and strain. The situation is bad enough and resort to work stoppages will only make it worse. It is deplorable that one of the labour leaders, Mr. N. Srikantan Nair, should have threatened that workers "are going to take direct action, emergency or no emergency."

Mr. Sanjivayya's exhortation to labour not to entertain any advice of despair is quite wholesome and pertinent. And his plea to employers to give a fair deal to labour and always act in the true spirit of the Code of Discipline is not unwarranted. Only one wonders if Mr. Sanjivayya, before he made this plea, had cared to find out whether things had been going on smoothly in the public sector undertakings. As between the private and public sector undertakings, it is the record of the latter that is not so satisfactory as that of the former. How else is one to explain the acute labour unrest that has frequently been witnessed in recent years in several public sector undertakings, notably the Rourkela steel plant, the Bhopal Heavy Electricals, the Barauni refinery, the Hindustan Antibiotics at Pimpri and, presently, the Sindri Fertiliser Factory which has been locked out? Generally speaking, the public sector enterprises have neither given a fair deal to labour—how many of them have so far linked dearness allowance to cost of living or declared bonus for their employees or set up suitable machinery for redressing workers' grievances?—nor acted in the true spirit of the Code of Discipline. In regard to arbitration, too, these enterprises do not seem to have made any headway, notwithstanding all the persuasions by those who are in charge of the Union Labour Ministry. In fact, their record in the matter of implementation of labour laws, in general, and resort to arbitration, in particular, is not, we say it again, enviable; if anything, it compares unfavourably with that of the private sector. It is, therefore, refreshing to find that Mr. Sanjivayya, unlike his predecessor, Mr. Nanda, who always sought to lay the blame at the doors of employers in the private sector, has urged the public sector enterprises to function as model employers. Here is what he is reported to have said while presiding over the meeting of heads of public sector undertakings at Bangalore on Monday this week:

"The public sector has to conduct itself as a progressive employer serving as a model for the private sector in the matter of application of labour laws. The public sector managements should, therefore, discharge their responsibility better than what is expected of employers in the private sector. It is necessary to ensure that workers' grievances are attended to and redressed promptly. There is no point in permitting tensions to poison the atmosphere which often affects production adversely. Managements in the public sector undertakings should set up a suitable procedure for dealing with workers' grievances in consultation with the workers' organisations. To assist them, the Union Ministry of Labour and Employment has circulated a model procedure."

This plain speaking by Mr. Sanjivayya is, indeed, commendable. One of the cardinal principles accepted by the Indian Labour Conference is that no distinction shall be made between private and public sectors in the application of labour laws. Public sector enterprises are, therefore, legally and morally bound to implement faithfully all labour laws.

Whether it is a public sector undertaking or a private sector enterprise, labour disputes arise often on the question of dearness allowance (D.A.). In the Bangalore Conference, the workers' representatives demanded the immediate linking of D.A. to cost of living index. Few will dispute the need for adjusting D.A. to living costs in a suitable manner. But it is absurd to urge, as some did in the Conference, a hundred per cent neutralisation of rise in cost of living. It is sheer common sense that, unless the supply of goods available is sufficiently large, the mere pouring in of more money by way of enhanced D.A. will not help workers at all. Such a remedy, as Mr. Sanjivayya stated, may prove worse than the disease and it may very well accelerate the spiral of rising prices. That the Government should have the matter thoroughly examined before deciding on this question was impressively brought out by Mr. Naval Tata, President of the Employers' Federation of India. Different industries have different systems of paying D.A. and, naturally, workers in some industries who get a lower D.A. as compared with their counterparts in other industries, sometimes even in the same locality or region, always nourish an ill-feeling. Mr. Tata was wholly in the right when he said that the decision had to be taken on an *all-India basis.*

Besides uniformity in paying D.A. to workers, there is the need for ensuring the correctness of the cost of living indices. The need is stressed because of the defects discovered in the old series. Viewed thus, the statement of Mr. Sanjivayya that every effort is being made to construct and publish the all-India new series of index numbers with 1960 as base which will give "full satisfaction to everybody" is certainly reassuring. Incidentally, some are inclined to lay greater stress on measures other than increase in D.A. in order to reduce the impact of high prices on workers. A specific measure that has actually been adopted relates to the scheme for the establishment of employer-sponsored fair-price shops or co-operatives for industrial workers. Although the idea behind the scheme is laudable, it has not been implemented in right earnest, as the scheme, several

ing to Mr. Tata, covers at present only 30 per cent of workers. The scheme can be made to operate more comprehensively and effectively, provided the fair price shops run by factories are assured of regular and adequate supplies of commodities at reasonable prices and the workers are prompted to avail themselves fully of this facility.

In the case of bonus, too, the decision taken should be on an all-India basis covering both public and private sectors. All trade unions participating in the Conference demanded immediate implementation of the Bonus Commission's recommendations. The anxiety of labour to see something final about the bonus question is understandable. But the formula for bonus evolved by the Commission is defective in several respects. It is unnecessary to dilate on this issue, as it has been discussed in detail in our first editorial in *Commerce* dated 15th February 1964. Suffice it to say that the bonus formula is excessively weighted in favour of employees and that its cumulative effect on the growth of investments in the private sector will be adverse. It is not too late even now to get the Bonus Commission's recommendations suitably modified by a tripartite body.

An important item on the agenda before the Labour Conference pertains to the legislation for granting of sick leave and casual leave to factory workers. The Punjab Government has prepared a Bill providing for paid casual leave and sick leave to workers. The proposal, according to the Union Home Ministry, may lead to some complications in relation to the working of the Employees' State Insurance Scheme and the Plantations Labour Act, 1951. Moreover, the proposal will impose an additional burden on the employers in the Punjab who will then be at a disadvantage as compared with employers in other States where no such legislation is contemplated. The Union Labour Ministry will do well, therefore, to persuade the Punjab Government to wait till a uniform legislation applicable to the whole country is thought of. The employers and workers can certainly agree to give a definite direction to the Government in regard to such legislation.

Another important item on the agenda of the Bangalore Conference relates to what is familiarly known as the Pay Roll Savings Scheme. The Scheme envisages a voluntary arrangement between employers and employees to facilitate regular investment of the savings of employees in small savings securities and accounts. Deductions for the purpose of making such investments are made by employers from the wages of their employees with their consent. Although this Scheme has been in operation for quite some time now—it was approved at the seventeenth session of the Labour Conference—the progress actually made has not been as encouraging as one would wish. The amount of collections per month under the Scheme is no more than Rs. 35 lakhs—the membership, too, is just 645,000—which represents an insignificant part of the aggregate wage disbursements of industrial establishments. The slow progress is apparently because of the fact that the savings potential of workers has thinned considerably due to price inflation. If price inflation is tackled in right earnest, there is no reason why the Pay Roll Savings Scheme will not get due support from workers.

ROADWAYS *Vs.* RAILWAYS

THERE can be no gainsaying the fact that one of the outstanding achievements of planning in India is the progress registered in road construction and improvement. The figures show that the mileage of surfaced roads rose from 98,000 in 1950-51 to 155,000 in 1962-63 and of unsurfaced roads from 151,000 to 235,000. It is confidently expected that the total length of surfaced roads in particular will increase to 172,000 miles by the end of the current Plan. In terms of annual expenditure, which is another measure of progress in this field, road building and maintenance will have absorbed upwards of Rs. 100 crores in 1964-65, as compared with a mere Rs. 18 crores in 1951-52. All this progress, impressive as it is, has still fallen short of the comparatively modest targets recommended in the 20-year (1961-81) Road Development Plan of the Chief Engineers. For instance, even the revised third Plan outlay of about Rs. 420 crores on road development is very much below the minimum of Rs. 590 crores recommended in the Chief Engineers' Plan for the period 1961-66. Incidentally, it is this inadequate allocation that limits the crust quality, width and capacity of roads and bridges and condemns the transport industry to the use of vehicles of uneconomic load capacity. The fact that this country has only 12 miles of surfaced roads per 100 square miles of area, as compared with underdeveloped Ceylon's 39 miles, may be noted in this connection. Quite apart from this quality aspect of road development, which is crucial to efficient lorry transport, there is the aspect of sheer quantity in terms of aggregate requirements of roads of any kind. Here, again, there is a long way to go before even the modest objective of bringing the villages in developed and agricultural areas within four miles from metalled roads or one-and-a-half miles from any type of road can be achieved.

Truly, in a country of the size of India, where many parts are inadequately served by roads and tens of thousands of villages lack the basic road links, the requirements of road building are enormous. And yet, as Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, said recently, "one must underline the vital role that can and must be played by road transport in locating and developing those hundred or two-hundred growth-centres in the hinterland that can serve as counter magnets to bring to the surface and retain the energy of persons who today are drawn to major cities where alone the opportunities seem to exist." But in emphasising the supreme importance of developing a connected network of national highways, State highways, district roads and village roads, Mr. Mehta has not been oblivious of the limitations arising from scarcities of materials and construction equipment. So, even if the limitation of financial resources is removed, there will still be the limitation of physical resources unless, of course, the indigenous manufacture of construction materials and equipment is stepped up and more economical techniques of road building and maintenance are evolved and applied.

The financial aspect is, of course, most important. It is, however, something of a disappointment to find that the Transport Development Council, which met at Srinagar last week-end, has endorsed the relevant working group's recommendation for an outlay of only Rs. 1,150 crores on road development during the fourth Plan period. Although this allocation is higher than the Rs. 1,065 crores recommended in the Chief Engineers' Plan for the 1966-71 period, it is less than what is strictly required, that is, Rs. 1,250 crores (Rs. 1,065 crores *plus* Rs. 185 crores of third Plan's investment backlog), even in terms of that Plan. And it is much less than what the Indian Roads and Transport Development Association has considered necessary. The Association's estimate, in this connection, is Rs. 1,700 crores. That investment of this order would be quite necessary and justifiable is the emphatic view expressed by the Association as follows:

"Since the formulation of the 20-year Road Plan six years ago, revenues from road transport have already increased far beyond the estimates of the authors of that Plan. The revenue in 1963-64 is 61 per cent higher than that mentioned by the Plan. During the third Plan, road transport will be yielding a revenue of over Rs. 1,000 crores; so even an allocation of Rs. 590 crores will leave Rs. 260 crores for general revenues after providing Rs. 150 crores for road maintenance. Again, during the fourth Plan, revenues can be expected to increase by at least 70 per cent over the Chief Engineers' estimates. Even assuming conservatively that the increase is no more than 65 per cent, that is, Rs. 1,980 crores, as against the Chief Engineers' estimate of Rs. 1,200 crores, Rs. 1,700 crores should in all fairness be expended on road development in the fourth Plan and the surplus channelised for road maintenance so as to bring roads in this country to the 'take off' stage."

But what is most desirable does not seem to be quite feasible, considering that the planners may have difficulty in accommodating even the recommended outlay of Rs. 1,150 crores in a possible Rs. 18,000-crore fourth Plan which alone, according to the reported view of the Union Finance Minister, could be safely undertaken in the light of foreign aid possibilities. Some readjustment in the proposed allocations for the two principal transport sectors, namely, (i) railways and (ii) roads and road transport, should be possible, if the share of the first can be substantially reduced from the Rs. 2,400 crores currently envisaged. Only, for this, the standing bias in favour of developing the railways further and further would have to be discarded. Otherwise, as Mr. J. R. D. Tata, Chairman of T.E.L.Co., has just stated in his statement to the shareholders of the Company, the Government's railway-dominated thinking would make the prospects of some relief to the road transport industry dim indeed. A somewhat lower outlay on railways and a correspondingly higher outlay on roadways would seem to be quite justified in view of the consideration that road transport is far more efficient than rail. This is how Mr. F. C. Badhwar, a former Chief Commissioner of Railways, himself has spoken of the efficiency of roadways:

"A modern roadway can pass three times, or more, the tonnage of traffic that a railway can handle, due mainly to the latter's handicap of not being permitted to admit more than one train at a time on a block section. Under normal Indian conditions, this limits in practice goods trains on an average block section of approximately four miles to about one per hour. Assuming that each such train carried 1,000 tons of goods, the throughput every 24 hours can be taken as 24,000 tons. On a modern roadway continuous streams of traffic, with insignificant intervals and short unoccupied spaces between load-carrying vehicles, are practical possibilities. For example, 5-ton lorries with 5-ton trailers can follow each other at 10-second intervals in almost uninterrupted streams, as they actually do in many Western countries. This alone means a throughput of the order of 60 tons per minute, or 3,000 tons an hour, or 86,400 tons per day."

But that is not all, for there are other considerations which speak more in favour of roadways than in favour of railways. Firstly, although the capital cost of providing rolling stock is practically the same for roadways and railways, the cost of constructing a broad-gauge railway track, whether in virgin territory or by way of doubling of an existing track, is about Rs. 10 lakhs per mile, as compared with Rs. 3.5 lakhs for a first class two-lane road. The cost of track for railway transport is in fact six times as heavy as that for road transport even on the assumption that the carrying capacity of the road is only twice that of the rail and not thrice, as worked out by Mr. Badhwar. Secondly, the speed of railways is an average of 50 miles per day, while that of roadways is three to six times more. This is a vital consideration, for it means a quickening of the tempo of economic activity and a higher return on capital for industry and commerce. For instance, Hindustan Lever has found that, by using road transport for half their despatches, the additional return on capital is not less than 25 per cent. Thirdly, the railways yield to the exchequer only five per cent on capital. But the return from roads has been worked out as 19 per cent of the cost of road system after meeting maintenance charges. Fourthly, road transport provides seven times as many jobs as railways do for a given quantity of goods moved. And, lastly, as regards operating costs, road transport can operate at the same rate per ton-mile as the railways, given modern vehicles and combinations and modern roads.

In view of these distinct advantages of roadways, the question has been rightly asked whether the country, with its relatively meagre investible resources and its millions of unemployed, can afford to develop unduly the less productive (and less efficient) railways. That a much smaller country like the United Kingdom has just proposed an aggregate public investment of £1,060 million (about Rs. 1,413 crores) in new roads construction and major improvements for the five years from 1965-66 may be usefully noted in this connection. The U.K. road plan, which does not include an estimated £390 million (Rs. 520 crores) of outlay on road maintenance and improvements by local authorities during the period, has earmarked as much as £575 million (Rs. 768 crores) for motorways and trunk roads. While thus Britain, that great pioneer in railways, is turning away from them, it is strange that "railway thinking" continues to dominate official attitude to transport problems in India. As Mr. J. R. D. Tata has said, "India must surely be one of the few countries where such numerous and oppressive barriers continue to be placed in the way of the development of road transport, while railway mileage continues to be expanded at tremendous cost." One hopes that roadways may yet receive a more liberal allocation and that the road planning boards at the Centre and in the States, recommended by the Transport Development Council, would help develop long-term road plans to meet the requirements of a developing economy. If these plans are integrated with the railway plan in a manner that will ensure bulk movement mainly by rail and development of road transport as a secondary supporting service to the railways on long-distance routes, it will be very good indeed. The Planning Commission's Transport Policy and Co-ordination Committee, if reports are to be believed, may well give a new turn to the country's transport policy which has all along had an excessive railway bias.

MARKET GOSSIP

Cheering The Capital Market

IN the present context of the depressed capital market, some of the recommendations made by the Capital Issues Control Advisory Committee, which met in Bombay on Tuesday this week under the chairmanship of Mr. C. L. Mehta, must be widely welcomed. The share markets might not have taken these recommendations with the seriousness they deserve, but there is no doubt that they will, sooner or later, come to appreciate the benefits resulting from their implementation. The recommendations are more or less in line with the suggestions made by the Bombay Shareholders' Association. By far the most interesting is the proposed relaxation in certain cases of the debt-equity ratio (2:1) so as to include deferred payments for acquisition of fixed assets with interest thereon. In India, both shareholders and company managers prefer to take recourse to borrowed finance rather than enlarging the capital base. The ratio is 1:1 in countries like Britain and the U.S., while, in Japan, it is said to be as high as 6:1. The high ratio in Japan is attributed to the peculiar nature of capital existing in that country, but, by and large, the consideration is that debts should not be such as to overburden a company. In India, some feel that it might be more advantageous to borrow from banks, as funds are available at reasonable rates of interest than to incur a permanent liability for dividends.

The markets should also be pleased with the Committee's plea for ending restrictions on transfer of shares (firm allotments) before a period of one year. This is good insofar as it goes, though it may not attract much attention right at present. Gone are the days when new issues were quoted at a premium of 200 per cent even before the lists opened. The Committee has further suggested that the managing brokers should be allowed brokerage (at ½ per cent for equity and preference shares and ¼ per cent for debentures) on new issues, even if the issues are fully underwritten. The relaxation is considered necessary, in view of the present state of the investment market. Even fully underwritten issues need promotional efforts and there have been many instances of managing brokers having burnt their fingers and being obliged to carry in their hands shares which the public would not want. The two other suggestions made by the Committee are: one, issue of participating preference shares should be permitted, provided the dividend does not exceed 11 per cent. Two, there should be no fees, remuneration or charges for transferring an individual licence by the promoter to the company and the expenditure, which is reimbursable, should be audited by the statutory auditors of the company.

Since the meeting of the Committee was attended by four senior officials of the Central Government (Joint Secretary to the Union Ministry of Finance, Controller of Capital Issues, Deputy Secretary in the Finance Ministry and Deputy Controller of Capital Issues), one may presume that its proposals will be accepted by the Government. But the implementation of the proposals alone cannot be expected to give the necessary boost to the capital market. What is urgently needed is a reduction in the burden of corporate taxation, besides removal of certain official restrictions and adoption of rational price policies.

Oilseeds Situation

It is now clear that long years of neglect of oilseeds have compelled the Government to reverse its earlier policies, thereby causing considerable misgivings both at home and abroad over the future outlook for the commodity. From dynamic measures taken only a year ago for stimulating exports of oils, the Government has gone to the other extreme of imposing a total ban on their exports. This has now been followed at the State level by a ban on exports of oils and oilseeds from Gujarat to other States in the Union. As if this is not uncertainty enough in the sphere of oilseeds, the U.P. Government is reported to be considering the question of banning exports of mustard seed from the State. Meanwhile, *vanaspati* units in Delhi, Rajasthan, M.P. and other Northern areas which generally draw their supplies of oil from Gujarat face the prospect of closure. Though the prices of oil have shown some signs of decline in Gujarat, the prices in other centres, as is only to be expected, continue to rule high.

It is evident that neither the ban on forward trading in oilseeds and oils nor the stoppage of exports has been much of a gain to the oilseeds economy. However, all this serves only to raise four fundamental issues. In the first place, what prevented the Government from intelligently anticipating the kind of shortage which has now compelled it to revise all its earlier policies? Secondly, assuming that the ban on exports is necessary, is it right that the ban should embrace even the commitments already entered into by exporters in foreign markets? Thirdly, how far is it appropriate that States should individually choose to impose a ban on exports of commodities to other areas in the country? Fourthly—and this is the most fundamental issue—what does the Government propose to do to place the oilseeds economy on a firm basis?

These questions call for a clear answer in view of the muddle into which the country's oilseeds economy has fallen. Surely, it is not beyond the wit and ingenuity of the Government to have foreseen that genuine shortages in oilseeds would develop. In fact, prices have been rising continually for quite some time now. The index number of edible oils (base 1952-53—100) has risen month after month in the last few months until it has climbed 27 points to over 175 in the last 12 months. Had the Government realised the gravity of the situation earlier, particularly when it knew that the country faced a very poor mustard crop, it could have evolved a simpler and more effective policy for oilseeds than the present unsatisfactory measure in the shape of an omnibus ban on exports. Possibly the Government could have imported soyabean oil from the U.S.—it is now feverishly trying to secure some one lakh tons—and thereby eased the upward pressure on oilseeds prices. It is a pity that it has not occurred to the Government that the total ban on exports disrupts the country's foreign trade and that links once broken cannot be re-forged without some difficulty. After all, no foreign consumer will be happy in dealing with a country which acts in fits and starts and prevents even negotiated contracts from being fulfilled. It is true that the quantum of exports which may suffer through this ban is limited; non-official estimates place it at about 5,000 tons of vegetable oils and 650 tons of *vanaspati*. But this does not alter the fact that it is extremely unwise on the part of the Government to impose a sudden and total ban on exports.

Gujarat's decision is certainly deplorable in that it is bound to choke the normal channels of supply of vegetable oils from that State to its natural markets. But this question has now become part of the wider issue of preserving the economic unity of the country. So long as the zonal system is allowed to impede the movement of foodgrains—Gujarat has been hurt by the zonal restrictions on the movement of wheat and coarse foodgrains—the tendency for each State to conserve its available surplus in particular commodities for the benefit of its own people will increasingly assert itself. Be that as it may, it remains to be seen what long-term effects Gujarat's decision will have on oilseeds and oils. Non-official estimates place the groundnut oil stocks in the State at 23.45 lakh tins, while forward sales to the extent of four lakh tins have been made by millers and commission agents. Gujarat's needs in the next three months—that is, till the new crop arrives in October—are estimated at over 26 lakh tins. Will Gujarat's farmer respond to the call for increased production if he knows that his produce is being singled out for special curbs?

The critical situation on the oilseeds front will still have done some good if it induces the Central and State Governments even now to give top priority to oilseeds production. Nothing is more calculated to bring the Government's agricultural programme into ridicule than the fact that, though we are now in the fourth year of the third Plan, there is no prospect of achievement of the target for oilseeds fixed under the second Plan. It is now believed that the actual achievement under the current Plan is likely to be only of the order of 72 lakh tons, as against the target of 97 lakh tons. The two reasons which have been cited for the failure of the programme for oilseeds is the shortage of superphosphate and the negligible extension of irrigated land to the cultivation of oilseeds. But these reasons cannot wholly explain the shortage of oilseeds.

The fact is there has been a deplorable failure on the part of the State Governments to stimulate the production of oilseeds. Though it is true that oilseeds are generally grown in dry areas where the possibility of improvement in yields is somewhat poor, there is much that could be done through contour bunding and pre-sowing treatment for seeds. The results of the extension programme undertaken by the *vanaspati* industry show what immense scope there is for raising the per-acre yields in groundnut. The industry's experimental efforts have demonstrated that yields could be stepped up considerably through treating seeds with pesticides; in a centre in Maharashtra, it was able to harvest 300 to 345 kgs. of groundnut pods per acre, as against 130 to 175 kgs. per acre in untreated fields. It is now up to the State Governments to do what the industry has done on its own and that, with its admittedly limited resources. They should also examine the scope for growing groundnut as a summer crop in several States, including Andhra Pradesh, Mysore and Maharashtra, and for raising more groundnut as a *kharif* crop in Northern States.

There is urgent need to assess the long-term implications of the shortage of oilseeds to the country's fat economy. It is vital that the available edible sources of fat should be conserved for human consumption and new sources of non-edible fat located for industrial uses. This will relieve the pressure on edible oils by industrial consumers. In particular, as production of soaps rises to meet the growing demand, arising from the increase in population and in the peoples' living standards, the industry's demand for fats will move up to much higher levels than now. Either the industry's fat requirements should be met by imports or new sources of non-edible fat developed speedily. The Indian Oilseeds Committee has surveyed certain areas in Madhya Pradesh where it has been able to locate a potential supply of *mahua* seed to the extent of two lakh tons. Further surveys could possibly yield similar results in other areas. The experimental cultivation of red oil palm in Kerala is believed to have yielded good results. This should induce the authorities to encourage its cultivation on a commercial basis. A far more important source of non-edible fat is rice bran oil and cottonseed extraction which, between themselves, could yield 200,000 tons. It is to be hoped that the Government will bestir itself and take early steps to develop non-edible fat for use by industrial consumers. But this alone is not enough. A much higher priority for oilseeds is necessary in the overall agricultural programmes. And for purposes of agricultural planning, oilseeds deserve to be placed on par with foodgrains, because not only are they the only source of fat for the common people whose diet is woefully deficient in nutritive content but they have an immense export and industrial potential.

Climate For Foreign Capital

The impression that India's investment climate for foreign capital has shown some improvement in recent months is supported by the current trend of thinking in London and Washington alike. Business circles in America appreciate India's earnestness to create a better climate through tax concessions and procedural reforms for attracting foreign investments in a big way. Besides this feeling, which is reflected in American businessmen's emerging interest in fertiliser, petro-chemical and machine building industries, press reactions in the United States are also quite encouraging. A recent despatch from the New Delhi correspondent of the U.S. financial daily *Wall Street Journal*, for instance, has testified to the view that private investment climate in India is improving rapidly and that beneficial results are just flowing from the recent changes in official policies. At present, according to the journal, there are certain important allurements for foreign capital such as: (i) grant of 10 per cent rebate to companies entering key industries and elimination of super-profits tax; (ii) establishment of a high-level committee to speed governmental approval of foreigners' investment proposals; (iii) allowing plant additions of less than $500,000 to be made without Government approval; the previous limit was $250,000; (iv) lifting of price controls on important industrial materials; and (v) introduction of special tax concessions on export earnings of many Indian concerns and establishment of price supports for some exportable goods.

Private foreign investment has so far played a relatively minor role in India's development, the total amount involved being $1,400 million only. The *Wall Street Journal* has quoted a high Indian Government spokesman as saying that the country needs at least $300 million in addition outside private investment yearly, that is, five times the current rate, and that the Government would like to get $300 million from the U.S. alone during the next two years. The *Journal* has concluded by saying: "There are indications, too, that India's new efforts to attract more private capital from abroad are beginning to pay off. In the first quarter of this year, for example, the Indian Government approved 105 new business projects involving foreigners, up from 72 in the last three months of 1963. Eighteen of the new projects involved U.S. concerns, compared with only 12 in the final 1963 quarter."

The American business team, which came to India last April to explore the possibilities for investment, has since conveyed its impressions to over 120 American companies in New York. That their reactions have been sufficiently favourable is indicated by the reported move on the part of some U.S. industrialists to form a consortium to help India in speeding up some of its major industries. In particular, an American consortium of petro-chemical and fertiliser interests is stated to have made an offer to participate in an ambitious scheme of production and distribution of fertilisers. Incidentally, if this offer represents a total fertiliser plan and is reasonably attractive, it will render the quest for individual collaborators unnecessary. But here, as in steel, a more flexible operation of industrial policy may be called for.

How the U.K. investor views the climate in India may also be considered here. According to a spokesman of the Federation of British Industries, India ranks very high, after Canada and Australia, in the list of countries where British businessman and industrialists would like to invest their capital. British businessmen, according to the F.B.I., have full understanding about India's policies and no fears are encountered by them about the socialist policies; they do not apprehend any outright nationalisation of their firms operating in India. A further encouraging feature at present is that even small British firms are evincing interest in India and wish to co-operate with medium and small Indian entrepreneurs. There is also the added appreciation for India's political stability and maturity and British investors, besides feeling secure in this country, are contemplating a huge market for their goods. The only factor, according to the F.B.I., that inhibits the flow of foreign capital into India is a plethora of controls and import restrictions. Of course, these impediments are being got over with the aid of "Kipping loans," under which a part of the aid given by Britain every year to India is being utilised for the import of British components and raw materials for British owned or British assisted industries in this country. The Government of India has been urged, however, to examine the question of excise duties which not only add to the prices of goods but also prevent their exports.

Steel Minister's Clarification

It is most unfortunate that, at a time when the aforesaid favourable view of India's investment climate is gaining currency in the United States and the United Kingdom, the Union Minister for Steel and Mines, Mr. Sanjiva Reddy, has chosen not to canvass Cabinet backing for his sensible view (albeit personal) that foreign capital could be associated with future steel development on the basis of minority participation (*vide* note entitled "Foreign Private Capital for Steel?" in our "Market Gossip" columns last week). Mr. Sanjiva Reddy, it is clear from the press statement issued by him this week, has no hope of imparting a degree of flexibility to the Government's industrial policy, in general, and steel policy, in particular. The following is his authoritative clarification:

"There has been some controversy in the press recently following certain observations made by

(*Continued on next page*)

REND OF SHARES

INTERMITTENT RALLIES

(From Our Own Correspondent)

BOMBAY, 30*th July*

THE trading pattern on stock exchange during the week was again one of irregular movements nder short alternate spells of bull liquidation and nort-covering plus replacement buying. No doubt iere were a few buoyant spots, but the list gene-ally showed small to moderate variations either 'ay. The tendency at the close, however, was istinctly weak. Although bulls were not in a iood to extend their commitments bear operators 'ere not bold either to go decisively short. Inter-ittent rallies were due mainly to short-covering y those operators who were content with a iodest profit.

Over the week, Tata Steel eased slightly to uote at Rs. 154, while Indian Iron was unchanged t Rs. 25.50. By and large, interest in steel shares eemed little and there was nothing for operators to ang on to once the dividends were announced and rough idea of the working became known. It is kely that this section will remain dull until fresh evelopments take place.

In fact, the market as a whole is awaiting new evelopments. The worsening food situation and ie continued reports of hostile operations on the akistani border are still there, but, as factors, ley have been more or less discounted by now. the situation worsens further—God forbid—it is different matter. The market, however, may not ve a definite indication so long as there is no-ling new in the news.

The Government's decision to go ahead with s scheme to control the prices, production and stribution of popular varieties of cloth was a amper on the textiles section. Century and a w others were exceptions. On hopes of a gher interim dividend and a probable bonus sue, Century were bid up on sustained profes-onal buying to Rs. 615, a new high in the recent oward trend, although, on profit-taking, they eased close at Rs. 610, as against Rs. 605 last week. ther shares were better or worse on their own erits, but Standard were taken down from Rs. 632 Rs. 629, while Bombay Dyeing was better at s. 57.80, as against Rs. 57.40. Kohinoor was ightly shaded at Rs. 324.50. Apart from Cen-ury, the star performer in the textiles group was vadeshi which were bid up from the last week's vel of Rs. 247 to Rs. 263 on heavy short-covering id institutional support.

Another notable counter was Belapur, in igars, which were bid up to Rs. 230. The shares ad been neglected for quite some time and their ooting up into the limelight on hopes of good cor-orate results attracted investors' attention. The ares eased to close the week lower at Rs. 225.50, it the rise, as compared with last week's level Rs. 219, was indeed considerable. The under-one continued to be firm and this induced a better one in other sugar shares. Phaltan moved up om Rs. 101 to Rs. 105 at the end of the week. 'alchand from Rs. 150.50 to Rs. 152, while even e normally dull Maharashtra was quoted at s. 139, as against Rs. 136.50 last week-end.

Yet another star performer during the week as National Rayon which on professional support se to Rs. 368.50, though, at the close, the quota-on was down to Rs. 363, a net gain of Rs. 5 over ie week. Support to these shares was said to be a professional nature and from knowledgeable urces. It appears that some professional ope-tors were building up long positions in the hope some relief to the industry to overcome the pre-nt depression. Further, the price level was also id to be attractive for purchases.

Hindustan Motors came in for considerable ng liquidation, as the mere maintenance of the vidend at 11.5 per cent gross came as a big dis-ppointment to a market which was anticipating a se in the dividend. The shares were done down Rs. 17.80, but scattered short-covering induced fractional rally on balance with the scrip clos-g the week at Rs. 17.88, as against Rs. 18.16. remier Auto was also a shade easy at Rs. 101.

Among other shares, Baroda Rayon were ightly easy at Rs. 74.50. Gwalior Rayon and dian Rayon closed the week at Rs. 40.50 and s. 58, respectively. Papers were erratic with rpur fractionally easy at Rs. 11.36, while West ast was a shade better at Rs. 159. Electricity ares were dull, but Ahmedabad attracted some tention at Rs. 100.25. Activity in bank shares as confined to India and Central, whereas, among surances, New India was placed at Rs. 45.50. India was shaded at Rs. 15.20 for want of sup-rt.

The decline on Thursday was particularly in-ced by end-account considerations as well as e possibility of the implementation of the Bonus mel's recommendations. However, the market as still very much above the 27th May levels. r example, Tata Steel was today done at s. 154 (as against Rs. 142.50 on 27th May), Indian on at Rs. 25.50 (Rs. 23.72), Century at Rs. 610 s. 583), Standard at Rs. 629 (Rs. 590) and Sva-shi at Rs. 263 (Rs. 245)). Scindia fetched s. 15.20, as against Rs. 13.84, while Belapur and remier construction are quoted at Rs. 225.50 and s. 183, as against Rs. 198 and Rs. 162, respec-vely. Despite current weakness, Dyestuff was oted at Rs. 263.75, as against Rs. 246.25. tional Rayon was bid at Rs. 363, as against Rs. 342. though jolted rather badly, Hindustan Motors as quoted at Rs. 17.88, as against Rs. 17.32.

During the process of a secondary correction, ares lose about 40 per cent of the gains and, this thesis, it seems that there is still scope for market to ease. Technical analysts say that market is consolidating itself and that it is a trading area. One can only wait and see whe-r some correction is still due or whether the process of consolidation has ended so that the market may push its way further.

A word about Telco. The close was modestly better at Rs. 290 and shareholders felt pleased by the Chairman's statement that, barring unforeseen circumstances, the larger profit that would follow the increase in output should enable the Company to maintain the ordinary dividend. The rate was likely to be maintained even on the capital proposed to be increased by a right issue. Shareholders also appreciated the gesture of the Chairman in proposing to collect the share amount of the new issue in two instalments.

* * * *

At the time of writing, Calcutta was easy, owing to selling in selected counters. Birla Jute was down to Rs. 33.44 and Dunlop Rubber eased to Rs. 32.50. Orient Paper receded to Rs. 34 and Shree Gopal was dull at Rs. 24.94.

* * * *

Madras was dull and very few shares changed hands. Business in plantations was at a low ebb. Mettur Chemicals attracted moderate inquiry and Aluminium Industries and Seshasayee Paper were better.

A NEW INDO-U.S. CHEMICAL VENTURE

The Government of India has approved a joint venture of the M. & T. Chemicals Inc. of New York and the Ronuk Industries Ltd. of Bombay to manufacture and market electroplating compounds and chemicals in India. The new firm is to be known as M. & T.-Ronuk Chemicals Ltd., with head office in Bombay where the Ronuk Industries Ltd. is already operating three plants. Sales will be handled by a subsidiary organisation of Ronuk Industries, Ronuk Sales. Eventually, the new joint venture will export plating products to the South-East Asia market area.

The basic product lines of M. & T.-Ronuk will be self-regulating high speed chromium plating compounds for decorative and hard chrome plating, chromic acid, nickel-plating chemicals and organic rack coatings for electroplating use. In the field of decorative chrome plating, the largest market potential is bicycle manufacturing. More than two-million bicycles are manufactured every year in India. The other large manufacturing markets are motor bikes, automobiles, trucks, business machines and hardware. Plating compounds are also used by the Indian defence industry. Hard chrome plating markets are in the manufacture of dies, pistons, piston rings, and—with a new diesel locomotive manufacturing facility now being built in India—locomotive cylinder liners.

PREMIER CABLE CO., LTD.

The Premier Cable Company Limited, which has obtained an industrial licence to manufacture P.V.C. insulated power cables, is expected to enter the capital market shortly with a public issue of Rs. 52 lakhs, divided into 300,000 equity shares of Rs. 10 each and 22,000 9.3 per cent cumulative redeemable preference shares of Rs. 100 each. The entire issue has been underwritten by the L.I.C., Industrial Finance Corporation of India, Kerala State Industrial Development Corporation and the I.C.I.C.I.

The Company's factory is being put up at Karukutty near Cochin port in Kerala. The construction of building is in progress and the machinery and equipment are expected to arrive by the beginning of next year. The foreign collaborators in the venture are Messrs. VEB Kabelwerk Oberspree of East Germany, one of the leading manufacturers of aluminium conductor cables in Europe. The firm has agreed to supply technical know-how, to supervise the erection and actural running of the factory, and to train Indian personnel. It will be paid only in lump sum for its services.

INDIAN OVERSEAS BANK

The accounts of the Indian Overseas Bank Ltd. for the first half of 1964 disclose a higher net profit (subject to audit) of Rs. 21.99 lakhs as against Rs. 20.76 lakhs for the corresponding period in 1963. The amount brouhgt in from the last year's account is Rs. 1.02 lakh.

MARKET GOSSIP

(Concluded from previous page)

me in the course of an interview granted to the industrial correspondent of a leading newspaper.

"There are no proposals to admit foreign capital participation in the expansion of the steel industry and a discussion of this issue in these circumstances can, therefore, be of academic interest only.

"I wish to make it clear that Government have no intention of deviating from the principles embodied in the industrial policy resolution of 1956. There is, therefore no question of a shift in Government's policy relating to the development of the public sector. I trust that, with this clarification the controversy will cease."

Monopoly In Engineering?

There has been a lot of loose talk about monopoly and concentration of economic power in the private sector, especially after the appointment of the Monopolies Inquiry Commission. The terms of reference of this Commission have, however, not made the meaning of the above concepts clear. But the Engineering Association of India, in its recent memorandum to the Commission, has tried to throw some light on these issues. The Association, at the outset, has stoutly denied the existence of any monopoly prejudicial to public interest in the engineering industry. If there is at all any monopoly in this field, it is in the public sector undertakings, manufacturing telephones, coaches and locomotives. But such public-sector monopoly has not been included in the scope of the Commission's inquiry.

The Association has maintained that, although the term "monopoly" usually denotes a single unit in the market, for purposes of measuring the effects of restrictive trade practices, the concept would have to adopt different standards for different industries, depending on each industry's development and the number of units operating in relation to their production and demand rates. The note has further added that, in a developing country like India, which is aiming at all-round growth, signs of monopoly, even if visible, cannot be called monopolies, as even in such cases imports do take place and gradually, with the rise in demand, more units enter the field.

The Engineering Association has also cautioned the Commission against the likely confusion in distinguishing between a "monopoly" and a "dominant enterprise." The need for the latter, according to the Association, arises in specialised industries which have limited markets and the economy of which necessitates the existence of only a few enterprises. Pointing out the case of automobile and antimony industries which have only a few units, it has emphasised that the factors governing demand, economies of scale, etc., which tend to reduce the number of units, should not be lost sight of. It has also referred to its own survey of 120 engineering industries, in most of which the units working are far too many to allow monopolies to operate. While the steel industry has five big units, with the State itself as a dominant partner, the aluminium industry has four units, the electric fans industry 24 units and the bicycle industry 21 units. The processing industries, on the other hand, have more than 100 units operating in the country.

As regards concentration of economic power, the Association has stated that, with the extensive legislative measures of the Government, it is difficult to believe that it exists in the present set-up. In support of its stand, it has referred to the Industrial Policy Resolution of 1956, Industries (Development and Regulation) Act and the Company Law, all of which have been intended to thwart any such trend of economic concentration in private hands. The Association has requested the Commission to take due note of the redistributive taxation measures adopted by the Government. Above all, the Commission should recognise that the circumstances in the country have not favoured the adoption of restrictive trade devices, for there has been a growing internal market for almost anything that is produced.

UNIT TRUST OF INDIA
(ESTABLISHED UNDER THE UNIT TRUST OF INDIA ACT, 1963)

Units Are Now On Sale

Units of the face value of Rs. 10/- each, available in multiples of ten, are being sold initially at Rs. 10/- upto 31st July 1964.

Investment in units gives you major advantages :

*Assured Income
*Liquidity of Investment
*Safety of Capital
*Important Tax Concessions

UNITS ARE AVAILABLE AT
ALL BRANCHES OF THE FOLLOWING BANKS :

State Bank of India, State Bank of Hyderabad, State Bank of Mysore, State Bank of Bikaner & Jaipur, State Bank of Indore, State Bank of Travancore, State Bank of Saurashtra, State Bank of Patiala, Bank of India, Central Bank of India, Punjab National Bank, Indian Overseas Bank, Indian Bank, United Commercial Bank, Canara Bank, Bank of Baroda, National & Grindlay's Bank, Syndicate Bank, Devkaran Nanjee Banking Co., United Bank of India, Andhra Bank, Allahabad Bank, Chartered Bank of India, Bank of Behar, New Bank of India, First National City Bank, Mercantile Bank, Hongkong and Shanghai Bank, Krishnaram Baldeo Bank, Tanjore Permanent Bank, Bank of Rajasthan, Lakshmi Commercial Bank, Hindusthan Mercantile Bank, Bank of Maharashtra, Union Bank of India, Netherlands Trading Society, Oriental Bank of Commerce and British Bank of the Middle East.

Also from sharebrokers registered with Stock Exchanges at : Ahmedabad, Bangalore, Bombay, Calcutta, Delhi, Hyderabad, Indore and Madras.

SUGAR POLICY

TWO important pronouncements bearing on the sugar industry were made by Mr. C. Subramaniam, Union Minister for Food and Agriculture, at a Press conference in New Delhi on Monday this week. One pertains to the *de novo* study of the price-distribution-production pattern for sugar and the other to the lifting of the ban on inter-State movement of *gur*. A special committee has been set up, with Dr. Sen of the Planning Commission as Chairman, to recommend, within a month, the aforesaid pattern and to examine the merit of the entire scheme for constituting a Sugar Marketing Board. The pattern suggested by the Committee, it is stated, will come into vogue from the next crushing season, due to begin (officially) on 1st November 1964.

Mr. Subramaniam must have evidently been prompted by the consideration that it would be better to frame the sugar policy on the basis of the findings of a special inquiry committee. A distinct advantage in doing so seems to be that if, by chance, the sugar policy were to fail, the Committee could be used as a scapegoat. That apart, one wonders whether there is any need at all for a special inquiry. This journal is among those who have repeatedly been drawing attention to the factors responsible for the lag in sugar production and indicating the solutions therefor. Only the Governments, Central and State, have not cared to pay heed to these; they have always preferred to play for safety in the context of pressure-tactics of vested interests, especially in the States of Uttar Pradesh and Bihar. It is, however, to be hoped that the report of the Sen Committee at least will pave the way for the formulation of a rational and, what is more important, a consistent sugar policy.

Thanks to the absence of such a policy, the trends in sugar economy have continued to be disquieting to a degree. Despite all the loud talk of encouraging sugar production, the actual output (less than 2.14 million tonnes) in the 1962-63 season was well below the peak level (3.03 million tonnes) touched in 1960-61 and the current season's output of 2.50 million tons, though it is higher than the previous season's is lower than the target of 3.3 million tonnes fixed to be achieved by the Government. While sugar production in the past two seasons has been low, domestic requirements have gone up, due to rise in population and increase in purchasing power, and there are also export commitments. The total closing stock of sugar with factories at present is said to be no more than 650,000 tonnes which is insufficient to meet the demand between now and the time when the new season's sugar becomes available.

The sugar supply position would not have been so tight but for the inability of the mills to utilise their crushing capacity—the capacity has expanded quite markedly in recent years—intensively. This inability is due to the inadequate supplies of cane, as a result of the large-scale diversion to the production of *gur* and *khandsari* which are commanding very high prices. The diversion is bound to be on a much larger scale, now that the ban on inter-State movement of *gur* has been removed and it is proposed to do away with movement restrictions on *khandsari* also. It is a pity that Mr. Subramaniam has fallen a victim to the pressure of *gur* manufacturers backed by the State Governments. If the ban on *gur* movement, as Mr. Subramaniam says, has not worked well, the remedy lies, surely, in enforcing the ban effectively and not in abolishing it.

MORE ON C. D. PROGRAMME

The Annual Conference on Community Development and *Panchayati Raj* held at New Delhi last week, it is gratifying to find, has made several practical recommendations relating to agricultural production. One of these is that "progressive farmers" should be increasingly associated with the local agricultural production plans. Their active association, it is needless to add, would constitute an example for all other farmers who can be brought into the planning process only by stages. Again, the twin idea that the production targets to be specified in the village plan should be those "agreed to by the farmers themselves" and that they should be based on improved agricultural practices "already demonstrated and accepted" is commendable, for any unrealistic production plan imposed from above is bound to be resented and even sabotaged by farmers who are generally more practical-minded. If individualistic farmers are to develop co-operative attitudes and become community-minded, gentle persuasion through a systematic programme of demonstrations, in which the "progressive farmers" take an active part, is the only way open to the C. D. Agency and the agricultural extension service.

Another recommendation made by the Conference is to the effect that those States, which have not so far introduced legislation for making beneficiaries responsible for excavation and maintenance of field channels, should do so expeditiously. This, again, is a salutary recommendation, for one of the factors responsible for the slow utilisation of irrigation facilities in the commanded areas of major and medium projects is the slow pace of construction of field channels. In particular, the idea of using the rural works programme, too, for excavation is quite a good one, for the beneficiaries who are made responsible for the construction of field channels can thereby be assured of some financial assistance from Government sources.

The Conference has also done well to express the opinion that any transfer of minor irrigation works to *panchayats* should be invariably accompanied by the provision of adequate funds for their maintenance. That only three States—Maharashtra, Punjab and Rajasthan—have provided the necessary funds so far is indeed disappointing in this connection. Since the *panchayats*, with their meagre resources, may not be in a position to discharge this necessary function satisfactorily without financial assistance, all the State Governments would do well to take the necessary steps in this regard This is all the more advisable because it is a notorious fact that the maintenance of older minor irrigation sources like tanks and wells has been largely neglected while spending money on newer minor works. Greater attention to this aspect is particularly urgent in the context of the proposed extension of the intensive cultivation programme to more districts. Likewise the proposal to dovetail rural electrification with lift irrigation by according a high priority to the supply of electricity for agricultural purposes deserves to be pursued energetically within the overall limits of power availability. This, incidentally, will give a further fillip to minor irrigation either as a main or as a supplemental source in all villages lying along main transmission lines.

HALDIA PORT PROJECT

The recent acute congestion in the Calcutta Port, which delayed the clearing of even essential items like foodgrains, has further underlined the need for developing the proposed subsidiary port at Haldia with expedition. As this port will be nearer the sea than Calcutta, its establishment will be to the advantage of larger and deeper-draught vessels which are unable to enter the relatively shallow Hooghly now. Moreover, such a stand-by port will also help divert the traffic from Calcutta if the entry to it is blocked by any accidental sinking of a vessel in the river. Industry and trade in the hinterland of Calcutta are, therefore, looking forward to the early construction of this ancillary port. They will be gratified to hear that the first phase of this port project has just been finalised by the Calcutta Port Commissioners in consultation with the Union Ministry of Transport.

The Haldia project report, as finalised now, has been prepared with the help of World Bank technicians and of experts belonging to some major international ports. The Bank's financial and technical assistance, in particular, has been of immense value in the preparation of the Master Plan for the project. It will be recalled, in this connection, that the Bank's mission in 1957 had taken note of the growth potentiality of trade through a port at Haldia because of the rapid industrialisation of about five lakh square miles of Calcutta's hinterland. That the World Bank continues to maintain a sense of urgency about the construction of this new port is even more gratifying in the context of the rather heavy foreign exchange component (Rs. 14 crores) of the Rs. 30-crore project covering the first phase.

The Chairman of the Calcutta Port Commission has just given the cheering news that the construction of the port is to begin in right earnest now with the co-operation of the World Bank. Already arrangements are being made to meet the initial power requirements of the project, and the West Bengal Electricity Board is expected to take the necessary steps for supplying 50 M.W. of electricity by 1970-71. The establishment of this port, according to him, will not come in the way of the development of Paradip port in Orissa. The volume of cargo handled at both the ports will be only complementary. Together these two ports will cater to the growing trade requirements of Eastern India, thereby easing the pressure on the Calcutta port.

Haldia port, when completed, is expected to handle a total traffic of 11-12 million tons, consisting of coal, iron-ore, crude oil, rock-phosphate and other miscellaneous cargo. To cope with this traffic, six mechanised berths are to be provided. The port will be able to handle large bulk carriers, and the overall costs of operation are likely to be much less than at Calcutta. Haldia will also be connected to the main railway system near Kharagpur. With the construction of a pipeline between Barauni and Haldia, additional imports of crude oil for the public-sector refinery can be effected through this port. Oil traffic will be about three to five million tons. Similarly, for the fertiliser factories at Sindri, Durgapur and Barauni, raw phosphate will be imported at this centre. Foodgrains may also figure in the port's imports. As so much is expected of the Haldia port, it is of the utmost importance that the first phase of the project should be completed according to schedule.

SOVIET AGRICULTURE

Despite the devastating drought that hit the major farming belts of the U.S.S.R. last year the Soviet Government procured 2,735 million poods (of 36 lbs. each) of foodgrains, as against 1,900 poods procured a decade back in 1953. During the past two five-year periods the output of grain has recorded an increase of about 77 per cent. Meat products have more than doubled and milk, butter and sugar have increased by 76 per cent, 82 per cent and 230 per cent, respectively. But these figures pertaining to Soviet agricultural growth over the last decade, so proudly quoted by Mr. Khrushchev in his report to the Supreme Soviet the other day, are not quite impressive in the context of a glaring deficiency in food supplies for some time now—a deficiency that has forced that country to import as much as 12 million tons of grain in a single year (1963-64). It is quite patent that, even after making allowance for the loss in output caused by last year's drought the quantum of grain imports is quite large. And that, incidentally, suggests that Soviet production of food, like other consumer goods, has not increased rapidly enough to meet consumer needs and wants fully. It is indeed characteristic of Mr. Khrushchev that he has just bluntly told the Supreme Soviet that before Communists can boast about their "just" system of distribution they "must have something to distribute."

The relative failure on the agricultural front, however, seems to have been a blessing in disguise, for it has compelled the Soviet Government to think in terms of providing greater inputs and incentives for that sector. Mr. Khrushchev's report reveals, in this connection, that a system of measures for the intensification of agriculture and for ensuring stable crops and high productivity of livestock breeding has just been evolved. According to this plan, there will be, firstly, a sharp increase in the output of mineral fertilisers, of chemical means for the protection of plants and of other chemical products for plant growing and livestock breeding. Secondly, it is proposed to intensify the mechanisation of agriculture. Lastly, it is planned to carry out on a large scale the work of irrigation and land reclamation. As these measures will call for vast capital inputs, an amount of 5,400 million roubles has been allocated in the current year, as compared with 900 million roubles spent in 1953.

At the same time, the need for greater incentives to collective farmers has been recognised. Hence the current proposal to introduce a system of pensions and other benefits for collective farmers with effect from 1st January 1965. The draft law, in this connection, envisages an All-Union Fund of Social Maintenance for Collective Farmers to be formed by the contributions of collective farms and by annual appropriations under the State budget. Under this scheme, some 6.5 million collective farmers will have the right to pension. The estimated expenditure on account of these pensions and allowances will come to 1,300-1,400 million roubles annually. There is no doubt that the pension system has been conceived as an indirect incentive to collective farmers who have always displayed greater enthusiasm for individual farming on their tiny kitchen plots and achieved much higher productivity thereon. In fact, Mr. Khrushchev's expectation is that "the introduction of a uniform system of pensions in collective farms will stimulate a new upsurge of creative activity of the workers of countryside in their devoted and dignified struggle for new sucesses in agriculture." Time alone will show whether the Soviet Premier's optimism is justified.

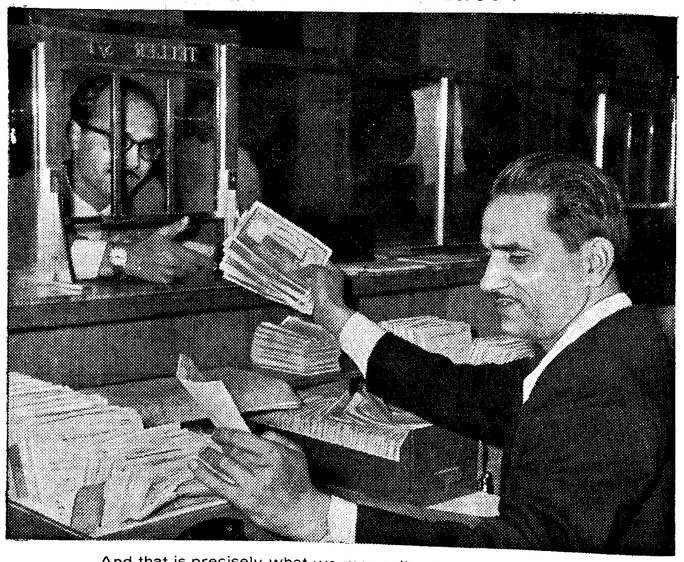
ESSO REFINERY'S FIRST DECADE

The tenth anniversary of the Esso Refinery, celebrated with *eclat* this week at Bombay, has highlighted the immense and varied contribution made by it to India's economic development. One measure of this contribution is to be found in the foreign exchange saving resulting from the Refinery's operations. This saving last year alone was Rs. 11.3 crores, and the total savings since the start-up of the plant in 1954 have come to Rs. 46 crores. All this has been made possible not only by refining crude locally but also by the export of surplus gasoline and asphalt and by the addition of new units for manufacturing products hitherto imported. The associated activities of the Refinery, which has itself more than doubled its initial capacity, have catered to both domestic and foreign markets and contributed their share to the saving (and earning) of foreign exchange.

But that is not all, for the refining company has made yet another contribution by relinquishing duty protection through a much higher level of refining efficiency, increased throughput, better product distribution and the use of lower priced crude.

A broader vista of opportunities may well open out for this refining company if the Government of India can see its way to adopting a more considerate and pragmatic approach to the pending question of expansion. It is indeed distressing that Esso's offer to negotiate a regular industrial licence in place of the refinery agreement of 1951, if the Government would agree to refinery expansion, is yet to be accepted by New Delhi. But it is gratifying to find that at least in the matter of negotiations for a lubricating plant in the vicinity of the Refinery, heads of agreements have been reached for erecting the plant as a joint enterprise of the Government of India and Esso Standard Eastern Inc. This limited achievement, however, can be no consolation either to Esso or to the country, for the bigger issue of expansion remains unresolved, as of today. Since India's consumption of petroleum products is expected to reach 18 million tons by 1966 and 30 million tons by 1970 and the new refineries that are either being built or planned cannot be expected to meet all the increase in demand, there is a sound case for allowing the three private refineries to expand their capacity. The most telling argument, in this connection, is that the investment for the expansion of an existing unit is much less than the investment for the erection of a new plant of the same capacity as is involved in such expansion. Moreover, expansion of existing units can save the country additional foreign exchange in the immediate future. That the Esso Refinery, if given the chance for expansion, will continue to prove itself unequalled in its ability to transform petroleum into creative service for the people of India is the most heartening assurance given by the Company on the occasion of its tenth anniversary.

Cashed in a Minute!



And that is precisely what we mean. It takes no longer than a minute to cash your cheque at any PNB office with the Teller System.

The streamlined Teller System eliminates tokens, queues, all tedious and unnecessary waiting and delay

PNB was the first bank to have introduced the Teller System as far back as 1954. Today, PNB has 90 branches operating this system and plans to introduce this on-the-spot service in 60 more branches throughout the country.

DELHI LETTER

TOWARDS A NATIONAL FOOD POLICY

DIFFERENCES AMONG MINISTERS PERSIST

From Our Special Correspondent

NEW DELHI, 28th July

A CURRENTLY popular quip about the Shastri administration, which has Congress President Kamaraj operating forcefully in the wings, is that it seeks to evolve a "Government by consensus." It was this factor, according to those who claim inside knowledge, which forced Food Minister Subramaniam to hold himself in check during the State Chief Ministers' Conference which discussed the critical food situation. In framing the broad outlines of his short-term tactics and long-term strategy, which he announced to newspaper correspondents on Monday, Mr. Subramaniam, no doubt, tried to evolve a policy comprising the consensus of various State interests and different Union Ministries concerned, but he has found the interests abounding in the food business are too conflicting to permit a commonly acceptable formula. Mr. Subramaniam has gone ahead with the enunciation of a policy which obviously has the full support of the Prime Minister; it is whispered that the Finance Minister, Mr. T. T. Krishnamachari, and the Congress President are not fully in agreement with the measures announced by the Food Minister. The Home Minister, Mr. Nanda, is reported to fear that the establishment of the Food Trading Corporation means greater scope for corruption which he is sworn to try root out. Mr. Krishnamachari, who told Parliament of his new belief in the need for State trading soon after Mr. Nehru's death, is reported to believe that half-way measures as conceived by the Food Minister may tend to confuse the situation further. A significant expression of doubts on the efficacy of the State trading palliative has come from Mr. R. Venkatraman, Madras Minister, who was Mr. Subramaniam's colleague in the Madras Ministry headed by Mr. Kamaraj. A question being asked is whether Mr. Venkatraman echoes the views of Mr. Kamaraj.

When he announced the elaborate programme on Monday, Mr. Subramaniam took pains to dispel the fears which have been growing more widespread day by day. The Union Minister for Community Development and Co-operation, Mr. S. K. Dey, whose portfolio has come under the general supervision of the Food and Agriculture Minister, raised the worst scare when he told the conference of State Ministers of Community Development and *Panchayati Raj* that he feared extensive rioting, dangerous to democratic Government, if the food situation deteriorated further. Home Minister Nanda also had cautioned senior police officers in conference of the dangers to the law and order situation in the event of the price levels continuing to rise.

Ship-to-Mouth Existence

The Food Minister has tried to present a bold face despite the fact that the revised estimates of food production show that the production in 1963-64 has been even lower than the first estimate of around 81 million tonnes of grains. The estimate now put the total output at 79.4 million tonnes; rice production is still placed at four million tonnes more than the previous season's, but the wheat production is about two million tonnes lower than expected. Mr. Subramaniam has stressed that the total food supplies *available* will be three or four million tonnes more than last year. This increase in availability is *almost solely* to be achieved by heavier unloading of imported grains—nearly 6.5 million tonnes this year. In 1963, the Government issued 4.92 million tonnes of foodgrains from its stocks. The Government releases will thus be one and a half million tonnes more than last year. The Food Minister's claim that the increase in supplies this year may be three or four million tonnes more does not appear to be correct. Six million tonnes are considered to be the highest limit of imports that can be handled in the country. The original estimates, when the third Plan was being framed, was that, for 1964-65, the foodgrain needs would be around 90 million tonnes. The home production plus the six and a half million tonnes of imported grains would make 86 million tonnes at best. This is the quantity theoretically available in the country. The Central Food Ministry will cut its teeth to attack the price problem, probably when the State Trading Corporation is established next year. Until then, the deficit regions may undergo a ship-to-mouth existence, with surplus States going back on promises.

Although the Food Grains Inquiry Committee, headed by Mr. Asoka Mehta, made its report several years ago, this is the first occasion that the Centre is attempting to tackle the food problem with a long-term strategy instead of a piecemeal approach. The Food Grains Inquiry Committee had said: "It should be ordinarily sufficient to undertake open market purchases and sales of foodgrains by the Government as a regular measure, socialise a part of the wholesale trade, exercise control over traders operating in the rest of the market through a system of licences, maintain a sizable reserve stock of wheat and rice, arrange for regular import of a certain quantity of rice and wheat. . . ." The Committee also recommended a Price Stabilisation Board for determining prices of foodgrains and the establishment of a Foodgrains Stabilisation Organisation.

The Planning Commission's Deputy Chairman has repeatedly maintained that the short-term steps for rectifying the price situation are the responsibility of the executive ministries. The Planning Commission, as such, has not entered the food debate in recent days nor has it explained its approach; but when the National Development Council meets, the planners will be expected to go beyond the suggestion to fix the fourth Plan food production target at 120 million tonnes and present an integrated programme.

Points for Consideration

Mr. Shriman Narayan, who handles the food portfolio at Yojana Bhavan, has recently spelled out points for consideration, dealing with problems other than production targets. Mr. Shriman Narayan's suggestions, some of which have already been implemented by Mr. Subramaniam, are:

1. It would not be desirable to follow either a policy of free trade and decontrol or to impose complete rationing and control of foodgrains; we should follow the middle course by regulating the food trade at strategic points, more specially at the wholesale level, and by building up adequate buffer stocks.

2. It should not be necessary for the Government to undertake the purchase of the entire marketed surpluses, as that would cast on the Government the responsibility for feeding the entire urban and semi-urban population;

3. Wholesalers should be permitted to function as licensed dealers who will make purchases on their own behalf and pay specified minimum prices to farmers; while the Government will have a right to acquire the whole or a portion of the stocks from the licensed traders at notified maximum prices the traders will be free to dispose of the remaining stocks to retailers at prices not exceeding these maximum prices.

4. The order enabling the State Governments to fix maximum prices should be enforced strictly and effectively.

5. To build up adequate buffer stocks, the Government should declare purchase prices of foodgrains well before the sowing season and set up an agency for making direct purchases from the producers.

6. To build up sizable buffer stocks, specially in rice, it may become necessary, as an experimental measure to purchase the entire marketable surplus in certain selected districts in surplus States.

7. A Foodgrains Trading Corporation should be established for purchasing and selling grain at specified prices.

8. For sale of foodgrains through fair-price shops, it may be desirable to control distribution through family identity cards.

9. The ultimate pattern of State trading in foodgrains should consist of a system which provides for the collection of farm surpluses through well-organised service co-operatives at the village level and channelling of the surpluses through marketing co-operatives for distribution through consumers' co-operatives.

LONDON LETTER

TROUBLED WATERS

POSTAL STRIKE AND AFTER

(*From Our Special Corrsepondent*)

LONDON, 18th July

(*Delayed in transit*)

THIS has not been a good week for Government or country, although it started off with proper *panache* over a long, detailed and agreed Commonwealth Premiers' *communique*. And then it became known that the African Prime Ministers were very seriously disturbed over the British Premier's failure to take their request for a conference on the Southern Rhodesian constitution seriously and some of the gilt flaked off Sir Alec Douglas-Home's gingerbread. Then there has been the strike of Post Office workers which has affected British communications with all parts of the world and, contrary to anticipations in some quarters that this would harm the Opposition's image, public sympathy has tended to remain with the postmen and the odium has fastened on the Postmaster General and the Chancellor of the Exchequer who, though carrying the main responsibility for sticking out against the postmen's demands, refused to intervene till too late and then with no intention of making any concession.

Postmen have not struck before this century and briefly their demand is for an 8 per cent rise on a pay which has been falling behind that of general industry for eight years. Thus the insistence on a 4 per cent rise was felt to be less than reasonable. Negotiations continue but it looks as if this country's postal services will stay in a poor way for some time.

The stock markets have sagged, after looking all set for making fresh records, partly because of the end-week trade figures, but on the last day because of the crash in one over-popular share. Spectacular crashes of this kind tend to have a depressing effect on the whole market even though there is no direct relationship. However, the malaise on this account is not likely to last above a week. The trade figures could have a more lasting effect—they have already caused sterling to dip as low as possible—especially as the month of June was not expected to be anything like so bad as has turned out. The following table compares the June figures with those for each of the preceding three-month periods:

(£ million)

Monthly averages	*Dec. 1963/ Feb. 1964*	*Mar./May*	*June*
Exports f.o.b. ..	364	373	360
Imports f.o.b. ..	398	403	423
(Imports c.i.f.) ..	(450)	(453)	(473)
Adverse balance ..	34	30	63

This is against a background of a £4-million per month adverse balance in 1963. So June joins the months of January and April as one of phenomenally bad figures. For the calendar year to date the adverse balance has now risen to over £40 million a month.

It will be noticed that the big jump in the adverse balance is due partly to a slump in exports (which dropped £23 million on the month) and as much to another jump in imports (which rose £23 million on the month). Even the President of the Board of Trade had to admit that he found the figures a bit disappointing!

Taking a longer view June exports are one per cent down on the figures for the first quarter, while imports are about 6 per cent up. For the first half of this year exports are still 4 per cent above the 1963 average, while imports are 14 per cent above it. If this is what the President of the Board of Trade calls an upward "underlying trend" which he regards as so important, then it is pertinent to ask which "upward" is he referring to? The fact that exports are upward?, that imports are upward?, that the adverse balance is upward? Surely the responsible Minister might have a more cogent observation to make.

But it seems that the Chancellor of the Exchequer is not really worried. His main worry had been inflation and he clearly has nothing to do about that at present, but he ought to remember that the Government's main claim in seeking re-election is that it has brought the country to and maintained it on a rising curve of prosperity. The export performance

BRITAIN TO START THE SPIRAL?

By Questor

MR. Dillon's plea to European Governments to make more use of fiscal policy and less of monetary policy does not seem to have gone entirely unheard. Interest rates have certainly risen in several European countries, including Britain, in the past few months. But a rise was inevitable, given the inflationary pressures which have emerged and the relative paucity of the economic weapons available to some Governments. It has not been large. It has not, so far, led to the competitive bidding up of rates. And it has not noticeably embarrassed the U.S. Administration. Indeed, the dollar, despite the persistence of the payments deficit, now seems to be over the worst of its troubles.

The strengthening of the dollar has been accompanied, as nearly always, by a weakening of the other reserve currency—sterling. The British balance of payments is in temporary deficit at the moment, as was only to be expected to be as business activity increased. It has long been realised that this deficit would become more apparent as the general election approached and movements of short-term capital became less favourable. The Government declared a long time ago that it would be ready to ride out a temporary deficit by drawing on the gold reserve and on its various lines of international credit, including a $1,000-million standby facility, recently renewed, with the International Monetary Fund and a $500-million swap with the U.S. Treasury.

It would prefer to do this, provided that the economy were free of inflationary tendencies, than to impose fresh restrictions on the growth of demand and jeopardise its attempt to achieve a faster and more even rate of growth. The British gold reserve, like Britain's diplomatic strength, is a good deal less than that of the U.S. But London has been trying to meet a basically similar problem—the combination of sluggish growth with reserve currency obligations—in a basically similar fashion.

Yet it is plain from the behaviour of the money and bond markets during the past couple of weeks that a good many people in London would not be surprised to see the official discount rate raised again—an attitude which is probably responsible for the hardening of the exchange rate. It is a traditional assumption in Britain that the discount rate should move by a full 1 per cent when it is rising, for fear that a mere ½ per cent might merely provoke expectation of the other half.

If the rate were to go up from the present 5 to 6 per cent, there is little doubt that there would be repercussions in other European countries and probably in the U.S. itself. The Government is as little anxious to be responsible for these as to take a step which might blight the present upswing in business investment plans. Why, then, is the possibility of another rise in the discount rate being discussed here quite seriously?

The reason is that the economy seems to be developing in a more complex way than most of the experts expected at the beginning of the year. Although labour is now becoming scarcer and there are bottlenecks in the supply of a few materials, there is no sign at all that the business upswing is getting out of hand.

Industrial production, if one can trust the figures, has remained fairly static, while unemployment has been declining, retail trade is no more than reasonably good, car sales have ceased to rise, small businessmen are not wildly optimistic about the outlook, and there is little evidence of the hoarding of scarce labour and materials which has accompanied previous booms. Wage rates, too, have been rising relatively slowly. Yet the latest trade figures—they have been fluctuating with unusual violence this year—suggest that exports are now rising more slowly and that imports are continuing to rise after the temporary jump caused by the rebuilding of industrial stocks.

If the balance of payments on current account is worsening because of something other than a temporary burst of stockbuilding, it can be argued, Britain ought not to borrow against a run on sterling without taking some action to deal with the situation. On the other hand, since there is no sign yet that domestic demand is excessive, it would be wrong-headed to restrict personal consumption by higher taxes or to cut public or private investment spending. The only sensible course, it follows, is to raise the discount rate—a step which might have a less dampening effect than direct restrictions on the much-needed recovery in investment plans and one which would certainly improve the balance of foreign payments on capital account.

I hope that this line of argument will not prevail. A sudden rise in British interest rates would further upset the international balance, would drive up the general level, and would serve no purpose but to slow down unnecessarily the growth of world output and trade. I agree that direct restrictions on the growth of demand would be much worse. But if Britain's balance of trade is seriously wrong—and the figures are still ambiguous—this shows only that the foreign balance needs more time than expected to adapt itself to a faster rate of growth.

The obvious conclusion, if import restrictions are ruled out, is that we may need to draw on international credit for a longer time and to a greater extent than we expected. Provided that the home economy remains as sound as at present, it is in the interest both of Britain herself and of her trading partners to see that ample credit is made available. The U.S., in particular, has surely learnt from experience that such matters cannot be put right quickly and will now use its strength to procure for Britain the breathing-space it has procured—with obvious success—for itself.

* * * *

THE PROSPEROUS MIDDLE

Nothing makes political economists get hotter under the collar than a discussion about taxation policy. Political and economic considerations often point in opposite directions. Modern democratic Governments, for example, take it for granted that the tax charged to each citizen should be tailored, in some measure, to his ability to pay: £10 or $30 means a great deal more to one than it does to another.

Yet this tailoring has only been possible since the introduction of taxes on income, which are a fairly recent development in most countries. And it is a hard fact that most industrialised countries originally accumulated the capital needed for development—Soviet Russia is no exception—by imposing poll taxes or sales taxes on the mass of the poor who could least afford to pay them and encouraging the enterprising rich to become richer in the public interest. Some countries, in which the social sense is still undeveloped and where there is no great middle class to bridge the gap between rich and poor, still have to rely on indirect taxes to a disproportionate extent.

It was only at the beginning of this century that the idea of matching the tax bill to the taxpayer's means produced the progressive income-tax, which now, particularly in the U.S. and Britain, bears very heavily on large incomes. Whether or not these high rates of tax are an actual disincentive to effort is still debated and the evidence is conflicting, but they are obviously an incentive to legalised tax avoidance.

Quite apart from this, it is clear that the tax system in countries like the U.S. and Britain is not nearly as progressive as liberals tend to assume. When indirect as well as direct taxation is taken into account, the burden does not move smoothly up with income but is disproportionately heavy on the minority extremes, the rich and the poor. The economist, Colin Clark, quotes in a recent book the effect of a proposed change in the Dutch tax structure which the newspapers represented in a diagram: the Dutch public noticed that the curve bulged downwards in the middle, assumed that the civil servants had planned it to meet their own circumstances, nicknamed it 'Civil Service belly' and complained until the bulge was removed.

Dissatisfaction with the extremes of progressive taxation has led to a demand by various U.S. theorists, and endorsed by Senator Barry Goldwater, that the means (capital as well as income?) of each citizen should be taxed in the same proportion. This demand forms a coherent part of a particular conservative philosophy which holds that Governments tend to grow too large and to interfere too much with the liberty of the individual; that administration and taxation should be decentralised as far as possible to create a sense of responsibility in the public spenders; and that the individual sense of involvement in policy will grow keener with the extent to which the individual pocket is directly affected.

This sort of philosophy still attracts many people in Britain. It is not officially supported at present by any of the three political parties—though they advocate different degrees of State interference in different fields—partly because the number of voters whose self-interest coincides with the theory is relatively small, partly because we are a small kingdom rather than a large federation and the scope for decentralising Government is limited, partly because the State is already accepted as playing so large a role in sectors like health and education that a complete return to the free market would be regarded as impossibly eccentric. Yet there is little doubt that the Conservatives, if re-elected, will introduce greater freedom to choose between public and private welfare services; and the modern Labour Party has abandoned the extremes of egalitarianism and is proposing to tax companies more and individual incomes less.

Colin Clark, whose recent book I have already mentioned, propounded the thesis twenty years ago—and received the support of Keynes for it—that when taxation (plus a large Budget deficit) exceeds 25 per cent of net national income, costs and prices are likely to rise as a result within two or three years. The figures he now presents to support his thesis I find unconvincing, since conditions differ so much from one country to another.

If Portugal and South Africa both have low tax rates and a low rate of inflation, and if the reverse is true of Britain and the Scandinavian countries, I tend to believe that the social and political environment, rather than an abstract relation between economic concepts, is the thing to look at; the U.S., after all, has managed to combine a high level of taxation with a remarkable degree of price stability.

But it may be true, in the case of individual countries, that a high level of taxation tends to produce, rather than merely be associated with, rising costs and prices. And many will agree with Colin Clark that Governments, their power swollen either by wartime necessity or political doctrine, tend to assume functions—and raise taxes to pay for them—which are properly the function of the individual.

But those who want to reverse this trend towards 'welfarism' should remember that it is the poor as well as the rich, in the U.S. as well as Britain, who are oppressed by the majority in the middle and who presumably stand in greater need of relief.

BUSINESS NEWS FROM EUROPE

THE OIL COMPANIES AND NORTH SEA GAS

EUROPEAN CAPITAL MARKETS BEGIN TO GROW

THE major oil companies stand to lose most from the discovery of natural gas in the North Sea. But they are in fact remarkably sanguine about the results of a successful search. This is because the possibility of finding oil at the same time remains high. But it is also because the oil companies themselves are pioneering much of the drilling work. At the same time, the companies know that they are unlikely to be abandoned completely by Governments. Oil now plays a very considerable part in the economies of most European States and it is inconceivable that any Government would allow cheap gas, if it is found, to undermine the position of the petroleum companies—not without a period of transition anyway.

Although the Dutch mainland and German North Sea gas field is known to be the second largest in the world, and may even be the largest (reserves around 40 million cu. ft. have been mentioned), it is matched by a steadily increasing demand for energy in Europe. World energy has doubled between 1946 and 1963 and is expected to double again by 1980. The place for oil in this expansion—with or without natural gas—is considerable.

What might in fact hit the oil companies, it is thought, would be the discovery of very large supplies of oil in the North Sea as well as gas. There is already a more-than-buoyant oil supply in the world and the difficulty has been in regulating output and prices as new supplies have been found. Big discoveries off Europe would only add to the problems. The most serious effect that large supplies of natural gas would have are thought to be on the hydro-electric producers—particularly Norway, but to a lesser extent Italy as well. Norway, thanks to large natural resources, has one of the largest supplies of cheap electric power in the world. This power has enabled it to build a number of energy-intensive industries that would probably not otherwise have gravitated to the country. These include aluminium, paper, iron and steel, rayon and chemicals. But as Norway produces more power than it needs there is also a considerable, and valuable, export market in power. Indeed, there is room for a lot more expansion in the economy as the hydro-electric industry is still underdeveloped. Economic advance depends on utilising this underdevelopment.

With the creation of another source of cheap power in Europe, Norway's economy would be faced with difficulties (Italy also, though to a much smaller extent). New industries would go where the power was cheaper. This movement will depend to a large extent on the price the Dutch, and any subsequent developers of gas, set. For the mid-'70s, when the Dutch expect to be in full production, with an output of 30,000 million cu. metres a year (half for its own consumption) a price of around 6 cents (1½d. sterling) a cu. metre is being talked about.

However, the natural gas industry itself is none too sure that the future will be completely profitable. Over its future looms the prospect of cheap electricity from nuclear power (which would also hit Norway) and the Dutch themselves are not sure how much of their output they will be able to sell when they are on full production.

Most important of all, no one can be sure of the role the Russians will play in releasing cheap oil into Europe. Supplies in 1963 were 37 million tons, but the rate of annual increase, which had been 50 per cent in 1959, has fallen to around 9 per cent. Even if the Russians increase sales to Europe by 10 per cent a year, a figure thought to be essentially conservative, at least 61.1 million tons would be on sale by 1970. This prospect is enough to cast gloom over oil, gas and electricity interests alike.

Capital Markets

There are signs at last that Europe's capital markets are beginning to flower and take some of the burden off the shoulders of the American market. The marks that progress is being made are slow, but sure. Paris has handled its first international public loan for 25 years and the German market has been more active this year than in any other full year since the way.

The impetus to the resurgence of the European market came last year when the late President Kennedy introduced measures to shore up the dollar and right the American balance of payments problem. One of the most important of these measures was the exchange equalisation tax which, in effect, clamped down on borrowing facilities in New York by the advanced nations (with the exception of Canada). Apart from the fact that something had to be done about her trade deficit, Americans felt Europe ought to be able to raise more money itself anyway.

A report prepared for Congress has shown that the seven major capital markets of Europe (Britain, West Germany, France, Belgium, Italy, Sweden and Holland) have raised only 30 per cent as much as the United States although these countries have a combined population larger than America's. Europe had raised 309,800 million dollars by 1962. And although this is an underestimate, since some figures from France, Holland, Italy, Belgium and Sweden are not available, the full picture would come nowhere near the United States 1,037,700 million dollars. Of the European total 44 per cent (137,600 million dollars) has been raised by Britain; the next most important market, Germany, has raised only a third as much. The British figure is, in fact, only slightly less than that for the rest of Europe. Partly this is due to the way in which two wars, and savage peace-time inflations, have wiped out much European indebtedness. But it also shows the extent to which Europe has been falling right behind America. This is why the emergence of European markets is so important.

Paris Issue
