The Corporations have augmented their resources by issuing bonds; in fact, the value of bonds issued by them is now greater than their paid-up capital. As at the end of 1962-63, the various Corporations had issued bonds amounting to Rs. 18.5 crores while for 1963-64, they issued bonds amounting to Rs. 2.10 crores. Thus, till the end of 1963-64, the value of bonds issued by all the Corporations was Rs. 20.60 crores. In the case of some of the Corporations, such as that of West Bengal, Punjab, Maharashtra and Madras, the value of bonds issued has been even two or three times their paid-up capital.

The Corporations can raise resources in the open market easily only when conditions are favourable to them. But in floating their bonds, they have to face the competition from other borrowers. So they have to offer attractive terms; and, in fact, some Corporations have been able to float bonds only on terms favourable to subscribers. They offer a higher rate of interest in order to encourage the public to contribute liberally to these bonds.

In 1961-62, it was possible for the Corporations to raise funds by offering interest rates of 4.25 percent and 4.5 percent, however, during 1962-63, some of the Corporations had to raise resources only by offering a higher rate of interest, namely, 4.75 percent and offering the bonds at an issue price of Rs. 99. Of late, there have been some difficulties in the way of the Corporations raising resources by issuing bonds.

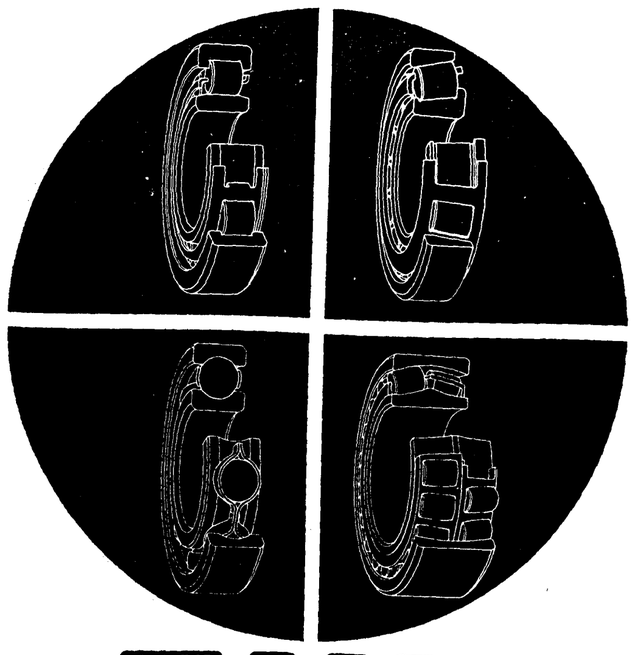
The acceptance of fixed deposits has also become a noteworthy feature with some of the Corporations. As at the end of February 1964, the Corporations had deposits of Rs. 9.1 crores. The Madras Industrial Credit and Investment Corporation has been able to mobilise the maximum amount of deposits aggregatting to more than Rs. 6 crores. The Andhra Pradesh and Kerala State Financial Corporations are also accepting fixed deposits, although such amounts are small. Apart from fixed deposits, the Madras State Financial Corporation is also accepting short-term and short-notice deposits; and the amount of these deposits stood at Rs. 50.2 lakhs and Rs. 6.3 lakhs, respectively, as at the end of 1963-64.

The State Financial Corporations of States like Bombay, West Bengal and Gujarat do not appear to have been successful in getting fixed deposits from the public although they offer higher rates of interest than commercial banks. This is due to the fact that the private firms in these States attract the savings of the people to a greater extent by the offer of higher interest rates.

Loans from Reserve Bank

Apart from these resources, the State Financial Corporations are also getting medium-term loans from the Reserve Bank of India and refinancing facilities from the Refinance Corporation. Till the end of March 1963, a few Corporations were granted medium-term financial assistance to the extent of Rs. 2.7 crores, while in 1963-64, they were sanctioned Rs. 3.9 crores by the Refinance Corporation. Thus, till now, the loans received from the Refinance Corporation have amounted to Rs. 6.6 crores. The medium-term loans taken by the Corporations from the Reserve Bank of India also help them in their lending operations. These loans are constantly renewed. Till the end of March 1964, the total amount of these loans was Rs. 4 crores.

So a number of measures have been taken for augmenting the resources of the Corporations. These measures would no doubt help in the lending activities of the Corporations; but they may not be enough. So some other measures have been suggested for improving the resources of these Corporations. The Indian Merchants Chamber has suggested that the State Financial Corporations should be given a tax holiday. According to it, "The State Financial Corporations are at present taxed like the other corporate sectors.....The Government should consider the advisability of extending fiscal relief to the State Financial Corporations, with a view to enabling them to augment their resources. It appears that the Government of Pakistan has given some tax concessions to the concerns operating in that country. The development corporations in some of the foreign countries are also granted similar concessions and facilities". This suggestion seems to be a good one and deserves serious consideration. Apart from this, the Chamber has also expressed the view that the Reserve Bank of India and the State Governments should forgo the dividends accruing to them on the shares owned by them in the State Financial Corporations.



This suggestion is based on the idea that just as the Reserve Bank of India and the Government of India have forgone the dividends accruing to them on the shares owned by them in the Industrial Finance Corporation, the State Governments and the Reserve Bank of India should also forgo the dividends accruing to them from the shares owned by them in the State Financial Corporations. It may be mentioned that the State Financial Corporations are already getting financial assistance from the State Governments in the form of subventions and hence it is not necessary for them to forgo the dividends on the shares owned by them. On the other hand, the Reserve Bank can forgo its dividends for some years just as it has done in the case of the Industrial Finance Corporation or the State Bank of India. This would provide some resources to the Corporations.

An important feature of the working of these Corporations is the degree of progress made by the Corporations. Although there are 15 Corporations, only a few have made adequate progress. Till the end of 1962-63, the Madras, Maharashtra, Punjab and West Bengal Corporations have sanctioned loans amounting to Rs. 10.55 crores, Rs. 10.29 crores, Rs. 7.92 crores and Rs. 6.15 crores, respectively. This would mean that a little more than 50 percent of the loans are sanctioned by these four Corporations. Among the other Corporations, the Madhya Pradesh, Assam and Andhra Pradesh State Financial Corporations have made some progress. But their progress is not as much as that of the Madras, Maharashtra, Punjab and West Bengal Corporations. The other Corporations have granted only a small volume of advances; and the amount of loans sanctioned by them was as follows as at the end of 1962-63:

	(In crores of rupees)
Bihar	3.80
U.P.	3.78
Kerala	3.12
Rajasthan	2.72
Gujarat	1.59
Mysore	1.57
Orissa	1.32
Kashmir	0.26

Difference in Progress

Some explanations may be given for the difference in the progress of these Corporations. This may be due to the variations in their size. Furthermore, all the Corporations were not established at about the same time; some have been in existence for a long period while others have been functioning for a relatively short period. Thus, even though the Corporations may be willing to lend, the various factors enumerated above must have been responsible for their slow progress.

"CAPITAL" STOCKS AND SHARES INDEX*

The *Capital* Stocks and Shares Index (Base: 1939) has now been brought up to October 1964. As compared with September, the October indices for Government securities and preference shares show rises of 1 point each.

There were decreases in banks 2.7 points, cottons 4.1 points, coals 3.6 points, jutes 1.6 points, teas 2.6 points, papers 15.2 points, sugars 5.7 points and miscellaneous 1.5 points, while increases occurred in minings and oils 1.6 points, cements 0.5 points and engineerings 1.7 points.

Combining all the factors, *Capital* variable yield securities in dropped by 2.0 points during O ber 1964.

	Index of Govt. Securities	Index of Preference Shares	Variable Yield Securities

INTRODUCING SHARES OF NO PAR VALUE

By G. S. Deb

The idea of introducing shares of no par value is gradually gaining ground in the industrially advanced countries of the West. India should consider whether it can be introduced here with proper legislative safeguards for investors.

THE historical concept about the formation of capital structure of joint-stock companies tends to undergo a change with the advent of new and progressive ideas of industrial finance. The capital of joint-stock companies, so far in traditional ways, has been understood as a certain nominal amount in terms of money divided into a certain definitive number of units of a specified nominal value. These units, usually known as shares, comprise the capital of the company which is ultimately reflected in its assets. The specified nominal value of each unit is called its par value, the total of which represents the nominal capital of the company. The company is authorised to issue its shares up to its nominal capital in the usual way, and once the capital is raised and invested in assets, the par value loses its identity and may represent a value which in terms of money be something higher than par or just at or below par. The question, therefore, arises that if the par value has, in fact, a limited significance, it is better as a matter of policy and in the interest of sound finance to have shares of no par value.

A no par value share has no nominal value specified for it but if such shares are desired to be issued on a company's formation, the particulars relating to them are to be laid down in the document of incorporation. In the case of subsequent issues, the consideration for which they may be issued or, as it is usually known, be sold may be fixed in the articles or bylaws but under most statutes, the directors may be empowered to settle the consideration. The law even provides that they have such power unless the articles reserve it to the general meeting. If, however, the power is reserved to the general meeting a majority of two-thirds of the total outstanding stock and if there is more than one class of each class—is usually required.

Generally, the directors are authorised to decide what part of the consideration received for no par value shares is to be appropriated to capital and what to surplus. According to the practice followed, every share of the capital stock without nominal or par value must be equal to every other such share of the capital stock subject to the preferred, deferred or other special rights or restrictions, conditions or limitations attached thereto. Moreover, each share certificate for no par value shares, in addition to complying with the requirements as to share certificates generally, must show the number of shares it represents and the number of such shares which the company is authorised to issue. The relative share certificate must not express any nominal or par value of such shares.

Great Flexibility

It is worth while to consider why the idea of having shares of no par value is gaining popularity Judged from a realistic standard, the chief reason for having shares of no par value is its flexibility in the event of changes in the financial structure of a company and affords a more realistic approach to the appraisal of profits in relation to assets employed in the business. It tends to avoid the common misunderstanding and uninformed criticism which arise when profits and dividends are measured by reference to the nominal value of shares. Such a faulty yardstick cannot be accurately considered as a guide to the assessment of the net worth of a company which ultimately determines the value of its shares. Of the various factors which are taken into consideration, the number of shares issued, the value of the assets of the company and their earning power are the most important elements and not the nominal par value of the share.

To an ordinary investor, who has no idea about the mechanics of investment, a share is considered to be cheap if it is below par and dear if it is above par. He will hardly appreciate that par value as mentioned is nothing more than a fiction once the shares are fully paid and the fact that a share is a token of a right to a portion of a company's divisible profits and in a winding up, to a share in the surplus assets is often lost under misconception. Once a share is issued and is fully paid its real worth may have little relation to par value but depends on the success or failure of the company. In some other matters, no par value shares have some distinct advantages particularly with reference to merger, payment of dividend, marketability and bonus issue.

In short these may be summarised as follows: (a) It is not really very convenient to make the valuation accurately in cases of reorganisations, mergers and amalgamations of companies. If earning power is considered to be the basis of evaluation, no par value shares can be issued on the basis of the earning power so determined and distributed equitably to the parties bringing in assets. The great advantage is the flexibility in the price of issue of no par value shares under circumstances when due to abnormal market conditions the issue of shares with a denomination could not be successfully made at their par value.

(b) The two useful criteria which act and react to determine the market price of a share are earnings yields and dividends yields under the existing conditions. The dividends on no par value shares having been declared and paid as a state amount of cash a share and not as a percentage of a nominal value becomes much more straightforward being in relation to the real value of a share.

(c) No par value shares could be made readily marketable than in the case of shares having a par value. The price for issue can be determined depending upon the climate of investment and, being flexible in nature, such issue price can be pegged high, medium or low as is warranted by the circumstances. It may be that shares of low nominal value suffer from certain unexplained prejudices from the point of investment but no par value shares do not suffer from such disadvantages since these can be "split" and/or "consolidated" as often as is necessary when the price makes the shares unwieldy or for any other reason which may be desirable.

(d) The question of making a scrip bonus issue for the purpose of minimising the palpable difference between nominal share capital and the value of real assets employed does not arise. This would mean a definite advantage since such bonus issues cause considerable misunderstanding as it is not realised by many and deliberately ignored by some that a bonus issue which consists merely in capitalising reserves does no more than divide into smaller pieces the existing claims of the members to the profits and assets.

Some Disadvantages

These are, of course, some of the highlights which make the no par value shares prominent and realistic, compared with the shares having a nominal value. But there are many other points to be considered, particularly those features which might tend to bring in disadvantage as well. One of the main reasons which led to the introduction of, or more currently the revival of, no par value shares was to evade any responsibility for the watering of stock. If the shares have no par value and there is no restriction in fixing the price which should be paid by the subscribers of original shares or of shares issued in connection with an increase of capital, the question of any further liability beyond the payment of the price agreed cannot arise. In case of issues for property, the company may give the vendor any number of no par value shares as consideration for the property transferred.

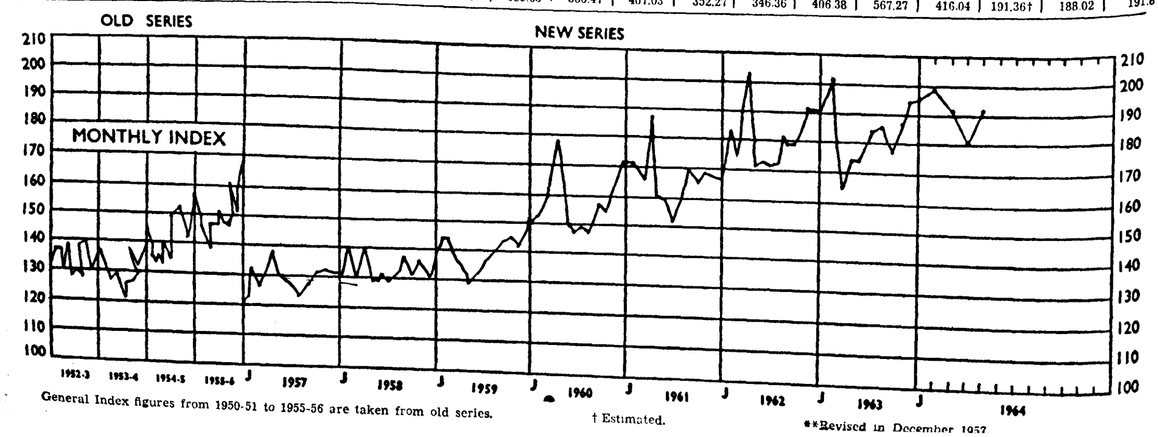
Again, if an increase of the company's working capital becomes necessary, the new shares can be issued at any price the company thinks fit. There remains, therefore, the possibility of overcapitalisation and if the company is a going concern, such an action might prove injurious to the existing shareholders. The shares having no par value unlike their counterpart with a stated nominal value justifying the existence of fixed capital, there seems to be no theoretical limit to the use for dividends of the considerations received on account of the issue of such no par value shares. It has been said that shares without par value conceal what money or property a share really represents, and this attack against the propriety and wisdom of the authorisation of no par value shares was mainly based on the conception of the erosion of capital in the guise of dividend.

All these and many more dangers can, however, be suitably checked by way of legislation supplemented by stock exchange regulations and sound accountancy practice to secure that the investor is as well protected as he is today. It would not be quite correct to say that this new system is more open to abuses than the par value system and provided adequate safeguards are taken, there is no reason why this stranger should not be allowed to pass in the formation of the capital structure of the company. In order to ensure that dissipation of capital by paying it away in dividends is prevented and that the power of the directors to issue further no par value shares at less than their market value is limited in favour of the existing members, some of the possible safeguards which might be considered to be useful may be outlined as follows: (1) The amount realised on subscription to an issue of no par value shares should be used for capital purposes only and should be subject to the provisions of the Companies Act concerning such matters as may relate to reduction of share capital. (2) The existing members of the company holding shares of no par value should be given the right to be offered *pro rata* all subsequent issues of such shares. (3) There cannot be any question of issue of no par value shares which might be prejudicial to the interest of the existing rights of any shareholder as a result of conversion of shares or stock into no par value shares. The law should be quite vigilant on this point and there should be adequate provision that in such a contingency any member may petition the court to disallow the issue if he can establish that the scheme envisaged will adversely affect his rights as a member of the company.

India which is gradually entering into a phase of planned industrial development and has given considerable opportunities for industries to develop in the private sector where joint-stock enterprise is a common feature should consider whether the shares of no par value can be introduced into her system and for that purpose what type of legislation would be necessary for ensuring safeguards for investors and public interest. There is no doubt that opposition to the introduction of no par value shares is based more on apathy and ignorance than on merit and justification favouring such an issue. The Indian investor has habitually looked into the price index in his quest for the justification of the success or failure of an enterprise, but such index has very often been misleading due to the existence of other forces manipulating the price. It is worth while to question on what basis the value of share of a company under flotation is determined and what safeguards are there for the investor to check the accuracy of such value except to base his ideas on certain hypothesis manifest from the relevant prospectus published in this connection.

New Issues

It has been observed in many cases that the higher the nominal value, the higher is the preference for investment. No wonder, therefore, a few years ago, due to the rather affluent conditions of the money market, some of the new issues of companies with a bit of promise for expansion as a result of technical collaboration from abroad were many times more oversubscribed than one could reasonably imagine. Furthermore, there have been cases when shares of newly floated companies were subject to brisk speculation shooting the price to a dangerously high level, and such conditions were predicted to be the result of growth prospect to characterise in the handsome yield of the dividend. All these features adequately prove that the nominal value of shares has no direct bearing on the price mechanism or in the determination of the net worth of a going concern.



Moreover, in the case of companies whose loan arrangements provide for conversion of such loans into equities under certain circumstances, it is often a headache for the management to safeguard the interest of the existing shareholders who might as a result of conversion turn into a minority and the possibilities for survival and continuation of the undertaking by its existing management might become problematical. It would not be quite correct to say that such a crisis, if it can be so called, can be overcome by manipulation of the capital structure of the company through the issue of shares in the usual way, but certainly the board of management would be able to find some comparative advantages under a no par value system to decide the number of shares to be so issued upon conversion in order to protect the interest of the existing shareholders.

"CAPITAL" INDEX OF INDIAN INDUSTRIAL ACTIVITY **

The *Capital* Index of Indian Industrial Activity (Base: 1953) has now been brought up to April 1964. Compared with the preceding month, there were rises in tea 49.16 points, tyres 10.98 points, bicycles 35.45 points and railway tonne-kilometres 10.55 points, while decreases occurred in sugar 125.91 points, jute 12.29 points, yarn 3.59 points, cloth 2.48 points, cement 18.32 points, coal 4.45 points, pig iron 5.61 points, finished steel 46.08 points, paper 14.93 points, motor-cars 191.21 points and electricity 9.49 points.

Combining all the factors, the *Capital* Index of Indian Industrial Activity rose by 11.1 points during April 1964.

New Delhi

DRIFT AND INDECISION IN MIDST OF ECONOMIC CRISIS

(FROM OUR NEW DELHI CORRESPONDENT)

In a book entitled *A Prime Minister Remembers*, Lord Attlee said "It is often a mistake to force the issue: better to let things take their time, let people blow off steam without actually bringing them to opposite sides of the line, where they cannot go back. There is sometimes virtue in not allowing people to make up their minds too quickly."

This is the way of thinking of a socialist Prime Minister, who gave freedom to India. Looking at the India of today, one would feel that the Government is faithfully implementing the Attlee doctrine of "wait and see". Parliament, and in particular the Public Accounts Committee, is given full freedom to "blow off steam". The Government, however, leaves problems over to solve themselves in time. The Public Accounts Committee, for example, is dominated by the Congress Party with a Congressman as its chairman. At regular intervals, it submits its reports to Parliament, criticising the inaction or defaults of the Government—not in generalities but by attracting attention to specific cases. The reports are published in the newspapers and are often commented upon, but they hardly disturb the placidity of the Government.

India is in the midst of one of the worst economic crises. Food shortages and high prices have affected the common man. And yet there is no coherent thinking in New Delhi. For the first time since independence, the writ of the Centre does not run in the States. And the Balkanisation of India will commence on 26th January, 1965, when the link language, namely, English, ceases to be the official language of India.

The country is passing through balance-of-payments difficulties of the worst type. As already reported, it has to pay $75 million to the International Monetary Fund and another $16 million to the India-Pakistan Indus Commission. Meanwhile, a cut of at least 10 percent in the import of industrial raw materials and components has become inevitable. Yet the Central Ministry of Oil continues to discuss the four-year-old proposal to set up a lubricating plant submitted by Esso which, according to the Government, would have saved Rs. 3 crores a year in foreign exchange. Esso's other proposal, to put up a million-ton iron ore reduction plant in Goa, which could earn about $18 million a year in foreign exchange, is facing ideological opposition.

The situation in recent years has gone from bad to worse. The tragedy is that there appears to be no breakaway from the cherished policy of drift. "Give them bread and circuses" was the ancient Roman *récipe* for keeping the population quiet. The Government is busy staging circuses and New Delhi's engagement diary is mostly crowded with inauguration ceremonies. The Government is busy celebrating a "family planning week" and a "Posts and Telegraphs week".

MANAGING AGENCY

Abolition Being Examined

The Central Finance Minister, Mr. T. T. Krishnamachari, said in the Lok Sabha last week that the question of the continuance or otherwise of the managing agency system in well-established industries is being examined by the Government. It is examining the proposal to abolish the system in such sectors of industries which no longer require an entrepreneur's guidance, skill and know-how. Some such industries, it is said, could be textiles, sugar and cement.

But the issue is not as simple as it looks. A managing agent of a textile mill may and does operate a number of other units, which may be in the state of infancy. There may be inter-locking of capital between a textile unit and other units. Then again, there are joint-stock companies, which may not have a managing agent but are controlled and dominated by members of one family to the exclusion of others. Such companies, some say, violate the basic principles of public limited liability companies.

H.E.C.

Reorganisation Planned

The Government is considering reorganising the Heavy Engineering Corporation. One of the units, at present managed by the Corporation, it is expected, will be separated and made independent. Meanwhile, the services of the Financial Director of the Corporation, Mr. R. V. Subramaniam, have been loaned to the Indian Investment Centre and he will become its Director. Mr. Subramaniam will take up his new assignment in January 1965.

COAL MINES

Mechanisation Recommended

The Coal Mining Adviser to the Government of India has stressed the need of mechanisation of coal mines. He says that mechanisation is the only answer if coal production is to be stepped up in a short period. As for coking coals, it is accepted that India will need washing arrangements for coals before they become suitable for the metallurgical industry. For efficient working of the washeries at economic costs, it is necessary that such units should be fairly large, and linked with individual producing units. According to the Coal Mining Adviser, the following steps are necessary for the existing mines:

1. Re-arrangement in the lay-out by the provision of better haulage system:

2. Greater use of modern underground mining machinery such as coal cutters, mechanical loaders, power drills, mechanical conveying from the face, etcetera.

3. Provision of better ventilation.

4. Improvement in surface lay-out, including loading arrangements.

The following steps are necessary for new mines: 1. For open-cast mines, complete mechanisation for the removal of both over-burden and coal is absolutely essential for obvious reasons;

2. For underground mines there should be complete mechanisation right from the face to the surface, *i.e.*, coal getting at the face; loading at the face; transportation from face to the main road; from the main road to the pit-bottom or the incline mouth to the surface and finally into the wagons.

Here India has to consider the adoption of modern long-wall method of mining with caving or stowing as conditions permit.

"To illustrate this point, India has coal cutters at the face. The coal cutter has to be supported by a suitable mechanical loader so that coal at the face is removed quickly. Where conditions permit, continuous miners can be introduced which perform double work, namely, cutting and loading. The coal from the face after being loaded has to be cleared. This can be accomplished by providing suitable conveyors—chain conveyors or locomotive haulage or shuttle cars, again depending upon the mining conditions. Once the coal comes to the main road, it can be moved quickly to the incline mouth or pit bottom by suitable belt conveyors.

"From this point coal has to go to surface loading arrangements through fast winding or other surface transportation, again depending upon the conditions. There will be need for provision of adequate bunkers so that the irregularity in the matter of wagon supply can be dealt with without affecting or breaking the chain in mechanisation from the face to the surface. Plans have been drawn for the manufacture of all types of machinery mentioned above, and these will be available in the country with adequate provision for spare parts, thus ensuring continuous and efficient working of this machinery in different stages.

"In the process of mechanisation in mines—open-cast or underground—there has to be complete link at all stages so that coal at the face is loaded rapidly and carried with the same speed to the main haulage point from where it is moved to the pit bottom or the incline mouth without causing detention or stoppage anywhere. From the pit bottom or the incline mouth, the coal has to come up quickly and they through suitable and adequate surface loading arrangements into the wagons for despatch to the consuming centres. In this process, if there is any hold-up anywhere, the whole link gets dislocated and, therefore, the obvious advantages of mechanisation get lost."

Steps have already been taken to manufacture different types of machinery required in the country in Durgapur and at other places. Along with the machinery, spare parts will also be manufactured.

GHANA

Indian Help for Textile Mill

India and Ghana are to co-operate in putting up a cotton textile mill at the site of the Volta river project in Ghana, it is understood. The project envisages the establishment of a composite cotton textile mill constsiing of about 12,500 spindles and 300 looms. The proposed mill will be capable of variegated production. It will be designed to produce the finer varieties of cloth and thus help to fulfil Ghana's need for locally manufactured quality fabrics.

The Indian participation in the project will be in the form of supply of machinery and equipment management of the unit in two initial stages, if necessary, and the provision of comprehensive training facilities to Ghanian executives, engineers and technicians in all responsible jobs to enable them to take over the entire management as quickly as possible. The major portion of the capital to be invested in the project, including land, building, etcetera, will come from Ghana.

The establishment of such a unit, requiring a very large number of workers will help substantially in providing continued employment to the labour force at present employed on the Volta river project. The details of the collaboration arrangement are being worked out through muttual consultation.

Investment Abroad

The question of Indian investment abroad was raised in the Informal Consultative Committee of Parliament, attached to the Central Ministry of Finance. The Finance Minister, Mr. T. T. Krishnamachari, explained that since India was short of capital and foreign exchange, the Government could not permit investment abroad by Indian nationals in any "sizable way". However, investments in the form of supply of machinery and equipment from India or when shares are acquired against the supply of know-how and other connected services will be permitted. In such cases, approval was given when there were prospects of earning a handsome dividend on the investment and there was scope for developing India's export trade by the supply of components and raw materials for the manufacturing programme.

Indian investments, Mr. Krishnamachari said, are normally made in joint ventures abroad engaged in manufacturing activities. The investment is normally made in the form of equity shares but any proposal from Indian parties to make a loan to these joint ventures of, say, three to five years' duration, could also be considered as long as the loan is to be used for the supply of goods from India.

Because of India's difficult foreign exchange position, the Government is not in a position to approve of any proposals for investment abroad by way of cash remittance. However, small amounts of foreign exchange might be released in good cases to cover comparatively small requirements of initial expenditure for incorporating the company, etcetera. In a really exceptional case, small investment in cash may also be considered if this is inescapable to clinch a major proposal where investment will mainly be in the form of supply of machinery from India.

The Minister said that there was no approved list as such of countries in which investments abroad were allowed. So far proposals had been received and approved for pharmaceuticals, sewing machines, bicycles, textiles, trailers, steel furniture, hume pipes, safety razor blades, fans and light engineering goods. The value of Indian investment abroad approved since 1961 amounted to about Rs. 31 crores.

OILSEEDS

Rise in Prices

Replying to a question as to whether due to the export of oilseeds to foreign countries, there had been an abnormal rise in the price of oilseeds in India, the Central Minister of Commerce, Mr. Manubhai Shah, said

that "these exports have no relation to internal prices which are continuously rising due to numerous factors. The internal prices have been rising for many commodities, of which most are not exported at all. Also prices of groundnut seeds were rising even before the small balance quantity of H.P.S. kernels was allowed to be exported. Hardly any actual exports of H.P.S. groundnut kernel have yet taken place and yet the internal prices are going up due to the internal demand and supply and other reasons."

The Minister explained that several measures to check a rise in prices had been taken, such as the import of 75,000 tons of soyabean oil and cottonseed oil from the U.S.A. under P.L. 480, of which 30,000 tons are expected to reach India very soon. The ban on export of all edible oils continues. Also, intensive steps have been taken to increase the production and area under cultivation of rape and mustardseeds in addition to groundnut seeds. "Perhaps the production of rape and mustardseeds this year would be a record crop over and above the favourable increased estimated production of groundnut seeds. The Forward Markets Commission has prescribed ceilings on contracts in oilseeds and oils which are having some restraining influence on the spot prices. Several fiscal measures and monetary controls have been imposed to control general prices of all commodities, including oilseeds."

The Minister added that "the need to promote exports and earn valuable foreign exchange to sustain and accelerate national development should be appreciated and that any minor hardship, real or psychological, on that account for temporary periods should be cheerfully tolerated."

KANDLA

Free Trade Zone

The free trade zone in Kandla is being set up in an enclosed area of half a square mile. The main objectives in establishing the zone are: (1) to promote Indian exports and earn foreign exchange; and (2) to bring about the fuller utilisation of the facilities already developed at Kandla port.

Export-oriented industries will only be permitted to be set up in the zone. The types of industries that have so far been approved for establishment in the zone are the following: readymade garments, embroidery and cut works, stainless steel utensils, P.V.C. electrical wires and cables, bicycle components, umbrella parts and umbrellas, pharmaceutical products, multiwall paper, exercise and account books, synthetic essential oils, perfumes, sports goods, tea bagging and plastic bangles.

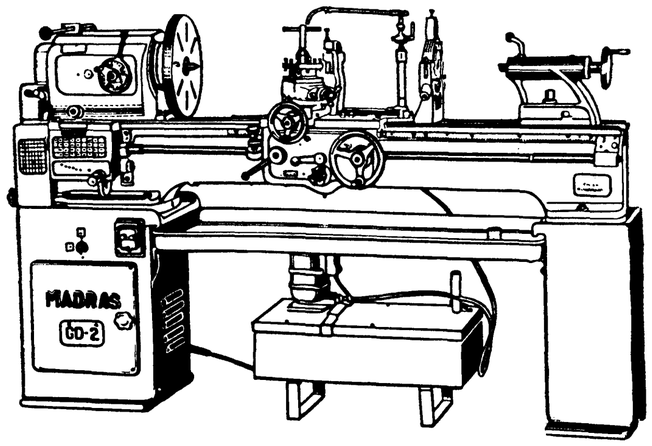
EXPORTS

Study by Expert Body

An international team of trade experts is now visiting India to study export efforts and suggest improvements. It consists of two members each from the U.K., the U.S.A., and Japan, and one from Italy. They are Messrs W. T. Pearce, H. W. Vallender, A. O. Stanley, M. Katoh, M. Yoshida, Drs. Roberts J. Clark and B. Tosarelli.

New Corporation Planned

A proposal to establish an Export Industries Materials Corporation has been endorsed by the three-day seminar on the export of chemicals and allied products held in Calcutta. The suggestion had been made by the Engineering Export Promotion Council in order to meet adequately the difficulties faced by the exporting industries in the procurement of raw materials and components. It is envisaged that the proposed corporation will stockpile the required imported and indigenous materials and make them available at international prices to the exporting industries which are now hampered by shortages.



It was noted that there was considerable unutilised capacity in the paints and varnishes, rubber products and glassware industries because of the shortage of raw materials. A study group will go into this question and suggest remedies. The seminar recommended the examination of the import entitlements permitted under the export promotion schemes for chemicals and allied products. It was felt that there was considerable scope for further adjustment of the freight rates. So these problems should be brought to the notice of the authorities concerned for remedial action.

AVAILABLE EARLY DELIVERY

MADRAS GD-1 & GD-2 LATHES

Kirloskar

TECHNICAL DATA: 8 Spindle speeds in the Range 48 to 1000 R. P. M. Quick change Gear Box with a longitudinal feed range from 0.028 to 1.596 mm/revoln. of Spindle

MK1264

HIGH-POWERED TRANSMITTER

Policy Clarified

Mrs. Indira Gandhi, Central Minister for Information and Broadcasting, made the following statement in the Lok Sabha on a high-powered transmitter. She said that "in October 1964, it was decided that (i) the earlier proposals of having six 100 kW/sw and one 1000 kW/mw transmitters, and five 100 kW/sw transmitters as provided for in the third five year plan may be given up; and that the Ministry of Information and Broadcasting may be authorised to enter into commitments for the purchase of two×250 kW/sw and one ×100 kW/sw transmitters for installation in Delhi within the third five year plan.

"However, in view of the feeling of urgency expressed in Parliament and outside, concerning the need for a super high power medium wave transmitter for broadcasting to countries to the north and south-east of India, the whole matter was recently reconsidered at a meeting to which technical experts were invited. At this meeting it was unaninously agreed that

"(i) Medium-wave transmission within its comparatively limited range was much more effective than short-wave transmission;

"(ii) It has the advantage of being received by even cheap single-band receivers as well as, of course, all-band sets;

"(iii) For the limited purpose of efficient broadcasts to countries like Tibet, Sikkim and Bhutan in the north and Burma, Thailand, Malaysia and part of Indo-China in the south-east, a powerful medium-wave transmitter would be preferable to a short-wave transmitter;

(vi) The medium-wave transmitter would be effective only for a limited period—four hours in the evening—and, if both the north as well as the south-eastern group were to be served, the time would have to be divided between the two, and arrangements for reversal of the beam would be necessary;

"(v) If a similar service was needed for broadcasts to the west, another transmitter to be sited either in Bombay or Bhuj would be necessary and this would cover Pakistan, Afghanistan, Saudi Arabia and the north-eastern portions of Africa;

"(vi) With suitable aerials, the two 250 kW short-wave transmitters, proposed to be stationed in Delhi, would serve all the areas mentioned above and also countries beyond, such as China towards the east, Russia and the African countries to the west;

"(Vii) The short-wave transmission would provide day and night service, but reception, though very much wider in range, would not be so effective in the countries within the shorter range as medium-wave transmission;

'(viii) Considering India's resources, although from the long-term angle, short-wave transmitters would be preferable, for the immediate presentation of a proper image of India and her policies to the countries to the north and south-east of India, a powerful medium-wave transmitter would be more advantageous, particularly in view of the fact that most listening is done during the evening hours.

"It has accordingly been decided that All India Radio should go in for a super high power medium-wave transmitter for location in Calcutta in addition to the short-wave transmitters already approved.

Television Service in Delhi

Arrangements for expanding the present limited television service in Delhi from 26th January, 1965, are in hand. The object is to find out by experience what type of programmes are likely to be educative as well as popular and also to prepare material for the future programmes. The social educative programme telecast at present only twice a week will now be telecast every evening, and the rest of the programme will provide entertainment as well as education for growing boys and girls.

The project will be implemented in two phases. The final capital cost is estimated at Rs. 55 lakhs, excluding cost of sites, and Rs. 24.23 lakhs a year as recurring expenditure. Of this amount, it is proposed to spend Rs. 11.5 lakhs (for capital equipment and spares) immediately to enable the expanded service to function efficiently. The fully expanded service will serve the villages within a radius of 60-80 miles from the station.

Side by side, the Government is examining proposals to set up transmitting stations in Bombay, Calcutta, Madras and Delhi as also to manufacture cheap receiving sets. The U.K. and U.S. offers to cover both the installation of transmitters, to manufacture sets in India and to operate services are being examined. Hungary has also shown interest.

TRACTORS

Import from Poland

Only 400 tractors in a semi-knocked-down condition will be imported from Poland during 1964 for assembly in the country under a manufacturing programme. The c.i.f. price of each tractor, with certain deletions, would be about Rs. 5,267.

LABOUR

Payment of Wages in Kind

Two statements, made in the Lok Sabha, should show that labour could never go wrong as far as production is concerned. The Central Labour Minister, Mr. Sanjivayya Reddy, admitted that workers had gone back on their agreement reached in Bangalore to receive part payment of their wages in kind. He explained that the Standing Committee on Industrial Truce Resolution, which met in Delhi in November, did not regard the system of payment of wages in kind as practicable. It, however, recommended that the Government should enact legislation immediately to compel employers to set up fair-price shops and that such shops should supply the six commodities at prices recommended by the Indian Labour Conference in Bangalore, namely, rice, wheat and sugar at scales and prices prevailing in general fair-price shops, and two varieties of textiles, pulses and cooking medium at wholesale rates as prevailing in the nearest wholesale market. Thus the main features of the scheme of payment of wages in kind would be included in the legislation on fair-price shops. The standing committee also reiterated the earlier decision that the fair-price shops should be converted into co-operatives as early as possible. It is accordingly proposed to introduce a Bill on the subject at an early date.

The Central Minister of Commerce, Mr. Manubhai Shah, recently outlined some of the reasons for the low productivity of Indian workers. He said that the main reasons for the lower productivity of an average Indian worker, compared with his counterpart in the U.S.A., were the differences in the level of technology employed, the standards of management, condition of machinery and its maintenance, differences in the training of workers, the level of wages and incomes, working conditions in the industry and other social and historical factors. The need for rehabilitation and modernisation of the industry has been kept in view, and assistance is given to the industry to meet these requirements. As for other aspects such as the training of workers and adoption of modern methods of management, efforts are being made to introduce them to the extent possible in Indian conditions.

What would have been the attitude of the Central Minister of Labour had the employers backed out from the Bangalore resolution of the Indian Labour Conference is not disclosed. Similarly, Mr. Manubhai Shah forgot to mention the important rôle played by competition in improving not only productivity but also the quality of goods and performances of workers.

DYESTUFFS

Protection to be Continued

The Government of India has accepted the Tariff Commission's recommendation to continue the existing protective duty of 20 percent *ad valorem* on dyestuffs. The Government has also accepted the recommendations of the Commission to bring under protection with immediate effect and up to 31st December, 1967, the following:

(1) naphthols at the existing revenue duty of 50 percent *ad valorem*.

(2) fast colour bases at the rate of duty of 75 percent *ad valorem*.

(3) 2-amino-anthraquinone at 45 percent *ad valorem* (preferential) and 55 percent *ad valorem* (standard).

(4) benzanthrone at 65 percent *ad valorem* (preferential) and 75 percent *ad valorem* (standard).

(5) beta oxy naphthoic acid (B.O.N. acid) at 65 percent *ad valorem* preferential and 75 percent *ad valorem* (standard).

The Government has also accepted the recommendations of the Tariff Commission that concessional rate of duty should be granted to certain intermediates up to 31st December, 1967, and also withdraw concessional duty enjoyed by some intermediates used by the dyestuff industry.

U.K.

The Import Surcharge

With effect from 27th October, 1964, the U.K. Government imposed a temporary levy of 15 percent on all imports, with the exception of foodstuffs, basic raw materials for industry, and unmanufactured tobacco. On the basis of a preliminary study is was apprehended that about 28 percent of India's exports might be affected by the levy. So representations were made for relief, especially in relation to hand-made products and other main affected sectors of trade. Subsequently, the U.K. Government took steps to remove certain anomalies in the levy and as a result undressed leather including, East India kips, has been exempted from the levy. Further developments are awaited.

ROAD TRANSPORT

High-powered Body Planned

A proposal to set up a high-powered committee to examine whether the present taxation on motor transport has become a disincentive to the growth of road transport in India is being considered by the Government. The bigger issue, however, is how the Central Government wil persuade the State Governments to implement the recommendations of the committee.

WOOL

Limited Imports Allowed

The Government has allowed limited imports of raw wool of all qualities, required by the woollen industry, valued at Rs. 5 crores for the period October 1964-September 1965. In addition, imports made under the export promotion scheme are expected to be of the order of about Rs. 2 crores to Rs. 3 crores. Total imports would thus be of the order of Rs. 7 crores to Rs. 8 crores which will provide the industry with about 13 million to 15 million lbs of imported raw wool. In addition, it is open to the industry to use synthetic fibres for blending with wool to increase the availability of raw materials. The requirements of the industry would be in the range of Rs. 18 crores to Rs. 20 crores for the full year but due to shortage of foreign exchange, larger imports are not possible.

EXCHANGE RESERVES

Drawing from I.M.F.

The Central Finance Minister, Mr. T. T. Krishnamachari, has openly admitted in Parliament that India's economic situation is extremely grim. Apart from internal discontent accentuated by the food shortage and inflation, the country is faced with one of its most serious foreign exchange crises. In addition to the repayment of loans, India has to repay, during this month, $75 million to the I.M.F. and $15 million to the Indo-Pakistan Joint Indus Commission. Her external reserves have already reached a dangerously low level. It looks as if India may have to renew her drawings from the I.M.F. for sometime more. As far as the repayment of loans is concerned, three possibilities are being discussed. They are: (1) the refinancing of loans by the lender countries; or (2) shifting by some years the date for the repayment of loans; or (3) an enhanced aid to meet the import bill, which will free resources for the repayment of loans. Britain and West Germany are the two principal countries whose short-term loans are due for repayment this year. Imports will be further slashed by 20 percent.

IMPORT DUTIES

Concessions for Indian Goods

The following countries have relaxed, suspended or removed import duties on Indian goods. Austria, Canada, Denmark and Sweden have taken off the import duty from tea. In Australia, tea in bulk, and in the countries of the European Economic Community black tea, is imported duty-free. Czechoslovakila has suspended import duties on the following Indian goods: tea, coffee, cocoa beans, unmanufactured tobacco, vegetable oils, oilseeds, cotton yarns, jute yarns, leather, various tanning extracts, mica-slabs, tyres and tubes, and prepared or preserved tinned fish.

In Finland, raw cotton is duty-free while duty on bananas with stems has been reduced by 13 percent. Unroasted coffee is free of duty in Austria while it has been suspended in Norway, Sweden, and Spain. In the U.S.A., instant coffee is duty-free.

The European Economic Community has allowed the following reductions to India:

Commodity	Reduced from
Cashew kernels	5 percent to 2.5 percent
Pepper of the genus piper, neither crushed nor ground	20 percent to 17 percent
Pimento of the genus capsicum neither crushed nor ground, other	20 percent to 10 percent
Nutmeg, neither crushed nor ground	20 percent to 15 percent
Coffee, unroasted, not freed of caffeine	16 percent to 9.6 percent
Castor oil, intended for other purposes	8 percent to 7 percent
Bathing costumes, babies outer garments	21 percent to 16.8 percent
Men's outer garments of man-made textile fibres	20 percent to 16 percent
Women's outer garments of man-made textile fibres, bathing costumes	20 percent to 16 percent
Tea, imported in immediate containers of net capacity of 3 kilograms or less	23 percent to 5 percent
Carpets, carpeting and rugs of wool or of fine animal hair, knotted	Binding of the existing duty of 32 percent with maximum of 4.5 A.U. a square metre
Seeds of coriander neither crushed nor ground	Exempted
Seeds of coriander crushed or ground	Exempted
Curry powder and paste	Exempted
Ginger in other form	Exempted
Bleached shellac	Exempted
Mango chutney	Exempted
Ginger, preserved by sugar	Exempted
Ginger, preserved or prepared without alcohol	Exempted
Black tea	Exempted
Cardamoms, neither crushed nor ground	Exempted
Cardamoms crushed or ground	Exempted
Tobacco seed oil, crude	Exempted
Tropical wood in the rough	Exempted
Tropical wood, roughly squared or half squared	Exempted
Tropical wood, sawn lengthwise	Exempted
Equipment for cricket and polo	Exempted

London

CONFLICTING VIEWS ON U.K. INDUSTRIAL TRENDS

(FROM OUR LONDON CORRESPONDENT)

THE latest economic indicators—the November trade figures and the index of production for October—once again offer conflicting pictures, with the result that the uncertainty about the economic outlook, and the various opinions held on it, continue to prevail and further complicate the issue. After nine months' stagnation, the all-industries index of production, adjusted to remove seasonal influences, rose two points in October to 129 (1958 equals 100). The expansion was mainly due to higher output by the iron and steel, engineering and vehicles industries and helped by the colder weather stimulating the output of gas and electricity. One month's figures are dangerous as a guide, but at last the index appears to be corresponding with industrialists' reports of rising output and sales instead of conflicting with them.

This is not the case, however, with the November trade figures. These show no real improvement over the October figures when seasonal changes between the two months are allowed for. The seasonally adjusted values are as follows: exports £357 million, up £6 million from October; imports £474 million up £19 million; re-exports £14 million, up £2 million. The crude "trade gap" works out at £103 million, against £92 million in October, but a better guide is the "trade balance", estimated in terms of actual payments, which is unchanged in November at £54 million.

November Trade Figure

The President of the U.K. Board of Trade, Mr. Douglas Jay, commented that there was nothing surprising in these November trade figures. Imports had continued to come in at about the level of recent months. These November imports were deliveries against contracts placed earlier. "It was not to be expected," Mr. Jay added, "that the temporary import charges imposed at the end of October would bring about such an early reduction in arrivals." Mr. Jay also suggested that the slight fall in exports earlier in the year may have come to an end, but much depended now on how Britain's exports to Europe would fare in the coming months.

One section of business expects output, and exports, to rise in the coming months. A clear majority of the firms answering the F.B.I.'s latest enquiries are optimistic on both counts. The problem is that in June the same people declared themselves to be even more optimistic than they are now. Yet official statistics have failed to show any improvement either in production generally or in export sales since then. There were two reasons why the results of the F.B.I. survey into industrial and export trends have been greeted with even more than the usual amount of interest. Firstly, they provide the first systematic analysis of industrial opinion after the general election. Secondly, they provide an interesting commentary on the rather pessimistic official economic indicators which show that industrial production had been maintained at the same level since January, and that the rate of increase of British exports had tended to level off.

The majority of the respondents are as optimistic about the general business situation as they were five months ago. Firms in the mechanical engineering and building material industries tend to be more optimistic, while those in shipbuilding, textiles and paper and printing are more pessimistic. Although the number of firms reporting an increase in the level of output was not as great as in June, nearly one half say that output has increased, while only 10 percent say that it has decreased. It seems to have increased particularly rapidly in the mechanical engineering, electrical engineering, chemical and building material industries, while it seems to have been rather sluggish in the textile and paper and printing industries.

Nearly half the firms also report an increase in the rate of total new orders. This is remarkably high. Many firms, working at full capacity and faced with an acute shortage of skilled labour must be tempted, during the present conditions to turn away or at least discourage new orders. One of the most interesting parts of the survey was the answers to the question: "What are the factors likely to limit your output over the next three months?" There is every indication that many of these "bottlenecks" are, as a result of the expansion during the past five months, becoming more serious.

Shortage of Skilled Labour

The shortage of skilled labour is certainly getting worse. It is hitting hard at the engineering industries, where over 60 percent of the respondents in the mechanical engineering and over 50 percent in the electrical engineering and shipbuilding industries say that it is likely to limit output. There does not as yet seem to be a great shortage of "other labour", except possibly in the metal and metal manufacturing industries, where nearly a third of the firms say that it is likely to limit output. There is no doubt, however, that this shortage of skilled labour is leading to hold-ups in the "pipeline" and to the fact that, in the mechanical engineering, electrical engineering and vehicle industries, a rapidly increasing number of firms say that a shortage of materials or components is likely to limit output.

It seems that most firms are managing to extend plant capacity. The shortage of plant capacity is still fairly serious in the metal industries but it is not as serious as it was five months ago in the engineering industries and in the vehicle industry. A large proportion of the respondents continue to expect to authorise more capital expenditure on new buildings and new plant and machinery during the next 12 months. It is expected, not surprisingly, to be at an exceptionally high level in the electrical engineering industry and the chemical and building material industries. But it is not expected to be at a very high level in the shipbuilding, textile and paper and printing industries. The high level of investment demand is reflected by the continuing high level of new orders received for capital equipment.

Nearly 10 percent of the respondents seem to have built up their stocks of raw materials during the summer months and to have anticipated the import surcharge. But having done so, there is every reason to hope that during the next three months at least, stock holdings will be maintained at a fairly constant level, or perhaps decrease. There is some cause for alarm in the fact that the majority of firms in every sector of manufacturing industry, except as usual, in chemicals, say that costs have risen and are expected to continue to rise sharply. However, only one quarter of the firms compared with nearly one-third in June say that average selling prices have risen.

Optimistic Results

The optimistic results of the export survey are at first sight, and in the light of recent official statistics, mystifying. Nearly one-third of the firms are more optimistic about their export prospects during the next 12 months than they were 12 months ago. Firms in electrical engineering, vehicles and shipbuilding tend to be particularly optimistic. This optimism is borne out by the fact that over 40 percent of the firms report an increase in export orders and over one third of the firms report an increase in export deliveries. Yet these figures conceal a wide difference in the export performance of various industry groups. In some of the main exporting industries, like mechanical engineering, electrical engineering and chemicals, the rate of increase of actual deliveries during the last five months fell significantly below the level that was forecast in June. In the less important exporting industries like food, drink and tobacco and building materials, firms have in general been able to live up to or improve upon their expectations.

The reason why firms in mechanical engineering and electrical engineering have not been able to live up to their expectations are not hard to find. Both these industries have been faced with acute shortages of skilled labour and growing shortages of materials or components. At the same time, the maintenance of the high level export orders in the engineering industries would indicate that future prospects continue to be favourable.

The respondents are, however, faced with increasing price competition in the export markets. Over 60 percent say that prices are likely to limit their ability to obtain export orders during the next three months. And very few firms, except in the vehicle industry, report that average prices at which export orders are booked have been increasing. An interesting corollary of this is that an increasing number of firms, more especially in the engineering industries, say that a shortage of credit or finance is likely to limit their ability to obtain export orders during the next three months.

In the industrial export markets, a large number of firms agree that export prospects in the European Free Trade Area are likely to improve while rather fewer than in June say that prospects are improving in the European Common Market. More firms say that export prospects in the less developed countries—and especially in Africa and India—are improving.

On the other hand, confidence among British merchants engaged in foreign trade, both about the general business situation in this country and about exports, has dropped sharply in the last four months. In a report, the Association of British Chambers of Commerce describes the result of its latest merchanting trends enquiry as easily the most pessimistic since the survey was started nearly three years ago. The report is based on replies from 305 merchants whose estimated annual turnover is about £430 million. Returns were filled in after the import surcharge and export rebate schemes had been announced but before Bank rate was raised. About half were also completed before the Budget.

Drop in Orders

Of those replying half say they are less optimistic about the general business siutation than they were at the time of the previous survey in August. A majority of export merchants say there has been a drop in the rate of orders received over the past four months and in the rate of deliveries and the level of outstanding orders. At the same time, delivery dates appear to have lengthened and prices to have risen. Looking ahead to the next four months, merchants expect to see a significant decline in the tempo of business and more than a third think that export prices will continue to rise. The bigger firms, moreover, are generally more pessimistic than smaller ones. The only exceptions to this generally gloomy picture are firms dealing in engineering products and manufactured chemicals who forecast increases in new orders and in deliveries.

All trades except textiles and clothing report reasonable prospects in the North American markets, but elsewhere the outlook is patchy. Textiles and clothing take a gloomy view in all markets, while manufactured chemicals report worsening prospects only in south-east Asia and Japan. Prospects for engineering products are thought to be reasonable in western Europe, Russian block countries and China. No sign is evident, however, of any real revival of business in the Indian sub-continent.

Import merchants expect a substantial decline in import business as a result of the 15-percent surcharge. All trade groups forecast a reduced rate of orders placed abroad and of import arrivals. Even trades not materially affected by the surcharge foresee some reduction in business, though food and drink imports are expected to show the least fall. There is evidence in the returns of some precautionary buying in anticipation of import controls.

A NICHOLAS (N) PRODUCT

FIBRE PRICES EASE ALTHOUGH ARRIVALS DECLINE

SLUGGISH conditions have been prevailing in the raw jute market during the past fortnight or so in spite of a decline in daily arrivals from 125,000 maunds to 100,000 maunds in the terminal markets. Mills have so far been selective in their offtake. Market circles believe that they have restricted their purchases to quality fibre. Meanwhile, there has been a glut of lower-grade jute in Cossipore and in the agencies. Nervous offerings of such jute by weak holders at a discount have brought about a general softening of prices during the fortnight by Re. 1 a maund to Rs. 34.50 a maund, f.o.r., Calcutta, ready, basis Assam Bottoms. There are also certain other factors which have contributed to the decline.

First, the resumption of work in East Pakistani mills has failed to prop up fibre prices in that country since the mills have comfortable stocks of raw jute in their warehouses. Overseas offtake has been sluggish, as foreign buyers of Pakistani fibre are in a holiday mood. With the arrival of more jute in upcountry markets and the mopping up of more than 50 percent of the seasonal crop, the earlier fears of a big shortfall in the output have been discounted. The latest trade estimates indicate a crop of 5.5 million bales, which will help Pakistan to cover its normal consumption needs and export commitments. The carry-over to the 1965-66 season is likely to be smaller than in the previous season. But Pakistani jute circles believe that the comparatively high prices received by growers this season will encourage them to produce a bigger crop next year.

Bigger Imports of Long Jute

Secondly Indian jute mills have already bought a bigger quantity of long jute and cuttings from Pakistan this year than in 1963-64. Enough foreign exchange has been allocated by the Government of India for this purpose. Since September 375,000 bales of long jute and cuttings have been lifted from Pakistan by the J.B.S.A. The latest import quota of 200,000 bales has also been allotted to the J.B.S.A., thus making a total of 575,000 bales (against last year's carryover of 560,000 bales) exclusive of the undelivered goods against contracts up to 30th June, 1964. The Jute Commissioner has assured the industry a fresh quota of 200,000 bales from Pakistan and another 200,000 bales from Thailand, if necessary. So the Indian industry's anxiety about the availability of quality long jute and cuttings for blending purposes has been allayed.

Thirdly, the earlier fears of a short-fall in the Indian jute crop have been removed with the announcement of a record crop of 3.67 million bales in West Bengal this season, against 3.2 million bales in 1963-64, despite the setback caused by drought conditions in May and June in the Daissee and Tossa belts and the flood damage to plants in northern Bengal. Bears now estimate the all-India crop around 7.5 million bales, while the conservative estimate is 7.2 million bales. Besides this, there has been a general improvement in quality due to the introduction of large-scale crop improvement and better retting techniques.

Fibre Supplies Adequate

Lastly, although the industry has been working its installed capacity at maximum levels (except in the case of some mills during September and October), it has been able to get a regular supply of jute. The mills have been able to build up some stocks besides meeting their day-to-day requirements. The indications are that a steady supply of fibre will be maintained during the rest of the season, though the carry-over may be much smaller than the 2.8 million bales brought forward from the previous season. A striking aspect of the marketing of the crop this season is that sharp fluctuations in fibre prices have been restrained by the judicious allocation of maximum weekly purchase quotas in proportion to the market arrivals and the regulation of mills, fibre stocks by the Jute Commissioner.

Since the resumption of work in Pakistani mills, prices have sharply reacted in the finished goods market. At the current levels of gunny prices, mills cannot afford to pay higher prices for fibre, since their manufacturing profits have already been squeezed to the minimum. So a downward movement of fibre prices seems to be warranted by the trend of the jute goods market.

Exports of Carpet-backing Fall

A sharp drop in the export of carpet-backing cloth from 11,600 tonnes in October to 8,500 tonnes in November has offset the increase of 4,100 tonnes in internal consumption of heavy goods. The total despatches from mills reporting to the I.J.M.A. show a modest rise of 1,700 tonnes to 107,500 tonnes. The offtake of sacking has improved by 5,200 tonnes to 49,500 tonnes and of other goods by 100 tonnes to 5,400 tonnes, while the offtake of hessian has declined by 500 tonnes to 44,100 tonnes.

Exports have absorbed 71,000 tonnes in November, against 72,700 tonnes in the preceding month. Shipments of hessian were 39,200 tonnes (against 39,500 tonnes), of sacking 21,100 tonnes (against 20,000 tonnes) and of miscellaneous sorts 2,200 tonnes (against 1,600 tonnes). The increase in internal consumption from 33,100 tonnes to 36,500 tonnes has been attributed mainly to the brisk offtake of heavy goods by the Indian Government and to seasonal factors. Sacking despatches have improved from 24,300 tonnes to 28,400 tonnes, while hessian has shown a minor decline from 5,100 tonnes to 4,900 tonnes and other goods from 3,700 tonnes to 3,200 tonnes.

In November 1963, total despatches were 100,200 tonnes—40,100 tonnes of hessian, 47,400 tonnes of sacking, 6,700 tonnes of carpet-backing and 6,000 tonnes of other goods. Exports absorbed 36,200 tonnes of hessian, 24,900 tonnes of sacking, 6,700 tonnes of carpet-backing and 2,500 tonnes of miscellaneous goods, making a total of 70,300 tonnes. Internal consumption amounted to 29,900 tonnes—3,900 tonnes of hessian, 22,500 tonnes of sacking, and 3,500 tonnes of other goods.

Decline in U.S. Burlap Consumption

Burlap consumption in the U.S.A. has declined from 72.6 million yards in October to 65.1 million yards in November. It was 76.9 million yards a year ago. The total offtake for the first 11 months of the year has been 799.7 million yards, against 836.8 million yards for the corresponding period of 1963. The monthly average so far this year has been 72.7 million yards, while it was 76.07 million yards in 1963. U.S. stocks at the end of November rose by 3 million yards to 271.8 million yards. Of these, 122.7 million yards (against 132.4 million yards) were spot stocks and 149.1 million yards (against 136.4 million yards) were afloat. In November 1963, the inventories were 280.7 million yards—159.2 million yards spot and 121.5 million yards afloat. At the November rate of consumption, the stocks will last 4.175 months. The corresponding stock duration at this time a year ago was 3.66 months on the same basis.

Shipper circles in Calcutta ascribe the decline in U.S. offtake to the hardening trend in burlap prices since the start of the strike in Pakistani mills. Heavy-duty, duty-paid, spot and afloat burlap prices in New York gradually rose from 12.65 cents a yard on 1st November to 12.85 cents a yard on 23rd November. After hovering around this level up to 1st December, the rate rose further to 12.90 cents on 9th December at which level it has been ruling so far. U.S. bookings, of late, have been more or less of a routine nature, indicating that the price has reached the critical level where a bulk consumer prefers to use up his stocks and adopt a "wait-and-see" attitude before placing fresh orders. Since the resumption of work in East Pakistani mills, prices of hessian have gradually softened in this country as well, and enquiries have started coming to Calcutta shippers.

No Decision on Bonus

The tripartite Industrial Committee on Jute, which met in New Delhi last Saturday, has failed to reach an agreement on the issue of the bonus payable to jute mill workers. At the suggestion of Mr. D. Sanjivayya, Central Minister for Labour and Employment, who presided over the meeting, the Committee has decided to meet again in Calcutta on 25th January to make a fresh effort to come to a settlement. Representatives of the I.J.M.A., the Employers Federation of India, the I.N.T.U.C., the A.I.T.U.C., the Hind Mazdoor Sabha and the United Trades Union Congress took part in the deliberations. The West Bengal Labour Minister, Mr. Bejoy Singh Nahar, also attended the talks.

THE JUTE MARKETS

Manufactured Goods: Easier conditions prevailed in the Calcutta gunny market during the past week on reports that Pakistani mills had resumed normal working after the long strike. Overseas buyers were in a holiday mood and awaited a decline in prices. Shippers deferred fresh commitments in view of the strike threat on the eastern coast of the U.S.A. Towards the week-end, it was learnt that the U.S. strike was called off following a wage settlement. Earlier in the week, sentiment was helped by reports of substantial enquiries for heavy goods for December-March positions from Nigeria and heavy bookings of woolpacks for January-June positions by Australia. But it suffered a setback on the publication of the I.J.M.A. despatch figures for November showing a decline in exports by 1,700 tonnes. The drop in carpet-backing shipments from 11,600 tonnes to 8,500 tonnes was ascribed to the clearance of huge lots of held-over cargoes during October. Smaller consumption of burlap in the U.S.A. during the previous month and the slow offtake by that country accentuated the bearishness. The small tender for B Twills for January delivery from the Indian Government was disappointing. Shorts and shippers continued their routine covering. But the continuing congestion of vessels at Sandheads impeded the smooth flow of export cargo. The weak sentiment in the spot market was influenced by the setback in the hedge market following heavy long-liquidation and some amount of short-selling. Prices fell after wide fluctuations. Sacking was affected more than hessian. Turnover was large in the futures market, and moderate in the spot market. The undertone was hesitant at the close.

Wednesday's quotations were as follows:

	Dec.	Jan.	Feb.	Mar.
40in. 7½oz.	37.80	37.80	37.65	37.60
40in. 8oz.	40.30	—	—	—
40in. 10oz.	48.35	48.25	49.25	49.50
B. Twills	148.40	144.25	142.30	140.00
Cornsacks	151.75	151.75	147.75	144.50

A Twills	177.50	175.50	173.00	171.00
Liverpools	166.50	163.00	161.50	159.00

Raw Jute: Subdued conditions prevailed in the raw jute market during the past week. Although daily arrivals in the terminal markets amounted only to about 100,000 maunds and the Jute Commissioner had renewed the maximum purchase quota of 200,000 bales for the week ending 26th December, prices drifted downwards by about 50 paise to Rs. 34 a maund, for Assam Bottoms

delivered in Calcutta. Panicky offerings by weak holders of ready lower-grade jute depressed the trend, although quality fibre still commanded a premium and met with ready acceptance. In the upcountry markets, prices, though softer, hovered above Calcutta parity. Reports of an easy trend in the Pakistani jute market were an additional depressant. Turnover was mainly confined to selected-grade jute for ready positions in Calcutta and the terminal markets. The closing undertone was hesitant.

Wednesday's quotations were as follows:

	Rates a maund Mid.	Bot.	Rates a quintal Mid.	Bot.

THE U.K. JUTE MARKETS

RESTRICTED BUYING OF FIBRE

(FROM OUR DUNDEE CORRESPONDENT)

THE raw jute market was quieter in Pakistan, and offers were being freely made during the past week. Less buying interest was shown by the mills there, and as a result of this, larger quantities of jute were becoming available to shippers. There are reports from Pakistan that the quality of fibre is now showing some improvement.

Demand for raw material from Dundee spinners was very small and the business taking place was mainly in spot parcels. A large quantity of unsold jute is now afloat to the U.K. and spinners will take this up in due course. However, this is bound to have a weakening influence on prices in the Dundee market as holders of these parcels are anxious for business because of the high interest charges in the U.K. at present.

Prices quoted were very irregular. This is likely to continue until all the unsold jute is taken up. Offers are being made at £150 for Mill Firsts, at £137 10s for Export Firsts, at £122 10s for Export Lightnings and at £114 for Export Hearts, c.i.f. U.K., for December-January shipment. Grade Tossa-2/3 was named at £151 and Grade Tossa-4 at £135. Dacca Tossa-5 was at £156 and Dacca Tossa-6 at £137 10s. There were sellers of Outport Tossa-2/3 at £117 10s and of Outport Tossa-4 at £111, December-January. Spot and afloat parcels could be obtained at less than the above rates in many instances.

Prices of cuttings showed little change during the past week. Offers were at £87 for S.N.C. and at £80 for N.C. Mesta was slightly easier, but the prices asked were still considered too high when compared with other types of raw material. Offers were at £109 10s for A, at £100 10s for B, at £91 5s for C and at £76 5s for cuttings, c.i.f. U.K., for December-January shipment.

The Siam jute market was quiet, and although prices were at a reasonable level, there was very little buying interest shown here. Offers were at £82 for grade A, at £77 10s for grade B, at £73 10s for grade C and at £71 10s for cuttings, delivered mill Dundee for December-January shipments.

The Calcutta goods market was steady and a small business took place in imported goods in the U.K. Quotations were at 81s 6d for 40in. 10oz. and at 63s 3d for 7½oz. a 100 yards c. and f. U.K. for December shipment, at 82s 3d and 63s 3d January and at 82s 8d and 63s 3d February. B Twills were at 254s 11d, 250s and 245s 10d for the respective shipment periods.

Dundee jute spinners are very busy, and they have orders in hand for delivery several months ahead. The carpet trade continues to take regular supplies and further buying has taken place as there is nothing to indicate that lower prices can be expected in the near future.

Manufacturers of hessian cloth are also busy, but their position is not quite so good as a month ago. There has been a slackening off in demand of late, but most producers have orders in hand for delivery over the next two months. The heavy end of the trade is very quiet and little buying interest is shown in sackings and tarpaulins. As a result of this, producers are offering a discount for large quantities. So far this has not increased demand.

U.S. BURLAP CONSUMPTION AND STOCKS

U.S. burlap consumption during November was 7.5 million yards less than during October 1964 and 11.8 million yards lower than in November a year ago. Bag cut-up was 46.8 million yards and piecegoods deliveries 18.3 million yards, compared with 55.9 million yards and 21 million yards, respectively, in November 1963. Consumption for the first 11 months of 1964 is 37 million yards less than during the comparable period a year ago. U.S. spots and afloat stocks at the end of November increased from the end of October by 3 million yards. At 271.8 million yards, 122.7 million yards were spots (down 9.7 million yards) and 149.1 million yards were afloats (up 12.7 million yards). Stocks represent about 3.7 months' supply.

COMMITTEE RECOMMENDS INCENTIVES FOR TEA

THE chairman of the Tea Finance Committee, Mr. V. V. Chari, has explained the background to the recommendations contained in the committee's report, which has since been submitted to the Government and placed before the Lok Sabha. (A summary of the recommendations was published in *Capital* of 10th December.) Mr. Chari, who is the Additional Secretary to the Central Ministry of Finance, has said that the tea industry needs incentives to embark on a steady development programme. Because of a downward trend in their profits over a number of years, there is disinclination on the part of the management to incur fresh expenditure on development. In the southern region, for instance, in 1964 which was a bumper crop year, the net profits on paid-up capital and reserves taken together increased to 26.5 percent from 24 percent in 1950, but in 1962 these declined sharply to 9.7 percent. Mr. Chari did not have the precise figures relating to estates in north India, but he felt that things could not have been very different for them. The industry had undertaken some replantation in good years, but later progress has been very inadequate. It will be difficult for the industry to fulfil the fourth plan target of 1,000 million lbs. Even in the third plan, output and export targets have had to be revised downwards.

Apart from the recommendations which have already been reported, the following are some of the important ones with which Mr. Chari dealt specifically at his Press conference:

(1) A cess at the rate of four paise a kilogram with effect from the next financial year, should be levied on all tea produced.

(2) All land suitable for tea plantation within the existing grants of tea gardens should be exempted at least for some years from resumption or requisition by the State Governments unless required for public projects of paramount importance.

(3) Applications from tea gardens for additional Government land for expanding the area under tea should receive favourable consideration by State Governments; and

(4) The price of fertilisers paid by tea gardens should not exceed the price payable by other agriculturists.

The expenditure on planting for the purpose of computing the development allowance will include (1) the cost of preparing the land; (2) the cost of seeds and cuttings and nurseries; (3) the cost of actual planting and (4) the cost of upkeep up to and including the fourth year commencing from the year in which a start is made for preparing the land. The assessing officers should deduct expenditure on the cost of upkeep after plantation in new areas in computing the taxable income. For the purpose of computing the development allowance, the cost of planting will be subject to a ceiling of Rs. 4,000 an acre in the plains and Rs. 5,000 an acre in the hill areas.

The report says that the rate of tax on the agricultural portion of the composite income should not exceed the rate of tax on the non-agricultural portion of it.

The committee has recommended that a suggestion made by the Agricultural Refinance Corporation that finance for small tea growers should be provided through central co-operative banks and land mortgage banks should be pursued. For the economically weak gardens, which are not necessarily small in area, the committee has recommended the relaxation of some of the conditions applicable to loans made by the Tea Board.

Also, extension service on the lines of what has been done for agriculture should be provided. Hire purchase loans should be allowed to be repaid over a period of ten years instead of the present duration of seven years. Furthermore, the hire-purchase scheme should be extended to the purchase of second-hand driers and prime movers provided the Tea Board is satisfied that these machines are suitable in all respects.

Tea estates are now required by law to provide houses for their labour. The committee has endorsed the recommendation of the working group on plantation labour housing that a subsidy of 25 percent of the cost of houses be provided on the lines of the industrial housing scheme.

It is understood that the allowance for new plantations will be 50 percent of expenditure, whereas the cost of replanting will receive financial assistance up to 40 percent of the cost including upkeep for four years, writes a special correspondent. Other matters under consideration include refund of a proportion of excise duty on exports (18 percent is indicated) as a surcharge of 20 percent was added to excise rates under the Finance Act 1963. At that time the export duty was abolished. The abolition of the West Bengal tax on tea entering Calcutta is also understood to have been recommended.

Interest at 4 percent on loans for replanting and new planting is said to have been recommended for the first five years and to compensate lenders, interest for two additional years, namely, the sixth and the seventh year, would be at 6 percent.

The congestion continues at Calcutta port and tea shipments fill all available space. At Sale No. 30 held in Calcutta recently on 14th, there was a good general demand for leaf, generally at a decline, but some grades continue to find buyers at firm and even dearer rates. Fannings sold well and there was definitely a better enquiry for C.T.C. offerings, while plain teas kept steady. Both medium and good C.T.C. found support, and in some cases, the rate appreciated. Darjeelings were reported slightly easier. In view of the large supplies from north India, this season, the current indications are encouraging. Cochin also reported a good demand for dust teas with high-growns well supported and good medium grades were firm to dearer. At the Calcutta tea sales of 31st December, there was a good general demand.

Some 31,450 packages were up for sale at the latest London auction of which 27,475 packages were from Calcutta. Prices for Assams were firm to dearer, but Dooars met with an irregular market with prices about 1d a lb lower.

LOSS INCURRED BY STATE ELECTRICITY BOARDS

On examining the accounts of the various State Electricity Boards for 1962-63, it was seen that except the Boards of Madras, Mysore, Madhya Pradesh and Uttar Pradesh, the other Boards were not in a position to pay even interest charges on the loans advanced by the State Governments. The Conference of Irrigation and Power Ministers, held earlier this year, had noted that the financial position of most of the State Electricity Boards in the country was unsatisfactory and that in the interest of promoting healthy power development, immediate steps were necessary to put the Boards on a sound financial footing. As decided at the Conference, a Power Tariff Committee was set up to examine the following:

(i) Ways and means of improving the revenues of the various State Electricity Boards and also the income from electricity duty; and

(ii) the pattern of relationship between the tariff and electricity duty.

The Commission, among other things, suggested that the objective for all the State Electricity Boards should be to aim at higher revenues sufficient to cover operation and maintenance charges, contributions to the general and depreciation reserves and interest charges on loan capital.

Boards should keep the cost of generation, transmission and distribution, including overheads, as low as possible taking necessary corrective steps by periodical reviews.

As a general rule, the Board should supply power only at rates which provide for operation and maintenance costs, depreciation and interest charges. However, for the supply of power to energy intensive industries, the Committee recommends that the different views expressed on the principles to be followed may be placed before the Government of India for its consideration.

To facilitate intensive rural electrification, the Committee recommends: (a) that the possibility of getting loans interest-free for the first five years may be explored, (b) advantage may be taken of the loan assistance, if any, offered by the Life Insurance Corporation and (c) Boards should consider whether the minimum guarantee levied by them on agricultural consumption can be reduced or abolished.

With the object of increasing agricultural production in the country, the Government of India has decided to liberalise the terms of loan assistance being given to the State Governments for rural electrification. Under the revised terms, the loans will be repayable over a period of 30 years. No interest will be payable in the first five years. The principal and interest will be recovered in 25 equal instalments every year from the sixth year.

The State Governments have been requested to pass on the loans to their State Electricity Boards without charging higher rates of interest.

For a nominal charge "Capital's Statistical Department can provide you with a certificate of share prices.

MIDDLE CLASS COST OF LIVING INDEX NUMBER FOR CALCUTTA

(Base: August 1939)

THE Middle Class Cost of Living Indices, by groups, have now been brought up to November 1964. As compared with October, the November indices for Food, Fuel & Lighting, Clothing and Miscellaneous remain unchanged at 642, 308, 620 and 331 points, respectively.

Combining all the factors, the Middle Class Cost of Living Index for Calcutta shows that the cost of living remained unchanged at 533 points during November 1964.

Books

ECONOMIC MIRACLES IN EUROPE

Economic "Miracles". By Jossleyn Hennessy, Vera Lutz and Giusseppe Scimone. (Published for the Institute of Economic Affairs by Andre Deutsche Ltd, London W.C.1. Review copy received from Rupa and Co., 15 Bankim Chatterjee Street, Calcutta 12. Price 25s, pages 228.)

In the postwar era, three countries in Europe are said to have experienced an economic "miracle"—West Germany, France and Italy. The experiences and methods adopted by them for the restoration of their crippled economies are examined separately against the background in each country by three economists; two of them are better known as journalists. The purpose of the book is to assess the significance of the "miracles" for Britain. The Institute of Economic Affairs invited the three writers to give their views on the causes, performance, adaptation or end of each "miracle". Written in a style free from political bias, the book provides useful information and stimulating discussion on the resurgence of these economies. While suggesting tentative answers to the current problems, the authors have left enough opportunity for readers to draw their own conclusions. The essays are thus useful not only to Britain but to all the economies of Asia.

The essay on the West German "miracle" is by Mr. Jossleyn Hennessy. He attributes the resurgence of the West German economy to the inspiration of the present Chancellor, Dr. Ludwig Erhard, who replaced the Nazi war economy by the *sozialemarktwirtschaft* or "the liberal market economy" as interpreted by Professors Eucken and Ropke. The former was Dr. Erhard's chief adviser; he protested against the totalitarian ideology of the Hitler *régime* and believed that the State's first obligation was to preserve the freedom of the individual. "Freedom was lost when the individual was at the mercy of concentration of power, political or economic". He was against both private monopoly and Government planning which eliminate competition and concentrate power. West Germany, therefore, chose the way of the free-market economy. The author concludes that the real guarantee for the genuine security of rising wages and employment is the rising productivity of a flexible, competitive economy—free from restrictive practices. This is what the West German worker enjoyed in the 1950's, and it is his guarantee for the future.

France chose the way of indicative planning and by a series of "plans" seems to have applied the opposite principle of State guidance and pressure. Starting with the first plan of modernisation and equipment, popularly known as the Monnet plan, four plans have almost been completed, and the fifth is already in the preparatory stages. With a brief description of the organisational and administrative machinery and the method of preparing the plans, Dr. Lutz establishes an interesting relation between the plan and economic policy as a whole. There is a judicious analysis of the achievements and failures of these plans. Two criticisms of the plan are particularly striking. One is that it has not so far succeeded in formulating an incomes policy, and the other is that it has not been sufficiently "democratic". But the popular enthusiasm for the plan in France since 1961 is in part explained by a very special political situation. Dr. Lutz is a British-born economist who lives in Switzerland and knows France well.

The third of the trinity of European economic "miracles", that of Italy, is described in a short essay by Dr. Giuseppe Scimone, an Italian journalist. It is claimed that the economic resurgence during the postwar years has been largely the result of the courageous political measures adopted by the Italian Government under the influence of Dr. Luigi Einaudi as Governor of the Bank of Italy and Minister of the Budget. Without resorting to increased import cuts, his policy restored the incentive of business men to increase their activity, made Italy attractive for foreign investment, increased savings and stabilised the cost of living. In spite of the "miracle", many problems have arisen due to the lack of confidence. Industrialists are uncertain of trade unionists, the taxpayer does not trust the impartiality of the tax office, the efficiency of the bureaucracy is in question, and fraud and dissimulation are common. The system is blamed as one major cause of the present inflationary trend.

In a stimulating introduction to the book, Mr. J. Enoch Powell asks: What is it that Britain and the United States "haven't got" which is yet common to all these faster growing economies? He reviews the possible explanations and concludes that there is no discernible relationship of cause and effect between the economic "miracles" and the direction of economic resources by Government action.

INDUSTRIAL PSYCHOLOGY

Industrial Psychology. By Thomas William Harrell. (Review copy received from Oxford Book Company, 17 Park Street, Calcutta 16. Price Rs. 9, pages 398.)

Industrial psychology is the study of people at work in industry and business. It is concerned with the physical aspects of the work environment as, for instance, lighting and temperature and their effect on work output and safety. It is also a study of the principles and practices of human relations and is concerned with the attitudes and motivation that effect high morale and enthusiasm at work and with the causes of monotony which bring about boredom. It is the study of mental health on the job and the ways of helping back to mental health those people who have become upset and confused. It is the study of the relations between the supervisor and his subordinates and of the factors which lead to industrial strife or to co-operation between management and labour.

Industrial psychology is a complicated study of a number of things, but it is always primarily the study of people—as individuals or in groups—in the work situation. The objective of industrial psychology will be principally one of profit, so productivity and efficiency are important. Having thus stated what industrial psychology is, it need hardly be emphasised how important this subject is to India, since practically no attempt has been made so far in this direction here.

The book is written in simple, readable style. The exposition is clear, and the three major aspects of industrial psychology, namely, individual differences, human relations, and human engineering have received a well-balanced coverage. The emphasis has rightly been laid on motivation. Modern industrial and psychological testing has also received due attention. Besides, many illustrative examples from actual industrial situations and practices have been incorporated.

Some of the author's remarks deserve to be quoted: "The result of time study on industrial efficiency are not known exactly. It is probable that time study accompanied by incentive-pay plans increases production. The amount of increase, however, is probably considerably less than the maximum possible because of labour's distrust of time study methods." "Accidents are related to many environmental, mechanical and human conditions. There is usually a combination of mechanical ineffectiveness and human error. Seldom is there an accident where either mechanical or human error is completely missing." "Pay has been assumed by business executives to be the most important incentive and at times to be the only incentive that needs to be considered. The viewpoint of business executives towards pay is changing. It is coming to be believed that the worker wants several things more than he wants higher pay." "Praise should be given for work well done wherever possible. Punishment, if it is a reprimand, should be given in private; in any event, it should be used only when necessary."

Brief chapter summaries, a list of current references offering suggestions for further reading and an index add to the value of the book. Although meant for the under-graduate student, it should be read by students, labour leaders, industrialists and personnel officers.

COMMON MARKET

A Study of the European Common Market and Its Impact on India's Foreign Trade. By R. S. Nigam. (Published by S. Chand and Co., Fountain, Delhi. Price Rs. 10, pages 196.)

Mr. Nigam has broken new ground in the current literature on Indian economic problems by writing this book on the impact of the European Common Market on India's foreign trade. At the outset, the author explains the constitution of the E.C.M. and discusses the general agreement arrived at in Rome to eradicate trade barriers between the six Continental countries and to adopt a common tariff policy towards other nations.

India's exports to the European Common Market countries amount to an annual average of Rs. 50 crores, but she is heavily dependent on them for machinery, chemicals and capital equipment which are so essential for her economic development. This is precisely the reason why she should seek every opportunity to increase her exports to these countries and reduce her mounting adverse balance of trade with them. Unfortunately, the uniform tariff policy and the inclusion of Associated Overseas Territories in the Common Market plan threaten the competitive position of her exports, mainly jute goods, cotton textiles, cotton waste, coir, tobacco, coffee and vegetable oil. The situation will become serious if Britain joins the Common Market and denies preferential treatment to traditional items of Indian exports like jute goods, cotton piecegoods, cotton yarn and tobacco. Britain being the largest single buyer of Indian goods, the repercussions on this country's ability to earn foreign exchange in such circumstances can hardly be over-emphasised.

The threat, meanwhile, is two-fold: first, the Common Market countries will tend to substitute their own products and those of their overseas territories for Indian goods, the latter's competitive strength being diminished by the discriminatory tariff imposed on them. Secondly, capital will increasingly flow to develop industries within the Common Market and the Associated Territories and less capital will be available for India.

The author discusses with admirable precision India's trade relations with the Common Market, both countrywise and commoditywise. Her largest single item of export to these countries is manganese ore, followed by coffee and hides and skin. There is scope for expansion of India's export of preserved food and light engineering materials. It is hoped that with the abolition of tariff on tea, Indian tea will have a better chance to compete with Indonesian tea.

SECRETARIAL PRACTICE

Secretarial Practice. By Acharya, Govekar and Date. (Published by A. R. Sheth and Co., Princess Street, Bombay 2. Price Rs. 10, pages 732.)

The number of public limited companies is increasing with the growth of industries in this country. An intimate and detailed knowledge of the working of a public limited company is now a necessary prerequisite for any student of modern industrial organisation. The law relating to incorporation and management of companies seeks to achieve several objectives. It defines and limits the powers and responsibilities of industrial management. The rights and duties of shareholders, boards of directors, managing agencies, auditors, etcetera, are all set out in considerable detail in the context of the law. The basic object of the latter is, of course, to ensure that competent and responsible units of industrial entrepreneurship are developed in this field so as to promote public welfare.

In this book, the three authors, who are teaching commerce and economics in different colleges, have attempted to discuss the legal position. They also suggest how secretarial duties should be discharged in day-to-day management. The inclusion of the text of the Companies Act pertaining to important topics and the specimen forms of various documents connected with secretarial work, the chapters on company correspondence, books and registers, company reports, company law administration and control of capital issues add to the utility of the book.

CENSUS REPORT

Census of India 1961 (Vol. XVI), West Bengal and Sikkim. By J. Datta Gupta. (Published by the Manager of Publications, Civil Lines, Delhi. Price Rs. 6.20, pages 377.)

The volume is immensely informative and interesting. One is naturally impressed by the meticulous calculations involved in it. But the delay involved in publishing such an important statistical report is rather too much—the 1961 census coming out in the middle of 1964. However onerous the job may be, considering its importance the Government should organise the whole set-up so that the next census report is published with all the good features of the present one minus the vicious temporal lag.

COMPANY AND PUBLIC NOTICES

THE GENERAL INVESTMENT & TRUST CO. LTD.

NOTICE OF INTERIM DIVIDENDS.

THE Board of Directors has sanctioned payment of the following Interim Dividends for the year ending 28th February, 1965, subject to deduction of tax.

On the 1st Cumulative Preference Shares @ 3.25%.

On the 2nd Cumulative Taxable Preference Shares @ 2.498%.

The above dividends will be paid on or after the 20th January, 1965, to those members whose names appear in the Company's books on the 11th January, 1965, or to their mandatees.

The Share Transfer Registers of the Company will be closed from 4th January, 1965 to 11th January, 1965, both days inclusive.

By Order of the Board,
BIRD & CO. (PRIVATE) LIMITED,
Secretary.

Registered Office,
Chartered Bank Buildings,
Calcutta, 16th December, 1964.

ASSOCIATED BATTERY MAKERS (EASTERN) LIMITED.

NOTICE TO SHAREHOLDERS.

THE Accounts of the Company for the year ended 31st August, 1964 exhibit a net profit after allowing for depreciation of Rs. 68.84 lakhs before tax.

After providing for taxation and reserves, and bringing in the balance from the last Account, the amount available is Rs. 19.56 lakhs.

The Board of Directors has resolved to recommend to the Shareholders at the forthcoming Annual General Meeting that the Dividend for the full year on the issued Capital of Rs. 118 lakhs be declared at the rate of 16½% subject to tax.

By Order of the Board,
H. M. COX,
Secretary.

Registered Office:
Barlow House,
59C, Chowringhee Road,
Calcutta-20.
Calcutta, 16th December, 1964.

HIDES AND SKINS STEADY

The market was quietly steady. Stocks were higher than in the previous week.

Bazaar Sales

(Between 15th December and 21st December, 1964)

Cowhides: Wet salted (Ord) 5,000 pcs. on the basis of Rs. 7.50 to Rs. 9.25; Wet salted (Slaughtered) 33,000 pcs. on the basis of Rs. 10.50 to Rs. 16.50 and Rs. 19 to Rs. 28; Wet salted (Ord) 1,000 pcs. on the basis of 90 P. a lb.

Goatskins: Wet salted (Patna, Daissee, Kustia) 60,700 pcs. on the basis of Rs. 340, Rs. 445 to Rs. 460 and Rs. 480 to Rs. 490; Wet salted (he-killed) on the basis of Rs 4.75 and (she-killed) Rs. 4.50 a piece; Purneah 6,200 pcs. on the basis of Rs. 315.

Bazaar Stocks

(21st December, 1964)

Cowhides: Wet salted 99,800 pcs.

Goatskins: Wet salted (Patna, Daissee, Kustia, Killed) 85,500 pcs; Assam-Dinajpur 182,000 pcs: Muzafferpore-Patna Pakur-Purneah-Kissenganj 350,000 pcs.

JOINT STOCK COMPANIES PREFERENCE SHARES

Dividends are cumulative and shares carry a Preferential claim on the property for the payment of capital and on the profits for dividend except in case of companies marked otherwise. Months against names of companies indicate approximately times of payment of dividends. T means that dividend tax is deducted at source.

COAL COMPANIES

O., Po., F. and Dd Indicate Ordinary, Preferred Ordinary, Founders and Deferred Shares respectively. 'P' next to the name of the company indicate that the company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

OUT OF THE ACHIEVEMENTS OF THE PAST A PROMISE FOR THE FUTURE.

10 JAN 1965

Consider almost any field of national development. Food and agriculture? Oil and mining? Power and irrigation? Cement? Steel?...Larsen & Toubro is in it.

Blast furnaces at Rourkela. Mining lignite at Neyveli. The first oil refinery in the Public Sector. A power station for Madhya Pradesh. A complex dairy, meeting the daily needs of a large city. A mammoth irrigation scheme changing near-desert tracts into arable land. These are but a few of the major projects where L&T's manufacturing skill, technical know-how and engineering experience have been effectively utilised in the service of the nation.

L&T's Fabrication Shop and Switchgear Factory at Powai is a dynamic industrial unit where many ideas originate and take shape. It fabricates and manufactures specialised plant and equipment for a variety of major industries; chemical and pharmaceutical, food processing, oil distribution, dairies, switchgear, fertilizers, petro-chemicals and paper. At Sion, the Drilling and Mining Division manufactures drills and diamond bits used in mining enterprises all over the country.

Tractors, trailers, cranes and dredgers, supplied by L&T's Earth-moving and Agricultural Equipment Division are busy at many of India's major projects. Other important L&T Divisions are Heavy Plant, Instruments, Industrial Appliances Cooling Towers and Engineering Projects.

Behind many L&T undertakings is the collaboration from world-renowned manufacturers GHH, Voith, Koppers, Caterpillar, Laur. Knudsen Silkeborg, Christensen, Longyear, Audco...

With such varied activities, valuable experience and world-wide contacts, L&T has steadily grown over the years. These significant achievements of the past hold a promise for a still brighter future

GKnoWledge

We do not wish to appear to be boastful but we are nevertheless very knowledgeable people in the engineering world. We make almost anything from alloy steel to safety pins and from points and crossings to wood screws.

We produce something for every engineer—whether he makes bicycles or railway engines, buckets or tractors.

Quality welding jobs deserve Advani-Oerlikon electrodes and the **TRIODYN K-320.** This mobile D.C. arc welder has a continuously variable current from 30 amps to 320 amps in 2 overlapping ranges, with a choice of 2 open circuit voltages. A detachable remote control device permits accurate current settings on the job location, making for increased productivity and better job quality. Need more details? Please Telephone 253029/254815 or write to J.B. Advani-Oerlikon Electrodes Private Ltd., Radia House, 6, Rampart Row, Bombay 1. The **TRIODYN K-320** is made by the Company that makes the finest range of welding electrodes.

SPEEDING TOWARDS PROGRESS

The cranes are moving. They stop, stretching forth a gigantic arm to lift and swallow chunks of earth. A road is built. The cranes move on . . . and India moves another step towards progress.

A roller bearing spins. Countless revolutions. A huge locomotive comes steaming out of the Works . . . and India speeds on towards progress.

A concrete wall stands sheer and invincible—a turbulent river looks as placid as a mountain lake. And India overcomes yet another obstacle towards progress.

All over the country, in various dam-sites, projects, mines and factories—William Jacks work with men and machines to help build the face of new India; machines ranging from generators, turbines, earthmovers, to pumps, drills, and tools; supplying these throughout the country, and providing on-the-spot service with highly trained technical personnel. Wherever there is progress, there is William Jacks.

fans/blowers, furnaces, conveyors, etc.

A. CENTRIFUGAL FANS

1. BACKWARD CURVED, LIMIT LOAD FANS TYPE "LLA" (Single Width Single Inlet), and Type "LLA/DW" (Double Width Double Inlet) for Air Conditioning, Ventilation and other duties involving the use of cold clean air at static pressure upto 3" water gauge.

2. BACKWARD INCLINED, LIMIT LOAD MEDIUM PRESSURE FANS TYPE "BCA" (Full Width Single Inlet) and Type "BCA/DW" (Double Width Double Inlet) and Type "BCB" (Narrow Width Single Inlet) for Forced Draught, Medium Pressure Ventilating Systems and all other duties involving cold clean air at pressures upto 20" water gauge (24" w.g. for Type "BCB" Fans.

3. FORWARD CURVED, MULTI-VANE VOLUME FANS TYPE "FCA" (Full Width Single Inlet) and "FCB" (Narrow Width Single Inlet) for all applications involving cold clean air upto pressures of 5" water gauge and 10" water gauge respectively.

4. PADDLE BLADED, SINGLE WIDTH, SINGLE INLET FANS TYPE "PBF" (Forward Tipped Blades), Type PBB (Backward Tipped Blades) and "PBR" (Radial Blades) for High pressure Ventilating Systems, Dust Extraction, Pneumatic Conveying and all other applications involving dust-laden air at pressures upto 24" water gauge. These Fans can be manufactured in Stainless Steel or Abrasion-resisting Steel as available or could be Metal-sprayed or Rubber-lined to resist the corrosive action of fumes.

5. SELF-CLEANING FANS TYPE "SC" FOR DUST EXTRACTION and High pressure Systems involving pressure upto 30" water gauge.

6. INDUCED DRAUGHT FANS of heavy constructions with Heat Dissipating Discs and Roller Bearings according to gas temperature. These Fans an be of the Forward Curved Design Type "FCA/ID" Paddle Bladed Design Type "PBF/ID" or Selfcleaning Paddle Bladed Type "SC/ID" according to working conditions.

7. NARROW WIDTH MEDIUM AND HIGH PRESSURE SINGLE INLET BLOWERS SC/NW and KBS/R (Belt-driven) or KBS/S (Direct-coupled) or KB/SE (Impeller on Motor shaft) for high or low volume applications such as Oil Atomisation, Forced Draught to Solid Fuel Furnaces, Smithy Fires and Cupolas and similar applications.

B. AXIAL FLOW FANS

1. Axial Flow Cased Type Fans for pressures upto 3" water gauge for Withering Tunnel, Workshop Ventilation, Auxiliary Mine Ventilation and all other applications involving cold clear air.

2. MULTI-STAGE AXIAL FLOW CASED FANS OF THE CONTRA-ROTATING TYPE for the same applications as under item 1, but involving static pressures upto 10" water gauge.

3. AXIAL FLOW WALL-MOUNTING EXHAUST FANS for pressures upto 3" water gauge.

4. AXIAL FLOW CASED TYPE PORTABLE MAN-COOLING FANS.

5. AXIAL FLOW WALL-MOUNTING PATTERN FANS for Forced Draught Cooling Towers.

6. Axial Flow Streamlined Reversible Fans for Mine Ventilation.

C. PROPELLER FANS

1. Wall-mounting Propeller Type Exhaust Fans upto 72" diameter for operation under free intake and discharge conditions.

2. Diaphragm-mounted Propeller Fans for operation against low static pressures upto ½" water gauge.

D. AUXILIARY EQUIPMENT FOR FAN APPLICATIONS

A complete range of Cyclones and Filter Bag Type Dust Collectors, Aerodynamic Dust Collectors, Ductwork, Air Washers and Filters. Pneumatic Conveying, Dust Extraction and similar plants.

E. OIL FIRING EQUIPMENT & INDUSTRIAL FURNACES

1. Low Pressure Type Oil Burners for Metallurgical & Heat Treatment Furnaces, Tea Drier Stoves, Kilns and other purposes with a complete range of accessories such as Oil Filters, Oil Preheaters, Oil Pumps and Storage Tanks.

2. Industrial Heat Treatment Furnaces, Oil, Gas and Solid Fuel Fired, for Case Hardening, Annealing, Normalising, Forging and other purposes.

F. MATERIALS HANDLING EQUIPMENT

1. A complete range of Belt Conveyors and Bucket Elevators.

2. Screw Conveyors.

3. Pneumatic Conveyors, Etc.

Soviet Trade and Aid Policies Towards Developing Countries

The object of this article is to examine the extent, motives and prospects of Soviet aid to, and trade with, developing countries. Professor Nove of Glasgow University, one of the world's leading authorities on the subject, says that the expansion of Soviet aid has been severely limited by the growing strains within the Soviet economy itself, which have made it difficult to make capital goods available, additional to those already covered under existing aid agreements. Neither the exaggerated fears of alarmed Western observers, nor the equally exaggerated hopes of pro-communist elements, have been confirmed by the events of the past few years.

By

ALEC NOVE

THE word "Soviet" has for long been the cause of a rise in emotional temperature, and this has often caused lack of understanding of Soviet actions and exaggerated alarm, or exaggerated hopes, of the consequences of such actions. There is a disinclination to adopt, or even consider, normal explanations. Indeed, there is something in such attitudes far older than communism. The story used to be told that, at the Congress of Vienna in 1815, a Russian delegate died. Metternich was said to have remarked: "I wonder what his motive was?" Yet the key to understanding is the avoidance of an attitude which ascribes to the Russians exceptional qualities of virtue, malevolence or effectiveness.

True, the Russians themselves have frequently endeavoured to present themselves as exceptional, as "people of a special kind", and have been so treated by American counter-propaganda. However, despite this rare instance of Russo-American agreement, it is always best to analyse the facts on the initial assumption that the most "ordinary" explanation is likely to be correct, and only if the facts refuse to fit such an interpretation should we look further. To take a political example, correspondents in the London *Times* some years ago sought to explain variations in Soviet foreign policy in terms of Pavlovian conditioned-reflex analysis, instead of analysing Soviet diplomatic manœuvres as diplomatic manœuvres. True, in respect of trade and diplomacy alike, Russia's ultimate aims are not of the traditional Great-Power type. However, in their actions the Soviet leaders tend to react to problems as they arise without constant reference to ideology or ultimate aims. Anyhow, this will be our initial hypothesis.

Relative Neglect

Having made these preliminary points, let us now examine the history of Soviet aid to and trade with developing countries in general, and India in particular. Russia virtually ignored developing countries until 1955, except for some traditional trade with neighbouring States (*e.g.*, Afghanistan, Iran) and some purchases of tropical raw materials such as rubber, the latter by using sterling earned by exports to Britain. There were several reasons for this relative neglect. One was that, until roughly 1950, Russia was not able to export appreciable quantities of manufactures. Her industries were still inadequately developed (though rapidly growing) when the war broke out, and the great damage done by the war was only made good around 1950. A second reason was a wrong political appreciation. The great decolonisation process, after the war, was not understood by Stalin. He thought that the West had found a new device for political and economic control, a kind of neo-colonialism, and that Nehru and other national leaders were imperialist tools. Absurd though this view was, no one dared challenge it so long as Stalin was alive, and so opportunities, economic and political, were missed. Stalin's death provided a belated opportunity for Soviet politicians and planners to bring their assessment of developing countries into line with reality.

A Reassessment

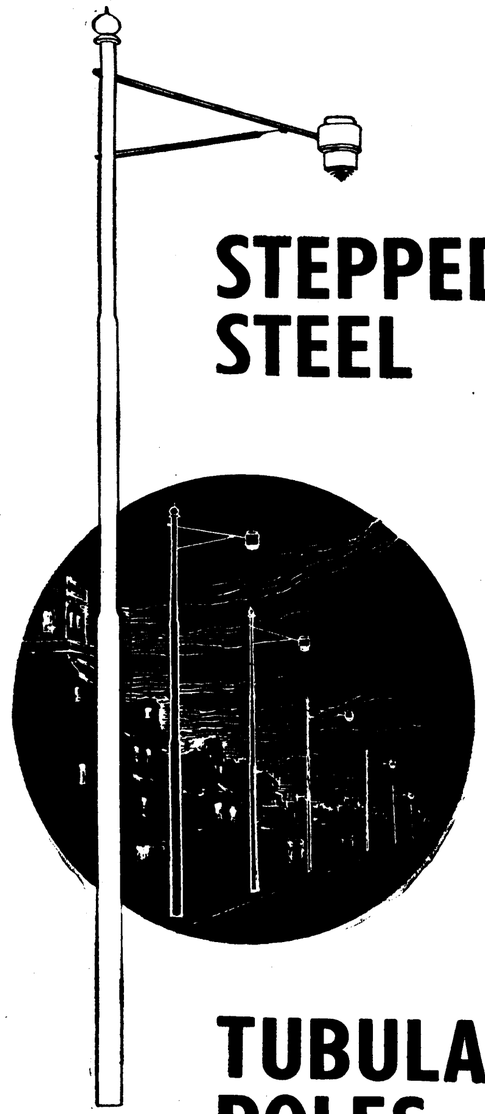
It followed from such a reassessment that Russia was bound to make some effort to expand her economic relations with, and political influence in, developing countries which had become newly independent. The West had already been granting economic aid, and this was in a number of instances tied to membership of military alliances directed against the Soviet Union. The developing countries were conscious of the urgent need to expand their industries, and Russia, claiming to be the world's second industrial power, could scarcely stand aside from aid and trade, unless she wished to let the whole "game" go to the West without a struggle.

The problem was, and is, to make available for developing countries resources which, in most cases, were also needed at home, or in the Soviet bloc. Russia, despite her industrial progress, remained and remains a country of shortages, of strain. Materials and machinery are administratively allocated, that is, rationed. The investment programme reconciled with difficulty the conflicting claims of many capital-starved branches of the economy. Those conflicts were exacerbated by the "liberalising" consequences of Stalin's death, as his successors sought to invest heavily in agriculture, housing, consumers' goods, *i.e.*, in the previously neglected sectors of the economy. In this context, while trade could be a valuable source of additional goods, aid was a burden which the economy could ill afford to bear, even though it represented a tiny percentage share in the national product.

Aid, from the first, took almost wholly the form of undertaking to deliver goods on credit, with interest generally around 2½ percent, repayment being made in the goods of the country concerned. Since this interest rate was well below the market rate, and since the goods in which repayment was to be made were often of low priority (*e.g.*, tea, cashewnuts), there is no doubt that these credits did impose some burden on the Soviet economy. It is perhaps not a coincidence that 1955, the year in which the first important credit agreements were negotiated, was also the last year in which Russia sent large quantities of capital goods on credit to China. Aid to (as distinct from trade with) China ceased altogether in 1956, and Chinese repayments began. This released some additional resources for aid to other countries.

Quarrels with the West

The turn in Soviet aid and trade policies was heralded by journeys to India and elsewhere by Khrushchev and Bulganin. The number of credit agreements grew steadily. Table 1 on page 9 shows the record up to a year ago. In a number of instances, aid and trade developed because the country concerned quarrelled with a former Western partner (Egypt, Iceland, later also Cuba), or because a fiercely anti-communist *régime* was overthrown (the Nuri Government in Iraq). In no case were the quarrels and changes in question *caused* by Soviet economic aid or trade. However, these things became closely associated in the public mind, and gave rise to an excessive degree of alarm about the effectiveness of "Soviet economic penetration".

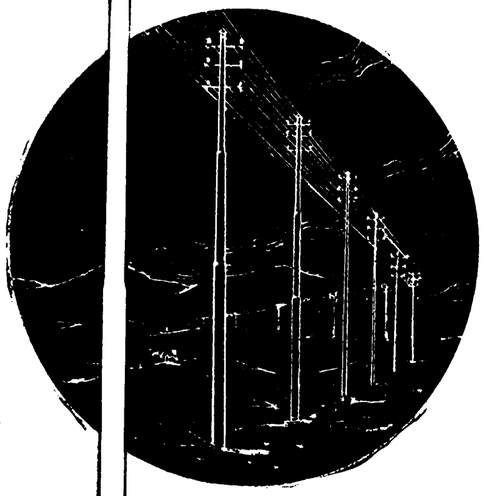


It is somewhat misleading to add Soviet credit agreements together and to present the resulting sum as representing the amount of "aid rendered". The agreements, to repeat, usually consist of undertakings to deliver goods at various future dates. Until the goods are delivered, no aid can be said to have been rendered. This point is made not in order to criticise the Soviet aid programme; it is alarmed Western publicists who have given great publicity to these somewhat exaggerated and misunderstood figures of "total aid".

The number and value of *new* aid agreements seem definitely to have shown a tendency to decline since 1958. The total flow of aid deliveries has shown a marked year-by-year fluctuation, but was considerably higher in 1963 than in previous years, especially to India, because of the delivery of capital goods in connection with credit agreements negotiated in past years. This is reflected in the upward trend in exports shown in Table 2 on page 9. There seem to have been two reasons for the slackening off of the rate at which new credits have been negotiated: growing economic strains within Russia, which find expression in much-reduced growth rates, and new commitments to aid Cuba. The bearing of all this on the likely future levels of Soviet aid will be further analysed at the conclusion of this article.

The Impact of Aid

Yet Soviet aid had, to some extent still has, an impact which seems disproportionate. Let us consider the reasons. In my view, they have been as follows:



(1) As already mentioned, the relative scale of Soviet aid has been exaggerated, notably by Western commentators. It has also been common to compare Soviet *credits* at 2½ percent interest with Western *grants*, as if a *loan* of $1 million, even at low interest rates, is equal to a gift of $1

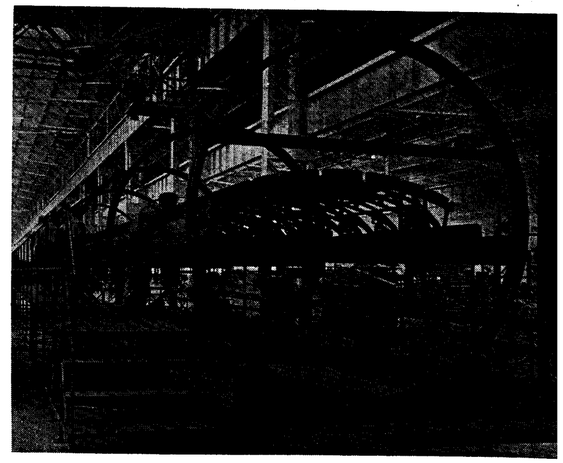
WORKS-CHOUDWAR, (ORISSA)

KALPANA.K.7.SP.2

million—a mistake none of us would make in our personal financial lives. Yet it is well known that a sizable proportion of Western aid takes the form of grants.

(2) Soviet aid has been concentrated on relatively few countries. India, Indonesia, Egypt and Afghanistan account for over two-thirds of all credit agreements negotiated with non-communist developing countries (*i.e.*, excluding Cuba) since the aid programmes began.

(3) It has been concentrated to a considerable extent on prestige projects. By this I do not just mean stadiums and hospitals, which are not relatively very important, but such items as the Bhilai steel mill, which has an impact on the imagination much greater than relief shipments of foodstuffs from America of equivalent value, because the steel mill is connected with development, with industrialisation, with progress.



(4) For good or bad reasons, Russia benefits from anti-imperialist sentiment, in countries other than those who, like Iran, Turkey and Poland, have traditionally regarded Russia as an imperialist Power. Russia is also a country itself recently underdeveloped. That such a country should be able to give aid, to supply an efficient steel mill and technical training, has a significant psychological effect. This was further strengthened by novelty; it seemed a new, exciting, promising source of support for industrialisation, especially as the Socialist aspirations of many developing countries were treated with some distaste in America.

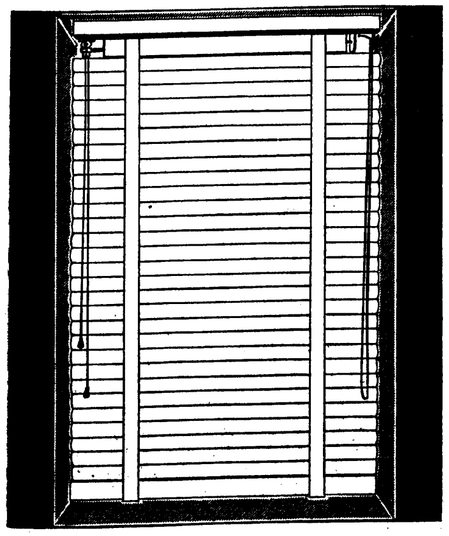
(5) Russia was careful at no time to make its aid conditional upon joining any Russian-led alliance. This pleased neutralist opinion, especially when, in the Dulles era, American policy was less intelligent in this respect. Even military aid was rendered to countries which, like Egypt, imprisoned communists and followed a quite independent foreign policy.

Western Fears

Contrary to Western fears, Soviet technicians did not behave like agents of "penetration", but tended to keep to themselves and get on with their job, as Indians connected with the Bhilai scheme have witnessed. It is possible that they have caused less annoyance than some Western specialists because they have been less obtrusive and have lower living standards, but this hardly constitutes subversion.

Soviet aims were, of course, in considerable part political, even though there were some economic dividends from establishing themselves in new and potentially important markets. (This consideration looms much larger in the motivation of Czechs, Hungarians and Poles, who face the urgent task of expanding exports and who rely much more than the Russians on foreign trade.) Soviet publicity naturally did its best to utilise the aid programmes so as to win friends and influence people, but it has been neither more efficient nor more energetic than, for example, the United States Information Service, and, in so far as there are "rules of the game" in trade-and-aid, Russia has observed them.

The integral coach factory in Perambur



Impact Less Now

However, in the last few years there is no doubt that the impact of Soviet aid is less than it was. The Soviet leaders must feel somewhat disappointed. Let us now examine the reasons for this. I suggest that there are five of them:

(1) Both the West in its alarm, and also the hopeful "developing" recipients, tended to project into the future the very large increase in a which characterised the period 195 58. When the wave levelled o there was some feeling of psychol gical let-down. Thus a glance the Indian trade statistics will sho how small a proportion of her i ports of manufactures comes fro Russia and her allies. The West r mains, and clearly will for long r main, the principal supplier, a everyone must know this.

(2) The novelty has worn off, a this at a time when repayment f

past credits, out of inadequate exportable surpluses, inevitably causes some strain.

(3) There have been some disappointments over quality, though undoubtedly some very good Russian equipment has been exported, and some legends current about Soviet mistakes would seem to be legends. Thus *Pravda* made fun of the allegation that the Russians sent "snow-ploughs to Guinea"; they were bush-cutting equipment, so it was claimed, and, since the error would have been so ludicrous, this explanation was probably correct. The same *Pravda* article noted the accusation that Russian cement was said to have hardened when left out in the rain at Rangoon; it pointed out that cement has a habit of hardening when it is wet, and it might not have been the Russians' fault if it was left out in the rain!

(4) Many of those who have been sent to Russia for training, far from becoming indoctrinated converts to communism, have been immunised against it for life, since there are many features of life in Moscow which must cause acute disappointment to those for whom distance lent enchantment.

(5) A growing list of internal difficulties, in agriculture and in industrial growth, have somewhat tarnished the image of Soviet planning, which had been helpful to Soviet influence in the past.

* Data for 1963 are preliminary.

** Actual drawings under these credits and grants during this period totalled $1,200 million.

Note: The above table is taken from *Annual Economic Indicators for the U.S.S.R.*, published by the Economic Committee of the United States Congress. As far as can be ascertained, this represents the best available estimates of Soviet aid down to the end of 1963. The table is confined to *economic* aid. The inclusion of military aid would considerably increase some of the abpve figures, notably those relating to Indonesia and Egypt. The table also excludes any Soviet aid to communist countries.

The Split with China

Perhaps one should add a sixth consideration, the indirect effects of the split with China. It is interesting to note that one of the many causes (as well as consequences) of the split was Chinese resentment at the scale of Soviet aid to other, non-communist States. As already pointed out, Soviet credits to China ceased as long ago as 1956. As Table 2 on this page shows, trade declined greatly after 1960. Facing serious problems at home, the Chinese leadership must have looked with no favour at all on the flow of Soviet credits to India, Egypt and elsewhere. China, indeed, began some modest aid programmes of her own, some to communist countries whom she wished to wean away from Moscow's influence (*e.g.*, North Korea, Albania), and also to other developing countries (Cambodia, Nepal, Ceylon, Algeria, among others). Her terms tended to be more favourable than Russia's; for example, much of the aid to Burma, Nepal and Ceylon consisted of gifts or was interest-free.

As China could ill afford such acts, it began to look as if she was intending to compete not so much with the West as with Russia. Similarly, the substantial scale of Soviet aid, especially in armaments, to Indonesia may well have had a primarily anti-Chinese connotation (military aid is "cheap", the reason being that it usually represents a transfer of obsolete weapons from a large stockpile and so is not a significant economic burden). The same has evidently been true in India, as Chinese propaganda has not failed to point out. The conflict between China and India did nothing to improve the standing of communism, and the evident disagreement on this issue between Russia and China underlined the split within communism, and weakened the impact of Communist Parties, which might otherwise have "cashed in" on the favourable atmosphere engendered by the flow of aid.

This point could be of really substantial importance, because the *direct* impact of Soviet aid on the political and strategic situation has never been as great as some alarmist critics imagined. The use of "loaded" words such as "communist penetration", with implications of exceedingly clever spies and propagandists, encouraged misunderstanding. Soviet aid, technicians and goods are not in themselves more likely than their American or British equivalents to overthrow governments or influence the minds of men. Political effect depends to some considerable extent on the idea that communism, or the history of Russia, offers a model for those who wish to break out of the vicious circles of underdevelopment and poverty. Soviet aid then becomes like an advertising poster attuned to consumer demand. But, for reasons already analysed, the appeal has been of decreasing effectiveness.

The Future

What of the future? The demand for aid is ever growing, the needs of the developing world are more urgent than ever. How will the Soviet Union react, now that Khrushchev has fallen? Obviously, any judgment can only be a more or less informed guess. To me at least, it seems very probable that Russia and her European allies will try to encourage mutually advantageous trade, but are much more likely to cut aid than to increase it. The reasons are closely connected with the internal economic difficulties common to all the communist-ruled States at the present time. Soviet planners are worried by a falling industrial growth rate, and by strong competing claims for resources. The new rulers have promised the fulfilment of ambitious plans to build more houses; they must attempt to provide much more capital for agriculture, and the vast programme for chemicals contributes to the present shortage of capital goods. Economies in military expenditure would relieve pressure on resources, but there seems little immediate prospect of this. The balance of payments is strained too, and the abnormally high sales of gold to pay for wheat last year has done nothing to improve matters. Foreign aid is unpopular.

The easiest way out will probably be to avoid making new commitments, while carrying out promises already made. An indication of this has been the reported disapproval by the new leaders of Khrushchev's latest commitments to aid Egypt, made without the prior approval of his colleagues, or so we are told. Czechoslovakia, Poland and Hungary are also in acute balance-of-payments difficulties, and their planners will seek to avoid "unrequited" exports, even while doing their utmost to sell manufactures in Asia, Africa and Latin America. These countries are now sufficiently independent of Russia to be able to resist pressure, if any were to be exercised, to make them increase their aid commitments. Therefore, we ought to expect no very striking contribution from Russia or her allies, at least until their internal economic problems become less troublesome.

The Rs. 200 million Birla-Kaiser aluminium project at Renukoot, near Rihand, in U.P., has, since December 1962, attained and surpassed the initial target capacity of 20,000 tonnes per annum. While the Renukoot plant is already the biggest integrated aluminium manufacturing complex in India, Hindalco is forging ahead with its programme of rapid expansion, for raising the primary aluminium capacity to 60,000 tonnes per annum (and to provide fabrication facilities totalling 37,000 tonnes per annum), to help the country's fast growing industries in their march towards progress and prosperity.

Place of Private Enterprise in the Fourth Plan

The private sector has an important place in the fourth plan. It will be responsible for producing priority items like food and cloth. On its success will depend to a large extent the success of the plan itself.

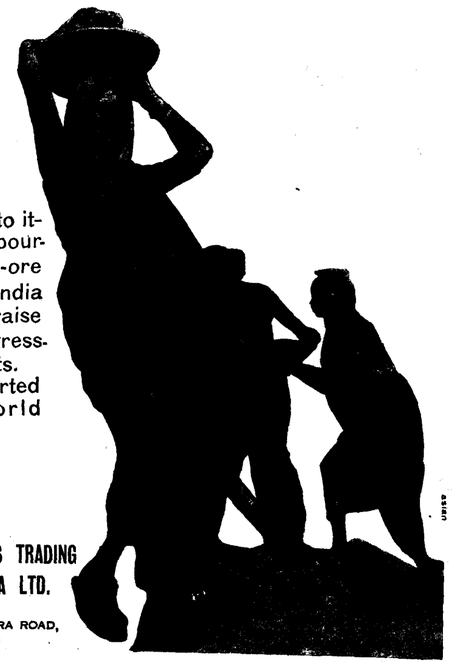
By

ASOKA MEHTA,

Deputy Chairman, Planning Commission

PRIVATE ownership continues to be the dominant form of organisation in the Indian economy. Agriculture, which accounts for nearly 50 percent of the national income and on which roughly 70 percent of the population depend for their living, is wholly privately owned. A considerable portion of large industry and practically the whole of medium and small industry, a part of such essential services as power, road and waterway transportation, health and education and nearly the entire distributive trade also belong to the private sector of the economy. The really interesting question is, therefore, not whether the private sector has a future or not in this country; it is whether and how a socialist society can be brought about while leaving such large and growing areas of productive activity to private ownership and largely free enterprise.

We have indeed been seeking an answer to this last question ever since 1929 when the Indian National Congress adopted its first important economic programme. Through a gradual process of clarification of ideas, resolution of doubts and rejection of alternatives repugnant to the basic philosophy of our State, we have evolved a workable solution to the problem. This solution is incorporated in the Industrial Policy Resolution of 1956 as well as in the Congress resolution on the socialist pattern of society. The resolution makes the consideration of social gain, rather than private profit, the basis of all socio-economic action. Within the larger framework of this policy, the Industrial Policy Resolution of 1956 lays down the respective fields of operation of the private and public sectors of the industrial economy. This Resolution delimits a well-defined area for the public-sector industries, leaving a large and growing field for the private sector.



While we have emphasised the need for State enterprises in heavy and machine-making industries, as well as for certain forms of State trading, we have recognised the usefulness of enlarging the scope of co-operation as a form of economic organisation, and have at the same time clearly undertaken to provide opportunities to the private sector to develop and expand as an agency for planned national development. This really means that in terms of State policy, the private sector is recognised as a tool of social advance and not as a necessary but transitory evil.

Progress of Private Sector

In view of this clearly set out policy, with its pragmatic as against dogmatic overtones, it is not surprising that the private sector should have made significant advances in many fields in the last few years. A random selection of new activity in the industrial field in particular would

Another Star crowns TELCO's 10 productive years

the new '1210' Series TMB 7-tonner

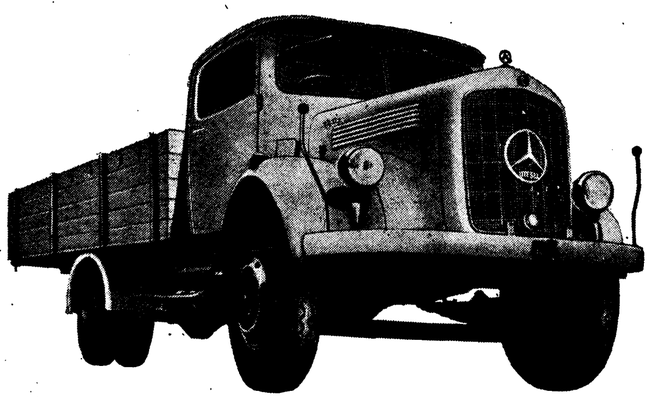
■ *40% increase in payload* ■ *unsurpassed quality*

Ten years ago, Telco introduced the first TATA MERCEDES-BENZ vehicle in India and operators swiftly named the TMB: the Star that hauls a fortune. ■ Throughout these years, Telco has continuously kept ahead of the times by offering vehicles that are ideally suited to actual operating conditions in this country. ■ The prototypes of these new vehicles have been fully tested and proved in every respect.

Special features of the new TMB:

EXTRA HEAVY DUTY FRONT AND REAR AXLE ASSEMBLIES designed to carry the increased payload

NEW STEERING ASSEMBLY fitted with a Universal Joint to cushion all road shocks and provide driving comfort



HYPOID GEARS for greater tooth contact, resulting in long life and quieter operation

Other technical features:

NEW CHASSIS FRAME of special quality high tensile steel

NEW FRONT AND REAR SPRINGS—wide, thicker and heavier

OM 3/2 DIESEL ENGINE, tried, tested and proved over millions of miles by thousands of satisfied customers

The TMB is a valuable, gilt-edged investment which offers maximum transport capability for every rupee invested. The TMB's built-in quality retains its value throughout its long operational life. Its economical, trouble-free performance and low maintenance cost make it a strong favourite of transport operators.

bear this out. Heavy chemicals, polyethylene, P.V.C., synthetic rubber, chemicals, carbon black, industrial explosives, hydrogen peroxide, fats, dyes, synthetic drugs and vitamins, automobiles, sugar and sugar plants, cement and cement machinery, paper machinery, steel boilers, locos and mineral oils—these are some of the fields in which private enterprise has made significant headway with the approval of the Government. From an investment of a little over Rs. 300 crores during the first plan period, the private sector in the field of industries alone came to have an investment of over Rs. 800 crores in the course of the second plan and is likely to double this scale of investment in the third plan.

According to the preliminary estimates for the fourth plan, the total private-sector investment in all fields is likely to be nearly Rs. 7,000 crores as against a total public-sector investment of between Rs. 14,500 and Rs. 15,500 crores. Of this Rs. 700 crores is likely to be invested in agriculture, Rs. 400 crores in small industry, Rs. 2,400 crores in organised industry, Rs. 650 crores in transport and communications and Rs. 1,470 crores in housing and construction. It may be noted that the scale of investment in organised industry in the private sector will be over 35 percent of the likely total investment (as distinct from outlay) in this field in the fourth plan. This points not only to the great importance accorded to the private sector in the fourth plan, but also to the great responsibilities placed on it in fulfilling the plan. While it is yet too early to indicate the actual programmes of which this total investment will be composed, there is no doubt that the utmost care will be given to the formulation of these programmes so that overlapping of activity in the public and the private sectors is avoided, and the programmes in the two sectors are built up in a co-ordinated fashion.

Producing Consumer Goods

It is obvious that in the interest of quicker production of consumer goods and agro-industries, which is going to be one of the main features of the fourth plan, the private sector will be given a big job in the field of consumer goods production. Its share in transportation, particularly in roadway transportation, is also likely to go up significantly. At the same time it is expected that in certain relatively sophisticated lines of production such as metals and petrochemical based industries, the private sector will have to shoulder a great responsibility. Finally, in the context of the vital need for increasing our exports, particularly of light engineering goods and other manufactures, the rôle of the private sector in these fields will be of crucial importance.

It is thus clear that even apart from agriculture, which holds the key to the success of the fourth plan and in which private enterprise has to give a proper account of itself, the rôle of private sector in industry and transportation as well as in distributive trades is going to be of much greater importance than in the past. In fact, the growth of agricultural production depends upon adequate output of the necessary industrial inputs. Then again, it is not sufficiently realised in this country that delays in or lack of co-ordination in the matter of scale of activity, proper location, etcetera, do not plague the public enterprises alone. These are ailments as much of the public sector as of the private. It is, therefore, necessary that private-sector enterprises become increasingly alert to the opportunities provided by the State to them in various ways and adopt a change in the style of their operation. In the last analysis, the capital that is made available to the private sector, although it may have come from the pockets of private individuals, is really a part of the capital of the society as a whole.

The Proper Line of Advance

An increase in awareness on the part of the private sector of its social responsibilities and its place in the total economic framework should also help in removing some of its misunderstandings about its proper line of advance. There is a well marked tendency on the part of private enterprise to modernise its techniques of production in the hope of earning greater profit and to take unilateral action for this purpose. The choice of techniques is a difficult socio-economic problem and it is necessary to take into account the implications of a change in technique for diverse economic factors such as employment in the industry as a whole, operation in the less advanced units, etcetera. These considerations may require the private sector in certain fields, say, in cotton textiles, to accept temporary restrictions in the choice of technique or in the tempo of modernisation which it might otherwise wish to maintain. In certain other fields again such as export industries, it may become necessary for the private sector quickly to modernise its method of production and adopt superior techniques, perhaps against its will or against consideration of its immediate profit. All these curbs and stimuli administered to the private sector are not arbitrary, and their rationale can be understood. Economic activity, production processes, are carried on in this country at different levels of technique. The raising of the levels has to be attempted purposefully, otherwise it would lead to disruption, economic and social. While capital is being accumulated to transform technologically the processes of production, it is also necessary to extract the maximum results out of the traditional methods of production. To get the maximum output out of the current stock of capital and also to augment it, not just by accretion but also by diversification of the processes of production, is the essence of development. It is obvious that this implies planning and conscious response on the part of private enterprise to the plan purposes.

Investment Planning

What all this amounts to is nothing but a plea for much more careful investment planning, based on considerations of social gain and maximum possible information about the social implications of private action. Although the institutional framework for such planning has already been brought into existence, it is unfortunate that private enterprise has not started making full use of its opportunities. Apart from the need for investment planning, there are certain areas in which fresh talents from the private sector have yet to be organised on a scale commensurate with the country's needs. The first and foremost requirement is that of developing industrial consultancy agencies, preferably organised on an industry-wise pattern, which can progressively undertake the work of advising entrepreneurs on ways of improving existing lines of production or of developing new ones. Along with this there is also a need for developing indigenous capacity for undertaking designing of equipment and for project engineering. It is true that there are rudiments of such organisations, both in the private and public sectors, in the case of various industries. But all this organisation is, quantitatively speaking, of limited influence when it is realised that the designing and engineering services needed in the next ten to 12 years are likely to be of the order of Rs. 800 crores or more! Full-scale development will be within the country's reach only when it is able to replace foreign technical know-how, assimilate the changes occurring almost immediately and also make its own contributions.

A large and crucially important portion of the priority production in the fourth plan will be in the private sector. Food, cloth and housing represent the core of these priorities. The failure or the success of the plan will, to a very large extent, be determined by the failure or success of the private sector. And failure or success of the private sector in the fourth plan, which will depend greatly on the quality of its performance, will also determine the future of the private sector in the economy. India has embarked on a great experiment in democratic planning, in bringing about thoughtful social change through peaceful means. Whether this experiment will succeed or not will depend to a very large extent on whether the private sector responds to its new rôle in the society, that of a responsible and creative agent of economic progress tempered with economic and social justice.

USHA MARTIN BLACK

LARGEST MANUFACTURERS OF STEEL WIRE ROPES IN INDIA

ISI and API Certified
Also approved by Lloyd's Register of Shipping

Formed as recently as 1961, Usha Martin Black is the first to attain the full rated capacity of 3600 tonnes of Steel Wire Ropes per annum within a year of commencement. Within the same period it embarked on its ambitious expansion programme—Phase II—aimed to raise its annual capacity to 7200 tonnes thereby covering a large variety of special and compound constructions of wire ropes needed for varied and specialised purposes.

The most modern and well laid-out UMB plant is run under the supervision of foreign and foreign trained Indian technicians. Strict quality control measures are enforced at every stage of manufacture and every rope that leaves the factory is assured of the highest standard.

UMB Ropes are the first in India to be granted API certification by the internationally recognised organisation of American Petroleum Institute for ropes for oil-well industry and use of ISI marking by the Indian Standards Institution on their mining, haulage and winding ropes. Lloyd's Register of Shipping has also approved them for use in ships.

UMB Wire Ropes are now available in a wide range of black and galvanized quality for oil drilling, engineering, mining, shipping, railways, earth moving and various other purposes.

ASP/UM—114

HINDSIGHT AND DISPUTATION ABOUT THE U.K. PAYMENTS CRISIS

Britain's central problem is to maintain solvency at home and abroad. An agreed incomes policy would greatly improve the prospects for her exports. She could then accelerate the growth of the economy and maintain the value of the pound.

By
GEOFFREY TYSON

SINCE the war there have been seven sterling crises of greater or less severity ; last month's affair was of the "greater" variety. It has been tided over temporarily and a devaluation has been avoided thanks to the ability of the Bank of England, and the oft-derided "City", to organise in a matter of 36 hours massive standby credits which would make it very unwise indeed to run a bear account in sterling in the foreign exchange market. We know a great deal more today about the problems of international liquidity and reserve currencies than we did 30 or 40 years ago.

I was active in financial journalism in India at the time of the devaluations of 1931 and 1949 and can testify that on the occasion of the first there was very little understanding of the real issues. What we did know was that the gold standard (to which Chancellor Winston Churchill had unwisely re-committed Britain in 1925) had been abandoned and that the pound was being allowed to depreciate in order to replenish the gold reserve. There followed substantial exports of "distress" gold from India, because world commodity prices had touched rock bottom and the agriculturist was very glad to turn his own metallic reserves into cash and at a reasonable profit. Sir George Schuster was the then Finance Member and to celebrate our misfortunes we had two Budgets. A few months after Britain devalued the pound, the U.S.A. devalued the dollar.

Premature Devaluation

I always considered the 1949 devaluation premature and overdone. Unquestionably sterling was overvalued immediately after the war, but Stafford Cripps, the then Chancellor, allowed himself to be persuaded, by the International Monetary Fund in which American counsels were dominant, to adopt a rate that was too low. On the other hand, in his Dadabhai Naoroji Memorial Lectures to Bombay University in 1957, Mr. C. D. Deshmukh declared : "What clearly emerges is that the rupee was overvalued when it was decided to devalue in consonance with Britain and thirty-odd other countries. At this distance, everything that went before it seems to point to this as the ineluctable *denouément*. That the Indian decision was inevitably hurried—both because of the comparative suddenness of the British decision and the need of prompt action to prevent confusion—did not mean that we were wholly unprepared for such a prospect. Devaluation was forced on India by economic circumstances ; its allegiance to and participation in the sterling area only influenced the timing of her decision."

The one sterling area country, of course, that did not devalue on this historic occasion was Pakistan. It was difficult at the time to discover on what technical grounds she took her stand, but that hardly mattered when, a few months later, the Korean war sent commodity prices sky-high and Pakistan reaped many uncovenanted benefits of her non-devaluation. She was, in fact, able to hold her rate until 1955 when she was obliged to bring her rupee into line with the rest of the sterling bloc.

Recent Sterling Crisis

Currency crises invariably give rise to a lot of disputation and the display of a great deal of hindsight. Last month's run on sterling was no exception, and it is safe to say that the debate will continue for quite a time yet, if only because the events of the third week of November represent a pretty narrow squeak for the pound. There have been innumerable explanations of which political Party was most responsible for the dangerous situation which was allowed to develop. None of them are wholly satisfactory. Only the Treasury and the Bank of England know all the facts though there is a good deal of evidence to suggest that the crisis was steadily building up throughout the summer. It is claimed that if a Conservative Government had been returned, ex-Chancellor Maudling would have tided over the difficulties with short-term borrowing and tackled the persistent and underlying problem of the balance of payments in his April 1965 Budget. The proponents of this point of view maintain that whereas Mr. Maudling would have played it *pianissimo* and off-the-cuff, Mr. Callaghan has shown much too little subtlety and understanding of the delicate character of what confidence means in the context of international finance.

Almost certainly there is a modicum of truth in both these assertions. The Conservative leader must accept a large share of the blame for the strain on the pound prior to 15th October—and in particular for prolonging the uncertainty by putting off the election to the last possible moment—while the Labour administration must assume responsibility for mistakes which can be traced to ham-fisted policies and maladroit utterances since it assumed office. Basically, Britain's problem is her balance of payments, but nothing that Mr. Callaghan initially said or did suggested that he appreciated this fact. Right up to a relatively short time ago he and his advisers were pouring scorn upon what they were pleased to call a "stop-go" policy which, reduced to its simplest form, is the intelligent use of Bank rate, to which incidentally they were driven in the end. The Labour Party has always allowed it to be supposed that they had some magic formula whereby you could run an international banking business and everything that goes with it without regard to interest rates.

Task of Maintaining Solvency

But, of course, while interest rates are essential items in monetary strategy they are only part of the problem which faces Britain today. Put in its crudest possible form, that problem consists of the task of paying our way in the world and of maintaining solvency at home and abroad. It is estimated that the deficit in the U.K. balance of payments for 1964 may amount to as much as £700 million to £800 million, and if this be so nothing short of a gigantic national effort will suffice to put the account right. The $3,000 million (£1,070 million) credit which was negotiated with foreign central banks in the last week of November for the defence of sterling provides nothing more than a breathing space and in any case much of it will have to be re-negotiated in three or six months' time when the life of the credit ends. Presumably the willingness of the lenders to continue the credits will turn very largely on the kind of promises and performance the Wilson Government has given by that time.

In a recent analysis of the situation the admirable *London and Cambridge Economic Bulletin* says it may yet

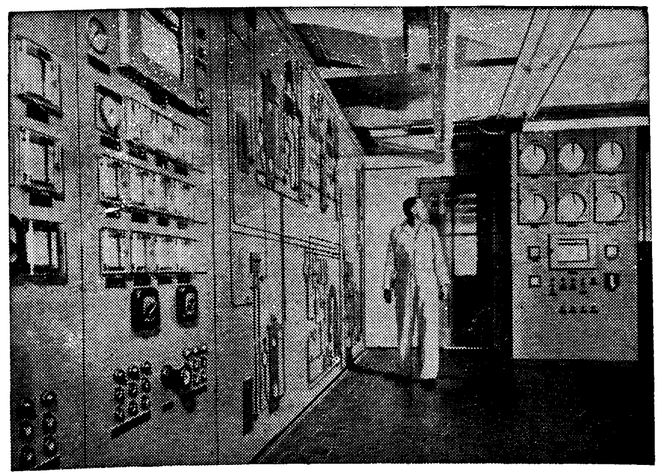
turn out that the two chief constraints on British economic policy that are at present accepted, i.e., "the 4 percent growth target and maintenance of the exchange value of the pound, between them make a solution impossible"; and it goes on to say that "the problems of internal balance and external balance must be tackled simultaneously if either is to be solved". What are those problems? Looking first at those which are related to internal balance one must enquire why in recent months there has been such a marked slowing down in the rate of growth. One of the major factors limiting production has undoubtedly been an increasing shortage of labour, on top of which there have been significant cuts in working hours during the last year. More regard must also be paid to the increasingly obvious limitations of plant capacity in the U.K. Thus, for a large part of 1964 output appears to have been fairly static, and in the engineering industry, for example, there is strong evidence that it was chiefly limited by supply rather than lack of demand. In other words, all the signs point to an economy whose internal resources have been pretty fully stretched.



Slow Expansion of Exports

So far as the external balance is concerned, it is crystal clear that Britain's overseas trade is not expanding at the rate that it should, and that in particular exports have been lagging badly behind imports. The latter have risen particularly sharply in the 1963-64 phase of the latest "stop-go" cycle. There has been a heavy increase in stock-building and imports of manufactures have increased sharply, always an ominous sign in an economy in which manufacturing activities are dominant. However, most analysts of the trade balance expect imports of manufactures to show some falling off in future trade returns beginning with the last quarter of 1964. And, of course, Mr. Callaghan's 15 percent surcharge is designed to achieve just that result. While a reduction of the import side of the equation is an essential step towards rectifying the present imbalance of payments, an increase in exports is also necessary. The *National Institute Economic Review* calculates that in the next two years or so the Government has to find some way of shifting at least £500 million of resources into the balance of payments either to increase exports or replace imports. In other words, a bigger share of Britain's output must be exported, and obviously it is in the manufactures sector that there is most scope for this.

Exports of manufactures, as a proportion of total output, appear to have been falling slightly for some years. In 1963, 30.2 percent of the output of manufacturing industry was exported; for the first nine months of 1964, the annual rate appeared to be running at about 29 percent. This is contrary to the experience of our chief trading rivals and while it is very easy to generalise and say that British exports are not competitive, it is very difficult to prove it. It does, however, appear clear that in some important branches of industry the easier home market has been given priority over exports. That seems the only explanation for the recent failure of machinery exports to rise during the first nine months of this year though such notoriously "sticky" export lines as cotton textiles show a 9-percent rise for the middle two quarters of 1964 compared with the average of the year 1963. The National Institute's verdict is that "since the engineering industry's output in the middle of this year was running some 5 percent above last year's average, the inference is clear that it has in the last year been giving priority to home orders over export orders".

Argument for Devaluation

There is a school of thought—true it is in a minority—which maintains that the quickest and surest way out of the present difficult situation is by a modest devaluation which would take the pound from its present $2.79 rate to say $2.50. The argument is that a mild devaluation would act quickly and surely on the balance of payments, whereas the deflationary measures (the object of which is to reduce domestic demand and free resources for the export market) will only act cumulatively over a lengthy period of time. Meanwhile, of course, growth is retarded and almost all the things that the Labour Party has been promising for years have to be put aside because of their inflationary implications. This must obviously be a bitter draught for Mr. Wilson and his colleagues to swallow, though as these lines are being written there are signs that they may be able to pull off an agreed incomes policy. Were we to have such a thing it would almost certainly make a great deal of difference to the prospects of British exports, of which has (£2,000 million) are sold by about 200 companies and the remainder by some 6,000 other companies according to a statement recently made by Sir Norman Kipping, Director General of the Federation of British Industries. If half of the latter group could be made as keen on exports as the select band of 200 there would be no balance-of-payments problem and no talk of a sterling devaluation, either in Britain or on the Continent.

Look what you get with

HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office, and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise instrumentation by Honeywell...and they apply regardless of whether you buy a single instrument, a replacement part, or a complete control system.

ECONOMIC PLANNING LACKS SENSE OF PURPOSE AND URGENCY

India's economic and political problems are increasing. Slow economic growth, the rapid rise in population and mounting shortages have disturbed stability. Yet there is no sense of urgency among those in authority.

By H. M. PATEL

THE world is in a parlous condition today and it is no exaggeration to say that India is, if anything, in an even more parlous condition. Its population is increasing at an uncomfortably fast rate: prices keep on rising in an equally uncomfortable manner: production is not increasing fast enough in the industrial sector, and is almost stationary in the agricultural sector: the authority of the Centre is being openly flouted by the States in matters where it is imperative that a uniform policy should be accepted throughout the country. The threat from China still remains, and is, if anything, more to be guarded against.

Against this background, it is most disturbing that those in authority still fight shy of taking action along lines which the facts of the case necessitate for fear of possible political reactions. Somehow or other, it is essential that a sense of urgency, and a determination to see that whatever is decided upon is carried through, should inspire the people, and, even more, the Government.

The midterm appraisal of the third five year plan brought out very vividly the fact that the country had not succeeded in making the progress that had been hoped it would make under the plan on a number of fronts. The failure was attributed not so much to defective planning as to the absence of a sense of urgency among those whose business it was to implement the plan. It appears to have been felt that organisationally, there were two major defects, and there had been failure in making a real impact in one important field. It is true that projects had been included which had not been as fully prepared as they should have been, but in the main, it was felt that procedural and other difficulties of the normal governmental machinery were responsible for greatly slowing down progress on most of the projects.

The moral was obvious, and it was decided to streamline the procedures to the maximum extent possible, and to lay the greatest possible emphasis on implementation. Secondly, in spite of the fact that there was an integrated plan, it had not been found possible to ensure the degree of co-ordination, in particular, of economic policies that is essential. And, finally, it had to be admitted that not much had been achieved in the sphere of agriculture, and that conditions in rural areas were not showing any marked improvement.

Lessons Not Learnt

Nothing, unfortunately, that has occurred since the midterm appraisal justifies thinking that the lessons have, in fact, been learnt. Despite a certain streamlining of procedures, procedural delays continue to take place, and no one in authority seems to feel particularly indignant at such delays. The progress of the projects in hand continues to be slow. No greater attention appears to be placed on the implementation of projects. Everything, it would appear, proceeds exactly as before, slowly, without any sense of urgency and without adequate co-ordination. And as for agriculture, it has the first priority only on paper and in speeches.

The fourth five year plan is now being drawn up. It has been tentatively decided that the total expenditure under the plan would be of the order of Rs. 21,500 crores. From time to time, one is told of sums of money which are to be allocated to the principal heads under which planning proceeds—power, irrigation, industry, agriculture, and so on. But relatively little is said about the steps that are contemplated for ensuring timely implementation of the various projects that it is intended to execute under each of these major heads. One is inclined to suspect that, as in the past, planning is proceeding on the assumption that the sponsors of the projects may be relied upon to see that they are executed efficiently and without avoidable delay. No doubt the project proposals will be subjected to the kind of scrutiny to which proposals are usually subjected, but can one be certain that the scrutiny will be directed in a realistic way towards satisfying oneself that the chances of the projects being executed according to the schedule contemplated will be good?

An illustration may serve the purpose of emphasising this point. As a result of the load survey carried out by the Central Water and Power Commission, it became clear that certain States will be faced with a power shortage in the early years of the fourth five year plan period. Accordingly it was decided to give advance sanction to certain power projects, which would otherwise have had to wait until the fourth plan period began, and the plan itself was ready in every respect. The underlying intention in giving advance sanction was to enable the implementing bodies to make sufficient progress on the relevant projects during the third five year plan itself, to ensure their completion during the first year or two of the fourth plan period. In actual fact, procedural obstacles have already all but neutralised the value of the advance action. And at the Government of India level, no one seems greatly to be perturbed.

Lack of Co-ordination

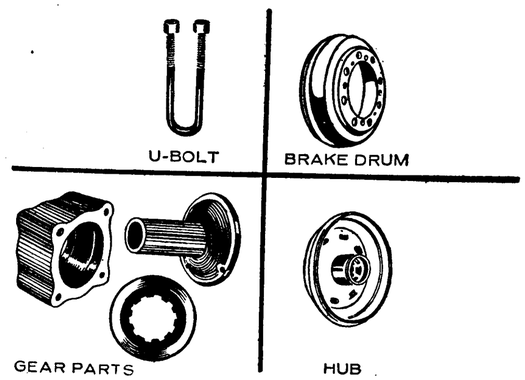
Of the failure to co-ordinate action and policies, any number of illustrations can be given. The question of the co-ordinated development of road and railway transport and of coastal shipping may perhaps provide a sufficiently convincing and representative illustration. Because, historically, the railways developed first in this country and were also the first major public-sector enterprise, their interest has very largely tended to dictate the Government's policies in relation to road development as also the development of coastal shipping. Both roads and shipping have had to struggle hard to get the Government to accept the position that both of them have a vital rôle to play in the economy of the country and that, therefore, their development also must receive the Government's serious attention.

While the railways cannot dispute this, they have continued to be jealous of their position and have not looked on the development of road transport and coastal shipping with a kindly eye. When a couple of years ago, there was an acute shortage of wagons, making it difficult for the railways to cope with the transport of coal required in different parts of the country, emergency action had to be taken to make coastal shipping take on the responsibility for carrying a couple of million tons to States situated on the eastern and the western coasts. The shipping companies were advised to make their plans on the assumption that they would be required to carry coal up to roughly that quantity year after year. As soon as the wagon situation eased, however, no time was lost by the railways in staking their claim to the additional one million tons that they had surrendered to coastal shipping! To coastal shipping, this one million tons makes all the difference between continuing to work at a loss and being able to break even or even make a small profit: to the railways, two million tons constitute a very negligible addition to the 250 million tons of goods that they would anyhow carry.

The railways have already arranged with the Ministry concerned with coal to transport these 2 million tons, even while the Ministry of Transport continues to argue about the justice of coastal shipping's claim. It is fairly obvious that the Government's avowed policy to develop a vital and vigorous coastal shipping system is being set at naught by the railways by depriving coastal shipping of just the extra amount of freight which would have helped to make the latter economically strong. The fact that the railways would not have actually gained if they did not have these two million tons of coal to carry over very long distances at a heavily subsidised rate is not strictly relevant here, but merely underlines the complications that are caused when there is no determined co-ordinating hand to arbitrate between contending interests.

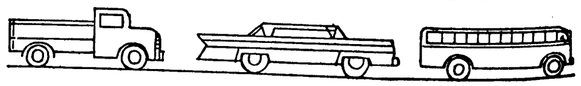
Road Transport Development

Likewise for years, the railways have prevented the development of road transport. Not until independence, for instance, was there a road connecting Bombay and Ahmedabad, two large industrial centres in what was then one State. Fortunately, good sense prevailed and there is today a national highway which connects these two important industrial centres. The volume of traffic along the road is very heavy, and yet the railways have been agreeably surprised to find that the volume of traffic which they are offered has not only not declined, but increased. The railways, nevertheless, persist in pressing upon the Government their apprehensions from these two directions and claim that the competition offered by road transport is of a wasteful character.



There are no two opinions but that the country must have a sound railway system, a sound road system, and also flourishing coastal shipping. What remains to be ensured is that there is no unhealthy competition: a modicum of competition is always healthy, for it ensures economy and efficiency on the one hand, and prevents wasteful expenditure on the other. It is for the Government to decide in a firm manner after a careful examination of all considerations what rôle each of the three has to play in the economy of the country. It must, in other words, co-ordinate and not just drift.

Contradictory Policies



Another illustration of contradictory and unco-ordinated policies is to be found in the anxiety of the Government to maximise industrial productivity, and to acquire a larger foothold in the export markets of the world on the one hand, and on the other, its pursuit of a labour policy which reduces hours of work and increases wages, without linking either with productivity.

It is surely time the Government made up its mind about what it really wants and then adapted its policies in different spheres so that they harmonise and facilitate the achievement of its major objectives. A factor which has contributed in a major way to the failure to achieve the targets set has been the failure of

agriculture to show an improvement in productivity of any significance. Since agriculture is responsible for about 50 percent of the national income, the effect of stagnancy in agricultural productivity is bound to be serious on the country's economy. The community development organisation which has been set up for the purpose of improving agricultural productivity and also conditions generally in the rural areas has been spending vast sums of money during the past several years. But, judging by results, it is difficult to resist the conclusion that that (community development) organisation has not been successful in its efforts to raise the yield of agricultural crops in general, and food crops in particular.

The reasons for this failure are manifold. The community development organisation does not appear to have allowed sufficiently for the fact that conditions in the rural areas vary from State to State, and in many cases, even from district to district. It is not only that the quality of land varies, or that the amount of rainfall in different parts of the country varies markedly, or that the irrigation facilities are by no means evenly spread, but even more that the quality of human beings varies greatly, in their temperament, their energy, their money sense, and above all in their attachment to traditional ways. Thus, in Gujarat, areas situated along the west coast are more advanced and more prosperous than those in the eastern and northern parts of the State. And among the areas along the coast, progress has been much more significant in some *talukas* or *tehsils* than elsewhere. In these areas, the bulk of the people are endowed with a money sense, have enterprise in their blood, and are hard working by nature. The people, in the main, do not wait helplessly until the Government comes along with assistance: once they are satisfied that by the adoption of any new practice or acceptance of any new activity, financial benefit would ensue, it does not take them long to find ways and means of adopting the new and improved practices, and securing the maximum benefits from them.

Community Development

In the eastern and northern parts of the State, the people are poorer and backward in every relevant way, educationally and as agriculturists. Clearly, the approach of the community development organisation must necessarily be different in the latter, compared with the former, and if that is not the case, there takes place much wasteful use of resources, human as well as material. In the former areas, far more satisfactory results could be achieved ensuring to farmers their requirements of fertilisers, improved seeds and pesticides in good time and in sufficient quantities. In the latter areas could have been concentrated the extension activities in an intensive form.

The community development organisation also did not allow sufficiently for the conservatism and prejudices of the farmers. The farmers are not reluctant to adopt new practices which can be demonstrated to them to be good. For this purpose, the person who advises them must be capable of inspiring in them confidence and faith in his knowledge and judgment. The village level worker rarely has the requisite knowledge or personality: nor, usually have his superiors.

Finally, few community development organisation workers show the necessary degree of missionary zeal for their work. Where such workers have operated, very good results have undoubtedly been realised. Even now if the activities and the areas of operation of the community development organisation are curtailed, and only those truly devoted to their duties as village level workers, etcetera, are engaged and encouraged, far more satisfactory results could definitely be achieved.

Cattle and the Rural Economy

It would be difficult to realise from a perusal of the activities of the community development organisation that cattle play a particularly significant and vital rôle in the economy of the rural areas. Bullock power still plays an important part in farming activities and is likely to continue to do for many years yet: and the quality of the bullocks, therefore, is something to which much attention needs to be given. This country has an enormous number of cows, but their quality, generally speaking, is extremely poor, and is growing progressively poorer in spite of various schemes for their improvement. There are large numbers of buffaloes, and because of the way in which milk supply of Bombay is organised, quite a considerable number of the best quality of animals are lost to the country every year. Neither the cow nor the buffalo can be improved unless there is a realisation that there are too many of them, that there is not enough fodder for all of them, and that a high percentage of them are useless as milch cattle.

The country at long last has woken up to the fact that the population is growing at too fast a rate to enable it to bring about an improvement in the general standard of living that it is seeking to achieve. There is, as a result, talk of drastic action to achieve effective reduction in the rate of population growth. As for cattle generally, however, the public has still to realise how very serious is the position, and how very urgent is the need for ruthless planned action for an immediate reduction of their numbers, coupled with vigorous steps for improving the quality of the surviving cattle.

The public mind must be trained appropriately. India cannot afford the luxury of the paradox that with the largest number of cattle in any country in the world, the total milk production is less than that of countries one-tenth her size. The average milk yield from each animal here is the lowest. With improved quality of cattle and with half the total number there are today, the milk yield could easily more than double itself. The pressure on land for pasture and cattle-feed too will be lessened, and many other worthwhile benefits would ensue.

Milch cattle are of great importance to the rural economy. Quite apart from the fact that milk in this country constitutes an important and essential food for the people, it can contribute greatly to the income of the farmer. An efficient dairy complex, like the Kaira District Milk Co-operative Union (Amul Dairy) is bringing to the small farmers of the district several crores of rupees a year: and what is more significant, has led to a marked improvement in the quality of the cattle. Within less than a decade, it has come about that virtually the same number of cattle yield almost twice the quantity of milk.

Amul Dairy itself runs a fine veterinary service of its own, which includes the maintenance of pedigree bulls and artificial insemination service based upon it. A question that

obviously poses itself is why, so far, Amul's achievements have not been emulated elsewhere in the country by any other co-operative organisation. Why have not the Central and the State Governments generally, thought it fit to devote greater attention to dairy development, and all that it implies in the way of improved quality cattle, increased supply of milk, and substantial addition of reliable subsidiary income to the farmers?

Foodgrain Shortages

The Government is rightly concerned about foodgrains shortages. And yet it is unwilling to take a series of obvious steps which would immediately increase the availability of foodgrains by at least 10 percent of the total production, and possibly, a substantially higher percentage. These steps relate to protection of crops from the depredations of monkeys, *neelgais*, peacocks, wild cows, and a host of other creatures, whom through misplaced "kindness to animals" theories, the authorities as well as the people refrain from destroying. This is another luxury the country cannot afford, and it is time the Government took courage and began a purposive education of the people to a right attitude in this matter.

Even more than the failure of the community development organisation to effect an improvement in the rural scene, what has been most unfortunate has been the attitude of the Government to the economic problems of the rural area. There has been a persistent tendency to look at the economic problems of the country from the point of view of the urban areas. Thus, for instance, it is recognised that only by ensuring the farmers reasonable prices for their produce, can it be hoped to induce them to put forth the effort needed to produce more. Nevertheless, the Government proceeds to determine the reasonableness of the prices to be given by the consideration that the cost of living of the people in the urban areas should not be allowed to rise! The result inevitably is to fix minimum prices at levels which certainly cannot be regarded as incentive prices by the farmers. It does not seem to have occurred so far to the Government that it may be possible to give to the agriculturist reasonable and incentive prices, without necessarily having to allow the cost of living indices to rise.

Minimum Food Prices

What is, however, even more surprising is that the Government, while it has now decided to fix minimum prices, has not yet given any thought to the establishment of machinery which would ensure that the farmers obtain the minimum prices for their produce, should they wish to take advantage of the Government's offer. The minimum prices fixed by the Government for agricultural produce have not only never been realistic, but from the point of view of the farmers have been completely illusory.

It has remained always one of the minor mysteries of administration, why the Government after first deciding to implement the very important recommendations of the Rural Credit Survey Committee's report in this matter, later reversed that decision in practice. The Survey had recommended the establishment of a large number of warehouses throughout the country, with a view to making them an important link in the marketing of agricultural produce. The Government of India has undoubetedly set up a Central Warehousing Corporation and most State Governments have also in their turn established State warehousing organisations. The total number of warehouses that have been constructed, however, in the past six to seven years of their existence has been remarkably small. What was needed was to see that the farmer is able to take his produce to a warehouse, obtain receipt for it, and on the strength of that receipt obtain finance for his current requirements from his village or *taluka* co-operative bank.

With such a machinery in existence, the farmer would rarely find it necessary to dispose of his produce at the harvest time when the prices may be at their lowest. The same machinery, likewise, would be available for the Government for the implementation of its policy to purchase agricultural produce at minimum prices laid down by it. In the absence of some machinery of this kind, the promulgation of minimum prices remains very largely meaningless as far as the farmer is concerned. This is so obvious that one wonders why it is that the Government has hitherto not taken energetic steps for the establishment of such a machinery when it is so anxious to increase agricultural productivity and when it is convinced that the assurance of minimum prices would constitute a major inducement to the farmer to put forth his best effort to increase his productivity.

Sound Infrastructure

It is generally agreed that without a sound infrastructure, the economy of the country cannot either develop rapidly or function efficiently. When the planners talk of this infrastructure, however, they have generally in mind the requirements of the industry and of the city rather than of agriculture and the rural areas. Thus, adequate transport and communication facilities are rightly considered essential basic requirements of a country. In India, however, the rural areas benefit from a road programme only, or very largely, because whether they are national highways or State and district roads, they must necessarily pass through the countryside. What the rural areas require most—the approach roads linking them with the State and district roads—have so far been given low priority. In monsoon many villages in Gujarat are cut off from their markets where they have to go for the disposal of their produce as also for the purchase of their essential requirements.

To sum up, if the maximum benefit is to be derived from the planning effort, the planners must be honest and not continue to delude themselves with high-sounding slogans and claptrap. If, as is universally accepted, agriculture should have the highest priority in the planning effort, it must be ensured in fact, as on paper, that priority is given to agriculture, and all that goes with it. Where so many interests are involved and so many different matters have to be embraced within the planning effort, it is inevitable that policies which are sound in themselves may clash with each other unless those policies are co-ordinated in a competent manner. Finally, competent implementation of the projects and policies of a plan is just as vital to its success as the soundness of the plan and the projects themselves. These may be said to be among the essential planning realities, and the authorities cannot afford to ignore them indefinitely.

New York – gay, glorious, glittering...so easy to reach by KLM

Read how reliable KLM's DC-8 jet services provide you with a choice of stopover possibilities in Athens, Rome, Zurich, Frankfurt and Amsterdam at no extra fare

KLM was the first European airline to operate a regular service across the North Atlantic after World War II. It was also the first non-American airline to order DC-8 jets, and the first to operate them. A KLM DC-8 jet has 4 American-built Pratt & Whitney turbo-jet or turbo-fan engines, each producing 17,000 lbs. static thrust or more.

KLM DC-8 jets serve all continents. They fly on many of the longest routes in the world—from Europe to the Far East and Australia, to North and South America, to Africa. From India, KLM operates twice-weekly westbound DC-8 jet services—on Saturdays from Calcutta, on Tuesdays from Delhi. Flying via Karachi, you have a choice of five KLM DC-8 jet flights, leaving on Mondays, Tuesdays, Thursdays, Fridays and Saturdays.

Athens, Rome, Zurich, Frankfurt and Amsterdam are served direct by these flights taken together. A nice opportunity for you to stopover at any of these places on your way to America, at no extra fare! KLM's Multi-Stopover Plan also enables you to stop in a city, not on the direct route of your flight, at no extra fare. Or you may avail of KLM's other facility which allows you to enjoy a side trip, for instance, to Boston or Montreal on your normal round-trip fare to New York. Ask your travel agent or KLM for various stopover and side trip possibilities.

From Amsterdam, KLM operates daily flights to New York. Frequent flights are also operated by KLM from Amsterdam to Houston, Montreal and Mexico City. During the tourist season, KLM flies 27 scheduled DC-8 flights between Europe and the USA every week.

Flying via the Pacific? KLM's eastbound flights connect at Manila with Philippine Air Lines' services across the Pacific to Honolulu and San Francisco.

Sky-high service

To fly KLM First Class is to experience extra-ordinary luxury—supreme cuisine, free wine* and other drinks, spacious comfort and many other thoughtful amenities. On all scheduled KLM flights, each passenger has his own individual table, whether he flies Tourist, Economy or First Class. And if you feel like playing a game of bridge, canasta or solitaire on your KLM flight, ask your purser for a pack of cards. Or you can have a special chess set—for use on board.

On a trans-Atlantic flight, one DC-8 jet needs 262 dishes, 385 plates, 349 cups, 504 glasses, 405 forks, 620 knives, 425 spoons, 430 teaspoons, 250 dinner trays. KLM's DC-8 jets have two pantries (for faster service), five flush toilets and several cloakrooms. The cabin, air-conditioned on the ground as well as aloft, gets a fresh supply of air every three minutes.

** Outside prohibition areas*

Do you know...

that KLM operates twice-weekly DC-8 jet flights from India to Japan; that you can fly from Japan to Europe on KLM's Polar route via Anchorage;

that in Europe alone as many as 44 cities are served by KLM;

that Air Cargo is carried on all KLM flights to 104 cities in 68 countries in all six continents.

All KLM stewardesses are taught baby care. Capable baby care is just one of KLM's services for children. KLM carries two kinds of baby food on board. Dutch baby food is tinned, American baby food is bottled. KLM does this because they know that mothers' preferences for baby food vary. KLM likes to keep everybody happy.

$5-A-Day plan

Those of you who want to see and do things on your own, will do well to study Arthur Frommer's '5 dollars a day' guides on Europe and New York, specially prepared for KLM, providing a fund of useful information and money-saving tips on where to stay, what to see, where to eat etc. Visit your travel agent or drop in at the nearest office of KLM, for a copy of this book available for inspection.

Every KLM intercontinental flight carries a travel case full of tourist information. Amongst other things, it contains a set of KLM Tourist Information leaflets, covering more than 100 countries. These leaflets are also available with the KLM offices and are supplied free of charge on request.

Flying via Amsterdam—a treat

Treat yourself to Amsterdam. If you cannot fit a full visit into your itinerary, take advantage of a Holland Minitour. It is 200 minutes of Amsterdam sightseeing that starts and finishes at Amsterdam Airport, and costs just US $ 4.00.

Other things you can do at Amsterdam International Airport between planes: Shop for luxury bargains at the Tax-Free Shopping Centre. Buy a tax-free car at ShipSide Showroom. Visit the airport's fascinating aeronautical museum.

Your Travel Agent will be able to tell you more about the advantages of flying KLM. Get in touch with him or contact the nearest KLM office.

POPULATION GROWTH NECESSITATES DESERT RECLAMATION

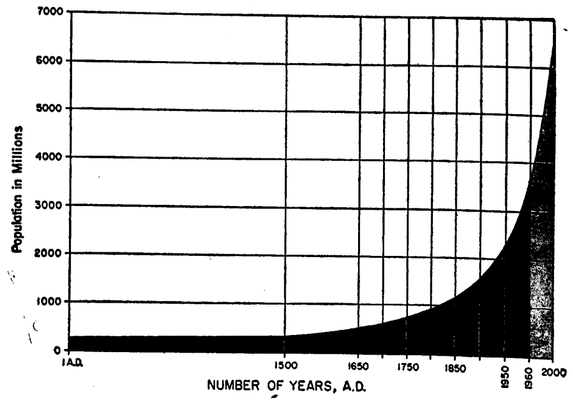
The world's population has been growing at an increasing rate. Man's hope lies in reclaiming deserts, which may yield not only food but also industrial raw materials.

By
S. CHANDRASEKHAR
Director, Indian Institute for Population Studies, Madras,
Visiting Professor, University of California

THE present state of man and his fellow creatures, his habitat the earth, and the universe of which it is a part, is the result of an incredibly long period of cosmic, biological and human evolution as well as of recent historical, cultural and demographic development.

Most cosmologists believe that the universe, including the galaxies of stars and the Extra Galactic Nebulae, as it is known today, is about 5,000 million to 15,000 million years old. The earth which we inhabit is one of the smaller planets and is of relatively recent origin, about 4,500 million to 5,000 million years old. This estimate is based on the fragmentary but reliable evidence of radioactive methods of dating.

And life—say the virus, the simplest organism—emerged on this planet about 3,500 million years ago and with it biological evolution was inaugurated. The hominids and eventually man as he is known today emerged on the cosmic scene about a million years ago. And in a sense, with the emergence of man and his gradually evolving superior powers, the population problem, not dissimilar to the population problem of the animal kingdom, began.



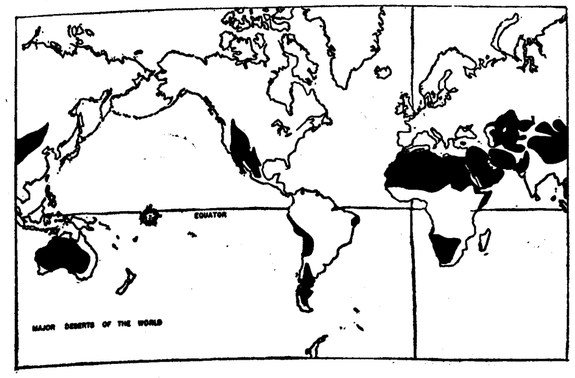
It has now been estimated on the basis of scattered and fragmentary evidence that the human population on this planet was about 125,000 about one million years before Christ. This number increased very slowly, in fact so slowly that the human numbers were almost stationary for long stretches of time. Man lived by hunting, fishing and gathering. Around 300,000 B.C. human numbers increased to one million. Man ate the animals and the more powerful animals ate him. He was hunted and eaten by lions and tigers. By 25,000 B.C. the human population of the world had increased to about five million. Man had become the most potent of living creatures because he was partially rational; he could think and reason. And he invented artificial weapons far more deadly than claws, teeth and brute force, the weapons used by non-human animals. His mastery over the animal world was soon established and by 8,000 B.C. his numbers increased to approximately 10 million This is the period when man became an agriculturist and neolithic culture sprang up in the Nile Valley.

Evolution of Civilisation

Between 4,000 B.C. and 3,000 B.C. "civilisation" slowly began to emerge. Metallurgy and manufacturing began. Writing was invented in Egypt and wheeled vehicles appeared in India. This period witnessed the rise of the ancient civilisations. The Mesopotamian civilisation (3,000 B.C.), the Chinese civilisation (3,500 B.C.), the Greek civilisation (3,000 B.C.) and India's Indus Valley Civilisation (2,500 B.C) witnessed the spread of organised agriculture and the rise of cities.

By 1,000 B.C. the population had increased to 100 million, despite the fact that the death rate during the period must have been almost equal to the birth rate. By the time of Christ (B.C.-1—A.D.), the world population is estimated to have increased to about 250 million. Between the Roman period and the Dark Ages up to 1,000 A.D. the population increased slowly to about 300 million. The effects of the Black Death (1348-1350) which killed a quarter of the population of Europe at the time continued to be felt for the next half a century. There was no medical science nor hygiene and sanitation as at present. The cities and countryside were incredibly filthy. The water closet, that underrated but most important invention, did not appear until the time of Queen Elizabeth.

Fortunately by 1650 the Modern Age began and from here there are relatively reliable figures for the population of the world. About 1650 the population became 550 million. The Industrial Revolution began in England around 1750 and gradually spread to France, Germany and other parts of Europe and the problem of poverty and population became acute enough in England and Europe for Malthus to publish his famous *Essay on the Principle of Population* in 1798.



World population growth after Christ

Expansion of Population

About 1850, when the Industrial Revolution had spread to the United States of America and Charles Darwin had brought out his great work *The Origin of Species* (1859) the world population had passed the 1,000 million mark and rose to 1,194 million. This is a landmark. Thus it took the *homo sapiens* nearly a million years to reach their first 1,000 million.

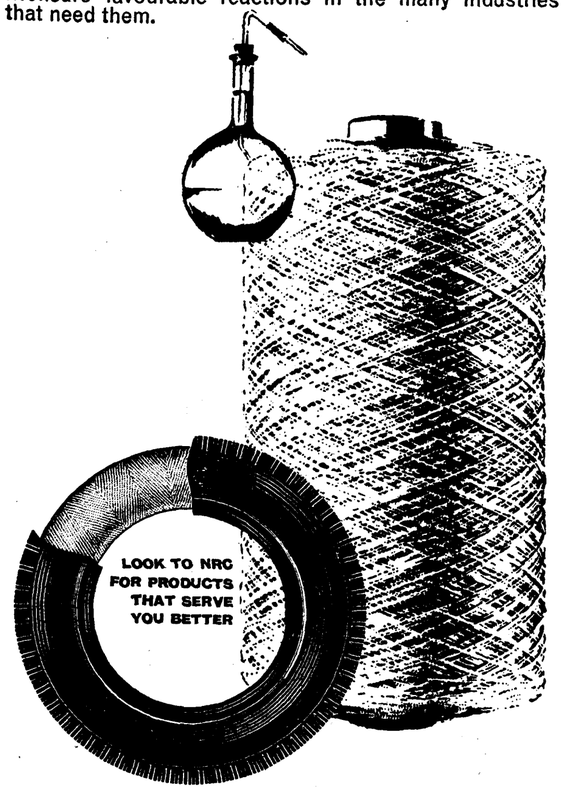
By 1950 an overwhelming majority of mankind had gone through the agricultural, industrial, commercial, health and scientific revolutions and human numbers exceeded 2,000 million. The population of the world reached the figure of 2,400 million in the mid-twentieth century. The first atom bomb was exploded in 1945 and man entered the nuclear age. In other words, man took almost a million years to increase his numbers to 1,000 million, but it took less than a hundred years (1850-1950) to reach 2,000 million. Man had successfully learnt to control his early death. The incidence of sickness had come down dramatically. The death rate was cut down from 50 to 15 per 1,000 in the more civilised parts of human society. Until recently the only creatures man had failed to master were bacteria or germs. The reason was simple: man did not know they existed. As soon as he discovered their existence he was able to produce antibiotics to overcome these invisible enemies, now visible, thanks to the electronic microscope. Thus man has been able to effect death control, but not birth control, and the resultant population explosion is more insidious in the long run than the atomic explosion. The only enemy man has not conquered is man himself. He has escaped being food for lions and tigers and bacteria, but unfortunately he continues to live under the threat of becoming cannon fodder or the victim of nuclear explosion.

Major deserts of the world

And by 1964 the world population has passed 3,000 million. Today it is around 3,300 million. It is remarkable that while it took nearly one million years to reach the 1,000 million and a hundred years to reach 2,000 million, it took less than fifty years to reach 3,000 million. This is extraordinary multiplication.

Likely Growth in 2000 A.D.

What will the size of the world's population be by 2,000 A.D.? The date is less than 35 years from now and will come about in the life-time of many of us. According to several projections on certain assumptions

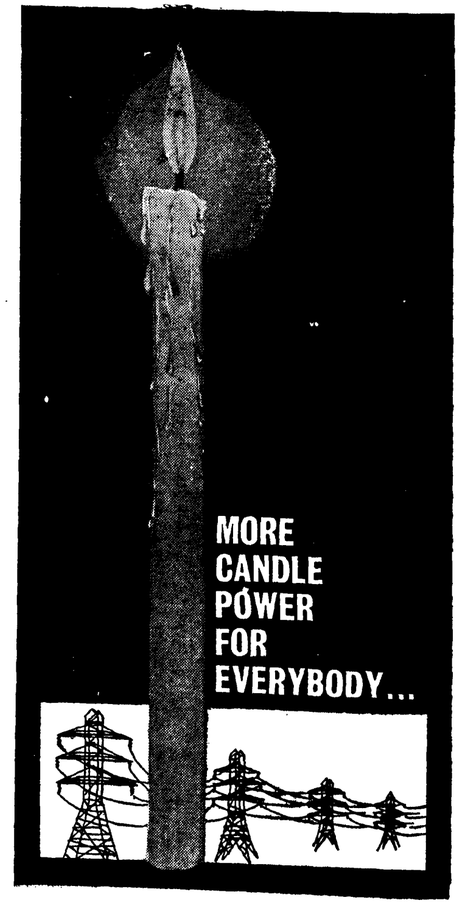


NRC
SERVES MANY VITAL INDUSTRIES

THE NATIONAL RAYON CORPORATION LIMITED ACCELERATES PROGRESS IN MANY INDUSTRIES THROUGH ITS VERSATILE PRODUCTS.

NRC RAYON YARN FOR TEXTILES
is soft and smooth. It is used by powerloom and handloom weavers for making colourful saris and fabrics...is interwoven in the lives of millions.

NRC RAYON CORD FOR INDUSTRY
is tough and resilient. It makes hardwearing transmission belts, conveyor belts and tyres...is a driving factor in both manufacturing and transport.



NRC CHEMICALS FOR COMMERCIAL USE
include Hydrochloric Acid, Sulphuric Acid, Liquid Chlorine, Oleum 20%, Carbon Disulphide and Carbon Tetrachloride. They are standard and reliable in quality ...ensure favourable reactions in the many industries that need them.

Growth of world population before the Christian era

on man's fertility and mortality, it is estimated that the world's population will exceed 6,300,000,000 by 2,000 A.D.

This phenomenal current and prospective increase poses many difficult problems but even the mere enumeration of these problems is outside the scope of this article. Two major difficulties may, however, be mentioned. One is the problem of food supply for the adequate nutrition of the present population and the future months yet to come, and the second is the problem of space for the needs of man's diverse activities.

As for food production and consumption, the available statistics give a rather grim picture of the extent of hunger in the world. It is estimated that at present 300 million to 500 million people out of more than 3,000 million people are underfed and that up to one half of the world population—perhaps even more—suffer from hunger and malnutrition. That is, half of the world's population suffers from some kind of nutritional deficiency. Undernutrition means insufficient *quantity* of the diet. That is, an insufficient calorie intake. This normally results in loss of body weight, the consequent weakness resulting in reduced physical activity. The term "hunger" usually denotes this condition. On the other hand, malnutrition refers to the defective *quality* of the diet. In many parts of the world, people—and these may include well-to-do people—may consume sufficient quantities of food but be deficient in such protective foods as meat, milk, fruit and vegetables. They usually consume a lot of cereals or starches. This is due to either poverty (protective foods are relatively expensive), ignorance (they do not know what a balanced diet is) or dietary prejudices and habits (they may know what is good diet but traditional prejudices prevent them from consuming such food). Thus both undernutrition and malnutrition lead to poor health and lower resistance to disease.

Sources of Food Supply

The total food supply available to the world has to come from either animals or plants or fish. If we exclude the fish from the waters, the supply of animal and plant products depends on land. And the pattern of land utilisation to obtain these two sets of products depends on a wide variety of factors such as the total available acreage for cultivation and pasture, rainfall and irrigation, the natural and "induced" fertility of the soil, fertilisers, seeds, and the general scientific level of farming which in turn depends upon a host of economic and cultural factors such as literacy and the knowledge of the farmer and the resources at his command. While all these factors are quite relevant, the major limiting factor to begin with is the area of the land available for cultivation and pasture.

There are only two basic ways of looking at land for agricultural purposes: one is to make the cultivated land yield double and treble present yields. And second is to bring the potentially usable land under cultivation.

Availability of Land

It has been estimated that with the world population at 3,000 million (the actual population is 3,300 million) there are about 12.5 acres of land theoretically available as living space for each man, woman and child. Of this area of 12.5 acres, only 1.1 acre is actually cultivated while 2.65 more acres are potentially available for cultivattion. The soil is rather inadequate on 1.25 acres, 2.5 acres are too arid, 2.5 acres are too mountainous for cultivation, and 2.5 acres have too cold a climate to grow any crops at all. Therefore, we shall have to give up the inadequate soil, the 2.5 acres of mountainous soil and the 2.5 acres of too cold land. What is then available is 2.65 acres of potentially usable soil and 2.5 acres of arid or desert land for use.

To repeat, what is actually cultivated per person is 1.1 acres. And then we have per person 2.6 acres of potentially usable land and 2.5 acres of arid land. Now the problem is whether we can bring these 5.1 acres (2.6 + 2.5) per person under cultivation.

To begin with, it may be objected that before we bring the difficult marginal lands under cultivation, we should make the already cultivated land yield more. This is necessary, for if India can make her cultivated land yield as much as China or Japan does, not to speak of any comparison with the United States, India's food problem can be solved in no time. This, of course, needs to be done, even

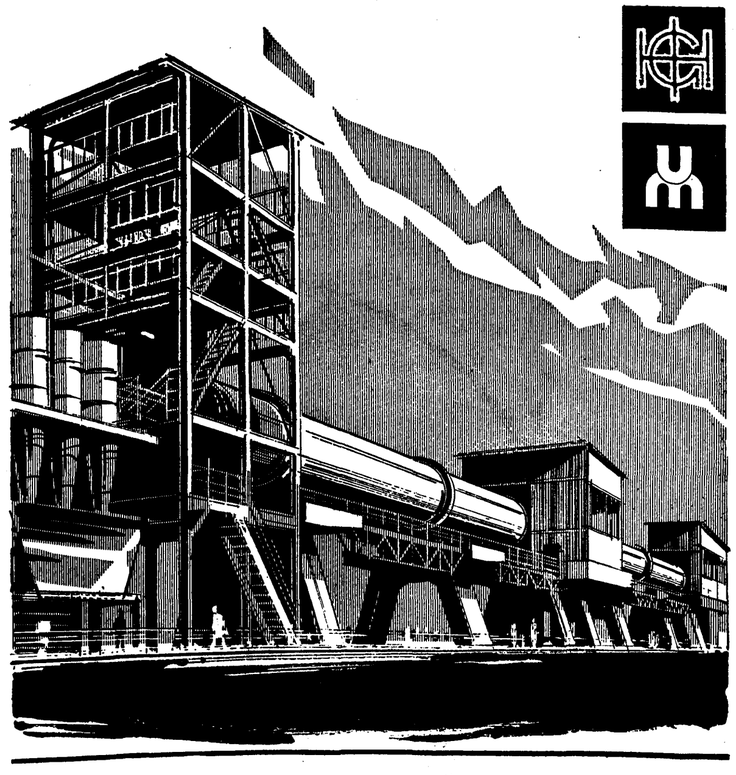
if it involves a silent social revolution in the countryside.

It is the other factor of bringing all potential land under cultivation that needs to be explored here. Particularly the arid or the desert lands. For a country like India where so many problems await attention and need to be tackled, the problem of harnessing the deserts for man's use —cultivation and habitation—may appear to be ot only remote interest. And, yet, the taming of the deserts for man's use should be given high priority, for we must realise that in less than 40 years the present total population of the world is likely to double, demanding more space on which to live and work and more land on which to raise food.

Characteristics of Deserts

What and where are these deserts? Arid, dry or desert land can be defined in several ways, from the point of view of soil, moisture, rainfall, precipitation, vegetation, etcetera. The simplest definition of a desert is a region with an average annual rainfall of less than 10 inches. But averages must be taken with some caution for deserts are notorious for extremes, whether it is rainfall or temperature. For ten years a desert may have a precipitation of only a few inches and may then suddenly experience a downpour and floods. At noon a desert may become intensely hot, and at night extremely cool. The Sahara desert has registered a temperature of 180 degrees (higher than that of boiling alcohol) at noon. At the other extreme, it has registered temperatures below freezing at night.



It is estimated that arid areas cover a seventh of the world's total land area of 56 million square miles and the deserts proper occupy a fifth of the arid areas. There are a dozen major deserts in the world and in order of size, they are the Sahara in north Africa (3.5 million square miles), the Australian desert (1.3 million square miles), the Arabian desert (nearly one million square miles), the Turkestan desert (three-quarters of a million square miles) in south-western Russia, the north American desert (half a million square miles) covering parts of south-western United States and north-western Mexico, the Patagonian desert in Argentina (260,000 square miles), the Thar or the Great Indian desert (230,000 square miles) east of the Indus in India and Pakistan, the Kalahari desert (220,000 square miles) in Bechuanaland, South Africa, the Takla Makan desert (200,000 square miles) in China's Sinkiang Province, the Iranian desert (150,000 square miles), the Atacama-Peruvian desert (140,000 square miles) in Chile and Peru and the Gobi desert (125,000 square miles) in Mongolia.

It is obvious that in the years to come the world's deserts will have to be pressed into the service of man. The deserts can yield minerals for man's factories, space for habitation and land for eventual cultivation. Today, this possibility may appear incredible and far-fetched for the simple, forbidding reason of lack of life-giving waters. Once man can use his technology to bring water either from the sub-soil, from outside or artifically from the sky, the desert can spring to life and make human habitation possible at far higher levels of living than what the desert nomads such as the Bedouins and the Tuaregs, the Bushmen and the Bindibus have been able to achieve through the centuries.

Implications of Desert Development

There is no doubt that the development of the deserts and semi-arid lands will need tremendous capital investments and technological pioneering. Apart from the possibilities of obtaining living space and land for factories and other non-agricultural uses, and soil for cultivation, the sands in some parts of the Sahara and Saudi Arabia have already yielded enormous oil resources —resources unsuspected half a century ago. In these areas the desert oil is paying for air-conditioned houses. It is true that several countries where large deserts are situated are relatively underdeveloped and cannot normally afford the capital investment or the technological know-how to begin to tap the potential resources of such land. But at the suggestion of U.N.E.S.C.O. and with the help of other U.N. specialised agencies, Desert or Arid Land Research Institutes have been set up in Egypt, Israel, Australia, the French Sahara, India and the United States, to study how best to bring these lands into use. The small state of Israel has already shown what can be done with planned determination. As the former Israeli Premier once observed, they could not afford the luxury of deserts with their limited land area. But now even the U.S.A., with tremendous land area, is gradually bringing the arid lands into use. They have even succeeded in making them tourist attractions.

Once desert resources are located and tapped, enormous areas can be brought under cultivation, exploitation and occupation. With population pressure mounting everyday no area of land, no matter how hostile and forbidding, should be left unexplored and unexploited.

Fixing Right Criteria for Growth: Need for Fresh Look at Planning

The scale of investment has increased in each successive plan, but with no corresponding increase in real incomes. Shortages and high prices have caused widespread distress and discontent. Dr. Rao stresses that the pattern of plan investments and priorities, and the very strategy of planning itself, need to be re-examined.

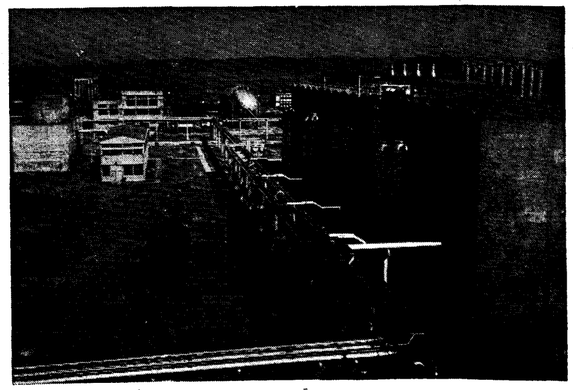
By
V. K. R. V. RAO
Member, Planning Commission

PLANNING has come to stay in India. All political Parties are in favour of it, although they may differ in their concepts of planning and the composition of the machinery. Planning has done positive good to the country. It has led to a higher rate of *per capita* consumption of foodgrains, sugar, coffee, tea and cloth; as well as of producers' goods like steel and electricity. India also has more of educational and medical facilities a head, compared with 1951.

Yet there is dissatisfaction. This is so because the rise in output has been below the target. Secondly, the economic development itself has aroused greater interest in planning among the people; correspondingly, expectations have increased, and with it, disappointments. A greater part of all economic life is now occupied by the plans and with the increasing rôle and magnitude of the public sector, a larger number of persons are coming under the scope of planning. Lastly, there have been distortions and failures in the planning process, resulting in rising prices and a higher cost of living. The people are naturally dissatisfied, in spite of a substantial growth of national income. This is realised both inside and outside the planning machinery.

Patterns of Investment

The first plan showed a more than anticipated rise in national income, and simultaneously also, a fall in prices, but the second plan ended with just the contrary results. During the first three years of the third plan, the country has been experiencing a virtual stagnation in agricultural production, and this has led to a conspicuous rise in prices. Increasingly larger amounts have been invested in every successive plan, and yet there have been no corresponding increases in real income, which means the investments are not giving adequate results. Therefore, a fresh look at Indian planning means a fresh look at the patterns of investment and their operation.



Why are the investments yielding results lower than targeted or anticipated? Firstly, the investments have generally a long gestation period (that is, the period between the first date of input and the first date of output). In other words, it may be said the investment pattern is such that many of the projects yield consumption goods after a long period of time, and they are also time-consuming even in producing non-consumption goods. It must also be remembered that in the early stages, a substantial part of the production consists of goods in process, which really mean no output is immediately available. On the other hand, the investments give rise to incomes immediately they are made, thereby creating a time lag between the flow of income and flow of goods and thus creating inflationary pressures.

The longer the gestation period of investment projects, the stronger are the forces of inflationary pressure. Nevertheless, the country has to go in for investment of this kind, since it has to produce capital goods to lay the foundations for stable and self-sustaining economic growth. Now that some steel and power plants have come into existence, a new look implies some change in the investment pattern so that there are more projects which give quicker results; and those having a longer gestation period are scrutinised more carefully.

Costs and Returns

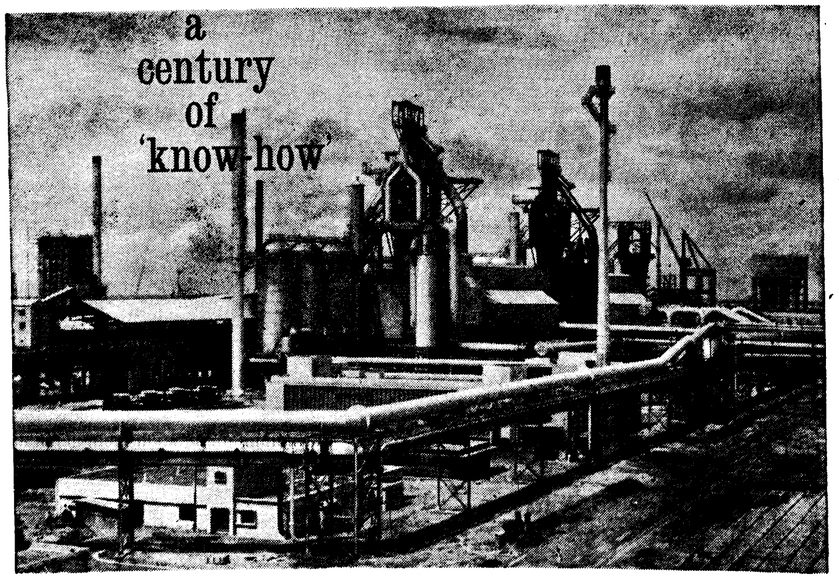
Secondly, a new look implies that the investment projects have to be examined more strictly from the economic point of view. Projects having a low cost-benefit ratio should be given priority. Therefore, functional location and economies of scale must weigh more heavily, rather than sentiments and pressures of non-economic nature, in allocating new projects. One cannot be sure whether all the projects taken up so far have really been located on the criterion of natural advantages. There have been some regional-*cum*-political pressures in the allocation of projects, with the result that output and time-phasing have not always been satisfactory. It is not suggested that projects with longer gestation periods be cut down or eliminated but the investment pattern has to be decided more on economic criteria than perhaps has been the case so far.

Thirdly, the projects yielding adequate returns are also to be scrutinised from the viewpoint of the utilisation of their capacity. In this context, the projects using maintenance imports or imported parts and components have to be more carefully examined not on an *ad hoc* basis, but as an integral part of long-period planning with a view to making both short-period and long-period arrangements which are needed for the utilisation of their full capacity. Therefore, a fresh look at Indian planning essentially involves a fresh look at the pattern and composition of investment. There is an element of truth in the argument that since a significant part of the investment is financed through the creation of money by the banks and thus involves a rise in prices, the total investment should be cut down. This view is correct, but only to a limited extent. What is more important is to screen the investment projects on the criteria of their size, composition, location and the extent of utilisation of their capacity.

The ammonia plant at the Rourkela fertiliser factory

Public Sector Efficiency

As the plans become larger it is imperative that the rate of return should also grow higher. If there must be a larger public sector in the planned system of the socialist economy, public enterprises should yield high rates of return. Otherwise, this country's socialism will become self-defeating. If public enterprises give lower returns, a larger ratio of public sector in industry will also lower the overall rate of growth. Therefore, it is necessary that the prices and production policy of public enterprises should be looked into with care from the points of view of cost reduction and increase of profitability.



Fourthly, there has also been dissatisfaction over planning on the ground that the benefits of development have been unequally distributed among classes and regions and between the urban and the rural areas. In particular, there is grave dissatisfaction with the fact that after 13 years of planning, there are so many millions of people who lead a sub-standard existence in terms of levels of living. Now the time has come to declare that the objective of planning should not merely be a rise in the per capita income, but also a significant rise in the minimum levels of income so that the poorer sections of the Indian society (such as the depressed classes, tribals, and agricultural labourers) have a level of living that will at least be a tolerable minimum.

The Human Factor

Lastly, the history of economic growth of developed countries like the U.S.A. shows that more than 50 percent of their development is traceable to what is called the residual factor, but should be more correctly described as the human factor. Therefore, in underdeveloped countries like India, the human factor should be given high priority in the investment and development programmes. There should be a special stress on the building of human capital, not only through education—general and scientific—but also through the creation and development of proper motivations, attitudes and oganisations, which are conducive to rapid economic development. These motivations and attitudes can be created partly through the necessary structural and institutional changes in the socio-economic field and partly through appropriate incentive schemes for the various categories of working people engaged in the planned reconstruction of the national economy.

On the whole, therefore, while the country has not done badly in its economic development efforts, it can do much more, provided it takes a fresh look at planning, its approach, its strategy, and its implementation.

HEAD WRIGHTSON

We operate in India a contracting and consulting service backed by experience of our U.K. associates. We are actively engaged in various fields which include a turn-key contract for a 1500 Ton Blast Furnace and ancillary equipment at Durgapur Steel Plant.

Head Wrightson undertake extensive work from initial research, through design and manufacture to erection, commissioning and after sales service.

Iron Making Plants, Ore Beneficiation, Sintering & Pelletising Plants ● Oxygen Steelmaking Plants ● Tinning & Galvanising lines ● Shearing & Cut-up Lines ● Sheet & Plate Levellers ● Coal Preparation Plants ● Mining Equipment including Headgears ● Heat Exchangers & Industrial Cooling Towers ● Water & Effluent Treatment Plants ● Dock & Harbour Equipment.

THE NEW SPIRIT OF CO-OPERATION IN AID AND TRADE

This year the poorer nations combined to demand bigger aid and trade programmes from the developed countries. India has an important role to play in the new scheme of international co-operation.

By

GEORGE BARRELL

THE year 1964 has not been without its full quota of important events. Asked to enumerate them, the thoughtful observer would almost certainly mention the Chinese atom bomb, the dismissal of Mr. Khrushchev and the outbreak of Goldwaterism in the United States. He would, of course, be perfectly right. Yet he could be accused of missing the most important of them all, at least potentially. This is nothing more or less than the progress which has taken place in international attitudes towards aid and development problems during the year. Such matters move slowly, and inevitably lack the spectacular character of the events just mentioned. Yet in terms of long-term world impact, and especially on the circumstances facing the poorer countries, recent changes in thinking about economic development could prove to be of immeasurably wider significance. Two years ago it had begun to look as if aid was falling into disrepute as a method of helping the underdeveloped countries, and that the main hope for the future was in expanding world trade. To some extent this is what has happened. But in seeking to tackle the situation, the poorer nations have not only succeeded in impressing their trade needs more firmly on the richer ones, but they have also created a new awareness of the importance of maintaining current aid programmes and expanding them during the years ahead. This has been no mean achievement.

Having established that fact, it is important to appreciate that progress has nevertheless been severely limited. This is inevitable. It takes considerable time for viewpoints to change and new ideas to permeate down. Future progress will continue to be marked by a general attitude of grudging reluctance on the part of those countries who will have to find the money for development and make the adjustments in their own economies which may be required to increase the trading opportunities of the poorer nations. But the importance of what has happened during the past year lies in the fact that it is these poorer nations which are themselves forcing the pace; and they have begun to appreciate the advantages of co-operating in order to do so. The main calendar event in this development year, the meeting in Geneva of the U.N. Conference on Trade and Development, was of major significance because it combined the forces of the poorer countries in the pursuit of a single goal; and, incidentally, put the richer nations well and truly on the defensive. The Conference set a pattern for the future, not only in the matter of its deliberations, but in this all-important sphere of co-operation. Other things being equal, the movement can expect to gather momentum in coming years, a fact which could have great significance indeed for the future of the world.

Limited Success of U.N.T.A.D.C.

The outcome of the U.N. Trade and Development Conference, (U.N.T.A.D.C.), far from justified the wilder hopes placed in it at the start. It did not, for instance, produce any concrete decisions for increasing aid and trade programmes. This was perhaps to be expected. The Conference was the largest international gathering of its kind ever held. The number of delegations, over 100, ensured that an exchange of views rather than any firm results would be the only practicable achievement. It was comparatively easy under these circumstances for the United States and Russia, the two nations whose economic size places them in the forefront of potential benefactors, to clothe in fine words their general unwillingness to make substantial concessions in favour of the underdeveloped. It was not difficult either for Britain and France, whose approach at least by comparison was constructive, to present their far-reaching and imaginative plans, and gain a useful propaganda advantage by doing so, without running too great a risk of having to implement them.

All this was rather a pity. But one solid achievement was recorded, the establishment of a permanent secretariat not vastly different from the original concept of a World Trade Organisation. This latter project was resisted by the western powers partly because it would have weakened the G.A.T.T., and partly due to the voice it would have given the Soviet Union in world trading affairs. In the event, the new Trade and Development Board, as it is to be called, will be like other specialist organs of the United Nations in that its decisions will not have executive authority. The richer countries will have no veto over its deliberations, such as they originally demanded. But all specific proposals for action may be referred to "conciliation committees", or "the good offices of the U.N. Secretary-General", or "any other means within the framework of the U.N." This somewhat tortuous procedure in case of dispute will limit the effectiveness of the new body and has certainly caused disappointment among the more militant of the underdeveloped countries. But it probably ensures greater progress in the long run. Results in this difficult field will be achieved by pressure and persuasion, not by dictation, which in any case the poorer nations are in no position to exercise.

No Sign of Life

The U.N.T.A.D.C. ended in June, but so far nothing has been heard from the continuing body. It was planned to have three committees, one dealing with commodity trading, another with trade in industrial products and the third with invisibles. This is an improvement on the original U.S. idea for one committee only, to handle commodities, and represents a considerable gain in organisational opportunities. If these committees are now functioning, then it is time the world was hearing from them. In particular, they ought to be making their weight felt in efforts to prevent the threatened collapse of the "Kennedy Round" of tariff cutting under the G.A.T.T. The first tasks of the new Board are to investigate, and suggest action on, the various proposals placed before the full conference, including particularly those for commodity price support and the granting of preferences on industrial manufactures. In some cases the committees were to absorb existing specialist organisations functioning under the United Nations; in others, close co-operation was to be maintained. The full Conference is to be reconvened periodically.

The important facts about the Conference and its continuing organisation are briefly these. They do represent a strong force working towards a solution of the outstanding problems facing the developing countries, and act as a constant reminder to the richer nations of their responsibilities in the process. They may not have the power of a World Trade Organisation, but they do at least ensure that the G.A.T.T. will be allowed a little longer in which to tackle the new functions required of it. The G.A.T.T. has produced results in the past; it would simply not be wise to replace it with a new and untried body until it has been proved conclusively that it cannot answer the needs of the underdeveloped countries, even if the richer nations agreed to such a change. Most important of all, the Board represents a new attempt at co-operation on the problems of development. Of its 55 members, 31 will be from the poorer countries and only 24 from the richer ones. This means that the weight should always be on the side of greater progress, that is, provided the underdeveloped members do not use the opportunity for making propaganda at the expense of the developed, thus damaging their cause. The whole set-up, though by no means perfect, is a considerable achievement in international co-operation and deserves to be regarded as such.

Bleak Prospects for the G.A.T.T.

If the verdict on the 1964 meeting of the U.N.T.A.D.C. is a reasonably promising one, it is impossible to say the same for the Kennedy Round of the G.A.T.T. This in fact began in 1963, and since then has twisted its way through an infinite maze of political and economic complications to its present threatened impasse. It will be something of a miracle if the Kennedy Round survives, and an even bigger one if anything of great benefit to the underdeveloped world emerges from it. Hitherto the danger has come from the "disparities" issue, which owes its origin more to political than economic factors. But now the main threat seems to be from the possible deliberate decision of France to break the negotiations up because West Germany has failed to keep to the spirit of her bargain of January 1963 and agree to a Common Market price for agricultural gains. There is no reason to suspect that France is bluffing about her intentions; politically she does not appear to be finding her ties with the European

cali—plast

pioneers progress thro' pvc

CALI-PLAST PVC—Polyvinyl Chloride—the modern plastic material for today's industrial age. CALI-PLAST PVC for rigid pipes and flexible tubes. For insulated and sheathed cables. For handrails. Coated fabrics. Films. For a variety of uses in a variety of industries. And the home, too.

CALI-PLAST, the Chemicals and Plastics Division of Calico Mills, are the pioneer manufacturers of PVC in India. Manufacture of raw materials and finished products started in August 1961 — in collaboration with Dynamit Nobel AG, West Germany.

To meet the needs of tomorrow, CALI-PLAST are planning today. Production of PVC has already been stepped up. A new plant to produce Polyvinyl Acetate (PVA) and copolymers is now under construction. In this and other ways, CALI-PLAST are helping the Nation's progress.

CALI-PLAST PVC is made to international quality standards. Resistant to chemicals. Corrosion-resistant. Fire-retardant. Light in weight. And in attractive colours. It can profitably be used to replace metals as well as soft flexible materials.

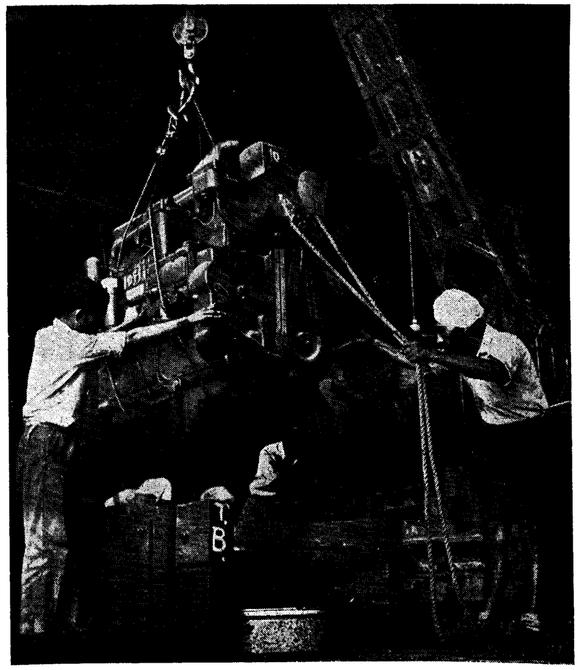
For information or technical service, write to: **calico chemicals and plastics division** anik-chembur, bombay 74 as.

Community particularly convenient at the moment.

There is at present a grave danger that the Kennedy Round will fail in its chief purpose of cutting the tariff barriers of the main developed countries. At least theoretically, however, this need not entirely exclude further consideration of the "Action Programme", although it almost certainly will do in practice. The Action Programme was originally drawn up by the poorer members of the G.A.T.T. as being the best means, within the present structure of the Agreement, by which their desire for increased trading opportunities might be satisfied. It is based on eight main points. These provide for a standstill on all new tariff and non-tariff barriers erected against the export by the underdeveloped of products identified as being of special interest to them; the elimination of quantitative restrictions from which they are at present suffering; the permission of duty-free entry for tropical products; the reduction and elimination of tariffs on primary products, semi-processed and processed goods; and the progressive reduction by the richer countries of internal fiscal charges and revenue duties. Other points deal with reporting procedures and further measures to assist the efforts of the poorer nations to diversify their economies and strengthen their export capabilities.

Hopes for the Action Programme

If it is ever implemented, the Action Programme should at least partly satisfy the main trading aspirations of the underdeveloped G.A.T.T. members. Lack of faith in this possibility, however, was partly responsible for the U.N.T.A.D.C. being convened, and it would be difficult to sustain any optimism concerning possible changes in the future. The main hope, perhaps, is that the obvious threat to the existence of the G.A.T.T., the Kennedy Round apart, if the Action Programme is not implemented, may push the richer member-countries into conceding some of its provisions. France, in particular, has sought to divorce consideration of the Action Programme from questions concerning the Kennedy Round, partly, no doubt, because she fears being shouldered with the blame for any failure.



The main value of the G.A.T.T. to the world as a whole lies in the fact that it has proved to be workable. Its demise would be a serious loss, although mainly to the developed countries. This fact imposes obligations. The richer nations are on the defensive in the G.A.T.T. and seem likely to remain so; it will not be easy for them to obstruct all progress on the Action Programme. The pressures from the underdeveloped countries have been mounting steadily in the past year, and will no doubt continue to do so as the habit of co-operating in their own interests grows on them. Progress is likely to be slow, and often conceded only reluctantly by the richer nations. Yet it cannot be ruled out altogether, especially as one of the main purposes of the U.N.T.A.D.C. continuing organisation, when it begins to operate, will be to nudge the richer members of the G.A.T.T. into a more co-operative frame of mind over the Action Programme.

Evidence of the growing aggressiveness of the developing countries towards the problems of aid and trade was also revealed in the annual deliberations of the International Monetary Fund and the World Bank family last September in Tokyo. This year's I.M.F. meeing produced more than a passing reference to development matters. It was not conceded that the interests of the poorer countries contributed to the argument in favour of expanding the Fund into a true world currency bank, or justified the adoption of some variant of the plan put forward by the British expert, Mr. Maxwell Stamp. But in rejecting such expedients, it was obviously considered necessary to divert criticism by dwelling at more than usual length on the contribution at present being made by the I.M.F. to world development. This has never been spectacular, inevitably perhaps in view of the structure and limited aims of its organisation. It would be surprising if in future years the pressure on the Fund did not increase for structural changes designed to increase its usefulness to the poorer countries. At present this is strictly limited by the rules governing its lending powers, which indeed are becoming increasingly irksome to the richer countries as well.

Under its new President, Mr. George Woods, the World Bank has recently broken new ground in its lending activities. The steady growth of its satellite organisations, the International Development Association and the International Finance Corporation, has also proved a boon to the developing world. It is probably unnecessary for the poorer countries, singly or in co-operation, to press the Bank too heavily for an enlargement of its activities. They are already expanding as a matter of course, and seem likely to go on doing so. It is indeed questionable whether further relaxation in its rules governing lending would be in the interests of the countries it is trying to help. These have generally had the effect of encouraging an often much-needed sense of realism. Some increased help with the drawing up of sound project proposals might be an asset. But on the whole, the Bank's policies have been both useful and realistic. They are also encouragingly progressive. Aim for the Future.

Aim for the Future

The aim for the future among the underdeveloped countries should now be to step up the pressure for concessions from the richer ones as rapidly as possible. They will not always be assisted by political developments, of course. Yet these need not necessarily impair the growing unity among the poorer nations. The events of the past year have shown clearly that whatever their political leanings, the one thing the poorer nations usually find they have in common is their poverty. The growing division of this world into rich and poor nations may be regrettable in many ways, but it promises increasingly to serve the interests of development generally. So does the recent thaw in the cold war. Admitted that East-West rivalries have up to now been one of the main motives behind aid programmes, but there is nothing to suggest that co-operation between the two sides would not promote even faster progress. The eclipse of Mr. Khrushchev has naturally raised doubts about whether such co-operation can be achieved in the foreseeable future, and until the new Russian leaders have shown their hand more clearly such doubts may remain. But this year the Russians found themselves ranged alongside the West in Geneva with their backs to the wall. It would be odd if this posture did not eventually encourage the spirit of co-operation between them in the field of development.

Repair work being done in a tractor workshop

This is where the main hope now lies. The new Trade and Development Board, the pressure group of the underdeveloped world, will be dealing with Russia and the West equally. When its activities meet with little response, the party responsible for obstructing will be held up to world ridicule on a particularly sensitive matter. Ground will have to be conceded, if only gradually and with reluctance. It will, of course, be necessary to understand the problems of the developed countries when dealing with their electorates, but on the whole this is not a matter calling for excessive tact. One of the main purposes of the new Board will be to create a climate in which the interests of the underdeveloped will be considered in every international economic move that is made in future, and in which the steady expansion of aid programmes will become for the developed countries an accepted way of life. There is no obvious reason why the Board cannot eventually attain a status comparable with that of, say, the G.A.T.T. The scope for its activities is practically limitless.

A Rôle for India

The record of the past year is, therefore, an impressive one. It should achieve its place in development history as the first in which the poorer countries chose to combine for the purpose of bringing concerted pressure to bear on the richer ones. The actual progress made does not necessarily detract from this achievement. It is now necessary to press the advantage, and at the same time show the developed nations how it can be in their best interests to step up their aid and trade programmes. It remains true that the chief hope lies with trade; aid matters are too easily influenced by international politics. The task of prizing open the domestic markets of the richer countries and impressing upon them the benefits to all concerned or a more efficient division of labour on the international plain, must be the long-term aim of the new Board. Its secretary-designate, Dr. Raul Prebisch, has already outlined his plan of attack.

The sharp division of the world into rich and poor regions, with the accompanying overtones of race and colour conflict, is now more readily accepted as a danger to world peace than it was even two years ago. The emergence of the larger part of Africa from colonialism is perhaps mainly responsible for this. The new awareness is not entirely the consequence of outraged conscience; more accurately it could be described as the promptings of enlightened self-interest. It is important that it be exploited to the utmost, and by all possible means. As the most populous of all the poorer countries, India must of necessity play a prominent part in the proceedings. India's representatives have earned a considerable reputation in the past year for the statesmanlike way in which they have behaved in international economic gatherings, particularly the U.N.T.A.D.C. There is a rôle ready made for them as leaders in this new movement towards greater co-operation in world trade and aid matters.

Need to Develop Export Industries to Cater to Foreign Markets

Exports play a vital role in a developing economy. Industries specially catering to overseas markets should be set up. There is also a need for an export policy resolution on the lines of the Industrial Policy Resolution.

By
P. S. LOKANATHAN
Director-General, National Council of Applied Economic Research

AMONG the many constraints slowing down India's rate of economic development, foreign exchange may easily be rated as amongst the most important. The rôle of foreign exchange in developing economies is not merely that it supplements domestic savings; though undoubtedly this is important. In India the difference between the 15-percent rate of investment and the 11-percent rate of domestic savings during the last two years is accounted for by foreign aid and foreign loans. But even more dominating is its rôle in extricating the country from its balance-of-payments difficulty. Without foreign exchange availability, even the available domestic capital and domestic material resources could not be put to proper use.

Many of the projects depending for their implementation upon foreign capital goods and equipment, not easy to manufacture within the country in a short period of time, would have to remain undeveloped but for the foreign exchange with which to buy the goods from abroad. Developing countries find difficulty in increasing exports sufficiently and rapidly to get the essential imports for their development programme. Many of the basic and heavy industries which have been developed during the second and third plans could not have been developed without the imports of equipment and capital goods, and even raw materials which foreign aid made possible. There is in India's case a third aspect of this problem. It is that the lack of sufficient foreign exchange and the inability to earn it through exports have tended to slow down output because most of the capacities built up through foreign capital and through domestic resources have remained greatly underutilised for lack of essential raw materials, components and accessories.

Idle Capacity in Industry

The degree of underutilisation in industry, transport and certain other sectors has not yet been studied thoroughly and completely. The National Council of Applied Economic Research is currently engaged in this task. But such partial studies as have been made by others and reports of study teams constituted for other purposes have made it clear that the degree and extent of underutilisation is pretty serious. So far as small industry of the modern type is concerned, there has been evidence to show that the degree of underutilisation is as much as 50 percent to 75 percent. But even in the large and medium industries, the capacities built up with such heavy investments of capital have been utilised only to the extent of 40 percent to 50 percent. Underutilisation varies between industry and industry.

The following table shows the extent of underutilisation of capacity in some of the industries, both in the consumer and capital goods sector :

Industry	Percentage of utilised capacity to total capacity (1963)
Bicycles	24
Watches	73
Fluorescent lamps	30
Aluminium conductors	32
Copper conductors	75
Paper-insulated power cables	60
Room air-conditioners	56
Brass/copper/lead pipes and tubes	66
Brass/copper sheets and circles	48
Duplicators	34
Conveyor belting	34
Machine screws	35
High-tensile bolts and nuts	53
Wire ropes	76
Railway wagons	40
Laboratory glassware	71
Sheet glass	40
H.T. insulators	40
Synthetic rubber	60
Power and industrial alcohol	50
Copper sulphate	35
Nitric acid	42
Sulphuric acid	33

Without claiming that 100 percent of capacity can always be utilised, there can be no gainsaying the fact that if only sufficient imports are possible, India's industrial output could increase by 15 percent to 20 percent, almost immediately. The maintenance imports, as they are called, are insufficient and unless the country is able to increase them to a level needed to maintain the economy in full steam, production will continue to suffer in volume. While the world recognises the legitimacy of our seeking foreign aid and loans for new projects for development, India's inability to earn the needed maintenance imports through her exports is rightly regarded as a failure of her planning policy and implementation. It is not that the difficulties in increasing exports are not appreciated. On the contrary they are. That is why, thanks partly to the British Industry (Kipping) Mission and thanks to the increased knowledge in other countries of the nature of India's maintenance imports problem, non-tied aid is being granted increasingly by the U.K., the U.S.A. and other countries. But there is a growing feeling that the country has not put forth sufficient effort to develop its exports rapidly to enable it to earn all the maintenance imports that it needs.

Rôle of Export Earnings

To summarise : the problem of foreign exchange for India's rapid economic development has three or four aspects. First, she should earn enough of it to balance her maintenance imports. Secondly, she should seek to supplement her domestic capital resources by foreign capital, and thirdly and not least importantly, she should find additional foreign exchange to enable her to buy all the capital goods and equipment which she needs for her new industries. And finally, and over a period of years, she should be able to become self-reliant in respect of all her capital needs in the sense that on balance she should not continue to be a net borrower.

If these objectives are kept clearly in view, the most important task is to develop a sound national export policy. It may seem strange that despite all the talk of exports and despite the excellent work which the Ministry of International Trade has been doing in the field of export promotion—thanks to the dynamism of the Minister for Commerce, no sound export policy should have been evolved. Yet that is a fact. Under the leadership of the Planning Commission, the country has been educated to regard exports as surpluses of domestic production over domestic consumption. This means in effect that exports are residual, a poor third after domestic production and domestic consumption. Whatever is left over is turned on to the foreign buyer who (as some Indians still think) should consider himself as fortunate that he is given a share of India's production. Such a concept is fatal to the export drive. As long as exports are regarded only as residual, to be promoted when the country is suffering from a glut and banned when she does not have enough for her consumption, there is no hope for India ever to solve her foreign exchange problem properly.

Such a concept suffers from two fatal weaknesses. It fails to assign to exports its proper rôle, and secondly, it regards exports as something taken away from the country and fails to understand that through exports she exchanges the less valuable commodities for the more valuable and essential ones. Exports are a nation's current savings which it employs either in exchanging for consumer goods and capital goods or for lending to other countries. In either case they would add to the strength of the nation's economy. But in the case of India, exports are an imperative. Without adequate exports the efficient running of her economy will not be easy. Her dependence on foreign countries for essential capital goods would also slow down the rate of her growth. In the light of the above, her whole attitude to exports must undergo a radical change. The country should decide firmly that her exports should not be relegated to a secondary place. Rather it should rank equally with other important goals—increased production, increased imports and increased exports.

Surplus Concept Meaningless

The surplus concept is dangerous in another way. With her population increasing at the rate of 10 million to 11 million a year (equal to the population of Australia) and with money incomes increasing on account of the enormous developmental and non-developmental outlays, the surplus concept will have no meaning. The country can consume all that she produces without leaving any surplus for export. Even now despite the development that has taken place in the country, the *per capita* consumption of many essential commodities has not increased appreciably. One could justifiably argue that since the levels of consumption are so low even with all that is produced, the country should utilise all her production for bringing up the consumption levels to a minimum.

But such a view would be fatal to exports. What really needs to be understood is that exports should rank with additional consumption in some proportion in respect of additional production. For example, not long ago when domestic production of steel was only two million tons, the country was prepared to be content with consuming 2½ million tons, half a million tons being imported. Now when production has gone up to about five million tons and at the end of the fourth plan it is expected to increase to 14 million or 15 million tons, there is no reason why domestic consumption should not be limited to a million short of the domestic production, leaving one million tons for export.

The policy should, therefore, be to permit a certain portion of the increased production for exports equally with domestic consumption. Another example may also be cited. A study by the N.C.A.E.R. of the

country's export possibilities has revealed that there is enormous demand for oils and oilseeds, but India is not in a position to export because the domestic demand not only outruns the supply but is permitted to get such a priority as to leave very little for further export. Hence along with intensive efforts to increase production, some restraint on additional consumption is necessary so that exports can be increased.

Need for Stable Policy

This is typical of many other commodities also; the export policy should also be clearly defined and there should be stability in India's policy and action. For example, the banning of vegetable oil exports by the Government of Gujarat was ill-conceived because the foreign buyer would naturally turn to other markets because of the uncertainty of getting Indian products. Hence, the export policy should be redefined thus: When domestic supplies increase, while a portion of the increase should obviously go for consumption, another portion should go for export. The proportion might vary as between different commodities. If this is not accepted and if the surplus policy continued, exports will never reach a level which is required for maintenance and growth.

There is a view widely held in this country that she should try to reach a self-generating economy at the end of the fifth plan willy-nilly, and towards this end she should try to secure a proper balance of payment by matching her imports to her export capacity. In other words, it is envisaged that the balance of payments can be struck at a relatively modest level of export and import. Such a view would justify reducing essential imports, to the barest minimum. This way of looking at the problem seems to be totally wrong. India's exports as a percentage of her national income are about the lowest in the world, the only exceptions being the U.S.A. and Russia. All other countries' exports constitute a higher percentage of national income ranging from 10 percent to 30 percent. India's exports are still at a meagre proportion of about 6 percent to 7 percent. The conditions in the U.S.A. and Russia are very different. Such a tight balancing of exports and imports at a low level would leave India in great difficulties in planning for development and would give her little opportunity for manœuvring to meet the changing domestic and international situation. On the other hand, a higher percentage of exports of national income will give her greater flexibility in planning and in implementation.

The aim should, therefore, be to increase the volume of exports so that exports reach about 10 percent to 12 percent of the national income thereby enabling the country to save for a larger volume of imports. If imports are restricted, she would be constrained to develop certain industries which are not necessarily the most profitable or productive. There might be a distortion of economic structure as a result of this voluntary imposition of constraint. For these reasons national policy requires that while aiming at a self-generating economy and a balance of payments equality as quickly as possible, this should not be at the sacrifice of a high level of exports and a high level of imports relatively to the present proportion.

Exports Look Up

After a decade of stagnation during which Indian exports stayed round about Rs. 600 crores per annum—exports were on average Rs. 609 crores a year during the first plan and Rs. 614 crores during the second plan—there has been a welcome improvement since the beginning of the 'sixties and this improvement has been maintained during the last three or four years. Last year (April 1963-March 1964) exports reached a new high of about Rs. 800 crores. Figures for recent months indicate that the third plan export target of Rs. 3,800 crores will be reached. If the September 1964 figures are indicative of the future, one might reasonably be sure of hitting a target of round about Rs. 900 crores this year. Many factors have contributed to this improved performance, not he least of which are the sustained efforts by the Government of India to promote exports. Export Promotion Councils are operating in respect of about 15 commodities and commodity boards have been set up for a number of other commodities.

The establishment of an Institute for International Trade with its emphasis on the training of export personnel and commercial counsellers who are to serve abroad is a milestone in export promotion effort. A substantial amount has been provided for market research which is to be conducted on a large scale. Export financing and export insurance schemes have been devised to help in sustaining the export effort. Pre-inspection arrangements for quality control, greater attention to standardisation and meeting the specifications of the foreign buyer are other steps taken to improve exports. There is a growing awareness on the part of export traders that the quality and scale of after-sale service should improve. Trade, commercial and industrial intelligence services have been streamlined. A new orientation has been given to the foreign service personnel working in Indian embassies and missions abroad; they have been taught to look upon trade promotion as an essential part of their work.

Board of Trade

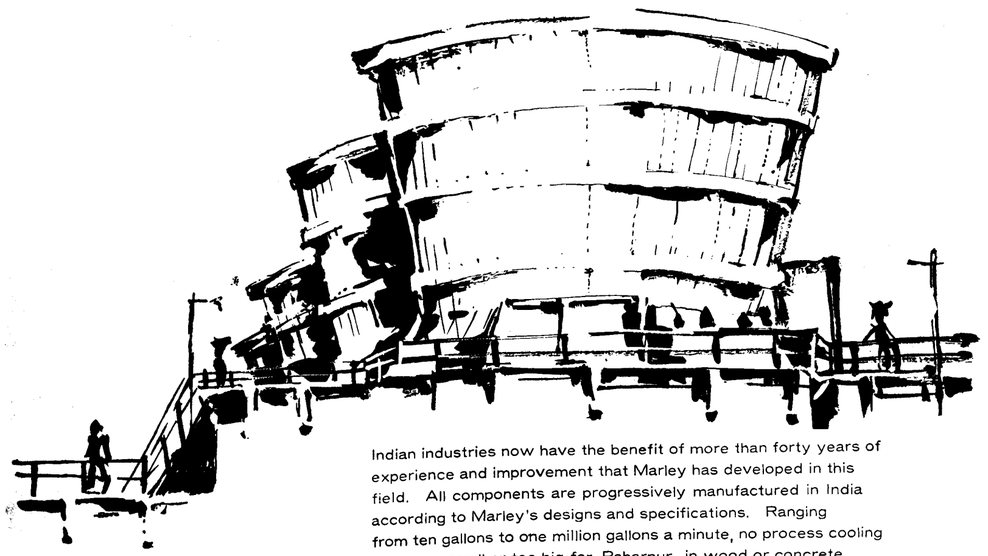
In fact there is an entirely new look in the Ministry of International Trade which with its various Directorates is now getting well equipped for the tasks it has undertaken to do. A Board of Trade which advises the minister is periodically reviewing and assessing the export performance and export efforts. Of course the results will take time to show. But anyone who has followed the export promotion efforts of the country during the last three or four years has no reason to be unduly pessimistic. Trade and industry are slowly getting to be export conscious. Nevertheless, much more remains to be done if the modest and even inadequate target of Rs. 5,100 crores of exports for the fourth plan period is to be achieved. The target has to be compared with the value of maintenance imports during the fourth plan estimated to be of the order of Rs. 5,500 crores and with the total import needs of over Rs. 8,000 crores.

Unless present policies and methods are further improved, even the target of Rs. 5,100 crores in the fourth plan pediod may be difficult to achieve. Hence there is need for further change in the export policy. The country should boldly decide that her export should not fall below the level needed to sustain the economy in full production and hence the export target should be raised to Rs. 5,500 crores with all the implications which a higher target would involve in terms of policies and measures of action. The need for larger exports is further reinforced by other considerations. India cannot afford to rely on too much of foreign aid and loans in the face of the growing demands of several other developing nations upon the not inexhaustible sources of foreign capital. The Planning Commission has recognised this implicitly by not seeking more foreign aid in the fourth plan than what has been provided for and assumed for the third plan requirements. But India's import needs are growing, and unless they are matched by more exports, balance of payments difficulties will be aggravated. Secondly, the burden of interest and repayment is growing. It can only be met by greater exports.

Here the question arises whether the country is borrowing more than she can afford. The answer would depend upon the burden of interest rates, the other terms of credits, upon the purposes for which the loans are secured and above all upon the effectiveness of the loan utilisation. On all the above the broad conclusion would appear to be one of cautious optimism. In recent years, thanks to the farsighted efforts of the World Bank, the terms of loans are more favourable to the borrowing countries, India included. The rates of interest have been brought down, the loans are for long term extending to 40 years, the terms of repayment provide for greater flexibility, and an initial moratorium period is allowed during which no interest or repayment has to be made. Loans have, on the whole, been properly utilised except for unusual delays both at the lending and the borrowing ends partly because some of the projects had not been fully worked out in advance and partly because by the very nature of these loans which are tied to projects, a great deal of time has to be spent in agreeing upon the details of the projects.

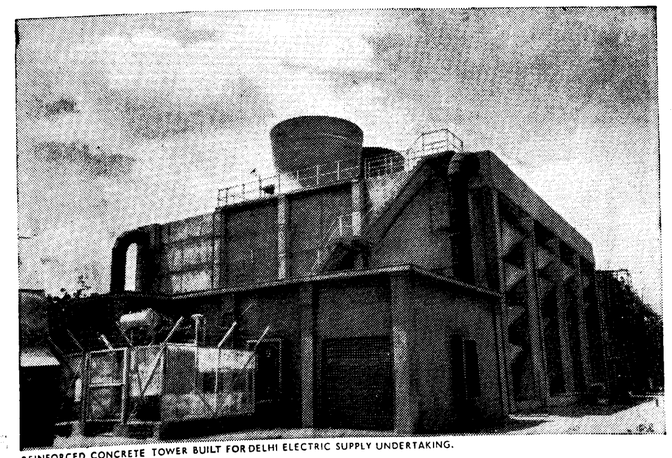
One unfavourable element in foreign private capital participation, which sought occasionally to impose restrictions on the sale of Indian products in specific foreign markets, has now been removed. The only major disadvantage yet remaining is perhaps the high cost of some of the tied foreign loans. It is estimated that the costs of capital goods and equipment which have necessarily to be secured from the donor countries have often been higher by 15 percent to 20 percent compared with international prices. This is an area where there is room for further negotiations between the lending and borrowing countries. But on the whole, provided the loans have been used in either import-saving industries or export promotion industries or in imports of essential economic overheads equipment, the real burden of foreign debt should not be too much, not beyond the capacity of the country to bear, and to repay. But a note of caution is necessary. It is that so long as repayments are involved, mere saving of foreign exchange will not be enough. There should be sufficient amount of foreign exchange earnings to repay the debt obligations. Hence the balance between developing import saving industries and export promotion industries should be properly struck.

Pessimistic Tone of Estimates



To resume the main thread, if India is determined to increase her exports to the level indicated above, there can be no reason why the goal cannot be achieved. Projections of future export possibilities in India usually have been on pessimistic lines. An E.C.A.F.E. document on export projections estimates the increase of India's exports by 50 per cent between 1960 and 1980. Even though the projection covers only some commodities, it seems to be a gross underestimate. Other estimates are slightly better, but even so there has been a general feeling that India's export will not increase very rapidly. But our needs certainly cannot be met except on a higher level of export performance. As the third plan report pointed out: "Considering the requirements on account of repayment obligations abroad and maintenance and development imports, it is estimated that by the end of the fourth plan the annual level of exports would have to rise to about Rs. 1,300 crores to Rs. 1,400 crores, that is, to at least twice the present level".

The pessimism governing India's future exports in some quarters, however, stems from the fact that the past trend was very poor; the cost of her products being too high in terms of international prices, and with a population explosion anticipated by 1980, the domestic consumption will absorb all the increases in production. But such a view fails to take note of the export imperatives. If such a low level of exports in 1980 is to be accepted as the target, it would be an admission of India's failure. It would also mean that the hope of India's attaining a reasonable level of economic prosperity will have to be abandoned. Such a view also fails to take note of the strength which India has in certain directions.



The possibilities of increasing exports of iron ore, pig iron and pig iron products, industrial machinery of some kinds, steel, several agricultural commodities and agriculture-based industry are immense. The country should adopt sound export and production policies, and these must be consistently implemented. There is need for a measure of economic, social, and political discipline which does not exist yet. The inflationary pressures that have been developed in the economy, which show a strong bias in favour of domestic consumption, should be reduced. Targets of export should be reflected in the policies adopted in the planning of industrial capacity and allocation of resources during the fourth plan period. There is also need for all the ministries in the Government of India and the State Governments to act in consonance with export policies, and for them not to take action which would impede the flow of exports.

Import Substitution

India, like other developing countries, has followed a policy of import substitution as one of the major

Indian industries now have the benefit of more than forty years of experience and improvement that Marley has developed in this field. All components are progressively manufactured in India according to Marley's designs and specifications. Ranging from ten gallons to one million gallons a minute, no process cooling job is too small or too big for Paharpur in wood or concrete

MARLEY PAHARPUR

DOUBLE-FLOW COOLING TOWERS

WHEREVER THERE'S INDUSTRY THERE'S PAHARPUR

The cross-flow principle as utilized in PAHARPUR MARLEY Double-Flow Cooling Towers gives optimum conditions for highest performance by permitting a greater flow of both air and water through the tower and promoting greater air-water contact essential for most efficient heat removal.

ADVANTAGES

- Low fan horsepower requirements
- Low pumping head
- Uniform water distribution
- Cells can be operated individually
- Cast Aluminium Alloy Multi-blade factory balanced fans upto 28ft. diameter
- Spiral bevel/helical double reduction heavy duty gears specially designed for use in Cooling Towers by MARLEY
- Patented herringbone eliminators permit greater air flow with minimum pressure drop and effectively control water losses

instruments to save foreign exchange. In this she has attained considerable success; but the possibilities of further saving on imports are favourable. The saving effected through the establishment not only of the steel industry but also of the aluminium industry, machine-building industries such as textile and sugar machinery industries and the establishment of the heavy engineering plant in Ranchi, the establishment of Heavy Electricals in Bhopal—all have contributed to substantial saving of imports. However, a review of India's policy on import substitution and export promotion industries seems to be called for.

Experience has shown that for all developing countries it is easy to promote import-saving industries because the advantages are very obvious. But as time goes on, the element of comparative advantage in some industries comes into the picture. As a country takes up more and more sophisticated and heavy capital-intensive industries, which require highly qualified and trained personnel for operating these plants, the advantages of import substitution lose their initial dimension, because such import-saving industries are built up at too much cost. On the other hand, export promotion industries if carefully planned would have a better advantage because the gains resulting from equal amounts of investments would be much more. Agricultural industry and agricultural processing industry are outstanding examples of how developing countries can earn substantial foreign exchange. The time is opportune for a review at a high expert level of the relative gains flowing from investments in import-saving and export promotion industries in terms of investments and in terms of time.

This is not to say that further investments should be directed only to export promotion industries. But the policy based on import saving cannot obviously be adequate for a country like India which must earn foreign exchange in order to meet repayment obligations. Therefore, export promotion industries must be given a higher degree of priority than has been the case so far. The pattern of investment should be more carefully and scientifically determined in terms of cost benefit ratio including the impact on foreign exchange. Such a study is immediately called for.

Public Sector Must Export

In this connection it may also be pointed out that public-sector enterprises manufacturing machinery and basic products are heavy consumers of foreign exchange. With our policy of expanding the public sector, unless attention is given to ensuring that the public-sector enterprises begin to earn some foreign exchange, the burden of reducing foreign exchange liability would fall more and more upon the declining private sector. Hence public-sector enterprises should become more and more aware of their responsibility for earning foreign exchange and should be brought into the scheme for increasing exports. In future, all public-sector enterprises should be required to plan for a certain volume of exports of the products which they manufacture.

Cost reduction should be treated as a major policy matter. It is well-known that in the present inflationary situation in the country, the cost of everything that is being produced or manufactured has gone up, thereby reducing her competitive position in the world market. Not long ago India was one of the cheap producers of steel. During the last few years, even steel is being priced out of the international market. In fact it would not be an exaggeration to say that there is hardly any manufactured product which can stand international competition or can stand on their own without subsidies and other concessions. The cost of India's industrialisation is getting to be very heavy and onerous, in terms of scarce real resources. Hence selectivity of approach is required in identifying industries for rapid development; otherwise, a time may come when India will ultimately be a high cost producer, and the total net return from all her investments would be a minus. In this context the establishment of a cost reduction cell in the Planning Commission should be welcomed. But as yet no results are visible.

External Tariffs

One of the handicaps of Indian exports besides her higher domestic costs is the high tariffs, quantitative restriction, and quota restrictions, internal duties on many of her manufactured commodities imposed by other countries, developed and developing. The Government of India has recently laboured hard to reduce some of these restrictions and has achieved some success. At the recent World Trade Conference, the developing countries pressed for a reduction of tariffs and quantitative restrictions. After all, lending countries cannot afford to be high tariff countries. It would not be possible for borrowing countries to repay the debt, if heavy restrictions are imposed upon their export products and exports are the only means for repayment of the debt. Therefore, it is essential that the developed countries' tariff policy should undergo a radical change. At the same time it should be frankly recognised that many of the difficulties in expanding exports is within the country and not without. India's exports suffer either because her production costs are high or she is not able to increase her production substantially to take advantage of the world demand for many of her commodities. The world's demand for Indian products is elastic by and large with the exception of jute and tea where India holds a dominant place. A slight reduction in the cost and hence in the price of India's export goods might cause a considerable expansion of her exports. During the last 15 years there has also been a reduction in the tariffs and internal duties imposed by the developed countries. Hence the argument that Indian exports suffer only because of external restriction is not wholly tenable.

India's competitive position is affected not only by cost factors but also by non-economic factors. Here also India's position has been very vulnerable. Her inexperience in export promotion, inability or unwillingness to maintain the quality, lack of standardisation, lack of organisation to render after-sale service, market research, understanding of the consumer needs and consumer preferences and lack of appreciation of the fact that she should produce what the foreign consumer wants rather than try to sell whatever she produces—these are some of the major handicaps which have affected her export trade adversely. It is also unfortunate that restrictions on travel by business men also have contributed to our failure to understand the needs of the foreign market.

Promoting an Export Sector

One important method of increasing exports is to promote the concept of an export sector in the Indian economy. This means that the country should begin to identify the products for which the world demand is pretty high and for which she has certain definite competitive advantages. The aim should be the establishment of export sectors in these industries for the manufacture of these products or for increasing the supplies.

The development of such an export sector would mean that the country can rationalise and secure economies of large-scale production by organising plants on a large scale. In cotton textile, which is a well-established industry in India, there may be scope for plants which will be specialising on finishing stages, products of which can be sold in outside market at a reasonable price. Similarly, concerning jute, the production of jute carpets can be organised on a large scale for which there is a good external market. Above all, there is the need for organising a steel plant specifically for export. The categories of steel which should be produced in the export plant should be clearly fixed after ascertaining the demands abroad.

In certain other parts of the world, the idea of export sector has been pursued to some effect. For example, in the U.A.R. a modern textile mill has turned out high class products at a reasonable cost. The entire production of this mill has been earmarked for export. It is no wonder that the competitive position of this industry has become very strong. It was stated at one time that a steel industry might be established in Goa specially for export. Similarly, other industries must be established with predominant export orientation. For example, in the case of sugar, it is clear that with the present localisation of the industry it would be impossible to export to the extent possible or necessary unless it is ensured that new sugar factories are established in areas which have comparative advantages. Special sugar factories should be established in the south and the west, the whole of whose product should be earmarked for export. Coupled with this policy of developing the export sector, there should be an integrated policy of tax incentive, export incentive and other measures to help export. The development of special export houses either on an individual basis or as a group of exporters would be a further step in the right direction.

Devaluation will Not Help

There is a growing opinion in the country and elsewhere that the high cost of Indian export is due to the over-valuation of the rupee. Some contend that India should, after a careful study, decide upon devaluation of her money. While devaluation has certainly some advantages and would increase her exports, one is not sure whether devaluation is a remedy for lagging exports. Success of devaluation measure is conditional upon the commodities having high price elasticity of demand in the world market and upon the domestic costs not going up proportionately to devaluation. Devaluation may affect not only the commodities which need some help but also those which do not need help. The possibility of counter-measures by other countries if India devalues her rupee should not also be overlooked. Again, having regard to the fact that India has to import for the next ten years substantial amounts of capital goods, raw materials, components and parts, one is not sure whether on balance the country would benefit from devaluation. In the writer's view devaluation is not really necessary. Better results can be secured by the policy of offering export incentives.

The export incentive scheme which is now in operation has undoubtedly given a fillip to the export of the new manufactured products in the engineering and chemical fields. When the export incentive scheme was initiated, there were some abuses by which the import entitlements were sold in the open market to the highest bidders without regard to the needs of the high priority industries or industries included in the third plan. These abuses have now been rectified. Import entitlement of raw materials and components and parts can only now go to a buyer who is himself a user, and the industrialists who get import entitlement should register with the Export Promotion Council not only their names but also the names of the parties to whom imports have been resold. Also the export incentive schemes affect only about 20 percent of India's exports, the rest of the exports have not needed any concession. With further improvements in the system of operating the scheme, there is no reason why export incentives should not be continued. It is true that the operation of the scheme of subsidies and incentives raises some administrative problems. But even so, on balance the country with a selective export incentive scheme would be better off than if devaluation of the rupee is resorted to.

Primacy of Agriculture

Whatever view one may take of the various matters discussed above, the primacy of the agricultural sector in the present context of India's development remains undisputed. Agriculture holds the key not only to the prosperity of the masses of the population but also to a successful solution of her balance-of-payments problems. Surpluses in traditional exports are dependent upon the development of agriculture. And in fact nearly 60 percent to 70 percent of India's exports are primarily or indirectly agriculture-based.

Apart from the fact that agricultural products are large foreign exchange earners like tea, coffee, spices, pepper, cotton, oils, oilseeds, etcetera, industries which are agriculture-based are also great foreign exchange earners; for example, cotton textile, jute, vegetable oils, sugar and other commodities of this kind. Consequently, improvements in agricultural production and larger allocation of scarce resources for agriculture will be highly rewarding. At present the Indian farmer is subject to a large negative tariff in the form

of subsidies for competitive imports. In India a farmer has to pay a very high price by international standards for most of his purchases. The present allocation is also heavily in favour of the non-farm manufacturing industries. A shift in investment to agriculture would be highly productive. It is in this sense that the new emphasis on agriculture is mostly to be welcomed. While it is true that the export prospects of Indian ore, pig iron, steel and other industrial products are bright, increased investments in agriculture should be further explored.

In framing the export policy, one should also recognise the fact that exports will not be possible unless the country is also prepared to import. It also needs to be recognised that each of the developing countries would also try to diversify its economy. This implies that India's export and import policy should be governed by the knowledge that while promoting exports one should be ready to import, if thereby domestic production and exports could be greatly increased. As a policy India may have to assist neighbouring developing countries in their progress towards industrialisation. Long-term agreements by which India agrees to buy imports of certain commodities in return for her exports could be very profitable. It is gratifying to note that India's policy is now being oriented towards assisting the industrialisation of her neighbours and efforts have been made recently to help in setting up textile mills, sugar mills and engineering industries. The Government of India has given permission to export capital in the form of machinery and other equipment from India. Such a policy should be doubly welcomed. It helps India to earn foreign exchange in the form of invisible earnings while affording her an opportunity to sell her machinery and equipment. It also creates an atmosphere in the other countries, which would be favourable to Indian exports. Although on balance India will be a net borrower for several years to come, the new trend by which she is also exporting a little of her capital should be greatly welcomed.

Conclusions

Finally to summarise :

(i) There is need for proper understanding of the rôle of export in the developing economy of India.

(ii) Export should not be regarded as merely a surplus after consumption needs of the country are met.

(iii) Export should be given equal importance with the principle of increasing domestic consumption.

(vi) The Indian public should be educated about the marginal nature of the impact of exports on domestic availability and prices.

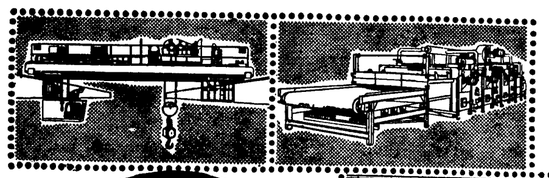
(v) Exports should not be regarded as a diminution in the total output ; rather as one that brings about a qualitative improvement in the output.

(vi) Agriculture and agriculture-based industry should receive the highest priority from the point of view of exports.

(vii) The policy of banning of ports should not be undertaken the first encounter of difficult without careful examination of oth possibilities.

(viii) An export sector should developed and should form an portant part of national exp policy.

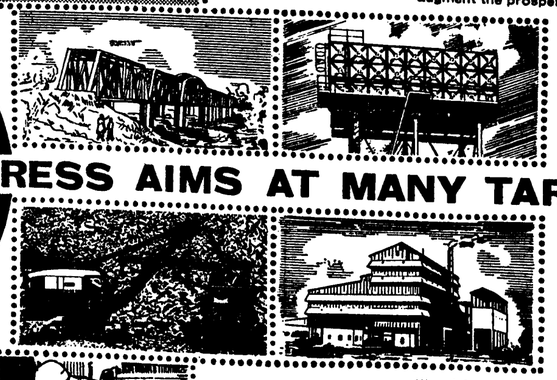
(ix) There is need for an expo policy resolution to be approved the country in the same way as t Industrial Policy Resolution.



(x) Market studies area-wise a product-wise should be intensified.

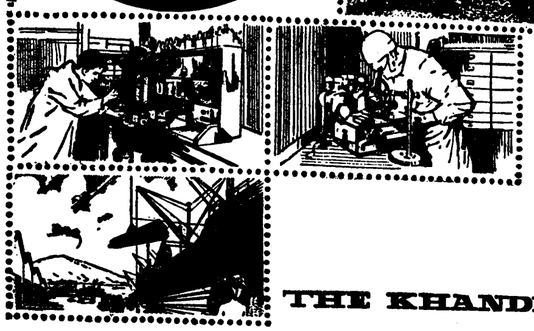
(xi) Target for export should n be lower than that required to me fully the maintenance imports.

(xii) Devaluation seems to be doubtful value.



(xiii) Export incentive scheme should work more efficiently and t greater effect.

(xiv) There is no virtue in setting a date like 1975 for the stoppage o foreign loans and foreign aid. What is needed is to ensure that the country increases her exports rapidly.



...in diverse fields of human activity, ceaseless effort is ever going on, to go a step further than the predecessors, for the achievement of one common goal... Prosperity.

FAULTY PLANNING HOLDS UP AGRICULTURAL PROGRESS

Indian agriculture has not done well during the third plan. Yet a target of 5 percent annual increase has been set for the next quinquennium. The target looks too high.

By
M. S. SIVARAMAN
Member, Board of Revenue, Madras

"OUT of evil cometh good". How true will this be if the prevailing stagnation in agriculture makes one realise that some of the current basic approaches to increasing production need objective study! Instead, uncritical explanations are being offered by some to account for the absence of progress in agriculture in general and food production in particular. The farmer, his practices and the seasons are blamed, but sound planning should aim at a progressive improvement of farming in spite of seasonal variations, and the ills of present-day Indian agriculture cannot be so readily explained.

If the first ten years of planning have shown a rising graph of over 3½ percent in the production of foodgrains, why has it flattened out in the next three years to hardly any rise at all? If the farmer is backward and his methods are primitive and unscientific, how were the acre yields of paddy in the last century nearly double of what they were in the base period of the plans in certain parts of the country? Why should a planned objective of a far lower level of yield be so difficult of attainment? Is there no method capable of wide application which can produce substantial results in a short time? These are problems for which a solution has to be found if Indian agriculture is to be developed to meet the needs of a growing population and economy.

Claims of Increase

Doubts have been expressed about the correctness of the inference drawn from the published figures of increase in the level of production of foodgrains from 57.6 million tons in 1949-50 to 79.7 million tons in 1960-61. Although this works out to an arithmetical increase of about 3½ percent a year, the actual could not have been so high, because of elements of non-comparability. For instance, the reported area under foodgrains has "increased considerably in ten years from 245 million acres to 280 million acres, but only a small part of this represents an actual extension of the cropped area, and the rest is accounted for by rectification of statistical omissions. The cultivated area in the base year was possibly nearly of the same order as 280 million acres. A major part of the production on the extra 35 million acres is now included in total production, but this cannot be called additional production.

Again, the earlier method of computing acre yields through eye estimates has been changed to crop-cutting in recent years. The results obtained by the two methods have been found to be widely different. Thus while eye estimates gave an annual production of 2.2 million tons of rice for Orissa for some years, crop cutting reported a production of 3.6 million tons in 1959, but for statistical purposes, 1.4 million tons have been taken as extra production.

In view of the wide changes affecting both the area and acre yields of the main crops, the reported production for 1949-50 cannot be adopted as such for projecting the likely trends in the future. However it is possible to estimate broadly the result of planned efforts for the more important of the aids to production, namely, irrigation, fertilisers and manures and improved seeds.

Expansion of Irrigation

By the end of the second plan, the gross cropped area and the net area under cultivation became more or less stabilised for the country as a whole. As a result of concerted attempts to exploit the water resources of the country, there has been a sizable addition to irrigation. The area of crops irrigated has increased from 53.7 million acres in the base year to about 69 million acres. Of this, the gross irrigated area under food crops has risen from about 49 million acres in 1949-50 to about 60 million acres by 1961. A part of the increase might have been the result of improvement in area and crop reporting, but even without taking into account this possibility and adopting the accepted yardstick of extra production of one-third ton of grains for every additional acre irrigated, the increase in the output of foodgrains from this factor works out to less than 4 millon tons.

One of the major drawbacks of Indian agriculture is the deficiency of nitrogen in the soil. Some steps have been taken to remedy this by using fertilisers, and as a result, the consumption of nitrogenous fertilisers has increased from 280,000 tons in terms of ammonium sulphate in 1950-51 to about 850,000 tons in 1960-61. A large part of the fertiliser was no doubt applied to cash crops which yield a higher profit to the cultivators; but assuming that the entire additional consumption of fertilisers was on food crops, the extra production from this would be 1.2 million tons—the yardstick of production is 2 tons of foodgrains for every ton of fertiliser.

While emphasis is being laid everywhere on the importance of using inorganic fertilisers, sufficient stress has not been placed on the need to replenish the organic nitrogen in the soil. To rectify this, the then deputy chairman of the Planning Commission, the late Sir V. T. Krishnamachari, was keen in 1957 that the author should take up this matter with the agricultural departments of all the States. In spite of the lukewarm and doubting attitude on the part of many to a programme which involved local initiative and drive and close contact with the farmers, an impetus has been given in several States to the production of composts and use of green manures for the important cereal crops like rice, wheat and barley and there was an increase from 2 million acres to about 10 million acres under green manure between 1956 and 1961.

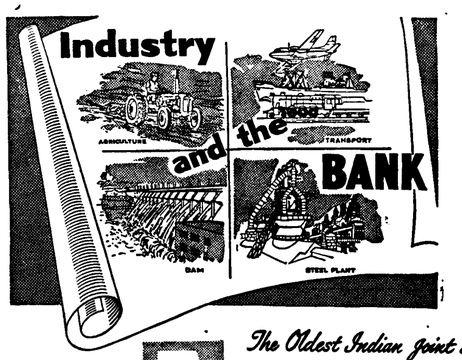
No financial outlay was involved and more spectacular results could have been achieved had the extension agencies directed their main attention to two or three carefully thought-out programmes of this nature where success could be obvious even to a casual visitor. A large part of the increase was in one State, Orissa, where the area went up from about 10,000 acres in 1957 to over 3 million acres by 1961, as a result of the enthusiastic co-operation of some of the principal officers in the State. The conventional yardstick ignores the cumulative effect of the repeated use of green manures : still the additional production from this factor would be about 1 million tons.

Area under Improved Seeds

By the end of the second plan, the area under improved seeds was reported to be about 55 million acres. No correct estimate of the area covered by improved seeds in the base period is available. Several of the important improved seeds for the major cereal crops have been evolved many years ago, and the cultivators have not been lagging behind in taking to high yielding or disease-resistant strains released by the research wings of the Agricultural Department. It is, therefore, possible that a large part of the area was already covered by improved seeds. Assuming that all the 55 million acres was an addition to the area which used improved seeds, the extra production from this would be about 5 percent an acre or 1 million tons.

Broadly speaking, the major growth factors which contribute to additional production could account for about 7 million tons a year by the end of the second plan. Taking this as high as 10 million tons, the actual production in the base year was possibly of the order of 79.69 minus 10 or 69.69 million tons or about 70 million tons. An addition of about 10 million tons in ten years' time will work out to an average increase of about 1.4 percent a year, whereas the population of the country has shown an annual rise of about 2.15 percent. While the rate of increase of population has not fallen off, food production has shown hardly any rise in the last three years.

The reported production of foodgrains was 79.74 million tons in 1961-62, 77.21 million tons in 1962-63 and 78.17 million tons in 1963-64. Thus the production in the third year of the third plan was 1.5 million tons below the level reached at the end of the second plan, and 16.5 million tons below the projected level for 1963-64 according to the third plan! The annual rate of rise during the first 13 years of planning may, therefore, dwindle down to below 1 percent a year, or less than half the rate of increase of population. The obvious consequence of this is seen in the rise of the price levels of foodgrains and general rise in the cost of living.



However that may be, it is obvious that foodgrain production has to go up at a much faster rate than in the past. An increase of 5 percent a year has been postulated as a desideratum during the next few years. But if grain production has to reach a level of 120 million tons in 1970-71, the annual increase will have to be still higher. Having regard to the depressing experience of the recent past, an increase of this order may look completely unrealistic.

The programme for improving crop yields and total production for the next plan are still under discussion in the Centre and in the States : but in effect, it looks as if they will be a continuation of the current approaches with some emphasis on select items like, (i) irrigation, particularly minor irrigation, (ii) increased annual consumpton of fertilisers to 2.2 million tons of nitrogen from the approved target of 1 million ton of nitrogen for the third plan, (iii) coverage of the entire area under foodgrains with improved seeds, (iv) extensive adoption of plant protection measures, (v) large use of improved implements, in particular low power tractors.

Irrigation no doubt plays a vital rôle in ensuring crop production, particularly in a tropical country where the annual precipitation barely extends over the duration of the major crops. However, except in south India where there is a compulsory charge for irrigation, the cultivators in other parts of India in areas of good rainfall resort to irrigation only when the course of the monsoon is adverse. In many States, irrigation is still treated merely as a protection against drought rather than as an assured aid to crop planning and this attitude has to change. According to earlier estimates, irrigation from the major and medium sources may reach 65 million to 90 million acres at the end of the fifth plan in 1976, from about 22 million acres at the beginning of the first plan.

Minor Irrigation Schemes

An additional irrigation of 19 million acres was expected from minor

Blueprints of expansion of a nation's industrial activity require adequate financial resources for implementation.

irrigation sources in the first two plans, but the actual increase was less than 7 million acres. The reasons for the considerable shortfall are not fully known. The common notion that minor irrigation sources are fully exploited soon after execution did not materialise in practice. Any expectation of a considerable addition to the area under minor irrigation has to be viewed with caution, particularly when fresh sources that could be readily tapped may not be found in abundance and the cost of future additions will be far higher than in the past. In any event, the total gross cropped irrigated area by the end of the fourth plan may not exceed 100 million acres which will be an increase of about 30 million acres from the position in 1960-61.

Under Indian conditions, there are two main agronomic limits to the use of nitrogenous fertiliser, namely, (i) availability of sufficient soil moisture during peak requirements like the time of flowering and fruiting, (ii) the response of the crops.

Tenancy Conditions

Besides these, the conditions of tenancy some time act as a disincentive to fertiliser application. An important feature that is lost sight of by many is that over two-thirds of the cultivated area in India depends entirely upon the monsoon rains which fall within a continuous period of three to four months. India is not favoured by nature in this matter, whereas in countries like the United States, there is a fair amount of rain every month. Under the Indian conditions of general high temperature, the nitrogenous fertiliser stimulates very rapid plant growth and excessive transpiration. This accelerates depletion of moisture from the soil with devastating effect if the rains happen to be then unfavourable.

There is a school of thought which holds the occurrence of unfavourable monsoons may be once in three to four years and, therefore, the cultivators should set off this failure against the additional output in normal years. But in the present economic set-up, most cultivators cannot afford to take such risks. There are others who advocate a general use of nitrogenous fertilisers for all crops even under rainfed condition in areas of "assured rainfall" which, according to them, are places where the rainfall exceeds about 40 inches in a year. What is required for the success of a crop is not the total quantum of rain as its proper distribution and this may be far from being assured. Often the distribution is adverse and the farmers come to grief when nitrogenous fertilisers are applied under rainfed conditions even in areas where the rainfall is normally heavy.

The prevailing temperatures and humidity are high in the main cropping season. There is, therefore, great danger of incidence of fungus diseases which thrive when there is extra availability of nitrogen in the soil. For instance, the autumn and winter paddies suffer from blast, and foot-rot in many regions. The crops suffer considerable damage particularly in the later stages of growth, whereas in Japan such fungus diseases cease to be a problem in the maturing period of the crop when the prevailing temperature is low. Some of the major crops like paddy and wheat have weak stems and the plants sometimes lodge in high wind.

If the lodging happens at the time of flowering, the yield is greatly affected. Any considerable increase in the use of nitrogenous fertilisers for cereal crops cannot, therefore, be expected unless non-lodging and high yielding types resistant to diseases are evolved. Attempts at inducing in the local paddies some of desirable qualities of the Japanese and Chinese varieties, have not yielded any significant or practical results. A few promising cultures are now available, but it will take many years before varieties of paddy with a higher intake of nitrogen can be distributed to suit the agroclimatic conditions of the different zones.

When the fertiliser target for the third plan was being considered, the writer had urged that a consumption target of 500,000 tons of nitrogen would be the optimum, but a target of 1 million tons was fixed. The reported consumption of nitrogenous fertilisers for three years from 1961-62 are 221,000 tons, 292,000 tons and 375,000 tons of nitrogen. The writer's estimate of the possible consumption at the end of the third plan appears to be nearer the mark. Apart from the general reasons already given, some of the specific points which the author had in view when he suggested a lower fertiliser target are summed up below :

Target for Fertiliser Consumption

(a) Some of the assumptions made while estimating a consumption target of 1 million tons were in my view completely unrealistic : for instance, the assumption that 40 million acres or 80 percent of the unirrigated paddy area in India would use nitrogenous fertilisers at the rate of 20 lbs of nitrogen an acre by 1956 could never materialise. A major part of the unirrigated paddy area is covered by the winter types which are season-bound. The flowering takes place in October, and the paddies suffer greatly in the areas when the monsoon withdraws prematurely by the middle of September. It is not likely that the cultivators would under such conditions take to the use of the fertiliser on any extensive scale except in low-lying areas where there will be assured moisture.

(b) The assumption that 80 percent of the area under irrigated paddy would use 20 lbs of nitrogen could not also be accepted : for under the prevailing terms of tenancy in many parts of the country, the cost of cultivation is borne by the tenant or landowner and the produce is shared. Sometimes, the proportionate share in the extra return may not compensate for the cost of the fertiliser. In areas like the Cauvery delta in which the cultivators have been accustomed to the use of fertilisers for several decades, the dosage seldom exceeds 15 lbs an acre for fear of lodging and fungus diseases.

(c) Sufficient account has not been taken of the current and future levels of application of organic manures like compost and green manures.

(d) The dosage adopted for sugarcane was 80 lbs (nitrogen) an acre as fertiliser but the optimum ranges from 80 lbs in the south to 40 lbs in Uttar Pradesh and Bihar which contain nearly two-thirds of the cane area in the country and double these as organic manures. A weighted average of inorganic nitrogen for sugarcane will not, therefore, exceed 53 lbs !

Fertilisers are now largely applied to cash crops which yield good profit and future increases in the offtake will have to be mainly for cereals. Apart from price incentives, there will be no great increase in the application of fertiliser to cereals unless there is considerable extension of irrigation. Thus, to consume 2 million tons of nitrogen by 1970-71, the irrigated area in the country will have to be of the order of over 200 million acres by the end of the fourth plan, and every acre of such irrigated area should use at least 20 lbs of nitrogen.

The stupendous magnitude of these assumptions can be imagined when one finds that after several decades of experience in the use of fertilisers and four years of intensive package assistance in a district like Tanjore, the average application is less than 8 lbs of nitrogen an acre for paddy even when every paddy field enjoys the benefit of a fine system of irrigation. As already mentioned, the use of nitrogenous fertilisers under unirrigated conditions in India with a brief spell of rain cannot be thought of for most crops without protective irrigation. At the present rate of progress of plant breeding and extension of irrigation, it is possible that it may not be possible to reach the third plan consumption target of 1 million tons of nitrogen even by the end of the fourth plan.

A programme which aims at covering with improved seeds to 270 million acres out of 286 million acres of cereals and pulses can have no relation to realities, for improved seeds have not been evolved for a major part of this area. Improved seeds have been released to suit about 80 percent of the area under paddy, wheat and barley and this can cover about a maximum of 100 million acres. Some improved seeds are available for pulses and millets for a few tracts. The total coverage under these may not exceed 30 million acres. The programmes for selection or breeding improved seeds for millets have lagged behind because many of the millets are extremely sensitive in their adaptability : for instance, the Periamanjal cholam (jowar) of Coimbatore does not thrive in an adjoining district like Salem. It may be mentioned that attempts were made to produce improved seeds for the Tenkasi tract of Tirunelveli at the Millet Breeding Station, Coimbatore, and seeds which gave good performance at Coimbatore were produced, but they failed at Tenkasi. Millet development is beset with many difficulties, and it is not likely that improved seeds will become available for large areas for several decades.

Agricultural Implements

There is a move to replace many of the existing agricultural implements, in particular, the wooden plough by other types. But as a measure of increasing production, a change in the type of plough will have no effect. According to Russell and Keen, there is no evidence to show that cultivation plays any significant part in increasing crop yields. A review of the past experiments in India has clearly established that the inversion iron plough has no marked advantage over the country plough except for some of the garden crops and for eradicating certain types of weeds. The general finding is that the indigenous tillage implements are quite adapted to local conditions. No doubt local ploughs can be improved to increase their efficiency without adding to the burden on the work animals. But some of the grandiose schemes for introducing several lakhs of power tillers or low horse-power tractors will not result either in quicker ploughing or in eliminating drudgery to the farmer, for the ploughman has to walk behind these tractors and the time taken to plough an acre will be nearly the same as with the bullock plough, being determined by the width of the furrow and the rate of walking ! By and large, the strain on the operator will be greater and the outturn of the power tiller will not be different from that of the ordinary bullock drawn plough : And of what use will these "walking" tractors be for transporting manure or the produce of the fields ? The bullocks will still have to be maintained in addition to the mechanical tillers !

On many occasions the writer has repeatedly stressed that the more correct approach to increasing agricultural production in India is to build up soil fertility and this is possible mainly through traditional agriculture with its emphasis on organic manures. It will be of interest to recall that in an experiment at Cuttack to study the residual and cumulative effects of organic and nitrogenous fertilisers, it was found that after eight years of continued application, there was significant residual effect from the use of composts whereas the fertiliser depressed the yield slightly below the control. The unmanured plot gave a yield of 2,053 lbs an acre, while the plot in which the ammonium sulphate had been applied for eight years previously, the yield was 1,976 lbs when no fertliser was used and the plot which received composts at 8,000 lbs an acre gave a yield of 2,605 lbs. even without any application of manure in the ninth year.

All over the world traditional agriculture with its emphasis on organic manures is essentially sound. But unfortunately, agricultural extension now proceeds on erroneous lines in many places. It is now an axiom with many that crop yields are generally low because the farmers' methods are primitive. The wooden plough is referred to contemptuously as the Vedic plough and an emblem of backwardness. There is considerable visdom and science in what the cultivator does and a failure to recognise this more than any other factor accounts for the craze for misplaced innovations which have slowed down the progress of real agriculture in India.

The general impression that is being sedulously fostered by some that the Indian farmer does not know his job is completely unfounded. Speaking of the cultivators of the Godavari delta, Dr. Roxburgh, the distinguished botanist who had spent 12 years among them observed in 1792 as follows : "When they (the Indian farmers) see a certain prospect of gain with little additional trouble they have frequently been known to

Leaders in Instrumentation

Now Pioneers in Automatic Process Controls

WE LIVE ON THE PAST: Four years ago, we ventured into the manufacture of a wide range of industrial measuring instruments in collaboration with Electroflo Meters Co. Ltd. of U.K. a member of the Elliott Automation Group. ■ WE LIVE IN THE PRESENT: Our present range of measuring instruments has been fully accepted by users as conforming to the rigid specifications required of precision instruments. Some users have done us honour of specifying the brand name 'Mahindra-Electroflo' against their requirement. ■ WE LIVE FOR THE FUTURE: And now we look ahead, with plans under way for the manufacture of a further range of sophisticated pneumatic, electronic, hydraulic process control equipment in collaboration with the same British Group. These instruments will find wide application in industries like... steel, paper, power generation, chemicals, fertilisers etc. where precise measurement and accurate control of Flow, Level, Pressure and Temperature is required.

adopt improved practices. The sugarcane impoverishes the soil so much that it must rest or be employed during the two or three intermediate years for the growth of such plants as are found to improve the soil of which the Indian farmer is a perfect judge. The leguminous tribe they find best for that purpose." The practical application of symbiosis and green manuring was well known to the Indian cultivator long before its scientific background was discovered in Europe in the last century.

Cotton Cultivation with U.S. Help

It may be of interest to narrate how the East India Company in its anxiety to promote cotton cultivation obtained the services of a few American cotton planters to teach the Coimbatore cultivators, as it was then considered that "the American system was based on simple principles of vegetable physiology and nearest approach to perfection." These planters came with their complete set of farm implements and tools and tried out the methods then prevalent in America.

In a detailed report made in 1845 on the results obtained, Dr. Wight observed as follows: "A few years' experience showed that the primitive implements of agriculture in India are well adapted for cultivation under local conditions" and that "the habitual rotation system is a thousand times better adapted to the soils of this country than the farming, one without rotation of America which in obedience to the practice of our instructors—the American planters—we have been hitherto required to adopt, but which they have also become now thoroughly satisfied is not applicable to the soils of India."

Dr. Wight also observed that "the American plough is better than the native one, but when the ground is turned over two to three times with the latter, the preponderance is not so much in favour of the former as might at first be supposed, a point on which we have had sufficient experience to enable me to speak with considerable confidence." His conclusions were that (a) the country ploughs were as good as the American ploughs, (b) riding of rows had to be discarded in order to conserve moisture in the soil and (c) cotton had to be rotated with other crops unlike in America." The story of the introduction of the American methods in Madras where the soil and climatic conditions are totally different should be a warning to those who now condemn the country plough and the local agronomic practices as fit to be scrapped and replaced by tools and practices of alien origin. But the lessons of history appear to have been forgotten.

It may be useful to refer to some observations of the Madras Board of Revenue in 1873 which are of topical interest. "The Board wish to say in vindication of the 'degraded' agriculture stigmatised by Dr. Robertson (then Superintendent of the Saidapet Experimental Farm) being persuaded that most of its shortcomings are due to want of means, rather than want of knowledge of first principles. There can be no greater error than to suppose the ryot ignorant of or indifferent to the use of animal or vegetable manure. He spares no pains in procuring both, carts leaves from the jungle to supplement his deficiencies ..... the Land Settlement Report on the charges of cultivation will show the place which manure occupies in the Hindu scheme of agriculture and the importance attached to cleaning the land. But the Board does not press this view so far as to deny that there is a great room for improvement: their object is to show that it is absolutely necessary before taking a decisive action, to know the real condition of agriculture in this Presidency and form a clear and just idea of where it is wanting and of what nature should be the remedies."

There is great practical wisdom in these observations of experienced administrators who had studied rural life with an earnestness and thoroughness which could well be copied, but it is unfortunate that some of the current methods for stimulating production partake of the wrong approaches mentioned by the Board of Revenue, Madras.

Vitality of Indian Agriculture

According to reports left by early Collectors the paddy yields in various districts in Madras at the beginning of the last century were nearly double of what they were during the base period of the plans. The high yields were obtained within a few years of the devastating effects of local wars and bear abundant testimony to the inherent vitality of Indian agriculture and the soundness of the traditional practices.

There has been undoubtedly a decline in the productivity of the soil, but this cannot be attributed to the ignorance of the cultivator or adoption of wrong methods. The decline was the result of development of conditions which have made it difficult to follow some of the old practices like the large-scale use of leaves and manures in cultivation. With the spread of cultivation the supply of manure leaves has dwindled. But it has been shown as a result of certain practical measures initiated by the author over 17 years ago in Madras that the leaves necessary for any holding for green manuring irrigated fields or for use on dry lands after composting can be produced from within the holding or along its borders without in any way affecting the usual crops.

A switch back to the traditional practices and level in the matter of manuring can be brought about within three to four years on over 90 percent of the cultivated area in India in the same way as was accomplished in every one of the State agricultural farms in the composite Madras State between 1951 and 1953. It may be recalled that the green manured area in Tanjore district was less than 200,000 acres in a year for several decades, but within three years every field in this district containing 1.4 million acres of paddy had a border crop of Sesbania in 1955 even before the community development programme was introduced in the district. This is equally possible in every village and on every holding in the country. No large staff is required, for the spread of Sesbania in Tanjore district was done with the limited staff then available in the Agricultural Department. What is required is enlistment of local enthusiasm and given proper direction it should not be difficult to achieve the same in every place for the very large staff of extension workers now in the country. This will be the beginning of a real leap forward in Indian agriculture.

Requirements of Tropical Agronomy

Many instances can be cited of striking improvement in production within a few years when an approach consistent with tropical agronomy is adopted; for instance, the average acre yield of paddy in the Aduthurai Research Station in the Cauvery delta was 1,860 lbs in 1948-49, and the standard of cultivation in this farm was then considered to be quite high. The acre yield was stepped up to 3,330 lbs, nearly double of what it was four years earlier, mainly by the adoption of a new approach to the production of green manure seeds initiated by the writer. The total output of paddy in the farm went up from 107,000 lbs to 233,000 lbs and at the same time, the production and use of green manure increased from 20 tonnes in 1948-49 to 397 tonnes in 1952-53. A partial adoption of these successful methods demonstrated in Aduthurai completely changed the food situation in the State from a deficit to a surplus economy within four years and the effect of this was seen in a spurt in the acre yield of paddy, whereas there was a steady declining trend for over two decades before 1950. The late Prime Minister of India, Pandit Jawaharlal Nehru, had on more than one occasion referred to the impact of this green manure programme in Madras on the agricultural economy of the State.

At Cuttack the average of yield of paddy in a plot of about five acres in which a permanent manurial experiment was conducted was 2.474 lbs in 1950-51; as a result of the cumulative effect of the application of green manures at 5,000 lbs an acre, the yield from each acre increased steadily from year to year up to 3,461 lbs in four years. The yield of paddy at the Coimbatore Central Farm likewise increased from about 2,000 lbs to 4,000 lbs in a period of 20 years, and according to the memoirs of the Madras Agricultural Department, this was the result of systematic growing of green manure crops in rotation with paddy.

Average Increase in Output

The average annual increase in production was over 21 percent in Aduthurai, over 10 percent in Cuttack and 5 percent in Coimbatore, in complete contrast with the halting progress of the last 13 years in the country. These instances from different agroclimatic zones show unmistakably that soil fertility can be built up and the acre yields increased within a few years by a reversion to some of the traditional methods which have stood the test of time. In places where the traditional methods are still observed, the crop yields continue to be high.

For example, in the Thambravarni valley of Thirunelveli district, the yield of paddy is over 4,000 lbs an acre in large areas, nearly double the State average. Here the paddy fields are not inherently fertile. The soils are often shallow with sheet granite underneath: but the farmer has continued to apply large quantities of leaves, brought from outside, and thereby the fertility of the soil is maintained at high levels. Now that there is a method by which the required organic manures can be grown from within the cultivated areas without affecting the crops, the level of manuring can be raised all over the country to what obtained in the last century and restore soil fertility to the old levels and also improve on them in the light of present-day advances in plant nutrition, plant breeding and plant protection.

It is not possible to progress far when the real organic base of agriculture is neglected and the blame is placed on the weather: for it should not be forgotten that in the old days when the seasons were not very different, crop yields were far higher. Those who blame the weather forget that sound planning in agriculture should eliminate as far as possible the adverse effects of seasonal variations by adopting helpful agronomic practices to overcome the twin problems of Indian agriculture, namely, deficiency of soil nitrogen and of soil moisture.

It is not generally realised that some of the methods now sought to be widely extended actually aggravate the difficulties which the Indian farmers face. For instance, extensive use of nitrogenous fertilisers under unirrigated conditions may lead to depletion of soil moisture during the critical phases of plant growth and depress production. Application of chemical fertilisers without addition of organic manures inhibits the population and activities of the natural agencies of soil recuperation like the earthworms, and microflora. Large scale use of high-yielding seeds without adequate manuring will reduce the store of plant nutrients and moisture in the soil and lead to diminishing results.

Lack of Adequate Drainage

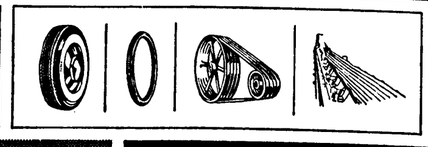
Extension of irrigation without attention to drainage has resulted in the rise of ground water to unhealthy levels in Punjab. In large areas in Punjab and Uttar Pradesh saline and alkaline conditions have resulted in the soil from defective drainage. Excess of moisture in some of the areas under the Hirakud project in Orissa has reduced paddy production in the lowlying fields which used to produce high yields in the pre-project days. Large-scale use of pesticides has destroyed the farmer's friends like the frogs, lizards, snakes and bumblebees which help to keep down many noxious insects. There can be no doubt at all that an important reason for the relatively tardy progress of agriculture in recent years is the self-stultifying effect of some of the major inputs of production.

In the anxiety to quicken the pace in agriculture, attempts have been made to stimulate production through short cuts, ignoring their fuller biological implications. We cannot supply concentrated nitrogen to plants without promoting transpiration and depletion of soil moisture. We cannot grow plants with higher potential for yield without draining the soil of moisture and plant nutrients. We cannot destroy the pests of crops without at the same time destroying the beneficial creatures and organisms. The resultant of some of the productive efforts has been stagnation after an initial rise, but steady progress can be ensured only when the approaches are attuned to the requirements of tropical agronomy. Nature's laws are inexorable: we can conquer Nature only by stooping to her dictates, but not in violent opposition.

NATIONAL RUBBER MANUFACTURERS LIMITED was incorporated eighteen years ago. Today, the House of NRM represents *the largest single unit in India* manufacturing Industrial and Mechanical Rubber Products. Its activities include production of Cycle Tyres and Tubes, Rickshaw Tyres, Railway Rubber Fittings, all types of Hoses, Industrial 'V' Belts and Fan Belts, Transmission and Conveyor Belting.

A *second major expansion programme* envisages increase in production capacity of Cycle Tyres and Tubes and also the manufacture of new items like P.V.C. Conveyor Belting and Reclaimed Rubber. This expansion is not just the result of the need to meet the increased national demand for NRM products, but also to fulfil the ever-widening export commitments

Recently, the House of NRM sponsored INCHEK TYRES LIMITED—the first wholly Indian-owned Automobile Tyre Company. Marketed under the brand name "INCHEK" these tyres have already won widespread consumer acceptance for quality. The company is already planning the expansion in production capacity from 1,80,000 to 3,00,000 each of tyres and tubes and 6,00,000 kgs. camel back annually.



Inchek Tyres Limited

In brief these are the activities of the House of NRM. They represent NRM as a progressive organisation within the growing economy of the country. They demonstrate that the House of NRM is ever-attuned to the contemporary needs of the nation

HIGH TAXES RETARD PROGRESS OF ROAD TRANSPORT

Taxation of road transport in India is the highest in the world. But the sums spent on road development are very small despite the need for better communication facilities.

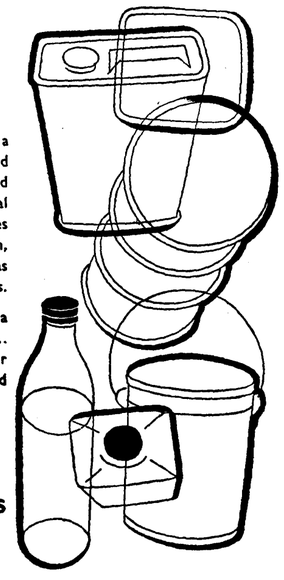
By

F. P. ANTIA

IMPROVED communication facilities are basic to the success of any plan for economic progress. While not discounting the importance of other transportation media, it can be said that roads have a vital rôle to play in the economic development of India. Essential to the well-being of a modern State, they are both a national amenity and an economic asset. The history of the world is replete with examples of economies vitalised and revitalised by highway construction—particularly the modern motorways linking strategic areas with each other and providing a cheaper, speedier and more efficient transportation agency than any other for the carriage of men and materials.

Italy was the first country in the world to build roads exclusively for motor traffic—with her "autostrada" linking principal cities and ports and running from Rome to Ostia, and Naples to Pompeii. Although, judged by modern standards, they leave much to be desired, this pioneer attempt is creditable for initiating the idea of segregating fast-moving, long-distance traffic. United States road engineers, however, went far beyond the Italians in devising plans for modern roads. None can fail to marvel at the breadth of vision and tremendous engineering skill symbolised in the construction of her superb motorways, magnificent flyways, and sub-surface expressways as, for example, in and around Detroit, New York and Los Angeles.

Trunk Road System



One of the finest examples of a complete modern trunk road system constructed to a national pattern is the German network of "Autobahnen". Their clean simplicity of line is both æsthetically satisfying and permissive of continuous speed with safety. France with her routes nationales, and Sweden with her superb flyways, elevated highways and sub-surface roads, provide further examples of the miracles of modern engineering. The advanced economies apart, numerous underdeveloped countries have launched ambitious road development programmes guided by the fact that nothing can stop the expansion of motor traffic and that ultimately a complete system of highways designed on a national scale has to be provided for. The pertinent question is: Can India afford the so-called "luxury" of these magnificent modern roads?

To begin with, it is a universally acknowledged fact that the road density in India is inadequate and out of line with the mounting needs in the country. With barely 0.36 mile of road a square mile of area, the country stands at the bottom of the road map of the world. Qualitative deficiencies in road surfacing and geometrics are equally deplorable. These alarming conditions, coupled with the current hand-to-mouth method of financing for road development in India, would lead one to imagine that the achievement of a road network comparable with that of an advanced industrialised country is almost impossible for her for decades to come. While the country has a long way to go to rival western highway standards, road transport is the one sphere of its economic activity wherein progress should not be retarded for financial or other reasons.

Contrary to the position that obtained half a century ago, the motor-vehicle today is not a mere "toy of the rich". Even assuming that the road transport industry did not pay sufficiently for its own advancement, it will have to be very high up in the country's list of priority during the successive five year plans, as a basic economic necessity for promoting its rapid advance. That this has not been so is regrettable, particularly because road transport operations constitute a major source of revenue to both Central and State Budgets, contributing to the State coffers far in excess of the disbursements made.

Taxation on road transport in India is notoriously high; it is, in

A COMPLETE SERVICE IN QUALITY PACKAGING

Containers and Closures Ltd., provide a complete service in drums, containers and metal seals. Outstanding in printing and experts in fabrication, backed by international skill and experience, Containers and Closures particularly assist the Paint and Varnish, Chemical, Mineral and Edible Oil industries as well as Confectionery and Biscuit manufacturers.

Whatever the shape or size, whether it be a steel keg,a tin container or a pilfer-proof cap... ...your product can be tailor-packaged to your specifications. And remember, durable and attractive packaging sells.

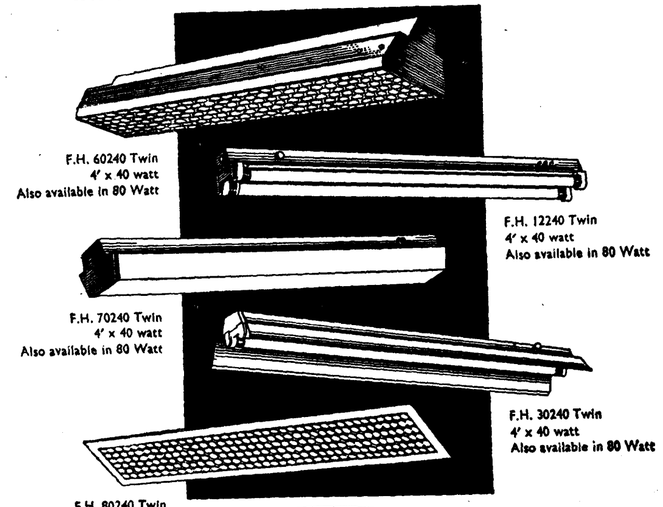
act, the highest in the world—averging Rs. 3,700 a year a vehicle, a igure which is over seven times the mount paid in an affluent society ike the U.S.A. High road taxation n India is a compound of a perplexng variety of levies, imposed at all evels—Central, State and municipal —and at all stages from the manufacture of vehicle components to vehicle operation. Thus the total revenues from road operations during 1963-64 amounted to Rs. 264.3 crores and are expected to be not less than Rs. 276.47 crores during the current financial year. In sharp contrast to these appreciable figures stands the paltry sum of Rs. 127.2 crores which was expended on road development during 1963-64. At a time when the country needs more and better roads with increasing urgency as an instrument to promote economic growth, it is indeed difficult to understand why large sums are being diverted from road transport to general revenues year after year.

The answer to this persistent neglect of road facilities may partially be sought in the attitude of the authorities concerned—an attitude strongly biased in favour of the railways. The very fact that colossal sums are being spent on railway development while the promotion of road transport—indeed of all other modes of surface transport—is being retarded, has rendered the country's entire transportation structure the Achilles' heel of its planning. Efficiency in transportation being an indispensable element in economic growth, the pulsation of the economy at every stage of production, distribution and consumption is extremely sensitive to its adequacy or otherwise. it is indeed a vulnerable sector in the entire infra-structure of planning.

One would have expected that the third plan, based on the lessons learnt from the two preceding plans, would be structurally better integrated, making full allowances for transport capacity to develop in step with production. As things stand, even assuming the railways augment their capacity to 260 million tons as scheduled, there being no other well-developed agency of transport, the burden of hauling some 115 million additional tons of traffic expected to be generated at the onset of the fourth plan, will inevitably fall on roads. The severe incongruity between supply and demand can well be appreciated when one considers that the total road facilities through the length and breadth of India will be geared to cater to some 25 million tons only, at best, at the close of the current five year plan.

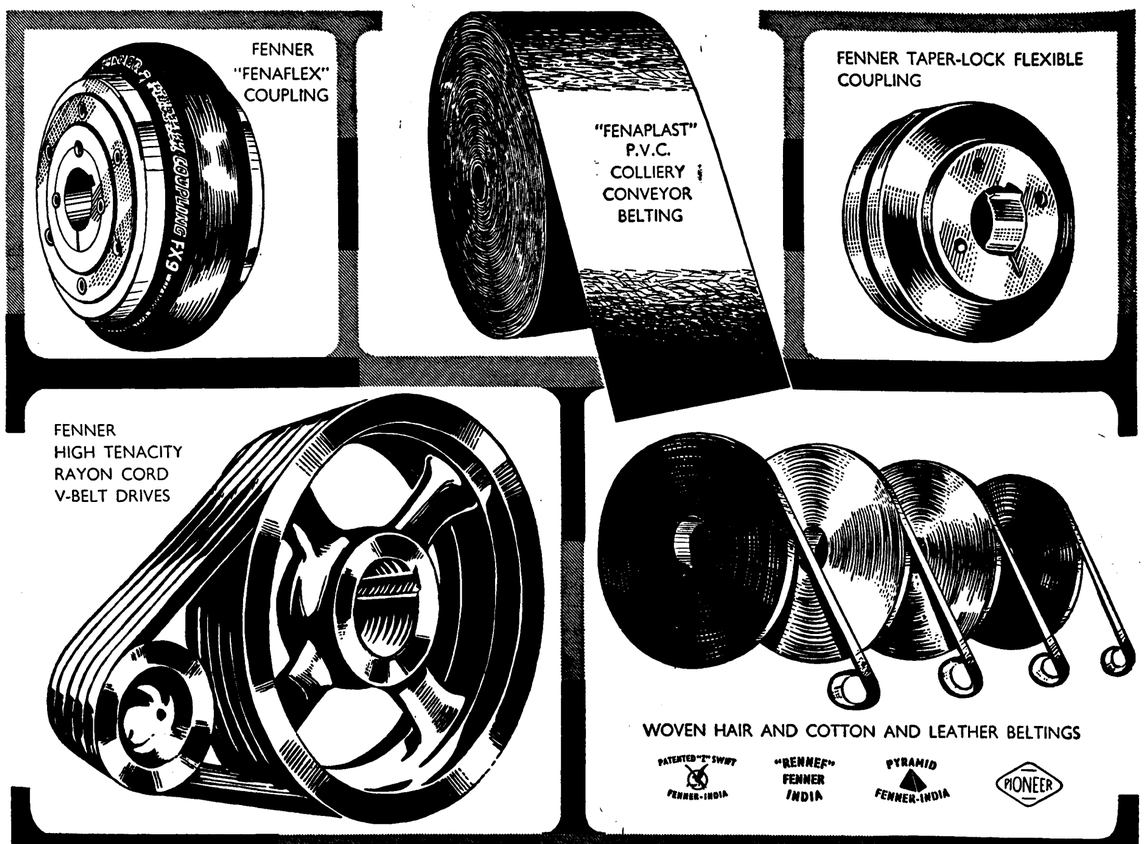
Strongly railway-oriented as it is, transport planning in India leaves much to be desired. In a world of increasing road-mindedness, the railway, the marvel of a bygone century, is beginning to become an obsolete agency of transport except in certain special fields. The severe rigidity of its operations renders it infinitely less efficient than the flexible modern mechanised road transport. As a less efficient agency is being sedulously nursed with the lion's share of investment in transport, it is inevitable that the improvements made in transport in the decade-and-a-half of planning have been only marginal.

The effects on the transport situation apart, the capital and employment aspects of rail and road transport exert their repercussions in varying ways on the economy at large. In the agrarian districts of the country, labour immobility through ignorance, lack of transport, etcetera, results in fractional and disguised unemployment in addition to the widespread undisguised unemployment that looms large in the country. The only way out of this economic "impasse" is an all-out attack on economic backwardness—a line of action in which the rôle of road transport can in no way be overestimated. Road transport, with its remarkable flexibility, can traverse almost any terrain, not open to the railways. The fact that it has the requisite capacity to reach rural India with her huge potential employable labour force is of tremendous significance. The employment potential of road transport is truly amazing. In the U.S.A.—a country with considerably less than half of India's population—the motor-car industry provides employment to 11.9 million persons. For a commercial vehicle, the National Council of Applied Economic Research in India has estimated labour potential at 12.63 persons—a point overwhelmingly in favour of extending road transport services on as wide a scale as possible.



As is only too well known, the rate of capital formation in India is regrettably low because savings in proportion to income are low. Under these conditions, economic wisdom dictates the extension of technical progress which is by and large capital-saving and not labour-saving. Compared with the railways, road transport is far the less capital-intensive agency, requiring less than Rs. 3 lakhs a mile for the construction of a dual-carriage road, against the Rs. 7 lakhs to Rs. 10 lakhs required for a corresponding length of a railway line. In this context, it must further be borne in mind that while technical progress creates those conditions under which a higher rate of capital formation may be obtained, its mere absorption in the economy does not connote that the rate of capital formation will automatically tend to rise in proportion. As long as capital formation is not stepped up in keeping with the massive investment made, there is a growing disequilibrium between the growth of work force and the growth in employment. In the context of investment in road transport, however, the problem does not arise, as the very forces governing the rate of capital formation increase to the extent necessary to absorb the labour force, both actual and potential.

Employment Potential



There is no denying that a high rate of capital formation is the only way out of the rut. By augmenting carrying capacity and economising on capital, road transport. while simultaneously opening up new vistas of employment to India's labour force, can make a significant contribution to this end.

India's chief problem in planning today is the achievement of a more balanced growth. The penetration of a road into a hitherto depressed region has been instrumental in revolutionising areas in both the developed and underdeveloped world. With the opening up of such areas and the provision of more effective links, larger and more profitable markets develop, new industries are attracted, wage bills rise, demands increase and diversify. No railway network, however elaborately planned, can bring about quite as spectacular an achievement.

CHECKING THE CONCENTRATION OF ECONOMIC POWER

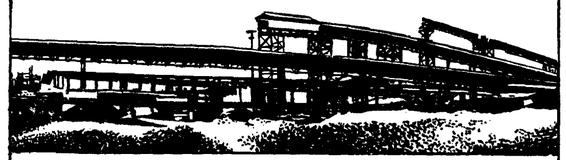
The Monopolies Commission faces a difficult task. It has to steer clear of popular prejudices and make an objective assessment of the nature of the so-called concentration of economic power. To shackle large-scale enterprises in the attempt to curb monopolies would be a mistake.

By
N. DAS

THE bogey of concentration of economic power has been with this country ever since the Constitution was adopted in 1950. The preamble to the Constitution solemnly resolved to secure to its citizens social, economic and political justice and equality of status and opportunity. The Directive Principles of State Policy—an important part of the Constitution—also said that the State shall direct its policy towards ensuring, among other things, that the operation of the economic system does not result in the concentration of wealth and the means of production to the common detriment.

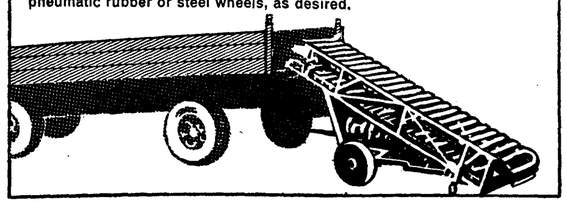
These objectives have been reiterated on many occasions both by the Government and the Planning Commission. As a matter of fact, one of the specific objectives of the third five year plan is "reduction of disparities in income and wealth, prevention of concentration of economic power and creation of the values and attitudes of a free and equal society". Even as the draft outline of the plan was being considered, the Government felt that an enquiry should be made "to study recent trends in the distribution of income and wealth and, in particular, to ascertain the extent to which the operation of the economic system has resulted in the concentration of wealth and the means of production". A Committee on the Distribution of Income and Levels of Living was accordingly appointed on 13th October, 1960, with Professor P. C. Mahalanobis as chairman. The Committee submitted the first part of its report in February 1964: this covered the main issues of recent trends in the distribution of income and wealth and of concentration of wealth and the means of production.

A Curious Document



The report was a curious document in as much as it made the frank admission that (a) the required data were not available for a direct study of the question of income distribution and no firm conclusions could be drawn on the subject and (b) even the data on concentration were inadequate and incomplete. Yet, it made certain observations on both the issues which seemed to confirm the popular belief that there had been an increase in the inequality of income distribution, particularly in the urban sector, and that the operation of the two plans had facilitated the process and increased the degree of concentration. Within a few days of the submission of this report, a Monopolies Commission was set up (a) to enquire into the extent and effect of concentration of economic power in private hands and the prevalence of monopolistic and restrictive practices in important sectors of economic activity other than agriculture and (b) to suggest such legislative and other measures that might be considered necessary in the light of such enquiries. The Commission got down to work towards the middle of 1964 and is expected to submit its report some time in 1965.

Although doubtful about the need for the appointment of a Monopolies Commission, the business community has accepted it with good grace, because it feels that an impartial and objective enquiry by an independent commission headed by a former Supreme Court Judge would expose the hollowness of the myth of monopoly and the concentration of economic power in the private corporate sector in India today. It will be interesting to recall in this connection that only a day prior to the announcement of the appointment of the Commission by the Central Finance Minister, Mr. Nityanand Kanungo, the then Central Minister for Industry, had assured the Lok Sabha that "the existing procedures and laws are sufficient to see that no monopolies are possible in the field of production".



Words like "monopoly" and "concentration of economic power" raise

such emotive feelings that it is necessary to know what precisely one implies when one uses them. The term "monopoly", in the strict sense, signifies sole control over the supply of any commodity or service. According to classical economic theory, the strength of the monopolist lay in his power to raise prices by regulating the supply as he pleased. It followed, by implication, that the activities of the monopolist were to the detriment of the consumer and of the community.

This classical concept of "monopoly" is, however, no longer valid in the world of today. It has been replaced by the concepts of duopoly, oligopoly, monopolistic competition and imperfect competition. In actual practice, in no country or industry is there one individual or company controlling all the supply (including possible substitutes). Secondly, monopolistic conditions of supply and price-fixing are not always disadvantageous to the community. Situations exist in which monopoly brings substantial benefits to the consumer—much greater than what could be had under conditions of perfect competition.

Three Schools of Thought

Broadly speaking, there are three schools of thought on the subject of monopoly. In the U.S.A.—the home of the classical tradition of economic theory and public policy—competition is regarded as an influence tending towards lower costs and prices, better quality and technological progress, because of inter-company pressures and the elimination of marginal enterprises. Socialist economic theory, on the other hand, regards competition as a source of duplication and waste and a cause of the degradation of quality and labour standards. Both the schools of thought, however, agree that unregulated private monopoly leads to excessive prices and profits, restriction of output, delay in the adoption of better production methods, and the impairment of quality and labour standards. Then, there is a third view which regards restrictions on competition as not inherently evil, but as a device of varying significance leading sometimes to monopolistic abuses, but more often to economies in production, rationalisation of industry and protection of business and labour from wasteful excesses of competition.

Before one can answer the question whether monopoly exists in India or not, it may be pertinent to point out that, even in western countries, information on the subject is incomplete and insufficient. Secondly, there is a lack of standards of judgment by which to determine the relative importance of different kinds of facts. There is also no agreement among economists and public men on some key issues like (a) how much competition is desirable and (b) whether it is possible to preserve this competition without adversely affecting the interests of the community. Data on the subject are even more fragmentary in our country; nor is there any accord on the main issues.

Does this country have "monopoly" in any form today? There are many examples of monopoly to be found in the public sector, *e.g.*, the railways, the telegraphs, the telephone industries, life insurance, civil aviation (internal) and certain fields of import and export. As many of these fall into the category of public utilities in which monopoly is considered desirable for economic reasons, no one is perturbed even when the State does manipulate the price or supply or both—not necessarily for the benefit of the consumer.

It has, however, been alleged that monopoly exists in certain segments of the private corporate sector. Now, we all know that there is no monopoly in terms of *absolute* control over supply. But is there even *substantial* control over supply in any field of economic activity? Here, it would be useful to apply the yardstick of western countries. The practice in the West is to regard a situation as monopolistic where, broadly speaking, at least one-third of the market is in the hands of a single firm or group of firms. In the United Kingdom, for example, under the Monopolies and Restrictive Practices (Enquiry and Control) Act of 1948, a case can be referred by the Board of Trade to the Monopolies Commission for enquiry if one-third of an industry is in the hands of a single company or a group of companies acting together. A recent study made by the Economic and Scientific Research Association, Calcutta, shows that in only three or four industries (cigarettes, soap, refrigerators, fluorescent lamps and electric fans), are there single units producing more than one-third of the total output of the industry.

Even in these cases, this is due either to superior efficiency and lower cost, or to the fact that they are pioneering units and others have yet to follow their lead. As a matter of fact, even the Mahalanobis Committee conceded that (a) the monopoly or semi-monopoly position enjoyed by a few concerns at the beginning of the first plan period has been considerably reduced as a result of steady expansion of the industrial sector (including the public sector) during the last decade or so, and (b) there was some justification for such localised industrial concentration in terms of the economies of scale.

This brings us to the question of bigness in the private corporate sector. In any democratic "have-not" society, "big business" is looked upon with suspicion by the man in the street. This suspicion becomes particularly acute when it so happens, as has happened in the scarce economy of this country today, that the smaller units and individuals—whether producers or consumers—do not have easy access to what they require for their own use (either production or consumption) while the bigger units or more prosperous individuals seem to wallow in plenitude. The slogan of monopoly and/or concentration of economic power is then raised and "big business" held responsible for the difficulties and travails of others.

Now, as everyone knows, bigness is the inevitable result of recent advances in technology. It is the fruit of mass production and mass consumption and is an index of economic progress, offering considerable opportunities for the reduction of costs, providing funds for research and enabling a large number of working population to maintain a standard of living which small business simply cannot provide. As a

BCA 3463R

matter of fact, all over the world, economic progress has been characterised by a steadily growing tendency towards the formation of large enterprises on the one hand and the growth of various types of integration on the other. Even the Mahalanobis Committee has said: "There is such a thing as the economy of scale which works in favour of big business, on purely economic grounds, and economic considerations are certainly relevant especially in the context of our scarce resources and the imperative need for our making the most economic utilisation of these resources. In many industries, the size of the domestic market is small in relation to the size of the plant at which maximum average costs begin to obtain; and any attempt to reduce the degree of concentration by breaking down economic-size units into a large number of uneconomic-size plants would only lead to economic waste".

Technological Developments

Then again, a country which intends to export on a large scale cannot afford to ignore the costs of production. India must sell at international prices and, to be able to do so, those units which hope to sell their products to foreign countries, must be abreast of the latest technological developments. This is possible only when the units are big. Secondly, leading foreign companies would ordinarily enter into collaboration arrangements only with firms of standing and repute—firms which have plenty of resources, managerial talent and technical competence. Because of their own international standing and power to dictate terms, the latter can also pick and choose their foreign collaborators.

Even so, our "big business" is really very small by international standards. In *Fortune's* latest (1963) list of the 200 largest foreign companies in the world ranked by sale and assets, there is the name of only one Indian Company, namely, Tata Iron and Steel, and it ranked 186th! Its sales and assets were $192,307,000 and $332,242,000, respectively, as against the sales and assets figures of $6,521,292,000 and $10,651,001,000 of the No. 1 largest foreign Company, *viz.*, Royal Dutch-Shell.

It is, however, argued that while there may not be any monopoly or semi-monopoly in India in the accepted sense, there is some concentration of economic power in the private corporate sector, especially when viewed from the angle of the economy as a whole. According to the Mahalanobis Committee, "there are a small number of individuals or groups who have in their control significant volumes of economic power in terms of capital, income, employment or media of communication which, though not consisting of a large percentage share of the national aggregate in each case, nevertheless set them so much higher than any other individual or group in the relevant context that it gives them a disproportionately large influence and enables them to exercise economic power not measurable statistically by mere ratios of concentration".

Unfortunately, this rather sweeping statement has not been buttressed by any scientifically processed and objectively presented data. Although the relevant chapter of the report and the appendix contain a number of tables, misleading or unwarranted conclusions have been drawn from them. For example, an analysis of advances made by scheduled banks to industry shows that the main beneficiaries have been the big and medium enterprises. Similarly, the share of loans in the total liabilities in the case of a few top "complexes" or "groups" has been shown to have increased to some extent during the period 1951-58. From this, the conclusion has been drawn that this has increased concentration of power in a few hands! Apart from the obvious fallacies, the fact has been completely overlooked that—far from increasing concentration—loans made by various financial institutions have subjected the borrowing enterprises to a more continuous scrutiny and caused a dent in their economic power! Similarly, figures have been given of 20 selected groups having increased their share of all corporate private capital from 29.2 percent to 34.2 percent during the period 1951-58, and the conclusion has been drawn that this was another evidence of the increasing tendency towards concentration!

The Mahalanobis Committee has obliquely hinted that a few groups in the private corporate sector wield a considerable amount of economic power through the devices of intercorporate investment, common managing agencies, common directors, etcetera. It has been conveniently overlooked that such devices are by no means peculiar to this country: similar arrangements are recognised methods of business in the developed countries of the West where the State is ever zealous to curb monopolies or monopolistic combinations. Secondly, such devices promote operational efficiency and reduce costs. Finally, the Government of India already exercises a number of countervailing powers and can and does put a stop to any abuse of these devices by any particular company or group.

Regulatory Powers

The last point needs to be amplified. Although there is no law at present specifically preventing monopolies, the Government has wide powers for regulating production, prices, profits and the movement and distribution of goods. These powers are exercised under the Industries (Development and Regulation) Act, the Essential Commodities Act, the Indian Companies Act, and various other Acts. During the last decade or so, the Government has made ample use of these countervailing powers and has seen to it that no single company or group is able to dictate what should be produced or sold and at what price. The entry of the State into industry and trade in a big way has further diluted any kind of concentration of economic power that might have existed in the private corporate sector. All the five year plans hold diffusion of economic power as one of their main objectives, and ever since the first plan was drawn up, the development of the private corporate sector has been made to conform to the pattern envisaged by the planners.

It is sometimes alleged that the Government's own policies have, instead of effecting a diffusion, led to further concentration of economic power in the private corporate sector. It has been stated, for instance, that "concentration is the fruit of Government planning and licensing policy in the industrial sector and the exercise of such concentration that exists in the big managing houses is, partly, the result of licensing which, in turn, is often directed by considerations of optimum size in particular industries". It is true that the Government's licensing policy has tended to give a certain degree of protection to producers at the expense of efficiency and has, to some extent, kept out competition, but this has been due to the fact that there is only a limited market for certain commodities and it would obviously not have been in the public interest to have granted licences to all and sundry. Secondly, certain industries are comparatively new to India: other units would come in only if a demand for the product has been already built up. New fields of industrial activity are necessarily pioneered by single units or at best by a very small number. Thirdly, there are industries which, by their very nature, do not admit of a large number of units either because of the huge capital outlay involved or of the comparatively limited market. In all these cases, the fact that more units have not come in yet need not be viewed with any great apprehension.

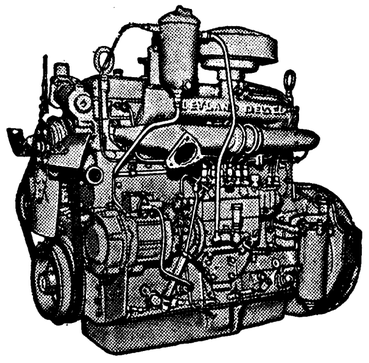
Planned Development

Planned development was initiated in this country only 13 years ago. Thirteen years is not a very long period of time in the history of a nation. Even so, all available evidence indicates that whatever quasi-monopoly or concentration of power there was at the beginning of the first plan period has become considerably diffused by now. In any case, there is no concentration of economic power (in the private corporate sector) of the type which one can see in some of the western countries.

In India today, the State has stepped in as the "countervailing power" in a big way. I had referred to the phenomenon as early as in 1961 in the third revised edition of my book, *Industrial Enterprise in India*. Since then, the State has assumed further powers, both direct and indirect, to contain "the original powers of capitalism".

Among the conditions that are necessary for preventing undue concentration of power in any industrial group, two are of special importance. Firstly, there should be no combination among the larger units and, secondly, there should not be any serious impediment to the entry of new enterprises. Both these conditions are to be found in India today. There is keen competition among the companies in the same industry, whether they are managed by managing agents or boards of directors. There has been no evidence of collusive combinations among them to restrict output or to raise prices. Even on the rare occasions when output has shown a tendency to fall, or prices a tendency to rise, due to the operation of factors over which industry has no control (*e.g.*, the shortage of raw materials or levy of heavy excise duties), the Government has appeared on the scene and sometimes compelled the units concerned to get on with production and distribution even at a temporary loss. As for the entry of new enterprises, not only do existing industrial groups have no powers to stop such entrants, but they submit gracefully to any measure the Government takes to broaden the industrial base.

As for market power, the scope for concentration is even less. The prices of many important commodities (*e.g.*, steel, motor-cars, cement, coal, petroleum, fertilisers and sugar) are more or less fixed by the Government, while, even in relation to others, a careful watch is kept. Although temporary cornering of goods and services is not unknown, restrictive practices deliberately manipulating prices are few and far between.



Encouraging Small Entrepreneurs

Another fact which militates against concentration of economic power in a few individuals or groups is the deliberate encouragement given by the Government to small entrepreneurs. A sizable proportion of the Government's direct outlay is on the development of cottage and small-scale industries: Rs. 33.6 crores was spent under this head in the first plan and Rs. 180 crores in the second, while the provision on this account in the third plan is of the order of Rs. 250 crores. In addition, small industries get financial accommodation from the various specialised institutions set up by the Government; some of them are also given preference when tendering for Government institutions and projects. India is certainly humming with industrial activity, but this activity is not confined to a privileged few.

One should, therefore, look at the problem calmly and dispassionately. Bigness is both necessary and desirable in the industrial world today and one need not look upon a company or group with suspicion merely because it is big or has controlling interest in a number of undertakings. Even if a company wields some economic power, as long as that power is not used irresponsibly (and the Government has already got enough countervailing powers in its armoury), the public need not feel unduly worried. The question that should be asked is whether a company or group is indulging in anti-social practices—practices which are not in conformity with the objectives of India's Constitution and the plans.

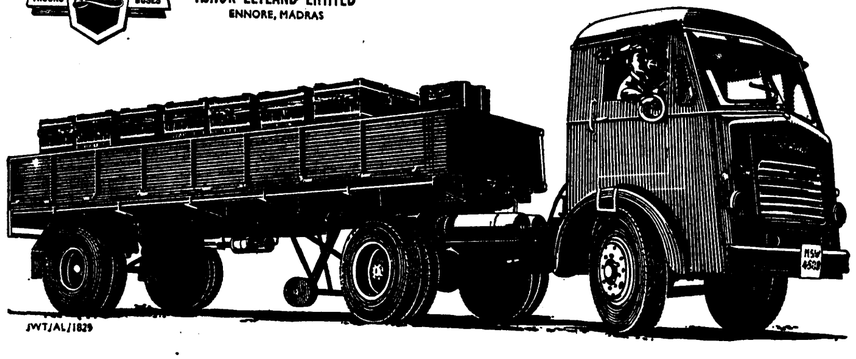
The Monopolies Commission has a very difficult task before it. It has to steer clear of popular prejudices on the subject and to make an objective assessment of the nature and extent of the so-called concentration of economic power in private hands and the prevalence, if any, of monopolistic or restrictive practices. As a result of the various controls and regulations and the very heavy fiscal burden, entrepreneurship in the private sector is already at a low ebb. While no sensible person would object to the Government assuming powers to put down monopolistic or restrictive practices which are against the public interest, the likelihood of the Government putting further fetters on large-scale enterprise in the private sector continues to worry those in charge of industry. It is never popular to dispel myths assiduously propagated, but one earnestly hopes that the Monopolies Commission will steer clear of slogans and shibboleths, and give an objective and definitive verdict on all the issues that have been referred to it.

A heavy-duty engine for a heavy-duty chassis

Mark III Diesel Engine

The Ashok Leyland Mark III diesel engine with its developed power of 100. B. H. P. at 2,200 R. P. M. has set up standards of longevity and operating economy. It has been developed with a background of experience in diesel engine power requirements for transport of men and materials. Its nitrided crankshaft is the toughest known and rarely needs the first regrind under 200,000 miles. Contributing to ease of maintenance are the push-fit cylinder liners which are replaceable with the engine *in situ*.

Heavy-duty chassis



The Ashok Leyland Comet is a heavy-duty chassis built for rugged performance. Every part is specifically designed for heavy duty. No other chassis offers 100 b.h.p. 255 lbs. ft. Torque engine, Nitrided Crankshaft, Slip Fit Liners, 13" Diameter Clutch, 5-speed Constant Mesh Gearbox, 9"-deep Frame, 8-ton Rear Axle and 24-volt Electrical System.

Fleet owners prefer Ashok Leyland Comets

Remarkably low fuel consumption and economy in maintenance and overhead costs are among the many superb qualities that make the Leyland Comet the choice vehicle in India just as it is in eighty other countries in the world.

INTERNATIONAL LIQUIDITY AND THE COMING WORLD RECESSION

The importance of gold in international settlements should be reduced. Because liquidity is inadequate, a world depression may come any time. The danger can be avoided if the International Monetary Fund is made into a super central bank.

By

KERSI DOODHA

Department of Economics, University of Bombay

FOR a little less than a century (1815 to 1914)), the gold standard ruled despotically over the monetary destiny of the world. After the first World War, attempts were made to restore it between 1926 and 1933. These did not succeed because of the parochial behaviour of various countries, the onset of the depression and the resultant currency chaos. Following the devaluation of sterling in 1931, a series of competitive exchange depreciations took place. The object was to earn more foreign exchange by exporting the domestic depression abroad. But as each was trying to outsell the other, none could benefit by the struggle for foreign markets. The breakdown in foreign exchange stability resulted in loss of mutual confidence and respect. As there was no machinery for negotiating, each country acted in isolation. Exchange restrictions, obstacles to free trade and other techniques for reducing the level of world's income were thoughtlessly imposed. The restrictive practices, except for a brief period after the Great Depression, tended to deepen; disaster inevitably followed in the shape of the second World War.

In the postwar period, a more sober world settled down to the job of reconstruction. This effort bore fruit in 1946 with the establishment of the Bretton Woods twins: the International Monetary Fund (I.M.F.) and the International Bank for Reconstruction and Development (I.B.R.D.). The former, with which we are directly concerned, was charged with the duty of gradually destroying barriers to free trade and introducing multilateralism through the medium of stable rates of exchange. Since exchange restrictions were the principal means of preventing free trade, the task before the I.M.F. was to dismantle this machinery. It was not an easy thing, because the lack of means to finance the balance of payments disequilibria, would force countries to retain exchange barriers. Therefore, the I.M.F. was so devised as to provide short-term loan assistance ranging from three to five years at the maximum, whenever temporary factors induced a distress in the balance of payments. Nevertheless, whenever a fundamental disequilibrium in the foreign trade account was observed, an orderly adjustment in the value of the exchange rate was to be effected. Finally, the I.M.F. was to provide a common meeting ground for diverse views from which a consensus would emerge.

Reconstruction Finance

These noble aims of the I.M.F., while being adequate for a normal period, proved insufficient to meet the requirements of the postwar world. The world in 1946 required reconstruction finance more than anything else. The Fund, however, was incapable of ministering to this need. Such aid, therefore, came to be bilaterally negotiated (the Marshall Plan) or through regional arrangements (the European Payments Union, the Colombo Plan, etcetera). The Fund remained aloof from these developments believing that these were attempts at undercutting its authority. This policy of lofty isolationism made it a stranger to such international monetary developments as *de facto* convertibility of sterling in 1955 and the limited convertibility of currencies of major international trading partners in 1958. Stable exchange rates and recourse to convertibility were the chief achievements of the 'fifties.

In an otherwise optimistic picture, a jarring development was simultaneously rearing its ugly head; the U.S.A. was suffering a continuous deficit in its balance of payments since 1952. Till 1958 the creditor countries were content to hold dollars as short-term assets in their reserve portfolio, so it did not create any special problem. The U.S.A. always got back what it had lost. However, after 1958 a mounting surplus of dollar holdings was partially converted into gold through the central bank window. (The U.S.A., because of the gold guarantee, is committed to give gold for dollars at a fixed price of $35 a fine ounce on demand to central banks.) This conversion led to a significant outflow of gold from the U.S.A. which was assumed to be a sign of weakness. It introduced an element of nervousness among the private holders of dollars. Since they were incapable of getting their dollars converted into gold at the U.S. Treasury, they took recourse to the free market in gold in London. Because of the sudden demand for gold, the gold price in London began to rise and in some unofficial dealings on 20th October, 1960, reached a record level of $40 an ounce. A collapse of convertibility *a la* 1958 seemed imminent. It was widely held that gold would be shortly revalued in terms of the dollar. Two events occurred, however, which frustrated this expectation. In a forthright post-election speech, President Kennedy announced that the U.S.A. had no intention of devaluing the dollar in terms of gold. Secondly, the U.S. Treasury secretly informed the Bank of England to sell gold from its reserves in the open market, such loss being replenished by it at a later date.

These decisions helped to stabilise the gold and exchange markets. Still, the consensus of European opinion was urging the United States to apply strong fiscal and monetary measures to correct the deficit in its balance of payments. If the U.S.A. accepted this advice, it was argued, her domestic economic policy would come into conflict with policy decisions imposed on her by her international relations. Moreover, if the deficit in the payments position was to be corrected, two major items, defence and development aid, would be the principal targets. Between them they accounted for $8,000 million worth of capital transfers in a single year. But if these items were axed, it was felt, the free world's survival would be jeopardised. Nevertheless, even if these issues were sidetracked, what is important to remember is that the moment the United States succeeded in restoring an equilibrium in her balance of payments, dollars would cease to flow out. This would tend to dry the fountain from which the world had got accustomed to supplementing its international reserves. There would, therefore, arise a liquidity crisis, if no *alternative* arrangement was made.

Measurement of Liquidity

But precisely what is this creature called international liquidity? How can one measure it? On what factors depend its adequacy? In what manner can liquidity be met without endangering world prosperity? International liquidity, in simple language, means the need for money at the international level to put through trade transactions and build up precautionary and speculative balances. Such a demand is measured as a ratio of gross reserves to total world imports. Gross reserves are further defined as gold in the treasury plus convertible currencies. The total world imports are valued at c.i.f. prices. Though the ratio of gross reserves to imports is found to be cyclically unstable, empirically it has been found that over the secular period, it tends to remain constant at 50 percent. This may be interpreted to mean that on average countries demand international reserves equivalent to their six months' imports.

It may be observed that in the above ratio, the constancy is secured by assuming steady rates of growth both in gross reserves and imports. It is generally held that gold, which is the major component in international reserves, appears to grow at an annual average compound rate of 1.5 percent. On the other hand, Gustav Cassel and Joseph Kitchin found from an analysis of time series data that total world imports tended to grow at the rate of 3 percent a year. The I.M.F. in its study *International Reserves and Liquidity* accepted the constant character of the numerator and denominator of the ratio, and came to the conclusion that international reserves would be adequate for the decade ending 1966. Robert Triffin in his *Gold and the Dollar Crisis* questioned the Fund's conclu-

TABLE 1

International Liquidity

(in $(U.S.) million)

Year	World's gold production	Gross reserves	World imports (c.i.f.)	Ratio of gross reserves to imports (percent)	Average world import prices* (1958 = 100)
1	2	3	4	5	6
1951	827	4.700	8,200	57	—
1952	852	4,800	8,000	59	—

sion. He pointed out that in so far as world trade may be expected to grow at a uniform historical rate, the Fund is justified in taking up a complacent attitude. What would happen, however, if world trade grew at more than the historical rate? Triffin hence posed the problem in terms of a spectrum of growth rates. He felt that as the rate of world growth tended to exceed the historical limit, gold will have to be supplemented increasingly by the holdings of currencies. Data in column 4, Table 1 seem to uphold Professor Triffin's fears because the growth in world imports during the period from 1951 to 1963 has been at the average rate of 5.7 percent a year.

Now when imports are rising faster than gold reserves and the gap in reserves comes to be met by increased holding of currencies, the national equilibrium of the ratio of gold to international reserves is disturbed. This ratio is implicitly assumed to possess in its turn an average value of 50 percent. Consequently, when with the increase in world trade a larger reliance is placed upon currencies, this notional equilibrum is destroyed. People begin to lose faith in holding on to currencies. There will be an undercurrent of tension which will remain latent, so long as international confidence persists. But perchance should an event occur, sufficient in importance to cast doubt upon the prevailing psychology, a run on currencies will take place, destroying the fabric of convertibility. This will cause nations to retreat into their shell; exchange restrictions and impediments to free flow of goods and services will crop up destroying world prosperity.

Plethora of Plans

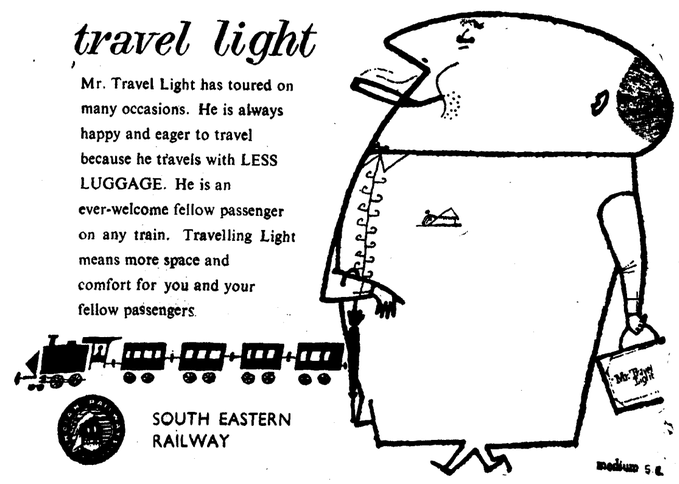
In order to save the world from such a disaster, as well as permanently to ward off the periodic crises of confidence, suitable modifications in the gold exchange standard adopted since 1922 have been advocated. Some like Sir Roy Harrod and Dr. W. J. Busschau want the price of gold to be doubled in terms of the dollar. Others like J. E. Meade and Milton Friedman suggest the employment of flexible exchange rates, rather than the current system of pegged exchange rates. Still others like Robert Triffin and Edward Bernstein recommend modifications in the institutional set-up of the I.M.F. to make it functional under modern developments. With this end in view, the Triffin plan, the Bernstein plans, the Stamp plan, the Maudling plan, the Zolottas plan, the Jacobsson plan, *et hoc genus omné* have been advanced. Some conservative elements notably Jacques Rueff have even gone to the extent of suggesting a return to the gold standard.

From all these suggestions, the most controversial is the one mooted by Professor Triffin. It is based essentially on the Keynes plan for the establishment of an International Clearing Union, which sought the creation of a central bank for central banks. This super central bank is to be endowed with powers to issue its own currency (bancor) at a definite rate a year. Though Triffin has watered down the controversial Keynesian proposals, critics continue to hold misgivings about its utility. Those who favour this ultimate goal say it is too much too soon. Others contend that since such a new organisation requires the delegation of national sovereignty to an international agency, it will not be acceptable to the conservative central bankers the world over. Some critics even go to the length of doubting the utility of the measurement criteria. Professor Fritz Machlup, for instance, feels that liquidity is a highly subjective phenomenon and can never be objectively calculated.

Ad Hoc Measures

For these reasons, a *via media* is struck in the form of undertaking *ad hoc* devices for strengthening world prosperity like the one in 1958, by which the I.M.F. quotas were subsequently increased by 50 percent. After the gold crisis in 1960, central bankers acted concertedly to refrain from converting their dollar holdings into gold. They further created in 1961 a gold and a currency pool to beat off speculative attacks on currencies. For instance, under the gold pool arrangement, an international gold price equalisation fund was created. Whenever an unusually large private demand for gold manifested, the dealers' depleting stocks were to be replenished by sales from this pool. On the other hand, when private demand tended to slacken, excess stocks with dealers were to be bought by the pool and the gold distributed to members for purposes of reserve holdings. Similar to the gold pool was the currency pool created by ten developing nations. Popularly called the Paris Club, the members who formed this group pledged to make available to the I.M.F., under certain conditions, a loan of $6,000 million, sufficient to meet the increase in demand for international reserves in the near future.

In a master move under the Roosa plan, the U.S.A. entered into bilateral agreements with some of the Continental countries in 1962 to build up a reserve of currencies. These holdings were to be later used for arbitrage purposes. In 1963, the system was extended to triangular swaps. In a way, the system of currency swaps merely endorses the use of larger number of currencies in international transactions. It thereby seeks to reduce the pressure on the dollar and the sterling as key currencies. It is quite likely that this is not a sound method of dealing with the liquidity problem, since experience seems to indicate a single reserve unit as an ideal solution. The reason is that a multicentred world can function as well as a unicentred world in periods of calm, but during periods of stress it is subject to wide and sweeping movements which may create a severe strain on the financial structure. So the Roosa plan, rather than fortify the world currency system, may probably add to its instability during a crisis of confidence. This once again emphasises the need for a centralised agency capable of issuing international legal tender.



Probably, such a conviction led the U.S.A. finally to accept the Keynes-Triffin plan as the basis of solving the international liquidity problem. It may also be that this change in attitude was forced upon the U.S.A. by the intransigent attitude of the French at the recent Fund annual meeting at Tokyo. It will be recalled that at this meeting held in September 1964 an unanimous decision was taken to increase members' quotas with the Fund by 25 percent. As one-fourth of any increase in quotas, under article III, section 2 of the Articles of Agreement of the I.M.F., is to be paid in gold, many of the developing nations objected to it. France insisted on gold payment saying that if this was not enforced, it would be an invitation to anarchy in the system of quotas. In the absence of gold payments, France felt, exaggerated quotas might be demanded, which if acceded to, would lead to drawings higher than the country's importance in world trade would warrant. This would provide not only unwarranted succour from the Fund, but also lead to heavy drawings from the I.M.F. and hence create a shortage in liquidity too!

Personally, I do not approve of the French attitude as since 1946 our common objective has been to bury for good the barbaric gold relic from our midst. Our task in the future is to reduce the importance of gold in official use. Let private individuals, if they so desire, continue to deal in gold. But at the international level, where countries are directly involved currency settlements should prevail. After all, confidence is not so much in gold, as in the will to honour international obligations. We have to learn to respect and trust one another. It is only when we get rid of suspicion that credit will commence to play in the international sphere the identical creative rôle it is playing in the domestic field.

If at all the world was saved from the danger of a liquidity crisis between 1956 and 1964, it was due to the rapid increase in the production of gold. As column 2 in table 1 (on page 57) reveals, gold production rose at an average annual compound rate of 3 percent a year, double the historical level. It thereby assisted in cushioning to some extent the increase in world imports too. Obviously the lack of confidence in the dollar and the practice of keeping reduced reserves of currencies led to a decline in the ratio of gross reserves to imports from 50 percent in 1960 to 46 percent in 1963 (column 5 in the table). Significantly, this did have a deflationary impact on prices as indicated by column 6 in table 1. In the table there, if the world's index of prices is measured as an unweighted average of import prices (1958 equals 100) prevailing in the United States, Canada, western Europe and Japan, then it will be noted that this index has tended to decline below its 1960 mark. It is quite likely that this trend would have been accentuated if the U.S. economy did not continue its record postwar prosperity cycle in 1964. Once signs of weakness again appear in the U.S.A., then *it is quite likely that a depression between now and 1966 may materialise.* This reduction in levels of economic activity may be directly attributed to the want of international liquidity. Before such a calamity comes, it is advisable to act now by negotiating to convert the I.M.F. into some kind of a super central bank.

High Interest Rates: Propitious Time for Revising Plan Priorities

The era of high interest rates should provide an excellent opportunity for revising India's plan priorities and her unduly inflated cost structure.

By

S. K. MURANJAN

EVEN in advanced industrial countries, the rôle of the interest rate in the management of their economies has fallen to a subordinate place. This is largely because maintenance of external balance has ceased to be the prime object of attention. Instead full employment has become the primary concern even at the sacrifice, if necessary, of external equilibrium. For achieving full employment, it is recognised that investment and national expenditure have to be sustained at the requisite level. Interest rate then becomes only one incentive or disincentive, and it has to be supplemented by varied fiscal measures according to the nature of each situation. As tax revenues and consequently government expenditure now account for a large fraction of national income and expenditure, it is not surprising that fiscal policies are looming larger and larger in overall economic policies.

The problem of developing countries like India is essentially different. These suffer from gross inadequacies of savings and productive equipment. Obstinate unemployment or underemployment is of course there. But they originate in lack of equipment or structural deficiencies which are not quite amenable to economic incentives alone. In any case, they call for very long-term remedies. Economic growth has, therefore, to take precedence over full employment.

Our past experience amply demonstrates that a sizable volume of savings and even creation of appreciable economic overheads do not by themselves assure economic growth. Political dependence was no doubt a serious obstacle. But even more serious was the paucity of economic enterprise in terms of both capacity and social coverage. Indian industrial and agricultural enterprise, as it has developed in the last 100 years, has commendable achievements to its credit, but historical and social limitations no less than limited resources do not qualify it for the task of overall growth. Hence the emergence of a public sector to supplement the efforts of private initiative and enterprise. With the public sector growing in volume and strength, monetary and fiscal policies had to undergo a profound reorientation not to be thought of in the case of more self-sustaining and self-reliant economies.

Interest Rate and Savings

The demands of the public and private sectors on the national volume of savings posed indeed a great hurdle. Some marginal augmentation of savings could be achieved by capital licensing aimed at prohibition of whatever is deemed luxury or non-urgent investment. The only other two straightforward remedies available were fiscal inducements to save and/or direct or indirect restriction of consumption.

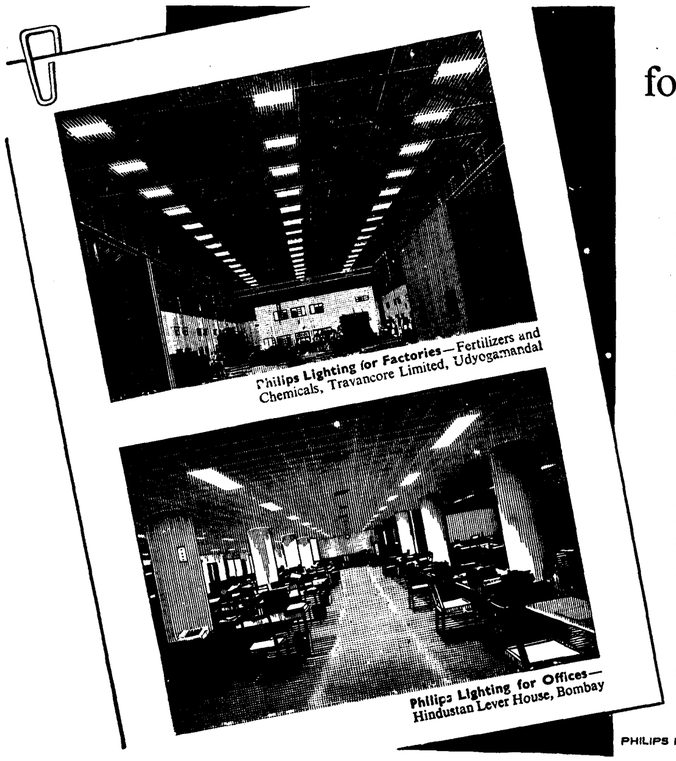
It was possible to adopt a policy of high interest rates from the very start. A high interest rate has a rather unpredictable effect on the volume of savings. Much depends on the economic and social structure of the community in question. A high interest rate has only a limited significance for "government savings". Apart from the burden of debt service, it is for government largely a matter of taxation and control of unproductive expenditure. For business and company savings, the interest rate is a very minor influence. The economic climate—in which the interest rate is the only factor—and fiscal incentives play a much more decisive rôle. The third main source of savings which in most advanced economies account for as much as 70 percent of the total is personal savings. While a high rate makes security for the future much easier to achieve for those who are otherwise deterred, there are others who are already saving and who may find that with higher interest rates security no longer requires the wonted sacrifice, of consumption. General experience seems to indicate that, by and large, higher rates stimulate the growth of savings. This is all the more so because in all modern communities there are compulsory social security funds of sizable aggregates which benefit from higher rates.

The deterrent to high interest rate as a monetary policy is not its problematic effect on the aggregate volume of savings, but its alleged unfavourable effect on economic activity in certain contexts. It is clear that such a fear is quite out of place for a country on the threshold of large-scale planned investment. The priorities of public-sector investment have little reference to the level of interest rates or short-run profitability—and very much more so where underdevelopment necessitates concentration on economic and social overheads. With a large volume of investment assured in the public sector, the private sector is assured an economic climate favourable to venture and enterprise despite high interest rates. Public-sector investment could be effectively reinforced by fiscal incentives. It would scarcely be an exaggeration to say that the discipline of high interest rates and relatively low price level might have precluded the emergence of intractable labour and wage problems which have bedevilled our planning so much.

The actual course of events was the reverse. Economic policy was probably dominated even in this underdeveloped country by the Keynesian superstition that a low interest rate is always good for economic growth no less than for full employment. The war-time era of low interest rates was prolonged into the planning era, facilitated no doubt by the continuation of some of the war-time controls and subsequently by the reaction of prices to the end of the Korean war. India's Bank rate was no doubt raised in November 1952 to 3½ percent, but it was only as a follower of the Bank of England rate, whose mechanism of operation is quite different. By and large, the low rates continued far into the second five year plan when investment began on a very large scale.

Apart from faith in the virtues of low rates in general, the impelling motive was to keep the price of public-sector borrowing as low as possible. It was not quite properly appreciated that low rate for public borrowing and high programmes of investment both in the public and the private sectors went *ill together*. As was inevitable in no year was the Government able to borrow more than a modicum of its requirements for implementing its ambitious plans, and for its failure to raise loans in adequate volume the country had to pay the penalty in other more distressful ways.

Outwardly, the policy of low rates seemed to succeed. With the war-time technique of short- and medium-term loans, the conditions of borrowing were kept moderate. There is always an assured market for loans of *this kind* in the world of business, banking and fiduciary investment. But this market has its limits. This policy of moderate rates succeeds only so long as it does not overstep these limits. But it left the problems of resources largely unsolved. Besides, a war does not last beyond five or six years. But war-time short-term borrowing does not quite suit investments which take relatively longer periods to bear fruit and this is another restriction on such borrowing. The policy of moderate rates appeared to succeed only because the Government was content with whatever it got.



High Rates in Capital Market

The avoidance of bigger raids on the funds of the capital market did not in any way accommodate the private sector. What the Government could not raise by way of loans, it began to consfiscate by way of taxation and in the last resort it practised deficit financing. Towards the latter half of the second plan, the Finance Minister initiated a policy of heavier and more widely spread taxation which tended to fall mostly on the savings of urban classes. Taxation of the omnivorous kind we have witnessed till today has two contradictory effects. With the classes of persons with more than ample incomes who save largely because they cannot spend, taxation merely shifts savings from private hands to government hands. The effect on the consumption of these classes is almost nil. In the case of higher and lower middle classes and labour, whose margin for savings is small, taxation restricts consumption and to that extent may be credited with the creation of new savings. In the aggregate, taxation has progressively reduced capital available to the private sector.

From 1957-58 coinciding with the omnivorous budgets, the growing scarcity of capital was reflected in the slow rise of interest rates in the private long-term capital market. Rates on debenture and preference capital began to creep up. The effect on short-term capital was muffled up for some time by the new money which flowed in from deficit finance. The deposit and lending rates of banks could not, however, long escape the influence of hardening long-term rate. The Government and the Reserve Bank seemed unwilling to accept the logic of the situation and the subsequent stepping-up of Bank rate to 4 percent was only a tardy and inadequate acknowledgment of a *de facto* situation. It was made effective not by its absolute level but by various devices which were adopted from time to time to ration central bank credit.

Matters were brought to a head by the Chinese invasion and its aftermath. Despite an unprecedented resort to deficit finance and heavier-than-ever taxation the economy could hardly bear the triple pressure of defence expenditure and the demands of the public sector and the private sector. The debenture rate passed beyond 7 percent which was a substantial rise from 6 percent of the middle 'fifties. Preference capital rate exceeded 9 percent to 10 percent, which compared with less than 7 percent in the middle 'fifties. The banks found their deposits stagnant and had to adjust their lending rates. Finally the Reserve Bank merely registered the changed climate by stepping up its rate first to 4½ percent early in 1963 and later recently to 5 percent. It is a matter for careful consideration whether in the prevailing economic environment a straight increase of 1 percent was not preferable to two steps of ½ percent each. Even with 5 percent, the rate has to be made effective by tying it to liquidity ratios of borrowing banks so that the actual rate is much higher.

From the later years of the second plan to the aftermath of the Chinese invasion, the time over which these changes in the structure of interest rates were spread is quite substantial

for the best lighting
ask the people who know lighting best

Correct, functional lighting, whether it is for a factory, office, shop or roadway, cannot be left to chance. It has to be *planned*... by people who have the experience and know-how. With their long experience of Indian conditions, and ready access to the vast resources of their international associates, Philips are fully equipped to design suitable lighting plans for every application. The Philips Lighting Service Bureau first studies the individual requirements of customers—then recommends the best and most economical lighting. And this expert Philips service is available *without obligation !*

Philips make in India a wide range of lamps, fittings and accessories to suit specific functional requirements. And in the widely varying and often severe Indian climatic conditions, Philips lighting equipment made to higher than international specifications, gives long, trouble-free service with minimum upkeep. That's why, all over India, Philips lighting equipment is specified for all-round economy.

Exporting just any goods from our end does not foster trade with other countries. The goods must be acceptable in the highly competitive market—in quality and in price. Timely supplies, their conformity to the customers' specifications and after-sales service facilities are also important so that further orders are placed from the other end and the business deal is brought to a sound conclusion.

This two-way operation becomes a sustained affair only when every manufacturer endeavours to introduce quality control in production and raw material selection, conforms to high standards and specifications, employs modern techniques of manufacture, adheres to promised schedules of delivery and offers after-sales service.

This Council is equipped to render engineering goods manufacturers every help and assistance in promoting their export.

—six to seven years in fact. As already observed, the effects of the shortage of long-term capital on the banking system were delayed by the steady practice of deficit finance by the Government to make good the shortfalls in investment resources. In most years the volume of deficit finance tended to equal or even exceed what the Government could raise by way of loans. As central bank credit granted to the Government on this account seeped into the banking system, multiple creation of credit took place and gave the illusion of abundant money capital. It is more than probable that those who decided on the volume of deficit finance overestimated from time to time the cash-absorbing capacity of the economy. The non-monetised sector of the economy is a large one, perhaps from one-quarter to one-half, and the impact of deficit finance fell exclusively on the monetised sector.

The situation was concealed for quite a time by the imports of American wheat and rice, and the steadiness in the prices of these superior foodgrains. But the danger signal was hoisted as early as the middle of 1961 by which time the prices of domestic agricultural materials rose quite appreciably, contrary to the steady level of world prices and quite out of parity with them. It required the recent flare-up of foodgrain prices caused by a marginal shortage to push up raw material prices still further, and with the absorption of surplus money supply in higher prices the all-round shortage of capital was disclosed to full view.

Incentives to Save

When a government diverts the bulk of the community's savings to itself by means other than loans and particularly by taxation, it makes itself responsible for two things. Firstly, it must maintain all inducements to save and, secondly, it must practise the utmost economy of capital. The first requirement is particularly important from the standpoint of the private sector, which because of high taxation of individuals must strive to generate savings within trade and industry themselves. Recent Indian Budgets seem to make serious inroads into these inducements. Apparently, the dividend tax is an inducement to keep profit in business rather than distribute it as dividends. But the taxes on bonus issues has dealt a severe blow to expectations and caused undue depression in the investment market. It has undermined the basis of bonus issues and curtailed investment actuated by hopes of capital appreciation.

The stake to revenues involved is not much as only a few well-managed and exceptionally prosperous concerns are in a position to issue bonus shares, but the psychological damage inflicted on the investment market is very widespread. The Unit Trust and nationalised insurance encourage saving, but these have largely a bearing on classes who rarely invested or are just developing interest in investment. By and large, the present state of the investment markets is not conducive to the generation or growth of venture capital, and the abolition of bonus share taxes or at least the tax on the unrealised profits of bonus shares in the hands of the shareholders would be a very suitable measure to improve the investment climate.

Wastage of Capital

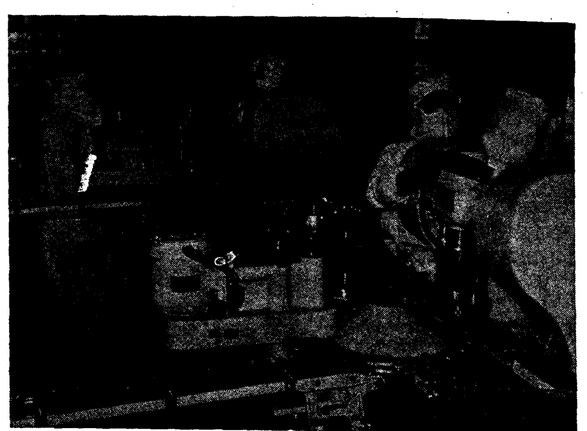
The Government is much more guilty on the charge of failure to practise economy in the use of scarce resources. When taxation passes much beyond the limit at which tax-paying classes cease to reduce consumption and begin to draw on savings to pay taxes, there is a moral obligation on the Government to ensure that these diverted savings are put to strict productive use. No one who knows anything about the Parkinsonian proliferation of governmental machinery and the armies of idlers who benefit by it can but wonder whether this is the same country of whose poverty Mahatma Gandhi was the visible symbol. The extravagance to which both our political leadership and higher official ranks have contributed has to be seen in order to be believed. Unless the non-development expenditure of the Government is severely curtailed this wastage of the country's resources must impair gravely its economic growth.

The other source of wastage is much more difficult to dissect and locate. It centres on the corruption and malpractices which have grown round India's economic planning. One can only indicate here the lines along which investigation has to be carried out. One has to locate the broad forms which these abuses assume, the classes of persons, who, as dispensers or recipients of unaccounted money, participate in them, the uses to which unaccounted money would be put if such abuses did not exist, the uses to which it is being actually put, effects which must ensue if the present campaign to unearth unaccounted money either succeeds or fails substantially, etcetera. This general definition of the problem indicates how difficult the analysis is particularly in quantitative terms. Briefly, one may say that unaccounted money takes three forms—bribes and illegal gratifications, premiums extracted to avoid or exploit price and other Government controls and finally income salted away to avoid taxation. Bribes and gratifications are paid by all sorts of people, business and non-business alike, and except at the higher non-political level, where they are rare, are small in amount and many in number.

These bribes act as additions to current income and where they are paid by business men mean some wastage of capital. Where this income is not hoarded, it will most probably find vent in better living. The matter becomes more serious with money used to evade controls. The amounts involved are huge though confined to a small class of people, are shared at the ultimate expense of the consumer between traders and business management, and, since a strict, integrated tax system does not permit open investment, they are either hoarded or dissipated in extravagant living. As for tax avoidance and the unaccounted money misappropriated thereby, the culprits are either traders who escape altogether or others like professional persons who benefit by understating their incomes. With both, some of the ill-gotten gains probably find their way into investment, *benami* or otherwise, but much is hoarded.

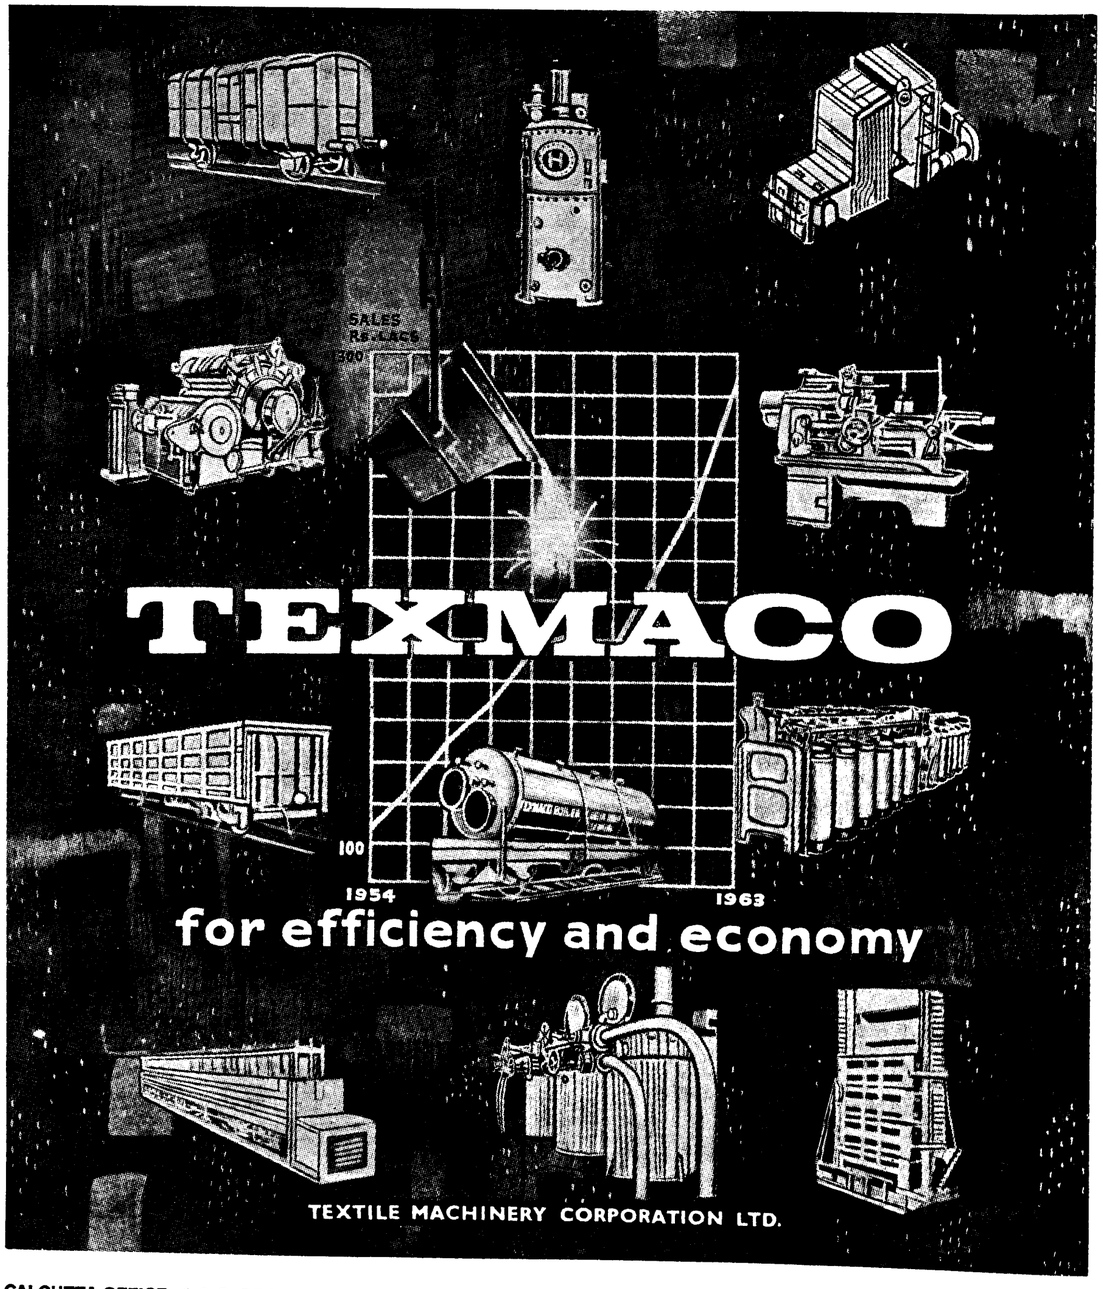
It is difficult to estimate the total amount of the national income involved in this unaccounted money. With a note circulation of about Rs. 2,500 crores, it would not be fantastic to suggest that not more than 10 percent or 20 percent of this circulation is passing as unaccounted income. But it is difficult to say how often in a year these notes are used as illegitimate money. All one could say with confidence is that illegitimate money has much slower turnover than legitimate money. It would be even more difficult to estimate the extent to which this total money is disposed of in hoarding, investment and extravagant living. But the visual evidence of unearthed hoards and extravagant living suggest that the wastage element must be substantial.

If the present efforts to unearth unaccounted money succeed and put such fear in the hearts of man that new culprits do not take the place of the old, the Government will benefit by increased revenues, have less cause to evoke deficit financing and there will be less extravagant living. Less resources will be diverted into avoidable and unnecessary production and more will be available to augment needed goods. If the present efforts fail, the future conditions will be worse than the present. There will be less of a proneness to hoard with its tendency to lower prices, and more of a propensity to spend extravagantly so that no trace will be left of the money for the authorities to raid or investigate about. As extravagant life must be screened from public attention, life must take to more subtle forms of corruption.



Future Policy

What should be India's monetary and investment policies for the future? The country is only on the threshold of an era of capital scarcity and high interest rates. A 5-percent Bank rate is not itself high although because of the tie with liquidity levels, the effective rate will be much higher. A 4-percent rate for three months prevails even now in the U.S.A. A difference between our banking system and advanced banking systems is that the latter hold the overwhelming bulk of their deposits on a less-than-one-year basis, whereas in India banks derive much the substantial portion of their working capital from deposits of one year right up to five years. It is a debatable point whether our banks should be allowed to compete for investible funds and weaken the growth of the investment habit, a situation accounted for very largely by their failure to attract short-term funds now going to waste. The position would be different if our banks were to develop proclivities towards industrial banking, of which there are as yet no signs and the merits of which are not so clear.



So long as the Government is undertaking large investments in the public sector and there is a race between shortages and still more investments, there need be no fear of even an economic recession. Even the private sector which will have to pay higher price for its working capital and select lines of investment with greater care, could be quite buoyant under the stimulus imparted by the public sector. The West German recovery and the rapid development in spite of maintenance of high interest rates in conformity with her labour and capital situation should be a sufficient assurance on this point. Both the public and the private sectors should benefit by the enforced revision of their ideas about techniques of production which must now suit higher rates all round.

There has been till now too little improvisation and too much blind adoption of techniques suitable to advanced and capital-glutted countries. This observation applies, of course, much more to fabricating than basic industries which have perforce to adopt the scale and techniques used in the advanced countries. Again, the era of high interest rates should provide a golden opportunity to revise our planning priorities and our unduly inflated cost structure. The key to the fourth plan should be public sector concentration on agriculture, industrialisation which strictly subserves the purposes of agriculture and the economic overheads of power, transport and water.

With a favourable harvest and less financial inducement to hold stocks, a fall of prices to more reasonable levels should be a prelude and signal to revise costs. The strain of adjustments will not be small. But India's industrial and other costs have been too long out of parity with world costs to such an extent that Indian planning is difficult to sustain on such a basis. A restraint on deficit finance is naturally a pre-condition of success in the new era.

Getting Commercial Banks to Provide More Long-term Loans for Agriculture

The Agricultural Refinance Corporation can play a big role in the development of agriculture, but it has been able to extend assistance only in the case of a few schemes so far. This is because of a lack of suitable schemes, and the commercial banks' limited interest in the farm sector.

AGRICULTURAL SCIENCES LIBRARY
31 DEC 1964
GOVERNMENT OF MADRAS

By
V. SIVARAMAN
Managing Director,
Agricultural Refinance Corporation

IT is more than 15 months since the Agricultural Refinance Corporation started functioning, so it is time to take stock of what it was expected to achieve, what it has done so far towards that end and what it should do in future. As one begins thinking on these lines, one's mind goes back to days towards the close of 1962 and early 1963, when in the course of the discussions on a Bill introduced in Parliament for the setting up of the Corporation, several members welcomed the proposal heartily; in particular, they gave active support to the definition given to the term "agriculture" in the Bill, which besides agriculture proper included all allied activities such as fishery, and animal husbandry, poultry farming, dairy farming. If one were to repeat the words of the ex-chairman, Professor D. G. Karve, from his speech made at the Corporation's inaugural function, the whole field of non-human biology, namely, all plants and animals are covered by the definition.

With agriculture defined in such wide terms, the scope of the Corporation's function has been so broad-based that there could be no development activity in the agricultural sector, worth its name, which would not secure adequate financial assistance from the Corporation by way of long-or medium-term loans. And the potentialities for agricultural development in India are very great calling for huge investment of capital and promising equally profitable returns. Such prospects for developmental activity have gained considerable importance in recent months on account of the great emphasis placed on increased agricultural production. It is in this context that the rôle of the Corporation in financing such endeavours assumes unique importance.

High Hopes

Ever since the Corporation started functioning, it has been very much alive to the great task assigned to it and has been always aware of the high hopes raised by the Members of Parliament and the Press at the time of its inauguration. It is this awareness that made it play, in the first year of its establishment, an active rôle in stimulating interest among the various State Governments, the financing institutions and several other statutory bodies connected with agricultural development, in the preparation of worthwhile and economic schemes designed for agricultural development, and thereby increase farm production.

This has been done side by side with its preoccupation in the first few months with essential preliminary matters connected with the organisation of an entirely new institution. This rôle called for frequent visits to the States by the officers, the managing director and the chairman of the Corporation and special on-the-spot studies. In spite of these, one has a feeling of disappointment that the fruits of such intense labour put in by the Corporation to stimulate interest in the preparation of good schemes of agricultural development have been quite discouraging. The Corporation has so far been able to approve only four schemes of agricultural development from two States, three for reclamation and development of land and one for development of coconut plantation involving a total financial outlay of Rs. 6.375 crores and a commitment to the Corporation of Rs. 5.738 crores. Even this sanction has not yet been drawn upon. This has been so, despite the availability of the much needed requisites for increased food production, namely, abundant resources by way of manpower, water, and larger tracts of unutilised cultivable waste land. It is most unfortunate that there should be something like a stalemate in that vital sector of the economy.

Before trying fully to analyse the causes underlying this stalemate, it would be necessary to know how a scheme is expected to be drawn up, what type of assistance is rendered by the Corporation in its preparation and with whom the responsibility for the preparation of a scheme rests.

Functions of the Corporation

For this purpose, it is necessary to review the functions of the Corporation broadly into two main divisions, (1) development of agriculture proper, that is, cultivation of food crops and cash crops grown on land and (2) development of other activities allied to agriculture, that is, the extended definition of agriculture given in the Act, namely, poultry farming, dairy farming, pisciculture, animal husbandry, etcetera. It may be mentioned here that even prior to the inauguration of the Corporation, the Reserve Bank of India had been interesting itself in the provision of financial assistance for certain special development schemes involving large amounts. These schemes related to the provision of long-term loans for agriculturists for the development of land under the Nagarjunasagar, K. C. Canal, Kaddam and Musi Canal projects for which correspondence had been going on for some time. After the Corporation came into existence, at least three circulars have been issued detailing the terms and conditions under which financial assistance would be available, indicating the procedure to be followed in the preparation of schemes and the agency through which such schemes should be submitted to the Corporation. The details required to be furnished in any scheme of development, in particular its economics, are not more than what any lender, private or institutional, would have called for in order to satisfy himself about the purpose for which the assistance is needed and the profitability of the venture.

The following are broadly the details called for by the Corporation in a scheme of development: (1) area selected for implementation; (2) arrangements made for supervision and technical advice; (3) duration and phases of the scheme; (4) ownership and valuation of land; (5) expected net increase in production; (6) the economics of the scheme giving in detail the gross annual income, the annual estimated expenditure, the existing liabilities of the agriculturists, other expenses, the net income available to the cultivator during each year of the cultivation till the loan is repaid in full and a repayment schedule for the loan; (7) agency for financing and execution of the scheme; (8) scale of financing an acre; (9) rate of interest to be charged; (10) arrangements for short-term finance and marketing and (11) arrangements for assured supply of water, improved seeds, fertilisers, implements, etcetera, and (12) most important of all, facilities for technical advice and guidance.

To fulfil its objective, the Corporation expects that a scheme should aim at increased agricultural production. Further, to ensure effective supervision over disbursements and recovery of loans and generally over the implementation of the scheme, it expects that any scheme should be drawn up for specified areas and for specified crops and that it should be a compact, and composite one. To see that the developmental finance given really benefits the agriculturists, emphasis is placed on a scheme being businesslike, commercially paying and economic in content.

Rôle of State Governments

It is also quite natural to expect that in any scheme of agricultural development, the concerned State Government should be very actively interested. It is for this reason that the State Governments through their departments of agriculture or any other technical departments concerned are expected to give technical advice and assistance in the formulation of a scheme. The Governments are expected to be associated not only in the formulation of a scheme, but also at various stages of its implementation. To further see that the State Governments have a demonstrable interest in special schemes, they are required ordinarily to take up at least 25 percent of the debentures to be floated by the central land mortgage banks for financing the same.

A long-term loan for developmental purposes cannot be given without adequate security. What security can be expected from a farmer other than his own land that he wants to develop? For this reason it is stipulated that the cultivators to be financed under any scheme should be those who have unrestricted mortgageable or alienable rights over their holdings which are proposed to be mortgaged to the financing institutions. The schemes should, therefore, relate to the areas where the participants own the land and have unrestricted rights. Further, with a view to ensuring that they take more than ordinary interest in the schemes evolved for their benefit, the cultivators are expected to contribute at least a part of the funds required, from their own resources.

The most important point to be noted here is the offer made by the Corporation to help any State Government who may so require, in the preparation of special schemes of development. For this purpose, officers of the Corporation are sent to the spot to help the authorities concerned to prepare schemes in a manner as close to the Corporation's requirements as possible. This would avoid unnecessary correspondence on missing links in any scheme or clarifications on points. This offer of help even in the preparatory stage of a scheme is anything other than its

financing activity. The Corporation does this as part of its developmental rôle.

Submitting Schemes for Loans

The schemes prepared on the lines indicated above and the application for refinance, have to be submitted by co-operative banks through the concerned Registrar of Co-operative Societies, who will forward them to the Corporation with his comments through State Governments. This will enable the Registrar to be actively associated with the development schemes to be financed by the Corporation. Scheduled banks need not route their schemes and applications through the Registrar of Co-operative Societies or any other Government departments unless otherwise indicated by the Corporation. However, since refinance from the Corporation will be available only if schemes of agricultural development have its approval, the financing scheduled banks will be well advised to refer the schemes to the Corporation before they proceed to give any loans. This will enable the Corporation to examine the schemes in all their aspects and suggest any changes which may be required. The applications for refinance by the scheduled bank concerned to the Corporation then becomes a routine matter.

After a scheme is received from a State Government, it is examined by the Corporation in detail and clarifications are sought on important points. After the receipt of such clarifications, the Corporation proceeds to assess the technical and economic feasibilities of the scheme. For this purpose, the Corporation itself takes certain steps and also requires the State Governments and the financing agencies to adopt certain measures, an idea of which is given below.

Technical Evaluation

The Corporation carries out a technical evaluation of the scheme through experts in the particular line, specially appointed for the purpose on an *ad hoc* basis. This technical report, for instance, in a scheme of land reclamation and development, will give an idea of the availability of sufficient water for irrigation purposes, construction of the necessary canals and channels, the suitability of the soil for the crops intended to be grown, the total output of farm produce which can be expected from the implementation of the scheme and based on farm requirements and the slope of levelling, fertilisers, the cost of reclamation, etcetera. This report is considered by the Corporation before sanctioning refinance facilities.

The Corporation also carries out with the help of the Division of Rural Economics, Reserve Bank of India, a benefit-cost survey in the area covered under the scheme. This survey is intended to show the extent to which the agriculturists, particularly the small agriculturists, would stand to benefit by the scheme in the form of a better crop pattern, yield and income from the land following the implementation of the scheme. One of the objects in taking up this survey is to ensure that farmers of small means are not left out from the purview of the scheme, but are assisted by the concerned State Governments, financially and otherwise, so that they may be able to repay the loans given to them out of their enhanced repaying capacity. This will incidentally ensure that the scheme is worked out on a compact basis and can be easily supervised.

Economic Feasibility

Apart from conducting a benefit-cost survey, a senior officer of the Corporation is also sent to make an on-the-spot study in the project area and to hold discussions with the officials of the Government and the primary financing agency thereafter, with a view to finding out the economic feasibility of the scheme, availability of facilities for the short-term requirements of the farmers, and the soundness of the various financing agencies which are expected to provide loans for both short and long-term purposes to the agriculturists under the scheme.

A technical plan is required to be prepared for every individual agriculturist covered by the scheme. For example, for schemes involving reclamation and development of land, the technical plan should take into account all the factors involved in the development of land, including levelling, bunding, crop pattern and even consolidation of holdings where feasible. The concerned State Government which is expected to play a significant rôle in the execution of all schemes of agricultural development on a planned and organised basis, should preferably initiate action in preparing such plans under its guidance, preferably by the agricultural or other technical departments and, if necessary, in consultation with the financing agencies.

Thus. it is only after satisfying itself about the thoroughness of a scheme, its economic viability, technical feasibility and its utility to the agriculturists that the Corporation proceeds to advise the financing institutions on approval of the schemes, and submission of formal loan applications thereafter. All these precautions and measures are intended to ensure that the refinance facilities made available by the Corporation are properly used and result in increasing agricultural production. This process no doubt would entail some time-lag between the submission of a scheme by a State Government or a scheduled bank to the Agricultural Refinance Corporation and its final passage at the hands of the Corporation. In a scheme of development which involves considerable financial outlay, if the lender is to be fully satisfied about the soundness of a proposal made, some time-lag is inevitable. But the Corporation endeavours to see that the time-lag is reduced to the minimum.

Terms and Conditions

Then one tries to look for the reasons for inadequate response to the appeals of the Agricultural Refinance Corporation in the terms and conditions attaching to refinance facilities for the Corporation. One wonders whether the fulfilment of the terms and conditions are so stringent as to make it difficult for the State Governments and the financing institutions to satisfy them. A brief idea of the terms is indicated below:

(i) *(a) Period and size of loan:* Financial assistance in the form of medium-term loans will be available for periods of not less than three years and not more than five years. Long-term assistance from the Corporation, that is, refinance or loans for periods exceeding five years will, for the time being, be restricted to a maximum period of 15 years, but in exceptional cases, the Corporation may extend the period up to 20 years. The Corporation will also consider the need for and permit in suitable cases deferred payments against principal and/or interest. For instance, in the case of plantations it may be several years, depending on the crop concerned, before a newly planted garden begins to yield fruit. During these years of waiting, a farmer may not be able to repay anything towards his principal loan instalment or even towards the interest thereon.

Even in the case of food crops, if new lands are reclaimed and put to cultivation a period of two years or so of waiting may be necessary. Deferred payment of loan instalments offered by the Agricultural Refinance Corporation is, therefore, a special facility not available from any existing long-term credit agencies. The minimum amount of financial assistance which can be obtained from the Corporation by way of refinance or loans will be Rs. 1 lakh. This does not mean that the minimum loan that a financing agency can make to its borrowers should be Rs. 1 lakh. The financing agency can make smaller loans to its clientale, but when it wants to reimburse itself from the Agricultural Refinance Corporation, the amount should be not less than Rs. 1 lakh.

(b) Rate of interest: The rate of interest to be charged by the Corporation will normally be 5½ percent a year for all types of financial assistance. However, this is subject to review from time to time, and will be fixed by the board of directors on the merits of each case. The interest is payable every half-year ending 31st December and 30th June. The financing institutions are granted discretion to charge interest according to the circumstances of each case, but subject to the approval of the Corporation.

(c) Security: The repayment of principal and payment of interest on the loans granted by the Corporation should be fully and unconditionally guaranteed by the Government. Under the first proviso to Section 22(4) of the Agricultural Refinance Corporation Act, the Corporation is empowered to dispense with Government guarantee if other security to the satisfaction of the board of the Corporation is made available to it. This enabling provision to dispense with Government guarantee has been recently invoked for purposes of financing development of plantation crops through scheduled banks. The security acceptable to it under the first proviso to Section 22(4) of the Act, is now the sub-mortgage, sub-hypothecation or sub-pledge, etcetera, of the security in the form of land, plant and machinery, etcetera, mortgaged, hypothecated, pledged or otherwise secured to the scheduled banks by the primary borrower.

(d) Other important terms and conditions: (i) As already referred to earlier. it will be advisable for a financing institution to refer to the Agricultural Refinance Corporation beforehand all schemes they intend to finance. This will enable the Corporation to examine schemes thoroughly and, if it aproves them, refinancing becomes assured. But it is open to a financing institution to first grant medium-term and long-term loans to constituents and then seek refinancing facilities from the Corporation. But, in such cases, the granting of refinance facilities will depend on the merits of each case.

Conditions of Refinance

(ii) The Corporation will not normally refinance a loan unless the application for it is submitted before the expiry of 12 months from the date on which the loan was granted by the concerned financing institution. But it has been recently decided to consider provision of refinance facilities in the case of plantation crops for the discharge of old debts if they had been incurred for development purposes and if it is satisfied that further development might suffer if the old debts are not cleared. A condition attaching to this is that the amount applied for meeting old debts should be within the balance available in the total limit to which the party is eligible from the standpoint of his security and repaying capacity, after satisfying the demand for funds for special development schemes.

(iii) In cases where the financing institution disburses a loan in instalments, the institution may avail itself of refinancing facilities for only some of the instalments. The reimbursement of each instalment will be treated as a separate loan by the Corporation by way of refinance.

(iv) A penal charge of 1 percent a year will be levied on loans repaid wholly or in part, earlier than the due date and the financing institution will not normally be allowed refinance facilities again for the same loan. Penalisation of earlier repayment may perhaps *prima facie* appear to be funny. Really it is not so. The intention is to ensure that borrowings from the Agricultural Refinance Corporation are used only for long-term development purposes and unless there is improper use, one cannot normally repay the loan taken before the due date. In fact, the repayment schedules are prepared taking into account the economics of the scheme and the repaying capacity of a borrower. Earlier repayment, made for instance by a financing agency to the Agricultural Refinance Corporation from its other resources would certainly not be repayment made from the fruits of the scheme refinanced by the Agricultural Refinance Corporation. However, if the repayment is effected by the borrower out of genuine recoveries, no penal interest would be levied.

These are normal conditions on a loan which would have been imposed on any borrower however creditworthy he may be. As a matter of fact, if a borrower is really creditworthy, the conditions will not be found stringent at all. All these terms and conditions, all questions put and all inspections and studies made by the Corporation have only this in view that the money disbursed by it in the form of loans is put to proper use and the country benefits from the use of the amount in the shape of increased food, increased fish, increased chicken, and increased edibles of every kind. This is a perfectly natural reaction of the Corporation when it prescribes certain

conditions for making refinance available to any scheme.

Relaxation in Terms of Security

The officers of the Corporation, including the managing director and even the chairman, have been going round the various States and attending conferences and seminars to explain the objectives of the Corporation and clear doubts, if any, in the minds of the people concerning its refinance facilities. During the course of the visits, the only real difficulty referred to by some individuals, banks and associations of planters related to the Corporation's insistence on Government guarantee for every loan given by the Corporation in terms of Section 22(4) of the Agricultural Refinance Corporation Act. As observed earlier, even this condition has been relaxed for loans made by scheduled banks for the development of plantation crops. This relaxation applies only to scheduled banks for the following reasons :

In the case of the land mortgage banks, the necessity to waive Government guarantee may not arise. The normal pattern of raising resources by land mortgage banks is by way of flotation of debentures which are guaranteed by the State Governments as to the payment of interest and repayment of principal. It is expected that the financing of special schemes of agricultural development will also be done through the flotation of special debentures for the purpose. The State Governments have never been chary of extending their guarantees to the co-operative movement as they are intimately connected with its growth and are helping it in many ways, through subsidy, grants-in-aid, cheap loans for share capital contribution, providing for inspection, audit and supervision of all co-operatives, supply of technical advice and guidance and so on. There is a separate department to look after co-operatives in every State.

In short, State Governments are functioning as partners in the co-operative movement, and hence would not have any objection to extend the guarantee to the special development debentures also. Real difficulties, in obtaining Government guarantee would, therefore, be felt only by scheduled banks. As the State Governments have no control over these banks who have their area of operation spread throughout the country and even outside the country also, some Governments may not be readily forthcoming to extend the necessary guarantee for special schemes even though the development of agriculture in their jurisdiction is one of their main concerns. Thus, it is to enable the scheduled banks to play their rightful rôle in helping agricultural development in this country that the first proviso to Section 22(4) was invoked enabling the Corporation to waive Government guarantee, which rightly or wrongly has come to be considered as an obstacle in the way of scheduled banks entering the picture.

Proper Initiative

The previous paragraphs would have clearly shown that neither the terms and conditions attached to the refinance facility are so stringent nor the procedure to be followed in the preparation of schemes, its scrutiny by the Corporation and disposal of loan applications thereafter, so cumbersome as to present difficulties for those wishing to avail themselves of the refinance facilities. Proper initiative in the preparation of worthwhile schemes of agricultural development has got to be shown by State Governments and financing institutions. The Corporation can fulfil the rôle it is expected to play in agricultural development only as a refinancing agency which means the original financier has got to play his part first and all authorities connected with development schemes directly as well as indirectly have got to put their heads together.

The Corporation has recently addressed the Chief Secretaries of the various State Governments, emphasising the need for preparing more schemes for agricultural development. For this purpose, it has been suggested to them that they might constitute special committees charged with the responsibility of the preparation and scrutiny of all such schemes. The committees might consist of representatives of the State Government departments of agriculture, co-operation, irrigation, finance and other technical departments and the finacing institutions eligible for assistance from the Corporation.

As far as the financing banks are concerned, although State co-operative banks are eligible for refinance facilities from the Corporation (besides central land mortgage banks and scheduled banks), their rôle is rather limited. They can finance only schemes which require medium-term loans, and such schemes which from the point of view of the amount of finance involved, or the other terms and conditions involved, cannot be handled in the normal course of their business. Therefore, besides the State Governments, the initiative in financing worthwhile schemes has largely to come from central land mortgage banks and scheduled banks. In the field of development of land proper, that is, in the levelling of land, application of manures and fertilisers, cultivation of paddy, wheat, etcetera, dependence can be and has to be placed to a very large extent on central land mortgage banks, which are now established in every State although they are well developed only in a few.

Ever since the Corporation started functioning, it has been very closely in touch with all the central land mortgage banks in the country, individually, as well as collectively, through seminars and conferences organised by the All India Central Land Mortgage Banks' Co-operative Union. It is, therefore, expected that within a year or two, from many of the States where unutilised land and water supply exist, worthwhile schemes of agricultural development will be forthcoming.

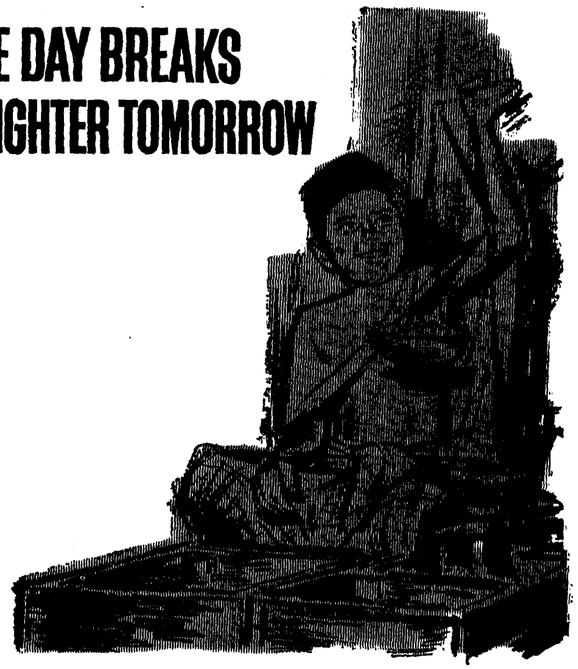
Rôle of Scheduled Banks

In the field of plantations, however, developmental activity cannot be promoted in a large number of cases, except through the scheduled banks. The larger among the individual planters would be requiring a sizable volume of funds, depending on the crop to be raised, which co-operative land mortgage banks would not, under their existing framework, be able to satisfy. It is said that the cost of preparing one acre of land and growing crops like tea or coffee would be between Rs. 3,000 and Rs. 4,000; their repayment would commence from, say, the seventh year and thereafter; a period of ten years or more would be necessary before a loan is fully repaid. The volume of finance required by big planters would, therefore, be considerable.

To organise a large number of bigger individual planters into a co-operative, subject to all the restrictions imposed on their activities by the Co-operative Societies Act, would, therefore, be a very difficult proposition. The inclusion of scheduled banks among the constituents of the Corporation is, therefore, a deliberate step. It casts a new responsibility on them. Hitherto, scheduled banks have generally kept away from meeting the financial needs of agriculture. Neither for current production nor for developmental investments have they lent to any noticeable extent. Their hesitation to enter into financing of agriculture on a long-term basis might have largely arisen from the fact that their resources, which are short-term in nature, could not be locked up in long-term investments. But in the context of planned development of agriculture on progressive and profitable lines, such aloofness would no longer be justified as the facility of refinance is being offered by the new Corporation to them. With this facility, it should be possible for scheduled banks to take a more possible constructive interest in schemes of progressive farming and agricultural development concerning that class of farmers and planters who for various reasons, are outside the co-operative fold today.

Therefore, if there are plantations which require developmental finance either for replanting purposes or for extension of estates and whose estimated value is high enough to warrant the sanctions of loans by scheduled banks after keeping the usual margin, scheduled banks should not lag behind in coming to their help. If such schemes of development are prepared on the lines indicated in the earlier paragraphs and presented to it for consideration, the Corporation would be prepared to examine them thoroughly and if the schemes are on approved lines, reimburse the scheduled banks fully. The Corporation is proposing to convene a conference of scheduled banks shortly to give the banks an opportunity to discuss the problems which they would have to face in entering the field of long-term finance so that the difficulties could be solved by mutual discussions and the banks enabled to play their rightful rôle in the agricultural development of the country.

Helping Small Planters



There are, however, small planters whose number is pretty large, but whose total holdings are very inconsiderable. In the case of tea, for instance, one is told that small planters, some 11,000 in number, would hardly constitute 1 percent of the total output of tea. But they also have to live. They are, individually speaking, perhaps financially too weak to be helped by scheduled banks but collectively organised, they may become creditworthy and actively help in increasing production. If small planters can be organised into separate primary land mortgage banks exclusively organised for their benefit, they may be able to obtain long-term financial aid either for new plantation or replantation from the Agricultural Refinance Corporation through the apex co-operative land mortgage bank in the States. But in this matter also, difficulties are there, the chief among them being the problem of making available short-term credit to these small planters through the co-operative movement namely, the apex co-operative banks central co-operative banks and primary societies. This also is engaging the Corporation's attention.

It now remains for the Press and the public to see that the financing agencies both in the co-operative and commercial banking sectors do not remain content with pointing out the difficulties standing in the way of preparing and implementing special schemes of agricultural development, but in trying to get over the difficulties and in searching for a solution for them so as to be of maximum help for the progressive improvement of India's agricultural economy. This is the vital need of the hour. As for the Corporation nothing would be wanting on its part in giving a most sympathetic consideration to all worthwhile schemes of agricultural development which may be presented by either sector.

Self-sustained Growth a Receding Goal in Indian Planning

Self-sustained growth is a major goal of Indian planning. But the rate of economic progress in recent years has been too slow with a meagre increase in per capita income. The ratio of capital to output is very high; the savings margin remains small.

By
D. BRIGHT SINGH

THE major objective of planned economic development in contemporary low-income countries is to transform these economies from a state of underdevelopment and stagnation into one of self-sustained growth. Such an economic transformation would eliminate most of the characteristics of economic backwardness—low income, low rate of savings and capital formation, preponderance of primary industries, poor standards of health and literacy of the people and the various social institutions and attitudes which inhibit material advancement. The transformation would lead to the emergence of those important economic and social features which mark the present-day advanced industrial economies.

In an important article published eight years ago, Professor W. W. Rostow[1] argued on the basis of statistical data relating to some of the developed countries that it is possible to fix approximately the period of time when they experienced such transformation. The process of change covers normally a period of about 20 or 30 years, but this crucial stage in the economic progress of a country is preceded by a much longer period of gestation when the preconditions are created for the economy to "take off into self-sustained growth". The more important among these conditions are the rise in national savings and capital formation to about 10 percent of national income, the emergence of an entrepreneurial class capable of making productive investments in the economy which would ensure a steady improvement in the rate of growth of national output and a significant change in the social attitudes of the people involving a modification of the institutional and organisational set-up in a manner that would facilitate economic expansion.

The most important feature of an advanced economy is that its growth is self-sustained, whereas in a backward economy what little improvement there is in national income, is achieved with considerable strain. This difference obviously springs from the fact that the rate of growth of an economy, by and large, depends on the rate of investment which in turn is determined by the volume of savings. Since savings are the difference between production and consumption, the extent to which savings can increase depends on the relative rates of growth of production and consumption. Thus as long as population is growing at the same rate as national income, production would just keep pace with consumption requirements so that there is no possibility of widening the savings margin. Most of the underdeveloped countries are in this trap. The population barrier to economic growth can be broken only if the rate of capital formation rises high enough to bring about a rate of growth of output which is appreciably higher than the increase in consumption. When that stage is reached, *per capita* income would steadily rise, savings would be enlarged and further increase in investment and output becomes easier. Growth then involves no strain and becomes self-sustained and automatic.

Increase in National Income

The need for an accelerated rate of increase in production and national income leading to self-sustained growth is stressed in the five year plans of India. It is, therefore, relevant to review briefly the progress made so far in this direction. However, in view of the changed political and economic circumstances under which the present day low-income countries are developing the relative significance of the different conditions of growth as laid down by Rostow requires some reassessment. In an economy like India's in which development is planned and in which public-sector investment is as great as or greater than private sector investment, and where public sector investment is concentrated on economic infrastructure and basic industries, it is clear that in initiating the process of growth, the State would have to play as important a part as private entrepreneurs did in the nineteenth century.

The importance of the conditions that ensure a free flow of loanable funds is certainly as great in planned and mixed economies as in free enterprise economies, but they take on a different form and aspect in the former. While in the free enterprise economies in their early stage of development, banking and financial institutions and the capital market developed spontaneously out of the needs of entrepreneurs and through their enterprise and initiative, in a country like India, the provision of financial facilities has to be organised by the State. In other words, the State plays an important part not only in the utilisation of savings, but also in the mobilisation and canalisation of such savings. At the same time, the increasing interest taken by the State in the development of transport and communications and in the starting of capital goods and basic industries may be expected to spark off the transformation into self-sustained growth.

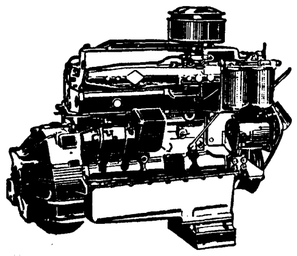
Hence the question how far planned economic development in India in the last decade has taken the country towards the stage of self-sustained growth has to be answered mostly in terms of what the State has achieved. As Rostow himself has indicated, the starting of the era of planning may be considered as an event which ushered in the transformation stage. The attainment of political freedom, the acquiring of international status as a free nation and the awakening of the masses to the need for building up the economy may be considered as the non-economic forces which have initiated this process of transformation. This process would continue until the stage of self-sustained growth is reached. Effective planning and development along proper lines would shorten this period of transformation and bring nearer the next stage of development when economic growth becomes automatic and normal. In this sense, the success or failure of planned development in the country has to be judged with reference to the following three considerations:

(1) Whether *per capita* income has increased substantially so that larger savings are available in the economy and the investment rate has risen appreciably;

(2) Whether social attitudes have changed in a manner conducive to economic progress; in other words, whether the achievement so far made has aroused in the minds of the people a desire to make further improvements, and widened their vision of the possibilities of development, whether it has awakened mass enthusiasm and support for development;

(3) Whether public investment for the provision of economic infrastructure and the development of basic industries has furnished a sound foundation for a rapid build-up of the superstructure.

Transition to Self-sustained Growth



The 10 percent rate of investment, the attainment of which according to Rostow marks the transition to self-sustained growth should not be interpreted too narrowly. What is significant about the minimum rate of investment is that this rate should be high enough to ensure such a rate of growth of income that would help further increase in investment. Rostow illustrates his statement with investment data relating to Sweden and Canada in the last three or four decades of the nineteenth century. However, in some of the contemporary under-developed countries one finds that the investment rate is equal to or exceeds the rate of 10 percent to 15 percent of national income attained in the western developed countries at the take-off stage.

In reality, the extent to which a given rate of investment would help in increasing income and accelerating savings and capital formation depends upon the efficiency of investment, that is, the capital-output ratio and also the rate of growth of population. But since the economic and non-economic conditions prevailing in the present-day developed countries in their early stages of growth were different from that of modern low-income countries, it is difficult to have any precise notion of the level of investment that would ensure self-sustained growth. Economic development in the western countries in the nineteenth century was brought about by private enterprise. Increased production of certain manufactured consumption goods and the emergence of some leading sectors of the economy facilitated the establishment and development of other industries. But the nature of economic development in the underdeveloped countries of today is different. In these countries investment in the initial stages has to be on economic and social overheads and on heavy industries which involve large initial capital outlay.

Further, the rate of growth of population is very much higher than what it was in the western countries in the nineteenth century. For these reasons, the minimum rate indicated by Rostow has to be raised considerably. Roughly we may say that a rise in the rate of net investment to about 15 percent or 18 percent of the net national product is necessary if an underdeveloped country of the present day is to approach the stage of self-sustained growth.

Viewed against this requirement, the achievement of India in the past few years is far from satisfactory. The national income at 1960-61 prices increased from Rs. 10,200.4 crores at the beginning of the first plan to Rs. 12,100.3 crores in 1955-56 and to Rs. 14,500 crores in 1960-61. Over the decade covered by the first two plans —1950-51 to 1960-61, national income increased by 42 percent, but since population increased by 21 percent in these ten years, *per capita* income increased by only 16 percent. In the ten years, 1950-51 to 1960-61, the rate of *per capita* income increase of 1.6 percent in India was lower than that of other under-developed countries like Burma (3.5 percent), the Philippines (2.6 percent) and Thailand (1.8 percent). In Japan in the same

period, the annual rate of increase in *per capita* income was 8.2 percent.

Savings and Investments

Corresponding to the meagre increase in *per capita* income, the savings and investment level also failed to move up to any appreciable extent. In the five years of the first plan, savings increased from about 5 percent of national income to about 7 percent and at the end of the second plan, it rose slightly to 8.5 percent, which was 3 percent less than the rate expected to be achieved. Total tax revenue of the Central and State Governments amounted to 7 percent of national income in 1950-51; in 1960-61 it increased to only 9 percent. Investment at the end of the second plan reached the target of about 11 percent of the national income, but this could not have been attained without the massive foreign aid which amounted to as much as 3 percent of national income. To some extent, the poor show of savings was due to the deterioration of the effectiveness of investment and the failure of the State to mop up a good proportion of the increased incomes of the wealthier classes. Investment resulted in a proportionately lesser increase in income in the second plan than in the first. Obviously, much of the rise in the ratio of capital to output in the second plan period was due to the nature of the investment—the greater emphasis on heavy industries.

Nevertheless, the unimpressive results in income growth can be explained only if other factors like waste in investment expenditure and the failure to utilise fully the capital created in the process are taken into account. The failure in savings is all the more disappointing when viewed in the light of the fact that much of the increase in income tended to get concentrated in the hands of a few who already belonged to the highest income groups. Hence the question arises whether there was not a failure to mobilise fully the savings potential provided by the higher incomes of particular classes of income earners. The fact is that while the consumption level of the masses of the society including the so-called middle class fixed income earners has not improved, there is ample evidence indicating indulgence in conspicuous consumption by the richer few. In short, planned development in India in the first decade of planning did not help in raising the savings margin to anywhere near the level necessary to bring about accelerated growth.

The next question to be considered is whether planned development has brought about the changes in social attitudes which are conducive to economic growth. An analysis of changes in human behaviour, attitudes and motivations or of modifications in social customs and pattern of living, is clearly beyond the scope of a study in economics. A quantitative assessment of such variations is difficult. Nevertheless, in so far as an improvement in this direction is set as one of the major objectives of planned development in this country, to be attained through public investment in social welfare measures and by means of an egalitarian tax and public expenditure policy, it would be possible to infer indirectly from government outlays on this head, the nature and degree of change that has taken place. It may also be added that successful execution of the programmes of development, particularly those which affect directly the immediate interests of the community, goes a long way towards enlisting the co-operation and support of the masses. Negatively, it means that to the extent public development expenditure has failed to show clear results it has failed to arouse popular enthusiasm.

Rapid Rise in Population

In view of the vastness of the country, the size of its population and the latter's rapid rate of increase, the very low standards of health and literacy, the social rigidities and the adverse influence of custom and tradition, and the general apathy of the masses, public outlay on social services and welfare schemes under the first two plans has to be considered as inadequate. Social services accounted for 23 percent of the first plan outlay, but the proportion declined to 18 percent in the second plan and to 17 percent in the third. It has also to be remembered that in the years 1950-51 to 1960-61, the actual expenditure under this head was much less than the planned amount.

Planned efforts over a decade succeeded in raising the percentage of students enrolled in schools in the age group six to 11 years from 42.6 to 61.1 only. The All India Educational Survey undertaken in 1957-59 pointed out that for the country as a whole in 1957, about 29 percent of rural habitations and about 17 percent of the rural population were not served by any school. Outlay on public health also falls short of the great needs of the economy. The increase in the number of hospitals and dispensaries from 8,600 in 1950-51 to 12,600 in 1960-61 and of beds from 113,000 to 185,600 is obviously very inadequate in a country with a population of 439 million, in which the average expectation of life of 40 years is among the lowest in the world, and where one out of ten children born dies before completing one year of life.

Bauer draws attention to the fact that the expenditure on education in the second plan is between one third and two fifths of that on large and medium industries in the public sector and that development expenditure on elementary education is about half the cost of each of the three steel plants planned in the public sector.[2] The expenditure on elementary education increased by only Rs. 2 crores in the second plan over the first—from Rs. 85 crores to Rs. 87 crores. The inadequacy of trained teachers and their very low incomes and status and the extreme measures taken to economise on educational facilities leave no doubt about the relative neglect of this important sector of the economy. The unimpressive performance of the community development projects and the halting manner in which land reform measures have progressed are other indications of the fact that social reconstruction has not been given the serious attention which it deserves.

Although repeated stress has been made in all the plans about the social objectives of bringing about economic equality and better distribution of the benefits of economic improvement among all classes of people, this objective still remains a distant ideal. Statements have been made over and over again in public documents about reducing disparities in income and wealth through taxation, control of monopolies, fixation of land ceilings and minium wages, better treatment of labour, granting of subsidies, etcetera. However, inflation and rise in capital values have only accentuated inequalities. The increase in agricultural and industrial production has not improved social well-being or reformed social structure, while community development has benefited only a minority. Thanks to a steady rise in prices, the lower middle classes have now lower real incomes and the industrial workers have barely maintained the prewar level of real wages.

Distribution of Income

It is estimated that as much as 30 percent of the increase in total income during the decade covered by the first two five year plans accrued to the higher income groups. The result is that the bulk of the population do not feel that they have benefited in any obvious way from the economic development of ten years. There has, therefore, been no social reawakening and the enthusiasm of the people has not been aroused. That in the initial stages of planned effort in an under-developed country like India which has stagnated for long, there is need for a great measure of austerity is understandable. But the fact is that in a backward economy where the consumption levels are miserably low, where planned development is taking place within a democratic framework, and where social ideals of justice and equality are loudly proclaimed, the average consumer expects some improvement in his lot as a result of all the ambitious investment schemes and is likely to be left with a sense of frustration when his hopes are not realised, in some measure.

Far from evoking his enthusiasm, this failure to raise consumption standards would only estrange his feelings and deprive him of what

little faith he might have had in Government schemes of economic expansion. The average intake of food in the country is still below accepted nutritional standards, and the consumption of cloth a head which rose from 9.2 yards in 1950-51 to 15.5 yards in 1955-56 has remained constant since then and is only around the prewar level. Housing is woefully deficient and about a half of the population of India has, on an average, only Rs. 13 a month to spend on consumer goods. It is, therefore, not surprising that labour productivity has not improved. Nor is sufficient attention devoted in the plans to increase the wages of labour and its productive efficiency.

Public co-operation in planning effort depends to a great extent on the degree of success attained in achieving the targets which in turn is determined by the efficiency of the techniques. Here again, the performance of economic planning in India has not been such as to create popular confidence and elicit the support of the masses. Among the laudable objectives of planned development, the achievement of which would undoubtedly appeal to the masses, are the provision of increasing employment opportunities, self-sufficiency in the mater of food and control of the price level. In none of these has the achievement been satisfactory.

Increase in Labour Force

It was expected that in the course of 1956-61 labour force would increase by about 10 million which it was hoped would be absorbed by the new employment opportunities created in the course of the five years. But in actual fact, employment in the second plan period increased by only 6.5 million, and since the backlog of unemployment at the commencement of the second plan was 5.3 million, the number of unemployed at the end of the second plan should have increased to about 9 million. According to the third plan, the addition to the labour force because of the growth of population in the five years covered by it would be about 17 million. If this is added to the backlog of 9 million, the total employment that would have to be provided in the third plan period would be of the order of 26 million. But the third plan hopes to create new employment for only about 15 million persons. This would mean that unemployment in the country would have increased by about 50 percent at the end of the third plan as compared with the position at the end of the second quinquennium. To this has to be added the problem of the under-employed whose number is reckoned at about 15 million to 18 million.

The effects of the failure to increase domestic food production to a sufficient extent are too obvious to need mentioning. Before the commencement of the first plan, the country was importing on the average about 3 million tons of foodgrains annually to meet domestic consumption requirements. The growth of population at a rate of 2.25 percent a year, would itself have created an additional demand of about 800,000 tons a year. Over the five years of the first plan, food production increased by 26 percent, but in the second plan period the increase was only 15 percent. As a proportion of total public outlay on development, the allotment to agriculture and community development under the third plan is increased to 14 percent, against 11 percent in the second plan. This is a welcome feature, but past experience makes it clear that planned development has not succeeded in effecting the breakthrough on the agricultural front which is basically important for the rapid growth of the economy.

Recently, in a note prepared for the National Development Council, the Planning Commission has admitted that the performance in the agricultural sector "has been woefully short of expectations".[3] The general wholesale price index (1952-53 equals 100) rose from 98.1 in 1956 to above 105 in 1957 and 1958 but since then, spurted to reach the high level of 158 in the second week of September 1964. That deficiencies in production, particularly of food, have much to do with this rise in prices is clear from the fact that an appreciable fall in the production of foodgrains and some industrial raw materials in 1957-58 brought about a sharp uptrend in prices in the next year. The similar rapid rise in prices in recent months has also to be attributed largely to deficiency in food production. But the rise in prices also reflects the lack of a price policy in the country and the failure to maintain a balance between the levels of investment and the resources available.

In addition to the obvious adverse economic and social consequences of persistent inflationary conditions, a steady and continuous rise in prices creates a feeling in the minds of the prople which the administration is incapable of tackling the problem successfully. At any rate, in so far as inflation has an obvious depressive effect on real incomes, the fixed income classes and wage-earners are led to think that what is called planned economic development, has only helped in lowering the purchasing power of the rupee and in transferring wealth to the already wealthy classes. In such a situation, it is idle to expect that the co-operation of the masses would be forthcoming or their enthusiasm for development effort could be aroused.

Outlay on Heavy Industries

It now remains to examine to what extent heavy public outlays on basic industries and on economic overheads have helped in preparing the ground for the economy to take off into self-sustained growth. Since planning started, considerable emphasis has been laid on the building up of economic overheads that would facilitate rapid growth. The proportion of public outlay on power, organised industry and minerals and transport and communications formed 44 percent of the total public outlay on development in the first plan period and increased to 58 percent in the third plan. The rise is particularly marked in the second plan, while total public spendings between the first and the second plan increased by 135 percent, expenditure on the above three items increased more than threefold.

Public expenditure visualised in the third plan represents a rise of about 60 percent over the second, and outlay on the heads of development mentioned above, is expected to increase by 50 percent. There has been a commensurate increase in output also. Over the ten years 1950-51 to 1960-61, industrial production increased by 94 percent; the output of iron and steel rose by 138 percent and chemicals by 188 percent, while machinery of all types increased by five times the size at the beginning of this period. In the third plan period, national income is expected to increase by about 30 percent. Among the different sectors contributing to total product, large increases of 237 percent, 145 percent and 114 percent are visualised for engineering, metal manufacture and power, respectively; also, agricultural output would improve by 21 percent. The figures in the following table convey an idea of the emphasis laid on the production of basic industrial goods and machinery in the second and third five year plans.

Accent on Capital Goods Industries

The policy of building up heavy industries started in the second plan period is continued in the third plan. The idea behind this policy is that the economy should become self-sufficient in the matter of capital goods and machinery so that the strain on the balance of payments will be eased. Self-sufficiency is not an essential condition of self-sustained growth. A country may be importing necessary goods which it cannot produce, yet it may have a high rate of income growth and can easily meet its import obligations out of its export earnings. The stress is on the ease with which domestic earnings are increased and savings accelerated. However, in a country like India, self-sufficiency in capital goods is a requisite for attaining the stage of self-sustained growth. Since exports and imports constitute only a small fraction of total income and there is difficulty in increasing exports, the wherewithal to bring about self-sustained growth has to be found within the country. This makes increased production of capital goods and machinery and the development of power and transport all the more important. And the prospects in this matter seem quite encouraging.

It is thus seen that while the achievements in a decade of planned economic progress in India in savings and in bringing about the necessary changes in social attitudes have been disappointing, the progress in industrialisation and especially in the building up of basic industries, constitutes an important redeeming feature. Estimates have been made about the point of time when the Indian economy would be able to take off into self-sustained growth. The third five year plan expects national income to rise to Rs. 19,000 crores by 1965-66 and to Rs. 25,000 crores and Rs. 33,000 to Rs. 34,000 crores at the end of the fourth and fifth five year plans. Simultaneously, *per capita* income would rise to Rs. 530 by 1976 representing an increase of 66 percent over the level in 1960-61. This would necessitate a rise in investment from 11 percent in 1960-61 to 14-15, 17-18, and 19 to 20 percent of national income by the end of the third, fourth and fifth plans. However, it is difficult to make any guess about the occurrence of the take-off with reference to the *per capita* income or even the rate of investment attained.

Matter of Faith

Such estimates have to be, by and large, merely a matter of faith. It does not seem correct to assume that when the investment rate reaches a certain level at a particular period of time, the economy would shake itself off the tentacles of economic backwardness and launch itself into an era of accelerated growth. The process of economic transformation is strenuous and may be quite long drawn. Nor is there any assurance that once a high rate of investment and income growth is attained, there would not be any falling back. All that can be said is that when the basic factors which conduce to a high growth rate are set—that is, economic overheads are provided, and structural, organisational and institutional changes are brought about, there is an opportunity for the economy to lift itself up from the state of stagnation so that the very process of growth would alter the pattern of savings and composition of income and other circumstances in a manner that would make further growth easier.

The entrepreneurial rôle assumed by the Government in India and the large investment outlays in the public sector may well be the element which would trigger off the forces of growth. Large Government spendings on heavy industries have raised the capital-output ratio and strained the resources of the country. Increased concentration on basic industries has led to a relative excess of overheads and under-utilisation of capacity in some lines of enterprise, but it only means that as economic activity in both the public and private sectors gains momentum, and the growth of income brings about a rise in the level of demand, the added capital equipment would be better and fully utilised, so that efficiency of investment would increase and the capital-output ratio would fall. When at this stage, large external economies become available, it would be easier to increase national output, *per capita* income would rise, savings margin would widen.

chain reaction

ESSO BOMBAY REFINERY
TENTH ANNIVERSARY 1954-1964

Ten years ago, India's first modern oil refinery began operations near Bombay. Once mainly a swamp known as Trombay, the area around the refinery is now a bustling industrial township. For the switches that started the Esso Refinery also sparked off a powerful chain reaction of industrial development—many ancillary industries, a thermal power station and a number of chemical plants have sprung up in the area and a fertilizer plant is now under construction.

Trombay will remain a significant land-mark in the economic take-off of the country and Esso's investment an example of how private 'seed capital' can provide the stimulus for continuous industrial growth.

ESSO STANDARD REFINING COMPANY OF INDIA LTD.

THE ROLE OF MONEY IN A DEVELOPING ECONOMY

Money is not a real factor of growth. But it plays a catalytic part in speeding up the process. Its supply must expand with national output. The monetary policy in a developing economy should aim at regulated expansion of the currency.

By
D. R. KHATKHATE

ALTHOUGH economic development is governed, in the final analysis, by the "real factors" such as saving-investment, productivity of capital and labour, population, etcetera, the rôle of money and other financial assets is crucial in determining its speed in view of the monetary manifestation of the growth process. In a free or partially planned economy, decisions to save and invest, when they are mediated through the use of money, are largely affected by attitudes and motivations of the spending and investing units towards money as an asset. The pervasive influence of money tends to increase with the proliferation and diversification of financial assets which are the consequences of a gradual separation of those who save from those who invest.

This importance of money as a factor in economic development stems mainly from its function as a store of value, which enables autonomous economic units to hold it for precautionary and speculative purposes. Thus, it is the demand for money to meet cash balance requirements in a growing economy, its intimate relationship with the demand for other financial assets and changes therein that should form, more appropriately, the main concern of monetary policy in relation to economic development.

Monetary policy, in its broader context, should deal with the cost of money, its availability and quantity. Since all these magnitudes—cost of money, availability and quantity—are affected, directly or indirectly, by the changes in the prices of Government bonds and other financial assets like shares and debentures, monetary policy, so interpreted, should not be confined merely to the operations of a central bank, but also cover those aspects of fiscal policy (such as the management of public debt) which have a bearing on variations in the stock of money.

In any discussion of the rôle of monetary policy in economic growth, it is essential to understand, in all its ramifications, the function of money in a given economy, and more so, when the economy does not possess al the hallmarks of a developed industrial and financial structure. Broadly, there are three approaches to the relation of money to economic growth whether as a circulating medium or a store of value. Firstly, money may be conceived to be a causal factor in economic development in so far as its availability induces a regular and balanced expansion of the economy. In this sense, money discharges the function of a catalytic agent. Secondly, money is taken to be a permissive rather than a causal factor. Use of money is a necessary but not sufficient condition for a rapid expansion of the economy. This interpretation makes money a positively ineffective force, but a negatively powerful one. Thirdly, the use and cost of money are simply considered to be immaterial for economic development or its speed. The rôle of money thus is purely passive. This manner of looking at money approximates to endowing it with a neutral rôle.[1]

Empirical Evidence

Empirically, it is almost difficult to pin down any one of these rôles on money in the context of economic growth. Data are often non-extant and inadequate, where available, which offer conflicting evidence as to the rôle money plays in economic growth. About money as a causal and catalytic agent of growth, the statistical series concerning the United States for about a century seem to suggest a significant relationship between changes in the stock of money and changes in economic activity.[2] But even here, the evidence is not conclusive. It is true that the turning points in the stock of money generaly preceded those in output, particularly industrial. However, all that this indicates is that there is a strong presumption in favour of money as a causal factor and nothing beyond. This would remain so as long as a *modus operandi* of the influence of money on the changes in the economic system is firmly identified.

What then is the precise rôle of money in economic development? A relationship between money and output, although stable through time, is mechanistic as a basis for seeking a causal connection between the two. It tends to slur over the complexity of the growth process in the real world. Perhaps a more helpful approach, and more rewarding in terms of practical policy, would be to view the rôle of money either as a causal or permissive or a passive factor; money is more of a transmuting agent which tends to galvanise the whole process of development. If, for instance, money is totally absent in the economic system, the crucial variables influencing growth would remain tethered and thus the growth would not be as fast as it would be otherwise.

The reasons why money plays such a vital rôle in the growth process are easy to understand. For one thing, the economy using money takes on an impersonal character. Savings remain no longer dormant in separate pockets for want of necessary matching investments; money helps to transmute them into monetary form available to anyone willing to pay the price. Thus the use of money obviates, at one sweep, all the obstacles arising from space and time. For another, money brings up to the surface all the price relationships in all their entirety which leads to optimum utilisation of resources. In other words, all that money does in a growth process is that it provides "an efficient payments mechanism" and guides "qualitatively and quantitatively the flow of funds to economic units whose aggressive spending is stimulating real output and the flow of financial assets to economic units whose restraint on spending frees resources for real investment."[3]

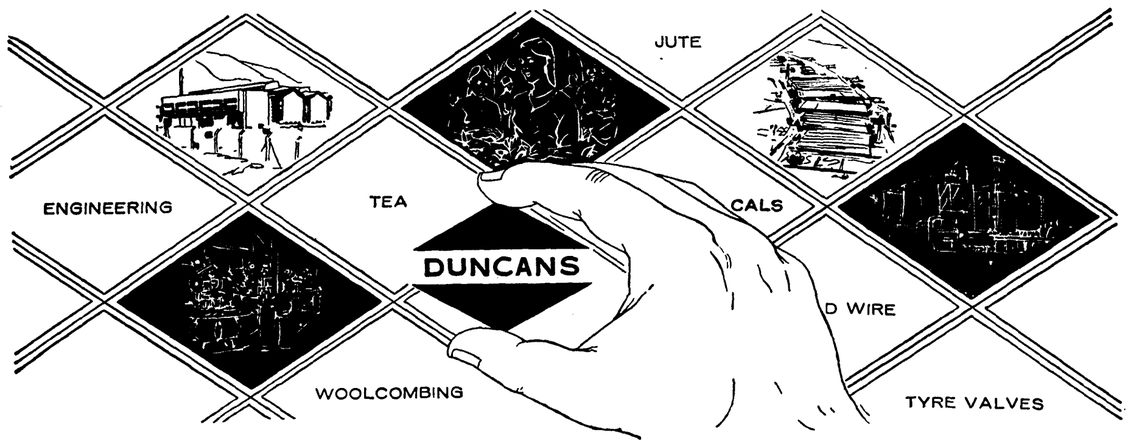
Having pinpointed the function of money in the process of development, the question is: what should more appropriately constitute money? Money is variously defined; at one extreme is pure currency while at the other is, besides currency, demand and time deposits, financial assets of all sorts. Thus, there is a whole spectrum of liquid assets, the nearest bar of which is represented by currency with almost 100 percent liquidity. However, for the under-developed economies, the definitional problem as regards money is hardly relevant. In such economies, it is more currency and bank deposits, the use of the latter is only limited; other types of financial assets are not available partly due to the inadequate growth of the financial institutions. In fact, as will be discussed later in this article, it becomes a prior charge on the monetary authorities to promote the use of financial assets. As a broad generalisation, therefore, it might be argued that the monetary authorities in developing countries should concern themselves primarily with the regulation and control of currency and deposits to facilitate the growth process.

Monetary Policy

For a proper evaluation of the rôle of monetary policy in economic development, it is necessary at the outset to indicate what economic development precisely implies. Without going into the problem of what constitutes a right measure of economic growth, it can be stated, in general terms, that economic development connotes (a) a rise in *per capita* income through time; (b) a gradual transformation of the subsistence sector which is a distinguishing feature of an under-developed economy into a monetised sector; and (c) increasing institutionalisation of saving and investment. The first two aspects have a direct relevance for the optimum degree of monetary expansion in a growing economy; the third one has a larger implication for a promotional monetary policy of the central bank in an under-developed economy. Each one of these aspects is dealt with separately in what follows:

Theoretically, the monetary authority should be able to ensure that level of money supply in a progressive economy which would be consistent with the growing national product, employment and a steady price level. Thus, the right rate of expansion in money supply should make it necessary for holders of money to effect any adjustment in prices or interest rates or output and employment so as to bring their demand for money in line with the cash balances made available to them by the monetary authorities. On the operational plane, however, the question of what should be the optimum degree of expansion in money demand in the context of economic growth is not altogether tractable. If the objective is development with a relative price stability, then the warranted expansion in money supply would be the same as the rate of growth in total national product. The underlying reasoning is that a larger national product implies corresponding rise in the volume of transactions and unless money supply increases in the same proportions, prices would tend to fall with consequent changes in output, employment and capital accumulation. Thus, only one function of money, namely, a medium of exchange, is emphasised. However, this argument, namely, that money supply should increase *pari passu* with the growth in national product, hinges for its acceptance on what objective the growing economy should place before itself to maintain a desirable level of prices.

Price Inflation



The question which then acquires crucial importance in this context is whether price inflation is helpful for rapid economic development. There is a fairly common notion that a certain degree of inflation acts as a catalytic agent in the development process. This is based on the fact that with steadily rising prices, the ratio of profit-income to national

income tends to rise in relation to the ratio of wage-income to national income. Since, generally, the proportion of profit-income saved is higher than that of wage-income, the aggregate saving-income ratio tends to grow faster and thus facilitates the acceleration of economic development. The implicit assumption is that it is a creeping inflation. Although this argument seems to be logically plausible and consistent, the empirical evidence concerning whether a growth rate is higher with creeping inflationary rise in price level than with relative stability in prices is conflicting.

A mass of statistical data has been put forth in support of the thesis that economic development is more rapid in countries which have been able to maintain comparative stability in prices than in countries with persistent inflationary pressures. In certain other countries, there is also evidence to the contrary. Thus, whether inflationary rise in prices, in the course of economic development, should be permitted or not, remains a question to be decided essentially on the basis of intuitive judgment and the knowledge of the behaviour of other variables in the economy—real as well as monetary. All that the economist *qua* economist can say is that a certain amount of inflationary rise in prices is inescapable as an incident of growth. The policy-maker, however, should ensure that the creeping inflation does not escalate into chronic inflation with all its deleterious effects.

The relevance of the above discussion for the right degree of money supply is obvious. If a certain price level is considered desirable or inevitable depending upon how one views it, the demand for money would then have to rise more than in proportion to the growth in national product, the extent being given by the desirable rise in prices.

Apart from this, there are two more reasons why it should be necessary to increase money supply more than in proportion to the rise in national product, even assuming that relative price stability continues to remain the principal objective of monetary policy. The first reason is that with the rise in income, demand for money as one component of saving tends to increase due to the precautionary and speculative motives of holding money. When *per capita* income grows, the need to hold a relatively large proportion of income in the form of money is felt more intensely as the financial commitment of people tends to increase. The utility of the precautionary monetary balances also reflects their invulnerability to risk from default or from increases in interest rates if savings are held in the form of other financial assets like government bonds or corporate debentures and shares. But there is a point beyond which it is more the speculative motive which necessitates holding of large cash balances. Since economic development connotes a widening of the range of financial assets, savers and investors are prone to shift their savings from one type of asset to another, out of their desire to make speculative gains. Thus, monetary balances as a proportion of national income tends to grow which is the same thing as a fall in the income velocity of money, namely, the number of times money enters into the generation of income-flow.

Income Velocity of Money

This is not, however, only a theoretical possibility ; it has a solid basis in the empirical investigations. That the income velocity of money falls with the growth of national product, is verified by Professor Milton Friedman on the basis of the data relating to the American economy.[4] His results show that, on an average, the cash balance requirements in the U.S.A. have risen by 1 percent every year, coinciding as they did with a corresponding rise in *per capita* income during 1867-1960. Judging by this historical experience, the behaviour of cash balances in the newly developing countries would not be radically different, although one may possibly argue on a plane of theoretical abstraction that a development of the financial system and consequent improvement in the payments mechanism may lead to a fall in the ratio of stock of money to national income.

The second reason referred to above relates to a gradual extension of frontiers of the exchange economy with the acceleration of the growth process, which requires a larger money supply for the use of the spending and investing units in the shrivelling subsistence sector for transactions, precautionary as well as speculative purposes. Most of the under-developed economies are characterised by a non-monetised or a subsistence sector, the extent of which varies from country to country. For example, it is estimated by the National Sample Survey (Fourth Round) that around one-third of the Indian economy in 1952 was represented by a subsistence sector, where saving, investment and other transactions were conducted without recourse to mnoey. Since then, the size of the sector might have shrunk, as the Indian economy progressed at a rapid rate, although it is difficult to specify any particular rate of monetisation. Due to a supplantation of the subsistence sector, the processes like investment and saving get translated into monetary form so that they grow at a faster rate. Furthermore, the scope for dissipation of saving, which takes place in a barter economy, is also less.

While a provision of money to meet the demands of a subsistence sector which is getting monetised acts as a stimulus to the economic development, accretion to stock of money as a result does not generate inflationary pressures as that money is used for transactions which were previously mediated without the use of money. Secondly, they go to satisfy the cash balance requirements of the newly monetised units.

Now the question raised initially about the optimum rate of monetary expansion consistent with the requirements of economic development can be answered. The right rate of growth of money that the monetary authorities in the developing economies should aim at is given by the rate of expansion in national output, the tolerable rise in price level, the extent of rise in cash balance requirements with a rise in *per capita* national income and the rate of monetisation of the subsistence sector. In deciding upon the actual extent of monetary expansion, the monetary authorities may fall back on the experience of now developed countries and on their own understanding of the economy. With all this, perhaps, the precise limit may be difficult to lay down. In that case, it would be more rewarding to indicate the range within which monetary expansion can take place and then regulate it within that range according to the exigencies of the situation.

[4] Milton Friedman and Ana Schwartz, *A Monetary History of the United States, 1867-1960*, pp. 679-682.

Deficit Financing

One of the interesting exercises made in India in recent years to indicate what is now known as a "non-inflationary" level of deficit financing is based on the above approach. Proceeding on the basis of certain assumptions concerning output, monetisation and prices, demand for money was projected and then working backwards, a non-inflationary deficit-financing (or net bank credit) to be incurred by the Government was arrived at.[5]

The task of monetary policy, however, is far from simple. The aggregate level of monetary expenditure is not represented by merely a stock of money ; it has another dimension as reflected in the velocity of money, namely, the number of times money is used for spending on goods and services. Thus changes in the aggregate level of expenditure are governed by the variations in money supply and its velocity. The transaction velocity of money depends on the range and availability of near-money assets which can easily and without much cost be converted into money proper. However, velocity of money is difficult to be controlled by the monetary authorities. It is generally the experience of developed and under-developed countries alike, that a fall in quantity of money brought through monetary measures is normally accompanied by an opposite effect, namely, an increase in the turnover of the reduced level of monetary stock so that aggregate monetary demand tends to remain unaffected.

Thus, the volatile nature of the velocity of money imposes a limitation on the rôle of monetary policy. This limitation, however, although serious in the short run, seems to recede in the long run. There is a certain definite maximum limit up to which velocity can increase. This is because conversion of any near-money asset does require money proper. If, therefore, money itself is regulatd, in course of time, its availability for conversion gets constricted and inevitably, the velocity tends to change in the same direction as the change in money supply. To that extent, therefore, monetary policy remains effective.

[5] B. K. Madan, *Aspects of Economic Development and Policy*, Bombay, 1964, pp. 247-264.

Monetary Expansion

If maintenance of an overall rate of desired monetary expansion is the object of the monetary authorities, the rôle of the monetary authorities may seem to be purely passive. In fact, it is even suggested by economists like Professor Friedman that there is no need for any central bank if a certain desired monetary expansion is automatically assured in a growing economy. Any such view, however, misconceives the nature of changes in the demand for money. Although the rising trend in money supply is predetermined with reference to population, output, monetisation, etcetera, there are often deviations, sharp and unpredictable, from the trend-rise in money supply.

For instance, over a long period, historical experience suggests that income velocity of money tends to decline at a rate of around 1 percent a year, but this does not warrant an assumption of absence of fluctuations in the long-term trend. In point of fact, it is found that during an expansionary phase of business cycles, the income velocity of money is higher than the trend-figure and lower than it during a downward phase of the cycle. Since any such deviations lead the economy away from its long-term timepath of growth, either though distorting the pattern of investment and saving or their size, it becomes necessary for the monetary authorities to take prompt action to regulate the changes in money supply so as to make them conform to the desired long-term changes. Furthermore, while the aggregate change in the stock of money may be in a desired direction, certain important sectors of the economy may yet remain starved of the money flows. The developing economy has some lagging sectors such as agriculture or small-scale industries, the growth of which is retarded by the lack of availability of finance on adequate scale and at reasonable cost. This implies that monetary policy should ensure a distribution of money flows in appropriate channels conducive to the rapid growth of the economy.

Regulating Private Outlay

In a partially planned developing economy, there is one more dimension to the operation of the monetary policy apart from ensuring overall expansion of money supply. It is sometimes argued that the main objective in such economies is one of influencing "private outlay in such a way as to supplement or offset public expenditure and contain total effective demand within limits compatible with price stability."[6] This manner of setting the objective, however, appears to be misleading. In a partially planned economy, there are certain targeted investment for the public and private sectors of the economy. If it is desired to achieve a safe rate of monetary expansion, as is done in India on the eve of the formulation of the third five year plan,[7] the planning authorities assume implicity a certain distribution of bank credit between the public and private sector investment, the total quantity of which is given by the safe rate of monetary expansion. If the actual private sector investment remains within the limits of targeted investment, then a corresponding expansion in bank credit to the private sector would be necessary, and would be consistent with a given objective of a safe increase in money supply.

The monetary authorities should curtail the credit expansion only if

it exceeds the limit set by the targeted private investment and thus contain the pressure on prices. But there may be occasions when the monetary expansion in the economy may well go beyond the safe level despite the private investment remaining within the confines of targeted investment. In that case, the objective of monetary policy should be to apply a brake on credit extension to public investment. It would then follow that the monetary authorities in a partially planned economy where actual private investment remains within the limit of a predetermined investment targeted cannot merely influence private outlay either to supplement or offset public expenditure because it would in that case merely reduce private investment below a planned level; it should instead curtail credit to the sector where actual investment has tended to exceed the targeted investmnt and thus to exert a presure on prices.[8]

Having examined the larger objectives of monetary policy in relation to economic development, the relative efficiency of various methods by which variations in money supply are brought about may be considered. Any change in money supply which is the same thing as the monetary liabilities of the banking system including the central bank is reflected in a change in the financial assets and/or the net monetary liabilities of the banking system, namely, a difference between non-monetary liabilities and non-financial assets. It would thus be seen that it is necessary to influence assets and/or liabilities of the banking system if money supply is to be changed in either direction. The instruments of monetary policy employed for this purpose are mainly (a) open market operations, (b) Bank rate and (c) variable reserve ratios. These are instruments of general credit control which do not discriminate between the sectors which use bank credit. Apart from this, recourse is had to selective credit controls to regulate the flow of credit to preferred sectors or prevent its flowing to certain inessential sectors. All these instruments of monetary regulation are well known and enough is said in text-books on monetary theory and policy on their relative efficiency. What is not sufficiently known is the extent of relevance of each of these instruments in developing economies which are partially planned. There are certain features of such economies which tend to modify substantially their effectiveness; in some cases, their connotation is altogether altered. These aspects of regulatory instruments are dealt with in the following.

Open Market Operations

Open market operations are considered to be a flexible instrument in influencing directly, without much delay, the volume of bank reserves and, therefore, of bank credit. But the difficulty lies not in the impact of this technique on bank money which is obvious; it is more a question of whether it is appropriate at all to classify it as a pure instrument of monetary control as divorced from the budgetary considerations. The purpose, nature and function of open market operations in under-developed countries are totally different. Unlike the practice in vogue in developed countries with well-knit capital and money markets, open market operations are mainly designed to manage the public debt.

For instance, it has been stated that "in general, open market operations have been used in India more to assist the Government in its borrowing operations and to maintain orderly conditions in the Government securities market than for influencing the availability and cost of credit."[9] It is not at all difficult to see the rationale of such a policy in relation to open market operations. For one thing, in ecinomies with partial planning, financing of public investment acquires crucial significance. Since borrowing from the public constitutes an important item in the pattern of financing, the Government is naturally concerned with the creation of an appropriate climate for smooth absorption of the sale of government bonds by the public. Thus, a preoccupation with this objective of maintaining orderly conditions in the security market tends to hamstring the use of open market operations as a technique of monetary control. For another, the under-developed countries have a narrow market for government securities due to the inchoate stage of their capital and money market so that any change that emanates from open market operations tends to result in more violent fluctuations in the prices of government bonds without affecting significantly the cash base of commercial banks. It is, of course, true that there are many occasions when requirements of the budgetary and monetary policies may coincide and the ensuing net sale or net purchases of securities on either count may be in the same direction. But it would be more a coincidence than a design implicit in a particular monetary action.

Rôle of Bank Rate

The primacy of Bank rate as a weapon of monetary control rests on a larger issue of the rôle of interest rate in determining decisions to save and invest, the choice of production techniques and the pattern of investment. Apart from these more fundamental questions, it is to be also seen whether the changes in interest rates would be sufficiently pervasive in under-developed economies. Taking the second technical aspect first, the pervasiveness of interest rate depends upon the speed with which any impulse in the short-term market is transmitted to the long-term capital market where funds for use for investing in fixed assets are lent or borrowed. Such an impulse can travel fast *via* its impact on the values of the financial assets in the economy and through them the lending operations of the financial intermediaries. However, there is no plethora of near-money assets in the developing economies and to that extent, the impulse from the short-term to long-term slows down, if not cut dead altogether.

Partly offsetting this disadvantage, however, is the existence of some of the medium-term and long-term lending institutions, directly under the aegis of the central bank. Since these institutions obtain a certain amount of share capital from the central bank as also occasionally borrow from it to replenish their resources, the monetary authorities get into a vantage position to regulate long-term rates almost as directly as the short-term rates. The degree of effectiveness, however, depends on the extent to which private sector investment relies on the term-lending institutions.

The impact of interest rate changes on the choice of production techniques and the pattern of investment is to be construed as more fundamental. It is often argued that the under-developed economies are characterised by a shortage of capital and abundance of labour so that rise in the interest rate would tend to economise the use of relatively scarce factor of production, namely, capital, and raise the input of relatively more abundant factor, namely, labour. However, this argument ignores some of the most important facts in the under-developed economies. True that a resource endowment is favourable to the rise in interest rates, but while it is a necessary condition it is not a sufficient condition for a change to take place in production techniques in response to a rise in interest rates.

Firstly, the choice of a production function is often discontinuous, such that a shift from a relatively capital-intensive technique to a relatively labour-intensive technique can take place only when a rise in interest rates is sufficiently sharp. Even granting that a rise is made very sharp to facilitate a shift along a discontinuous production function, it ill-serves the requirements of economic development as its adverse psychological repercussions would outweigh the favourable impact tn the production techniques. The result may be a slowing down of the rate of growth of the economy. Secondly, although labour is abundant and consequently "shadow" wages are lower than the market wages, the efficiency wage is much higher. The net advantages of use of more labour-intensive techniques is, therefore, limited. Thirdly, the existing technological horizon in the under-developed economy is such that the so-called labour-intensive techniques are both labour-consuming and capital-consuming, so that purely on the basis of efficiency, the use of labour-intensive techniques is wasteful, unless a new intermediate technology is thought out.

Above all, the experience of the now advanced countries shows that the growth is facilitated more by a modern sector of the economy which uses the most up-to-date techniques of production. The modern sector sets a pace for the rest of the economy and the resultant growth rate is higher than it would be in the absence of it. The logic of this is simple. In an industry which uses modern techniques of production, capital-output ratio is no doubt higher, but it is associated with a greater rate tf growth as a result of technical progress which is rapid in sectors using advanced technology.

Saving and Interest Rate

Likewise, the effects of a higher interest rate on decisions to save is rather problematic. It is an observed fact that in countries like India and Ceylon that as much as about 70 percent of the saving of the household sector is in the form of physical assets like housing, small business or insurance policies. None of these can be considered to be motivated by the interest rate. The factors affecting the desire to save, therefore, are altogether different. It is, however, true that the higher interest rates may in many cases draw the monetary savings from the unorganised to the organised sectors. To the extent the savings are brought within the ambit of organised banks, the influence of monetary policy is fortified.[10]

The use of variable reserve ratios is generally more potent as their impact is known to be direct, precise and certain. By raising or lowering the reserve ratio, the monetary authorities affect the credit creating capacity of banks, volume of credit and, therefore, the stock of money. However, this technique for its more efficient use has to influence also other liquid assets of banks. If this is not done, banks might meet the additional cash requirements consequent on any change in reserve ratios by adjusting the portfolio of liquid assets. For this reason, in some of the countries the ratio that is varied is the liquid assets ratio. While employing this instrument it has to be remembered that changes in the reserve or liquid assets ratio have to be sharp and large, if that instrument is to succeed in the context of under-developed countries. The total impact of any change in the reserve ratio on money supply depends, besides the extent of multiple credit creation by banks, on the ratio of bank reserves to total reserve money which is defined as currency with the public and bank reserves. This ratio is normally smaller in under-developed countries than in more advanced countries and, therefore, the final impact on money supply of a given increase or decrease in the reserve ratio of banks is smaller. For instance, in India this ratio is only 6.3 : 100, compared with 43.3 : 100 in the United States and 24.5 : 100 in the U.K. and 10.3 : 100 in Japan.

Credit Control

A flow of credit to the strategic sectors of the economy is usually regulated through operations of selective credit controls. This takes various forms in various countries. It may stipulate margins on credit against certain securities. In the advanced countries like the U.S.A., margins are imposed on advances against shares, consumer durables and real estate, etcetera, while in India the practice is to vary the margins for lending against the commodities in short supply or to impose ceilings on credit to certain undersirable sectors. However these controls are conceived and implemented, they hardly go to the heart of the problem, namely, to ensure the end-use of credit.

The problem in the partially-planned economy is somewhat different because of certain institutional developments. Where planning is in operation, certain output targets are set and to ensure that these targets are conformed to, some control devices such as capital issues, import

[10] Madan, B. K., "*Monetary Policy and Economic Development*," *Reserve Bank of India Bulletin*, July 1964.

licensing, foreign exchange allocation, etcetera, are evolved. This implies that corresponding to the plan in real terms, the financial counterpart with its predetermined sectoral allocation of funds is also available so that it is possible for the financial institutions, be they commercial banks or term-lending institutions, to decide upon the priority to be granted to certain industries. Provided a proper co-ordination is brought about between various control organisations and the financial institutions, it is easy for the monetary authorities to ensure the end-use of credit flows and thus to give a content to the selective credit controls.

The last aspect of monetary policy in developing economies is associated with the institutionalisation of saving and investment. Accumulation of debt in the economy is one facet of the growth process. In the early stage, investment by any unit is limited to the saving of the same unit. Once, however, economic development gathers momentum, the requirements of investment tend to go beyond the limits imposed by self-financing and in consequence, the net investing units borrow directly from the net saving units. Thus, the financial liabilities and assets rise in the same proportion. In most of the under-developed countries, the method of direct financing, namely, issue of debt by those who save to those who invest is more widely prevalent as exemplified by the existence of a large unorganised credit sector, providing credit to the farmer, business and small-scale industrial enterprises. In the organised corporate sector, the direct financing takes the form of issue of debentures, preference shares, etcetera.

Economic growth is slower when methods of financing remain confined to only self-financing and direct financing. With the progress of the economy, direct financing tends to prove inadequate to meet an intense demand for loanable funds. It is at this point that the emergence of financial intermediaries, both bank and non-bank, has proved to be of crucial importance. The primary function of these institutions is to issue debt of their own by getting surplus funds from the net saving units and loaning them out to the net investing units. But the total debt accumulation through institutionalisation of saving and investment tends to rise faster in relation to income and wealth than under self-financing or direct financing. The growing importance of financial assets arising from indirect financing is manifested in the widening of preference of the people for financial assets as saving media. The more advanced the economy is, greater is the ratio of saving in the form of financial assets to that in non-financial assets. For example, this ratio for the household sector in the United States is 3 : 1. The corresponding ratio for India was .8 : 1 in 1950, and it has risen since then to 1 : 1.

The relevance of all this for monetary policy in a developing economy is self-evident. If indirect financing as reflected in the rising ratio of financial assets to national income and wealth is a concomitant of the process of economic growth, it follows that the creation of a climate for the evolution of an appropriate structure of financial intermediaries including commercial banks should become a first charge on policy-makers. These institutions do not grow in an autonomous manner. It requires, therefore, nursing from the authorities to hasten the formation of such financial institution. A central bank by virtue of its being at the helm of financial management, can undertake this task by adopting a promotional monetary policy as distinct from the regulatory one. In many developing countries, a central bank has been instrumental in creating a wide network of financial institutions to channelise saving of the community to the sectors where its use is most urgent. Perhaps, this promotional aspect has acquired a much greater prominence in the operation of monetary policy in these countries than its regulatory aspects.

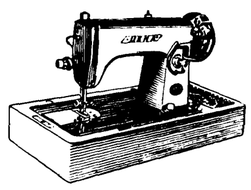
USHA

THE NAME SPANS SIX CONTINENTS



Over the years we've spread the name USHA across six continents and over 50 foreign markets. It represents quality sewing machines and fans—reputed for streamlined styling, superb finish, top performance . . . features which enable USHA to compete successfully with well-known foreign brands.

Today, our company has emerged as the largest manufacturer of sewing machines in Asia, and we can rightly claim that we operate the biggest single-unit fan factory in the world. Our network of selling and servicing centres is the widest in India. Our technical services have helped set up USHA plants in Saigon and Colombo.

Today, USHA is earning the country vital foreign exchange... it is the symbol of national progress.

Measures to Check the Growth of Unrecorded Gains

The Government may not be able to check the growth of unrecorded gains and unaccounted money by coercive measures alone. To achieve the purpose, it has to adjust taxes to a level that people can be persuaded to accept.

By

C. N. VAKIL

IN recent discussions, the phrase "unaccounted money" is frequently used to indicate certain resources which some persons seem to have obtained by undesirable means. They seem to have succeeded in not accounting such resources to the income tax authorities and, therefore, in evading taxes. The volume of such resources seems to have grown to large dimensions; various estimates have been made in this connection, although everybody knows that it is not possible to make even an approximate estimate because by hypothesis such resources are secret and not recorded. In view of the importance that has grown round this phenomenon since it was first referred to by the Central Finance Minister, Mr. T. T. Krishnamachari, in November 1963, it would be appropriate to understand it as clearly as possible.

It is usually assumed in discussions on the subject that the resources referred to above are in the form of cash or currency notes. The phrase "unaccounted money" helps to create this presumption in the minds of those who talk about it. The estimates of such money have been put at Rs. 3,000 crores. The recent raids in Bombay on the houses of some well-known film stars revealing hoards of large amounts of cash in their possession must have further confirmed the current belief that such resources are held in cash. The fallacy of the estimate in terms of money is seen when one remembers that the total notes in circulation issued by the Reserve Bank of India is about Rs. 2,500 crores. Those who suggest an estimate of Rs. 3,000 crores of "unaccounted money" are obviously wrong, if one assumes that these resources are in terms of so much cash.

Double Transactions

It may be asserted that those who hold such resources in cash are more an exception than the rule. It is true that such resources are often obtained, in the first instance, in the form of money. Being aware of the risk of holding the resources in cash, they are anxious to convert them into something else. The money is either spent in lavish expenditure or converted into commodities or invested in property. As it is no longer possible to invest large amounts in gold, people may invest in other forms of jewellery such as diamonds and pearls. Some use these amounts to buy stocks of certain commodities, raising their prices in consequence; they do so in the hope of selling the commodities at an advantage later. It is well known that property, such as land, buildings and flats, changes hands creating the peculiar phenomenon of double transactions, one official and legal in terms of which the transfer is effected; the other, which is a condition precedent to the former, is a transfer of a certain amount of cash between the parties concerned without which the legal transaction would not take place. Such transfer of cash is known as *pugree* or "on money" or some such phrase understood between the parties themselves.

There is no record of such transfer of cash; no receipt is given. There are also certain methods which are becoming current by which the so-called black money can be converted into white and used in the normal way. Fictitious transactions are made on paper for this purpose. For example, a person having a genuine deposit of his own in a bank is persuaded to withdraw, say, a lakh of rupees. He gives a nominal loan of the amount to "X" who wants to convert his "black" money into "white". "X" gives a promissory note to the lender which is then cancelled with the remark "paid", and returned to "X". For this service, the lender gets an amount treated as interest on the loan. The lender does not part with his cash; he puts it back in his deposit account in due course when the transaction has come to an end. "X" is able to show with the document in his possession that he has raised a loan of a lakh of rupees. His "black" money is then accounted in his books as a loan from his friend, in whose books also the loan would be shown. Any number of ingenious devices are contrived by people who wish to cheat the law by creating paper evidence of legal transactions, behind which it may be difficult for the income tax authorities to probe further.

If one can visualise the nature and volume of transactions which may be taking place on these lines with the help of resources of the type referred to above, one would come to the conclusion that the term "unaccounted money" does not describe the phenomenon correctly. It leads to the conclusion referred to above, namely, the impression of the large size of such resources which goes beyond the total volume of currency issued by the Reserve Bank. It is possible, however, to say that the claims on different types of commodities, property and other forms of wealth that the parties in question may have obtained may be in large dimensions, approximating to the suggested figure of Rs. 3,000 crores for the country as a whole. If this assumption is nearer the truth, then it reflects the gravity of the situation and the immensity of the problem that has been created. We prefer to designate such resources as "unrecorded gains*", which brings out the nature of the phenomenon perhaps more effectively than "unaccounted money". It would, therefore, be desirable to analyse the problem as far as possible to ascertain the motives which lead to the situation, its effects on the economy and possible remedies.

Avoidance of Taxation

As far as the principal motive of the persons who indulge in acquiring such unrecorded gains is concerned, it is avoidance of taxation. When avoidance of taxation occurs on a fairly large scale in a democratic society, the phenomenon should be examined sympathetically, even though it is a most undesirable form of anti-social activity. In the first place, it is obvious that those who avoid taxes in this manner show a complete lack of identity of interests between themselves and the Government. They seem to believe that the Government is some authority interested in fleecing them, and that it is their normal function to defeat such measures of the Government. They ignore the fact that the Government represents society at large and has important functions not only for law and order, but also for social welfare and economic development. They do not realise that they are a part of the society which the State represents and that it is their prime duty to co-operate with the State in carrying out its objectives.

When such a person is reminded that it is the national Government that he is dealing with, his answer would be something of this nature: "He would say that he fails to understand the policy of the Government and that he does not have confidence in the same. He is not able to understand the need for heavy taxation. When he is told about the schemes of development, his rejoinder is that a good bit of the money so collected by the Government is wasted, because he is aware of the corruption and inefficiency in schemes which the Government undertakes. He is quick in pointing out some top persons in the Government, such as Ministers and officials, who are known to be corrupt and waste public money raised from taxation. He, therefore, argues that he is justified in avoiding paying taxes to the Government which does not use his resources properly." The attitude of mind reflected in the above sentiments easily spreads among certain classes of people who would like to have larger resources left at their disposal instead of having to pay them as taxes; they are used to somewhat higher expenditure and are goaded by self-interest in this attitude. They have found methods by which they can escape taxation and treat them as a normal affair, almost a way of life.

The prevailing belief concerning the taxation policy of the Government is that the limit of taxation is determined by the limit of squeezability. The Government or the officers concerned are looked upon as heartless persons anxious to squeeze to the utmost the resources of the people by way of taxes; this attitude implies that the taxpayer is left dry or he is squeezed out. This attitude is accompanied by an open or concealed effort at resistance against the squeezing process; this leads to systematic efforts to evade taxes. One may characterise this attitude as wrong; there is no effort to justify it in any way. But as long as it exists on a large scale, it is desirable and essential in the interests of the country to take adequate and timely steps to change the outlook of the people towards a better understanding of their rights and responsibilities.

It is obvious that the above situation in the first place brings about a complete distortion of the economy. The transactions indulged in by these persons do not enter into any official record and, therefore, official statistics of economic activity tell an incomplete tale. Because they are anxious to spend away such resources as fast as possible, they do not mind paying more for a given object that they desire and in the bargain push up prices. This situation further brings about moral deterioration in society in as much as there is an adverse effect on human values, particularly on things which one should consider as good and noble. Those who are able to parade riches so obtained are able to get power and influence in society and the honest person remains at a discount.

The younger generation who observe this way of life in their surroundings in the family and elsewhere get accustomed to this situation as a normal way of life, and to some extent they share in the advantages in as much as they have

* The phrase "unrecorded gains" was first used by me in the Ogale Memorial Lecture delivered under the auspices of the Maharashtra Chamber of Commerce on 16th October, 1963, in Poona.

the opportunity to spend lavishly. For example, the pocket money in the hands of boys and girls in such families is known to be unusually large. Such a moral deterioration in society is obviously against national interests. It is bound to corrode society in general by spreading wrong values in every walk of life. The phenomenon should, therefore, be treated as a national disease which requires radical remedies. It is a moral problem, although in the economic form.

Coercive Measures

The Government may adopt both legislative and administrative measures to deal with such unrecorded gains. Such coercive measures may have some effect but may not root out the evil. Such an effort on the part of the Government would create complicated problems of administration and a series of unpleasant measures against which political pressures may emerge. In spite of this, it becomes the duty of the Government not to look on, but to strain its resources to deal with the evil as far as possible. A series of measures have been taken recently to deal with the situation. Although the effect of the same cannot be seen in a short time, it is realised by all that the evil is deeper than can be treated only by such measures.

From the long-term point of view, therefore, it may be said that unless the outlook of the people is changed, it will not be easy to remove this tendency completely. People should be made to realise the importance of honest dealings with the Government. They would realise this if they had national consciousness and the feeling that the interests of the country should be placed above one's self-interest. Such a national consciousness would result in complete identity of interests between the people and the Government with the result that the people would be willing to sacrifice for the country, if necessary, and in any case would not be willing to take advantage for themselves at the cost of the interests of the country. Such national consciousness should establish a widespread feeling in all classes of people that certain things cannot and should not be done by a national of the country, and anyone who indulges in such undesirable things would be branded and treated as "un-Aryan".

For this purpose, it is essential under present conditions to have a simultaneous approach to bring about such a change in outlook both with reference to the adult population as well as the younger generation. Systematic propaganda of a convincing nature is called for to bring about the desired change in the outlook of the adult population. The fact that the interests of each person are completely inter-woven with those of the country as a whole, has to be instilled in the mind of every adult person in the country. Anyone departing from the code of behaviour consistent with the interests of the country would invite general odium from other members of society, would be looked down upon and ostracised. As far as the younger generation is concerned, it should be possible to raise in them the necessary patriotic sense so that their outlook on life may be of the right character.

That there is considerable room for improvement in the country's educational system for acheiving this goal need not be stressed. In the haste with which quantitative progress has been made in the educational sphere at all levels, the country has overlooked the quality of education not only in the standards of subjects taught but also in the maintenance and development of character of the younger generation. The sense of patriotic discipline and the attitude for correct values to be adopted for the purpose of the unity of the country have not been developed in the right spirit.

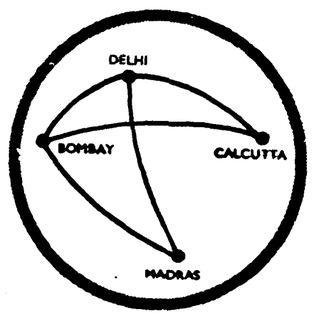
During British rule, religious teaching was not introduced in schools and colleges as the British Government found it convenient to adopt a neutral attitude towards the different religions of the country. Since independence, India has become a secular State and has thus avoided religious differences in political life. This has also resulted in the continuation of the British method of avoiding the teaching of religion in educational institutions. The cultural heritage of India is bound up with the ancient religion of the country; the teachings of the highest principles of religion would go a long way in inculcating in the young mind noble ideas leading to the building up of character, discipline and patriotism.

In a democratic society, it is essential that the masses of people are able to understand the Government's policy in general, the need for growing expenditure in a welfare State and, therefore, the need for raising additional taxes. If such understanding does not exist, there will be resistance to the policy of the Government with undesirable consequences. In spite of adult suffrage, it cannot be denied that the masses of the people are not able to understand the significance of the rapid changes in the country as well as of the need for growing expenditure and additional taxation.

The evidence of waste and inefficiency as well as of corruption which it is not difficult for the ordinary man to notice in the public life and administration of the country is likely to create antipathy for Governmental schemes of development and an attitude of indifference, if not of active hostility, towards the Government. It is usual for the Government to think in terms of nationalisation of different activities or of expanding the functions of the State in the hope of bringing about a socialistic society or removing the known evils of free enterprise. But as long as the attitude of the people is that of indifference towards the expansion of Governmental activities, the success of such measures is doubtful. Socialistic measures presuppose an understanding as well as active cooperation of the people for their success in a democratic society. As long as the above conflict continues, it is not possible for the Government to achieve the desired end. Care has to be taken to see that socialistic reform does not lead to unsocialistic evils on account of the non-acceptance in practice of widespread resistance in private of such reform amounting to disobedience of Authority.

The policy of progressive taxation at a high level in the interests of socialism defeats its purpose, if it results in widespread evasion and demoralisation of society. It is no equality, if it is accompanied in practice by unrecorded gains and wasteful expenditure both in the public and private affairs. The object of better distribution should proceed in a manner by which the New Society develops national consciousness and disciplined efforts for mutual help and national progress, without straining the inherent self-interest in man beyond reasonable limits. Legislative and administrative actions for which the people are not mentally ready are often defeated in the long run. National character should not be sacrificed at the altar of theoretical equality.

Taking the above considerations collectively in view, one may say that the ideal limit of taxability in a country like India should be that limit at which there would be no temptation to evade taxation; such a limit would be higher if there was full understanding of the Government's policy and full confidence in the Government's capacity to spend public resources efficiently without leakage. The assumption is that there is complete identity of interests between the people and the Government, and that the people are patriotic enough to resist the temptation to evade taxes provided they are convinced of the justification for the same. It is not possible to lay down any formula for such a limit of taxability; it is bound to vary according to circumstances and it has to be ascertained by trial and error. The proposed limit of taxability makes the Government responsible for explaining its policy to all classes of people and justify additional taxation to the satisfaction of the people.



Besides, it requires the Government at all levels to be above board and set an example of integrity and efficiency. It also puts equal responsibility on the people who are expected to be patriotic and willing to part with their resources in the common cause; such willingness follows greater understanding of the policy of the Government. If there is such liaison between the people and the Government, it would not be difficult for the latter to carry out a socialistic policy intended for the progress of the country. Once the concept of "squeezability" as the limit of taxation is removed and replaced by that of "willing acceptability" by the people, the outlook will change for the better. The yield from taxes under the proposed method need not be smaller than from the prevailing method, for once people realise the need for paying more and are convinced of the good use of their resources, they will be willing to accept more burdens with active co-operation, and without resistance. The Government should work towards such an ideal and stop the moral deterioration which has overtaken the people before it is too late.

Growth of the Corporate Sector: Role of Reserves in Financing Expansion

Private industry has not resorted much to borrowing for its fixed capital formation in recent years. It has shown a tendency to use owned funds or to issue further share capital for financing expansion.

By

H. T. PAREKH

General Manager, The Industrial Credit and Investment Corporation of India

THE progress made by industry in the private sector during the period of the plans is reflected most comprehensively and concretely in the annual studies published by the Reserve Bank of India in its monthly *Bulletin* as "Finances of Indian Joint Stock Companies". These are based on an analysis of the annual balance-sheets and profit and loss accounts of individual companies since 1951. An attempt is made here to bring these annual studies together with a view to examining what light they throw on certain aspects of the nation's industrial development.

These studies measure, in financial terms, the substantial expansion that has taken place in productive facilities and output of the organised private industrial sector, both in the aggregate and also industrywise. They bring out the extent of capital formation taking place in industry and how far this was financed by internally generated funds and how far from funds raised outside in the form of permanent or long-term capital and borrowing from banks and other sources. They show the relative importance of long-term capital and of working capital used to build up fixed assets and to finance inventories. They give a picture of the capital structure of the industrial sector and the relative composition of different forms of capital in this structure.

Of even greater interest perhaps is the analysis of operations of these companies which brings out the relative costs of the three factors of production—labour, capital and management—during the dynamic decade of development. The study also brings out the increasing contribution which the industrial sector has been able to make to Government revenues by providing resources through direct corporate taxation and indirectly from excise duties.

They also show the rate of profitability in industry as a whole and in each industry year after year, extending over a decade of planned development. The overall findings which emerge out of these figures may be of general interest, particularly at a time when the fourth plan is being formulated.

Better Coverage

These annual studies of company finances have been expanded over the period to give a better coverage; although the figures are, therefore, not strictly comparable over the years, they have grown to be more representative of the corporate sector. The following table shows the extent to which the industrial sector has been covered by successive studies, which deal with public limited companies only having a paid-up capital of not less than Rs. 5 lakhs. Public-sector companies are not included in these studies. Banking, insurance and investment companies are also excluded to bring out the industrial growth. These studies broadly cover the period of the first, second and third plans as shown in the following table:

Table I

ANNUAL STUDIES OF THE COMPANY SECTOR

1950-55	1956-60	1961 and 1962
Number of companies analysed each year 757, 746, 771 and 751.	Number of companies analysed 1,001	Number of companies analysed 1,331
Percentage covered by paid-up capital of companies included to total paid-up capital of public companies. 66 percent	Percentage covered by paid-up capital of all companies at work at the end of March 1956 78 percent	Percentage covered by paid-up capital of all companies at work at the end of March 1961 87 percent

The consolidated financial picture of Indian industry in the private sector at the beginning of the period in 1951 and after the development of 11 years in 1962 is shown in Table II below:

Table II

CONSOLIDATED BALANCE-SHEET OF CORPORATE SECTOR 1951 AND 1962

(Rs. in crores)

Capital and liabilities	1951	1962	Assets	1951	1962
Companies	757	1331	Gross fixed assets	580	2213
Paid-up capital	337	800	Less: Depreciation	277	928
Reserves	197	602			
Borrowings (other than bank borrowing for working capital)	93	402	Net fixed assets	303	1285
Borrowing from banks	103	493	Investments	58	137
Current liabilities and provisions	235	841	Inventories		
			Raw materials, finished goods, work in progress, stores, receivables, etcetera	465	1462
			Cash	61	120
			Other miscellaneous assets	78	134
	965	3138		965	3138

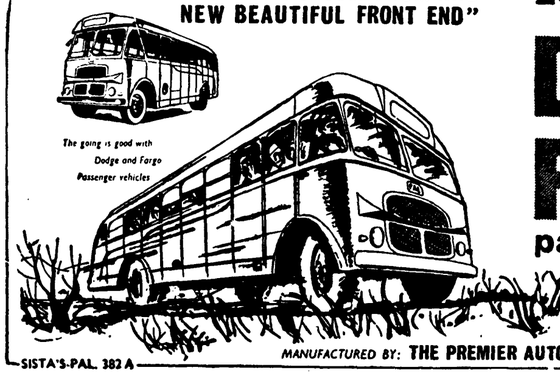
The above table shows the four-fold growth which has taken place during the planned years, in fixed capital formation, although some allowance should be made for the fact that the industry covered in 1951 was 66 percent and that covered in 1962 was 87 percent. In this period, the gross fixed assets have increased by over Rs. 1,600 crores from Rs. 589 crores to Rs. 2,213 crores, while the net fixed asset formation in the form of depreciated value of fixed assets increased over four times from Rs. 303 crores to Rs. 1,285 crores. The gross capital formation has thus increased at an average rate of over Rs. 150 crores. The development in recent years is known to be at a much bigger rate than this average. The depreciation provision during this period amounted to about Rs. 650 crores.

Ploughing Back Earnings

The capital needed for this expansion has been almost wholly met by ploughing back earnings and by raising new capital to a small extent. As shown in Table II, the paid-up capital of the companies concerned increased during this period from Rs. 337 crores to Rs. 800 crores. The reserves of the companies have increased three-fold to Rs. 600 crores in 1962, against Rs. 197 crores in 1951. The balanced character of the capital structure of the Indian industry as a whole is well reflected in the fact that at the end of 1962 the entire net fixed assets of Rs. 1,285 crores were financed only from owned funds of Rs. 1,400 crores made up of the paid-up capital of Rs. 800 crores and reserves of Rs. 600 crores. That is to say, the private industrial sector has not depended on any borrowings for its fixed capital formation but has carried out its development with cash generated by industry itself and partly with further share capital.

Moreover, the investments held by the companies at the end of 1962 of Rs. 137 crores have also been largely financed out of the balance of owned funds. These investments have increased during the period by about Rs. 80 crores from Rs. 58 crores to Rs. 137 crores.

Besides the fixed capital formation, the consolidated balance-sheet shows the changes which have taken place in the inventories and book debts and the manner in which this has been financed between the years 1951 and 1962. The current assets of the corporate sector made up of raw materials, finished goods, work-in-progress, stores and receivables increased three-fold by Rs. 1,000 crores from Rs. 465 crores to Rs. 1,462 crores. The cash and bank balances held by the companies have doubled from Rs. 61 crores to Rs. 120 crores. This growth in the current assets has been financed by a four-fold increase in the long-term borrowings from institutions other than commercial banks which have increased by about Rs. 300 crores from Rs. 93 crores to Rs. 402 crores. The normal channel of borrowings from commercial banks for working capital has provided Rs. 493 crores, a five-fold increase from Rs. 103 crores in 1951. Thus, the corporate sector has found it necessary to incur long-term debt from non-banking channels primarily for working capital purposes. The rest of the finances for carrying the inventories which include book debts has been met by trade credits and outstandings included under current liabilities and provisions.



It can be, therefore, concluded that the finances of the corporate sector as a whole are well balanced and the borrowings, both short-term and long-term, bear a satisfactory relationship with the permanent capital in the form of owned funds. The ratio of equity to long-term debt of industry as a whole is 3½:1 and of capital to debt 1½:1, which is very satisfactory.

It has been stated above that the industrial sector met its capital needs mostly from profits generated

within but that a part of the capital was raised by new issues.

Table III below shows the new capital raised by these companies yearly from 1951 to 1962 and also the kinds of capital raised:

Table III

CAPITAL AND DEBENTURE ISSUES 1951-1962

(Rs. in crores)

Year	Ordinary shares	Preference shares	Debentures	Total	
1951	5	2	2	9	
1952	3	2	2	7	
1953	5	1	2	8	
1954	5	1	3	9	
1955	8	3	5	16	49 (1951-55)
1956	19	5	1	25	
1957	25	4	1	30	
1958	18	4	6	28	
1959	20	7	5	32	
1960	20	2	5	27	
					142 (1956-60)
1961	31	3	6	40	
1962	25	1	5	31	71 (1961-62)
	184	35	43	262	

The table brings out the interesting fact that during the five-year period 1951-55, new capital issues totalled Rs. 49 crores or an average of about Rs. 10 crores a year. In the following five-year period, the total was Rs. 142 crores or an average of Rs. 28 crores a year. In the following two years of the third plan, the average has gone up to Rs. 36 crores.

During the 11 years, the total capital raised amounted to Rs. 262 crores, of which Rs. 184 crores was in ordinary shares, Rs. 35 crores in preference and Rs. 43 crores in debentures. Thus ordinary capital accounted for 70 percent of the total issued capital.

Annual Company Accounts

Viewed in the context of India's planned development, during the first plan period of 1951-55, gross fixed assets formation—as shown in the annual accounts of 750 companies—amounted to Rs. 238 crores (average Rs. 48 crores) which these companies met wholly by internal cash generation of Rs. 242 crores (Rs. 150 crores in depreciation provision + Rs. 92 crores in addition to reserves). During this period, the companies increased their share capital by new issues of Rs. 50 crores and capitalised reserves to the extent of Rs. 28 crores by bonus issues.

During the second plan period of 1956-60, gross fixed capital formation of 1,001 companies amounted to Rs. 550 crores or an average of Rs. 110 crores which is double the capital formation under the first plan. Internal earnings to finance this capital expenditure exceeded Rs. 450 crores (depreciation Rs. 310 crores + addition to reserves Rs. 147 crores). This works out to an average of over Rs. 90 crores a year which is almost twice the amount ploughed back in the preceding five years. Thus 80 percent of the gross fixed asset formation was paid for from internal earnings. The amount of new capital raised during the five-year period was Rs. 142 crores, which at an average of Rs. 28 crores a year is nearly three times the capital raised in the previous period.

This comparison of the fixed capital formation and its financing during the two plan periods brings out clearly the dynamic aspect of industrial growth for those who doubt the availability of resources to match the requirements of industrial development.

The results of the first two years of the third plan show likewise that gross fixed assets formation tended once again to double over the average of the second plan. It amounted to Rs. 380 crores in two years which is an average of Rs. 190 crores. This was financed by internal earnings of Rs. 311 crores (depreciation Rs. 217 crores + addition to reserves Rs. 94 crores), which is an average of Rs. 155 crores. As in the earlier period, 80 percent of the fixed assets formation was met out of internal funds. External capital raised during the period was about Rs. 70 crores, which met the balance of the finance needed to purchase capital assets.

Costs of Operation

The above is the financial profile of industry on capital account. On revenue or operations account, the picture looks as in Table IV below:

Table IV

CONSOLIDATED REVENUE ACCOUNT

(Rs. in crores)

	1951	1962		1951	1962
Raw materials and manufacturing expenses	736	1,757	Sales	1,076	3,166
Salaries and wages	168	495			
Other expenses	61	264	Difference between opening and closing stocks	28	26
Interest	7	50			
Excise duty	11	247			
Managing agency commission	12	13			
	995	2,826		1,104	3,192
Depreciation	26	113			
	1,021	2,939			
Profit before taxation	83	254			
Provision for taxation	33	129			
	50	125			
Dividend	26	80			
Transfer to reserves	24	45			

In a period of 11 years, sales increased three times from Rs. 1,076 crores to Rs. 3,166 crores. Raw materials and other manufacturing expenses in 1962 amounted to Rs. 1,757 crores (raw materials consumed Rs. 1,463 crores) which is 55 percent of sales. The corresponding ratio of manufacturing expenses to sales in 1951 was 68 percent. The second major item of expenditure is salaries and wages which also trebled during this period from Rs. 168 crores to Rs. 495 crores. The labour cost as percentage of sales has remained unchanged at 15 percent in 1962 as in 1951. It has not increased relatively as is commonly supposed. The increase in "other expenses" has been nearly four times during this period. Interest payment, as may be expected, increased to Rs. 50 crores in 1962, against Rs. 7 crores in 1951. The service charge on borrowed funds of the corporate sector at the end of 1962 in the form of interest works out to an average of 6 percent. The cost of borrowing was relatively more than twice what it was in 1951.

The most striking item of expenditure is payment for excise duty, which increased over 20 times from Rs. 11 crores to Rs. 247 crores. The incidence of indirect taxation in the cost structure of industry is well brought out by this figure which shows that the excise duty collection constituted 8 percent of sales and even higher of the total cost. In 1962-63, the total collection from excise duties of the Centre and States amounted to Rs. 715 crores. The incidence of excise duties falls normally on the consumer, but the figures given above show how the cost structure of industry is being rapidly inflated by this form of taxation. Its impact has been rising steeply in recent years and it is possible that the percentage today will be higher than two years ago.

Rising Turnover

It is interesting to observe that while the total turnover has risen three times and almost every other item of cost has increased correspondingly, the cost of management in the form of managing agency commission has not gone up at all. The rate of remuneration of managing agents has been reduced by legislation and the number of managing agencies has also been falling in recent years. The cost of management at Rs. 13 crores is practically the same as 11 years ago. It constituted 1 percent of sales in 1951 and 0.4 percent in 1962. Moreover, several managing agencies are themselves public limited companies whose income does not go to a few persons but to a large number of shareholders. The financial cost of management is no longer heavy as in the past.

While the cost of labour has remained unchanged over the period and the cost of management has gone down, the provision of capital has risen, as is natural. As the productive facilities improve by more and better equipment, the depreciation cost must tend to rise. Depreciation provision which was Rs. 26 crores in 1951 has risen over four times to Rs. 113 crores in 1962. This is 3½ percent of turnover, against 2½ percent in 1951.

Profit, after depreciation but before taxation, has also shown a threefold increase during the period from Rs. 83 crores to Rs. 254 crores. Provision for taxation has, however, risen four times from Rs. 33 crores to Rs. 129 crores. Whereas in 1951, direct taxation took away 40 percent of profits before taxation, it now takes away 50 percent. This reduces the capacity of the industry to strengthen its reserves which is shown by the fact that while in 1951 almost 50 percent of net profits was ploughed back, only 36 percent is ploughed back today.

The amount distributed as dividend also shows a corresponding increase, having risen to Rs. 80 crores, compared with Rs. 26 crores. This works out to 10 percent on the total paid-up share capital of Rs. 800 crores shown in Table II, compared with 7½ percent in 1951. The servicing of the owners' capital thus costs on average 10 percent of the paid-up capital (not taking into account reserves of the companies). The service charge on borrowed funds of the corporate sector at the end of 1962 in the form of interest works out to an average of about 6 percent.

Measuring Profitability

From a study of the capital and revenue account of the corporate sector, its profitability can be established. Profits can be measured in relation to sales and turnover. They can be measured in relation to capital employed which itself is interpreted in a variety of ways by including or excluding borrowed funds. In Table V below, the profitability rate is first shown in relation to sales year by year. The second set of figures, also year by year, establishes the net return on owned funds or permanent share capital of the corporate sector after tax provision is made from profits.

As shown above, gross profits as percentage of sales was 10 percent in 1962, against 9.7 percent in 1951. In most of the years, it has ranged between 9 and 10 percent. The corresponding figures for the U.S.A. are lower as shown in the table.

Profits after tax as percentage of net worth (*i.e.*, capital + reserves) was 9.6 percent in 1951 and 9 percent in 1952 after declining at one time to 5.7 percent in 1962 and having risen to 10.8 percent in 1960. Here the U.S. figures are somewhat higher than in India. It is not possible to draw any conclusions from these comparative ratios except to say that they do not appear to be unreasonably low for India.

The broad conclusion which emerges from the above study is that gross fixed assets have shown a tendency to double themselves every five years. Secondly, 80 percent and more of such capital formation is financed from internal earnings of the corporate sector and the rest has been met from new capital raised on the

market. Thirdly, while fixed assets increased by 281 percent between 1951-62, sales increased only by 194 percent, in other words the ratio of fixed assets to sales declined from 1.9 in 1951 to 1.4 in 1962. This shows that the requirement of capital for achieving a given rate of output (adjustment required for inventory is small) has increased, particularly if the change in price levels is taken into account. This shows that the balance in the corporate sector is moving in favour of more capital-intensive industries.

At the same time, it is also seen that inventory growth is almost as large as in fixed assets. In a growing economy, as production increases, requirements of the stock of materials to feed the higher requirements increases. This growth in inventory needs not only to be managed thro inventory control methods, but it also to be financed. The figures 1951-62 show that of the rise of Rs. crores in inventories, Rs. 390 cro (39 percent) was financed thro bank borrowings. The balance financed through other sources, cluding suppliers' credit.

This has important lessons future planning. Firstly, as the co try becomes more industrialised, t growth in output to be expected a result of a given investment likely to be smaller. Secondly, a p of the increasing output would co to be held in inventories and wo not be available for immediate c sumption. Both these points wo need to be kept in mind when fina cial requirements of industry determined under the fourth plan.

MISCELLANEOUS ACCIDENT

Restricting Credit to Check Inflation: Unaccounted Money Makes Control Ineffective

The Reserve Bank has tried to establish a healthy relationship between the growth of credit and deposits through its recent credit control measures. But unaccounted money continues to accentuate inflation.

By R. M. MITRA

THE tangled web of "relative ease" and "relative restriction" has provided the pattern for credit control policy of the Indian monetary authorities since 1956 when the qualitative or selective control of bank credit was introduced for the first time. The current theme of this policy is that if the quality or purpose of a credit-use accords with the basic objectives of "development and defence", the quantity available for it should not be restricted.

Doubts about the effectiveness of the measures so far taken in accordance with this policy have, however, been increasing in the face of the steadily rising price level. The distortive effect of rising prices is underlined by the fact that national income in 1955-56, computed at current prices, was 4.8 percent less than that estimated at 1948-49 prices; on the other hand, the computation of national income in 1962-63 at current prices was 157 percent higher than that at 1948-49 prices.

Control of Bank Credit

It has, therefore, been thought fit to make a bolder use of the traditional weapon of Bank rate. The latter, which was increased from 4 percent to 4.5 percent on 2nd January, 1963, was again raised to 5 percent on 25th September, 1964. The system of slab rates for the Reserve Bank's lending introduced in October 1960, has simultaneously undergone a structural change; the "tiers" were hitherto linked to the "average statutory reserves", but they are now arranged on the structure of "liquidity reserve". Both the systems of "tiers" are designed to control the amount of borrowing through the operation of differential interest rates for credit made available by the Reserve Bank to scheduled banks. But the previous system purported to allot a "quota" of borrowing to each scheduled bank on the basis of a prescribed percentage of the statutory reserve maintained by it with the Reserve Bank under Section 42 (1) of the Reserve Bank of India Act, 1934; borrowings in excess of the quota would, however, be permitted up to the declared ceiling, subject to increasingly higher rates of interest for the rising "tiers" of credit (each "tier", also, represents a declared percentage of the statutory reserve).

The present system abandons the link with statutory reserve and seeks to make credit costlier in proportion to diminishing liquidity. The aggregate of cash, balances with the Reserve Bank and other notified banks, balances in current account with other banks and investments in Government securities *as reduced* by the total of borrowings from the Reserve Bank and the State Bank, will represent the extent of liquidity of a bank (as distinguished from the liquidity requirements contained in Section 24 of the Banking Companies Act, 1949). The percentage of liquidity to the aggregate of time and demand liabilities (as defined for the purpose of Section 42 of the Reserve Bank of India Act, 1934) will measure the liquidity position of each bank. Interest on credit obtained by a scheduled bank from the Reserve Bank will be charged at Bank rate as long as the liquidity position is not less than 28 percent; but the lending rate will increase by ½ percent for the entire amount of borrowing for every one percentage point decrease in the liquidity position. An exception to the new system of lending rates should, however, be noted; banks will continue to be allowed refinance facilities at Bank rate against rupee export bills, subject to the existing condition that commission, interest and discount charged by them on such bills shall not aggregate to more than 1½ percent a year above Bank rate.

Although the new system of lending rates does not seem to have set a quantitative limit to the credit available from the Reserve Bank, a directive simultaneously issued by the Reserve Bank under Section 21 of the Banking Companies Act, has served to introduce an effective ceiling. This directive prohibits an Indian scheduled bank with demand and time liabilities aggregating Rs. 50 crores or more and every scheduled bank incorporated outside India, from charging interest or discount, as the case may be, at more than 9 percent a year on loans, advances, cash credits, overdrafts or usance bills, made, renewed or discounted, as the case may be, on or after 26th September, 1964.

Fears have been expressed that the combined effect of these measures will be to prevent the banks from playing their normal rôle in financing the current busy season activity.

Supply of Credit

If, as in the case of rupee export bills, the banks found it remunerative to work on the basis of a margin of 1½ percent between the rates of borrowing and lending, they could continue to borrow from the Reserve Bank as long as the Reserve Bank's lending rate did not exceed 7½ percent, and thus could allow their liquidity position to fall as low as 23 percent. The statistics published in the *Reserve Bank of India Bulletin* show that the liabilities of all scheduled banks on the last Friday of August 1964, aggregated Rs. 2,729 crores (liabilities for the purpose of Section 42 of the Reserve Bank of India Act include deposit and all other liabilities other than paid-up capital, reserves, credit balance in the profit and loss account, loans taken from the Reserve Bank, the State Bank, any other notified bank and from the Refinance Corporation for Industry) and that the quantity of liquidity as defined above amounted to Rs. 947.27 crores; the liquidity position, therefore, stands at about 34.7 percent. The average position (without allowing for the effect of individual variations from the average) could, therefore, permit the scheduled banks to borrow till an impairment to the extent of 11.7 percent took place in their existing liquidity position. Thus the scheduled banks could conceivably increase their borrowings from the Reserve Bank by about Rs. 320 crores with reference to the position as on 28th August, 1964 (and without taking into account the effect of subsequent increases in deposits and other liabilities and of further contraction of credit, if any, before the close of the 1964 slack season).

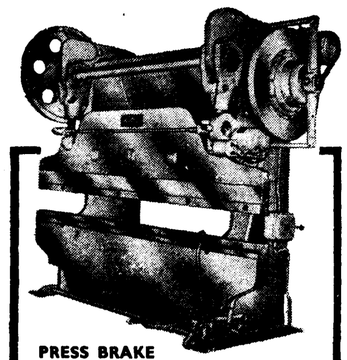
It is observed that the expansion of credit during the 1963-64 busy season amounted to Rs. 376 crores; as the requirements of the 1964-65 busy season should be at least 10 percent higher than those of the preceding year (considering the increasing rate of economic activity), the total expansion of bank credit may need to reach about Rs. 414 crores. The increase in deposits to the extent of about Rs. 94 crores might, therefore, fill the gap. Scheduled banks' deposits increased by Rs. 84.51 crores (from Rs. 2,235.75 crores to Rs. 2,320.26 crores) during November 1963 to April 1964: and it will not be reasonable to expect an increase in deposit of not below the above level for the period November 1964 to April 1965. But the above assumption are weakened by the provision for the application of an increase in the Reserve Bank's lending rate to the entire amount of a scheduled bank's borrowing and not simply to the amount represented by the relative stage of deterioration of the liquidity position. For conserving their earning capacity, the banks may not, in the event, find it prudent to allow their liquidity position to be reduced below 28 percent which provides scope for an increase in total borrowing of not more than Rs. 183 crores with reference to the position as in August 1964.

Scheduled Bank Borrowings

It is true that the scheduled banks' borrowings from the Reserve Bank did not exceed Rs. 107 crores outstanding at any time during November 1963 to April 1964; the scope for borrowing of Rs. 183 crores during November 1964 to April 1965 would, therefore, seem to pose no serious threat to the supply of bank finance for legitimate economic activity. But during the last busy season, additional resources were mobilised by realisation of investment in Government securities to the extent of about Rs. 145 crores and a fall in cash in hand and balances with the Reserve Bank of about Rs. 29 crores apart from the above-mentioned increase in deposit of about Rs. 85 crores. As any decline in investment in Government securities and cash holding will have adverse effect on the liquidity position, its impact on the scheduled banks' borrowing rates will be the same as that of the increase in the amount of borrowings.

The fact that the difference between earnings at 4 percent on Rs. 183 crores and at 1½ percent on Rs. 320 crores amounts to Rs. 2.52 crores should *a priori*, operate as a positive deterrent in the availability of resources for bank finance for the current busy season.

The Reserve Bank has taken particular care to make it clear that the object of the revised credit control measures is not to curb credit as such but to prevent deterioration of the relation between bank credit and deposit resources. It has accordingly advocated a rationalisation of interest rates on deposits since it feels that a "narrow spread between the interest rates on deposits placed for very short periods and for longer periods is not conducive to the process of deposit mobilisation". The Reserve Bank has also expressed its feeling that a minimum rate of 4 percent a year for deposits of 91 days with suitable spreads for deposits on longer terms, may promote an adequate growth of bank deposit.



It is significant, however, to note that although a directive was issued on the same day, that is, on 25th September, 1964, to control interest rates on deposits, in exercise of the powers conferred on the Reserve Bank by Section 35A of the Banking Companies Act, the directive confines itself to prescribing maximum rates for shorter-term deposits. According to the directive, no scheduled bank shall pay interest on deposits accepted or renewed as from 26th September, 1964, at rates higher than (i) those being paid on current accounts as on 25th September, 1964, for deposits up to 14 days, (ii) 1.25 percent a year for deposits for 15 to 45 days and (iii) 2.50 percent a year for deposits for 46 to 90 days. A lower range of rates for shorter-term deposits has perhaps been laid down so that suitable spreads for rates on longer-term deposits may not bring

about an irrational rise in interest rates. (It seems that the objective as stated by the Reserve Bank would be served more effectively if a scheme of "spreads" was formulated for deposits in different groups of maturity and a maximum prescribed for deposit in the longest period group.)

It is evident that the underlying motive of the measures discussed above is to ensure that money flows in the recognised channels of banking. Indications are that the money which eludes the supervision and control of the monetary authorities is being employed to a great extent in hoarding, unhealthy speculation and other activities not essential to the processes of production and distribution, while "over-extended" credit is resorted to by bankers to provide finance for essential and productive operations. The unwholesome results of this situation are that money operating outside banking channels generates inflation while bank money based on "over-extended" credit endangers the stability of the banking structure. But it remains to be seen whether upward pushes of interest rates will serve to achieve the desired diversion of the flow of money and will not enhance the cost of banking operations.

In this connection, it may be noted that the pace of growth of banking resources, which received a great stimulus under the impact of the second five year plan, seems to have slowed during the current plan period. Scheduled banks, aggregate liabilities, including inter-bank balances, rose by about 27 percent from Rs. 822.05 crores as on the last Friday of March 1952 to Rs. 1,043.15 crores on the last Friday of March 1956. The corresponding period between 1956 and 1960 showed a significant rise of about 82 percent from Rs. 1,043.15 crores to Rs. 1,902.02 crores. Deposit figures, excluding inter-bank balances, are available as from 25th November, 1960, and show a rise of 37 percent from Rs. 1,746.06 crores in March 1961 to Rs. 2,384.76 crores in June 1964. It is true that figures excluding inter-bank balances and those including such balances are not strictly comparable. But, if anything, the change in the basis of computation of figures for periods subsequent to 25th November, 1960, accentuates the broad trends.

Problem of Inflation

The index number of wholesale prices for all commodities rose by 28.5 percent during the period of the second five year plan from 99.2 in March 1956 to 127.5 in March 1961 (Base: 1952-53 equals 100). The first year of the third plan showed a fall in the index number which stood at 122.9 in March 1962. But this downward course proved short-lived, and the index sauntered up to 127.4 in 1962-63; thereafter, it steadied and developed speed to reach 147.8 in June 1964, showing a 16-percent rise in the course of 15 months. There has been a total rise of 49 percent in the index number of wholesale prices within a period of a little more than eight years; and the index number of consumer prices which rose from 96 in 1955-56 to 150 in June 1964 (Base: 1949 equals 100) recorded a higher proportional increase of 56 percent. It will be interesting to know that the fall in the index number of wholesale prices occurring between March 1961 and March 1962 was accompanied by a rise in bank deposits of about 10 percent (from Rs. 1,746.06 crores to Rs. 1,921.87 crores) while the rise of 16 percent in the index number between March 1963 and June 1964 coincided with a rise in bank deposits of little above 16 percent (from Rs. 2,042.26 crores to Rs. 2,384.76 crores). Furthermore, despite an increase in scheduled banks' liabilities of 27 percent, the first plan witnessed falls in the index numbers for both wholesale and consumer prices (as indicated by the figures quoted above for 1956). It is no wonder, therefore, that the problem of inflation continues to worry monetary and fiscal authorities. Meanwhile, the "great debate" goes on.

Some believe that the money made available by the Reserve Bank for agricultural loans through the State Co-operative Bank (which rose from Rs. 12.98 crores outstanding in March 1956 to Rs. 164.83 crores outstanding in June 1964) strengthens the holding power of the producer and that this factor contributes to the rise in price level; some point to the rising curve of commercial bank credit which has recorded an increase of about 133 percent from Rs. 761.25 crores in March 1956 to Rs. 1,773.78 crores in June 1964 and which represented 74.38 percent of deposits in June 1964, against 72.98 percent in March 1956; some maintain that the plan outlay represented by slow-maturing capital projects and unmatched consumer goods in adequate quantity is the villain of the piece and that the "unaccounted money", escaping the channels of organised banking, is the main accomplice.

The preliminary estimates made by the Central Statistical Organisation show national income for 1962-63 at Rs. 13,370 crores (worked out at 1948-49 prices) which registers a rise of 2.4 percent over the revised estimate for 1961-62 and brings about an annual average rise of 2.5 percent for the first two years of the third plan period, compared with the average annual rises of 3.4 percent under the first plan and 4 percent under the second (as against the target of 5.4 percent for the third plan). Available indications would seem to permit an assumption of an increase of 3 percent for 1963-64; national income at constant prices may, therefore, aggregate Rs. 13,770 crores for 1963-64, showing a total rise of 31.5 percent between 1955-56 and (national income for 1955-56 amounted to Rs. 10,480 crores at 1948-49 prices). It is significant, however, that national income for 1962-63 amounted to Rs. 15,400 crores at current prices, showing a rise of 4.1 percent over Rs. 14,800 crores for 1961-62 and about 54.3 percent over Rs. 9,980 crores for 1955-56. If, again, an assumption of 5-percent increase in national income at current prices is made for 1963-64, the figure would work out to Rs. 16,170 crores, registering an increase of 62 percent between 1955-56 and 1963-64.

A general idea of the part played by prices of goods as distinguished from the cost of services in the progress of inflation disclosed by the above figures, may be obtained from a consideration of the arithmetical calculations shown below (on the basis of the decline of 5 percent in the index number of wholesale prices between 1948-49 and 1955-56 and the rise of 46 percent during the period 1955-56 and 1963-64.) A simple application of the different figures discussed above yields the following results:

(A) National income in 1955-56 at constant prices	=	100.0
Add increase at constant prices	...	31.5
National income at constant prices in 1963-64	...	131.5
Add increase in the index number of prices at 46 percent	...	605
National income at current prices in 1963-64		192.0
(B) National income in 1955-56 at constant prices	=	100.0
Deduct decrease in the index number of price at 5 percent	—	5.0
National income at current prices in 1955-56	—	95.0
(C) Increase in national income at current prices between 1955-56 and 1963-64=192-95=97, i.e., 102 percent.		

On the other hand, the estimates shown earlier indicate a rise of 62 percent in national income at current prices which works out as follows:

National income at constant prices in 1955-56	=	100.0
Deduct fall in prices between 1948-49 and 1955-56	=	5.0
National income at current price in 1955-56	=	95.0
Add rise of 62 percent	...	58.9
National income at current prices in 1963-64	=	153.9

Influence of Money

The discrepancy in results produced by the two processes of calculation is perhaps accounted for by the fact that the rise in prices of goods has not been reflected in a corresponding or uniform increase in factor cost of the various components of national income (*e.g.*, commerce, transport, communications and other services).

A study conducted in the Economic Department of the Reserve Bank on trends in money and real wages in India (1951-61) seems to strengthen the above indication of a lack of uniformity between costs and prices. The study (published in the April 1964 issue of the *Rseerve Bank of India Bulletin*) shows that the average annual money earning a factory worker rose by about 21 percent between 1955-56 and 1961, whereas it appears from the statistics compiled in the office of the Economic Adviser to the Government of India, that the average of monthly index number of wholesale prices of all commodities rose by 35 percent (from 92.5 to 124.9) during the corresponding period.

It is true that factory wages represented only about 4.4 percent of national income in 1961 and further that this element merged in the price of manufactured goods which (and not factory wages, separately) forms a component of national income. Still, the trend of factory wages indicates the course of money wages in the field of commerce, transport, communications and other services which do not enter the official wholesale price structure but constitute separate components of national income. The above considerations seem to make it a tenable proposition that wages, whether or not they are disproportionately high compared with productivity, are lagging behind in the race to catch up with prices. It may, therefore, be interesting to enquire whether and how the weight of money and the influence of other factors like cost of credit and indirect taxes are the operative factors in the growth of inflation.

Legal tender in circulation (excluding the holdings of treasure and banks) have increased by 68 percent from Rs. 1,571.01 crores in March 1956 to Rs. 2,635.92 crores in June 1964; during the same period scheduled banks' deposits have risen by about 129 percent from Rs. 1,043.15 crores (without adjustment for inter-bank transactions) to Rs. 2,384.76 crores (after adjustment for inter-bank transactions).

In this connection, it may be useful to note that it is the turnover of money rather than the stock that directly influences prices (although a larger stock of money may indirectly cause a larger turnover under the operation of "motives" described by Keynes).

The amount of cheques passing though the bankers' clearing houses rose from Rs. 7,960.24 crores in 1955-56 to Rs. 16,808.54 crores in 1963-64; the ratio of cheque clearances to aggregate deposits of scheduled banks, however, fell from 7.6:1 to 7.4:1.

Turnover of Bank Money

It is customary to consider the turnover of bank money as a coefficient of demand deposits and not to treat time deposits as part of the money supply. While this method of computation of money supply seems to be outworn in view of the easily convertible character of time deposits, which really serve to meet the definition of Keynes' "speculation" motive, the absence of reliable data relating to the turnover of demand deposits other than on current accounts operates as a further limiting factor.

It is gathered that the total debits to current accounts (including cash credit and overdraft accounts) amounted to Rs. 25,087.85 crores in 1960-61, against Rs. 16,823.83 crores in 1955-56. Cheque clearances for 1960-61 and 1963-64 were Rs. 12,550.66 crores and Rs. 16,808.54 crores, respectively. If one be permitted to make a notional calculation of the turnover of current accounts for 1963-64 on the basis of the proportion of cheque clearances and total debits obtaining in 1960-61, the aggregate debits to current accounts in 1963-64 would amount to about Rs. 33,800 crores.

As it would perhaps be futile to conjecture the rate of turnover of legal money, the present enquiry may be confined to an examination of (i) the relationship between the turnover of current accounts and national income, (ii) the relationship between the stock of legal money (outside

banking channels) and national income and (iii) the relationship between the amount of aggregate bank deposits and national income.

The turnover of current accounts (as notionally computed) represents about 245 percent of national income in 1963-64 at constant prices, against about 161 percent in 1955-56. Legal money (outside banking channels) aggregating Rs. 157.01 crores on the last Friday of March 1956, represented 15 percent of national income at constant prices in 1955-56 while the last Friday of March 1964 showed legal money so circulating at Rs. 2,605,56 crores, representing 18.9 percent of national income for 1963-64 at constant prices. The percentages relating to national income at current prices would work out to 209 for the turnover of current accounts and 16.1 percent for circulating legal money in 1963-64, compared with 168.8 and 15.7 percent, respectively, in 1955-56.

It is important to note that while the percentage of circulating legal money in relation to national income at constant prices rose by about 26 percent (from 15 to 18.9), that of bank money turnover rose by 52.2 percent (from 161 to 245). The corresponding rises at current prices amount to 2.5 percent (from 15.7 to 16.1) and to 23.8 percent (from 168.8 to 209), respectively, for legal money and the turnover of bank money.

It appears, therefore, that compared with the bank money turnover, the amount of circulating legal money shows a relatively small rise at constant prices and an inconsequential rise at current prices. As for the turnover of bank money, it is worth noticing that the 1955-56 figure of Rs. 16,823.83 crores bears a ratio of about 16.7 : 1 to the annual average of aggregate deposits (Rs. 1,003.54 crores) in 1955-56 while the estimated figure of Rs. 33,800 crores gives a ratio of 15.5 : 1 to the annual average deposits for 1963-64 (Rs. 2,194.23 crores). Although there has been an increase in the average time deposits from 40.3 percent of average aggregate deposits in 1955-56 to about 58.5 in 1963-64, it is clear that the above-noted relative increase in turnover of bank money (including credit money) is in tune with the growth of total deposits which, as has been noted earlier, has not yet had any influence on prices. The rôle played by the turnover of legal money remains an imponderable; but it seems evident that neither the stock of legal money nor the turnover of current accounts and the amount of bank deposits has exercised a strong upward pressure on the price level.

Unaccounted Money

It has been noted that legal currency in circulation represented 15 percent and 18.9 percent of national income (at constant prices) in 1955-56 and 1963-64, respectively. The annual average of aggregate bank deposits amounted to Rs. 1,003.54 crores, representing 9.6 percent of national income at constant prices in 1955-56 and Rs. 2,194.23 crores, representing 15.9 percent in 1963-64.

According to informed opinion, these rises in money flowing outside the banking channels and aggregate bank deposits are accounted for by increasing monetisation of the economy. And, in any case, their aggregate of about 35 percent of national income remains much less than 60 percent prevailing in the U.S.A. It would appear, therefore, to be a fair assumption that the increasing weight of money stems not from the stock of money (whether bank money or unaccounted money) but mainly from the turnover of unaccounted money.

The question arises, therefore, whether suitable measures can be evolved to stop money flowing outside banking channels or to keep the turnover of money so flowing under the supervision and control of the monetary authorities.

It would be an absorbing, but perhaps not very rewarding, job to follow the course of money from the point of issue to such recipients who withhold it from the banking sector. It is obvious that legal money issued by the Reserve Bank in the course of disbursement of either Government payments or loans and other payments returns to the Reserve Bank through the process of payments made by the public to the governmental authorities or loans repaid and other payments made to the Reserve Bank. But the actual operation of the issue of legal money takes place when the bodies maintaining accounts with the Reserve Bank withdraw money in cash and release it to the public or persons claiming direct payments from the Reserve Bank receive them in cash, and the operation of return of such money takes place when bodies maintaining accounts with the Reserve Bank deposit cash in these accounts or persons liable for any payment to the Reserve Bank of India make it in cash. Excess of cash released over the amount of cash returning, represents, by and large, the amount of money flowing outside banking channels. These outflow and reflow of money pass through commercial banks, co-operative banks, recognised financial agencies and Governmental authorities.

The repayment of deposit and the extension of loans are the principal occasions for release of money by commercial banks, co-operative banks and other financial agencies; and Budgetary payments and plan expenditure provide the main outlet for the release of money by the Governmental authorities. Any money that circulates in the form of legal tender is generally required to cover (i) the necessities of cash payments for small transactions or for transactions at places distant from banking offices, (iii) unorthodox profit accruing from the use of loan money in the private sector, (iii) manipulative profit accruing to the private sector from supplies to, or contracts executed for, the public sector and (iv) undisclosed surplus of income over expenditure in the hands of individual income-holders.

Although the requirements of cash according to item (i) may be reduced with further expansion and rationalisation of banking services, the very nature of its use is a safeguard agains inflation. Cash according to item (iv) to the extent held by wage-earners should also not be of much consequence in view of the lag between prices and wages and because it really forms part of item (i). Cash referred to at items (ii) and (iii) and surplus income of income-holders other than wage-earners, would thus appear to account for the bulk of unaccounted money.

The profit of 1,333 selected medium and large public companies as appearing from studies published in the *Reserve Bank of India Bulletins,* fell from 10.2 percent of sales in 1961-62 to 10.1 percent in 1962-63, while tax provisions rose from 43.3 percent of profits in the earlier year to 50.6 percent in the latter year. There does not, therefore, seem to have been any rise in the profitability of disclosed trading operations. And, in any event, cash in hand held by these companies amounted to only about 0.5 percent of their total assets in both 1961-62 and 1962-63. As for individual income-holders other than wage-earners, provisions for progressively rising rates of income tax and other direct taxes combined with rising prices should not leave scope for any worthwhile surplus.

Manipulative Transactions

These considerations lend strength to the assumption hinted earlier that the part of cash flowing outside banking channels, not represented by item (i) above, is the aggregate of (a) manipulative transactions and/or undisclosed profits of manufacturing, trading and other business concerns and (b) undisclosed income of income-holders belonging to professional classes. Experience shows that the inadequate supply of bank credit encourages one to resort to the unorganised sector for financing even legitimate economic activity and that use of such credit leads to manipulative transactions.

It is true that the average aggregate bank credit rose from Rs. 632.46 crores in 1955-56 to Rs. 1,568.09 crores in 1963-64, representing 6.4 percent and 11.4 percent, respectively, of national income at constant prices. But the impact of this increase has been reflected in the turnover of current accounts which has already been discussed. Moreover, considering that commercial bank credit in the U.S.A. ranges in the neighbourhood of 30 percent of national income, it would appear that a further rise in bank credit in India is necessary to lessen the importance of the rôle of unaccounted money in the financing of productive and distributive operations. Furthermore, it is worthwhile to remember that the declared objective of the Reserve Bank is not to reduce the amount of bank credit but to bring about a healthy ratio between credit and deposit. Money represented by unlawful or undisclosed profits and income which flows outside the banking sector, cannot evidently be attracted by higher interest on deposit rates nor restrained by higher lending rates in the organised banking system.

Control of Managerial Remuneration Under the Companies Act

The Companies Act has imposed several curbs on managerial remuneration. It is necessary to review the provisions to ensure that the incentives for corporate management do not suffer.

By

A SPECIAL CORRESPONDENT

IN the history of corporate enterprise and company law in India, the detailed intervention by the State occurred only after the passing and promulgation of the present Companies Act in 1956. Numerous provisions of the present Act today constitute a rigorous system of control over corporate enterprise and their application differs only in degree, if a company is a private company and not a public company or if a company is a board-of-directors-managed one and not one under the management of managing agents. The control exercised by the provisions of the Companies Act, 1956, is so comprehensive and multi-faced that the traditional autonomy or freedom of company managements in the affairs of a company has been substantially controlled and its place has been taken by new traditions of "State-guided" corporate management.

In some ways, the freedom of company managements in other countries having a well-developed corporate sector has in recent decades been restrained or circumscribed by certain conventions or rules drawn up outside the framework of the company law as a result of pressures from public institutions or even voluntarily adopted by them in response to public opinion prevailing in those countries. But such curtailment of freedom of company management is regarded as neither restrictive nor damaging to the spirit of corporate enterprise as it is believed to be imbued with a sense of realism which leaves the springs of enterprise quite free and lets the forces of public control or to be more specific those of public opinion operate in a constructive and positive manner that allows an enterprise sufficient manoeuvrability to grow and develop and not binds it down to meeting certain social imperatives fully first and then permit it to think of growing and expanding. In spite of the desirability of giving a trial to voluntary restraints for the preservation of larger interests of public and more directly those of the persons coming in direct contact with the company, socio-economic scene in the country had changed radically after independence as a result of the adoption of socialistic policies and goals by the Government. These, in fact, became a matter of creed be-fact, became a matter of creed be-cause of their adoption in the country's Constitution and in the preamble of the five year plan reports.

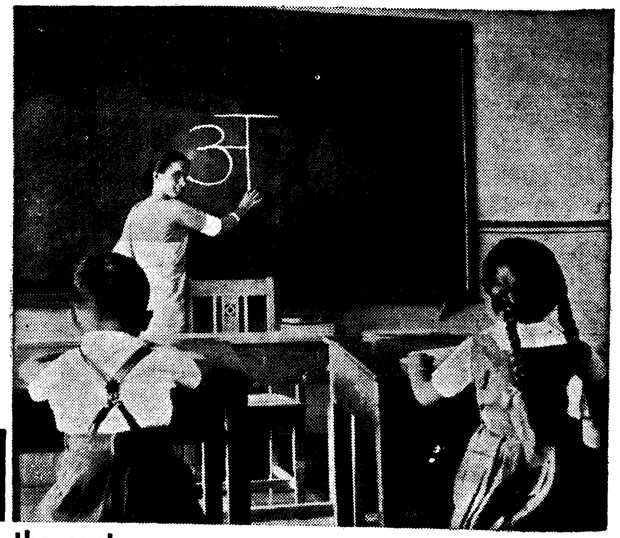
Deep Suspicion

Moreover, the distasteful demeanour of the corporate management during the second World War period aroused deep suspicion in the minds of the public and the Government. The combined effect of this thus had been that the revised company law came to contain stringent provisions which are said to promote the welfare State goals cherished in the various State documents. The provisions of the Companies Act are all-round stringent, be it the matter of disclosures to be made at the time of the incorporation of a company, disclosures to be made in the profit and loss accounts and balance-sheets, inter-corporate loans and investments, or of appointments, terms, tenure and remuneration of managerial personnel. Of these various matters, the approach of the provisions of the law is particularly strict in relation to matters directly concerning the managerial personnel. This is clear from the fact that no less than 108 sections directly concern the managerial personnel including all categories of personnel such as the directors, managing directors or whole-time directors, managing agents, secretaries and treasurers and managers.

Apart from these sections which deal with their obligations, duties, circumstances in which they could or could not be appointed, how they are to run the company, what remuneration they are to draw and how long they could continue in office or when they have to go out of office and in such an eventuality what compensation they are entitled to, etcetera, there are many other sections which cast certain obligations on the corporate bodies and their board of directors which have a bearing on managerial personnel. In fact, it can easily be said that next to the winding up matters which take about 144 sections of the Companies Act—that is one-fifth of the total number of sections of the Act—comes the bunch of provisions which directly concern the managerial personnel.

Company law in no other country, excepting perhaps in the United Arab Republic, devotes such a great attention to the behaviour of managerial personnel. In that country, the provisions pertaining to managerial personnel are few in a rather diminutive Act but they are very frightfully strict. On the question of managerial remuneration, the provisions of the U.A.R. law are that "while the statute of the company would lay down the method of fixing the remuneration of the members of the board of directors, the remuneration of the board, if fixed on the basis of percentage of profits, would not exceed 10 percent of the profits after deduction of depreciation, legal and statutory reserves and the distribution to shareholders of a dividend of not less than 5 percent on the capital or such higher percentage as may be provided for in the statutes". That is to say, the remuneration payable to the management is some sort of a residuary payment after all other apportionments have been made and as a result of these prior allocations, the statutory limit of 10 percent could even in most cases become an illusory maximum that is very rarely reached.

Furthermore, the U.A.R. law provides that the total amounts that a director can get for his directorship from a company in the form of a salary would not exceed £(E)600, that is approximately Rs. 8,000 a year or in other words, Rs. 660 a month. Taking into account the provision in the law that no person can be a member of the boards of more than six joint stock companies, which are subject to the company law, and assuming that a person can be remunerated by way of salaries by the companies, a director's aggregate remuneration from six companies could come to a maximum amount of £(E)3,600 or Rs. 48,000 a year, that is, Rs. 3,600 a month. This is the limit of salary income.



For global income including all payments including remuneration, salaries, attendance fee, representation allowance and any other payment in any form, a third provision in the U.A.R. law says that the total remuneration or payment of any kind received by a chairman of a board of directors, a managing director, a member of a board of directors or any member of personnel employed by any company is not to exceed a maximum of £(E)5,000, that is Rs. 70,000 a year, *i.e.*, Rs. 5,900 a month. In comparison to the above limits of remuneration allowed to the managerial personnel in the U.A.R., the provisions of the Indian Act are no doubt liberal but they are decidedly strict if one compares the levels of remuneration sanctioned to the managerial personnel under them in this country with the levels of remuneration which the company managing directors designated as chairman and vice-chairman in the United States and other directors are actually paid in the U.K. and the U.S.A.

Restrictions on Remuneration

Thus, unlike the company law in other countries like the U.K. and the U.S.A., one of the distinguishing features of the Indian company law is that it limits the maximum managerial remuneration payable by public companies and within these ceilings the Government has laid down the restrictions on the remuneration payable to various categories of managerial personnel. The origin of these restrictions, in some way, can be traced back to the extensive amendments to the company law made in 1936 when, for the first time, some element of regulation on various aspects of company management was written into the statute and a new Section 87C was introduced according to which all future appointments of managing agents could be made only on the basis of remuneration calculated on a fixed percentage of the net annual profits of the companies concerned with a provision for minimum payment in the case of inadequate profits.

The manner in which the net profits for purposes of calculating remuneration of the managing agents were to be computed was also spelt out in the sections introduced into the substantive Companies Act, 1913, by the 1936 Amendment Act. Later in 1951, the Indian Companies (Amendment) Act, 1951, added some important provisions to the law which, among other things, made it compulsory for public companies to seek approval of the Government in relation to any increase in the remuneration of existing managing agents and managing directors as also the terms of appointment of new managerial personnel. This had been done as it was seen that the company managements in control of affairs of companies had indulged in an orgy of enrichment at the cost of consuming public by widening profit margins as also that of the investing public by raising the remuneration, fees and commissions. The latter phenomenon alone could be tackled within the framework of the Companies Act. The alarming proportions that this

LIC—YOUR COMPANION IN PROGRESS

SYMBOLS OF PROGRESS

Progress takes different shapes at different times. These shapes constantly keep on changing in the minds of planners who design and build the symbols by which progress can be perceived.

For around fifty years engineers at Gammon India Limited have actively engaged themselves in building large numbers of these symbols — Bridges, Water Storage Tanks, Reservoirs, Industrial Cooling Towers, Factory Sites, Power Transmission Tower Foundations, Materials Storage Facilities, Silos, Aircraft Hangars, etc. — which serve as massive milestones in concrete along India's road to progress, contributing in a large measure to the country's industrial advance and economic well-being.

abuse along with many others had reached led the Government to sponsor the Amendment Bill in 1951 without waiting for the report of the Bhabha Committee which was currently reviewing the working of the Companies Act and was to suggest "the measures necessary to promote efficient and economic management of companies".

For administering the provisions of the Amendment Act, 1951, the Government set up an Advisory Commission to make recommendations to the Government concerning the appointment, remuneration, etcetera, of the managerial personnel. Later on, when the Companies Act, 1956, which was based on the recommendations of the Bhabha Committee was passed, the functions of the Advisory Commission were enlarged and it got full statutory status under Section 411 of the Act. Here, it may be mentioned that the latest Companies (Second Amendment) Bill, 1964, propoes to abolish this Advisory Commission as such and the decisions on matters pertaining to the managerial personnel would in future be taken by the Company Law Board. The Advisory Committee which is to take the place of the Advisory Commission would not have such quasi-administrative functions which the Commission enjoyed but will rather have more generalised functions as indicated by the language used in Clause 53 of the Bill which says that "for the purpose of advising the Central Government and the Company Law Board on such matters arising out of the administration of this Act as may be referred to it by that Government or Board, the Central Government may constitute an Advisory Committee consisting of not more than five persons with suitable qualifications". In other words, the existing Technical Advisory Committee which considers general issues of administration has been given a statutory recognition on the lines as the English Companies Act does.

To understand the nature and significance of the scheme of managerial remuneration outlined in the substantive provisions of the Companies Act, 1956, it is necessary to take cognisance of the five forms of management, namely, (a) board of directors form of management, (b) management by managing agents, (c) management of secretaries and treasurers, (d) management by managing or whole-time directors and (e) management by managers. Further, Section 197A which was introduced in the substantive Act of 1956 in 1960 prohibits the simultaneous appointment by companies, including private companies, of more than one of the four categories of managerial personnel, i.e., the managing director, managing agent, secretaries and treasurers and manager.

The Key Section

In the scheme of managerial remuneration, the key section which has relevance to all categories of managerial personnel is Section 198 which says that in the case of a public company or a private company which is a subsidiary of a public company, an overall maximum of managerial remuneration is to be 11 percent of its annual net profits computed according to the provisions of Sections 348 to 350 of the Act. The term "remuneration" includes monetary equivalent of amenities and perquisites also apart from salaries. Further, this section says that in the event of absence or inadequacy of profits in any year, a minimum remuneration up to Rs. 50,000 a year can be paid to all managerial personnel together, but in addition, directors can be paid sitting fees for attending the board meetings. The section also permits in appropriate cases an increase in the minimum remuneration beyond Rs. 50,000 provided the Central Government has approved of it. This provision has been made to relieve hardships where the lack of profits is not due to inefficient and bad management but due to certain extraneous reasons beyond the control of the management.

Further, under the overall umbrella of 11 percent, individual ceilings for different categories of managerial personnel have also been prescribed. For the managing agents, the provisions of Section 348 of the Act say that "a company shall not pay by way of remuneration, whether for his services as managing agent or in any other capacity, any sum in excess of 10 percent of the net profits of the company in any year. In this prescribed statutory maximum, any payment made by way of remuneration to every partner of the managing agency firm, or every director of the managing agency company if it is a public company or to every director and member of the managing agency company if it is a private company will be deemed to be included in the remuneration of the managing agent". For the secretaries and treasurers, the statutory limit fixed is 7½ percent of the net profits under the provisions of Section 381 of the Act, whereas for new managerial class of "managers" the maximum limit is 5 percent of net profits payable by way of a monthly payment or by way of a specified percentage.

For remunerating managing director or whole-time director, the provisions of sub-section (3) of Section 309 state that he may be paid remuneration either by way of a monthly payment or at a specified percentage of the net profits of the company or partly by one way and partly by the other provided that except with the approval of the Central Government such remuneration shall not exceed 5 percent of the net profits for one such director and if there is more than one such director, 10 percent for all of them together. These maxima would include salary allowances and perquisites. For the other directors who are neither the whole-time or managing directors and the remuneration does not include anything by way of a monthly payment, sub-section (4) of Section 309 lays down a maximum remuneration of 1 percent of net profits if the company has managing agents, secretaries and treasurers, managing or whole-time directors or manager and where none of these exists, the aggregate remuneration of the directors would exceed 3 percent of net profits.

Percentage Ceilings

The foregoing different percentage ceilings have been fixed considering the nature of duties, responsibilities and services expected to be performed by each category. Within the aforesaid maximum limits, the actual remuneration payable to each category has to be fixed by the articles or by a resolution of the company or of the board or by an agreement. Approval of the Central Government is required to the terms of remuneration of the managerial personnel at the time of their appointment or reappointment or when an increase in the existing remuneration is proposed. The maxima indicated above can be exceeded in individual and deserving cases after obtaining the Government's approval. In the case of managing agent or secretaries and treasurers, however, approval can be accorded to exceed the percentage ceilings only if it is in the public interest. These regulatory provisions do not apply to the remuneration of other categories of employees, including executives not being manager or managing director or whole-time director.

The basic philosophy or objective underlying the whole scheme of managerial remuneration in the Act is to cut down the cost of management consistent with efficiency and maintenance of high standards, to link the remuneration of the managerial personnel to the fortunes of their companies, to evolve patterns of corporate behaviour in the sphere of management in tune with modern developments and the changing circumstances of a developing economy and contribute in some measure to the attainment of the ultimate ends of the social policy of the country. Government control was considered necessary because past experience did not justify vesting of complete discretion in the shareholders mainly for the reason that, by and large, the shareholders either through apathy or through a feeling of ineffectiveness or on account of being dispersed far and wide in the country, were not in a position to exert any influence in these matters. The limits specified, soon after the provisions of the Act came into force, were made known by the Government to be the maxima and the actual amount of remuneration within the respective maxima was to be determined on the merits of each case.

In administering the provisions of the Act pertaining to managerial remuneration as in other managerial matters, the Government was to be guided by the advice of the Advisory Commission which—as the Government contemplated—was to be a highly expert and independent body composed of a chairman preferably with a judicial background and four members representing the interests of trade and industry, labour shareholders and the accounting profession. The interposition of the Advisory Commission between the corporate management and the Government was considered necessary or desirable because it was felt that in the exercise of large discretionary powers of overpowering nature for the corporate management, the Government should have the benefit of a careful assessment of the *pros* and *cons* of individual cases, which called for the exercise of the Government's discretionary authority, by a body of competent people who were generally familiar with company methods and practices, and could be expected at the same time to take a broad view of the legal and social responsibility of company managements and also of the pervasive public interest implicit in the manner in which the companies carry on their work.

The Advisory Commission set up under Section 411 of the Companies Act, 1956, in April 1956 during the course of the last ten years has evolved a number of guiding principles on the basis of which they advise on remuneration in individual cases to the Government. As for other managerial matters, the Commission had the advantage of adopting some of the criteria laid down by the predecessor commission which had been formed after the passing of the Companies Amendment Act in 1951 but in the matter of remuneration all guiding principles at present in vogue have been framed by the three successive Advisory Commissions that have been formed by the Government since 1956. The more important guiding principles pertaining to remuneration are mentioned in the following.

Payment of Commission

In the case of board of directors managed companies, the payment of commission to the director is to be freely allowed up to the statutory maximum of 3 percent of net profits. While the Act permitted the sanction of remuneration in excess of 3 percent as also a similar liberal dispensation in minimum remuneration, but this should not be done. As for the sitting fees, these have to be decided on the basis of the size of the company and its profits during the preceding three years and generally the maximum sitting fees are not to exceed Rs. 250 a meeting.

For the managing agency-managed companies, the Commission evolved the following light-step sliding scale formula for fixing the remuneration to be paid by them to their managing agents. In fixing the managing agent's remuneration on the sliding scale given below, the Commission had assumed the 10-percent remuneration allowable under the provisions of Section 348 of the Companies Act, 1956, to be the ceiling for the remuneration and not the remuneration to which the managing agents became automatically entitled. The Commission was guided by the consideration that there was scope for reducing the managing agent's remuneration, particularly in the case of bigger units where a smaller percentage remuneration would, in absolute terms, amount to a considerable figure. For example, if the profits of the managed company came to Rs. 1 crore, on the basis of the slab rates of 10 percent, the managing agents would receive a commission of Rs. 10 lakhs, but under the formula worked out by the Commission, the remuneration would come down to about Rs. 6½ lakhs.

10 percent on the first Rs. 10 lakhs of net profit or fraction thereof.
9 percent on the next Rs. 10 lakhs of net profit or fraction thereof.
8 percent on the next Rs. 10 lakhs of net profit or fraction thereof.
7 percent on the next Rs. 10 lakhs of net profit or fraction thereof.
6 percent on the next Rs. 25 lakhs of net profit or fraction thereof.
5½ percent on the next Rs. 25 lakhs of net profit or fraction thereof.
5 percent on the next Rs. 25 lakhs of net profit or fraction thereof.
4 percent on any sum over Rs. 1 crore.

As for the minimum remuneration, the Commission evolved the principle that it was to be fixed with reference to the size of the company which was to be determined by effective capital

apply the limit of Rs. 50,000 in the particular cases. Ordinarily, it can be ascertained only at the end of the financial year of a company whether the proposed remuneration payable to managing or whole-time directors will be within the statutory limit of 11 percent of the net profits of the company or not. But since monthly salary and allowances payable to the managing or whole-time directors will be deemed to be the minimum remuneration in the event of absence or inadequacy of profits in any year, for the purpose of Section 198(4), the Advisory Commission necessarily has to consider all these matters before agreeing to any fixing of remuneration on the proposed scales.

No Specific Ceilings

Although there is no specific ceiling provided in the Act in relation to the maximum amount that can be paid annually to an individual managing or whole-time director (or manager) apart from the fact that the ceiling is expressed as a percentage of the net profits, the Commission has laid down that the remuneration by way of salary and commission payable to a managing or whole-time director should not ordinarily exceed Rs. 1,20,000 a year, even if the total managerial remuneration was well within the ceiling of 11 percent of the net profits of the company as laid down in Section 198. This principle has been laid down to cover the cases of companies which make very large profits and would have on that basis paid a very high remuneration to the managing directors. This absolute amount of Rs. 1,20,000 is to cover the remuneration by way of salary, dearness allowance, overseas allowance, any other fixed allowance and commission on net profits, but not perquisites such as free house, car, servants, provident fund, and pensionary benefits. Only under very exceptional circumstances, relaxation from this ceiling is allowed.

The exceptions given are (a) in the case of oil companies, where remuneration paid to personnel working in India for the time being has to bear parity with the remuneration paid to similar personnel working in other units in the other countries, (b) in cases where the director concerned had already been working under the same company on a remuneration in excess of the ceiling and he is to be reappointed on the same post or is to be promoted to another directorship involving higher or additional responsibilities, (c) in cases where on the appointment of an existing director to another directorship involving additional or higher responsibilities, it is proposed to allow a reasonable increase on the remuneration he had been drawing and (d) in cases where on the appointment of a senior executive to the office of director, it is proposed to allow a reasonable increase on the remuneration he had been drawing as an executive.

Managing or whole-time directors who are in receipt of monthly salary and commission on net profits should not be allowed to draw any additional guaranteed minimum remuneration besides their monthly salaries in the event of absence or inadequacy of profits.

The sum total of the various guiding principles adopted by the Advisory Commission is that if these were to be written into the framework of the Companies Act, they would have the effect of increasing the number of regulatory provisions concerning managerial remuneration from 10 to 50. Thus the flexibility which was said to be the key-note of regulatory provision for managerial remuneration, with the various guiding principles laid down by the Advisory Commission, has changed into rigidity, for there was some criterion or guiding rule for even an odd type of case, let alone for generality of cases with some distinguishing characteristics. Apart from this fact that the provisions of law have been overloaded with a number of administrative rules of criteria, another basic point to be noted in this connection is that the correlation of managerial remuneration to net profits arrived at after deduction of various expenses, etcetera, is not found in any studies on the subject in the U.K. or the U.S.A., let alone the cognisance of this principle in the official papers or any statute. The scientific, statistical investigations of correlation between the managerial-executive income, sales and profits in the U.S.A. and the U.K. showed that it was higher between executive income and sales than between executive income and profits. Secondly, some studies have shown that a typically large company seeks to maximise not its profits but its sales and the executive salaries, therefore, appear to be far more closely correlated with the scale of operation of the firm than with its profitability. Thirdly, managerial remuneration has been observed to vary with the size of the company. Fourthly, the amount of remuneration in industrial cases is based on such rational factors also, as a fair reward for the responsibility assumed by the individual executive and the motivation of the executives who significantly affect company profits to discharge their responsibilities in an outstanding way.

Personal Factors

Apart from these, personal factors such as family relationships, length of time for which a person has been connected with the enterprise or ability also determine remuneration in some cases. Thus a comparative study of criteria of managerial remuneration in the U.K. and the U.S.A. with those in this country makes it clear that in India the normal remuneration is determined almost entirely by the past performance and the size of the company and the personal competence and qualifications of the individuals have a marginal importance in the sense that their absence would push the remuneration further down or even result in rejection of the proposal of appointment by the Government and their presence would not go to increase the amount of remuneration as at present calculated on the basis of the profit-cum-size formula. The operation of the remuneration criteria followed by the administration in India in the short run is likely to show the reduction in the managerial remuneration paid by the company but they may not in the long run prove conducive to the growth of the enterprise as the remuneration structure bears little correlation to sales, which have a greater psychological appeal to managerial personnel than the net profits as the latter are subject to a number of extraneous reductions and factors.

Furthermore, the present criterion, namely, that of making managerial remuneration dependent on net profits provides an incentive to the unscrupulous management to increase profits, even by restricting production and supply—a technique not unusually employed by unscrupulous managements and which encourages exploitation of the consumer. If, on the other hand, sales become the measuring rod of managerial remuneration, the management will seek its salvation by pushing up sales which will not only benefit the consumer, the management and the company but would go a long way in relieving the economy from the muddles it is caught in.

However, the managerial remuneration scheme as laid down in the Indian Companies Act and as evolved by the Government is a novel one. It derived its justification from the exploitation practices indulged in by corporate managements whose sole preoccupation while in power had been to enrich themselves at the expense of current prosperity and future growth of the enterprises and deserved to be given a trial. A ten year period of experimentation should be enough and a stock-taking should take place during the next financial year 1965-66. The abolition of the Advisory Commission as contemplated in the Companies (Second Amendment) Bill, 1964, which might result in a break in the present policies pertaining to managerial remuneration makes such an appraisal a relevant matter.

Monetary Policy of Reserve Bank: Scope for Restricting Credit

Over the years, the Reserve Bank has shown a preference for selective credit controls. But their effectiveness has been greater when used in conjunction with more general instruments of credit control.

IN a developing country such as India, monetary authorities are faced with a difficult task. When the Government pursues inflationary methods of financing development, and calls upon the central bank to control the resultant inflation, the *restrictive* rôle of monetary policy assumes special importance. This

By
SID MITTRA
*University of Detroit**

rôle implies that the authorities not only have to use quantitative instruments of credit policy more vigorously, but must also be versatile in developing qualitative controls best suited to the needs of the particular stage of development.

This article briefly recounts the efforts of the Reserve Bank of India in developing a monetary policy consistent with the planned development of India during the four-year period ended March 1964. In doing so, an attempt will be made to focus sharply on the restrictive rôle played by the Bank.

On 11th March, 1960, the Reserve Bank announced a series of credit restraint measures in order to meet the expansionary situation which threatened the Indian economy. These measures consisted not only of selective credit controls but also included, for the first time, resort to the instrument of variable reserve requirements. The selective credit control measures consisted of: (1) the imposition of a minimum margin of 50 percent on advances by sheduled banks against ordinary shares, above Rs. 5,000, (2) a ban on the direct financing of *budla* (switch) transactions by scheduled banks through the purchase of shares in their name for the current settlement and sale for the next settlement; and (3) fixing of a ceiling on clean (that is, unsecured) advances.[1]

Impounding Additional Deposits

On the same day, the Reserve Bank impounded 25 percent of the additional deposits flowing into the banking system after 11th March, 1960. It might be of some interest to note in this connection that while scheduled banks could be legally called upon to maintain reserves with the Reserve Bank up to a maximum of 20 percent of demand and 8 percent of time liabilities, the Bank did not make any such distinction in resorting to this measure, nor did it relate the percentage to total deposits. Instead, it made the higher margin applicable *at a uniform rate to all classes of deposits* that would accrue after the date of the order. This method was followed presumably to accord a fair treatment to all types of banks and also to avoid penalising those banks which had taken more pains to attract deposits.[2]

In short, during 1959-60, the Reserve Bank impounded additional deposits equal to 25 percent of the increase in total liabilities since 11th March, 1960; further, it imposed a ban on direct *budla* financing by banks as well as on advances against equity shares and unsecured loans. Various selective credit control measures were also taken to match the dynamic credit policy of the Bank.

Soon after the imposition of reserve requirements in March, slack season conditions appeared in the economy calling for some additional measures. Accordingly, the Bank raised the percentage of additional deposits to be maintained with itself from 25 to 50 with effect from 6th May, 1960. Furthermore, it was decided to confine advances under the bill market scheme during the period June to September 1960, only to such banks as had availed themselves of the facilities in the preceding busy season and further to restrict the relative credit limit to each of these banks.

These measures, restrictive as they were, failed to bring about the degree of credit contraction as had been hoped for by the authorities. This induced the Bank to introduce with effect from 1st October a system of graded lending rates keeping Bank rate unchanged at 4 percent. The salient features of the system of graded lending rates may be described here briefly. Effective 1st October, 1960, each scheduled bank was assigned (for borrowing from the Reserve Bank) a quota for each quarter equal to half of the average amount of the statutory reserves required to be maintained by it under Section 42 (1) of the Reserve Bank of India Act during each week of the previous quarter. Borrowings within the quota limit were to be charged interest at Bank rate. Any borrowing over this limit up to 200 percent of the quota would bear a penal rate of 1 percent over Bank rate, and borrowings above 200 percent of the quota, a penal rate of 2 percent above Bank rate. Since the rates applied to borrowings under both Section 17 (4) and (c) of the Reserve Bank of India Act, it was no longer considered necessary to fix separate ceilings for individual banks for borrowings under the bill market scheme.[3]

In addition to introducing the graded lending rates, the Bank directed all scheduled banks to adhere to a minimum lending rate of 5 percent on all advances; banks were also directed to raise their average lending rate at least by 0.5 percent. It is worth noting that while these restrictive measures were aimed at increasing the cost of credit, no attempt was made to limit the volume of credit the Bank would make available to scheduled banks.

It is a well-known fact that the Indian credit market follows in a broad sense a rhythmic pattern of slack and busy seasons during which time the demand for credit waxes and wanes. The various measures described above were taken during the slack season of 1960 to direct the "excess" credit into the "pipe line." As the economy passed from easy to stringent credit conditions towards the end of the year, relaxation of earlier measures became necessary. Consequently the Bank withdrew in two stages the directive of 6th May concerning the maintenance of additional statutory reserves with the Reserve Bank. Effective 11th November, further impounding of the increase in liabilities over the existing level was suspended and about half of the reserves already impounded amounting to Rs. 13 crores was also released. Subsequently, beginning 13th January, 1961, the additional reserve requirement imposed in March 1960 was totally revoked thereby releasing another Rs. 13 crores of reserves to banks. Finally, with effect from 22nd February, 1961, the Bank also removed the ceiling of 2 percent on interest on specified time deposits. In conformity with its policy of operating credit regulation measures in a flexible manner, the Reserve Bank also modified selective credit controls. These controls were relaxed in the case of sugar and foodgrains and extended to cover advances against raw jute and jute goods. The provisions of the control on advances against groundnuts and other oilseeds were left unchanged.[4]

Open Market Purchases

In passing, it may be mentioned that the Reserve Bank resumed its net open market purchases in 1960-61, the total net purchase amounting to Rs. 6.5 crores. It is worth mentioning that to a considerable extent the sales of securities represented investments in Government securities by the State Bank of funds accruing to it on account of the operation of the P.L. 480. To that extent, net purchases of securities in the *normal* sense could be considered even higher.

To conclude, the year 1960-61 witnessed once again an active and highly flexible credit policy which was consistent with the general trend in the monetary policy of the Reserve Bank during the past few years. Until the end of the slack season, the Bank further tightened its restrictive measures of the previous year; first the Bank raised the additional reserve requirements in May and later in October introduced a system of graded lending rates. With the advent of the busy season, however, it relaxed the special reserve requirements. In addition to the general credit control measures, the Bank also applied selective credit controls to exert proper influence on the selected commodities.

Three-tier System

The history of monetary policy in the subsequent year was rather uneventful. During 1961-62, the Bank used the three-tier system of slab rates devised in 1960 as the chief instrument of credit control. The Bank's credit policy continued to be characterised by caution with due consideration to the needs of the development plan and the changing economy.

While in 1960-62, the Reserve Bank used both the reserve requirements and Bank rate to restrict credit, it did not do so in relation to open market operations, although they were conducted in broad conformity with its general line of policy. In fact, in an atmosphere of inflationary pressures, the Bank purchased Rs. 6.52 crores worth of securities in 1960-61 and another Rs. 8 lakhs in the following year. It was officially explained that these purchases were made to ease out the restrictive repercussions arising from the tightening of other instruments.

The manner in which the Reserve Bank imposed selective controls broadly followed the pattern established a year earlier. As the supply and the price situation improved during the slack season of 1961, controls on advances against paddy, rice, groundnuts and shares were relaxed. Likewise, improved conditions warranted complete removal of the controls on advances against sugar, wheat, raw jute, jute goods and finally, on clean advances. Also, the permissible limits on advances against paddy and rice were raised. In short, while the Bank's policy on selective controls was one of progressive relaxation, wherever necessary, it did not fail to tighten these controls to the appropriate degree.

In passing, it may be mentioned that as in previous years, in 1961-62 the Bank did not find it of much importance to enhance the effectiveness of its general and selective controls through the use of moral suasion. While no official justification was provided for such inaction, vigorous monetary controls over a

Harbinger of a new Industrial era

AMBATTUR, a tiny village twelve miles away from Madras, lay sleepily, neglected by history, by-passed by the industrial revolution. Then, on a cool morning in November 1949, the village woke suddenly to life. Bulldozers and excavators arrived on the scene to be followed by a mass of steel and weird-looking machines. The T.I. Cycles factory had come into being. T.I. Cycles was only the first venture of Tube Investments of India, a joint enterprise of Murugappa & Sons of Madras, and Tube Investments of England. The scope of the T. I. group had been widening year by year and today it embraces steel strip rolling; tube making, the manufacture of cycles and cycle accessories and industrial chains. T.I. Cycles was the harbinger of a new industrial era for Ambattur, and its environs are today among the busiest industrial townships in our country.

decade might have conditioned the system to a degree that further persuasiveness on a voluntary basis was rendered unnecessary.

Onerous Task

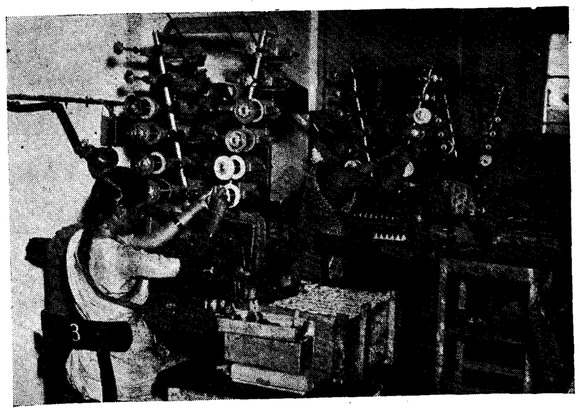
The task of the Reserve Bank during 1962-63 turned out to be particularly onerous. For, on the one hand, the Bank had to assist in the maintenance of the tempo of development effort and, on the other, resources had to be allocated in a substantial measure to higher expenditure on defence. The objective of the Bank's credit policy continued to be one of adequate financing of economic growth and simultaneously ensuring a reasonable price stability. More specifically, the Bank raised both the cost of central bank credit and tightened restrictions on its availability. However, great care was taken to regulate the supply of credit in a flexible manner so that banks could finance credit expansion during the year to satisfy both the development and defence needs of the economy.

As might be expected, in the slack season of 1962, in the midst of a general all-round relaxation and easiness, the Reserve Bank vigilantly watched the developments in the economy. And, as the possibilities for an undue growth in deposits became evident in the slack season of 1962, the Bank clamped down its restrictive measure on the banking system. Effective July 1962, a four-tier system was introduced, designed to raise the average lending rate of the Reserve Bank by ½ percent or more.[5]

Following the measure mentioned above, the Bank observed that the contraction of credit in the 1962 slack season was relatively small; also, since there was need for greater restraint in view of the possible inflationary implications of increased defence expenditure, a revised system of lending rates, effective 31st October, 1962, was announced on the eve of the 1962-63 busy season. Under this system, for the first time, a limit equal to a bank's average statutory reserves during the previous quarter was set on the total amount which a bank could normally borrow from the Reserve Bank.[6] However, the Bank explained the revised system by pointing out that the new system of quotas and lending rates would be operated in a flexible manner and banks were consequently asked to furnish details of their requirements of finance from the Bank during the busy season. Banks were also urged to control their advances, refuse advances for speculative purposes and consider recalling in suitable cases their advances against gold and shares and unsecured advances.

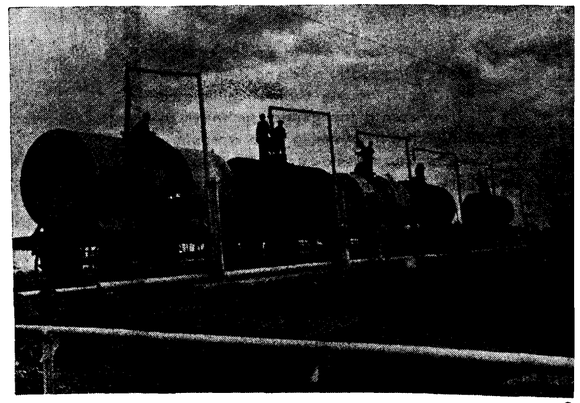
A cursory glance at the Reserve Bank's official rate policy clearly reveals that since May 1957, when the rate was formally raised from 3.5 percent to 4 percent, the rate had been progressively raised in a subtle way in the form of a slab rate system introduced on 1st October, 1960, and modified in July and October 1962. In order to formalise these progressive increases, the Reserve Bank officially announced its third Bank rate increase from 4 percent to 4.5 percent. The increase, which became effective on 2nd January, 1963, was characterised as in "the nature of a simplification and realignment of the Bank's lending rate structure."[7] Simultaneously, the three-tier system of lending rates introduced in October 1962 was simplified into a two-tier system by merging the first two slabs. Under the latter system, banks were permitted to borrow a sum equal to 50 percent of their statutory reserves at Bank rate and the remaining 50 percent at 6 percent; any borrowing beyond this level was to be charged a higher rate.

Preferential Treatment



Another interesting feature of the Reserve Bank's general credit control policy was the continuation of the preferential treatment to certain specified sectors of the economy, such as small-scale industries, co-operatives and the export sector.[8] At the time when the October 1962 scheme was announced, banks were permitted to borrow at Bank rate additional amounts based on their lending to small-scale industries and co-operatives; however, their quotas in the next higher slab or slabs would stand reduced to the extent of such additions. This concession which was retained in the revised slab rate system introduced in January 1963 was further liberalised, effective March 1963, when the Bank decided that the additional quota would be available at Bank rate for such lending, over and above the normal borrowing limit.

The Reserve Bank's selective control policy was similar to the policy of previous years. On 25th January, 1963, the Bank amended its previous directive of 28th February, 1962, thereby relaxing the restrictions placed upon bank advances against groundnuts and other oilseeds. Furthermore, an important change in the Bank's policy of exempting advances against warehouse receipts covering foodgrains was brought about by issuing two directives, one in January 1963 and the other one two months later. Under these directives, the exemption was withdrawn and a margin of 25 percent was imposed on these advances. Finally, in April 1963, when the sugar prices began to rise due to the expectations of lower output in the 1962-63 season and the spurt in bank advances to parties other than those manufacturing sugar, the Bank issued a directive to scheduled banks prescribing a minimum margin of 45 percent on credit limits or advances granted to parties manufacturing sugar.



During 1963-64, the Reserve Bank first pursued credit policies similar to what was developed in the previous year, but later modified such policies in view of the changed situation. Thus, in October 1963, a directive was issued increasing the permissible quota for borrowings by scheduled banks from 100 percent to 150 percent of their statutory reserves. Under this directive, banks were permitted to borrow one-half of their quota at Bank rate and an equal amount at 6 percent. Borrowings beyond this limit, at 6 percent, were to be considered to be special accommodation, subject to a discussion between the Bank and the individual banks concerned. Additional quotas at Bank rate were permitted in relation to certain specified advances.

As the 1963-64 busy season advanced, it became evident that banks were borrowing heavy amounts from the Reserve Bank. This development appeared to be particularly alarming because of an anticipated slowing down of agricultural production. Consequently, on 11th March, 1964, the system of quotas and lending rates, which had been relaxed on the eve of the busy season, was restored to its earlier position, thus reverting to the tighter credit policy in force prior to October 1963. In addition, banks were asked to review their clean advances other than those to industrial borrowers and bring down the level of such advances. Banks were also asked to step up their efforts to mobilise deposits by all possible measures including reexamination of the interest rates offered by them on deposits.

Selective credit controls were also modified during the year. In general, the adjustments included reimposition of controls in the case of sugar and wheat, relaxation of the control on advances against shares and the

Women technicians in an electrical factory

Oil tankers being filled at Ankleshwar

[5] The basic quota of each scheduled bank for borrowing at Bank rate was reduced by one-half to 25 percent of the average statutory reserves of the bank in the preceding quarter; borrowings equal to another 25 percent of the average statutory reserves were to be charged a rate of 1 percent above Bank rate; those above 50 percent and up to 100 percent of the average statutory reserves a rate of 2 percent above Bank rate, and those above the statutory reserves a rate of 2.5 percent above Bank rate.

For details, see *Currency Report*, 1962-63, p. 42.

[6] According to this new system, borrowing up to 25 percent of the statutory reserves was to be charged at 4 percent, another 25 percent at 5 percent and the balance at 6 percent. However, it was indicated that the Bank would permit borrowing beyond this limit after making an assessment of the overall position of the borrowing bank and that such special accommodation would be at a higher rate of interest.

See *Currency Report, loc. cit.*

[7] *Reserve Bank of India Bulletin*, Vol. XVI, No. 12 (December 1962), 1959. In raising Bank rate, the Reserve Bank stated: "The question of adjusting Bank rate in the light of the trends in the money and capital markets has been engaging the attention of the Bank for some time. It has now been decided to fix Bank rate at 4½ percent and with effect from the close of business today, 2nd January, 1963, Bank rate will be 4½ percent.

The system of quotas and lending rates of the Bank for both bills and Government securities is, at the same time, simplified as under:

Rate	*Quota for borrowing*
4½ percent	50 percent of statutory reserve[9]
6 percent	Another 50 percent of statutory reserve.

[9] The average of the reserve required to be kept by a bank under Section 42(1) of the Reserve Bank Act during each week of the previous quarter."

Ibid.

tightening of the existing controls on foodgrains and groundnuts.[9]

An important observation that is pertinent in this connection is that the Reserve Bank did not make use of open market operations with the same flexibility as it did with its instrument of Bank rate. Open market operations were, however, consistent with the restrictive monetary policy that the Bank pursued. The Bank's open market operations were directed towards absorbing the excess liquidity; in 1962-63, its net sales amounted to Rs. 11 crores whereas these operations resulted in much larger net sales (Rs. 45 crores) in 1963-64.

Monetary Policy in Perspective

The story of monetary policy in India beginning with the period March 1960 until the present day is fascinating. Traditionally, the major responsibility of a central bank of a developed nation is considered to be the use of general and selective instruments of credit control with the prime objective of maintaining monetary *stability* of the country. The rôle of the central bank is, therefore, characterised primarily as regulatory. In India, the central bank has to operate in an institutional set-up of a mixed economy, heavy public expenditure under a planned development programme, existence of a large and important private sector, an indigenous juxtaposition of a highly organised and a loosely unorganised money and banking sector, and above all the existence of a primitive barter economy to a large degree. Under conditions such as these, the central bank must assist the Government to the maximum possible extent in the development process itself. In doing so, it may have to reorient itself for playing a highly versatile restrictive rôle.

Viewed in perspective, the history of monetary policy in India does suggest that the Reserve Bank as a monetary authority used the instruments of credit control judiciously in a manner to control the inflation that was generated primarily as a result of the Government's inflationary methods of financing.

An overall view of the general and selective instruments of credit control that were used over the period 1951-52 to 1963-64 would reveal that whereas both these types of instruments were used as complementary to each other, since 1956 until October 1960, selective controls were used much more frequently than general controls. Following October 1960, as observed above, while the Bank began experimenting with a novel Bank rate policy, selective controls continued to play their former dynamic rôle in monetary management. These controls were primarily directed towards foodgrains, but were also extended to sugar, groundnuts, other oilseeds, cotton textiles, stocks and shares and, recently, to advances against warehouse receipts.

The official preference for selective controls over general instruments was based on the following arguments. In the process of India's economic development, there is a legitimate and essential need for higher bank credit to be channelled into desirable avenues which, in turn, would encourage investment. Selective controls are designed to restrain particular types of investment or consumption. What is more important concerning these controls, however, is the fact that they *serve to divert* the flow of bank credit into the channels most desirable from the point of view of economic development of India. Moreover, the operation of selective controls can be discriminatory not only in relation to advances against different articles but also within the field where the controls are being imposed. It is true that selective controls are highly discriminatory. The official answer to that objection is that all types of controls are likely to prove discriminatory in some matters. Besides, in India there has already been set a preference for a socialistic economy in which the Government plays a major rôle in the development process, and hence selective controls would seem to be compatible with the present economic set-up in India.

While the preference for selective controls was definitely established, the Reserve Bank conceded the difficulties in the effective enforcement of these controls. As the Bank put it: "The problem of enforcement of selective credit controls among a host of banks differing widely in the structure of assets and liabilities and standards of management and some of them possessing large network of branches scattered throughout the country, has bristled with difficulties. Besides it could happen that by the time the Bank brought the excess over permitted levels to the notice of a bank and by the time the bank took action, seasonal forces would have brought about the desired result."

Reserve Bank Experiments

Since the implementation of the second plan, the Reserve Bank frequently experimented with selective instruments. However, granting the limitations, the effectiveness of these controls were more pronounced when used in conjunction with other instruments of credit control.[11]

In addition to selective controls, the Bank used, although with caution and restraint, *all* the instruments of general credit control, among which the instrument of Bank rate deserves special mention. In October 1960, a graded system of Bank Rate was introduced which, in effect, implied the raising of the rate for certain types of borrowings and also over a certain specified minimum. These quotas and the purposes of borrowing were frequently changed while keeping the basic Bank rate fairly stable. It is pertinent to point out here that the underlying objective of the use of the various instruments of credit control was actively to assist in the Government's planning efforts.

SIEMENS

Are
Siemens systems
expandable?

We can plan any system for you in a way that allows expansion at any time whether you order a large-capacity system or decide to manage with a small unit for the time being.

Power stations, for example, must be designed so that their capacity can be increased at any time by the addition of a new unit. The capacity of the switching assembly of a telephone exchange must be sufficiently large for new trunks to be added as required.

In other words, provision should always be made in advance for future growth. And this is exactly what we do. So once you have decided in favour of a Siemens system, your capital investment will be safe.

81-SE-103

NEED TO FIX ECONOMIC FREIGHT RATES FOR SEA TRANSPORT

Freight rates should allow a reasonable return on the capital invested in shipping and also a margin to meet replacement costs. If freight rates are artificially depressed in order to help exports, the quality of the service may suffer.

By
NEIL FORSTER

A VIGOROUS discussion has been going on over the last few years throughout the world on the question of the proper organisation and pricing of international sea transport. Sea transport is not the only industry faced with such a problem: the international airlines have also signally failed to find a pricing procedure which does not leave the great majority of them with an operating loss, or alternatively with an operating profit which is totally insufficient to replace their expensive units. Yet the fact is that international shipping rates rather than air transport fares have attracted most of the attention and criticism. This is because the former vitally affect the economies of nearly all countries in the world: airlines are by comparison a marginal luxury. There is little doubt that the influence of ocean freight rates on the marketability of exports and imports has been exaggerated; but, on the other hand, they can be a significant factor in c.i.f. prices, particularly in the case of low value commodities.

It is natural, therefore, that Governments should be extremely concerned about the impact of freight rates on imports and exports. Apparently they are not always so aware of the influence which their own actions have on these rates. All Governments naturally like to see their sea-farers well paid and so press for increases in their emoluments. All Governments are under pressure to ensure that their dock workers have bigger pay and welfare facilities. All of them are faced with the problem of expanding and maintaining port facilities in a world where the costs of these operations have been steadily increasing. The effect of pursuing these worthy objectives, and also of the general increase in prices in most countries, is to raise sharply the costs of the shipowner. Furthermore, he is hit by increasing and sometimes chronic port delays, by the rise in the cost of building and repairing ships and by a host of other factors.

Increase in Costs

In this steady rise in costs the shipowner, of course, shares the experience of most manufacturers or exporters of manufactured or processed materials. Yet, although many of the cost increases are directly influenced by Government or Government-sponsored action, it does not seem to be accepted yet that the ship operator must in the long run recover at least part of the extra expenditure from an increase in the price of the service he sells. Thus it is agreed that, in nearly every other branch of economy, prices have inevitably risen to meet the increase in costs. Yet it is not often realised that in many shipping trades the freight rates for major commodities are less than they were eight years ago, or at best the increase over the period has been marginal, even allowing for the increases of the past year or so. Why is it that in other industries an increase in prices is accepted as necessary, whereas in shipping this is considered immoral?

The fact is that the central issue does not seem to have been faced. Nobody has really come round to saying precisely how an international transport service ought to be priced. The purists will argue (when it suits them) that the free operation of market forces should be allowed unhindered. But this is not really practicable in a vital transport organisation because the whole basis of regular schedules and proper coverage of trades would collapse. That would be far more damaging to trade than a marginal rise in freight rates.

Furthermore, in international liner shipping, the days of entirely free markets have passed long ago because many lines are subsidised either directly or indirectly, and a situation would soon be reached where all would be either running at a loss or receiving heavy subsidies. This would in turn lead to discrimination in the distribution of Government and other cargoes. The result would be a distortion of normal services, a loss of efficiency and a heavy increase (though perhaps concealed by subsidies) in costs. Another point to bear in mind is that the growth of the national fleets of developing countries requires a certain stability in freight rates and services in order that sound experience and reasonable profits may be built up at an early stage.

Fixing Freight Rates

As an alternative, the freight rates for liner services can be fixed by the unilateral decisions of Shipping Conferences, which are themselves international bodies. In fact, this has not brought any excessive profits to shipowners as compared with other industries, but it has naturally given rise to a feeling that these international bodies are supranational and might attempt to dictate terms to Governments. The feeling was reflected at the U.N. Conference on Trade and Development held in Geneva earlier this year.

A third method of regulating freight rates is by direct Government control. This has been considered repeatedly by various Governments in the past, but in nearly every case it has been categorically rejected. How can any single Government control rates in any section of an international route where ten Governments may be involved? Each is naturally anxious about its exports, but the exports of one are the imports of another, so which of the Government concerned is going to control the freight rates? There cannot be a situation where freight rates one way are controlled by one Government and rates the other way are controlled by the other Government, with both trying to depress the rates on their own exports. Presumably, in the long run, the various Governments on the route would get together to decide freight levels. But then this would be almost a return to the Conference rate-fixing system because the Conference already consists of the shipping lines of many nationalities, all of which are probably basically representative of their national points of view.

At the U.N. Trade and Development Conference in Geneva, a certain amount of hostility was shown towards Shipping Conferences, but there was some lack of understanding of the basic principles involved. Fortunately, the good sense and moderation of the Indian delegation did much to guide the discussions on sounder lines. For instance, a great deal was said about discrimination in freight rates against the developing countries, whereas in fact the discrimination is the other way about. Freight rates on the exports of developed countries are almost invariably higher and more remunerative than those on the exports of developing countries. Of course, this is not the full picture because a shipowner sells space and the profitability of the voyage depends basically on the freight rate a cubic foot or cubic metre, which may not properly take into account the difference in the value of the commodities concerned and the incidence of the freight rate on that value.

Views of U.N.C.T.A.D.

The Geneva conference, under the guidance of the Indian delegation, concluded that some international body should be set up to investigate the structure of ocean freights; there does not seem any harm in that. But what is to be the criterion of judgment? Unless ocean freight rates are going to be distorted and used as a form of direct aid to developing countries or to subsidise their exports, any investigation will ultimately come back to the fact that the financial yield of each voyage should leave the operator with a margin of profit sufficient to replace his vessels in the long run and also to reward him reasonably for the capital he has at risk. Unless this principle is followed, the service will suffer as the shipowner may desperately try to squeeze some return from an unnaturally low freight revenue. When this happens, the damage to trade will probably be far greater than would have been the case if the freight rates initially had been pitched at a reasonable level.

The effect of depressing freight rates below economic levels, and thereby subsidising exports, would be to produce an everworsening service and a distorted picture of the true competitiveness of exports. If export subsidies are required, they should be direct and not at the expense of another industry. One often hears of sensitive commodities which should enjoy preferential freight rates; to some extent, this is reasonable where new exports are being promoted. But if an article is sensitive in the sense that it is scarcely competitive in international markets, it is neither just nor in the country's interests that its competitive position should be bolstered by low freight rates.

Many of the pleas for special consideration or for general reductions in freight levels, and many of the arguments against increases, fail to produce an answer to this basic problem. The only sensible yardstick for fixing freight rates in international liner trades is that the overall yield from a given voyage should in the long run cover the cost and maintenance of an adequate and efficient service, permit suitable depreciation to be provided and offer a reasonable return on the capital employed. Previously, the Shipping Conferences fixed their own freight rates to ensure that they were able to conduct their business without losses. If this system is now considered inadequate or unfair, any changes contemplated still need to meet the same objectives. The fact that shipping is a service industry does not in any way make it different from other industries where the price of the article sold must inevitably in the long run cover the cost of producing it. The problem is to establish the price by some system which is considered fair to the many and varied interests involved without jeopardising the efficiency of the service itself.

A RADIAN ELECTRODE IS CHECKED AND RE-CHECKED BEFORE IT IS SOLD

Such is the quality control which goes into the production of RADIAN ELECTRODES, now made in India. Use a carton of Radian Electrodes and see the difference it makes in joining all types of mild steel sections.

Big Increase in Railway Revenue but Working Expenses Rise Sharply

The railways have to cope with an increasing volume of traffic under the plans. A fair proportion of the traffic consists of "smalls" and is uneconomic. The optimum use of capacity is possible only if a balanced policy on transport is followed.

By

L. A. NATESAN

THE railways occupy so important a place in the national economy that their operations reflect its general health, As the handmaid of agriculture, industry and trade, the railways register faithfully the pulsations in these sectors. Prosperity in agriculture and industry reacts on trade and results in increased earnings and traffic for the railways. Depression in these, on the contrary, affects railway earnings and traffic adversely. Improved and more efficient transport also promotes economic activity in the country. It is useful to keep from time to time a watch on the different aspects of railway working. The present time seems to be appropriate to attempt a brief review of the finances and performance of the Indian railways. The appraisal of their needs from the point of view of their present shortcomings is a necessary preliminary to taking the steps to meet transport demands likely to emerge during the fourth plan.

The gross traffic receipts budgeted for 1964-65 represent the highest level so far touched, namely, Rs. 668 crores, about Rs. 46 crores more than in the previous year, to be ascribed largely to the effect of some adjustments and a 2 percent supplementary charge on all freight other than export ore. Ordinary expenses for the year are Rs. 21.59 crores more than the revised estimates of last year, the increases being mostly under staff, repairs and maintenance, and fuel. Depreciation was placed at Rs. 83 crores and a special appropriation of Rs. 19 crores has been made to create a pension fund.

The main details of these items, as compared with the previous year, may be seen from Table I below:

TABLE I

INDIAN RAILWAYS' FINANCES DURING 1962-63 TO 1964-65

(In crores of Rs.)

	1962-63	1963-64*	1964-65**
Gross traffic receipts	566.79	622.22	668.00
Ordinary working expenses	362.38	393.34	414.68
Depreciation	67.00	80.00	83.00
Appropriation to pension fund	—	—	19.00
Payments to worked lines	0.14	0.14	0.14
Total working expenses	429.52	473.48	516.82
Net traffic receipts	137.27	148.74	151.18
Net miscellaneous expenditure	13.95	15.96	17.08
Net revenue	123.32	132.78	134.10
Payments to general revenues†	68.76	82.53	90.73
Payments in lieu of passenger tax	12.50	12.50	12.50
Net gain or surplus	42.06	37.75	30.87

* Revised estimates. ** Budget estimates. †Also called dividend.

The picture of buoyant revenues which Table 1 conveys does not indicate the signicant shortfalls under coal, export ore and raw materials for the steel plants, as these have been made up by compensating traffic in the high-rated categories during 1963-64. The financial figures cannot always indicate the true picture of the volume of traffic because of the effects of changes of fares and freight rates. The volume of traffic has to be examined from this point of view. Current figures available relate only to wagon loadings during the first half of the year. These indicate that the broad-gauge lines handled 3,637,000 wagon loads during April-September 1964 or some 41,000 less than during the corresponding period of last year.

The loadings on the metre gauge, however, have been on the increase, but the improvement here cannot offset the deterioration on the broad gauge which handles by far the largest proportion of the total traffic. What has made the trend rather disturbing are the lower levels of the broad-gauge loadings from May onwards, compared with the previous year, as shown in the accompanying table.

TABLE II

MONTHLY WAGON LOADINGS DURING APRIL-SEPTEMBER 1963 AND 1964

Year	Broad		Metre	
Month	625,998	633,038	296,713	328,392
April	624,711	617,574	301,104	318,156
May	596.925	607 115	281,199	297,546
June	629,723	602,165	298,618	294,863
July	601,829	678,034	293,287	290,772
August	599,047	598 831	293,050	288.813
September				
Total	3.678,152	3,637,187	1,757,809	1,876,180

The principal items under which the decreases have occurred and their comparative extent may be seen from Table III showing the cumulative loadings by commodity groups during the six months on the two gauges.

TABLE III

WAGON LOADINGS, APRIL-SEPTEMBER 1962, 1963 AND 1964

	Broad gauge

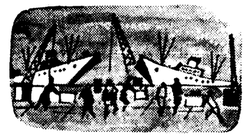
Drop in Some Commodities

The recession in one or two commodities may occur for unexpected and unpredictable reasons at all times. But the commodity groups referred to in the table are rather too many and too important for complacency or comfort. Coal despatches, according to later reports, are down by about 2 million tons. Iron ore production has also dropped by 4 percent during January-August over the corresponding period of last year.

There is still the second half of the Budget year in which the lag of the first can be overtaken and the earlier anticipations concerning increased traffic made good. The dilatoriness of official statistics militate against any worthwhile probe into the future. It is not clear that the economy has regained its resilience and, at the time of writing, the situation concerning food and prices has given rise to a great deal of anxiety. Although the penultimate year of the third plan should, from previous calculations, prove more promising than its predecessors, it would be unrealistic for more than operation on a lower key, say, the current levels of traffic volume.



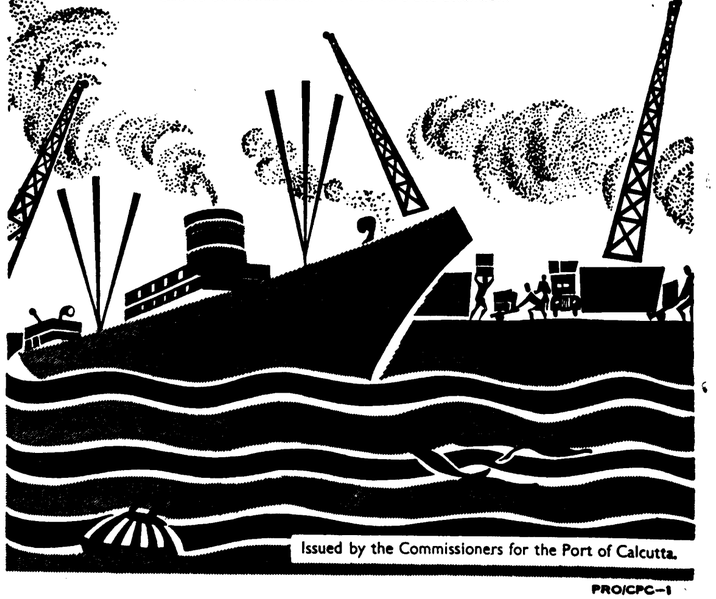
The position concerning capacity has become easier because of goods traffic not coming up to expectations. The passenger services have, therefore, been allowed to take up some of this, and there have been additions to trains as well as extensions to existing services. The approximate passenger earnings during the first half-year amount to Rs. 100.06 crores, or about 46 percent of the budgeted figure. If the present difficult situation in the domestic economy, particularly in the light of the erosion of incomes due to rising prics, continues much longer—it is difficult to see that it may not—a recession in passenger travel cannot be ruled out.

It is useful to view the latest year in the perspective of the performance of recent years. Table IV on page 118 shows how 1962-63 compares with 1950-51. The finances of the railways have increased under gross traffic receipts to 275 percent of the earlier year. The ordinary working expenses have just about doubled. The net revenue has risen from Rs. 48 crores to Rs. 123 crores.

The volume of traffic during this period shows an increase of 37 percent under originating passengers, 27 percent under passenger-kilometres. Under the impact of the plans and industrial activity freight traffic has gone up by 143 percent under originating tonnes and 138 percent under tonne-kilom tre. The additional train-kilometrage operated amounts to 28 percent under passenger and the proporti n of mixed, despite the considerable increase to 55 percent under goods and proportion of mixed.

Increase in Equipment

To secure these results, there has been a great increase in the equip-



in tune with the progress of trade and industry

Serving a hinterland of 5,00,000 square miles with 180 million people, The Calcutta Port has to live up to the increasing demands of our national plans and progress. With the aid of over 42,000 workers and the best possible equipment, the Port helps the country to earn 50% of the foreign exchange from export. The task and target of the vital cause that this Port serves are as complex as they are extensive. By 1971, the traffic capacity has to be geared up to about 14 million tons from nearly 10 million tons in 1960. To be an active participant in the gigantic national programme of progress is the proud privilege of

CALCUTTA PORT COMMISSIONERS

Food & oil, huge machineries & tiny equipment, raw materials and finished goods—are all part of the total cargo and none is less important. Men who work and the machines that help have also to be looked after with all care and attention.

Issued by the Commissioners for the Port of Calcutta.

PRO/CPC—1

TABLE IV

RAILWAY REVENUES AND TRAFFIC DURING 1950-51 AND 1962-63

	(Rs. in crores, other figures in million) 1950-51	1962-63
Gross traffic receipts ..	263	567
Ordinary working expenses ..	180	363
Total working expenses ..	210	430
Net revenue ..	48	123
Number of passengers ..	1,284	1,749
Passenger-kilometres ..	66,517	84,078
Tonnes, originating ..	93	179
Tonnes, kilometres ..	44,117	100.693
Train-kilometres, passenger and proportion of mixed	154	196
Train-kilometres, goods and proportion of mixed ..	112	174

ment used. The number of locomotives has increased by 30 percent from 5,416 to 7,042 on the broad gauge and by 52 percent from 2,494 to 3,788 on the metre gauge. The increase in the tractive power of the locomotives has been even more, namely, 109 million kilograms or 46 percent (B.G.) and 32 million kilograms or 64 percent (M.G.). The number of coaching vehicles which was inadequate to cope with the postwar demands of passenger traffic has increased by about two-thirds on both gauges.

The number of seats in the upper classes are up by 73 percent (B.G.) and by 40 percent (M.G.); in the third class by 36 percent (B.G.), and 78 percent (M.G.). The larger number of coaching stock has undoubtedly contributed to the substantial relief to overcrowding of trains in recent years. Turning to goods wagons, there has been an increase of 45 percent to 200,166 on the broad gauge and of 92 percent to 95,279 on the metre gauge. The increases in capacity have been even greater, namely, 57 percent and 129 percent, respectively, on the two gauges.

As against these striking increases, the size of the railway network has shown only a slight increase of about 5 percent from 53,955 kilometres to 56.742 route kilometres. There has been a greater increase under track-kilometrage from 76,248 to 87,019. But there has been a remarkable increase in electrification of the lines, from 380 route kilometres to 1,614 route kilometres and from 913 kilometres to 4,176 track kilometres.

These large additions to equipment, shown in greater detail in Table V under the different physical assets of the railways, have necessarily involved a considerable amount of new investment. The capital at charge of the Government railways has increased spectacularly from Rs. 827 crores in 1950-51 to Rs. 1,897 crores in 1962-63. Although this represents an increase of 138 percent, this is not all. For, other assets, not included in this figure, have been added to the railways financed from the depreciation fund and the reserve fund, amounting to Rs. 816 crores. Taking also this into account, the total works out to Rs. 2,713 crores, representing an increase of more than three times, namely, to 327 percent. So large an increase if considered from the point of view of the actual traffic increases would seem to be rather disproportionate. But railways have to plan ahead to provide capacity to meet future requirements, exceeding the current demands, by way of line capacity works, equipment and other facilities. The electrification programme should permit of much larger capacity than might be in evidence at present.

Rise in Staff Strength

The number of staff has risen in 1962-63 by 33 percent from 913,553 in 1950-51 to 1,212,040, in response partly to the demands of additional traffic. The number of staff is also affected by the capital investments in the industry. There is a close correspondence between employee productivity and the ratio of capital an employee. A comparative increase in the ratio of capital is always accompanied by increased productivity, generally more than in proportion to the extent of such increase. The capital an employee in 1950-51 worked out at Rs. 9,053; it has risen to Rs. 22,283, or to 247 percent in 1962-63. It should be worth while to enquire as to how the productivity of the railway employee has fared from this point of view.

The productivity of railway employees may be measured in terms of train-kilometres—the number of trains and the distances to which they have been operated—and the kilometrage under the passengers and goods. The ratio of train kilometrage an employee has risen during the period covered here from 290 to 305, or by about 5 percent. The ratio of transport output—taking the passenger kilometres and tonne kilometres together representing the transport output—worked out, at 152,441 in 1962-63 an employee, compared with 121,103 in 1950-51, an increase of 25 percent. These are overall averages, and some allowance has to be made for a train-kilometre now representing much more than what it did in 1950-51. But even taking into account the allowance to be made for such differences, the figures of productivity compares rather too poorly with the increase in the ratio of average capital an employee.

There must, of course, be reasons for these differences, which require to be probed further. While there have been gratifying advances in several factors of operating efficiency, the average speed of goods trains have been consistently on the decline. Despite the additions of more modern equipment such as the high-powered diesel-electric and electric locomotives, the speeds of goods trains have dropped from 17.4 kilometres to 15.4 kilometres on the broad-gauge and from 15 kilometres to 13.6 kilometres on the metre gauge. Heavier loads in trains are no answer to slow speeds, and unless there is improvement here fairly quickly, there is bound to be more costly operation to all concerned.

Lack of Cost-consciousness

As a commercial undertaking, the railways have in recent years missed the stimulating influence of cost-consciousness, essentially because transport has been enjoying a sellers' market, and because of the ease with which their revenues can be augmented by raising rates and fares. The effect of this is writ large in the average receipts a passenger and a tonne a kilometre.

TABLE VII

AVERAGE RECEIPTS A PASSENGER AND A TONNE A KILOMETRE

Year	Passenger	Tonne Paise
1950-51	1.45	3.20
1951-52	1.72	3.27
1955-56	1.72	3.50
1959-60	1.72	3.72
1960-61	1.71	3.87
1961-62	1.85	3.98
1962-63	2.01	4.12

The average has gone up by 38 percent by 1962-63 a passenger and by 29 percent a tonne a kilometre, and this, be it noted, especially during a period of unprecedented growth in the volume of traffic and steady improvement in operating efficiency. Formerly, any proposal for the enhancement of fares and freight rates would have had to pass through a critical Central Advisory Council and Standing Finance Committee. The abolition of these under the Constitution has deprived the country as well as Parliament and the Government of the benefits of the valuable scrutiny of these committees. The debates in Parliament can hardly afford the scope for the deliberative examination which can be conducted in the calmer atmosphere with the executive officials to assist. The result has undoubtedly been a diminished sensitiveness to financial controls, compared with the past.

This can be put right only if Parliament adopts a more effective method of scrutiny. It has now to allow for factors which did not exist before. One of these refers to the execution of many large projects under the plans, and these cannot brook the delays characteristic of the financial surveillance of a more leisurely period. The procedures have to be expedited. Another is that suggestions of strict financial justification of expenditures and new investment are often put off by vague appeals to increased employment, the obligations of a welfare State, etcetera, backed by political commitments or pressures. In the circumstances, it seems, easier to manipulate rates and fares, when such a course can be resorted to with the least trouble, than to cut down expenditure on items productive of neither additional earnings, nor economy. It is possible to be over-enthusiastic about regional claims of railway development, labour welfare schemes and concessions to special interests when no great difficulty need be experienced in finding the funds. The recent extension of the pension benefits to the railway employees seems to have fallen into this category.

Individually, some of these measures can be justified on large humanitarian grounds. Starting in a modest and limited way involving comparatively small expenditure, such proposals gradually increase in number and raise questions as to how these are going to be financed. If such socially desirable objectives are pursued at public expense in a particular public sector or industry, irrespective of their relation to the general level in other sectors, a more

serious injustice is perpetrated by transference of benefits to particular groups of employees, thereby creating preferred groups. It would indeed be an odd kind of socialist policy if this result comes about from deliberate State action.

Wrong Allocation of Resources

A situation of this kind can indeed be exceedingly susceptible to wrong allocations of resources of a pretty large magnitude. Insistence on financial justification is about the only means of preventing the law of diminishing utility to apply in the case of expenditure of the character just referred to.

The future of the railways is apt to be affected not only by these factors, but also by the present indecision as to transport policy in the country. When enormous sums are being invested in the provision of facilities for the different forms of transport, it is of the utmost importance to see that the outlays are so made as to be to the best advantage of the country. This means something more than elimination of inter-agency competition or the so-called co-ordination. It means that there is definite awareness of the economic fitness of each form of transport to handle particular traffics, and that the different media of transport are being so developed as to ensure adequacy of capacity for each eventually, if not immediately.

It also means that there is a clear recognition on the part of the policy-makers of the present state of transport and the tasks expected to be handled, what is needed to cope with the dimensions of the tasks of the immediate future, and finally, the emergence of adequate transport facilities so as to allow the different means of transport to handle the nation's traffic according to their respective economic suitability. Transport policy must take into account not only the relative state of development of the different agencies in relation to the traffic currently handled by them, but also of what is required to enable them to attain optimum capacity in relation to the needs of the future.

The nation, unfortunately, has been no wiser all these years for the labours of the Committee on Transport Policy and Co-ordination since 1959. Until its report comes out, it will not be known to what questions of transport policy, it will seek to provide an answer. If rumination over the ascertainment of policy takes all this time, how much more unpredictable will be the process of its implementation! Meanwhile, vast sums are being expended on transport in all its categories without any clear vision as to what they ought to be. For economic activity cannot be suspended till a leisurely committee makes up its mind to announce the conclusions it has reached.

There is indeed a note of urgency on this subject, because the dangers of the present drift are that too many at different levels are exerting pressure on transport policy and not all of them for sound reasons. The result is seen in the present unsatisfactory state of inter-State road transport, passenger as well as goods,

Boiler being made at a locomotive works

the procedure for licensing, and the regulation of rates and fares. The task of indicating what gaps have to be filled and how may have to be left to another committee to examine and report within a prescribed period.

The railways are too deeply interested in the enunciation of a sound national transport policy. In the absence of a properly organised alternative transport, they are often obliged to assume uneconomic burdens. It is certainly not in the nation's interests that an agency eminently designed for mass and long distance transport should be used for movement of smalls. But then, if there is other means for moving such traffic, there is no escape for the railways from having to handle them. This is a situation in which only a balanced transport policy and its implementation can help.

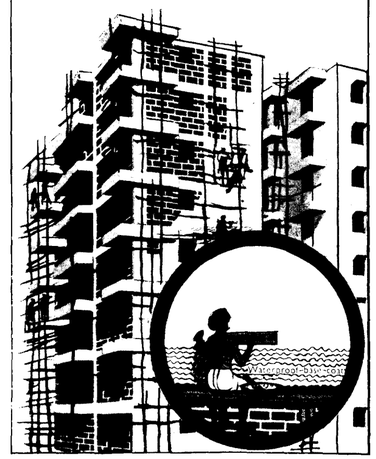
India's vital Coal Industry had its beginnings here in Bengal with the opening of the first mine at Ranigunj in 1814, and in this era of transition and promise, coal is in demand more than ever before to meet the requirements of Industry, Trade and Commerce.



The Bengal Coal Company Ltd., were the first of existing Coal Companies to be formed and on its formation in 1843, took over among others, this famous Ranigunj Colliery.

Raising Indian Exports to E.E.C.: Prospects of Tariff Concessions Uncertain

If India can increase her exports to the E.E.C., it will be possible for her to increase her imports from that region. But the Indian plea for tariff and other concessions has yielded little by way of practical action so far.

By
MALCOLM SUBHAN

INDIA'S efforts during 1964 to improve her trading relations with the six-member European Economic Community were largely conditioned by the U.N. Conference on Trade and Development and the struggles of the contracting parties to the G.A.T.T. to revise it. The conference, which was attended by 119 countries, is likely to be regarded in years to come as marking a turning point in the economic relations between industrialised and developing countries. It was the first major conference to focus attention on the economic problems of the developing countries, and the first to stress the importance of foreign trade as an instrument of economic development.

During the conference, a large number of delegations strongly criticised the G.A.T.T. for its failure to help the economically weaker countries, and urged that it be replaced by a more representative organisation. A number of the developing contracting parties, including India, took the view that it would be more useful to write into the General Agreement a new chapter on the trade and development problems of the developing countries. Although attempts to revise the G.A.T.T. were begun in 1963, progress was slow, and the project was shelved pending the outcome of the recent world trade conference. Efforts to reach agreement on the model chapter were redoubled this autumn, and the special session of the contracting parties in mid-November was expected to adopt a new chapter whose operative section is based on the G.A.T.T. Action Programme.

Multilateral Negotiations

India's relations with the E.E.C. must be seen against the background of these multilateral negotiations in which both India and the E.E.C. have played important—if opposing—rôles. Like other developing countries, India has been trying to secure tariff and other trade concessions through bilateral as well as multilateral negotiations. Like many of them, she maintains relations with each of the six member States of the E.E.C. and also with its executive commission—the Hallstein Commission—in Brussels. At the same time, India is a member of various international bodies—the G.A.T.T. is only one of them—along with the six E.E.C. countries. This multiplicity of contacts is necessary as some ends are most readily achieved bilaterally whereas others must be pursued within a multilateral framework.

The choice of the forum may be dictated by external events. If India's efforts have been concentrated this year on multilateral trade negotiations, it is because the year has been dominated by such negotiations. The most important no doubt was the historic U.N. trade conference. One must not minimise the importance, however, of the negotiations within the G.A.T.T.: the Kennedy round, which opened this May and is expected to last two years, and the revision of the General Agreement. In a sense, India had no alternative but to concentrate her energies on these negotiations. When her Ambassador to the European Communities proposed last December informal talks with the Commission in order to study practical solutions to some of the graver problems facing India in her relations with the E.E.C., the Council of Ministers turned down the suggestion. The Six clearly were reluctant to negotiate bilaterally with India until they knew what the results of the various multilateral negotiations were likely to be.

The decision of October 1963, to grant India a number of tariff concessions unilaterally, appears to have been dictated by a desire to postpone bilateral talks for at least the coming year. As the concessions were of marginal importance in themselves, the Indian Mission continued to press the case for more comprehensive measures. In a letter to the Commission in January 1964, the Mission —after thanking the Community for the tariff suspensions on products of export interest to India—expressed the hope that talks would be held shortly on the many specific matters which could be resolved on a bilateral basis. It thus rejected the Six's argument that the solution to the remaining problems depended on the solutions adopted by the U.N. trade conference and the contracting parties to the G.A.T.T.

The request fell, on deaf ears, however. In its reply to the Indian *note verbale*, the Commission maintained its view that it was necessary to wait for the world trade conference and the Kennedy round to end before a detailed study along the lines advocated by India could be undertaken. This refusal even to envisage exploratory talks points to one of the principal difficulties facing India and other developing countries that try to open negotiations with the E.E.C. The decisions taken by the Six must be unanimous; hence they usually represent a compromise, between opposing points of view. But unanimous decisions tend to be rather more negative than if they have been taken on, say, a majority basis. Thus while some of the Six were prepared to consider sympathetically India's request for more substantial concessions, the need for unanimity resulted in a decision reflecting the opposing view.

The Hallstein Commission could perhaps tip the balance in favour of India (it has strongly urged exploratory talks with the Indian Mission in Brussels as a prelude to negotiations for a trade agreement); but its influence on the member-Governments has waned considerably since the breakdown of the British negotiations. The alternative to negotiations with the Community would be separate negotiations with each of the six member-States; but such bilateral negotiations are no longer possible on tariff matters as the Six now form a Customs union.

Views Exchanged

Exchanges on technical matters have continued between the Indian Mission and the Commission's experts, of course. In the early summer, the two sides exchanged views on such products as handloom cloth, jute goods and foodstuffs. Then in September, the Indian Mission addressed a second *note verbale* to the Commission drawing the latter's attention to the guidelines for tariff and non-tariff measures adopted by the U.N. Conference in June. The Mission expressed the hope that the Six would endeavour to apply them in their relations with India. The *note verbale* also proposed exploratory contacts for the autumn in order to prepare a programme of work based on a product-by-product approach.

Before examining the various solutions contained in the two Indian memoranda to the Commission this year, it will be helpful to examine briefly the basic problem which confronts India. It is primarily one of correcting the structural unbalance in its trade with the member-States of the Community. Although India's trade deficit with the Six has declined during the last few years, it nevertheless remains substantial, as the following table shows (the net deficit is defined as imports less exports plus aid):

INDIA'S NET DEFICIT WITH THE E.E.C.
(In $ million)

Member-country	1960-61	1961-62	1962-63	1963-64
West Germany	160	157	157	146
France	26	18	9	10
Italy	35	36	25	10
Netherlands	4	11	8	+2
Belgium	21	11	8	4
Luxembourg	Negligible			
Total	246	233	207	168

Although the overall deficit has been declining, that with West Germany remains substantial. Moreover, the decline is due not only to increased exports to the E.E.C. but also to a fall in the Community's exports to India. The emphasis clearly must be on finding ways and means of increasing India's exports to the Community: increased aid will merely postpone the day of reckoning. This is particularly true for aid given by the Six, much of which is in the form of suppliers' credits at commercial rates. The servicing of such loans inevitably represents a substantial burden on the economy.

The proposals contained in the Indian memoranda are, in fact, designed to fit in with the Six's common commercial policy, for they are largely based on measures already adopted by the E.E.C. It will be remembered that the Six last year suspended their tariffs on a number of products, the principal one of which was tea. The Indian Mission has suggested that these suspensions be extended to a number of other tropical products, including pepper, mushrooms, fresh and tinned fruits and juices, prawns and froglegs.

This list, which is not intended to be exhaustive of course, already bristles with difficulties from the Six's point of view. They maintain that as India is not the principal supplier, these suspensions would mainly benefit others. (Under G.A.T.T. rules, these suspensions would have to be on a non-discriminatory basis.) While the Six may not object to extending these concessions to other developing countries, they will certainly want to draw the line at countries such as Australia and the United States (both of which export tropical fruits). Moreover, the E.E.C. does not have unlimited freedom of action in relation to tropical products: the Convention of Associaton limits the concessions that may be offered. Imports of bananas, for instance, are subject to severe restrictions in order to safeguard the rights of the associated States and territories. (It is amusing to note that the Six had virtually agreed to suspend the tariff on froglegs, when the Belgians declared they could not support the measure as the sale of this item is forbidden in Belgium.)

A second group of products for which India is seeking tariff concessions includes such items as heavy jute goods, coir mats, handknitted carpets, handloom cloth and East India kips. There is a substantial tariff on nearly all these products in order to protect local manufacturers. Efforts were made to secure the reduction, if not elimination, of these tariffs during the British negotiations,

ASSAM SILLIMANITE
OFFER
IN 1964
PYROPHYLLITE
a mineral with rare qualities with a variety of uses
IN

✓ STEEL PLANTS : —for manufacture of Blast Furnace and Ladle refractories.
✓ REFRACTORY WORKS : —for manufacture of specialised Kiln Furniture requiring high R.U.L. qualities.
✓ CERAMIC WORKS : —for manufacture of Pottery and Glazed Ware, Glazed Tiles, Insulators, etc.
✓ ENAMEL WORKS : —for obtaining hard smooth and firmly attached coatings to iron and steel bodies—Gives greater Adherence, Resistance to Oxidation and Thermal Shock, and longer life of enamel wares.
✓ GLASS WORKS : —As an added source of Alumina when blended with felspar.
✓ CHEMICAL WORKS : —for Insecticide dusts.
✓ PAINT & ALLIED WORKS :—As a Filler.

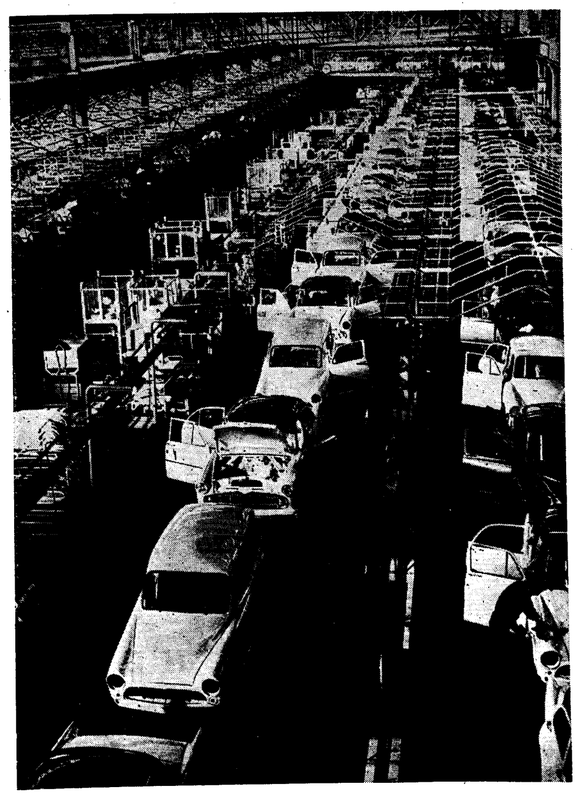
but proved largely fruitless. India has now proposed the creation of new tariff sub-positions with sharply reduced tariffs. This would allow the Six to limit the concessions to products which are not produced in the Community in significant quantities and for which India is a principal supplier, *e.g.*, gray cloth produced from yarn of 30 counts and below and heavy jute bags. Although the Six have already made use of this technique—in the case of Iranian caviar, for instance—their response to the Indian proposal has been lukewarm. The fact is that the domestic industry in each case strongly opposes all attempts to reduce the level of protection.

Removing Tariff Differentials

The Indian memoranda also propose the elimination of the tariff differentials between raw materials and the finished and semi-finished products. Raw skins, for example, are allowed into the European Common Market duty-free, whereas the tariff on kips is 7 percent. Similarly, loose tea enters the E.E.C. duty-free, but tea in packets is subject to a 5 percent duty. (The Ceylon Government is trying to obtain duty-free entry for instant tea, which at present is subject to a duty of 24 percent.) A product-by-product study will obviously be necessary. Thus the Six have refused to remove the tariff on tea in packets on the grounds that such a measure would principally benefit British packers, while the main objection to eliminating the duty on kips has come from Italy.

Other Indian proposals cover products such as vegetable oils, manioc meal, sugar and tobacco, whose marketing prospects are likely to be endangered through the application of the common agricultural policy. (India's exports of manioc meal have already fallen sharply.) In certain cases—sugar and vegetable oils, for instance—the Community has not yet adopted the necessary regulations, and India has asked to be consulted before they are finalised. In other cases—tobacco is the principal one—the Six have granted preferential treatment to their associated States. The prospects for immediate concessions on these products are undoubtedly slight. For products such as sugar and vegetable oils, the Six are expected to follow a policy aimed at protecting either domestic interests or the interests of their African associates. Their reluctance to make concessions on vegetable oils is evident in the negotiations with Nigeria, despite the fact that for political reasons the Six would like these negotiations to succeed.

The final group of products for which India has requested tariff concessions includes her non-traditional exports of manufactured goods—light machinery, diesel engines, household equipment, etcetera. For such items a preferential suspension of the common external tariff was suggested in January, although with the failure of the industrialised countries to agree in Geneva to the creation of new preferential arrangements in favour of developing countries this solution is not feasible for the time being. It is not easy to find an alternative solution, however. A system of preferential quotas has been suggested, and may prove to be the only practical alternative. The Six have so far refused to consider a partial reduction of their tariffs on manufactured products on the grounds that it would only benefit other industrialised countries, especially Japan.

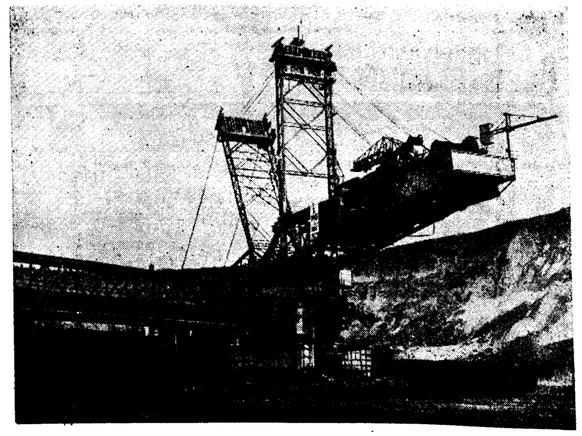


The two Indian memoranda also proposed a comparative study of tariffs on such traditional Indian exports as jute and coir products and their substitutes, paper and plastic in the one case and floor coverings in general in the other. Both the Indian products suffer from a tariff disadvantage in the sense that the tariffs on their substitutes are often substantially lower. At the same time, India has suggested an exchange of views on such problems as the supply of raw materials, principally mineral ores, to industries established in the E.E.C., preferential access for goods manufactured in India from raw materials imported from the E.E.C., and technical and financial assistance in production and marketing.

No Formal Reply

There has been no formal reply from the Commission to the *note verbale* of September, and it is clear that no decision can be expected before 1965. Much of the Indian effort has been directed at keeping India's problems constantly before the Commission, for it is recognised in official circles in Brussels that no action is likely in the near future on the Indian memoranda. It is not merely a question of lack of time on the part of the Six. After all, negotiations are going on with several other countries, and it is planned to hold talks at the level of experts with Yugoslavia at the latter's request. Some Community officials have suggested that the Six may agree to talks with India once discussion with Japan has started. Despite the obvious differences between the two countries, it is argued that the same formula—tariff quotas—may prove feasible in both cases.

In view of the severity of the present crisis within the E.E.C., it is extremely unlikely that the member-States will want to embark on any fresh ventures in the immediate future. The crisis—the gravest with which the Six have been confronted so far—has arisen over the French refusal to continue to participate in the work of the E.E.C. unless there is agreement on a broad range of agricultural problems, including the adoption of a uniform cereal price. The crisis is political as much as economic, however; it relates not only to the E.E.C. but also—and perhaps even principally—to the entire western alliance.



It must be remembered that for the French President the European Common Market is simply the first stage on the road to the political union of western Europe. The Franco-German alliance—intended as the cornerstone of this union—lost much of its significance with the departure from the political scene of Dr. Adenauer. His successor's readiness to accept the American proposals for a multilateral nuclear force is regarded by General de Gaulle as a betrayal of the principles enshrined in the Franco-German treaty. In order to prevent the emergence of a Washington-London-Bonn axis, the General has threatened to withdraw France from the E.E.C. unless the Germans accept the agricultural agreements for which he is pressing, and from N.A.T.O. unless the German and other European Governments abandon their plans to join the United States in setting up a multilateral nuclear force.

Assembly line in a French motor-car plant

Under such circumstances, bilateral negotiations with the E.E.C. are doomed from the start. Not until the present crisis has been resolved are the Six likely to be in a position to consider the numerous proposals outlined in the Indian memoranda. The alternative, of course, is to try to secure concessions through multilateral negotiations, such as those going on at present in the G.A.T.T. and familiarly known as the Kennedy round. (These negotiations are likely to suffer also as long as the E.E.C. is divided by internal disputes.) Moreover, multilateral negotiations can be as frustrating as bilateral—and even more time-consuming.

The solutions that India has proposed in its memoranda to the Six are inevitably among those which it has either proposed or supported in the G.A.T.T. and the U.N. Conference on Trade and Development. This is inevitable, for multilateral negotiations may be regarded as the extension of bilateral. The close connection between the two is perhaps best

emonstrated in relation to the ndian demand for preferential tariffs vhich, although it was made to the ix also, has been pressed mainly in he multilateral forums offered by the vorld trade conference and the .A.T.T. (where India has been supported, as for the principle at any ate, by the E.E.C.)

Principal Obstacle

The General Agreement, in its present form, is perhaps the principal egal obstacle to the creation of new preferences (except in connection with a free trade area or a Customs nion). The G.A.T.T. is based on the principle of non-discrimination, of which the corollary is the most-favoured-nation clause. What this means in practice is that any tariff concession offered by one contracting party to another must be extended to all other contracting parties. It is the application of this principle which will ensure that the developing contracting parties enjoy the tariff reductions which the industrialised eventually extend to one another during the Kennedy round. (It is likewise this principle which requires the Six to extend to all contracting parties any tariff suspensions they may grant India.)

India and the other developing countries have argued that in practice the principle of non-discrimination favours the economically strong at the expense of the weak. They have, therefore, been pressing for discriminatory treatment for developing countries—that is, for the removal of the restrictions on preferential arrangements, at least between industrialised and developing countries. A Group on Preferences was set up last year, and it eventually succeeded in drafting a clause which would make it possible for the industrialised contracting parties to extend preferences to the developing.

Although the Six have supported the proposed amendment to the General Agreement, its adoption has so far proved impossible because of the opposition of a handful of the industrialised contracting parties, the most important of which is the United States. While American opposition to preferential systems has its roots in the commercial history of the country, it is both economic as well as political in nature. Economically, the Americans feel that non-discriminatory tariff reductions, such as those envisaged under the Kennedy round, offer the developing countries the most scope for expanding their exports to the industrialised. Politically they maintain that the extension of preferences by industrialised to developing countries implies political links which, if acceptable in an earlier period, have no justification in the world of today.

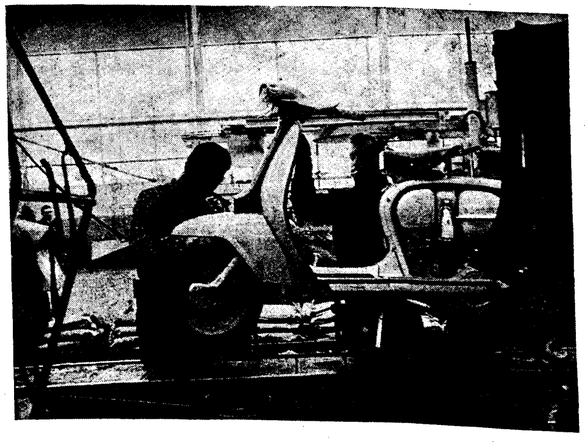
The Special Session of the G.A.T.T. is unlikely to modify the General Agreement to admit preferential arrangements—even by treating them as temporary exceptions to the most-favoured-nation rule. The Group on Preferences, in fact, suspended its work indefinitely when it became clear that no compromise was possible. It is interesting to note, however, that during the opening session of the Kennedy round in May 1964, Mr. K. B. Lall, the leader of the Indian delegation, unsuccessfully tried to secure preferential treatment from the industrialised contracting parties by avoiding the use of the term "preferences."

Mr. Lall took as his point of departure the American claim that the Kennedy round will benefit both industrialised and developing countries alike. He pointed out that the negotiations would take considerable time, whereas the need for urgent action to solve the economic problems of the developing countries was widely recognised. He, therefore, urged the United States and other industrialised participants in the Kennedy round to extend the benefits of the projected 50-percent tariff reduction to the developing countries without waiting for the conclusion of the negotiations.

The failure of the developing contracting parties to secure preferences under the G.A.T.T. does not mean that all efforts will have to be abandoned for the time being. The fact is that a parallel struggle to secure preferential treatment was initiated in the U.N. Conference on Trade and Development, and is being continued in the special committee set up by the U.N. Secretary-General, U Thant, at the recommendation of the Conference.

From the Indian point of view, preferences are of importance only in relation to semi-manufactured and manufactured products; in the case of raw materials and primary commodities India has been pressing—along with other developing countries—for the complete elimination of all tariff and non-tariff restrictions, This is the basis of the Action Programme prepared by 18 developing countries and adopted by the G.A.T.T. ministerial session in 1963; and it is expected that it will be embodied in the model chapter to be incorporated into the General Agreement. Consequently, when India presented her proposal for preferential tariffs at the U.N. Conference, she did so in the second committee, which was concerned with the trade in manufactures and semi-manufactures.

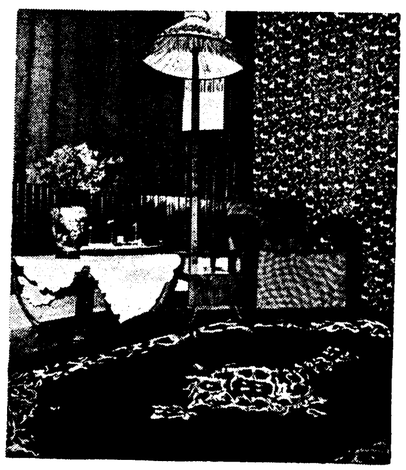
Two Main Proposals



Interestingly enough, the two main proposals for preferential arrangements before the second committee were submitted by India, on the one hand, and Belgium on the other. The Indian proposal called on industrialised countries to modify their tariff structure so as to "provide for import duties on products imported from developing countries, which are not accorded duty-free treatment, to be reduced by a minimum of 50-percent of the m-f-n rate." It stipulated that the preferential treatment should be extended uniformly and in a non-discriminatory manner to all developing countries for a period of at least ten years.

The Belgian proposals, which were supported by the other members of the E.E.C., although they were presented on behalf of Belgium alone, provided for preferences to be granted by industrialised countries to developing on a selective, temporary and degressive basis. Under the Belgian plan, preferences would be extended only to countries that asked for them and only for products which had been approved by a committee on which both industrialised and developing countries were represented. The committee would also determine the size of the preference and its duration. Such preferences would be degressive in the sense that they would be gradually reduced during the period for which they were granted.

The Belgian proposals obviously appealed strongly to a number of the economically weaker developing countries. They were criticised by India's representative. He pointed out that experience had shown that product-by-product negotiations are time-consuming and generally unsatisfactory, and suggested that the conference adopt instead "a scheme of general preferences . . . providing in special cases for individual exceptions from the rule of preference." He also held that degressive preferences were contrary to the widely accepted principle of trade liberalisation.



The developing countries that had initially opposed the Indian proposal for generalised preferences were persuaded to support it after it was made clear to them that their needs would be met by "special measures, particularly in the field of financial and technical assistance." The result was that the demand for generalised preferences was soon supported by all the developing countries and by a number of the industrialised, including the U.K. The United States, however, refused to accept either proposal, and in the end forced the developing countries to accept a compromise under which the U.N. Secretary-General would appoint a committee to re-examine the entire question.

If there is any lesson to be drawn from the Indian experience, with the Six as well as within the multilateral framework of the G.A.T.T. and the U.N. trade conference, it is that trade negotiations proceed slowly, and that in the last analysis concessions are not made on the basis of altruism but in return for real or imagined benefits. Consequently, India has tried to demonstrate to the E.E.C. that the expansion of her exports to the Community will make it possible for her both to increase her imports and to service the debt she has already contracted. In the multilateral forums, India has tried to show that the same principles are valid whether applied multilaterally or bilaterally. However, even when the argument carries conviction, its translation into action may still be far off.

STRENGTHENING COMMONWEALTH RELATIONS THROUGH CONSTITUTIONAL LINKS

The Commonwealth is an association of free nations. Its economic ties are strong. The political bond could be strengthened through constitutional links such as a Commonwealth Privy Council.

By
A SPECIAL CORRESPONDENT

As a welcome sequel to the success of the last Commonwealth Prime Ministers' Conference, even the Astor-owned *Times* and *Sunday Observer*—hitherto dedicated to the U.K.'s political and economic integration with continental Europe—now admit that the Commonwealth embodies a greater economic and political "potential" than its critics have hitherto realised. Both national parties, *The Times* now affirms, are "Commonwealth Parties", and that at least is a step forward. As a politico-economic group, covering four continents, the Commonwealth, if well organised, offers wider scope for economic development than any alternative combination in the non-communist world. It has a moral, as well as material, appeal.

No other group is making a comparable contribution to the extension and development of parliamentary democracy. India—the most populous market in the non-communist world—is also the world's largest, and not the least stable, parliamentary democracy. It is too early to condemn the new African States, all less than a decade old, for immaturities not unnatural at this early period in their experience of responsible Government. Mr. Macmillan's attempt to take the U.K. into the European Common Market included one domestic objective, none the less impelling, although not publicly avowed. Inclusion of U.K. industry in a continental confederation, based predominantly on a commercial foundation, would have rendered it immune, at any rate for many years to come, from further nationalisation by placing it firmly and irrevocably on an international basis. The industrial egg, once scrambled, would have been extremely difficult to reintegrate. Another five years of Tory Government would probably have achieved that aim, and forced the Labour Party to seek an alternative philosophy and programme.

The aim was high, but so was the price—much too high. There are alternative ways of defeating or sterilising the form of creeping economic paralysis typified by bureaucratic socialism. The surest way to perpetuate and reinforce current prosperity would be to mobilise the political, economic, and financial resources of the welfare State to develop, step by step, a welfare Commonwealth. That is not a political day-dream. A Commonwealth decade of development depends for its success only on vigorous leadership.

Forms of Aid

The financial aspect is as important as the technical. American aid, on an 80-percent buy-American basis, is leading, *via* price inflation, to debt inflation and cumulative exchange difficulties which are now slowing down progress. Mechanical aid, in the form of peasant tractors, would avoid all three objections. Disused arsenals, aircraft factories, etcetera, could all be turned over to participation in the "war against want." An upsurge in agricultural productivity would underpin industries in the new Commonwealth States which are now forced to seek overseas markets because their own vast rural populations are, for the most part, unable to buy sufficient food, much less sufficient clothing, and other normal amenities. The weekly pay-packet of British workers exceeds the yearly income of an overwhelming majority of the 650 million citizens in the Commonwealth.

U.K. industry is being mobilised to reinforce mechanisation and chemicalisation of the communist *bloc* farms—with the active credit-support of the U.K. Government. The Government should apply at least equal energy and resources to stepping up Commonwealth farm productivity. The potential loss to U.K. exports ascribed to exclusion from the Common Market, has no economic warrant. Industrial production has never been more mobile and migratory. If any major exporting industry is unable to leap fiscal hurdles, tariff and non-tariff, it establishes branch factories on the right side of them. Some have done so; more will do so. A branch factory in Europe facilitates land-contact with 250 million or more potential buyers. Branch factories in Europe export employment, hoping to import dividends. U.K. industries are participating in local manufacture in every important Commonwealth country, helping to meet not only domestic demands, but export demands. Such industries would not have survived if the Beaverbrook dream of Empire Free Trade had crystallised. Political slogans rarely reflect sound economies whatever their origin or purpose. As the new chairman of a Commonwealth Economic Assessment Committee might discover, a programme of mutual aid, intelligently devised and applied, would show that the new Commonwealth countries offer U.K. industry the most lucrative "growth potential" accessible in the non-communist world.

Development Programme

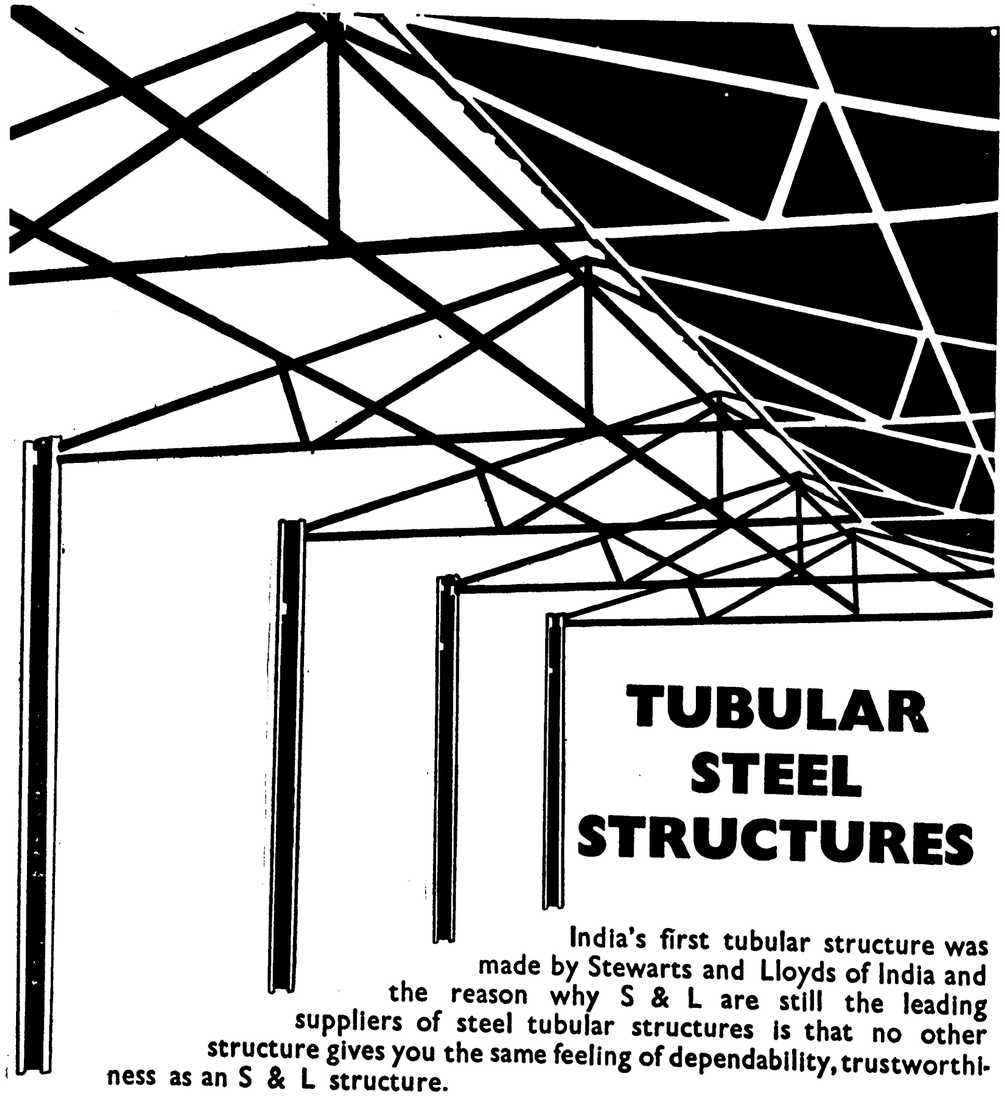
The Common Market will not be neglected, but Commonwealth development programmes should go ahead concurrently. National development bonds are becoming productive. Local authority bonds are popular. Commonwealth development bonds, operating as export development bonds, are equally essential. The European and Commonwealth markets are complementary, not mutually exclusive.

Either the Commonwealth must draw closer together or, inevitably, it will drift further apart. The Suez misadventure almost dispersed it under the Eden Ministry. The Common Market misadventure only failed to do so because of the Gaullist veto. At this juncture—excluded from Europe—Britain retains the opportunity to regain Commonwealth leadership. Nostalgic imperialism in some circles has been succeeded by nostalgic Europeanism. There is no conceivable electoral or economic profitability in either mood.

Political Reconciliation

Those who prefer to look forward rather than backward, regard the creation of the new Commonwealth States—all voluntary members of the Commonwealth club—as Britain's "finest hour", constituting, as the Indian President said a few months ago, the "greatest act of political reconciliation in human history." Analogously, the Burmese Secretary-General of the U.N.O. described the new Commonwealth as "one of the noblest chapters in human history". Then why deplore as a calamitous defeat the completion of the political task all British political parties were pledged, irrevocably, to achieve?

In the British imperial record, there have been no Congos, no Algerias, no Abyssinias, nor, today, are there Cubas. The new Commonwealth States remain under the Crown because they are equally free to retain or abandon allegiance. The members pursue the same political ideals even though at varying paces, and perchance, with varying degrees of sincerity. There are dictatorships in the Commonwealth; but there are far more in Europe, and of older duration. There are more genuine parliamentary democracies inside the Commonwealth than beyond. All the new Commonwealth States, it is too often forgotten, are of postwar vintage. With 17 years of independence, India, the most mature, is nevertheless only of political under-graduate status. Some of the new African States are learning to walk, others have hardly reached that stage of growth and rank as kindergarten kids. Since when have mothers rebuked their offspring for lacking their own maturity of deportment and judgment? And why should the Mother of Parliaments show less tolerance and understanding than mothers of lesser experience and stature?



Closer economic links between Commonwealth units will, almost inevitably, lead to closer political links, leaving the political independence of all members completely intact. Commonwealth political links, enfeebled by decolonialisation, could be reinforced, on the new Commonwealth foundations, by placing the U.K. Privy Council on a fully Commonwealth basis, raising all Commonwealth Cabinet Ministers to that proud status (Right Honourables).

New Ministry Needed

The first step should be the supersession of the obsolete Commonwealth and Colonial Departments by a Commonwealth Economic Development Ministry focussed on economic problems alone. That transformation would facilitate concentration in the Foreign Office of all complementary functions including diplomatic relations. In that event as representatives of sovereign States, Commonwealth High Commissioners in London and other Commonwealth capitals should blossom into Commonwealth Ambassadors, adding diplomatic equality to political equality.

As members of a Commonwealth Privy Council, Commonwealth Cabinet Ministers would acquire constitutional contacts now wholly lacking. At this juncture such a link, wholly consultative even though Constitutional, might well prove mutually advantageous as between India and Pakistan in relation both to Kashmir and less explosive problems. At present—without such a constitutional link—meetings between Indian and Pakistani Ministers are ad hoc, and not always easy to arrange. Creation of a Commonwealth Privy Council would make contacts routine, and all the more fruitful for that reason. At this stage, Commonwealth Conferences are mostly limited to the Prime Minister level, and at varying intervals. A Commonwealth Privy Council would facilitate, and therefore encourage, recurring consultations at lower levels—among all Finance Ministers, perhaps linked in a Commonwealth Investment Council; among Foreign Secretaries; Education Ministers; Commerce Ministers, and so forth. No prior or post-commitment would necessarily be involved, but consultations might well promote prevision, and avoid policy clashes thereby: as, for instance, exemplified by the Suez and Common Market deadlocks, which a Commonwealth Privy Council would almost certainly have averted.

Another consultative link would also be opportune. The House of Lords might well gain additional prestige and value by developing into a Commonwealth Senate, using the new device of life peerages to promote that aim. If an Indian Peer, why not a Pakistani Peer? As there are Life Peeresses, who would be more welcome, and helpful, than Mrs. Pandit, who, as High Commissioner, President of the U.N.O. and in other high offices, has displayed competence and charm in equal measure. It might well be that if President Nkrumah agreed to become the voice of African nationalism in Westminster, the people of Ghana might have the opportunity to gain experience in the difficult art of parliamentary government. The experiment might prove enlightening.

TUBULAR STEEL STRUCTURES

India's first tubular structure was made by Stewarts and Lloyds of India and the reason why S & L are still the leading suppliers of steel tubular structures is that no other structure gives you the same feeling of dependability, trustworthiness as an S & L structure.

All S & L roofing structures are delivered complete in every respect with trusses, purlins, columns, hook bolts for roofing and all necessary studs, nuts and washers.

Write today for your requirement of these sturdy and dependable tubular steel structures.

A British Venture To Keep Abreast Of What is New

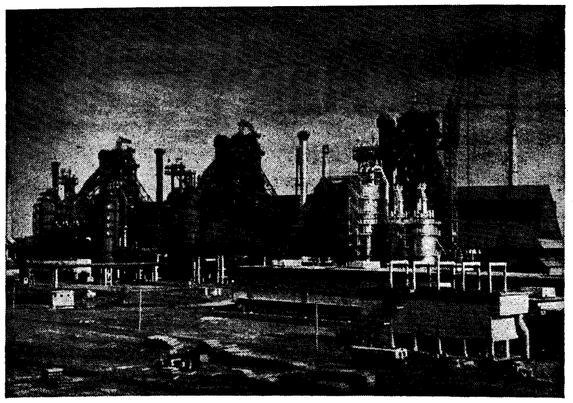
By
OUR LONDON CORRESPONDENT

NOT far from London's Victoria rail terminal, there is a small office staffed by no more than 20 people who face a formidable task. They aim to collect, summarise, file and make available to industry details of all new products, all current development, all research. Seeing that the office came into being as recently as last April, the use of *all* is perhaps rather optimistic, at least at this stage, but there is no doubt that already, in the course of a few months, considerable progress has been made. It has written, or is in the course of writing, to every manufacturer who employs 20 or more people in the world asking for details of his new products, or the latest modifications to old ones, which the office undertakes to publicise free of charge.

In addition to this, it is establishing communications with universities and research bodies throughout the world asking for details of non-embargoed current research and development. Every report, abstract or bulletin, will be processed, put on to punched cards and incorporated in the monthly journal which the firm publishes. All this activity, of course, takes place behind the scenes. It takes a more tangible form in the New Product Centre, offering display facilities for the products themselves, and the Centre's monthly journal *New Products International*, which classifies condensed details of new products, processes, developments and research in an attractive form which proves easy to understand and, what is even more important, easy to use by those seeking information.

The Centre is run by a new company called Industrial Opportunities Ltd, for which the financial backing has been provided by Technical Development Capital Ltd, in which 41 insurance companies, merchant banks and investment trusts are shareholders, including Eagle Star, Legal and General, Prudential, Hambros and S. G. Warburg, among others. Sir John Benn, chairman of the United Kingdom Provident Institution, is chairman of Technical Development Capital, which was set up to provide risk capital to accelerate technical development on the lines suggested by the Radcliffe Report, but without any Government subsidies. T.D.C. has offices at 7, Copthall Avenue, London, E.C.2, the headquarters of Industrial and Commercial Finance Corporation, who act as secretaries to the Company. Because the New Product Centre will deal with projects which, in some cases, will require finance for their development, opportunities should arise in which its association with T.D.C. will be of advantage to all parties concerned.

New Product Centre



Essentially, the New Product Centre consists of (1) a filing system, (2) a means of providing information in "nutshell" form, (3) a library, (4) a "referral" service, and (5) display facilities for new products. The filing system has been started as a relatively simple lateral lay-out indexed according to the Europen Convention on the International Classification of Patents for Invention (this classification is used throughout the Centre and in the journal). It is controlled by a card index system which enables the Centre staff to locate by (a) class of product, (b) country of origin, (c) date of introduction. Ultimately, consideration will be given to changing over to a digital computer system.

The means of providing information in a nutshell form is represented by the journal itself. The library, which is also controlled by the card index system, contains relevant books, journals, papers and reports. It will be instantly apparent where documents not filed there can be obtained. This represents the essence of the "referral" method, which is the Centre's speciality. There will undoubtedly be many problems to which the Centre will not be able to provide an immediate solution. They claim, however, to know the most likely source of a solution to an industrial problem, especially those concerned with new products and processes, patents, manufacturing under licence, and disclosed research and development.

The Centre is Britain's first and indeed only industrial intelligence bureau, and that it meets a real need is evident from the fact that although it has been in existence for only a few months already well over 100 of Britain's top industrial companies are full subscribers, and even a larger number subscribe only to *New Products International*. Interest is fast developing both in the Commonwealth (members from which enjoy the same terms as those from Britain) and foreign countries. Full membership costs only 25 guineas a year, while the journal subscription is only 10 guineas a year.

Flow of Information

Information about new products and processes is reaching the New Product Centre at an ever-increasing rate. This is reflected in the steady expansion in the volume of the journal. The third issue of *New Products International* contained 10 percent more items than the first, and it is anticipated that this rate of increase will continue for some months to come. Already some 250 items of information are being dealt with each month. There is, of course, a good deal of wastage. Some "new" devices may be merely slightly modified versions of older products.

The blast furnaces in a State steel plant

What is a new product? It is a difficult question to answer. The Centre's definition is arbitrary, and also fluid. "A new product is a product which in our opinion is new to a market", they say. For instance, a product which is new to the French market, but old to the British, would be regarded as new (to satisfy French subscribers), but the washing powder in an exciting new dispenser would not be new, unless the brand had a new ingredient in it. Significant modifications are regarded as new, since by and large development inches forward with modification after modification and only occasionally do the Whittles and Flemings burst on the firmament.

The Centre's aim is to assemble in one package details of every genuinely new product and process marketed anywhere in the world. It also aims to supply a subscriber with details of products, processes, current research and development under any of the many classifications employed in summarised form or by referral to chapter and verse. The card index system which has been set up in the Centre, although still short on "memory", really works. It has proved more flexible than was first expected, and without elaborate cross-indexing. Queries in any particular field of manufacture can be simply and quickly "pre-screened" for possible reference to other fields. For example, a query on the spraying of crops raises possibilities in the internal-combustion engine, plastics and aircraft fields. This is not quite to suggest that the seeker after diversification may enter with crop spraying on his mind, but depart with the documentation necessary to enable him to launch into the plastics field, but, on a less dramatic level, this sort of thing does happen and has happened.

Answering Questions

A question which many visitors to the Centre have asked is: "Why should I be interested in a journal covering the whole spectrum of industry?" The answer lies in the fact that today we live in a world of specialists with little or no communication with the specialists in other fields than their own. Since an idea in one field so often has implications and applications for another, a journal such as *New Products International* serves as a catalyst or cross-fertilising agent. As a management journal it is surely essential reading for managing directors in small and medium firms, and technical directors, general managers and new product managers in larger companies. As the central processor of information (published in condensed form in the journal), the New Product Centre offers an invaluable service to top executives throughout industry.

Suppose a manufacturer is looking for a new product to produce under licence. The journal can offer him a wide variety from which to choose and the Centre can tell him how best to go about it. Perhaps he is looking for associated fields into which to diversify. Once again the journal gives him ample scope for selection. He may be seeking sub-contract work, and once again the journal can give him leads; or some one is requiring new lines to make his selling operation more profitable, so the journal provides the contacts.

Suppose an import-export agent is seeking new lines. Then *New Products International* summarises for him the products displayed at many more trade fairs than he can possibly visit himself, while also bringing him in summarised form a range of products he could match only by subscribing to at least a hundred journals. Or he may be anxious to find products to buy to make his own research, testing, production or administration more efficient. Then the Centre journal keeps him abreast of all the latest developments throughout industry.

'BEHAR' the dependable name in FIRECLAY & SILICA *Refractories* for nearly half a century

"BEHAR" REFRACTORIES are being used by leading Iron & Steel Works, Cement & Glass Factories, Tea Industry, Sugar & Cotton Mills and other industries in the country.

Our manufacturing range includes

SILICA BRICKS • FIRE-BRICKS • HIGH ALUMINA BRICKS • INSULATING BRICKS • FIRECLAY • FIRE CEMENT • STOPPERS • SLEEVES • NOZZLES • TUYERS, ETC.

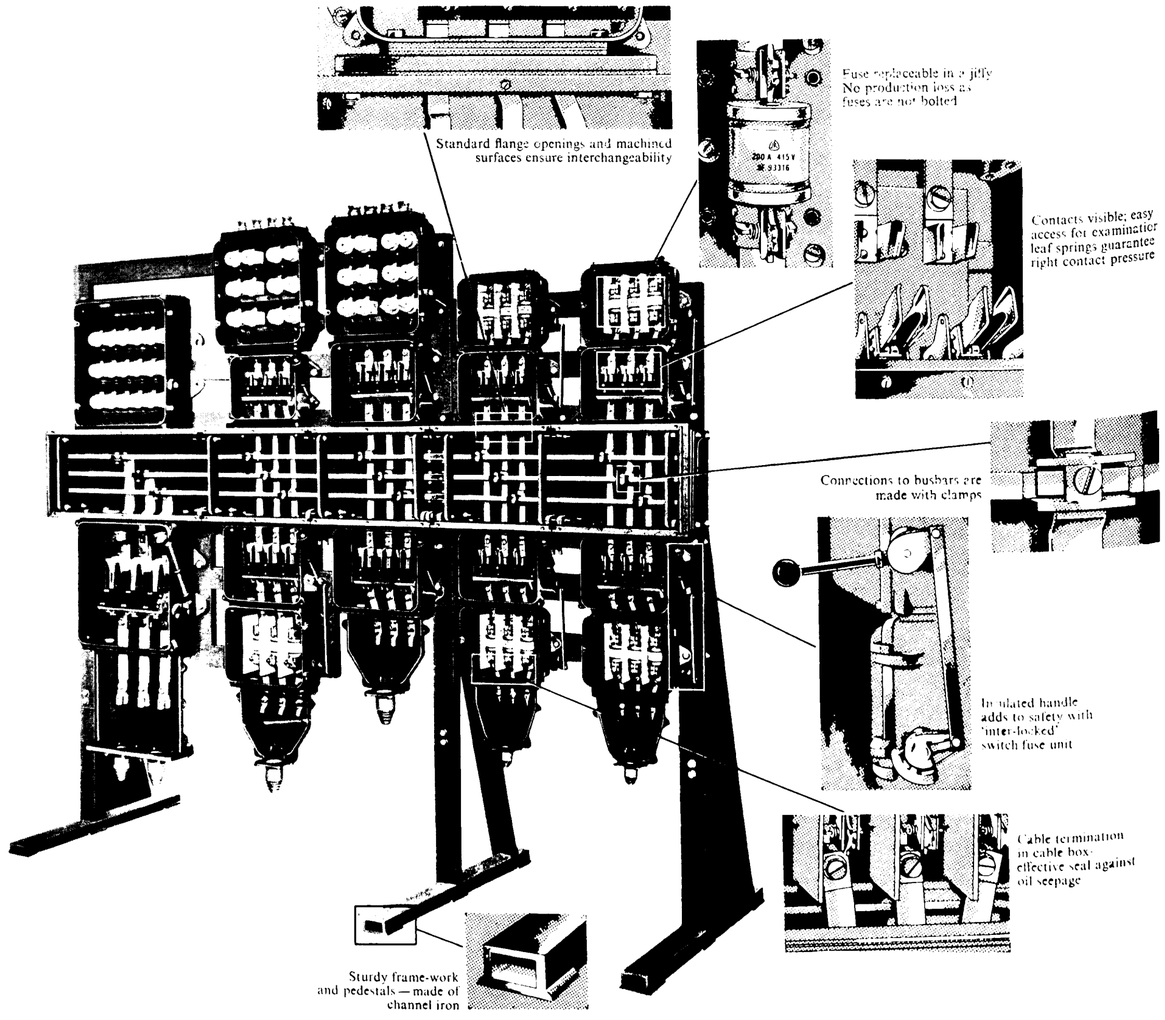
FANNING OUT TO RELIEVE THE STRAIN ON INDUSTRY

The history of Calcutta Fan, pioneers in the field of industrial ventilation, is a mirror of their growing contribution to the industrial progress of India. The best of INDIGENOUS SKILL AND RESOURCES were harnessed by Calcutta Fan Engineers to solve diverse problems of industrial ventilation—at Barauni, Durgapur, Rourkela, Belpahar, Jamshedpur, Hirakud, Perambur, Alwaye, Trichinapalli, Bangalore, Bhadravati etc. The wide range of Calcutta Fans so superior in design and performance can relieve the strain on any industry.

CALCUTTA FAN WORKS PRIVATE LTD CALCUTTA 16

THE TEST OF QUALITY



At any time, in any place, since the emergence of competitive enterprise, the quality of a product—tested continuously by that most critical of critics, the consumer—has made or marred the manufacturer's reputation. And a product, once firmly established by virtue of its Quality, is difficult to dislodge even in the intense price market of India, if that Quality is steadily maintained.

For more than a decade, Sen-Raleigh has been increasing its production of the well-known Raleigh, Rudge, Humber and Robin Hood bicycles. Yet their demand seems to be insatiable.

Sen-Raleigh manufactures, in addition to these bicycles, quality Union components and Wittkop saddles.

What every engineer should insist on — in Switchboard DESIGN

In evaluating a switchboard, some features are of greater importance than others, depending on the environment in which it has to function. What are these features? Can you recognise them?

Totally enclosed design: In almost any industry, dust, like corrosion, is a very serious problem. To keep dust out, every unit has to be made to seal like an oyster-shell. Research has revealed that only a carefully machined, rigid, cast-iron clad enclosure, lined with rubber gasket, effectively resists dust, vermin and moisture.

Interchangeability: All components should have standard flange openings and machined surfaces; only then can they be inter-changed.

Flexibility: It should be easy to extend the switchboard at site, when you want to. This is possible only if the busbar chamber has standard end openings.

Maintenance: Must be judged largely by your ready access to busbars and easy examination of contacts.

Safety: A dented cover of a unit not only fails to keep dust, vermin and moisture out but could become a source of great danger without your knowing it. So value every safety feature in the design, the rigid sturdy shell, interlocking system, and insulated handles.

Carefully examine all these features listed here against your own specific needs.

LT-LK switchboards, like LT-LK motor starters, have secured in so short a time, the highest sales in the country. Take another look at the features and you will know just why!

Switchgear Division LT LK **LARSEN & TOUBRO LIMITED**

FILMS IN INDUSTRY AND EXPORT PROMOTION

From being a medium of entertainment, films are fast becoming a means of industrial education. They also play a valuable role in export promotion.

By HUBERT E. WOUTERS

THE film is too often regarded solely from the point of view of its value as a medium of entertainment. It has other uses, and especially to industry as a whole, which call for wider appreciation. For instance, its use as a means of education offers opportunities for training apprentices or new employees, familiarising employees with new techniques, and not least in advancing the safety and comfort of workers. In this same field the film can do marvels in maintaining communications between management and labour and fostering better relations. But most important of all, perhaps, is the wonderful job the film can play in promoting sales of industrial products, especially in foreign countries.

It is possible to draw on the experience of British industry to illustrate just what facilities the film has to offer. So far as the use of films to communicate within organisations is concerned, Dr. Beeching, chairman of British Railways, and Sir Richard Costain, chairman of Richard Costain Ltd, the civil engineering contractors who work on projects all over the world, recently described to a meeting jointly organised by the British Industrial Film Association and the British Institute of Management, the communications problems met with in their very different circumstances and how they used films to help solve them.

Sir Richard explained that the problem of external communication for a rapidly growing organisation, even when faced with increased competition in the international market, is a comparatively straightforward one. Much more difficult is the problem of internal communication, for staffs of successful organisations tend to be overtaken by the increasing size and complexity of events. In the case of senior management it is essential that they be kept fully informed of the latest developments if they are to continue to be interested and efficient—yet the difficulty of doing this increases in proportion to the complexity of the information to be communicated. To give an example, Costain, as well as other major contractors, have adopted a method of planning sequential operations, based on a system evolved by contractors engaged on the American polaris project. Known in Britain as the "network analysis" or "critical path", the planning system is rather complicated and difficult to explain in writing. To ensure that Costain's technical and executive management fully understood the implications and operation of the system, a 15-minute film was made to put across the basic idea.

Aid to Education

The film, *Critical Path*, is a straightforward example of the power of the audiovisual media to explain and promote understanding of unfamiliar concepts. As there is considerable interest in the "critical path" system throughout industry—and as the film is the only one designed for British needs—Costain has made it available to industry through the Central Film Library, a Government operated organisation. Altogether 150 copies of the film are in use.

Discussing the reasons why film should be so effective in communicating with management, Sir Richard said that he would not suggest that film was at all times the only, or the best, method of communication, but it did possess a personal element which made it of tremendous value when both sponsors and producers clearly understood the jobs the films were intended to do and the type of audience for whom they were made.

This was also the theme of Dr. Beeching's remarks. He explained that probably no organisation in the country had a more difficult communications job than British Railways. There was not only the problem of explaining the changed rôle of the railways to the staff and the public, but there was also the task of overcoming a tremendous emotional resistance to change necessary before people would be reconciled to accept the ideas, no matter how well they might be understood. He used films to appeal to reason in such a way as to penetrate the emotional barrier and he thought they achieved the dual task because they created atmosphere, whilst presenting facts which themselves were seen in their appropriate environment.

The ability of film to carry audiences into the world created by it and participate in the situations presented in the film, is well exploited by entertainment film producers. In management communications this participation is particularly important when both emotion and reason are involved but, even when emotional resistance is small, the power of film to cause participation is very valuable. Dr. Beeching explained that in training drivers for the new electric trains some had to be retrained after long experience with steam or diesel and some were new men. Training took the form of lectures, wall-charts, diagrams, models and, most important, practical experience on the track. For many reasons it was essential to shorten the period of learner driving as much as possible—and this had been achieved by using films which enable the trainee to imagine himself at the controls and to experience in the world of the film, the actual sensation of driving. In a similar way passenger airlines train pilots to become familiar with landing on unfamiliar airfields by means of a pilot's-eye film technique, perfected by British Overseas Airways.

Use in British Railways

Dr. Beeching went on to describe his problems in presenting his plan for reshaping British Railways, to his employees as well as the public. As in the case of the *Critical Path* and the driving technique, there was a complicated story to tell, with much factual information leading to conclusions which were not likely to be accepted immediately by either the railway staff or the public. It was necessary, therefore, that the story should be presented in such a way as to draw people into realisation of the problems which confronted the Railway Board—and the people themselves—as managers, employees, users and owners of a nationalised railway system. The means of telling such a story had to be a film, which was considered to be "a much better medium than the written word lying cold on a page, with parts of the problem necessarily separated for the sake of clarity and with every opportunity for the biased reader to pick and choose."

A film, titled *Reshaping British Railways*, was made, not only to introduce the plan to the public on television, but also for special showings to B. R. staff throughout the country. In one month over 100,000 employees were reached in public cinemas hired in mornings, in halls and meeting places by mobile projectors, in mobile cinemas and even railway cinema coaches pulled into remote stations. (This was probably the first time that audiovisual means had been used in a major rôle to present an official report to the nation—but it was followed very closely by the Ministry of Transport, when it released the Buchanan Report on film to explain the implications of the report through *Traffic in Towns.)*

In explaining why filmed reports are successful, Dr. Beeching said, "the difference between a viable transport link and a non-viable one is essentially a matter of how much movement there is and how fast and efficient it is. What better medium to demonstrate this than the moving picture? Films have the advantage, too, of being able to use animated diagrams, of conjuring up history from the past and sometimes of anticipating the future. They can condense time and space. All these things help to enlarge the reality of the arguments to be presented."

Courtesy Drive

Discussing the need to maintain good relations between railway staff and the public, Dr. Beeching said that, as railway employees were in a job where there was no escape from human relationships, they might as well enjoy some of the real satisfaction and pleasure there is to be got out of them.

To achieve this, he used film. *Courtesy* is a film which looks at the situation and contains enough controversial material to stimulate discussion. "The film will be shown to station staff who will then be asked to comment. Previous experience shows that there will be plenty to say and plenty of disagreement about the points the film raises. The more, the better, for what is important is that because of its power to highlight living situations into which the audience is drawn, the film can make staff argue about things that they regard only with apathy when they come across them in their daily work. Emotion has been brought in."

What is so significant about the Costain and Beeching demonstrations was not so much what they said and showed, because for many years communications specialists have used the same arguments, backed up by practical examples. The significance is the level at which these arguments were expressed. In general, leaders of industry are concerned with broad policies, not so much with the techniques through which the policies are carried out, and for two men representative of the "new" type of industrial executive to recommend motion pictures as an essential and highly effective means of management communication marks an important step forward in our appreciation of communication technique.

In Dr. Beeching's own words, "In all our films, because we are often dealing with delicate things like building an emotional climate, we find that we need a high standard of

RAISING EXPORTS TO AVOID PAYMENTS DEFICIT IN FOURTH PLAN

India's foreign exchange reserves are extremely inadequate in relation to her payments deficit. Since non-essential imports have already been drastically cut, exports need to be sharply increased in order to avoid a sizable payments deficit in the fourth plan.

By

R. L. VARSHNEY

INDIA'S imports have sharply risen during the first three years of the third plan, having increased from Rs. 1,006 crores in 1961-62 to Rs. 1,091 crores in 1962-63 and to Rs. 1,230 crores in 1963-64. The rate of increase in imports in 1963-64 at 13 percent is higher than the 8-percent increase in world imports and also the 10-percent increase in imports of industrial countries witnessed in 1963.

India's exports have also shown a steady increase and, in fact, reached the record level of Rs. 802 crores in 1963-64. This increase was mainly due to a general rise in world exports which increased at the rate of 8.5 percent in 1963, against 6 percent in 1962, although a part of this increase was also due to better arrangements for reporting the data. However, the increase in exports was less than the rise in imports with the result that the import surplus showed a continuous increase from Rs. 338 crores in 1961-62 to Rs. 429 crores in 1963-64.

As India's sterling balances had been reduced to an irreducible minimum by the end of the second plan, the heavy import surplus during the first three years of the third plan has been mainly financed by external assistance, the amount actually used to finance the balance of payments deficit being Rs. 1,314 crores (Rs. 202 crores by way of grants and Rs. 1,112 crores by way of loans).

The factors responsible for an enormous increase in imports have been (i) a high tempo of developmental activity resulting in large-scale imports of capital goods and other producer goods (total imports of capital goods, both on private and Government accounts, have been rising continuously for the last few years and in 1963-64, they accounted for nearly one-half of the total import bill), (ii) a sharp increase in food imports due to the continued shortage of food caused by a virtual stagnation in foodgrains production, (iii) increasing maintenance requirements of the developing Indian economy, (iv) substantial increase in imports for defence purposes, and (v) an increase in import prices specially in the case of machinery and transport equipment.

Virtual Stagnation in Exports

On the other hand, India's exports have been sluggish and stagnant and have failed to share in the growth of world trade. Despite the significant increase in world trade during the decade 1951-60 both in terms of value (by 55 percent) and volume (by 62 percent), India's share of world exports fell from slightly less than 2 percent in 1951 to about 1 percent in 1960. The proportion of exports to gross national product has also declined from 5.4 percent in 1951-53 to 4 percent in 1958-60. Export earnings financed 85 percent of India's total imports during the first plan period, 57 percent of her imports during the second and about 65 percent of her imports during the first three years of the third plan. The various reasons for the virtual stagnation of exports are summarised below:

(1) Stagnation in domestic agricultural production.

(2) Increased consumption of exportable goods at home due to (i) increased domestic utilisation of India's raw materials for industrial production, (b) larger purchasing power of the people and (c) growing population.

(3) Inflationary pressures in the Indian economy—inflation usually leads to a decline in exports (a) due to greater consumption of exportable products at home caused by an increase in domestic incomes, more so when imports are controlled, and (b) because the country becomes expensive to buy from. India has become a high cost producer, and in most of the important commodities, India has been priced out of the world markets. An increase in domestic demand has led Indian industry to concentrate on production for the internal market rather than for exports.

(4) Indian exports are facing a tough competition in world markets due to (a) the emergence of communist countries as suppliers, (b) stiffer competition from Japan and Pakistan and (c) high cost of Indian products.

(5) Relatively static world demand for the major traditional products exported by India.

(6) Protectionist trade policies of developed countries both for their manufacturing industries and agriculture; tariff increases at each stage from crude to processed materials and from processed materials to finished products, are a common feature of the tariffs of most industrialised countries. And this stands in the way of promoting India's exports of simpler manufactures. In addition, there are many non-tariff barriers such as quantitative restrictions and internal excise duties, specially in the E.E.C. countries which frustrate India's efforts to promote exports.

(7) Tariffs and other restrictions imposed by developing countries due to their balance-of-payments difficulties. There are a number of problems in increasing exports to developing countries, namely, (i) slow growth of effective demand in these countries, (b) restrictions placed therein on non-developmental imports and (c) their natural drive towards import substitution.

(8) Shrinkage in the total world trade in certain commodities due to fresh entrants in the field of their manufacture. This is specially true of cotton textiles.

(9) Fall in export prices—the volume of India's exports in the second plan was higher than in the first plan by 9 percent but this increase was not reflected in export earnings due to a fall in her export prices. The trend has continued during the first three years of the third plan. While the volume index of India's exports has increased from 100 in 1960-61 (1958 equals 100) to 126 in 1963-64, the unit value index has gone down from 110 in 1960-61 to 105 in 1963-64.

(10) Disturbed political and economic conditions in many of India's traditional export markets, particularly in the Middle East and the south-east Asian countries.

Terms of Trade

Between 1951 and 1956, the terms of trade were favourable to India and this resulted in a gain of Rs. 325 crores for India.[1] But from 1957-58, there has been an adverse shift in the terms of trade which has also adversely affected India's balance of payments. The terms of trade have continued to deteriorate during the third plan period from 115 in 1960-61 to 108 in 1963-64.

The recent increase in exports has also been achieved mostly by a rise in the volume of exports rather than by an increase in the unit value of exports. On the other hand, the import price index for machinery which constitutes about one-third of India's imports, increased from 98 in 1960-61 to 128 in 1963-64. There was no increase in the volume of machinery imports in 1963-64, compared with 1960-61, yet the value of their imports in 1963-64 was higher by Rs. 87.59 crores than in 1960-61. Thus the increase in value was caused by a rise in import prices only. This can give an idea of the extent to which the deterioration in the terms of trade must have affected India's balance of payments.

Imports have now been cut to the bone. The drastic import cuts have led to an acute shortage of many basic raw materials and components. This has retarded the rate of growth of industrial production. Costly substitutes are now being used, which has led to an increase in the cost of India's industrial products. Fortunately, due to greater availability of non-tied aid, the Government has announced some relief for the import of essential raw materials. Yet the foreign exchange allocation for the import of raw materials is far from adequate and the uneasiness on this score is likely to continue.

Any further cut in imports is just not feasible without adversely affecting production. The policy of import cuts, if pursued indiscriminately, would ultimately slow down the rate of development. In fact, the country must be prepared for a moderate increase in imports with the growth of industrialisation. If the experience of other countries is to be any guide, it can safely be asserted that the process of import substitution itself leads to an increase in the import requirements for components, spare parts, etcetera. It may not be out of place to mention that indiscriminate drive for import substitution may lead to the growth of industries which will never be truly efficient and thus would be a permanent drag on the progress of the country.

Export Promotion Efforts

The Government of India has taken a number of steps to increase India's exports and in recent years, export promotion efforts have been intensified. The target for exports during the fourth plan has been fixed at Rs. 5,100 crores. A realistic appraisal of the possibilities of expanding India's exports reveals that the achievement of this target will be an uphill task. Nearly 80 percent of her exports comprise agricultural products and agricultural-based goods. And the Central Food Ministry is already reported to be of the view that there would not be enough exportable

surplus in agriculture or in agriculture-based industries to warrant the Rs. 1,200-crore export target set by the Planning Commission. Apart from the difficulties in expanding India's exports, India's exportable articles are few and limited in number and most of them are subject to tough international competition. The total world market for cotton textiles is contracting but the competition is increasing. Even in jute manufactures which are expected to earn Rs. 20 crores more a year, there is increasing competition from Pakistan. Besides, the use of paper, cotton and polythene as substitutes for jute goods has steadily increased.

World production of tea is increasing and a surplus is forecast by 1970 and competition from new sources must not be underestimated. Already India's contribution to the total world exports of tea has gone down from 45 percent in 1951 to 40 percent in 1963. As the price elasticity of demand for tea is lower than unity, increasing supply may involve pressure on tea prices and a fall in export earnings from tea should not be surprising. India's exports of cashewnuts are likely to face keen competition from Brazil and Mozambique and those of pepper from Indonesia and Malaya. The use of mica and lac is also likely to be seriously affected by the successful development of synthetic substitutes. Moreover, exports of raw cotton and jute manufactures and other producer goods are governed largely by business conditions abroad. Here also, the prospects are none too certain. There are indications that the boom conditions at present prevailing in the U.S.A. and the west European countries may not continue unabated for long.

India's exports of iron ore are expected to increase by about Rs. 60 crores a year on the assumption that world trade in iron ore will expand with the projected increase in steel output. It is very often ignored that steel expansion in Japan has already slowed down while the European and American steel industries have been faced with idle capacities. Again, a very large proportion of iron ore used by steel companies often comes from captive mines. Moreover, price prospects are uncertain. It seems very doubtful, therefore, if India can hope to increase her exports of iron ore by Rs. 60 crores a year. In the case of manganese ores, too, India has to face competition from Russia and the newly developing sources in South Africa and South America.

Vegetable oils, oilseeds and oilcakes are other items expected to contribute substantially to the increase in India's exports. Apart from the question of raising the domestic production of oilseeds, which is the condition precedent for any increase in exports of these products, there are other problems too. The unprecedented increase in the export of oilcakes in 1963 was caused by the shortage of fodder in Europe which may not continue for long. The demand for oils, specially for soapmaking oils, is uncertain due to the advent of synthetic substitutes emanating from petroleum chemistry. High expectations of earning a substantial quantity of foreign exchange by doubling the quantity of sugar exported may not materialise as the present favourable conditions may not continue for long.

Whether India should continue to subsidise exports of sugar at this rate is another question. Indian steel is no longer the cheapest in the world, and there is a surplus of steel capacity in the world. It is doubtful whether there would be any export market for Indian steel at all. However, there is good scope for increasing the exports of engineering goods. But here also it is very doubtful if India can increase their exports to about Rs. 50 crores a year. The possibility of increasing the country's exports in newer lines is wholly dependent upon its capacity to outbid the already established suppliers in the matter of prices and liberal credit terms. Even now the rate of increase in engineering exports has been very much short of what was envisaged in the third plan.

There is a growing satisfaction on the phenomenal increase in the volume of India's trade with the communist countries. But most of this increase has been achieved by exporting traditional items. If the increase has been achieved by diverting supplies from her traditional markets, there is no net gain. Again, as most of these goods are consumer goods, there would always remain a possibility that the import of these items may be curtailed to suit the balance of payments or other requirements of their own economies.

Increase in Foreign Aid

India has already got substantial external assistance for financing her development plans which amounted to Rs. 2,934 crores up to the end of the second plan and to Rs. 1,538 crores during the first three years of the third plan. She might get additional aid for the fourth plan too. But the chances of getting the entire foreign exchange component of the fourth plan underwritten by foreign countries do not seem to be very bright, partly because foreign aid is a matter of politics but mainly because foreign countries are getting concerned about India's increasing foreign exchange obligations. Her chronic balance-of-payments difficulties have created apprehensions about her capacity for debt servicing and timely repayments. The Government should also take this fact into consideration. The repayment obligations are already very heavy having been estimated at Rs. 1,200 crores during the fourth plan period. So before incurring fresh external obligations, India should be careful. There is a limit beyond which she cannot borrow as her capacity to service the debts is limited.

Again, most of the aid received by her is tied aid. The result of the tie-up is that the prices charged for goods obtained under these credits are higher than those charged by other suppliers. In the case of the U.S.A., the gap is estimated to be of the order of 30 percent to 40 percent.[2] The result is that the Indian industries start with an initial handicap in the form of higher costs. There is not much hope of a large increase in untied aid, particularly because the most important aid-giving countries, the U.S.A. and the U.K., are themselves facing balance-of-payments difficulties.

Imports of capital goods in the fourth plan have been estimated at Rs. 2,500 crores, and on maintenance accounts at Rs. 5,300 crores. India's total import requirements can, therefore, be placed at Rs. 7,800 crores. In addition, her liability for interest charges and the repayments due in connection with her external debt has been estimated at Rs. 1,200 crores during the fourth plan period. Assuming that her exports can reach the plan target of Rs. 5,100 crores, although it would be an uphill task, her foreign exchange gap during the fourth plan would amount to Rs. 3,900 crores. The official thinking on external assistance is that it would not show a significant rise over the third plan level of Rs. 2,500 crores. After taking into account this expected external assistance, there would be a gap of about Rs. 1,400 crores. A part of this gap may be financed out of the unspent authorisations during the third plan. Even then, there would be a gap of about Rs. 1,000 crores. India's foreign exchange reserves (excluding gold held by the Reserve Bank) at Rs. 125 crores are utterly inadequate in relation to her average payments deficit. The following suggestions are made in the light of the above facts :

1. The fourth plan should be such that it could be financed out of the available resources. That is inevitable if inflationary pressures are to be controlled and the foreign exchange problem is to be solved. The World Bank has rightly advised the Government of India that plans for development should be based on a realistic assessment of resources. India should be bold but not reckless. It may be noted that even with a lower investment, much better results can be achieved by (i) economy in the construction of plan projects, (ii) reduction in unproductive expenditure, and (iii) elimination of wasteful and nugatory expenditure. If the size of the fourth plan is reduced to match the available resources, the volume of maintenance imports would also be reduced proportionately.

2. An increase in production, both industrial and agricultural, is the condition precedent to a successful export drive and to a successful reconciliation of the external and internal needs. As about 80 percent of the country's exports depend upon agricultural production, an increase in the latter would go a long way in increasing our exports. An increase in the foodgrains production will provide a long-term solution to India's balance of payments. A rise in agricultural production is possible by an increase in the yield an acre for which there is good scope. Larger supplies of raw materials would not only make some increase in their exports possible but also enable fuller utilisation of industrial capacities. Industrial production should be increased by working more shifts where possible, maximum utilisation of industrial capacities and modernisation of existing equipment.

3. Import policy—A strict regulation of imports is unavoidable. There should be no liberalisation for some time to come even if the foreign exchange position of the country improves. Adjustment of import policy to the foreign exchange position from time to time has been the greatest weakness of India's import policy. Successive liberalisation of imports in the early years of the second plan, which coincided with inflationary pressures in the country, was responsible for the foreign exchange crisis she faced during the period. Her position would have been very comfortable indeed, if an austere policy similar to that which was being followed before 1955 had continued with suitable modifications. It is imperative to have a stable and uniform import policy independent of the foreign exchange position. As import requirements have already been determined by the Planning Commission, it should not be difficult to follow a stable import policy.

Imports of essential raw materials and spare parts essential for maintaining the domestic industrial and tertiary production should be allowed freely. It is a sad reflection on India's import policy that while essential industries are not allowed to import their raw materials due to the shortage of foreign exchange, industries producing air-conditioners, coolers, electrical gadgets, etcetera, required by people of the higher income brackets, continue to get their raw materials, and there is a glut of these goods in the market. Even imports of machinery and capital goods should be carefully scrutinised. There is ample reason to believe that the rate at which imports of capital goods have been taking place has been faster than what the resources and the requirements of the country permit. There is scope for reduction in Government imports also. Complaints are frequently made that the Government imports some of its requirements even when domestic supplies are available.

Export Policy

4. Export policy—A survey of the possibilities of expanding her exports shows that there is no room for complacency and that India will have to make all-out efforts to increase her exports. A suggestion frequently made is that exports should be encouraged even at some sacrifice in relation to domestic consumption. It is difficult to agree entirely with this view. A close scrutiny of the principal items of her exports would show that the potentialities of curtailing domestic consumption for greater exports are not much. Her major exportable commodities have been produced largely for exports, dependence being roughly 80-95 percent in tea and jute goods.

Then again, even if domestic consumption is curtailed for exports, it would offer only an iota of relief to the heavy import surplus. Of course, there may be some commodities where additional foreign exchange can be earned by sparing more for exports. In such cases, the remedy lies in an increase in production so that both the internal and external markets are satisfied. And production in such cases can be easily expanded by the utilisation of unused capacities which would also lead to lower costs. More than once the Government has hinted at the enactment of legislation to fix limits of internal sales of some commodities so that manufacturing units could export more.

This policy is open to serious objections : (1) If manufacturers are com-

[2] A study made by the Columbia University reported in the *Economic Times* of 26th October, 1964.

pelled to export, they would increase their internal prices to compensate themselves for losses incurred on exports. And it would be unfair to the internal consumer if he is asked to pay more when he is already paying higher prices than the world prices, the domestic market being a protected one. (2) Foreign buyers cannot be compelled to accept commodities they are not interested in. (3) Selling below domestic prices may be taken as dumping which may invite retaliation in which the more industrially advanced countries usually win. (4) Moreover, the policy of curbing the internal market is fraught with serious consequences. The internal market provides an essential cushion to domestic industries in times of world depression. (5) Lastly, any reduction in supplies for the internal market will be inflationary. As a matter of fact, the problem is not entirely of the availability of surplus for exports but of how to sell and to whom to sell.

The crux of the export problem is that India's prices are not competitive enough. In the long run, all export promotion efforts are likely to prove fruitless unless the exported article is able to sell itself. Hence every effort must be made to reduce costs of production by (i) ensuring the supply of cheap raw materials even if they have to be imported, (ii) introduction of modern techniques, (iii) rationalisation and modernisation of equipment and (iv) linking of wage increases to the rise in labour productivity. A major factor that reduces the competitive capacity of her export products is the large element of taxation that goes to increase the ultimate price. Levies like export duties, excise duties, sales taxes, cesses and surcharges should be rationalised.

Sooner or later, India will have to produce and export more and more processed and manufactured goods. A practical beginning in this direction should be made by an assessment of the possibilities of developing new industries, not just for import substitution but also for exports. Foreign capital may be invited to participate in developing suitable export industries for India. There is an increasing tendency on the part of developing countries to reduce the imports of assembled products and to increase the imports of spare parts and components. Herein lies a great opportunity to increase the exports of Indian components, spare parts and machine tools. Side by side, attempts must be made to project India's image abroad as a country capable of manufacturing goods of a high standard. It is a sad reflection on the work of India's trade commissioners and the export promotion councils that there is a noticeable lack of understanding in foreign countries about India's industrial progress.

Devaluation of the Rupee

5. Devaluation of the rupee as advocated by some economists will not be a solution of our balance of payments problem. Our imports have already been reduced to the minimum and a rise in the rupee prices of imported goods is not needed as a deterrent to the demand for them. India's essential import requirements are quite heavy and an increase in their prices will only accentuate inflationary tendencies. The foreign demand for about 50 percent of our exports is elastic in relation to business activity and not to price cuts. For about 30 percent of the country's exports consisting of "food, drink and tobacco", devaluation will lead to an increase in exports but the rise will not be sufficient to offset the decline in foreign exchange receipts due to a reduction in their foreign prices a unit. In the case of 20 percent of India's exports consisting of consumer goods other than food, devaluation will lead to a substantial increase and she might earn a little more in terms of foreign exchange. But international competition is the keenest in relation to such goods, and it is doubtful if China and Japan will allow India to take advantage of devaluation for more than a very short period. The domestic supply position of such goods is not likely to be very comfortable either. Thus an analysis of exports reveals that there is not much scope for an increase in exports by devaluation. It will only aggravate her import surplus and the foreign exchange problem.

6. Increase in foreign investments—India should invite private foreign capital to participate in India's economic development. From the balance-of-payments point of view, private foreign capital has some concrete advantages. Repayment of principal is necessary where the lender is a foreign government or an international institution. But private investors regard their ... ments as permanent. Methods of Compiling Income Statistics in India Need Refinement

Indian national income statistics, especially those relating to inter-State comparisons of income and growth, are crude. No meaningful conclusion can be derived from them. The concepts and methods employed by different agencies vary widely.

By

V. G. RAMAKRISHNA AIYER

DO the prevailing statistical measurements really show the state of the country's economic growth? Do they represent the "quality" of the Indian economy as is reflected in the lives of the common people? Recent studies of inter-district and inter-State income differentials reveal that the economic disparities between several districts of a State are as grave as those among the States in the country. For instance, a recent study of the National Council of Applied Economic Research showed that out of 289 districts covered, the *per capita* income of as many as 207 are below the national average. The district-wise study shows Greater Bombay as the richest while Tehri Garhwal in Uttar Pradesh occupies the bottom place in the economic ladder. The top 10 percent of the districts arranged on a *per capita* basis accounts for nearly 20 percent of the aggregate income, while their population strength hardly comes to 11 percent. On the contrary, the share of the total income of the bottom 10 percent of the districts amounts to 7.5 percent, although they cover 13.5 percent of the population.

State-wise Break-up

A State-wise break-up gives top position to West Bengal and Maharashtra, while U.P. and Bihar are relegated to the foot of the table. There are also significant inter-State differences in the sectoral composition of income. Whereas 69 percent of the income of West Bengal and Maharashtra originates from the non-agricultural sector, nearly 59 percent of the income of Bihar and Madhya Pradesh is derived from agriculture. The other States in the Union are between these two extremes. Contrary to the general notion, Orissa and Assam do not figure as the least developed States judged by the sectoral composition of income.

As a matter of fact, economic disparities have little relation to industrial development in any State. They are found to be as marked in a State with a high degree of industrialisation as in another whose mainstay is agriculture. Similarly, the proportion of income originating from agriculture indicated notable variations in different States. While Bihar and Madhya Pradesh are dependent on agriculture to the extent of nearly 59 percent, the smallest proportion is found in West Bengal and Maharashtra with nearly 32 percent. Gujarat and Madras have a proportion of nearly 43 percent (less than the all-India average of 45 percent). All the remaining States seem to have exceeded the all-India average.

There are distinct disparities in the proportion of income derived from manufacturing, ranging from as low as 12 percent in Orissa and Punjab to 30 percent in West Bengal. As a general rule, the more affluent States lean more heavily on industry than on agriculture and services, with the sole exception of Punjab which gets the higher proportion of its income from services.

Data Collection Agencies

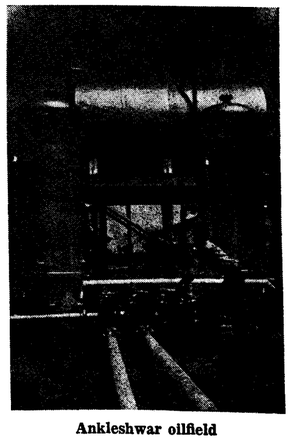
Apart from the N.C.A.E.R. findings, several statistical agencies such as the Central Statistical Organisation, State statistical bureau and even individual statisticians are already engaged in working out estimates of total income and *per capita* income in each State. These estimates were intended to indicate the differential economic development in the various States, but they are extremely rough and suffer from severe limitations. For instance, the estimates made by State statistical bureaux are not based on uniform estimation procedures and are not reconciled with national aggregates. Further, they are available for a few isolated years, and do not lend themselves to continuity of interpretation. On the other hand, estimates of State income by the Reserve Bank of India are not quite so reliable for sectors other than agriculture, mining and manufacturing and Central and State Governments.

There are also difficulties in the allocation of national income among various States. The most serious of these is that these estimates are, in fact, not estimates of State incomes, but of only State outputs, and they indicate only the output originating in the States and not the incomes accruing to the residents of the States. For example, these estimates indicate the value added by manufacture in a State, but it is quite likely that a greater part of this income finally accrues to the residents of other States to which workers or shareholders belong.

From the available estimates and the latest 1961 census results, it would appear that Punjab, Bengal, Bombay and Assam had the highest *per capita* income well above the all-India average. Madras, Andhra Pradesh, Uttar Pradesh and Madhya Pradesh had *per capita* incomes which were more or less equal to the all-India average, while the *per capita* incomes of Mysore, Bihar, Rajastan, Kerala, Orissa were lower than the national average, the lowest being the case of Orissa.

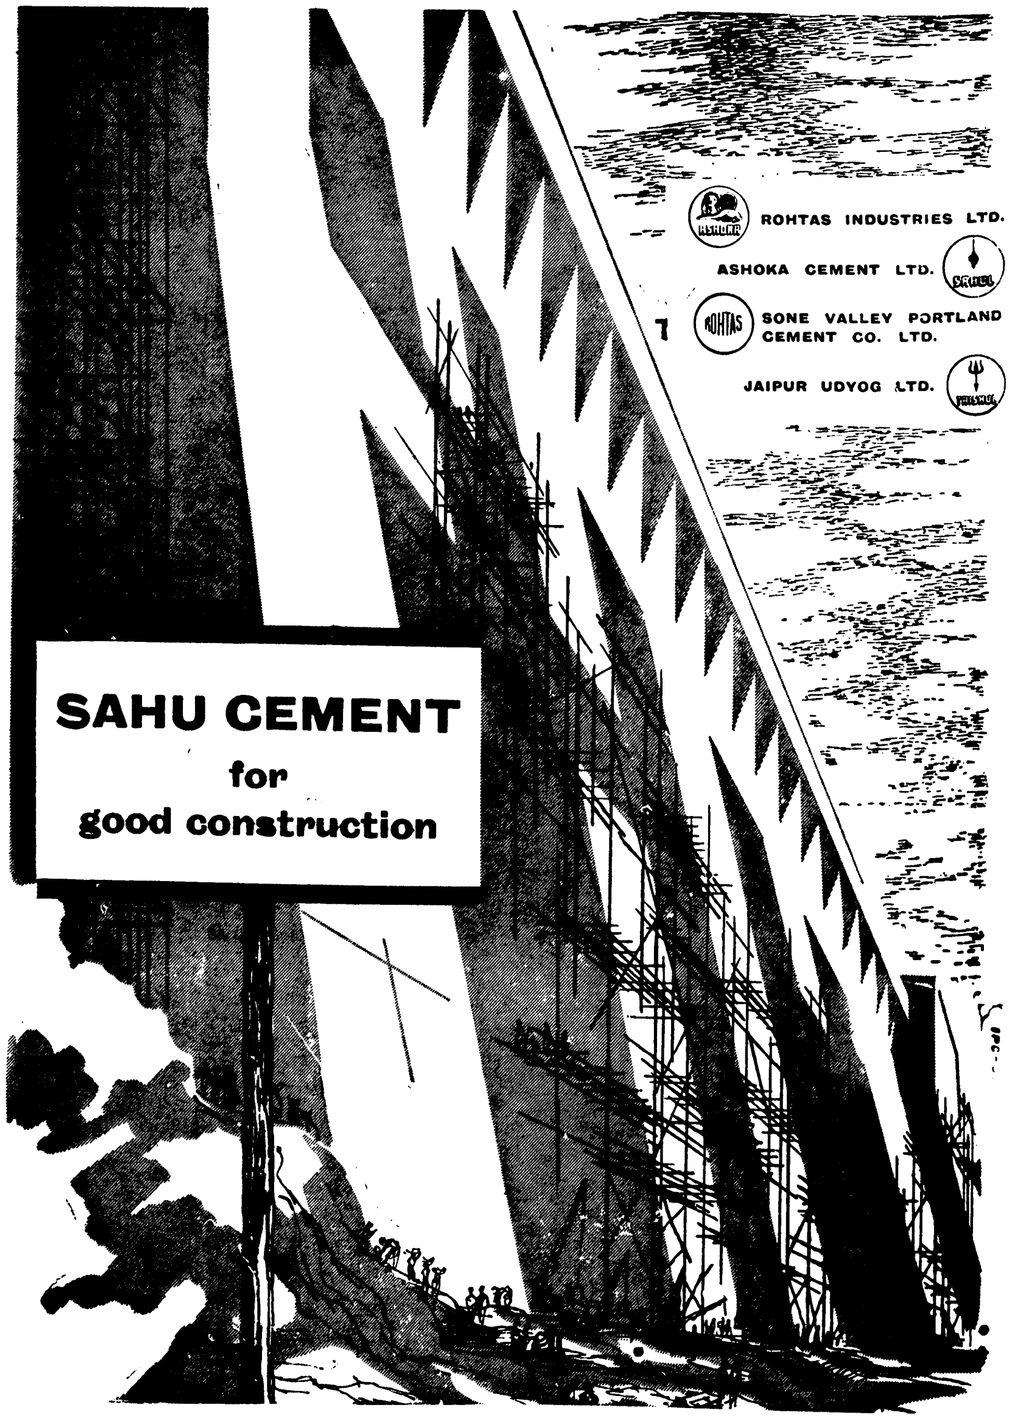
Income Figures

In interpreting these results, however, particular attention had to be paid to the difficulty that the income figures related to the origin and not to ultimate accrual. Thus Bengal with its immense industrial complex, naturally came high in the list, but this did not necessarily mean that the people of Bengal as a whole were better off from the point of view of consumption standards than, say, the people of Madras.



Inter-State comparisons are likely to get distorted by the presence in particular States of large-scale industry of which the ownership is widespread. Where there is no such statistically complicating factor, the ranking in the list might be considered as close to reality. This ranking is in relation to the absolute figures of *per capita* incomes in States. When one comes to consider the rate of growth of *per capita* income, say, in the last decade, the sharpest difference was in the case of Kerala, Rajasthan and Punjab. According to one estimate, there was a high rate of growth in Rajasthan and Punjab and a lower than the national average rate of growth in Kerala. According to another, there was the highest rate of growth in the former two, while yet another found that there was a lower than the national average rate of growth in Punjab and Rajasthan. Such bizarre results are due to the fragmentary character of the data and changes in the concept and methods of the estimates. The ranking of States on the basis of *per capita* income would be altered if account were taken of income accruing to, rather than, income originating in each State. In trying to find out in what way this pattern would be altered, the tax data might be used with profit.

Disparities and National Unity



Is it political wisdom to discuss the fundamental question of considering the differential incomes as between States because it might be harmful to the concept of national integration? All efforts should be aimed at national integration. In development particularly, the concept of India as one unit is essential and that, therefore, the estimate of what happens in individual States is inappropriate and possibly dangerous. A much more important task would be to find out how the weaker sections of the community are faring.

On the other hand, it could be argued that one of the bonds that help to keep the country together is the feeling that all the States are taking part in a common adventure. From this point of view, it might lead to political frustration, if the feeling arose that some States were advancing more rapidly while others were lagging far behind. In other words, it might be considered necessary on political grounds to avoid serious disparities in the rates of growth lest political pressures developed of a character that might affect the country's integrity. No one could take up the position that progress must be uniform all over the country, for that would be clearly impossible. The iron and coal complex of Bengal and Bihar could not possibly be set up in areas where this raw material is not abundantly available. The generation of hydro-electric power is not possible in the Gangetic plain, as it is in parts of south and west India with their unique configuration of mountains and rivers. But subject to differences arising from the availability of raw materials and the like, the general position is that regional disparities should be avoided as far as possible. In fact, here one is projecting on a geographical plane, the concept in the social plane that wide disparities between different sectors of the population should be avoided as a matter of social justice.

At present, data available for inter-State comparisons are not susceptible of meaningful interpretation and require considerable refinement before they can be used. There has to be uniform concepts and uniform methods of collecting data. The method of investigation needs to be improved and the range of enquiry to be widened, statistical tools have to be devised in order that differential incomes and rates of growth among States may be estimated from time to time. There is a crying need for co-ordination in Indian planning, and nowhere it is more imperative than in the compilation of statistical data.

L.I.C. Investments not in Best Interests of Policyholders: Expense Ratio High

The L. I. C. is doing well in its line of business, but its bonus record is not satisfactory according to current market standards. This is because the investment policy is designed to serve aims other than the policyholders' interests.

By
A. C. GUHA RAY

THE mounting discontent and the stalemate arising from the various trade union demands of the employees, including the field force and some officials of the Life Insurance Corporation of India, have brought many issues to the fore. They have also brought to the fore the controversial question whether nationalisation as a purely socialistic measure has not unleashed forces within the Corporation which have created the present difficulties. Experience has now made it clear that the nationalisation of a service like insurance has promoted no useful social purpose. Certain quarters still hold that in a welfare State, social utilities should be produced and controlled by the State. This is only a doctrinaire argument.

Creative efforts produce welfare, enriching the national dividend. When life insurance was nationalised, no new wealth was created. In this process, the waste of manhours has been colossal and waste of effort incalculable. Fiscal necessity led the then Central Finance Minister, Mr. C. D. Deshmukh, to nationalise life insurance. Barring that and except for the ideological bias of the ruling Party, no rational explanation can be given for this huge experiment. Experiment is always risky. It is more so when social life is concerned, and disastrous when it is purposeless. If life insurance was not to be left as a source of private profit, it would have been a comparatively easy matter to mutualise the companies, thus making every policyholder a participant in the gain and loss of a common venture. Since the world's largest insurance companies are primarily mutual companies, there is ample experience to draw lessons on this form of organisation. Therefore, the formation of a few mutual companies by mergers or alliances would have produced the desired goal. If fiscal considerations were the main reason for nationalisation, it would have been no particularly difficult thing to take control of the life funds without making such violent and radical changes.

Modern socialists have practically discarded nationalisation as a goal. The State is viewed as a federation of ventures where employers and employees work on agreed terms for the realisation of common objectives. Class distinctions automatically disappear in the new social order. While the State can get the best out of its citizens, it eliminates despotism of the bureaucracy. The nationalisation of life insurance in India is now bearing curious fruits. It is proving detrimental to the building up of a dynamic social order, to the interest of the common man, and particularly to life insurance itself. The State as a creator of employment has possibly chosen the course as one of its instruments. All socially necessary objectives may be good, but it will be an error if life insurance itself is considered secondary. Millions of policyholders who watch the career of the Life Insurance Corporation of India are filled with grave forebodings, and look with dismay at the wrangles that continually go on inside the Corporation. These wrangles are socially unnecessary and detrimental.

High Expense Ratio

It is common knowledge that the expense ratio of the L.I.C. is high. Its lapse ratio is disconcerting. Its bonus rates compare unfavourably with what could have been given in the current investment climate in India. These issues require to be tackled with foresight, thoroughness and on sound business principles. Life insurance is a highly technical subject. Unless there is dedication to the cause, the palliatives that are available will soon cease to be effective leaving the Corporation in a position where it might not even, by strict actuarial standards, meet all its liabilities.

The fourth valuation report on the assets and liabilities of the Life Insurance Corporation as on 31st March, 1963, discloses a profit of Rs. 26.34 crores, against Rs. 34.45 crores shown in the previous valuation for the two years 1960 and 1961. The share of the policyholders in the profit in accordance with the provisions of the Life Insurance Corporation Act, 1956, amounts to Rs. 25.39 crores, against Rs. 32.73 crores in the previous valuation period. The Central Government's share is Rs. 1.32 crores, against Rs. 1.72 crores. The return to the Central Government on its capital investment amounts to 20.57 percent, against 15.95 percent earned by it in the previous valuation period. On the whole, the Corporation has stepped up the bonus rates on insurance policies for the 15-month period ended 31st March, 1963.

As far as the Corporation is concerned, the bonus on whole life assurance policies has been raised from Rs. 16 a Rs. 1,000 a year declared for the two-year period ended December 1961, to Rs. 17.50 a Rs. 1,000 and that on the endowment assurances from Rs. 12.80 a Rs. 1,000 to Rs. 14 a Rs. 1,000. Likewise, proportionately higher bonuses have been declared for participating policies of the former insurers, in accordance with the classification of policies under the Differential Bonuses Regulations, 1961. The higher distribution, it has been claimed, has been rendered possible by the larger profit earned in the inter-valuation period, in spite of the slight increase in the rate of interest shown in the valuation.

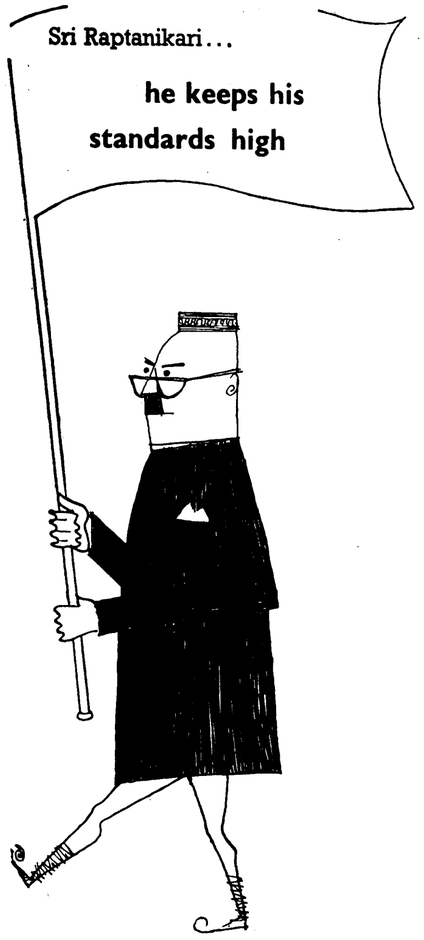
Financial Condition

According to the Life Insurance Corporation Act, the Corporation will, at least once in every two years, cause an investigation to be made by actuaries into the financial condition of the business, including the valuation of its assets and liabilities. It is, however, not mentioned in this Section what should be the nature of qualifications of the actuary and also how he should be appointed—whether he should be an employee of the Corporation or an independent actuary. Public interest demands that the person entrusted with the actuarial investigation should be independent of any control of or influence by the Corporation itself or the Central Government and the policyholders should have opportunities to say what they think in the matter of appointment of the actuary. Since the Corporation has all along published its reports on the basis of valuations made by the actuaries who are its employees, the valuation suffers from the defect that an independent actuary had no opportunity of pronouncing judgment on the methods employed.

The chairman in reply to suggestions that have been repeatedly made that in view of the favourable mortality experience of the Corporation, the premium rates should be reduced, stated that when most of the insurers effected a substantial reduction in the premium rates in 1954, a considerable part of the current favourable experience concerning mortality and interest was anticipated and taken into account. He further pointed out that in adopting in 1956 the premium rates of the Oriental after further reducing these by Re. 1 on a Rs. 1,000 of the sum assured, or 5 percent of the premium whichever was less, the Corporation anticipated economy in expenses.

This anticipation, however, was belied; according to the chairman himself, because of the increasing pressure of inflationary forces it would be too much to expect any significant reduction in the expenses in the near future. He, therefore, stated that the general practice among insurers even in foreign countries is not to revise the premium rates for with-profit policies frequently. The general view of the insurers is that changes in experience concerning mortality, interest and expenses can more equitably be handled under with-profit policies by changes in the bonus rates than by altering the general level of premiums. He pointed out that when 90 percent to 95 percent of the new business is generally under with-profit plans, as is the case in India, passing the benefits of favourable experience in the form of reversionary bonuses to the policyholders rather than reductions in premiums is desirable, particularly as an anti-inflationary measure.

Small Increase in Bonus Rates



In conformity with this view and the line of policy, the Corporation has stepped up the bonuses on the policies not only of the Corporation but also of the former insurers. But while the bonus rates of some of the former insurers have shown favourable increases, the rise in the rates of the Corporation is rather nominal. It does not offset the progressive erosion of the value of the policyholder's savings on account of rising prices, nor is the increase an adequate index of the Corporation's economy in expenses.

For some years past, the mounting expenses of the Corporation have been cutting into the policyholder's surpluses. The renewal expense ratio for the inter-valuation period was 14.13 percent which is higher than 12.42 percent in 1961 and 12.90 percent in 1960. Again, the net rate of interest earned, in the inter-valuation period was 4.08 percent, compar-

Sri Raptanikari...

he keeps his standards high

He's a stickler for quality. Ever striving for perfection. Takes meticulous care in selecting raw materials. Keeps well equipped test room and laboratory Exercises strict quality control. Products are checked at each stage of manufacture. Double checked before despatch.

Sri Raptanikari realises the importance of it all. He is conscious of the fact that to compete in an international market his goods should be second to none in quality. Repeat orders, he realises, depend on the quality of his product and Sri Raptanikari scores every time. The reputation his goods have earned in other countries is a credit for India and a help for other exporters to get easy acceptance of their goods.

In order to earn a good name for Indian goods and get repeat orders that bring foreign exchange for the country it is important that the standard of quality is kept high.

Contributing to Nation's Progress ....

After achieving Independence India is marching ahead with national development projects. The Five Year Plans are further step forward towards building up newer and better India. Private sector should also contribute towards the fulfilment of the ambitious plan.

We, on our little part, are always striving to serve our country by manufacturing the following :—

- **PHARMACEUTICALS**—Drugs and Galenicals, Medicinal Specialities, Injectables.
- **CHEMICALS**—Heavy, Fine and Technical.
- **LABORATORY RE-AGENTS**
- **SOAPS & COSMETICS**—viz. Margo Soap, Neem Tooth Paste, etc.
- **ESSENTIAL OILS & AROMATIC CHEMICALS**
- **DISINFECTANTS & ANTISEPTICS**

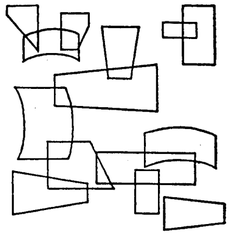
ed with 4.14 percent earned in the previous valuation. The chairman explained that the lower yield was due to the fact that comparatively few declarations of dividends on preference or ordinary shares had been made during the months January to March. All these factors tended to erode the funds of the Corporation one way or the other thereby not making available to the policyholders any higher yield in the shape of dividends which they expected after the chairman had made the announcement some months ago that the favourable experience would be passed on to the policyholders in the form of reversionary bonus. This expectation has been more or less belied in the present valuation also. It now remains to be seen whether in the next valuation, more favourable results for the policyholders will be produced.

Protest by Mr. Kaul

The chairman, Mr. B. K. Kaul, has been criticised for the L.I.C.'s unsatisfactory record in bonus rates, which stems primarily from the low interest yield on investments and high expenses. When Mr. Kaul said that the benefits of favourable experience would be passed on in the form of reversionary bonuses to policyholders, he was taken at his word. Yet in the last valuation, he only paid lip service to this theme. Analysing the root causes of his failures, he wrote to the chairman of the Planning Commission with refreshing candour and commendable forthrightness. The L.I.C. chairman's main complaint is that the Industrial Finance Corporation and similar other institutions seek to raise medium-term loans at low rates in the hope of forcing them down the throat of the Life Insurance Corporation. Many of these loans are quoted at substantial discounts even before the lists open. While the institutions themselves charge interest at rates of 7 percent or 7½ percent, they expect the L.I.C. to finance them at 4¾ percent as if that was the main purpose of the nationalisation of life insurance.

As long as life insurance is voluntary, the volume of business, the chairman has observed, can be increased only if the L.I.C. can year after year show more profitable working. Unless it can demonstrate that a with-profit endowment insurance policy is a good investment proposition, it cannot make a substantially large impact on the masses. The L.I.C., the chairman added, has always been putting greater emphasis on its responsibilities to its policyholders. The extent to which the L.I.C. discharges its responsibilities to them, it would automatically discharge its responsibilities to serve the objectives of the plan. Since serving the interest of the policyholders would be the paramount consideration, the interests of the institution and the policyholders would be harmed if the L.I.C. did not work profitably. Its earnings from investments must be reasonable and adequate.



Wrong Impression

The impression in Parliament and Government circles that the funds of the L.I.C. are to be treated as a reservoir for providing cheap credit to Government and semi-Government institutions, who in turn would earn higher interest rates on credits expended by them on the strength of the funds drawn from the L.I.C., should be got rid of, and indeed the process now existing does more harm than good to the L.I.C. and to the millions of its policyholders who, in good faith, have entrusted to the Corporation their savings as investment. While the Industrial Finance Corporation, the various State financial corporations and Central land mortgage banks, pointed out the chairman, can themselves charge a higher rate of interest (as much as 7 percent to 7½ percent), the L.I.C. must, they expect, provide them funds at 4¾ percent. A distorted view of the nationalisation of life insurance persists among these institutions, and they expect, as a matter of right, to draw funds from the L.I.C. at cheap rates as if the L.I.C. is merely a purveyor of cheap credit and has no other obligations.

It has also been argued that the L.I.C. has no business to go about purchasing shares of companies in the private sector and thus lend support to the stock exchanges, considered, in some quarters, a den of speculators. They expect the L.I.C. to support new capital issues, particularly those which are not likely to find adequate public support, and thus help the industrialisation of the country. The chairman pointed out that the L.I.C. is not interested in supporting the stock exchanges or the speculators. It is merely interested in seeking a more satisfactory and progressive yield. Any other effects that its actions may produce are purely incidental. In its search for better yields, any large investment in new capital issues is out of the question and, of necessity, the chairman observed, the L.I.C. has to be choosy.

Not in Interest of Policyholders

What effect this communication of the L.I.C. chairman, will have on the Planning Commission and the Central Government is hard to predict, but the communication confirms the view long held by millions of policyholders that the funds are being channelled to subserve interests other than those of the policyholders. The L.I.C.'s prime rôle as a custodian of the policyholder's savings has been sought to be subverted in order that the various objectives of the Planning Commission can be served. As Mr. Kaul has rightly urged, the L.I.C. must be left free to seek profitable yields and thus should continue to make more profitable investments in the private sector. The proportions of its investment in the latter field should not be reduced with a view to providing a higher percentage for the public sector. The distortions that are being continuously made of the traditional image of a life insurance company must cease; otherwise, before long, the L.I.C. would lose the support of the savers. If the life fund declines, the part which the L.I.C. is playing in the capital market will inevitably decline with it, resulting in loss both to the L.I.C. and the capital market.

WHY INDUSTRY PREFERS

- The modernisation of machines and methods at KFS ensures firebricks of excellent quality and greater durability.
- Quicker deliveries of standard and regular shapes. Plus, a depot in Calcutta and stockists in other major industrial centres offering immediate supply.
- Complete sets of firebricks to suit the needs of industry.
- Technical after-sales service.
- Specialists in Moderate Heat Duty and High Heat Duty Fireclay, Silica Sillimanite, Acid Proof and Insulating Bricks or Cements.

Implications of the L.I.C. Entry into General Insurance

The business of general insurers in India continues to grow. But with the entry of the Life Insurance Corporation into the field, private insurers feel uncertain about their future.

By

A SPECIAL CORRESPONDENT

THE entry of the Life Insurance Corporation of India into the general insurance field is the biggest event of the year. It marks the commencement of a new era in this line of business in the country. Under the provisions of the Life Insurance Corporation Act, 1956, the Corporation is authorised to carry on any other business which may seem "to be capable of conveniently carried on in connection with its business and calculated directly or indirectly to render profitable the business of the Corporation." Since the Life Insurance Corporation of India is not a creature of the Insurance Act, 1938, the provisions of that Act concerning tariffs, etcetera, do not apply to the Corporation. They will apply only when there is a notification from the Government of India to this effect.

The Central Finance Minister in his statement has made it amply clear that the rulings of the Tariff Committee and the Executive Committee will not apply to the Life Insurance Corporation. That enables the Corporation in the transaction of general insurance business not to follow the tariffs of India or to be guided by the Executive Committee in the matter of setting up standards of conduct and sound practice. Nevertheless, the Life Insurance Corporation has entered into a gentleman's agreement with the tariff insurers in the country to follow the tariffs in force for the time being. This will continue for some time until, as is reported, the Corporation has the facility to devise on the basis of experience, its own rating structure. The Executive Committee's directives, in any event, will not be binding on the Corporation.

Basic Aim of Government

The entry of the Corporation into the new line, was prefaced by various statements. They were many, but it is not difficult to gather from them the basic aim the Government of India has in view. When life insurance was nationalised, the first phase of State trading in insurance started. With the L.I.C. taking to general insurance, the second phase has just begun. Although it is said that the Corporation by acting as a non-tariff company will act as a stabiliser in the uncertain general insurance market, it is obvious from the statement made by Mr. T. T. Krishnamachari in Bhubaneswar that the Life Insurance Corporation will make such a "serious dent" on the general insurance business of the private sector in about five years' time that there will be no need to pay compensation and that nobody will be upset. It will be seen from this pronouncement that the Central Government has ushered the Life Insurance Corporation into the general insurance trading in furtherance of its socialistic objectives. It has often been denied that the entry of the L.I.C. is calculated to introduce nationalisation by the back-door. But words cannot allay misgivings when there is every evidence to show what the ultimate intentions of the Government of India are. The L.I.C., to all intents and purposes, is the instrument by which the Government hopes to squeeze out the private companies from the market, and thus create conditions under which the L.I.C. will be able to shape the character of general insurance trading. The income of private companies will sooner or later be depleted, because of the business lost. Since the L.I.C. will be eventually reducing rates, even on retained business, their private insurers' premium income will be reduced. It has been claimed that by this device the L.I.C. will act as a stabilising force, for with a depleted premium income, the private insurers will have no funds to pay rebates or illicit inducements.

Competition with Private Insurers

Such are the assumptions of the new policy, but they cannot blind one to other consequences. If the L.I.C. so wishes, its vast manpower, branch offices, and above all, investments in several sectors of business can be used to take a good part away from large number of businesses in the books of the private companies. The beginning of operations of the L.I.C. in the general insurance field could be the beginning of the end of private general insurers. It may actually turn out to be a dangerous form of nationalisation.

For the first time, a significant analysis has been incorporated in the *Insurance Year Book 1963*, the latest, not included in the previous publications, giving a mathematical summary of the expenditure on account of reinsurance transactions abroad with the Indian business of non-Indian insurers and the total business of the Indian insurers during 1960, 1961 and 1962. The amount has been estimated at Rs. 1.84 crores, Rs. 3.27 crores and Rs. 2.06 crores, respectively. The method of computation leaves little room for criticism. It has been arrived at by adding profit of gross direct business in India of all insurers to the profit of gross direct business outside India of Indian insurers less the profit of total net business of Indian insurers and the profit of net business in India of non-Indian insurers.

The points to be considered, therefore, are the basic causes for this expenditure. Taking one section of general insurance in India only, namely, fire, it would appear that the sizable profits of Rs. 3.68 crores in 1960 on gross direct business in India of all insurers, Rs. 3.80 crores in 1961 and Rs. 5.60 crores in 1962 have been so processed by the insurers themselves that ultimately there was a drain of Rs. 1.26 crores in 1960, Rs. 99 lakhs in 1961 and Rs. 1.78 crores in 1962. This should show that the insurers in this country have not been able to utilise fully the absorbing capacity of the Indian reinsurance market. It has been suggested that as far as the non-Indian insurers are concerned, there is extensive reinsurance overseas by various book entries and that they hardly utilise India's absorbing capacity. If this be correct, then Indian and non-Indian insurers can retain the profits, as far as the fire and miscellaneous sections are concerned, within the country by exchanging business among themselves and pooling their own resources. Professional reinsurers, namely, the India Reinsurance Corporation and the Indian Guarantee, have not yet been able to influence results, and there seems to be scope for more professional reinsurers in India. The emergence of the L.I.C. as a direct writing company in India is based on wrong priorities and emphasis. The L.I.C. would have served the interests of the country better if, instead of being a direct writing company, it had emerged as a professional reinsurer.

Growth of Business

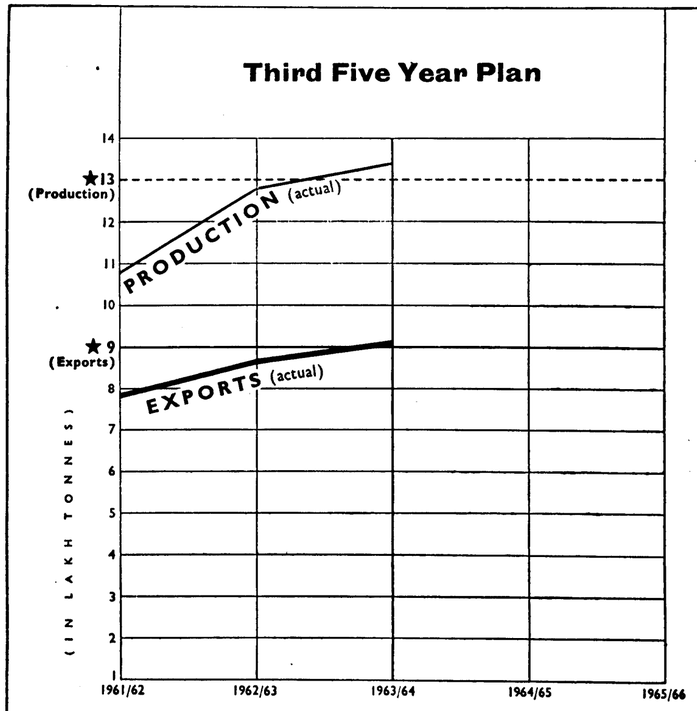
The growth of general insurance business in India has been substantial. The gross premium income written direct in India in 1962 reached the figure of almost Rs. 48 crores, compared with about Rs. 44 crores in 1961. It is estimated that in 1964 the gross premium income written direct in India will be near about Rs. 55 crores. Similarly, the net premium income in India has grown from about Rs. 32 crores in 1961 to about Rs. 36 crores in 1962.

The gross premium written direct outside India by Indian insurers (in fire and marine insurance business) in 1962 has suffered a fall, while the gross premium written direct in miscellaneous insurance business in 1962 has registered an increase over that of 1961.

The net premium income outside India of Indian insurers in all the three classes of general insurance business in 1962, has increased, compared with that of 1961. Yet in 1962, Indian insurers in gross direct business written outside India amounting to Rs. 10.19 lakhs, compared with Rs. 9.68 crores in 1961, suffered a loss of Rs. 1.18 crores, compared with Rs. 1.03 crores in 1961. Claims alone accounted for 62.8 percent of the said gross direct premium income in 1961, and this went up to 66.79 percent in 1962. There can be no more eloquent commentary on the poor standard of underwriting done outside the borders.

Underwriting Experience

The underwriting experience of Indian and non-Indian insurers in their total net business and net business in India in 1962 is, however, otherwise. Here the experience has been profitable throughout, it being 16.1 percent in fire department for Indian insurers, against 28.6 percent of non-Indian insurers. Similarly, it was 0.3 percent and 5.9 percent for Indian insurers in marine and miscellaneous departments, respectively, against 11 percent and 11.1 percent, respectively, for non-Indian insurers. Indian insurers seem to have broken the ice in net marine writings for the first time in recent years by showing a balance, although small, of 0.3 percent.



The underwriting experience of Indian and non-Indian insurers in their general insurance business written direct in India in 1962 is, however, quite favourable. It is 32 percent, 1.3 percent and 13.4 percent in fire, marine and miscellaneous sections, respectively, of Indian insurers, against 32 percent, 12.1 percent and 14.6 percent, respectively, for non-Indian insurers. It is obvious from this review that Indian insurers' gross profit in each section is considerably reduced by the process of exchange of business primarily transacted overseas, whether by treaty exchange or otherwise.

★ Third Five Year Plan Targets to be achieved in 1965/66

A PROUD FIRST

The Indian jute industry takes pride in the fact that it has lived up to the expectations of the country's planners by fulfilling the targets set for it in the Third Plan. The jute industry was also the first to reach the Plan targets for production and exports, and this too in only the third year of the Plan.

The Indian jute industry provides employment to millions of farmers, traders and mill workers ...earns foreign exchange worth many crores of rupees every year—in short, serves the nation in many ways and strengthens its economy.

Stock Market Depressed: High Taxes and Low Yields Discourage Investment

By
A SPECIAL CORRESPONDENT

THE Indian stock exchanges are closing 1964 in a depressed mood. The all-India index for ordinary shares has dropped from 172.6 to 164.9 (1952-53 equals 100) over the past year. The index for the Calcutta stock market has declined from 160.1 to 151.8 and that for Bombay from 181.2 to 174.6. The index for Madras has lost only fractionally from 174.7 to 174. Despondency has been caused by several unfavourable developments, both economic and political. Investors have turned apathetic because of two factors. Firstly, the current yields from ordinary shares are considered unattractive by present market standards. Due to soaring interest rates, the current yields of around 5½ percent to 6 percent are considered low, and investors do not think it worth while to buy shares unless the yield is 8 percent or so. So they are inclined to wait until share prices drop further to give a yield equivalent to the market rate of interest.

Secondly, the glamour of growth relating to equities has suffered a great deal due to the heavy fiscal levies on the corporate sector. The treatment of bonus shares—except those that are capitalised out of the share premium account—combined with the tax on bonus shares, has deprived equities of a good deal of attraction. The prospect for larger dividends has suffered due to the levy of the 7½-percent tax on dividends. Although production, sales and profits of companies have, on the whole, tended to increase, operators are worried because a large part of the profit has been mopped up by taxation. Furthermore, profits have not improved in proportion to turnover due to the rising production costs. Judging from current indications, it does not look as if prices of raw materials, stores, power and transport will decline in the near future.

Rising Prices

Meanwhile, wages of workers have risen considerably under various Wage Board awards. But in spite of larger emoluments, workers are still discontented due to the rising prices of essential commodities. The profitability of the corporate sector has been threatened by the Government's acceptance of the Bonus Commission's recommendations in a modified form. The implementation of the recommendations will mean that 60 percent of corporate profits will have to be paid towards workers' bonuses. Companies will, therefore, be left with little funds for modernisation, expansion and replacement.

Investors and operators have been worried by the critical food situation. The rising prices of essential commodities have strained the economy. The Reserve Bank's restrictive credit policy, it is feared, will interrupt the flow of bank credit into stocks and shares. Since the banking community is obliged to comply with a higher liquidity ratio, commercial banks will find it difficult to finance the requirements of the coming busy season. The proposed amendment to the Companies Act to restrict the currency of blank transfers has caused a great deal of concern, since it will tend to reduce liquidity and negotiability of shares. Funds will, therefore, be diverted from stocks and shares to other investment channels. Banks will be reluctant to extend credit to the stock market if the currency of blank transfers is reduced. Meanwhile, high lending rates of banks have rendered it almost impossible to finance stock market activities by borrowed funds.

Move to End Managing Agencies

Mr. T. T. Krishnamachari, Central Finance Minister, has recently made two important statements. Firstly, the possibility of terminating the managing agency system in selected industries next year has been indicated. Since it is difficult to recruit efficient directors, the removal of managing agents may deprive companies of efficient and experienced managerial personnel. Mr. Krishnamachari has also hinted at the possibility of reviving the former system of asking companies to deposit a part of their reserves with the Reserve Bank for development. The move seems pointless because companies are already using almost all their reserves for modernisation, expansion and diversification. The proposal of the Prime Minister, Mr. Lal Bahadur Shastri, to encourage the participation of the public sector in consumer goods industries, combined with the move of the Planning Commission to modify the Industrial Policy Resolution of 1956, has caused fresh jitters in the market.

In the political sphere, the Kashmir problem looks intractable, although the one relating to Indian immigrants into Ceylon has been partly resolved. The tension between India and Pakistan and between India and China has not yet abated. The change in the Russian leadership, and the detonation of the first atom bomb by China have caused fresh uncertainties. The troubles in Orissa and Kerala also pose fresh problems.

Share prices have fluctuated widely during the past year. There was a marked revival of confidence when Mr. T. T. Krishnamachari took over the Finance portfolio in August 1963. Despite the acceptance of the resolution on democratic socialism by the Congress Party at its Bhubaneswar session, operators were jubilant because some good measures were initiated by Mr. Krishnamachari. The compulsory deposit scheme and the Gold Control Rules were modified, credit supply from banks was liberalised; price control was removed from a few selected industries, and industrial licensing was liberalised. The steadiness was maintained until the 1964-65 Central Budget, but the market was disappointed by the measures introduced by the former. The replacement of the super profits tax by a surtax on profits has given only marginal reliefs to the corporate sector. The good effects of the grant of a rebate of 10 percent on income tax and supertax and 20 percent on surtax to companies engaged in certain priority industries have been of only marginal significance. The exemption of all inter-corporate dividends from supertax, the reduction in the rate of deduction of income tax at source from 30 percent to 20 percent on dividends declared by companies has been neutralised by the levy of the new tax on dividends. Although the Compulsory Deposit Scheme was withdrawn, the introduction of the annuity scheme for middle and high-income groups has tended to mop up substantial savings of the people who are prone to investing funds in stocks and shares. The few incentives offered to foreign collaborators have failed to attract foreign capital to any considerable extent. Anyway, the 1964-65 Central Budget adversely affected sentiment in the stock market. Heavy direct taxes—including the increase in the rates of wealth tax, gifts tax, estate duty and the substantial rises in excise duty, have tended to reduce the attraction for stocks and shares.

Depression Deepens

The depression was aggravated towards the end of May due to the death of Mr. Jawaharlal Nehru. Since then, the stock markets in India have tended to decline except for intermittent rallies due to short-covering and replacement purchases. The markets attach great importance to the establishment of the two public-sector institutions—the Unit Trust of India and the Industrial Development Bank. The establishment of the Trust should have bullish effects since it will invest large sums of money in shares. But in the long run it will influence the stock market bearishly. Since the units tend to assure an attractive tax-free return, they are expected to attract large savings. This will reduce the flow of funds into the stock market. This apart, it is time to consider the long-term effects of the operations of the Unit Trust of India and the Life Insurance Corporation of India on the market. Since large blocks of shares will pass into the tills of these two public-sector enterprises, it is wondered whether a large part of private-sector companies will not ultimately pass into the control of the Government. This besides, the purchase by these two big financial institutions will steadily lead to a shortage of good scrip.

As far as the Industrial Development Bank is concerned, it has been welcomed because it will tend to facilitate the supply of long-term funds to industries. It will co-ordinate the activities of the Industrial Finance Corporation, various State Financial Corporations and the Industrial Credit and Investment Corporation of India. Although the problem relating to industrial finance will be greatly mitigated by all these financial institutions, they will not be of much help to attract the savings of the community. Unless activity in the stock market is encouraged, it is difficult to mobilise savings.

Steel Shares Attract

Sectionwise, steel shares have attracted the most attention. The payment of a larger dividend of 17 percent, including a cash bonus of 1 percent, by the Indian Iron and Steel Co. Ltd for 1963-64, against 16 percent for 1962-63, has had good effects. The working of the steel companies during the current year will be governed by two factors. Firstly, production is expected to be bigger during the current year than in 1963-64. The bulk of the output has been decontrolled, although prices of these items are being voluntarily regulated. As far as the controlled items of production are concerned, they will not yield a better profit unless their retention prices are raised to more realistic levels. The worry of the shareholders centres on the important issue relating to the payment of advances which the Government gave to the Indian Iron and Steel Co. Ltd and the Tata Iron and Steel Co. Ltd. Although the Government has assured the Companies that it has no intention of converting the loans into shares, it remains to be seen whether it will provide funds to them for repaying the advances by raising the retention prices of steel. Meanwhile, both the companies have been asked to undertake further expansion. Indian Iron has already launched the first phase of expansion. The managements of both the Companies have assured the shareholders that no expansion will be undertaken unless it contributes to their benefit.

As far as engineering shares are concerned, the outlook is fairly encouraging. Order-books of almost all engineering firms are well filled, but nobody can guarantee that their working will not be interrupted by the shortage of raw materials, spare parts and power. It should not be forgotten that a considerable part of their installed capacities continues to remain idle, so steps should be taken to make a fuller use of these capacities. It is hoped that the larger non-project aid offered by foreign countries will be used to import more raw materials and spare parts to ensure a fuller working of installed capacities. But due to the progress in economic development, the demand for engineering products should steadily increase.

There has been great attraction for good miscellaneous shares because the supply of miscellaneous goods has generally been short of demand. Most of these industries are expanding as far as possible to cope with the rising requirements. Shares of companies making copper, rubber, motor-vehicles, batteries, paints, biscuits, chemicals and cables, etcetera, have generally been favoured. Despite the prospect of an increase in the reasonable return allowed to electric companies due to the increase in the Bank rate with which the reasonable return has been linked, electric company shares have not attracted attention due to the apprehension of nationali-

sation of these companies in the long run. Insurance shares are neglected because of numerous statutory controls under which these companies are obliged to work. Bank shares are being dealt in cautiously because the effects of the large liquidity ratio requirement and the restrictive credit policy of the Reserve Bank have not yet been fully worked out. Managing agency shares are not favoured because the Government intends to terminate the managing agency system in selected industries in due course. The prospect for cement shares depends on whether the Government will agree to increase the price of cement to a more realistic level. Support has been extended to paper shares because the price of paper may be raised to encourage further expansion of the industry. The supply of paper is short of demand which is expected to increase considerably in the near future. Sugar shares have been difficult to transact due to the absence of support. During the past two years, sugar companies have generally suffered losses due to a smaller output, combined with rising production costs. Their working will not improve unless an adequate supply of cane is assured to sugar factories.

Although jute shares have not met with selling pressure, buyers have tended to be cautious. During the current year, profits of mills have tended to shrink due to the sharper rise in the price of fibre than that of jute goods. Production costs have also been inflated by increased emoluments to workers, combined with higher prices of stores and power. The output of mills has, however, increased due to the scrapping of the Working Time Agreement. But it remains to be seen whether the increased production will be matched by a corresponding rise in the overseas offtake of jute goods. The levy of the surcharge of 15 percent on imports into the U.K. may reduce the offtake of jute goods by that country. However, the earlier fear relating to the shortage of fibre is unlikely to materialise. Current indications are that mills will have an abundant supply of raw jute during the current year.

Coal shares lack interest due to two factors. Firstly, the present price of coal fixed by the Government is not considered remunerative enough to give reasonable profits to collieries. Secondly, the output during the current year has been interrupted by the large accumulation of pithead stocks following the decline in demand. The steel companies, in particular, have reduced their offtake of coal to a considerable extent. Support is forthcoming for good cotton mill shares because the partial control of cloth is expected to ensure fair profits to mills. Furthermore, the supply of cotton is expected to be adequate. The domestic cotton crop during the current year will be larger than that of the previous year. Steps have also been taken to import a fair quantity of foreign cotton.

Tea shares have not been favoured, and stray business has been transacted. Only a few selected Assam and Dooars gardens have been fancied. Despite the prospect of a bigger crop in north India during 1964, investors have been discouraged by the poor marketing outlook for tea. The average price during the current season is barely equal to that of the previous season. Since production costs have risen substantially, it is feared that profits of tea companies during the current year will not be better than they were in 1963.

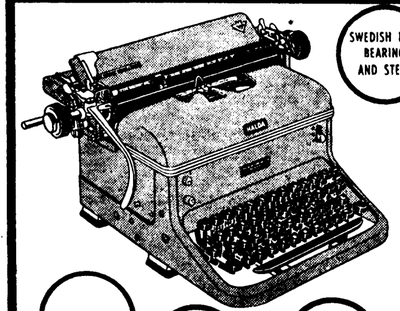
New Issue Market Dull

The new issue market has been depressed in line with the general trend of the stock market and the bulk of new issues have been quoted below par. During recent months, most of the new issues have had to be subscribed by the underwriters themselves. Although underwriting facilities have tended to increase, it is apprehended that in the coming months promoters will find it difficult to get their issues underwritten since funds of underwriters have been largely blocked in new issues. The depression is understandable because the prospect for equities has suffered a great deal due to various fiscal levies on corporate profits. Confidence in the new issue market will not revive until the fiscal system is suitably modified.

Investors have also tended to shy away from new shares because many new projects have gone awry due to miscalculation or mismanagement. Apart from the fact that the progress of new enterprises has been interrupted by various difficulties in the form of shortage of foreign exchange and raw materials, experience shows that many new companies have carelessly estimated their project costs. So they have been handicapped by the shortage of funds. Quite a number of companies have also been poorly managed. Although the Advisory Committee on Capital Issues has recommended to the Government that the restriction on the sale of shares allotted directly by a company before public subscription should be removed, it is unlikely to revive confidence unless the outlook for equities is improved by a modification of the fiscal system.

Government securities have turned dull and quiet. At this time of year when the busy season begins to gather momentum, banks generally take little interest in investments because their funds are used to finance the rising tempo of economic activities. This besides, prices of securities have tended to drop due to the increase in Bank rate from 4½ percent to 5 percent. The market for Government securities in India is more or less a closed one because buyers generally include banks, the Life Insurance Corporation of India, the Unit Trust of India, various financial institutions in the public and private sectors, provident funds, Port Trusts, municipalities, the Central and State Governments and other Government or semi-Government institutions. The Reserve Bank of India is no doubt a substantial holder of these securities. A striking anomaly is that there is very little support from the public. It is unfortunate that the Government shows no keenness to attract more public support by making yields on securities more attractive.

As far as the banking community is concerned, it is forced to hold substantial securities to comply with the increased liquidity ratio of 28 percent. Since the Reserve Bank operates Government securities in a restricted way, holders of these have found it difficult to transact them freely. It is time active steps were taken to liberalise the open market operations of the Reserve Bank. This will help impart greater liquidity and negotiability to these securities.



Borrowing Target

The 1964-65 Central Budget laid down a borrowing target of Rs. 295 crores. The Central Government made a conversion loan offer last April. Holders of the 3½ percent National Plan Loan 1964 and 3 percent Loan 1964 were offered to convert their holdings into either the 4 percent 1970 loan or the 4½ percent 1989 loan. The total conversion subscription amounted to Rs. 141.52 crores, leaving Rs. 47 crores which had to be repaid in cash by the Government towards the liquidation of the two maturing securities. Later in July, the second tranche of loans for cash subscription was offered to raise Rs. 150 crores. The 4 percent 1970 and 4½ percent 1989 loans were offered earlier. Since the rate of interest on the new loans was increased, the prices of existing securities tended to soften. In August, 13 State Governments, except Punjab, offered loans to raise Rs. 100 crores. These new loans carry an interest of 4.75 percent and are repayable in 1976. As was expected, a part of the total subscription was obtained through persuasion and pressure. So unwilling buyers have now been forced to sell their holdings at a discount.

The following table represents the movement of clearing shares in the Calcutta stock market during 1964:

	Opening	Highest	Lowest	Closing (as on 18-12-64)
Birla Jute	34.94	38.75	29.50	38.50
Burrakur Coal	17.50	17.94	15.47	15.87 x.d.
Dunlop Rubber	38.62	39.25	31.06	30.62
Guest, Keen, Williams	26.37	28.12	22.50	22.75
Hindustan Motor	19.03	20.12	16.41	16.34

Bonus Commission Recommendation Will Strain Tea Industry Further

The tea industry is bearing a heavy tax burden. The Bonus Commission's recommendations will further strain the industry's resources, and make it difficult for it to fulfil the plan targets.

By

A SPECIAL CORRESPONDENT

THE picture of the tea industry is very much the same as in 1963. Very high targets both for production and for export have been set by the Planning Commission, and accepted by the industry with the proviso that certain measures of tax relief must be given if the targets are to be achieved. The measures of relief are still being talked about, perhaps with more sympathy or even urgency than before, but they have not yet been given, and the targets are scarcely on the way to being achieved.

Meanwhile, several additional burdens have been laid on the industry. Firstly, the wage board, under strong political pressure, has decided on a second "interim" wage increase to labour. Rises in wages, within reasonable limits, should not be grudged, but this one was given on no rational basis other than a guess at the capacity of the industry in various areas to pay. The increases combined with the interim increase of 1962 considerably outstripped the rise in the cost of living since minimum wages were last fixed; such investigation as the wage board had made showed that over the previous 11 years, on average, 20 percent of the tea companies were making losses—not a very economical basis on which to run an industry.

Secondly, disregarding repeated warnings given by those responsible for the industry and ignoring the promise of prior consultation before any policy decision was made public, the Government of India (at the time this article was written) seems inclined to impose a minimum annual bonus of Rs. 40 a worker even on the many companies which year after year have made losses or only marginal profits. This, in a labour-intensive industry such as tea, may mean an additional burden of about Rs. 40,000 an estate, and many companies simply cannot obtain the funds to pay it. A temporary compromise has been reached with the labour organisations (including the I.N.T.U.C., U.T.U.C., and A.I.T.U.C.,) in north-east India to pay Rs 20 a head in the case of losing gardens, Rs. 25 in the case of gardens which have made "inadequate" profits (defined as those which, under the Bonus Commission's formula, would have been due to pay less than Rs. 40, had it not been for the minimum), and Rs. 40 in the case of those which have made adequate profit, as payment on account pending further negotiation. It may be noted that the first two classes above represent more than 70 percent of the acreage under tea in India.

The industry, like most employers, resents the imposition of bonus payments where there has been no profit. In north-east India it has previously never sought to impose a maximum limit on bonus a worker; under the previous agreement, now expired, the bonus was a straight percentage of profits divided in proportion to earnings. So the sole justification for a minimum bonus which the Bonus Commission could find, namely, that a maximum is to be applied, did not relate to the tea industry in north-east India. Nevertheless, the industry would probably now be prepared to compromise on the minimum formula suggested for the industry by Mr. Dandekar in his minute of dissent to the Bonus Commission's Report, i.e., 2 percent of annual earnings. It must be remembered that the tea garden workers are still recruited on a family basis, and strict preference is given to those living on the estate when vacancies occur. A bonus of Rs. 40 a worker would, therefore, mean a total family earning of about Rs. 120.

Concessional Supply of Grains

Thirdly, the price of rice and wheat has been steadily rising. In north-east India, which covers some four-fifths of the industry, foodgrains are sold to labour at concessional prices. These prices have not been raised, so that the whole of the cost of the rise in price has to be borne by the tea companies, the workers being completely sheltered. In south India, rice is sold to workers at cost price, but purchase by the tea companies at reasonable procurement prices is becoming increasingly difficult. The situation has been particularly difficult in Assam, where the State Government has not taken the same care as in West Bengal to see that the tea estates can obtain supplies, and indeed has, by regulation, kept them off the market in order to conserve supplies for the towns. When an industry is forced to accept the responsibility of supplying rice at fixed rates to its workers and is denied access to the open market, it is only fair that, under a system of control, the Government should see that adequate supplies are made available at fair prices.

Fourthly, so far from relieving the industry of its heavy burden of taxation, various State Governments during the past year have enhanced the rate of taxes. Assam has raised its agricultural income tax, and joins Kerala in the distinction of levying agricultural income tax at a higher rate than the Central Government levy (by convention 60 percent of the profits of the industry is taxed by State Government and 40 percent by the Centre, but there is nothing to prevent a State from raising its rate of tax higher than the Centre's, although the method of assessment may be the same). Assam has started on a policy of doubling up the land tax, and this has beeen followed by Mysore and now by West Bengal. Assam seems piqued by the fact that while West Bengal was allowed to keep its octroi collections indefinitely after the Supreme Court decided that such measures required the consent of the President (in effect the Government of India), Assam's carriage tax, as it then stood, was given only a limited extension up to March 1962.

Plea for Single Excise Levy

Limiting taxation when several authorities compete for revenue is difficult. What the industry pleads for is that, by and large, the Central Government should determine what level of taxation the industry should bear, that agricultural income tax on tea should be made uniform throughout the country at not more than the Central Government's rates; and that taxes on production, including carriage and octroi duties and the sales tax on the Cochin auctions should be confined to the Central Government's excise duty, a share of which might be given as a grant by the Centre to the State Governments within whose jurisdiction tea is grown and in proportion to such production, in compensation for their agreeing to forgo their right to levy special taxes on movement of tea.

It is noteworthy that over the last ten years not only have the marginal companies had a dismal record of loss and inability to fulfil their obligations under the Plantations Labour Act, but even the comparatively good going concerns, as shown by a recent review of 31 of the best known exporting companies, have suffered a steady contraction of their profits, so that they no longer have the funds to plough back, extend and rehabilitate their concerns. Still less do they have the funds to rebuild their workers' houses to the specifications laid down by the Assam and other State Governments. It is impossible now to attract fresh outside capital into the industry—not at least from the class of investor who believes in progress and expansion. The return on investment is not sufficient for the risk involved. It is easy enough to find buyers for what one might call the "run down" value of an existing estate. Loans are not the solution if there is not the wherewithal to service them.

Now that profit margins are not sufficient to provide for expansion, the tea industry is making a strong representation to the Government that there should be a direct reduction in the level of excise; the producers would not object if the funds accruing from such reduction were earmarked in the hands of the tea companies for replacements and extensions of tea areas and for installing new machinery in the factories. In order to get the maximum value from such tax relief, it is suggested that replacements and extensions of

Plucking in a tea garden

the tea area, hitherto regarded as a capital charge although no depreciation is allowed on the bushes, should be treated as a revenue charge. Unless this reasonable concession is allowed, half the value of the excise tax reduction may well be lost in additional income tax.

Producing Quality Teas

Measures such as these—and a restraint on the part of the State Governments from taking over for other purposes land within estates suitable for extensions—are quite essential if there is to be a successful effort during the succeeding five year plans to extend the area under good quality tea and achieve the export targets adumbrated by the working group of the Planning Commission. To produce more quality tea it is essential to plant on suitable ground—preferably not that from which old tea has recently been uprooted—with the best modern methods from tried and tested stock of high quality, and this costs much money. Nevertheless, great scientific advances have recently been made in the use of clonal material for new planting, and the know-how is there. It is the production and export of more quality tea that will bring in more foreign exchange. However much the world market for common tea may grow, many competitors are now steadily increasing their production, and most of them have readier geographical access to the markets of Europe and America. Yet India's tea can still fetch a higher average price a pound than any of her competitors'.

Instant Tea

For common tea, perhaps the future is with so-called "instant" tea. As those who have tasted the several brands know, this development has a long way to go before it can equal tea infused properly from leaf by orthodox methods. It is possible, however, that public taste may change to accept such substitutes. It should also be possible to add essences to instant tea in similar powdered form, orange or lemon or even whisky type to taste. But as an economical long-term proposition instant tea is best made not from already manufactured black tea but directly in a continuous process from green leaf. For this it is essential, again from the point of view of saving costs, to have a continuous suply of fresh leaf to keep the factory going all the year round. Here Ceylon (like Indonesia, if she is ever permitted again to develop) has with her continuous rainfall and absence of winter a great advantage over India, except for some portions of the Western Ghats in the south. It is thus in south India that production of instant tea is going ahead.

Turning to the opening of new markets abroad, the most hopeful area is still the European Common Market. However, despite the reduction of its external tariffs to nil as from 1st January, 1964, the E.C.M. countries still hold fast to their internal revenue duties on tea, and all the efforts of India's Ministers and diplomats have not succeeded in getting them lowered. The excuse given is that they apply equally to coffee and beer—in fact tea is still regarded as a comparative luxury. Nevertheless, vigorous efforts are being made by the Indian Tea Board from their propaganda centre in Brussels to expand the popularity of tea in western Europe.

Market Potential in U.K.

In Britain too a large campaign is afoot to preserve the popularity of the Englishman's traditional drink, for it shows signs of decline among the rising generation in the face of coffee. This decline can, however, be exaggerated, and it is perhaps rather beer and lemonade-type drinks that coffee is tending to replace among the monied teenagers of today.

In the U.S.A., India and Ceylon have for many years run a vigorous propaganda campaign for tea. Exports of Indian tea remain around 10,000 tonnes a year, but the value shows little tendency to rise above Rs. 6 crores despite the fall in the value of money. Canada unfortunately shows a persistent decline in consumption.

It is Russia and the U.A.R. which have shown the most remarkable rise in offtake from India over the past eight years, the former now absorbing as much as a seventh of the traditional British offtake, and it is the main purchaser of Darjeeling tea. The buying policies of communist countries may or may not persist, a thought that gives rise to considerable apprehension among tea producers. Any day a Russian government may decide that perhaps China is the country from which they should get their tea after all.

The 1964 crop in India has been a good one, in quality and in quantity. Prices have been shaky; and on average below that of last year, when the crop was short for climatic reasons. In a year of heavy crop, quality teas maintain their value while common teas drop. It will be interesting to see whether the total export earning during July 1964 to June 1965 exceeds the 1963-64 total of Rs. 121 crores or the 1962-63 total of Rs. 128 crores. Perhaps Rs. 125 crores is a modest bet. Meanwhile money does not rise in value.

TOO MANY TAXES CHECK GROWTH OF PLANTATION INDUSTRY IN SOUTH

The plantation industry represents an important sector of the economy. It is a major foreign exchange earner. But heavy taxation has been hampering its growth.

By
K. K. KURIEN

THE resource problems of the plantation industry are today discussed extensively in the context of the appointment of the Tea Finance Committee by the Government of India. Apart from the money required to meet the rising cost of production, the industry is urgently in need of huge funds for replanting and expansion, and also for discharging its obligations under various labour laws. According to one estimate, the cost of production in south Indian tea estates has increased three-fold in the past 17 years to well over Rs. 2,000 an acre. Similar increases might have occurred in the case of coffee and rubber as well. This has strained the financial resources of almost every planting company.

During the past decade, producers in south India have been becoming increasingly aware of the need for replacing the old type of plants with modern high-yielding varieties. To the country and the industry, it is equally beneficial to have the field planted with such material as would help each one to produce three times the present level of output. The replanting cost is estimated at about Rs. 5,000 an acre in the case of tea, Rs. 2,500 for rubber and Rs. 3,000 for coffee. The annual requirement for replanting tea alone is placed at Rs. 3 crores. Factories are in need of modernisation and expansion because most of them were set up in the '20s or even earlier. Over and above these, are the amounts required to discharge the industry's obligations under the Plantation Labour Act and other labour laws. Welfare measures involving capital outlay now exceed the cost of opening the plantations concerned.

There is little hope of attracting the capital needed to meet these requirements from the open market, unless the industry is in a position to give a reasonable return on the investment. There is no hope of lowering the cost of production if the present level of wages and amenities are to be maintained. There is no means of saving for reinvestment unless there is a reduction in the crippling burden of taxation.

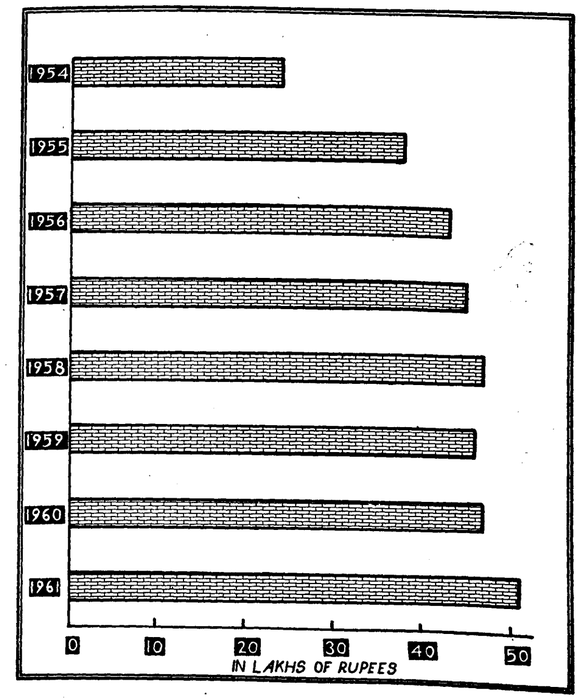
The plantation industry is subject to a plethora of taxes. The Centre imposes income tax, excise duties and sales tax and the States agricultural income tax, sales tax, entry duties, octroi duties, land tax and building tax and the *panchayats* and other local bodies their own levies. The Central Government levies Union income tax on 40 percent of the income of the tea industry, and the State Governments within whose jurisdictions the plantation properties are situated, levy agricultural income tax on the remainder of the income. The State Governments also levy agricultural income tax on the whole of the income of the rubber and coffee plantations. The Central Govenment, through the State Governments, collects a Central sales tax on tea and coffee on inter-State transactions, and the State Governments, in addition, levy their own sales tax on local transactions.

Agricultural Income Tax

There is no uniformity concerning the rating of agricultural income tax in different States as also in the manner of ascertaining the taxable income, exemption, depreciation, etcetera. For instance, the Agricultural Income Tax Act of Kerala and that of Mysore impose rates which rise progressively with the corporate income. Variations in taxation on the same commodity which is produced in the different parts of the country are highly undesirable, particularly in the case of commodities like tea which have to be marketed under conditions of stiff competition. While Madras and Kerala have accepted the Central Government's recommendation to exempt the depreciation element in the price of rubber from the State agricultural income tax, the Government of Mysore has refused to fall in line. There is no limit placed upon the rate or extent to which agricultural income may be taxed by any individual State Government. This has resulted in the assessment of agricultural income at widely ranging and desperate rates. At least two south Indian States have imposed rates higher than the maximum to which the same income would have been liable under the Central income tax.

The rebates and concessions which are available under the Central Income Tax Act to specified industries of national importance of which tea is one, are not available under the Agricultural Income Tax Acts of the Kerala, Mysore and Madras Governments. The planters' plea is that the combined incidence of the Union income tax and the State agricultural income tax on tea and agricultural income tax on coffee and rubber should not exceed the net tax payable if the whole of the tea, coffee and rubber incomes were treated as subject to Central taxation.

The Kerala levy of 5 percent sales tax and a 5-percent super tax on tea sold through the Cochin auctions is particularly resented by the planters. This levy is in violation of the principle that goods for export should be exempted from sales tax. Besides, if the principle of exempting the first two sales from the levy of sales tax is accepted, teas sold through auctions for export will not attract this tax.



Unless the Tea Finance Committee deals with the problem of the ever-increasing taxation, it cannot find a satisfactory solution to the resource problems of the tea plantation industry. Most of the planters are working on large overdrafts. Any additional loans offered would only mean increasing their obligations to add to their cost under interest, besides having to pay back the principal. What the industry wants is a more reasonable tax structure. There are indications that the Government may appoint similar committees for the coffee and rubber plantation industries some time later and if it happens, the lessons learnt from the experience of the Tea Finance Committee would be of use to them. Any committee which examines the problem of resources for any branch of the plantation industry cannot avoid looking into the tax structure and if it really wants to see that the resource position is improved to any satisfactory level, it will have to recommend a rationalisation of the present tax structure of the Central and State Governments.

One interesting suggestion for coordinated approach to fiscal levies on plantations is that the Centre should take over the entire taxation of income and a fair share may be given to the respective States in keeping with the revenue they are currently receiving from the plantation industry. Although this may not fall within the precise jurisdiction of the Fourth Finance Commission, it can also be asked to examine this question in anticipation of a co-ordination of the taxes that fall on the plantation industry.

Depreciation of Field Assets

Among the other factors which affect the growth of the plantation industry is the disallowance of depreciation on field assets. Although plant age and soil become exhausted, no depreciation is allowed on planted assets and this factor lowers the ability of the industry to find the resources for replacement. The Tariff Commission on rubber has accepted the fact of the rubber tree having a limited economic life and accordingly provided for depreciation against capital consumption as in the case of other fixed assets. The same wastage takes place in the case of tea and coffee so much so they are also entitled for this depreciation allowance.

Another disability is that new plantings are treated as capital expenditure. Planters' case is that as a powerful incentive for expansion, the actual cost of those plantings should be charged to revenue. If for any reason, the Governments can not see their way to agreeing to this, a development rebate at 50 percent of

Outlay on labour quarters in South Indian tea plantations

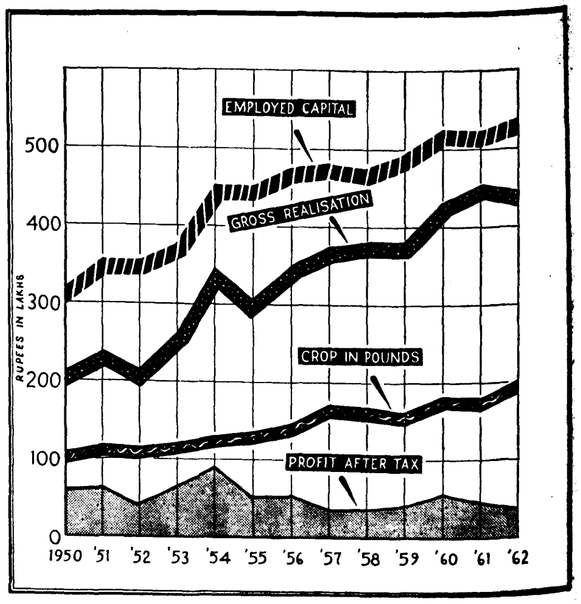
the cost incurred may be allowed on all new plantings, whether replacement or extension.

Capital diverted to fulfil the obligations under the Plantation Labour Act now forms a large portion of the fixed assets of the planting companies. When these welfare measures were originally conceived, the availability of resources was fairly favourable. In the last ten years, the position has undergone a considerable change. In some cases, these welfare measures now exceed the cost of established plantations. This capital is not an investment as there is no financial return on it, so much so that it cannot be called for from the public. Therefore, it has to come from out of current savings. As in the case of new plantings, a 50 percent development rebate is sought by the planters with a view to enabling them to maintain the same tempo of welfare expenditure as in the past.

The planting districts of south India had experienced a prolonged and severe drought during the first half of 1964. Consequently, most of the crops were hit adversely. The worst hit was tea, the production of which was lagging behind last year's by about 17 million lbs by September-end, the period covered by the latest available figures at the time of writing. The loss was so big that in spite of the improvement in weather, planting circles hold the view that it is beyond the industry's capacity to make up this 17 million lbs by the end of the year, although they are confident of narrowing the gap substantially if weather remains favourable as it is at present. South India had a record output of tea at 193 million lbs in 1963. Production during the first nine months of the current year was to the tune of 126 million lbs, against 143.3 million lbs in the same period of 1963. Fortunately for the country, north India has had a very favourable weather this year, and the production there to the end of September at 441.2 million lbs was a gain of 43.6 million lbs over that of the same period last year. Present indications are that in spite of any possible shortage in south India, the Indian production of tea in 1964 will be a record 800 million lbs, thanks to the abundant harvest in north India.

Trend of Tea Exports

As for exports, both south India and north India have failed to keep up the tempo of the previous two years. The smaller crop has had its reflection on the exports from the south. Although production in north India has been higher, exports had been lower up to the end of June because of the lesser availability of tea during the first few months of the year. This was the result of smaller crops and higher exports in the previous two years. Exports have been looking up since June from both the south and the north, and the feeling in official circles is that by the end of the year, it will be possible to export at least 510 million lbs.



During the course of the year, an auction centre was opened in Coonoor on the Nilgiris and the result so far is said to be encouraging. Because of the presence of a large number of small growers with common teas to offer and the penal rate of a 5 percent sales tax imposed by the Kerala Government on teas sold at Cochin auctions, the Coonoor centre is expected to get a substantial share of the teas grown on the Nilgiris. This area has about 6,000 small growers, who feel that the classification of the Nilgiris as Zone IV is unfair, as its excise rate is fixed at 42 paise a kilogram. If a proper average is taken inclusive of the prices realised by the small growers, the average for the Nilgiris would be much lower than the auction sales average for selected teas at Cochin. A reclassification of the Nilgiris as Zone II is sought by the planters.

Record Coffee Output

A record volume of about 68,500 tonnes of coffee reached the Coffee Board's pool from the 1963-64 crop during the year. The Board had to carry out a big marketing operation in disposing of this crop. According to the latest available report, it had sold for export just over 30,000 tonnes from the 1963-64 crop by the end of October. Releases in the internal market during the first nine months of the year came to a total of 25,454 tonnes, representing a marginal increase of 344 tonnes over that of the corresponding period of last year. Internal consumption has been remaining static around 34,000 tonnes a year for some time now. It is not known how much of this was due to the rigid release policy of the Coffee Board, and how much to a market sense of adequacy. But with a production reaching around 70,000 tonnes, probably by the next season, the export quota for India at just over 22,000 tonnes is wholly inadequate. Given favourable weather, India's output could be well over 80,000 tonnes, of which 45,000 tonnes should easily be available for export.

The export quota of 22,000 tonnes which India has been given under the International Coffee Agreement, represents a meagre 33 percent of her production, compared with a quota of up to 80 percent of the maximum production fixed for some other countries. India has been pressing for an upward revision of her quota. The International Coffee Organisation has deferred a decision on this request, pending the report of a team it has deputed to India to study her production and export capacities in the light of her request. Planting opinion in India is that production by the end of the third plan period will be sufficient to meet internal demand on present levels and leave a surplus of 45,000 tonnes to 50,000 tonnes a year for export.

Another bright feature of the year was the higher return the growers had received on their crop. As against a final pool payment of Rs. 2 a point for the 1960-61 crop of 67,800 tonnes, the payment up to August 1964 on the 1963-64 crop had reached this figure. Although the final shape of the total payment for the season is not yet known, the Coffee Board authorities have already announced that the growers can expect a handsome payment. The main factor which had enabled the Board to pay a good price to the grower in spite of the big harvest was the higher price realised on export coffee. Export price has been ruling high for some time now on account of a shortage in the world market, brought about by successive crop failures in some countries like Brazil. Open auction was introduced again in India for export coffee during the year. Its results so far are considered encouraging.

Shrinking profits in plantations

Rubber Ceiling Price Removed

Towards the end of 1963, the Central Government withdrew the control over the maximum price fixed for natural rubber. It must have been thought possible that once the maximum price limit was removed in a country where production was hardly sufficient to meet even 50 percent of the rubber required by the manufacturing industry, the price would automatically rise. It must be credited to the capable manner in which the manufacturers were able to secure their supplies without in any way allowing the prices to rise.

There was a further increase in the indigenous production of natural rubber during the year. The 1964 output is expected to reach 46,000 tonnes, against 38,000 tonnes of 1963. In the coming years, the rate of increase would be even higher as new plantings come into being.

According to present forecasts of production and internal demand by the manufacturing industry for the next two plan periods, there should still remain a large gap between indigenous supply and total demand. Based on this there is a move for the setting up of more synthetic plants. There is at present one unit in this country with a capacity to produce 30,000 tonnes of S. B. rubber a year. Its owners are now finding it extremely difficult to sell this quantity due to the dearth of buyers. The reason is said to be the high cost of the material. It is at present priced at about Rs. 4 a kilogram, against Rs. 3.23 a kilogram of the first grade natural rubber produced in south India. It is said that synthetic rubber is not in a position to compete in point of price with natural in the near future. However, both the producers and consumers of natural rubber are unhappy about the favoured treatment given to the producer of synthetic rubber in U.P. by the Government of India. It is said that the developmental efforts which are being made on behalf of the natural rubber industry would largely be negatived by the new policy of the Central Government that every manufacturer should lift a certain percentage of the locally produced synthetic rubber in order to get his import licence.

Replanting Rubber Areas

The programme of replanting old and uneconomic rubber area is being actively pursued by many a grower. It is expected that much progress will be made in this direction in the coming years. New plantings also are taking place on an extensive scale. The attractions for both appear to be the fairly good return on rubber as well as the exemption given to rubber estates from the ceiling provisions of the land reform legislation of the State Governments.

Fresh plantations of high yielding strains are giving a good yield. The average yield from each acre has exceeded 900 lbs, where replanting has been done. This compares well with the yield rates in Malaya. According to one estimate, the yield rate is probably higher in certain parts of south India than in Malaya. This estimate rests on the fact that the Indian tapper exploits his plants far more lightly than his counterpart in Malaya where the number of tapping days is at least 70 more than in India. Several tapping days are lost in south Indian plantations in festival and other holidays and due to casual absence. The rubber planting industry now finds itself in a position to compete with synthetic rubber even at the ruling price of about Re. 1 a lb. About 65 per cent of the rubber area in the country has been replanted since 1953. These areas are giving on an average an yield of 900 lbs an acre. It is the high yield that makes the Malayan rubber planting industry fully competitive with synthetic producers.

Raising Cloth Production: Partial Control May Hamper Effort

In introducing partial control on cotton textiles to check the rise in prices, the Government has overlooked the industry's difficulties. Although the producers have decided to give it a fair trial, they feel that there can be no lasting solution to the price problem unless the mills are allowed to expand their capacity without any restriction.

By

RAMNATH A. PODAR

AGAINST the third plan target of 17.4 yards of cloth a head a year, the present availability is only 15.7 yards. This figure is, in fact, lower than the *per capita* consumption of 16.08 yards at the beginning of the second plan. This surely calls for vigorous measures to increase the production of cloth and the productive capacity of mills, but the measures that have been taken in this direction have been halting and half-hearted.

Even when India becomes an industrially advanced nation, the cotton mill industry will remain easily the most important national industry. This is so for the simple reason that clothing is one of the primary necessities of man and cloth production will have to be increased to meet the needs of the rising population. Furthermore, in a tropical country like India, man-made fibres can never be a substitute for cotton. It must also be realised that the cotton mill industry is the third highest foreign exchange earner and can increase its foreign exchange earnings provided it is allowed to do so.

Challenging Opportunity

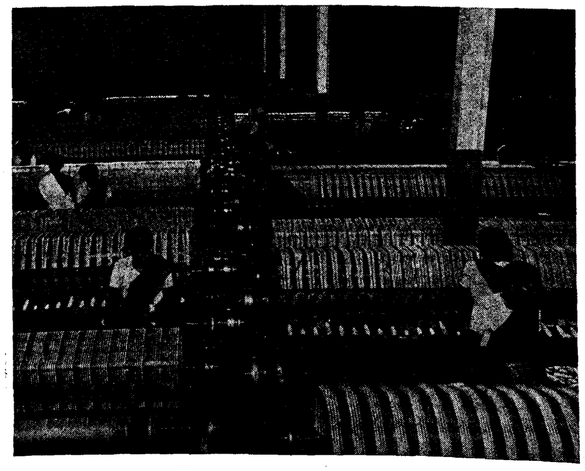
The future of cotton textiles lies with the cotton-producing countries. With her vast acreage of 20 million acres under cotton, India has the potential to assume the leadership in the world markets. Unfortunately, the Government has failed so far to rise equal to this challenging opportunity.

This year's Central Budget afforded an excellent opportunity to the Government to accord to the cotton mill industry the priority that it deserves. Under the Budget, tax rebates have been conceded to certain specified industries in view of their importance to the country. The Indian cotton mill industry pleaded that it should find a place in this list of priority industries, but its plea has not been heeded. On the other hand, the industry had the misfortunue to witness in this year the publication of a document—the Powerloom Enquiry Committee's report—which recommends that during the fourth plan there should be no expansion of the mill sector's capacity.

The highlight of the current year was the scrapping of the voluntary price regulation scheme. The industry has welcomed this event for very good reasons. As the name of the scheme suggests, it was adopted voluntarily by the industry although at the request of, and in co-operation with, the Government. The scheme was introduced in August 1960 to check the rising prices of cotton textiles in sympathy with the soaring prices of all other commodities. The rise in prices was a necessity forced on the industry by extraneous circumstances. Between 1956 and 1958, the industry passed through a severe crisis caused by an oppressive excise levy imposed at the beginning of 1956. Relief came at last in 1958, but the industry's difficulties caused by the earlier heavy accumulation of stocks and the general economic malaise persisted until the middle of 1959. It was after this that the industry began to recover, but was immediately faced with two developments.

In the first place, there was a severe shortage of cotton and, moreover, the prices of Indian cotton at this time rose above world prices and continue to remain at that level. Secondly, there was the Central Wage Board's award which inflated the industry's wage bill from January 1960 onwards. Cotton and wages account for more than 75 percent of the industry's production costs, so it is natural that the prices of cloth should increase. The Government, however, wanted the prices to be brought down and bowing to its wishes and at considerable sacrifice to itself, the industry accepted a voluntary cut in textile prices. The first reduction was announced in August 1960 and it was followed by another in September. As the Government desired a bigger gesture from the industry, the prices of yarn and cloth were further brought down—the former in December 1960 and the latter in January 1961.

Voluntary Price Regulation



The voluntary price regulation scheme worked fairly smoothly in 1961 and the best part of 1962. But it was always conceived as a temporary measure which was to be replaced by a scheme to be enunciated by the Tariff Commission. Unfortunately, the Government never published the Commission's report, so the stop-gap scheme remained in operation beyond the time when it could be useful, and the inevitable results followed. The simple fact is that the prices of all the elements that go into the cost of production of cloth began to rise from the middle of 1962, and by the middle of 1963 the cost of production increased by 14 percent. By June 1964, the price increase required was of the order of 16 percent. It was obvious that the prices of cloth could not remain pegged to a level which had been rendered unrealistic by the rising cost of production.

In spite of the industry's persistent demands for an increase in cloth prices commensurate with the rise in production costs, the Government remained impervious. The result was that the scheme went completely out of alignment. The Indian Cotton Mills Federation, therefore, repeatedly urged the Government that the scheme should be abolished. After protracted negotiations, the Government decided that the voluntary price regulation scheme should be scrapped and replaced by partial control. As a matter of fact, the Government could easily have tried complete decontrol, particularly because of the easy supply and demand position, but the Government probably felt that decontrol was a risky proposition. The alternative adopted was partial control. Here too, the Government at first agreed to the proposal that a specified proportion of the industry's entire output should be brought under control. Subsequently, however, despite the industry's plea to the contrary, the Government decided to impose control on the production and prices of the entire output of four categories of cloth, namely, *dhotis*, *sarees*, long-cloth and shirting.

The scheme came into force on 20th October, 1964. It is estimated that the production of the four categories would amount to 45 percent of the civilian deliveries of mill cloth. A schedule of realisation multipliers was circulated to the mills in the last week of September to enable them to mark the prices on the controlled varieties of cloth by taking into account the cost of cotton and the conversion and processing charges. The schedule had been drawn up by the Government in consultation with textile technicians, but in the second week of October it was substantially modified on the ground that the prices indicated by the earlier multipliers were considered higher than those envisaged by the authorities.

Rising Production Costs

In the case of the majority of varieties, the prices under the new scheme are much lower than those fixed under the voluntary price regulation scheme. In other words, the increase in the cost of production, to which the industry has repeatedly drawn the attention of the Government, had not been fully taken into

Women workers in a textile mill

account. There are certain sorts which have been continuously running over a long period at prices fixed years ago under the industry's scheme without any additions to them due to rising costs. The producers of such varieties expected an increase in their prices by at least 10 percent. But this has not materialised.

Other equally valid objections can be levelled against the control scheme, but the industry has decided to give it a fair trial. It would, however, be pertinent to recall here what the Central Minister for Commerce said about it on 28th September, 1964. "The Government is fully aware", he said, "of the difficulties involved in the implementation of a scheme of statutory controls of this nature" and appealed to the industry, trade, the State Governments and the consumers to ensure its success. High-powered vigilance and enforcing bodies have been created for this purpose. So the industry has again entered the era of controls. But it is convinced that a great future awaits it if only the production of Indian cotton can be raised to the required level. With more than 19 million acres devoted to cotton, the task of realising the target of 7 million bales a year cannot be regarded as overambitious. It is unnecessary to ask for a larger acreage for this crop by ignoring the equally pressing claims of foodgrains. In fact, the area under cotton in this country is the largest in the world.

Raising the Yield

What is required, therefore, is the adoption of suitable measures for increasing the yielding capacity of land which today is extremely low. For instance, the yield of cotton an acre in India is 115 lbs, against 543 lbs in Russia, 457 lbs in the U.S.A., 463 lbs in the Sudan, 586 lbs in the United Arab Republic and 228 lbs in Pakistan. The much-cherished goal of self-sufficiency in cotton can be realised by India if only she can reach half of the world average of 290 lbs or 297 lbs an acre.

The Central and State Governments and the Indian Central Cotton Committee have been making ceaseless efforts to hasten the attainment of self-sufficiency in cotton. Since the industry has a large stake in the realisation of this goal, the Indian Cotton Mills Federation, its representative organisation, has drawn up a scheme with a view to offering its own assistance in furtherance of the objective.

The Federation's project will operate in five specially selected units of one thousand acres each situated in five of the most important cotton growing regions of the country. The first centre was inaugurated in Tudialur, near Coimbatore, on 13th October, 1964, by the Chief Minister of Madras. There will be similar centres in Maharashtra, Gujarat, Rajasthan and Punjab. An essential feature of the Federation's scheme is the rendering of assistance to the farmers in the project areas to adopt modern agricultural practices. They will be given better seeds, apart from fertilisers, and will be encouraged to adopt plant protection measures. Trained men will be stationed at each centre to undertake this responsibility. Their work will be supervised and guided by a senior agricultural expert who has already been appointed. For the present, the Federation's scheme is a modest one. It will certainly be expanded if it yields promising results.

It will, however, not be enough to make the country self-sufficient in cotton. This cotton can be spun and woven efficiently and at a reasonable cost only by the mill sector. Handlooms have no doubt a part to play in producing cotton textiles. But barring the cloth which the handlooms can produce economically and to the required standard of quality, the rest of the country's cloth requirements can be supplied to the satisfaction of all only by the mill sector. For more than two decades, mills were prevented from expanding their loomage and all encouragement was given to the so-called decentralised sector. Had it not been for this hostile attitude towards the mill sector, the cloth situation today could well have been entirely different.

However that may be, some marginal expansion in the spinning and weaving capacity of the mill sector has now been permitted. But what is required is that the mills should be allowed to expand their capacity without any restrictions. Any move to freeze the capacity as recommended by the Powerloom Enquiry Committee will be disastrous from the point of view of the national economy, Government revenues, export earnings, employment of workers and earnings and above all the interests of the consumer which seem to have been ignored by the Committee.

THE CHARTERED BANK GROUP

These are the territories served by The Chartered Bank group through a system of over 200 branches extending to most centres of commercial importance in India, the Middle East, South and South East Asia and the Far East.

New Perspectives Before Indian Jute Industry

The jute goods industry has achieved the third plan output and export targets well before schedule. As India's biggest foreign exchange earner, it faces the future with confidence in spite of the challenge from substitutes.

By

A SPECIAL CORRESPONDENT

TYPICALLY, the year 1964 has not been uneventful for the jute industry. It has again shown how vulnerable the mills are to awkward changes in their raw material supply, with damaging effects on market stability and manufacturing costs. The year has also been notable in other, more congenial ways. Demand for the industry's products has been strongly maintained, both at home and abroad, although the pattern of offtake has varied. Substantial progress has been made with the development of quality control and inspection systems, and also in the allied sphere of standardisation. Product research and development, though long-term and somewhat daunting activities, are continuing to receive increased attention. There have also been international stirrings, with an unusual number of cosmopolitan meetings concerned with jute—all evidence of a growing awareness that, overriding purely national interests, there is a battle to be fought for jute itself.

In the financial year 1963-64, the Indian jute industry produced 1,320,000 tons of goods and exported 900,000 tons. By so doing, the industry reached the targets set for it in the (final year of the) third five year plan, which in terms of output and export were 1.3 million tons and 900,000 tons, respectively. These figures are likely to be improved upon in the current year. It is understood that no other sector of the economy has matched this performance. The jute industry is, of course, pleased with its achievement but not unreservedly. Neither the industry nor the national planners could have foreseen the spectacular rise which took place during the early years of the third plan in two particular fields of export, namely, jute carpet-backing and the trade in jute goods with Russia; and it is these two factors, outweighing all others, which have been responsible for the jute industry reaching its targets.

Progress of Carpet-backing

In 1960-61, which was the year before the third plan was launched, the industry's exports of carpet-backing amounted to some 40,000 tons, representing 5.1 percent of the total exports By 1963-64 the statistics were reading 108,000 tons and 12 percent. Similarly, in the case of trade with Russia, there has been a remarkable transformation. In 1960-61, our total exports of jute products to that country amounted to 21,300 tons, representing 2.7 percent of the total exports while in 1963-64 the corresponding figures were 70,200 tons and 7.8 percent, respectively. In terms of production only, the attainment of the third plan target was, of course, greatly assisted by the continuing growth in the domestic consumption of jute goods. The internal offtake in 1960-61 amounted to 306,000 tons, rising to 374,000 tons in 1963-64.

From the point of view of bulk marketing, carpet-backing cloth for the tufted carpet industry is the only really major addition to the Indian jute industry's list of sale products for decades. Whether it will continue to feature prominently on that list is by no means certain. At present, most of the jute carpet-backing produced is marketed in the U.S.A. It still enjoys consumer preference there, but the manufacturers of synthetics are breathing hard down the jute industry's neck. The Indian jute delegation which visited North America in June this year came back with the strong impression that India will eventually, and before very long, lose business in the carpet industry to the petro-chemical, paper and fibre-glass complexes, though to what extent is unpredictable.

Main Problems Before the Industry

There are other important reservations in assessing the recent performance of the Indian jute industry and the latter's liability to continue to improve on this performance. These are concerned with (1) raw jute supply, (2) the steady expansion of the jute manufacturing industry in Pakistan and (3) technological advances in the world at large.

As already indicated, the past year has seen a recurrence of jute supply problems. This is bad enough in itself but worse when one considers that the cost of the Indian industry's raw material represents some 60 percent of the total cost of the finished product. The sharp and speculative rise in fibre prices in July and August, shortly after the commencement of the new jute season, was induced by reports of a short crop in Pakistan and some damage to the Indian crop by floods. For a time, in terms of simultaneous business, mills were incurring a loss on every ton of goods they produced. The price of Assam Bottoms touched Rs. 47 a maund in the third week of August, and this is to be compared with the minimum support price of Rs. 30 a maund operative in the previous season.

The situation improved only after various counter-measures were taken, including voluntary restraints on production by mills, the imposition by the East India Jute and Hessian Exchange of margins on hedge and T.S.D. contracts, the release of buffer stock jute with a deferment of its replacement, and the introduction by the Jute Commissioner of weekly maximum jute purchase quotas for the mills. (The last measure illustrates the vagaries to which the jute trade is subject: only a few months previously, in the 1963-64 season, the Jute Commissioner had been issuing minimum jute purchase quotas to support prices.) The release of licences for the import of raw material also helped ease the situation, although the consistently high prices prevailing in Pakistan have not offered very favourable marketing opportunities. At the time of writing, no reliable estimate is yet available of the current season's jute crops in India and Pakistan but almost certainly there will be a reduced carryover at the end of the season, i.e., in June 1965. It is also unlikely that replacement of the buffer stock jute will be practicable to any significant extent before next season.

Fibre Needs of Fourth Plan

These preoccupations within a season's compass are normal to the jute mill owners but both they and the Government have also to think, and are beginning seriously to do so, about the long-term problem of jute supply. If the fourth plan production target of 1.7 million tons of jute manufactures is to be realised, viewing the problem purely as a physical one, then an annual requirement of fibre of close on 10 million bales will have to be met by the end of the plan. Against this the present indigenous production is 7 million to 7.5 million bales and the consumption some 8 million bales. Considering the very marginal increase in the acreage yield of jute achieved in the last 18 years and the growing pressure on arable land for increased food production, it does not seem realistic, even after making reasonable allowance for more intensive cultivation, to assume that India will be able to produce 10 million bales of jute and mesta fibre by 1970-71.

A target of 9 million bales will be difficult enough to attain, and then only if there is a radically new approach to agricultural administration. The methods by which jute yields can be significantly improved are fully known for a long time. What is needed is an effective means of translating the theory into practice; or, if it is considered that the administrative machinery for this already exists, to make that machinery work. This is one of the most challenging situations facing the jute industry and, more especially, the Government.

It seems, too, that if the demand for India's jute goods develops in line with the present production programme, the country is going to be dependent on imports of fibre for quite some time to come. Here again there is a large question mark, as the ready availability of imported fibre cannot be confidently assumed.

Shortage of Quality Fibre

The third problem in the raw material context is the shortage of good quality fibre in India. The demand for this has increased with the shift in production to finer fabrics and speciality products, but it is a demand which is not being fully satisfied. The recent introduction of I.S.I. specifications for Indian hessians, requiring a better average standard of product from the industry, could well make the shortage of quality fibre even more acute. This only serves to underline the pressing need for improved methods of cultivation throughout the jute growing areas of India.

Plans in Pakistan for the installation of additional loomage continue to come off the drawing board, and official pronouncements from time to time are not lacking in ambition. A target of 22,000 looms by the end of 1970 has been set, compared with the existing complement of around 11,000 looms. Such proliferation, if it can be accomplished in the time prescribed (which is very doubtful), will seriously affect India's export trade, quite apart from upsetting the present balance of world jute manufacture and commerce. There are, however, many factors, some discernible now and others only potential, which could alter the trend of events. Raw material availability is one such factor, efficient maintenance of plant and machinery another, physical limitations on building, equipment and management programmes another, and changes in the absolute demand for jute products yet another.

The year 1970 is a long way off, and much could happen between now and then. In the meantime, India cannot afford to nourish herself on expectations, and, with no rapprochement between India and Pakistan on jute manufacture presently in sight, policy-making in India must be on the basis that competition from

Pakistan will intensify. How that competition can be effectively met is a problem still awaiting a solution; and the temporary reprieve afforded by the prolonged strike in the Pakistani jute industry does not lessen the urgency of finding such a solution.

Scope for Joint Consultation

The trade rivalry between the two major Asian producers does not, happily, preclude joint consultations in areas where common benefit can be seen, as for example, in research to promote and extend the utilisation of jute. Both countries, together with those others abroad with established jute goods industries, have a common interest in keeping jute fashionable in the face of rapid technological developments throughout the world. The loss of markets which jute has sustained in the past 25 years to substitutes is by now common knowledge. This process of substitution has in no way spent itself. It has simply been obscured in the last decade or so by jute's gains (largely as a packaging material) in the developing countries and, to a lesser extent, by the development of new outlets for jute, as for example in carpet-backing, laminated bags for special uses, and decorative fabrics. This diversification of manufacture is encouraging, but it represents as yet only a small percentage of world jute production, which is still heavily committed to the packaging market. There are ominous signs that straight jute packaging has now reached the limit of its marketability in the more sophisticated countries; and this can be expected to happen in due course in the so-called developing countries, which are eager to identify themselves with the "developed". How will jute fare then?

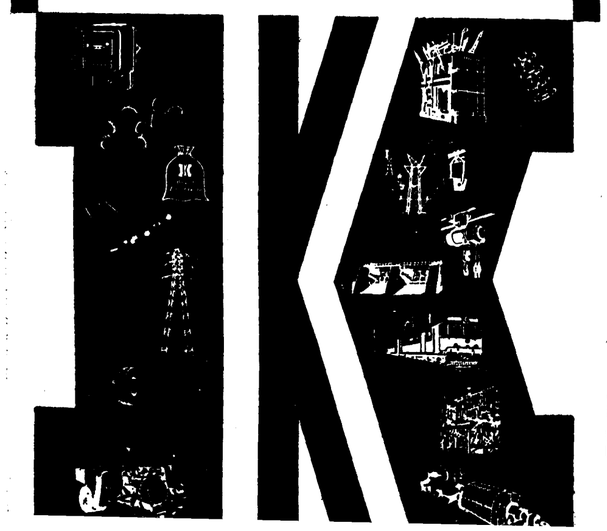
Convention, it seems, must go by the board if jute is to retain its place in the register of important international commodities, such as for example wool and cotton (not to mention the ubiquitous man-made fibres). A very recent illustration of the precarious position which jute now occupies has been afforded by the development of a polyethylene woolpack, now being marketed in Australia by Japan. Here is another challenge to the jute industry, and an opportunity to prove that jute can adjust itself to modern tastes and needs. The loss of this wool market would be a severe blow to the jute industry, just as its preservation, if present endeavours are successful, will be a fillip to jute product research and development.

Research Conference

The Indian Jute Mills Association is to be commended for its initiative in convening, at the end of November this year, a conference of Research Directors of the Indian, Pakistan and United Kingdom jute industries. This will be an important landmark, as it will be the first occasion on which there has been joint consultation between these three leading jute goods manufacturing countries on the future of jute in world commerce. Among the subjects discussed were raw material in its various aspects; the uses of jute; product development; alternative materials, methods and processes; collaboration in textile research; quality control and standardisation; and the processes of manufacture.

Earlier in the year there were two other international jute conferences, both very much concerned with integrated planning for the future. The first of these was the Congress of the Association of European Jute Industries held at Paris in May, and at which the Indian, Pakistan and Japanese producers were represented by invitation, as observers. Attention was focussed on the decline in the European jute industry's share in world production from 32 percent in 1954 to 17 percent today, and a plea was made for balanced progress in the world jute economy, with the established and skilled European industry continuing to play its part. The Congress also emphasised the need for collaboration between the major jute producers and converters in stabilising jute prices.

An even more widely attended conference—the first session of the F.A.O. Study Group on Jute, Kenaf and Allied Fibres—took place in September in Rome, with 18 countries (including India) represented in addition to seven international organisations. The deliberations were wide-ranging, and covered long-term structural problems in the world jute economy, the pattern of manufacture and demand, the grading of raw jute, instability of supply and prices and the means of reducing it, and the improvement of statistics. It was agreed that the second session should be held in about one year's time. Meanwhile, a Working Party on Stabilisation has been set up and will have its first meeting in Dacca early next year.



Turning from these international exchanges, which, it is hoped, foreshadow a concerted approach to the solution of the jute industry's problems, we might consider some of the more important developments in the Indian industry during the year under review. The abolition of the Indian Jute Mills Association's Working Time Agreement shortly after the commencement of the year, following consultations between the industry's leaders and the Government of India, was a major and unexpected event. For the first time in 25 years the industry found itself without the customary instrument to regulate its production. Commenting on this step, the chairman of the I.J.M.A. said at the last annual general meeting of the Association that he did not think they need fear any adverse repercussions, although he stressed that the Agreement had shown itself to be an admirable means of applying controls when they were required. One surmises that the Agreement, if it had still been in existence, would almost certainly have been used to help check the unwarranted rise in the jute market in August. As it was, mills individually took action through voluntary reductions in their output.

Two Administrative Bodies

Two new administrative bodies for jute were set up by the Government of India during the year in the shape of a Jute Textiles Consultative Board and a Jute Goods Export Promotion Advisory Committee. The resolution appointing the Consultative Board, of which the Commerce Minister is chairman and on which the industry and trade are represented, stated that the Government would endeavour as far as possible to consult the Board generally on

important matters concerning the jute industry, particularly in regard to production, distribution and exports of jute goods, imports and exports of raw jute, matters relating to the development of the jute industry, research, and the procurement of raw materials, machinery and accessories required for the industry. The main function of the Export Promotion Advisory Committee, which has the Jute Commissioner as its chairman and also includes industry and trade representatives, is to act as a channel of communication between the Government, the industry and the exporting interests so as to facilitate discussion of export problems.

Good progress has been made with the development of quality control systems in the jute mills, under the stimulus of the I.J.M.A.'s voluntary scheme of quality control and inspection introduced in the latter part of 1963. The administrative machinery established by the Association, under the day-to-day management of the I.J.M.A. Quality Control and Inspection Committee (I.J.M.A.Q.C.-I.C.), has functioned most effectively and it has been recognised as the competent authority to deal with pre-shipment inspection of jute goods for export. Compulsory pre-shipment inspection, based on I.S.I. certification marking, will be introduced from 1st January next year. Four standard specifications have recently been finalised and issued, these being for Indian hessians, A Twills, heavy Cees and Cornsacks. Other standards under preparation include one for B Twills and another for "Seaworthy Packaging of Jute Products".

Better Deal for Customers

There is no doubt whatever that the Indian jute industry's customers are going to get a better and more uniform quality of product as a result of these disciplines, although it will be some time before their full effect makes itself felt. Instrumentation for quality control in the mills is not yet complete, additional staff have to be trained and gain experience, and quality consciousness has to percolate right down from the management to the factory floor. As for the I.S.I. standards, these are being treated as tentative for a period because experience alone will tell whether they are suitable or require modification in certain respects. The industry and its customers have been trading for over 100 years on the basis of the omnibus standard of "fair, average Calcutta quality". The translation of this guarantee into scientific terms is no easy task, but given time it will be accomplished.

Release of Buffer Stock

Reference has already been made to the release of the buffer stock jute to the mills. This decision was taken in August as a means of helping to counteract the abnormal rise in jute prices. The president of the Jute Buffer Stock Association, when speaking at the Association's annual meeting in September, correctly pointed

A carpet-backing loom

out that this operation could be seen as vindicating the principle of maintaining a buffer stock. He went on to say, however, that there was need for building up a really substantial stock amounting to around three months' consumption, as compared with the five to six weeks' stock which the J.B.S.A. had. The value of buffer stock operations was acknowledged at the Jute Study Group meeting in Rome in September, in the context of the discussions on stabilisation. Whether there could be an international arrangement, was canvassed at this meeting, problematic, but the possibility likely to be further examined.

The jute industry's future, in India and generally, is clearly exercising the minds of all concerned. If the past year has done no more than throw up indications that the industry is trying to shape events, rather than allow itself to be shaped by them, then some advance has been made.

Fourth Plan Coal Target Should Be Based on Realistic Demand Estimates

Coal production, after a steady increase, has lately shown signs of stagnating. There is a surplus of the lower grades. The relative overproduction is due to wrong estimates of demand. The fourth plan output target should be based on accurate and realistic estimates of the economy's coal requirements.

By

A SPECIAL CORRESPONDENT

THE general slowing down in the growth in the nation's economy which has been apparent over the last year and a half has had a serious impact on the state of the coal industry. Whereas on the eve of the Third plan the coal industry looked forward hopefully to a progressively rising demand, the picture now is one of a slump in demand, and a fading away of the earlier expectations. It is to be hoped that this is a temporary phase, but such a situation on the eve of the fourth five year plan cannot be ignored. It is, therefore, essential that stock be taken of the situation so that mistakes may not be repeated, and any lessons to be drawn therefrom are clearly understood so that by the time the fourth plan comes into operation, the industry's economic ills—for it undoubtedly is at present a "sick" industry economically—will have been diagnosed correctly and the appropriate remedy applied.

The industry's basic problem has been that the sluggish progress of industrial projects has continued to plague the demand for coal, and embarrassing surpluses of low and medium grades of coal have appeared which at times have compelled distress sales, thereby depressing the profit ratios of coal companies. As a corollary to this, coal stocks at pitheads have accumulated, and this in turn has been reflected in an overall fall in production.

Dealing first with the question of supply and demand, the following statistics of production speak for themselves:

TABLE I

OVERALL PRODUCTION

	(Million tonnes)
1956-57	40.95
1961-62	55.22
1962-63	63.83
1963-64	66.33
1964-65	63.00*

* Estimated.

From the overall production figures it would appear that the present production, which is likely to be some 3 million tonnes less than the 1963-64 production figure of 66.33 million tonnes, is now more or less in line with current demand.

TABLE II

COMPARATIVE STATEMENT OF GRADEWISE PRODUCTION

(In million tonnes)

Grades	1956-57 i.e., first year of second plan	1960-61 i.e., final year of second plan	Difference between cols. (2) and (3)	1963-64 i.e., third year of third plan	Difference between cols. (5) and (2)	1964-65 April to September Actuals	1964-65 Estimated

Non-graded*	8.213	4.080	− 4.133	6.440	− 1.773	3.429	6.858
Total non-coking	26.032	39.740	+ 13.708	48.836	+ 22.804	23.190	46.380
Grand total	40.067	55.720	+ 15.653	66.333	+ 26.266	31.376	62.752

* Up to 1960-61 included all outlying coalfields. Since 1960-61 includes Singareni and Assam only, and also the Neyvelli lignite project.

Note :
(A) Since 1962 Grades A, B and C.
(B) Since 1962 Grades D and E.
(C) Since 1962 Grades F, G. and H.
(D) Since 1962 Grade HII.

The gradewise production figures reveal that while the production of superior grades of coking and non-coking coals has remained more or less constant and the production of Grade I, both coking and non-coking has been steadily increasing—such coals now account for some 42 percent of the total production of coal—the production of medium and lower grades has also increased. The result has been to accentuate the pressure of demand for superior grades while there has been a glut in the inferior coals in the medium and low grade varieties.

Curb on Coking Coal

As for coking coal, a temporary restriction which augured ill for the producers of these coals and could well have had very serious effects on their programmes of expansion and finances, was the instruction issued in April 1964, pegging the output of coking coal at 12.5 million tonnes, against the current rate of 17.5 million tonnes on the ground that the reduced figure was all that was "immediately" needed by esential consumers and stating that it would not be possible, thereafter, to release coking coal to non-essential consumers as this would be in contravention of the Government's conservation policy. That the instruction was unnecessary and issued in haste will be apparent from the fact that six months later it had been estimated that, to meet the requirements of steel plants and cokeries, an additional production of 1.17 million tonnes of coking coal would be required over the accepted figure of 25.98 million tonnes of coking coal to be produced by the private sector during the fourth plan period. Fortunately, the instruction was withdrawn before any serious damage was done, but the consequences would have been most serious if the collieries concerned had been forced to put a stop, albeit temporary, to their expansion programmes and to lose heavily on the capital that had already been sunk by way of the investment needed for such expansion.

Moreover, this instruction ignored the facts that the current excess of production over consumption by steel plants, merchant cokeries and washeries was only temporary, that mining is a long-term process, and the work of development has always to be planned in advance of actual requirements. An offtake must, therefore, be provided for such coals even though they may not all be required immediately for metallurgical purposes. This is the inescapable price to be paid for the time lag between production and utilisation since if the latter is restricted at any particular juncture, it will be extremely difficult to build up production in a short time with consequent adverse effects on the rest of the economy.

As it is, the production of coking coal by private sector collieries has remained static over the last few years primarily because the major part of production is from old and well-established collieries where development has, in most cases, been substantially completed. Moreover, most of the increased production required from the collieries concerned can only be obtained through extensive sand-stowing and sand is in extremely short supply; to remedy the shortage of sand, the Coal Board's scheme for setting up central ropeways for sand for stowing purposes must be expedited.

Another reason for the reduced production of the better grades of coal is that, due to the reduced offtake of coal, several coal companies have reconsidered their ambitious production programmes and postponed the implementation of their expansion schemes until such time as they can find a market for the increased production, most of which will come from the increased investment by way of mechanisation. Finally, cognisance must also be taken of the fact that there has been downgrading of coking coals on a large scale with the result that the planned production of the original higher grades has fallen while there has been a corresponding increase in the unplanned production of the lower grades.

Glut in Inferior Coals

The current glut in inferior coals, referred to above, is serious and the question that naturally arises is how, in a planned economy, could a surplus of low grade coal arise? As far as the third five year plan is concerned—and, for that matter, the second five year plan also—the private sector was required to step up the output of only those better grades of coal, down to Grade I, which had all along been, and still are, in short supply. Its target, made up of programmes submitted by individual units, was accepted only after searching enquiries by technical committees into the particular projects submitted by the units concerned had been made. Even then, some of these projects were rejected

as being not feasible technically. Over and above the production programme as sanctioned under the third five year plan and which, except for some 1 million tonnes of Grade II coal in West Bengal and Bihar, did not visualise increased production in grades below Grade I, the production of Grade II, Grade IIIA and Grade IIIB in West Bengal and Bihar has increased by some 7 million tonnes over the production of those grades in 1956-57, i.e. at the end of the first year of the second five year plan.

In fairness, it must be pointed out that some 1 million tonnes of Grade I coal has been downgraded but even after taking this into account, as also approximately 1 million tonnes of Grade II coal covered by the third plan target, the fact nevertheless remains that the unplanned production of lower grade coals is in the region of 5 million tonnes. In view of the strict licensing policy under the Industries (Development and Regulation) Act, it is not understood how, in a planned economy, the overproduction of the qualities of coals not covered by the plan has been permitted. However, faced with a *fait accompli*, all that can be done is to ensure that this kind of unbalance does not arise in the fourth plan period.

As has already been stated, the overall demand for coal has not improved and has in fact worsened. By way of example, it is pointed out that up to the end of October 1964, some 3,000 wagons less than those placed during the corresponding period in 1963 were supplied to collieries in West Bengal and Bihar and that in the months of July and August alone, supplies fell by some 1,150 wagons. The railways themselves have now announced that their requirements of loco coal in December 1964, will be some 2,400 wagons less than had originally been planned due to: (1) a decrease in railway traffic and the fact that the anticipated increase in railway traffic has not materialised; (2) the progressive substitution of electric and diesel traction for steam traction; and (3) the railways' mounting coal stocks.

The question of demand is closely tied up with the five year plan targets since the target of production has naturally to be geared to estimated demand. That assessments of demand have been unreliable in the past will be apparent from the fact that the original third plan coal production target was fixed at 97 million tons (98.6 million tonnes). Later, there was talk of revising the target to 104 million tonnes, but nothing further materialised. According to the Planning Commission's mid-term appraisal of the third plan, the likely achievement would be in the neighbourhood of 90 million tonnes, which was lower than the demand originally anticipated on account of reductions in offtake of (a) between 3 and 4 million tonnes in the case of steel, (b) 2 million tonnes in the case of other industries, and (c) 1 million tonnes on account of the railways due to electrification and dieselisation. The coal industry has since been told that at the end of the third plan period the total demand is not likely to exceed 76 million tonnes. The fact that the production target has had to be reduced by some 21 million tonnes, whereas at one time it was sought to increase it by 7 million tonnes, brings out the necessity not only of more realistic estimates of future demand, but also of keeping a close watch on demand and changes in its pattern so that excessive over-production does not take place. Unless this is done, detailed planning is not possible. It is, therefore, essential that the instruments of planning are used with greater precision. This is particularly important since consideration is now being given to the industry's rôle in the fourth five year plan.

Shares of the Sectors

Turning to the fourth five year plan, according to the latest tentative assessment of the Central Ministry of Steel and Mines, the coal production target at the end of the fourth five year plan will be 136 million tonnes, i.e., 60.02 million over the estimated production at the end of the third plan period and 70.86 million tonnes over actual production in 1963-64. Of this increased production, the public sector will be required to produce 59.71 million tonnes, against its 1963-64 production of 12.48 million tonnes while the private sector is required to produce 76.49 million tonnes, against 1963-64 production of 52.66 million tonnes. In terms of coking, non-coking and blendable coals, the tentative targets are as follows:

	Production in million tonnes		
	1963-64 (actuals)	1970-71 (targets)	Increase in 1970-71 over 1963-64
(A) Coking			
Public sector	3.02	20.63	17.61
Private sector	14.50	25.98	11.48
Total coking	17.52	46.61	29.09
(B) Non-coking			
Public sector:			
(1) Bengal/ Bihar	0.76	1.76	1.00
(2) Outlying	6.70	33.88	27.18
Total	7.46	35.64	28.18
Private sector:			
(1) Bengal/ Bihar	27.59	37.50	9.91
(2) Outlying	8.07	9.57	1.50
Total	35.66	47.07	11.41
Total Non-coking	43.12	82.71	39.59
(C) Blendable			
Public sector	2.00	3.24	1.24
Private sector	2.50	3.44	0.94
Total Blendable	4.50	6.68	2.18
Total			
Public sector	12.48	59.51	47.03
Private sector	52.66	76.49	23.83
Grand total	65.14	136.00	70.86

These targets are not yet final and there are indications that a lower figure of 125 million tonnes is being considered. The World Bank has assessed the target at a much lower figure of 112.4 million tonnes, its lower estimate being accounted for by the continuing decline in coal consumption by the railways—even after making allowance for the railways additional power requirements to be generated entirely by thermal stations, the decline in the output of the iron and steel industry based on an output of 15 million tonnes of pig iron as against 18 million tonnes, and a 20 percent lower estimate than the Planning Commission's of the thermal electrical power demand in 1970-71.

When considering the erratic nature of planning for coal, it may also be mentioned that, in April 1963, a target of 180 million tonnes of coal was being considered and private sector collieries were asked to consider the possibility of stepping up their production by a total of 23.5 million tonnes. The final target will obviously depend on the Government's decision on the overall size of the plan and, thereafter, consideration will have to be given to the allocation of targets between the public and private sectors of the industry in the light of the funds allocated for coal development during the fourth plan.

Whatever target may eventually be decided on, steps must be taken to improve urgently the industry's viability since without a radical improvement in this, it will not be possible for the private sector to mobilise its full potential and resources in order to fulfil its targets. The industry has already suggested that the Government should diagnose the real reasons for the coal industry's malaise and prescribe the necessary remedy.

The Price Question

Of the many problems confronting the industry—and no apologies are made for repeating this—the largest single and most pressing problem is that of price, it being the industry's contention that the present price structure does not enable the coal companies to plough back into the business sufficient funds not only to meet the capital expenditure necessary for development, but also to redeem the present heavy indebtedness and to give shareholders a fair return. It is true that some coal companies are making profits, but these are low in comparison with those of other industries. In any case, what must not be lost sight of is the fact that whatever is available for ploughing back is grossly insufficient. Moreover, it appears that the problem of adequate price is not confined to the private sector alone since the Committee on Resources for the Fourth Plan has indicated that the return on capital employed by the National Coal Development Corporation is small and that if a return of 10 percent is to be achieved, an increase in the Corporation's coal selling prices appears to be unavoidable.

The view is apparently held in some quarters that the fact that the unplanned expansion of non-coking coals of the lower grades referred to earlier was achieved without any special price incentives or subsidies, indicates that the coal industry is financially stable. This view ignores the realities of the situation and the circumstances under which a major proportion of such lower grade coals are raised and the fact that with the exception of the National Coal Development Corporation where such coals are excavated mechanically from opencast mines the majority of mines producing these coals are run on what might be best termed a cottage industry basis. Moreover, this view also ignores completely two important factors, namely, the increased mechanisation in the large collieries and the comparative low output of the Indian mine worker. These two factors are closely interlinked in that although the proportion of coal won by the use of machines has increased by 70 percent during the last five years and the quantity of coal mechanically loaded and conveyed has increased three-fold, the average o.m.s. (output a man-shift in India) is at present of the order of half a tonne (compared with 96,000 tonnes for Hungary, 1,530 tonnes for Poland and 1,970 tonnes for West Germany). Although a considerably higher o.m.s. is being achieved in some of the larger and more mechanised mines due, in a large measure, to the fact of mechanisation, it is to be noted that it is only recently that the industry has gained the level of output a man-year which was being obtained in 1935. Moreover, during the period 1956-60, there was considerable additional capital investment in the industry as will be apparent from the fact that during this period, gross fixed assets rose from 4.8 percent a year to 6.3 percent a year, compared with an overall increase in o.m.s. of 0.05 tonnes during the same period.

The coal industry's price structure was last investigated by the Coal Price Revision Committee in 1959. In its award, the Coal Price Revision Committee provided for depreciation of Rs. 1.70 a ton of production as ploughback for rehabilitation and development, but in fact the coal industry has been unable to achieve this rate of plough-back. The Committee also recommended a profit margin of Rs. 1.75 a ton to permit the payment of a reasonable dividend after payment of taxes, but even this has been gradually eroded by various subsequent impositions on the industry which were not provided for in the formula evolved, and the failure of the Government to neutralise adequately past production cost increases. The result has been that representative units of the industry have not been earning even the meagre profit margin allowed. In the past, it has been the practice of the industry to ask for a uniform price increase to neutralise enhanced production costs, whenever this became necessary, but recently, the major producers and particularly those of the higher grades of coal currently in short supply, have urged in addition to neutralisation, direct price increases by way of an incentive in order to (a) increase the production of those coals which are immediately and vitally needed and (b) to modernise and rationalise production in order to lay the groundwork for the fourth and subsequent plans, for which development work must commence now. The last straight price increase granted from 3rd March, 1964, though inadequate,

Workers in an open cast coal mine

recognised the importance of this issue.

Outlay Estimates

Until the private sector's coal production target for the fourth plan is finally fixed and its share of the funds allocated for coal development known, it is not possible to state the amount of capital investment, that will be required to be made by private collieries. It is true that the Central Ministry of Steel and Mines has indicated a figure of Rs. 48.30 crores—Rs. 14.74 crores for additional production and Rs. 33.56 crores for the maintenance of production—for an increase in output of some 24 million tonnes, but neither this nor the foreign exchange component that will be necessary has yet been examined by the industry. Some indication of what the final outlay could be may be gauged from the fact that the third plan visualised a capital outlay of the order of Rs. 60 crores, with a foreign exchange component of some Rs. 28 crores, for an increased production of 17 million tonnes by the private sector.

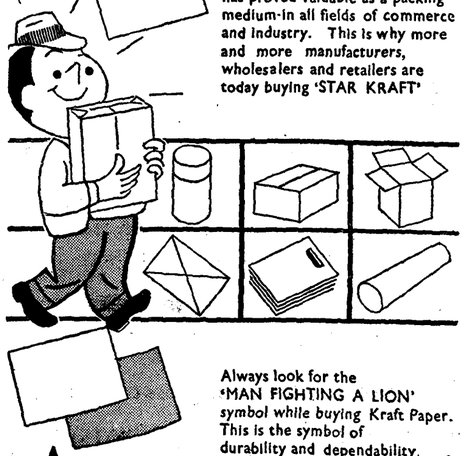
As for the third plan outlay, it will be recalled that the private sector of the industry requested that sufficient foreign exchange should be provided to cover its requirement of imported plant and equipment and the spare parts essential for the maintenance and expansion of production and that, as a result, the World Bank agreed to provide Rs. 16.7 crores by way of foreign exchange to enable the private sector to import these requirements. At the time, most of the coal companies estimated that they would be able to finance their expenditure on expansion by the plough-back of profits from increased production, but, for a variety of reasons, such as increased taxation, enhanced costs of labour, stores, import duty, etcetera, without adequate and corresponding increases in coal selling prices, the plough-back originally anticipated did not materialise. It was not, in fact, until mid-1963, when the then Refinance Corporation of India Ltd prepared a scheme for the guarantee of advances granted to the private sector of the coal industry by approved credit institutions, that coal companies were able to arrange for the rupee funds necessary for the payment of imported machinery and its installation. That the coal industry is still considered to be one of the least inviting industries for attracting fresh investment support from the public is a well-known fact. It is, therefore, essential that the question of the viability of the industry receives immediate attention so that the appropriate remedy may be prescribed without which, it is feared, the industry's financial difficulties will merely be repeated—possibly to an exaggerated degree—during the fourth plan.

Aiding Collieries

Apart from a straight increase in prices, there are several other ways in which assistance can be provided readily. Among these are: (i) an increase in the present inadequate rates of subsidy for mining under deep, difficult and gassy conditions; (ii) the fully and speedy neutralisation of stowing costs, as also of special works carried out in the interest of conservation and safety, so that stowing costs are reimbursed in full, as recommended by the Coal Prices Revision Committee; (iii) the provision of an extra shift depreciation allowance and revision of the existing rates of depreciation on colliery plant and equipment to compensate for the increased wear and tear on colliery equipment and to neutralise the extremely arduous conditions under which this machinery has to be operated; and (iv) the provision of a depletion allowance.

While failure to improve the economic health of the private sector of the coal industry will undoubtedly be a major obstacle to the attainment of whatever production targets may be fixed for the fourth plan period, there are certain other prerequisites which are also essential. The first is the necessity of more broad, liberal and pragmatic application of the Industrial Policy Resolution. It is the private sector's experience that the Industrial Policy Resolution, as at present applied, is unduly restrictive. It is pointed out that there are many collieries whose reserves are depleting rapidly and whose production is likely to decline in the not-too-distant future. It is, therefore, necessary that they be granted leases for new coal areas if only so that they can maintain their production; unless this is done, many coal companies will be faced with the prospect of declining production, rising costs and, as a consequence, retrenchment of labour. The private sector also considers it most unfair and unjust that the National Coal Development Corporation should, for example, be able to notify "unworked" seams in otherwise working properties since the existing seams in working properties form part of the reserves of a colliery and to deprive the colliery of these naturally affects seriously the very foundation of the unit's viability. There are also instances where the private sector has not been permitted to work certain areas because, even though they have not been notified, the National Coal Development Corporation is said to be "interested" in them. Such areas comprise small areas between faults and/or small working properties contiguous to existing private sector working collieries and which can obviously be more easily and economically worked by those existing collieries. It is to be stressed that the private sector's attitude to the public sector is not a "dog in the manger attitude" since it is appreciated that, in years to come, the major part of the nation's coal production will come from the public sector. As long as the private sector exists, however, it is their view that the only criterion for deciding whether the public sector or the private sector should work a particular area should be which sector can work it more economically and easily.

Allocation of Production



The private sector is also most concerned that the tentative breakdown of the required production under the fourth plan does not give it sufficient scope. For example, in

PACKING PROBLEMS - SOLVED

Packing industry needs Kraft Paper which should be very tough, durable and elegant to impart a dignified look to your packages and provide safe transit of their contents—

Developed through years of research and experience, 'STAR KRAFT' meets the highest standard of packing paper and has proved valuable as a packing medium in all fields of commerce and industry. This is why more and more manufacturers, wholesalers and retailers are today buying 'STAR KRAFT'

Always look for the 'MAN FIGHTING A LION' symbol while buying Kraft Paper. This is the symbol of durability and dependability.

STAR PAPER MILLS LTD.

4-P/0-34

the case of the outlying coalfields, namely, Madhya Pradesh and Central India, no provision at all has been made for any increase in the production of non-coking coal from private sector collieries while the production of the National Coal Development Corporation is to be increased from the present figure of 6.70 million tonnes to 33.88 million tonnes by the end of the fourth plan, a projected increase of over 400 percent! This aspect apart, the private sector has invested considerable amount of capital in obtaining plant and equipment under the World Bank loan and in modernising its collieries to improve production facilities and to increase production. If adequate scope is now not given to such collieries for an expansion in production during the fourth plan, such companies will be left with a larger surplus productive capacity and their viability will be seriously jeopardised. This would clearly be a waste of valuable resources and not in the nation's overall interests.

Looking to the future, and assuming that the industry's present difficulties will be surmounted, the following trends in the pattern of the industry are discernible. These are (i) that the units of production will be larger; (ii) increased mechanisation; and (iii) as a consequence of increased mechanisation, a gradewise change in the quality composition of output.

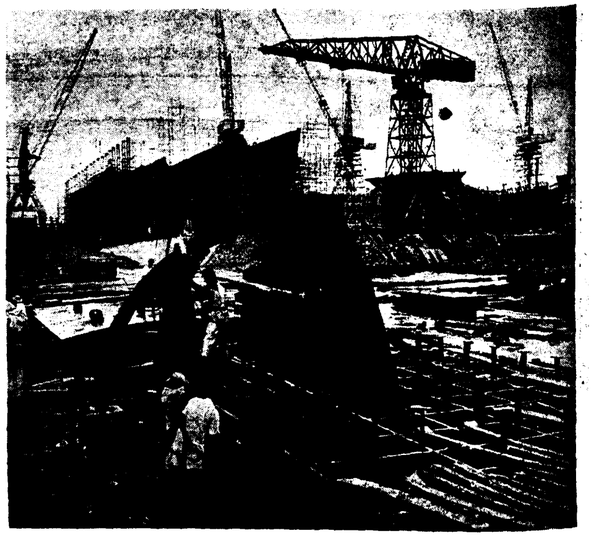
Increase in Colliery Size

In so far as (i) is concerned, this trend is already evident from the following comparative analysis:

	Number of collieries	
Annual production	**1953**	**1962**
up to 5,000 tonnes	261	173
5001 to 50,000 tonnes	392	346
50,001 to 100,000 tonnes	102	121
100,001 to 300,000 tonnes	95	175
above 300,000 tonnes	8	36
	858	851

Figures for 1964 are not strictly comparable since the collieries have been categorised on a slightly different basis and the categories also differ slightly. However, according to the latest statistics, the number of collieries currently in production is 815, distribution on the basis of output being as follows:

Up to 6,000 tonnes	222
6,001 to 60,000 tonnes	327
60,001 to 120,000 tonnes	102
120,001 to 300,000 tonnes	125
above 300,000 tonnes	39
	815



It will thus be apparent that while the number of very small collieries and of those producing up to 60,000 tonnes a year is decreasing, and some have in fact already ceased production on economic and other grounds, there has been a substantial increase in the number of collieries producing between 100,000 and 300,000 tonnes a year and over 300,000 tonnes a year. Even so, in 1964, 549 collieries out of a total of 815 were each producing not more than 60,000 tonnes a year. This raises the question of amalgamation of uneconomic collieries, the object of which is to bring them under unified control, to reorganise them and modernise them so that scientific and planned methods of exploiting coal can be followed and their resources exploited in the best possible manner, and it is believed that legislation is being considered to give effect to this.

As regards (ii), a corollary to the tendency towards large units of production is increasing mechanisation. This is essential if the industry's pace of production is to be accelerated at the tremendous rate at which it is planned. On the eve of the fourth plan, the industry must look much further ahead to the fifth and even sixth plans—when the fourth plan production might be expected to be doubled and quadrupled—in view of the inevitable long time lag between planning for development and the time when the expected peak production planned for is attained. Such massive production can only be achieved by increased mechanisation leading to the rationalisation of the techniques and scale of production.

As for (iii), a consequence of increased mechanisation is a gradewise change in the quality composition of output due to the fact that mechanisation results in the production of very small sized coal; in future, therefore, a large proportion of coal will be produced as slack rather than as steam coal. Moreover, as is already apparent, the percentage of the best grades of coal in relation to total output will necessarily fall, and, proportionately, the share of medium and low grade coal will naturally increase. To safeguard the quality of coal supplies, the extensive use of washeries and beneficiation plants will be necessary.

While the present position is bleak, there are hopes for the future since it has all along been assumed that the present lull in demand is purely temporary and that with the thermal power stations, steel, cement, brick and other coal consuming industries coming up, the demand is bound to increase in the future. While colliery owners are naturally greatly perturbed at the stocks of coal accumulated at pitheads, it is a basic fact that even when other sources of power are available such as atomic power, electricity, furnace oil, etcetera, coal will still be the prime source of power in the country and account for 70 percent of its power requirements. Furthermore, it must not be overlooked that coal is also of value as a raw material and, apart from being a necessary raw material for steel production, is used in the manufacture of coal-based chemicals and other derivatives, and it may be assumed that there will be a growing demand for coal as a raw material rather than solely as a source of power. Moreover, the fact that, in an expanding economy, coal production must always be slightly in excess of demand, must not be lost sight of.

These future trends are already discernible, but much will depend on the groundwork which is now being prepared for the fourth plan. If this is flimsy and superficial, the consequence will be disastrous for the industry and the economy as a whole. It is, therefore, to be hoped that a speedy and satisfactory solution to the coal industry's present problems may soon be found.

Uneconomic Prices May Affect Sugar Production

The Government has fixed uneconomic prices for sugar while trying to raise its output. Both production and profitability of mills will suffer unless prices are made economic and unnecessary controls are removed.

By
J. S. MEHTA

THE year 1963-64 has been one of great strain. There was a general stagnation in agriculture as a result of which the country was in the grip of an acute food shortage and rising prices. Sugar prospects also continued to be shrouded by uncertainties. The production target of 3.3 million tonnes set by the Government for the 1963-64 season could not be achieved and the output is finally placed at about 2.6 million tonnes. The problem of sugar shortage, which emanated in 1962-63 following the unexpected and precipitous fall in the sugar output to about 2,135,000 tonnes, continued to remain unresolved. If anything, the problem of consumers—including bulk industrial consumers—was further accentuated.

It is indeed baffling how from an era of surplus, sugar has become a scarce commodity over the past two years, so much so that controls enforced on 17th April, 1963, were continued during the 1963-64 season as well. The industry, which had the satisfaction of maintaining a general upward trend in production since the initiation of the first plan and was justly proud of the distinction of having exceeded the production targets laid down in the first and second plans, finds itself in sorry straits since the beginning of the third plan. It is common knowledge that sugar production in 1960-61, the last year of the second plan period, was at the record level of about 3,029,000 tonnes. However, with internal consumption stagnating at about 2,126,000 tonnes and in spite of the additional demand created by export of about 247,000 tonnes, the industry was burdened with the excessive carryover stock of about 1,202,000 tonnes, causing unprecedented problems of storage and finance. Therefore, the third plan, which envisaged a production target of 3.5 million tonnes (3 million tonnes for internal consumption plus 500,000 tonnes for exports), commenced under very peculiar circumstances and ways and means had to be found to resolve the crisis of surplus sugar.

Production Cut

In order to balance the divergent forces of supply and demand, in the first year of the third plan, *i.e.*, 1961-62, the Government imposed a general 10 percent statutory cut on the production of factories. Furthermore, with a view to stimulating internal demand, the stifling control over the movement and price of released sugar was lifted in September 1961. These measures did have their intended effect because while sugar production was pegged down to the level of about 2,730,000 tonnes, the internal consumption recorded a very encouraging increase to about 2,562,000 tonnes, against about 2,126,000 tonnes in the preceding season. Sugar exports in 1961-62 were also stepped up to about 361,000 tonnes. These developments led to a marginal reduction in the stocks carried forward to the 1962-63 season, the figure being about 1,012,000 tonnes.

Although the reduction in stocks carried forward from the 1961-62 season was only marginal, the season had ended opening a new vista for the industry so that it could reasonably look forward to a total offtake of 3.2 million tonnes, including about 2.7 million tonnes for internal consumption and 500,000 tonnes for export. There was, therefore, the urgent need to increase sugar production in order to cater to the rising demand for both internal consumption and export. Because of this need, the Government removed the 10-percent statutory cut on production by factories imposed in the last season, and the mills were free to crush to their capacity. But belying all expectations, production in 1962-63 recorded a sharp decline to about 2,135,000 tonnes. This precipitous fall in output was beyond the control of the industry. Natural vagaries were responsible for this: while there was drought in some areas, in some others there were floods which severely damaged the cane crop. To add to the problem of the factories in getting adequate cane supplies for crushing, there was large-scale diversion of cane to its alternative users, namely, *gur* and *khandsari*. The cumulative effect of all these factors was the steep decline in production to 2,135,000 tonnes. In fact, the industry had foreseen this unfortunate development and had called upon the Government to adopt suitable corrective measures.

Apprehending that consumers may find it difficult to procure their normal sugar requirement at reasonable prices, the industry was contemplating voluntary regulation of prices and supplying sugar to consumers through fair price shops. The Government, on the other hand, seemed to remain oblivious of this fact and the industry came in for criticism as creating a psychology of scarcity. But when most of the factories actually stopped crushing operations in February 1963, the realisation of a shortfall in output dawned upon the Government, and as stated before, sugar control was enforced on 17th April, 1963, for the fourth time since independence without giving the industry a chance to put its scheme of voluntary regulation into operation. This extreme step was taken by the Government in spite of the experience gained in previous controls which inevitably stifled consumption and inhibited production. Despite the varied measures taken by the State Governments to ensure equitable distribution at reasonable prices, the consumers faced great difficulties in procuring even their normal requirements at the control prices and pockets of shortage were not an uncommon feature. It was once again proved beyond doubt that the enforcement of control measures in a geographically vast country like India presents unique problems of proper co-ordination and effective control.

Voluntary Regulation

Some sort of regulation was necessary in view of the decline in sugar production to about 2,135,000 tonnes which meant that the total available supplies in the country were about 3,147,000 tonnes (including the 1,012,000 tonnes carried forward from the preceding season), against the expected total offtake of about 3.2 million tonnes. But instead of resorting to statutory sugar control, the Government would have done well to give the industry a fair chance to put its scheme of voluntary regulation into operation. However, with rigid control on internal consumption, a stock of about 150,000 tonnes was carried forward in the 1963-64 season, although sugar exports in 1962-63 were higher at about 514,000 tonnes. The Government seemed to appreciate that in periods of real shortage, no amount of regimentation or control can keep the prices at reasonable levels in the interest of consumers and that the real solution of the problem lay in increasing sugar production substantially.

The realisation of the need to step up sugar production was manifested from the fact that the Government fixed a production target of 3.3 million tonnes for the 1963-64 season. To achieve this target, the Government allowed certain incentives to the cane growers and sugar factories. In the case of the former, cane price was generally raised to Rs. 1.75 a maund. Factories in the north facing keen competition from *gur* and *khandsari* were authorised to pay a cane price of Rs. 2 a maund, which was subsequently fixed as the minimum cane price. The maximum rebate on road centre cane was fixed at 12 paisa a maund, which meant that growers supplying their cane from a radius of 8 to 12 miles of the factory by road, got an additional 24 paisa a maund for their cane. Sugar factories were allowed a rebate in basic excise duty at rates varying between 20 percent and 50 percent in different parts of the season on additional production achieved over 1961-62.

What was perhaps the most welcome feature of the Government's sugar policy in the 1963-64 season was the belated recognition of the need to impose some sort of regulation on the other two sweetening agents, namely, *gur* and *khandsari* alongside sugar. With this end in view and in order to prevent an undue rise in prices of *gur* and *khandsari*, thereby guarding against any large-scale cane diversion from factory areas, the inter-State movement of *gur* and *khandsari* was restricted. The Government also amended the Defence of India Rules and added a new Clause 125 B whereby it gained powers to regulate cane supplies, particularly to factories. These powers were subsequently delegated by the Centre to the State Governments.

While the industry was at one with the Government concerning the need to increase sugar production substantially in 1963-64 and offered its best co-operation, it felt that the target of 3.3 million tonnes fixed by the Government, which was meant to be achieved with an effective production capacity of 2,812,000 tonnes, was rather optimistic considering the size of the crop and the policy adopted. The industry felt that if the Government were able to bring down and maintain *gur* and *khandsari* prices at a reasonable level, production achieved would be about 2.8 million tonnes. Actually following the Government's measures, *gur* and *khandsari* prices declined and the prospects of achieving a production of 2.8 million tonnes seemed to improve. But this optimism was rather short-lived as the Government was not able to maintain *gur* and *khandsari* prices at reasonable levels and they once again recorded inordinate increases leading to the large-scale diversion of cane from factory areas.

Selective Control

The Government did not see its way to accede to the industry's request for "selective control" whereby it could acquire a set percentage of the factories' output for controlled distribution at fixed prices against ration cards, leaving the factories free to dispose of their balance production in the open market so that they could take the normal business risk of paying a higher cane price in competition with *gur* and *khandsari*. This request went unheeded and the result was that the production target of 3.3 million tonnes set by the Government could not be achieved

and output is finally estimated at around 2.6 million tonnes. This means that the total available sugar supplies in 1963-64 were only about 2,750,000 tonnes, against about 3,147,000 tonnes in 1962-63. In view of this, in 1963-64, internal consumption has been reduced to about 2,350,000 tonnes. Exports also suffered, the quantity exported during 1963-64 being only about 250,000 tonnes. The following table gives the production, consumption and carryover stocks during the past few years:

(Figures in '00,000 tonnes)

Years	Production	Consumption	Carryover stock from previous season
1957-58	20.08	20.77	4.66
1958-59	19.38	20.98	3.65
1959-60	24.84	20.56	1.77
1960-61	30.29	21.26	6.05
1961-62	27.30	25.62	12.02
1962-63	21.35	25.26	10.12
1963-64 (estimated)	26.00	23.50	1.50

The bulk industrial consumers of sugar like fruit preservation industries, confectionery, biscuits, etcetera, were confronted with the unprecedented problem of sugar shortage. Their working was adversely affected by the insufficient sugar quotas allotted through the State Governments. These industries form an integral part of the country's economy and have been set up with high capital cost. Surely, it cannot be in the national interest to allow industrial capacity to work below capacity or intermittently. The sugar requirement of industrial consumers is a very insignificant proportion of the total annual sugar production, even in years of shortfall in production. In the national interest, the Central Government should itself undertake the responsibility of allotting sugar to its industrial consumers so as to ensure that the available industrial capacity in the country is put to optimum use and is not allowed to remain idle for want of an adequate supply of essential and basic raw material.

It would be pertinent to mention here that the steep decline in sugar production during 1962-63 and the shortfall in production, compared with the target in 1963-64, was principally confined to U.P., Bihar and Punjab where competition is mainly faced from *gur* and *khandsari*. The following figures will elucidate the point:

States	Sugar production 1961-62	Sugar production 1962-63	Percentage increase or decrease	Sugar output in 1963-64 (target fixed)	Production (estimated) in 1963-64
Uttar Pradesh	12,03,530	8,49,621	—29.43	15.00	11.08
Bihar	3,58,677	1,70,033	—52.62	3.50	2.38
Maharashtra	5,07,419	5,30,220	+ 4.38	6.50	5.30
Gujarat	33,861	36,893	+ 9.22	—	0.43
Madras	1,16,261	99,064	— 7.48	1.40	1.25
Andhra Pradesh	1,87,663	1,72,192	— 8.25	2.50	2.32
Punjab	90,592	62,445	—31.07	1.40	0.69
West Bengal	16,081	10,773	—33.01	...	0.09
Orissa	4,242	3,533	—16.73	...	0.06
Madhya Pradesh	30,948	34,250	+10.67	...	0.21
Rajasthan	15,551	13,714	—11.86	...	0.06

Pondicherry	10,269	9,744	— 5.12	...	0.15
All India	27,30,419	21,35,183	—21.24	...	
		(Other States)		2.20	
(a) Estimated production for the special season					0.90
		Total ...		33.00	26.00

In U.P., during 1962-63, production declined by about 354,000 tonnes, compared with 1961-62, while in Bihar the fall was of about 189,000 tonnes and Punjab 28,147 tonnes. These three States alone, therefore, accounted for 571,147 tonnes or about 98 percent of the total decline in production. Factories in these three States worked only for a limited period. In U.P., the duration of the season was 99 days, against 151 days in the 1961-62 season. The average duration during the first plan was 112 days while during the second plan period it was 148 days. In Bihar, the duration was unusually short. Factories worked for 73 days, compared with 148 days during the previous season, the average of 103 days during the first plan period and the average of 131 days during the second plan period. In Punjab, the corresponding figures were 84 days, 136 days and 125 days.

State-wise Production

As far as some other States like Maharashtra, Gujarat, Kerala and Madhya Pradesh are concerned, the situation was normal; production, instead of decreasing in 1962-63 compared with 1961-62, in fact rose. In Maharashtra, production increased by about 4.38 percent, in Gujarat by 8.95 percent while in Madhya Pradesh and Kerala the rise was 10.67 percent and 11.53 percent, respectively. During 1963-64, the situation is more or less the same despite best efforts of the industry. Against a production target of 1.5 million tonnes fixed for U.P., the output is estimated at 1,108,000 tonnes. In Bihar, against a target of 350,000 tonnes, production is estimated to be 238,000 tonnes. Punjab also has fared no better with a production of 690,000 tonnes, against the target of 140,000 tonnes. In these three States alone, the shortfall in production, compared with the targeted output, is 575,000 tonnes or about 82 percent of the total shortfall.

The foregoing clearly underlines the need for a thorough and objective study of the problems confronting the industry in U.P., Bihar and Punjab where the prospects of increasing production in the immediate future exist. Although the area under cane in the northern region is very large, the level of productivity is extremely low. Thus the scope for intensifying sugarcane cultivation in this region is very great.

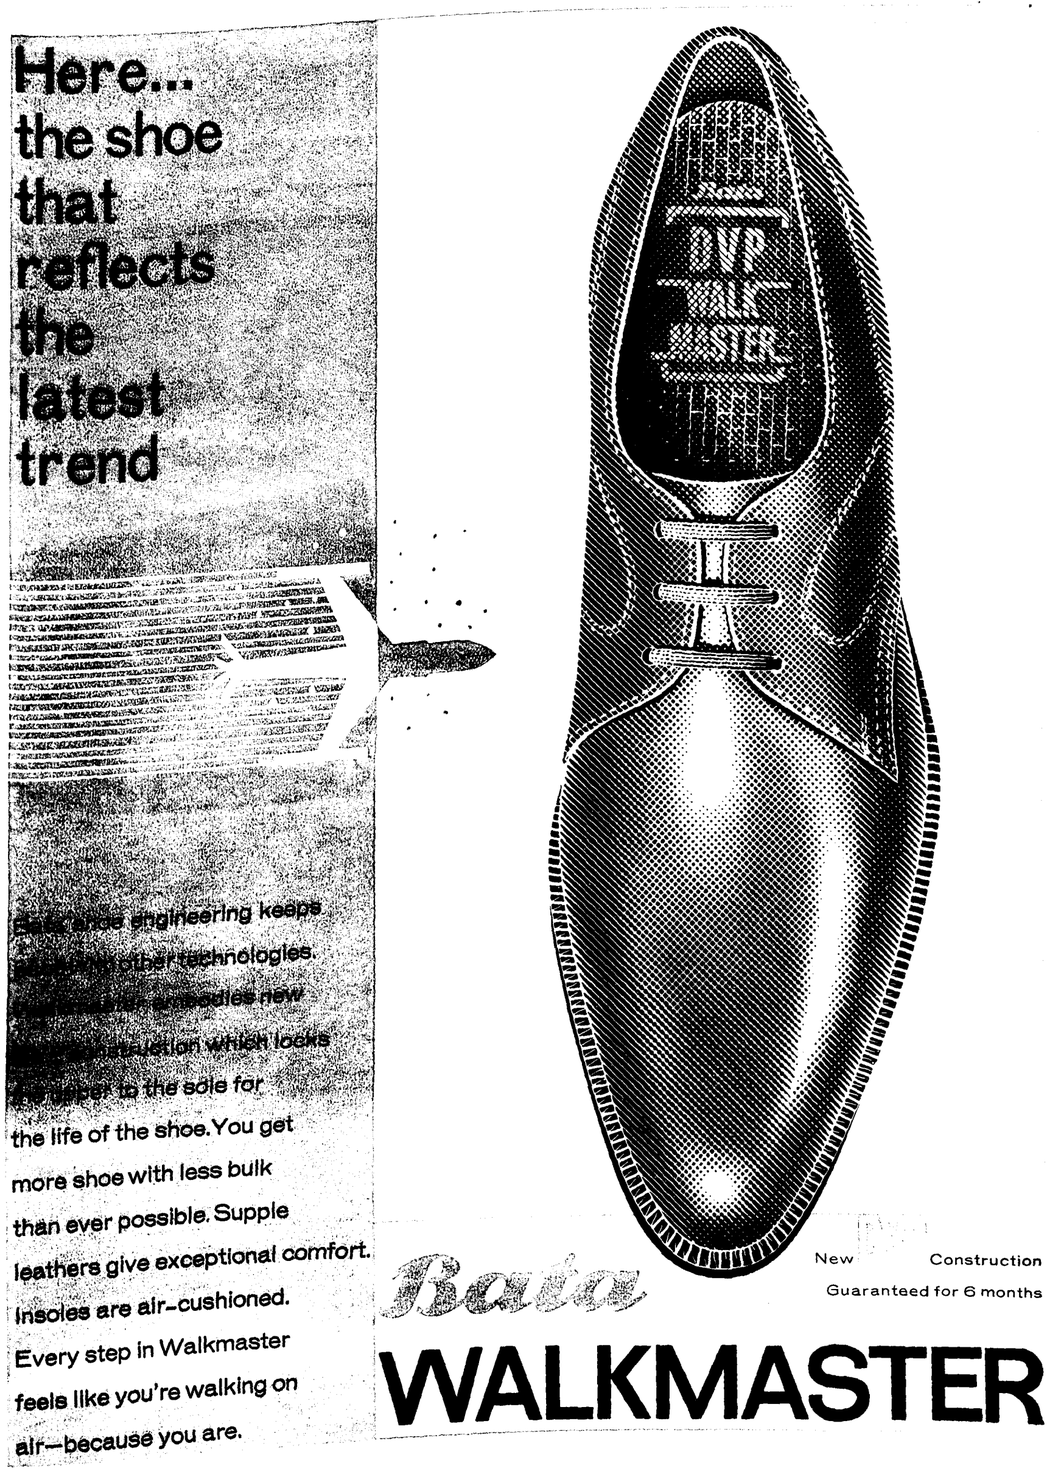
Since production has fallen substantially in U.P., Bihar and the Punjab, it is here that output will have to be increased. There is vast scope to step up sugar production in these areas, since the recovery and the yield of cane an acre are notoriously poor. The State Government has at long last realised the need to undertake cane development work. And intensive cane development schemes have been launched in U.P., Bihar and Punjab. The backward state of agriculture in these areas is attributable to the complete dependence on natural vagaries. Proper irrigation facilities, good seeds, fertlisers, etcetera, are lacking. The State Governments are to blame for the present unsatisfactory state of affairs. For the specific purpose of collecting funds for cane development work, the State Governments levy cane cess or purchase tax on cane consumed by factories. But the sizable funds collected have not been wholly used for cane development. In fact, a very large percentage of the collections have been appropriated to general revenues.

The Punjab Government has taken a bold decision to use all cane cess collections for cane development work. The State Governments of U.P. and Bihar must emulate this fine example.

Low Yield

Due to the low yield of cane an acre and also low recoveries, the affairs of the industry in the north have been going from bad to worse. It is here and that too in U.P. and Bihar that most of the smaller units are situated. The sugar factories here are by no means technically inferior to their counterparts elsewhere in the country. It is only that their working has been rendered uneconomical due to inadequate and poor cane quality and low capacities. The machinery in factories installed in the early 'thirties of the present century are due for large-scale replacement. But the factories have been unable to put aside suitable funds for the purpose due to uneconomic prices fixed for them. So the working of the factories in these regions has proved uneconomical.

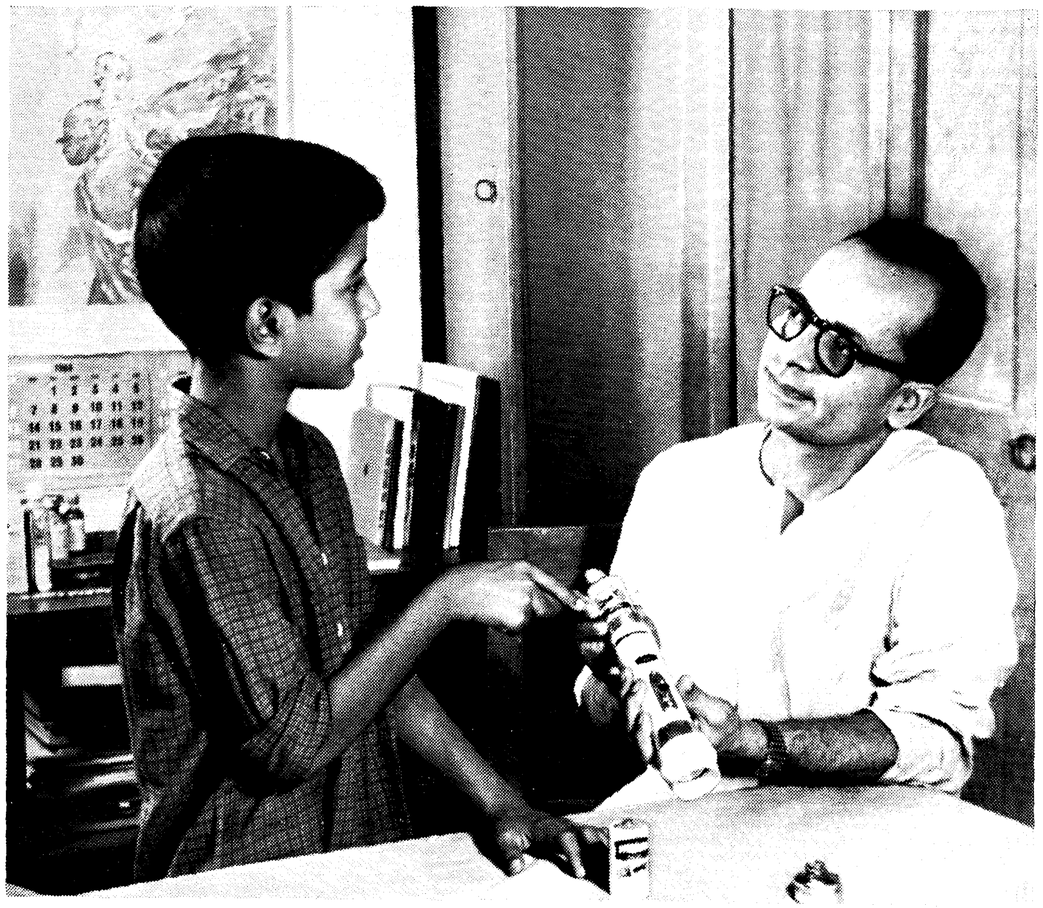
The problems of the very large segment of the industry situated in the north are now to some extent receiving the Central Government's attention. To resolve the problem of smaller units, the Government appointed a special committee under the chairmanship of Mr. S. N. Gundu Rao, ex-director of the National Sugar Institute, Kanpur, to study the matter in all its aspects. The committee is expected to submit its report shortly. The Central Government is also an active participant in the intensive cane development schemes launched in U.P., Bihar and Punjab. It will bear a part of the costs involved.



To facilitate cane development, perhaps in the realisation that the country's efforts to increase sugar production will depend on the development of agriculture, the Government introduced a scheme for paying cane price on the basis of its quality from the 1962-63 season. This scheme replaced the old and outmoded method of paying cane price on the basis of weight irrespective of the sugar content. Under this scheme, the Government has announced a minimum cane price linked to a specified recovery percent and for every 0.1-percent increase in recovery over the minimum, the growers are allowed an additional 1.5 paise a maund of cane. This is undoubtedly a step in the right direction and provides impetus to growers to improve their yields an acre and the recovery percent knowing that they will get higher prices for better quality cane.

The ultimate objective of the scheme is to pay cane price to individual growers on the basis of the cane grown by them, but due to the large number of growers involved, the achievement of the ultimate objective presents some practical difficulties. The scheme is to be implemented in a phased manner, extended to village, group levels and finally each grower will be paid a price on the basis of the quality of his cane.

Diversion of Cane



However, increasing supplies or improving the quality of cane will not be of much help if large-scale diversion of cane to the alternative sweetening agents, namely, *gur* and *khandsari* is not prevented. For maintaining parity between sugar, *gur* and *khandsari* in the matter of cane supplies, it is essential that the three must enjoy the same degree of freedom. Recently, Mr. C. Subramaniam, the Central Food Minister, has taken the bold decision of removing the ban on inter-State movement imposed on *gur* last year. He also indicated the possibility of removing the inter-State movement restrictions on *khandsari*. Thus *gur* and *khandsari* have been assured complete freedom. There is already fiscal discrimination against sugar vis-à-vis *gur* and *khandsari* because while excise duty is levied on sugar at Rs. 10.70 a maund, *gur* is fully exempted and on *khandsari* the levy is very nominal. Due to this fiscal disparity as well as the higher prices generally realised by *gur* and *khandsari* manufacturers, they are able to pay much higher prices for cane than that which the sugar factories can pay under the rigid cost structure allowed to them.

If on top of this, controls are limited to the sugar industry alone, it is bound to affect severely the industry's capacity to compete effectively with the alternative sweetening agents after securing adequate supplies of cane. The industry has strongly advocated and rightly too that the Government should allow at least limited freedom to factories by adopting a policy of selective control in the 1964-65 season. Under this policy, the Government can obtain from the factories at fixed prices such quantities as are actually required for

Is this what lights my torch?

Yes, the electricity that produces the bright beam of a torch comes from the dry battery. And the torch is only one of many ingenious devices that work on 'packaged' electricity.

The many types of 'Eveready' dry batteries made by Union Carbide India, power torches and radios...help run telecommunications equipment used by India's armed forces...operate railway signalling systems...furnish power for such diverse applications as hearing-aids, toys, weather balloons, electronic and transistorised equipment.

Union Carbide India established the first dry battery manufacturing plant in India in 1926. And since Independence the demand for dry batteries grew so fast and for so many diverse applications that a second 'Eveready' battery plant was set up in Madras in 1952.

Union Carbide India's dry battery plants and their torch factory in Lucknow—one of the most modern—are but a few seeds of industry that the Company have sown in India. The variety and value of products made by Union Carbide India today show how the resources and the know-how of a world-wide organisation can serve the needs of a developing economy.

controlled distribution, leaving them free to dispose of the balance in the free market. This will afford a limited freedom to the factories to increase cane price in order to counteract competition from the other two sweetening agents and would also make available requisite sugar supplies to the Government for controlled distribution. It would lead to free availability of sugar in the country and will also have a healthy impact on *gur* and *khandsari* prices which are now ruling at a high level. The policy of partial control has been gainfully tried in the 1950-51 season when it led to a sizable increase in sugar output. All these factors warrant that the industry's plea for partial control must be given favourable consideration.

Creating Additional Capacity

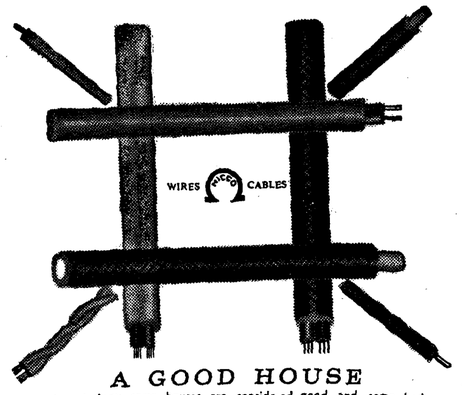
Moving from sugarcane to sugar, it may be pointed out that the Government's policy on sugar prices, the licensing of additional capacity and other allied matters is also very significant for stepping up output commensurate with the rising demand for both internal consumption and export.

The granting of an economic sugar price is a must for improving the working of the factories. In the matter of sugar prices, the industry has generally not received a fair deal at the hands of the Government. Due to the uneconomic prices generally allowed, the finances of the industry, particularly in the north, have been severely strained. The rigid cost structure of the industry has prevented factories from building up suitable reserves for the purpose of replacement and modernisation of their plants which were, by and large, put into commission some three decades ago. As such, it is imperative that the prices fixed not only cover the cost of production which has gone up in diverse ways but should also provide reasonable returns to the industry for replacement and modernisation of their old and outworn plants. In the ultimate analysis, the efficiency of a price policy has to be judged by the industry's financial results and its productivity. While the production of sugar has lagged behind and the country has been faced with an acute shortage, the financial results of the factories also make a very poor showing.

A large number of units are actually incurring losses and the return on capital which at present stands at an alarmingly low figure is declining. The Reserve Bank of India's study on the financial results of 1,331 companies, as published in its *Bulletin* of July 1964, shows that even during 1960-61, the gross profit as percentage of capital employed for the industry was as low as 8.8 percent. During the subsequent 1961-62 and 1962-63 seasons, this figure declined further to 7.4 percent and 7.6 percent, respectively. As against this, the gross profit in woollen textiles, matches, silk and rayon textiles, mineral oils, medicines, cotton textiles, tobacco, rubber plantations and basic industrial chemicals, etcetera, were much higher. The figure of net profit as a percentage of net worth as given in the said Reserve Bank survey further confirms the poor profitability of the industry. The comparative figures are as follows:

Industries	Gross profit as percentage of capital employed			Profit after tax as percentage of net worth		
	1960-61	1961-62	1962-63	1960-61	1961-62	1962-63
Woollen textiles	19.4	20.1	17.5	17.8	19.9	17.4
Silk and rayon textiles	15.8	13.2	9.7	19.1	17.1	11.1
Matches	15.9	16.1	17.6	12.5	11.7	13.4
Rubber plantations	16.9	14.0	13.3	10.5	7.3	8.0
Mineral oils	12.8	14.1	14.3	11.0	10.8	7.1
Medicines and pharmaceutical preparations	15.4	14.2	13.7	17.1	15.9	12.0
Basic industrial chemicals	13.7	12.3	10.5	14.1	13.1	11.4
Other chemical products	11.5	11.0	13.4	11.3	10.3	9.8
Cotton textiles	12.0	12.9	7.9	13.5	13.1	5.8
Electrical machinery	12.9	11.6	14.1	14.2	13.4	11.5
Machinery other than transport and electrical	11.5	10.4	11.0	14.7	12.8	10.7
Non-ferrous metals	12.8	10.9	9.6	17.4	9.0	9.9
Tobacco	13.5	11.9	14.2	8.7	6.9	7.7
Sugar	8.8	7.4	7.6	11.2	7.4	3.5
All industries	10.1	10.0	10.1	10.9	10.0	9.0

The foregoing analysis reveals that the sugar price policy which the Government has hitherto followed leaves much to be desired. In the absence of an appropriate price policy, both the productivity and the profitability of the industry, so vital for its growth and development, has suffered. It is hoped that the Government would adopt a positive sugar price policy which would take due note of the industry's requirement to rehabilitate, modernise and expand, consistent with the part it has to play in the country's economic development.



Rising Domestic Consumption

As for the licensing of additional capacity in the industry, it may be pointed out that the capacity hitherto licensed over the first, second and third plans is estimated at 8.2 million tonnes on the basis of an average recovery of 10 percent and a duration of 140 days. This means that an additional 300,000 tonnes still remains to be licensed to achieve the third plan target of 3.5 million tonnes. For the fourth plan, the Development Council has suggested a target of 4.5 million tonnes (including 500,000 tonnes for export). In doing so, it has assumed that due to improvement in the standard of living leading to a change in dietic habits, growth of population, etcetera, the increase in internal consumption a year will be of the order of 200,000 tonnes. However, it is felt that this rated increase of 200,000 tonnes a year during the fourth plan, assumed by the Development Council against the prevalent increase of about 100,000 tonnes a year, is very much on the higher side and the rate of growth in internal demand should be kept at the third plan level of 100,000 tonnes a year. Calculating on this basis, the capacity and production target would amount to 4 million tonnes. The achievement of this capacity means that 800,000 tonnes of additional capacity will have to be licensed.

In fact, with a view to boosting up sugar production, the Government plans to resume licensing in the sugar industry. The question arises in what manner this additional capacity should be licensed. The Development Council for the Sugar Industry has rightfully advocated that as far as possible additional capacity should be created by allowing the existing units to expand rather than through the setting up of new units. It has stressed that the additional capacity created by allowing the existing units to expand would cost 50 percent less than the cost of setting up new units.

India is short of foreign exchange and rupee capital, so she cannot afford to fritter away her meagre resources arbitrarily.

The Development Council has placed the economic capacity of new units during the fourth plan at 2,000 tonnes. If the existing units are to stand in competition with them, it is necessary that they should also be allowed to expand up to that size wherever feasible. It is, however, accepted that it would not be possible for all the existing units below the 2,000-tonne capacity, i.e., 175 factories to expand up to that size due to practical difficulties, such as cane availability, but even if half of them expand up to 2,000 tonnes, the additional capacity would be more than 1.2 million tonnes, which is just about the additional capacity proposed to be licensed even to achieve the fourth plan target of 4.5 million tonnes suggested by the Development Council. It may also be mentioned that the Planning Commission, in its memorandum to the National Development Council, also strongly recommended that the expansion of existing units should get priority over new ones. Sound economic and commercial interests, therefore, demand that the additional capacity in

the industry should be achieved to the maximum extent by allowing the existing units to expand.

The Sen Commission

The Government also appointed a Sugar Enquiry Commission under the chairmanship of Dr. S. R. Sen of the Planning Commission on 17th July, 1964, to enquire into (1) the determination of price and system of distribution of sugar and (2) the licensing of new sugar factories and the expansion of the existing ones.

After detailed deliberations, the Sugar Enquiry Commission is reported to have submitted its interim report to the Government on the determination of price and the system of distribution of sugar. It is to submit its final report to the Government by the end of this year. The Commission seemed to have appreciated the industry's request for a minimum cane price of Rs. 2 a maund for the 1964-65 season in place of Rs. 1.85 linked to a recovery of 9.4 percent announced by the Central Food Minister in March 1964. The Government has accepted the Commission's recommendations on this matter and has notified a minimum cane price of Rs. 2 a maund linked to a recovery of 10.4 percent or less.

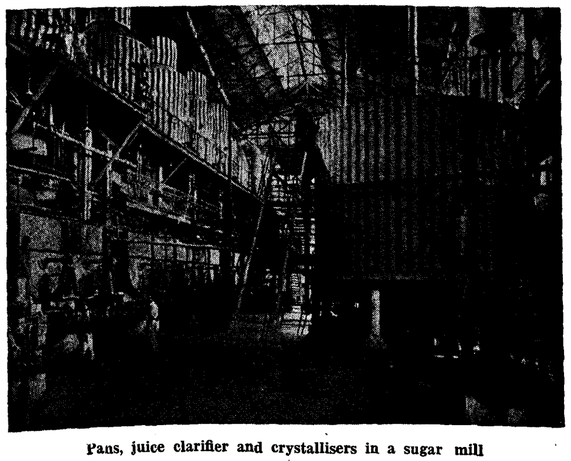
The Commission is also reported to be favourably inclined to grant suitable incentives to the industry for raising sugar production. It is probably on the Commission's recommendation that the Government has announced a 50-percent rebate in excise duty on additional production achieved in October-November 1964 over that for the corresponding period in 1962. In repeating the last year's incentive of excise duty rebate on excess production during the early part of the season, the Government has disregarded the industry's demand for the introduction of selective control to enable the mills to meet effectively the competition from *gur* and *khandsari*. According to reports, the Sugar Enquiry Commission is believed to have not favoured the introduction of selective control in the ensuing season. The main reason adduced by the Commission is that partial decontrol will lead to an undue increase in consumption which, in the present condition of scarcity, is undesirable. It considers it risky to make any departure from the present system of rigid control until sufficient carry-over stocks are built up first. Another reason attributed by the Commission is that the estimates of sugar output at the beginning of a season often prove wrong. So until sufficient reliable estimates of the sugarcane crop, trend of prices of *gur* and the rate of sugar production are available and sufficient stocks are built up, it would not be safe to make a major change in the present policy of control.

It needs no emphasis that the industry should maintain an adequate running stock of sugar to ensure a stable level of prices in the interest of consumers. But it may not be possible to build up such stock in the course of next one or two years, without seriously stifling internal consumption, which is neither desirable nor necessary. The stocks should be built up over a period to minimise the strain on consumers. Even for this, it is essential that the sugar output should be raised to the maximum extent possible. This is the basic issue, and the industry's demand should be considered in this context.

The Sugar Enquiry Commission has contended that the estimates of sugar output at the beginning of a season often prove wrong. At present, the problem of undue diversion of cane to *gur* and *khandsari* stands in the way of making a fair estimate of production at the beginning of the season. If the disparity between sugar and *gur* and *khandsari* industries is minimised through a policy of selective control, the factories will be able to arrest the undue diversion and a fair estimate of sugar production will be possible.

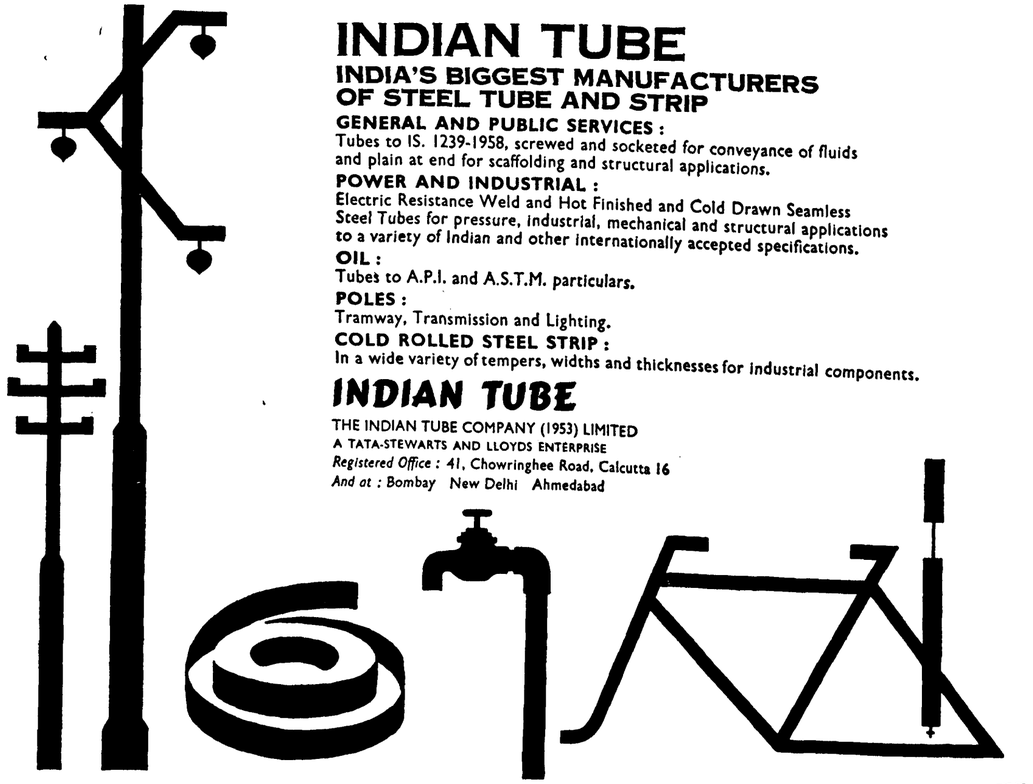
Partial Decontrol

Yet another contention of the Sen Commission that partial decontrol will lead to an undue increase in consumption does not seem to be well founded, for even during the period of decontrol, the Government has retained the mechanism of controlled releases. Under this system, the despatches from factories are governed by the monthly quotas released by the Government and thus the internal consumption remains well regulated and there should be no apprehension of sudden spurt in consumption.



Since the Commission is expected to make its final recommendations by the end of the current year, it is hoped that it will reconsider the matter and recommend a policy of gradual decontrol for the future seasons.

In the context of the compelling need to increase sugar production, the Government order of 2nd November, 1964, imposing an immediate ban on the sale and manufacture of bolder grain sugar (sizes A and B) has come as a rude shock to the industry. The Defence of India Rules, under which this order has been promulgated, empowers the Government to regulate or prohibit the production, manufacture, supply and distribution if it is of the opinion that it is necessary or expedient to do so for ensuring the defence of India and civil defence or the maintenance or increase of supplies and services essential to the life of the community or for securing an equitable distribution and availability of any article or thing at fair prices.



But none of the above stated objections will be realised by the Government order. In effect, the supply of sugar is likely to fall since the working of the 36 carbonation factories, whose production mainly consists of bolder grain sugars, will be thrown out of gear and their production capacity will be adversely affected. It will be appreciated that factories have commenced crushing operations and banning of A and B grain sizes of sugar with immediate effect does not give them any time to change their plants and equipment which is necessary for production of smaller grains. The carbonation factories have installed costly plant and equipment for producing bold grain sugar for which there is considerable demand in the country due to the great preference for it shown by consumers, including bulk industrial consumers.

It is hardly fair that the Government should have introduced such sudden measures of far-reaching consequences which will seriously undermine the economy of a large number of sugar factories. The industry has, therefore, rightly urged the Government to reconsider the matter. If at all it decides to prohibit the manufacture of these grain sizes, it should give adequate time, at least two years, to the factories concerned to effect necessary changes in plant and equipment so as to guard against any dislocation in their working, thereby ensuring that production of these units is not affected in any way.

In the interest of maximising sugar production which is the Government's declared policy, New Delhi would do well to defer its above decision in the interest of smooth working of a large number of sugar factories whose functioning will otherwise seriously suffer.

Pans, juice clarifier and crystallisers in a sugar mill

INDIAN TUBE

INDIA'S BIGGEST MANUFACTURERS OF STEEL TUBE AND STRIP

GENERAL AND PUBLIC SERVICES :
Tubes to IS. 1239-1958, screwed and socketed for conveyance of fluids and plain at end for scaffolding and structural applications.

POWER AND INDUSTRIAL :
Electric Resistance Weld and Hot Finished and Cold Drawn Seamless Steel Tubes for pressure, industrial, mechanical and structural applications to a variety of Indian and other internationally accepted specifications.

OIL :
Tubes to A.P.I. and A.S.T.M. particulars.

POLES :
Tramway, Transmission and Lighting.

COLD ROLLED STEEL STRIP :
In a wide variety of tempers, widths and thicknesses for industrial components.

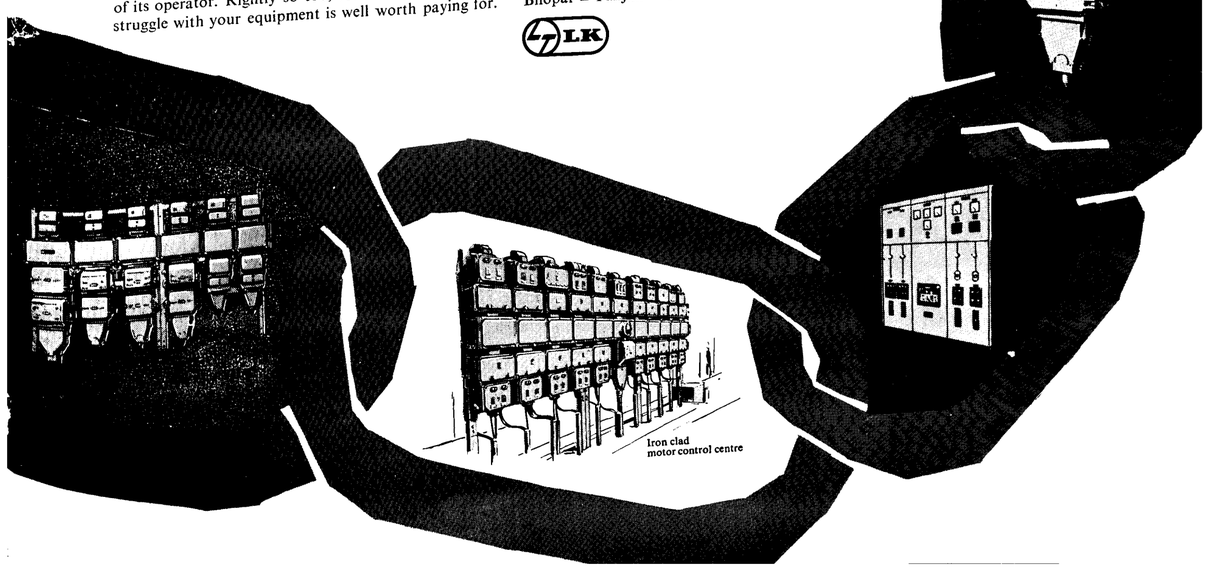
Automatic
Type MK1 starter

When would you call equipment reliable? When reliability is built into it from the stage of initial design.

To meet every specification of this design, selection of materials, manufacturing experience, up to date plant and production techniques and rigid testing are all essential. This is an intelligent engineer's concept of reliability.



But if an equipment fails in even one of its functions it becomes just as unreliable as a broken one. An equipment designed for facile manipulation is the joy of its operator. Rightly so too, for avoiding a laocoon struggle with your equipment is well worth paying for.

Two or three extra units of reliability would cost more – for us, and you too. But these units have secured for LT-LK Motor Starters the highest sales in the country and a very successful entry into the markets of Europe!

When you pay for any LT-LK product you should know that you are paying for equipment that has satisfied every criterion of reliability.

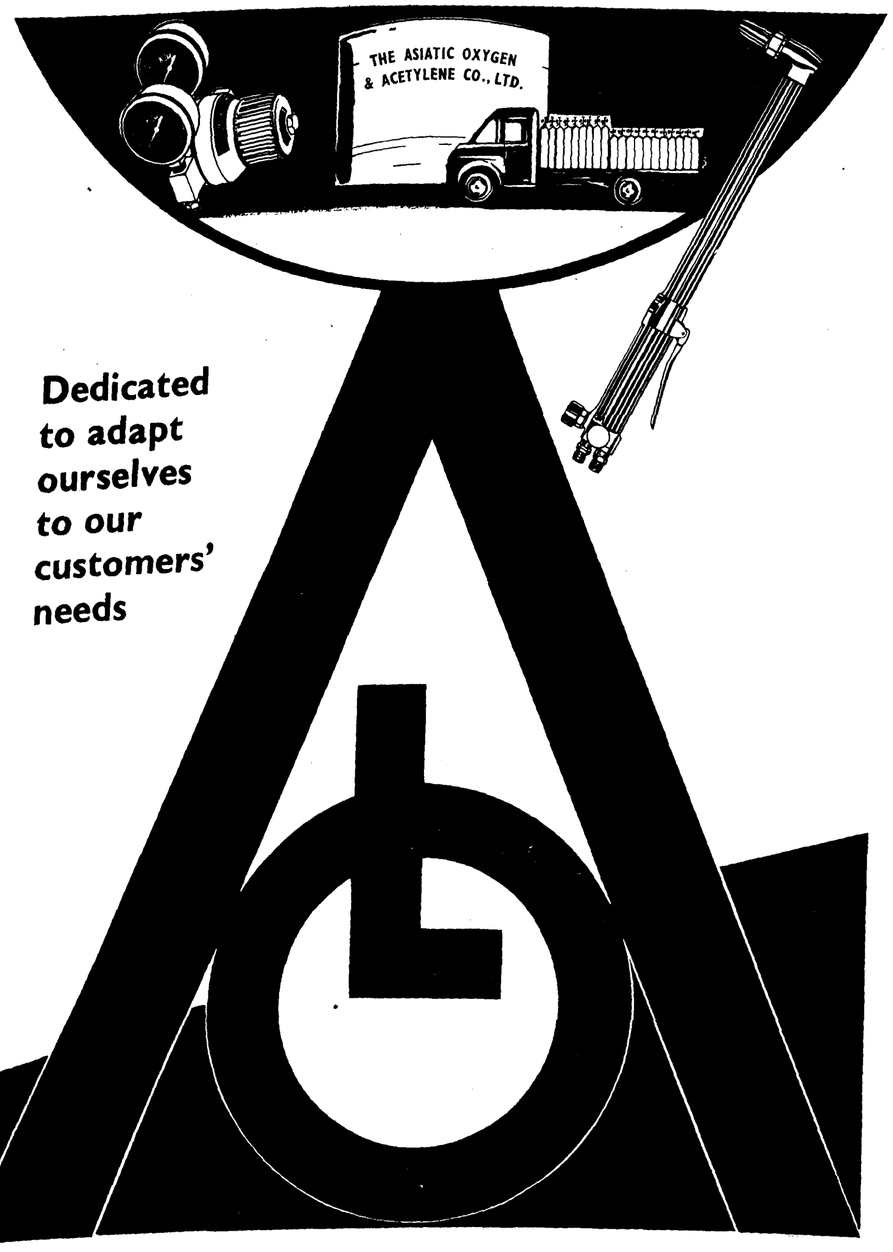
GKW

INTERLOCKING PARTS



GKW is a jigsaw of manufacturing units. Each production or fabrication department in Calcutta could be called a Works within a Works. They operate, to a great extent, independently of each other but, at the same time, for each other.

For the railways they make permanent way equipment, including points and crossings, mechanical signalling equipment and rail lubricators — and, of course, a wide variety of wagon forgings. For road transport — motor car and Jeep wheels, automobile forgings and fasteners. They supply tungsten carbide tipped tools to the mining industry. They cater to industrial expansion in India by manufacturing fittings for tubular scaffolding, rivets, bolts and nuts; and there are few power transmission towers in India which are not held together by their galvanised fasteners.

A variety impressive enough in itself, but only part of the GKW output.

Expanding Steel Capacity: Need for Long-range Planning

By

SIR JEHANGIR GHANDY

NEW capacity in the steel industry takes notoriously long to establish. This is less because of the time it takes to instal new plant and equipment than the much longer period needed to bring ancillary facilities like coal and ore mines, railway links and power supplies, into commission. It is for this reason that many in the industry have been advocating that the planning for steel should be for a longer period than the five-year span in terms of which New Delhi is accustomed to think.

Work should in fact be starting right now on any capacity intended to be in production at the end of the fourth plan. The Ministry sees this need for advance action, and has been endeavouring to arrange its time-table accordingly. Unfortunately, however, a start cannot often be made until the foreign exchange financing has been arranged. This implies that the time-table must allow for the time that negotiation for financing requires. Bokaro provides a telling case in point. Planning for this project may be said to have begun with the commissioning of a feasibility study at the end of 1958 but, although a good deal of preparatory work was done in between, its fate hung in the balance until the Russian aid offer was announced on 1st May this year. A third plan project that Bokaro was intended to be will now be ready only towards the end of the fourth.

One cannot, of course, provide in advance for the quite unforeseen delays that Bokaro suffered. Yet the moral may still be drawn that until India reaches the happy position of not having to worry about the foreign exchange component of new capacity, it will be prudent to allow for the uncertainties of aid-seeking. This carries two implications. First, the technical and economic feasibility of new schemes should be clearly established by adequate studies so that the aid-givers can be presented with a concrete proposition for acceptance. Secondly, alternative schemes must be kept ready so that any one falling through because of the lack of foreign support can be quickly substituted by another not open to the same objections.

All this is more readily said than done. The Ministry would no doubt like as many feasibility studies done as possible but the availability of personnel for such work is extremely limited. There are several agencies now undertaking such work in India, but not all of them are as yet equipped to do a good job. This may explain the unevenness in the quality of work which is already proving something of a handicap. But individual studies apart, there is a good deal to do on the formulation of the overall steel plan—a responsibility carried now by what is called the Steering Group. This, like most other official committees, consists of hard-pressed individuals who may be able to bring mature judgment to bear on problems but cannot be expected to draw up a plan in any detail. While it is realised that there should be a permanent nucleus of planning staff, this has remained no more than a pious wish. The lapse is once again attributable to the shortage of personnel, a situation which warrants seeking outside assistance through one of the several international institutions prepared to assist in such matters.

Reliable Demand Projections

The starting point for drawing up a plan for steel expansion is a reasonably accurate and comprehensive estimate of the demand arising at the end of the plan period. It is not open to us in India to rely on extrapolation of past trends in consumption. The character and volume of demand is changing so materially that any inference based on the past can hardly serve. It is appropriate, therefore, to make an assessment by the end-use method. This implies working backwards from production targets for steel-using industries formulated in the light of broad assumptions about the rate of economic growth expected to be achieved in a particular plan period. Obviously these targets need to be internally consistent—progress in one direction must match what is planned to be done in other related spheres. While consistency is technically verifiable, the broader issue of growth rate involves a large measure of qualitative judgment.

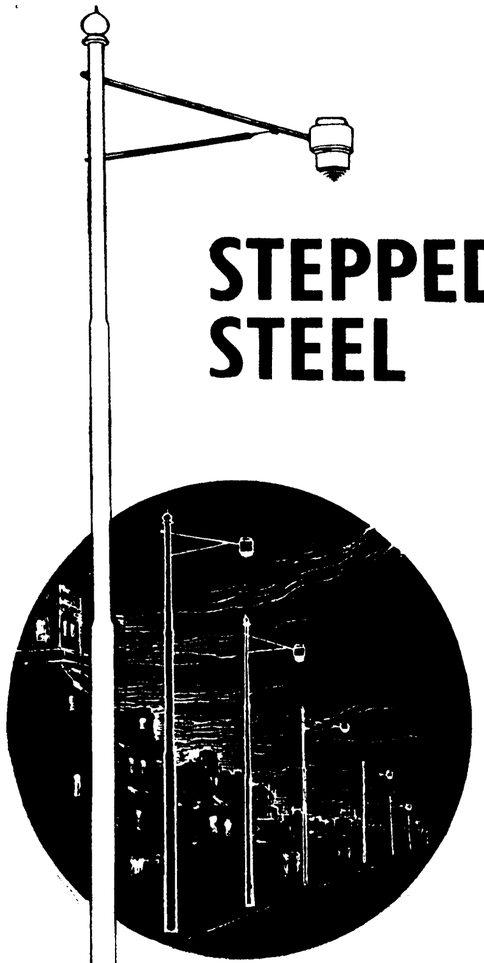
In relation to the fourth plan, several approximations have been made to define a steel target consistent with a given overall growth rate for the economy as a whole. Since all approximations were based on the same growth model, assuming that the economy will be expanding at a certain rate during the fourth plan, there is naturally broad agreement among the estimates which range from a little under 10 million tons of steel (in terms of ingots) to just over 11 million tons for 1965-66, and between 16 million and 18 million tons for 1970-71. That these several estimates vary within narrow limits does not necessarily enhance their reliability, as is sometimes assumed, but only underlines the fact that they start from the same premises.

One can readily agree that steel should occupy a place of importance in the strategy of development because of the crucial rôle this metal plays in economic growth. But by itself steel is just one of the many basic needs of a developing economy. As the Central Finance Minister, Mr. T. T. Krishnamachari, said in Bombay last December, India would in future years need to take up chemical industries with as much enthusiasm as marked steel development during the second and third plans. In any case steel must be transformed into engineering goods—capital or consumer—before this raw material brings any benefit to the community. Steel can, of course, be exported as steel but before this becomes a practical possibility, several major steps will have to be taken to restore to the Indian industry the cost advantage it once enjoyed. Just now the c.i.f. price of several categories of steel imported from Japan and Europe is below that of comparable Indian products. While it may be readily conceded that world export prices often bear little relation to those charged to domestic consumers or to even production costs, the current underselling highlights the difficulty of making substantial exports.

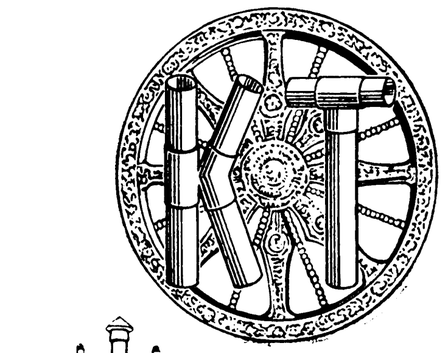
Desirable Growth Rate

It will be inappropriate at this stage of thinking about the fourth plan to arrive at any firm conclusion about a desirable rate of growth in steel. Much will depend on the larger decisions concerning the total investment contemplated and its pattern. But regardless of what the "desirable" rate should be, some judgments can be made even at this stage on what will, in fact, be practical from both the technical and financial viewpoints. My own view, which I find is endorsed by others, is that it will not be practical to plan for more than 14 million tons of production by 1970-71, 5 million tons above the capacity to be installed under the third plan.

The first constraint to keep in mind is foreign exchange. At a rough guess, 50 percent of the total cost of a new integrated plant represents the foreign component. While the endeavour must be to do as much as possible within the country, it is clear that the beginnings in equipment manufacture made in recent months cannot be expected to make any significant contribution until the early 1970's. The Ranchi heavy engineering complex represents the most ambitious bid in this direction. This plant—originally scheduled to be in production by the end of the third plan—will not have got past the construction stage until early in the fourth plan. Getting it organised for full production will take more time, at least until the end of the plan. But Ranchi cannot function in isolation—what it turns out will in many cases require completing equipment from other sources. This requires the development of subsidiary manufacturing facilities, mostly in medium-weight engineering enterprises. Some of these already exist but cannot work more than a fraction of their capacity because they are themselves dependent on yet other plants for components and starting materials. In sum, it will be some time before India can make do with a significantly smaller import component in building new steel capacity than the 50 percent assumed here.

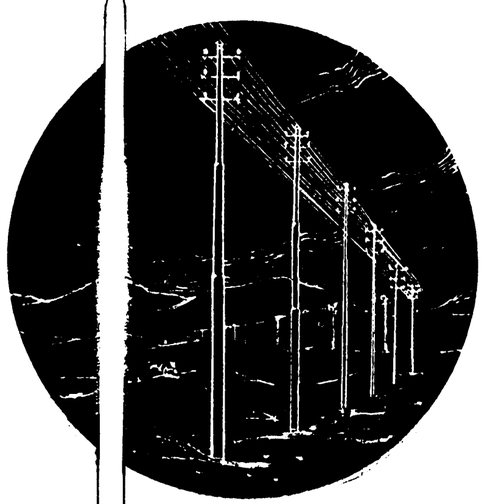


Each million ton of new capacity will need a total investment upwards of Rs. 150 crores within the plant. But neither the direct total investment, nor the foreign exchange component of Rs. 75 crores, is by any means a true measure of the requirements. Any new capacity will require ancillary facilities like water, power, mining development, washeries and other beneficiation plants—all of them demanding substantial outlays—specially for the purpose of meeting steel plant needs. From this it follows that any proposal for new capacity should explicitly take into account the financial implications of the total project, rather than of the plant itself as is being done. The final decision should be made only after such a comprehensive assessment of the resources required. To do otherwise will not only be misleading but in many ways dangerous in a situation where pressure on resources, both foreign and domestic, is likely to be extremely severe.



The second constraint to keep in mind is the physical feasibility of expansion. The steel plant proper presents, as mentioned, the least difficulty—it is a compact construction job which can be handled on the basis of the considerable experience that now exists. Shortages of men and materials may have to be faced—as is the case now at many work sites—but the problems should still be manageable because assistance can, in the last resort, be mobilised from abroad to get over acute bottlenecks. One must quickly add, however, that this cannot be on anything but a limited scale for obvious reasons.

Need to Raise Coal Output



But when it comes to opening up new mines—specially deep mines for coking coal, the difficulties are far more formidable. At the present time, the output of coking coal is around 17 million tons which is somewhat in excess of the immediate requirements of the metallurgical industry. But this surplus will disappear and, in fact, a good deal more will be needed to match the new steel capacity now under construction. Any additional steel capacity established during the fourth plan will thus require a corresponding expansion in coal mining. Since coal as mined will mostly be of qualities which cannot be directly utilised for metallurgical purposes, there will have to be equivalent increase in washing capacity.

Only two of the steel plants, Jamshedpur and Burnpur, work captive collieries. Production from these mines is not at present sufficient to meet the full needs of both plants, but expansion is either under way or contemplated to make both units

STEPPED STEEL

TUBULAR POLES

KALINGA TUBES LTD.

CALCUTTA—12.
WORKS-CHOUDWAR, (ORISSA)

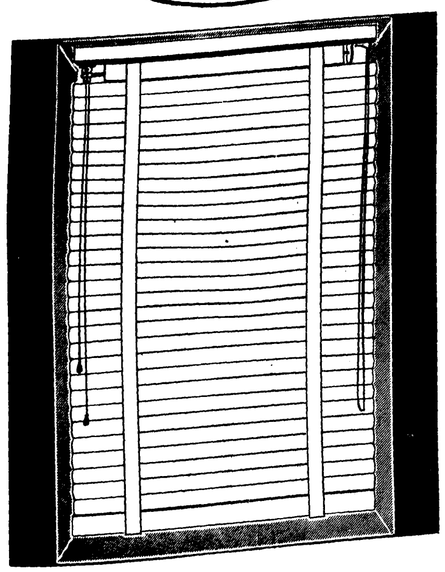
KALPANA.K.T.9.P.B

self-sufficient. Other plants are, however, entirely dependent on market collieries, mostly in the private sector. This implies that the feasibility of steel expansion will depend to a great extent on progress in the coal industry.

In India, where much of the coal that is raised has too high an ash content to permit direct metallurgical use, it is necessary to put raw coal through a washery to improve the grade. Washing may involve losses of up to 40 percent, two tons of raw coal fed into the washery yielding 1.2 tons or a little more of clean coal. There is some danger that losses may be even higher as less suitable deposits of raw coal are brought into use in order to meet increasing demand. Allowing for washing losses and a much smaller but still significant loss during coking, it has been estimated that each ton of steel production will require to be supported by 2½ tons of raw coal. This indicates the substantial expansion that will be necessary for each million tons of new steel capacity.

Quite clearly, much of the additional production of coking coal will have to come from new deep mines, such as the one National Coal Development Corporation is putting down at Sudamdih with Polish assistance. Considering that it may take up to seven years to sink a deep shaft and bring a mine into full output, the danger of steel expansion being held up by the lack of coal is at once evident. There are technological limitations to speedier progress, but that apart, there is also considerable uncertainty about financing, both domestic and foreign. In a new deep mine investment can hardly be less than Rs. 200 a ton of annual output, this being a fairly reliable norm subject to variations depending upon geological and other circumstances. Going by this yardstick the coal needed to feed a million tons of steel capacity will require an outlay of Rs. 50 crores on mining development alone. At the present time, the foreign exchange requirement works out to a little less than one-third of the total investment. This all-industry average obscures the much higher foreign component of large and deep mines. With the advance that has been made in recent months towards local manufacture of mining equipment, the foreign component should decline somewhat during the fourth plan. More substantial reduction will, however, come only towards the end of the next plan when enterprises like the Durgapur Coal Mining Machinery project come into full production.

At the time New Delhi was still thinking in terms of producing 18 million tons of steel by 1970-71, the corresponding requirement of coking coal was put at 45 million tons to meet steel plant needs and an additional 10 million tons to cater to merchant cokeries and others. Of this total of 55 million tons, N.C.D.C. claimed that it could raise 24 million tons leaving it to the private sector to provide the balance of 31 million tons. How N.C.D.C. expected to go up to 24 million tons is anybody's guess since it has not been conspicuously successful in meeting the tasks set for it in the past. In the private sector, the share allotted to it would have implied doubling production in five years with annual increases of the order of 3 million tons or more. Many in the coal industry have judged such accelerated advance not merely unlikely but impossible. As if the technological difficulties are not formidable enough, there are also very serious financial disabilities to overcome. After its experience during the third plan, the coal industry can hardly be blamed if it takes promises of future official help with a large pinch of salt.



World Bank Aid to Coal Mines

In 1960, at the time the private sector was persuaded to fall in line with the official ideas about expansion, it was encouraged to negotiate for a foreign exchange loan from the World Bank. The loan came through —not to the industry but to the Government—making it possible to import equipment and spares required from abroad, provided of course the industry found the requisite rupee resources. The exceedingly slow pace of utilisation of the foreign exchange provided by the Bank in this manner convincingly proves that mining enterprises are not in the best possible financial health. Years of high taxation and rising costs, which controlled prices failed to compensate, have had a markedly debilitating effect on the industry. The incentives promised by New Delhi to facilitate expansion never fully materialised, partly because of the political difficulties inherent in allowing price increases for a basic commodity like coal and partly because good intentions got subverted along the line by legal and procedural difficulties. With this unhappy experience still fresh in their minds, the mining companies can scarcely be enthusiastic about the prospects for 1970-71.

In the light of these circumstances, technical and financial, the outlook for domestic coal production is distinctly unpromising. This makes it appropriate to consider the import of coking coal, an idea gaining increasing acceptance in many circles. The idea should be considered in two parts: one in relation to the existing plants and the other to the new plants which may for this reason have to be located along the coast. All five existing works are situated inland at distances ranging from 150 miles to 350 miles from the nearest port. The feasibility of using imported coal at these locations depends partly on the cost factor and partly on physical limitations. Ocean freight for coal coming by bulk carriers may be low, but to this will have to be added the extra cost of transhipment from ship to train plus inland freight. The higher cost will, no doubt, be offset to some extent by the productivity gains arising from use of better-grade foreign coal. Even if circumstances were so compelling that cost calculations lost much relevance, import would still be unlikely in any substantial quantities because the port of Calcutta cannot handle ships carrying more than 10,000 tons of payload. This may well be decisive in ruling out imports in relation to Jamshedpur, Burnpur and Durgapur except in marginal quantities and under special circumstances. Rourkela and Bhilai have access to Visakhapatnam which is being developed to handle bulk carriers. The availability of ore empties at Visakhapatnam through which Kiriburu and Bailadilla ores are to be shipped to Japan is also a factor to be taken into account. But even so, large-scale imports are unlikely to be feasible.

An entirely different set of considerations apply in considering the

import of coal for new coastal plants. To examine this proposition meaningfully, one has to start with an assessment of Indian reserves. This is not easy to make because of the dispute over estimates, but going by the latest seam-by-seam survey conducted by the Fuel Research Institute, the reserves up to 2,000 feet may be taken as 5,800 million tons of coking coal. This is, however, the figure for coal in the ground—*in situ*. One has to allow for mining losses to work out how much can actually be recovered. While the proportion of recovery will vary, 50 percent is a good average to go by. The validity of the average is borne out by the fact that recovery is only about 40 percent at present, but may be expected to improve with the use of better mining technology. Going by the 50 percent average, the recoverable reserves come to 2,900 million tons of raw coal. After this is washed—assuming a 40 percent yield—the supply of clean coal available to steel plants will be only 1,740 million tons. The supply can be extended by adding blendable coal to the full extent possible. In the present state of technology a 10-percent addition is possible, allowing for which the total availability rises to just over 1,900 million tons.

Need to Import Coking Coal

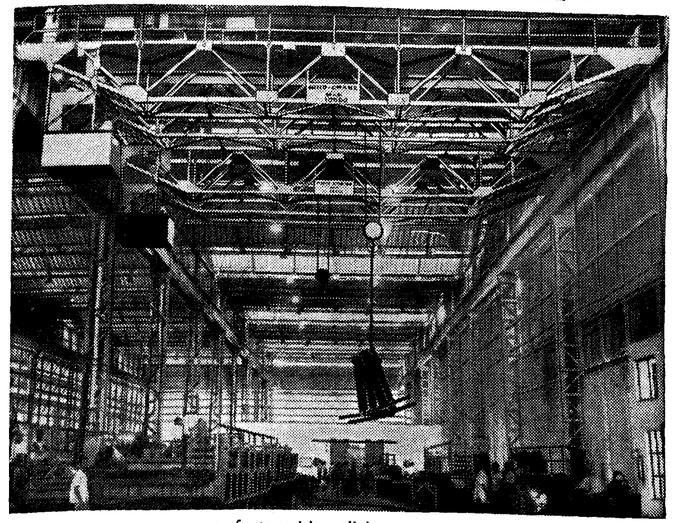
In making these calculations based on the estimates of the Energy Survey of India, (which recently submitted its draft report) one comes to the fairly obvious conclusion that Indian reserves should be approaching exhaustion in 50 to 60 years. There would still be the reserves of coking coal at depths beyond 2,000 feet for which the current estimate is 2,000 million tons *in situ* up to 4,000 feet, a limit set by the current state of technology. In any case the deeper one goes down, the higher will be the cost of mining and consequently greater the threat of competition from more favourably placed industry elsewhere.

Given this long-term outlook, there is every need to consider the import of coking coal to stretch out Indian reserves—a corollary of the imbalance between India's fabulous reserves of iron ore and her meagre endowment in coking coal. The import need not be considered only in relation to this long-term outlook. Dispersal of the Indian steel industry will almost certainly require imports much sooner. At new locations in the south and the west, the cost of transporting Jharia coal overland or by the sea-*cum*-rail route will be high enough to make it advantageous to use imported coal which should ideally be discharged direct from ships to steel plants' storage yards, as in the case of coastal plants elsewhere. Import implies, of course, an outgo of foreign exchange which many people find difficult to contemplate in today's balance-of-payments situation. Regardless of technological advantages in favour of relying wholly on imported coal, it may well be necessary to adopt a blend of foreign and domestic coal to reduce the exchange outgo—an alternative that has been recommended to the Government by its consultants for the Goa-Hospet plant.

No fears about the future arise either in the case of iron ore or limestone. But, as in the case of coal, time will have to be allowed for detailed prospecting, mining development and construction of transport links. A major project like Kiriburu has taken six years to complete. Although one may hope to do better in the future, there will still be a long lag between taking up a mining scheme and getting it to yield full results. It is not at all too soon to be starting work on developing ore mines for the quantities required in 1970-71. This implies taking decisions and setting aside money and personnel to start preparatory work rightaway if New Delhi is at all serious about rapid expansion of steel capacity.

Beneficiating Iron Ore

In both these minerals there has been a great deal of complacency about costs. Indian iron ore deposits lie close to the surface and can be successfully mined by open cast methods. The iron content is so high that each ton goes much further than the lower-grade deposits used in steel industries elsewhere. Even so the delivered cost to steel plants is rising (and may be expected to rise further) because all iron ore may in future have to be beneficiated to overcome high alumina. The technical problems involved in beneficiation are well on their way to solution but the fact of extra costs has to be faced. This requires special efforts to attain high productivity in mining and beneficiation operations. Large mines must be the norm where the high capital costs of modern mining can be spread over an adequate output.



It will no longer be economic to discard ore fines arising during mining operations. The ratio between fines and lump ore which can be directly used in blast furnaces may be as high as 60 to 40. Utilisation will require sintering or some other technique of agglomeration. An additional reason for doing so is that an agglomerated burden is in some ways a better starting material than lump ore, its greater reducibility helping to improve blast furnace productivity. While this factor should offset the extra cost of beneficiation it will be important to watch production economics carefully lest the Indian industry should find its competitive ability badly impaired. In limestone there is a similar problem of quality to be overcome but only in relation to the limited quantity of material used in steel-melting operations. The lines along which a technical solution may be found are clear, and it now remains to translate laboratory ideas into production-scale facilities. Quality apart, the physical problem of raising enough limestone can be successfully tackled provided a big enough effort is made to locate suitable deposits and prove them. While this effort is under way, it may well be necessary to reserve better-grade deposits for the metallurgical industry.

Manpower Requirements

These are the physical tasks related to the steel expansion programme. They are formidable enough but even more intractable is the problem of mobilising manpower. Training facilities now available can indeed turn out the required number of engineers and artisans, but they cannot provide experience in depth. It takes five to seven years of experience on the shop floor to make a good steel man. In management cadres, this lack of experience can be a severe handicap. The gap between requirement and supply of skills may persist for ten years or more placing a limit upon India's ambitions in steel. The employment of foreigners as in Rourkela or Durgapur is, of course, a possible way out but recruitment on short-term contract is not going to be easy in conditions of full employment in western countries.

Raising Food Output through Bigger Use of Fertilisers

By JOHN K. JOHN

A FEW years ago, Mr. Jawaharlal Nehru, speaking of conservatism and the Indian economy, said that it was not a question of a decision to change or not to change. India, he said, had to run to stay where she was. Although there is much talk, often despairingly, of the population explosion, one wonders how many in this country are aware of the stark facts of the case.

India's population is increasing at over 10 million a year. Each day she has an extra 28,000 human beings to clothe and feed. Viewed from another perspective, India is creating each year a population equal to that of, say, Belgium or the Netherlands, or Tanganyika, or the combined populations of Norway and Sweden. In two decades, the country achieves an increase equal to the present population of Africa. Awesome as this increase in itself is, a look at the other side of the coin, food production, brings into focus the rather nightmarish situation India is facing.

Food production increased from 50 million tons in 1950-51 to over 80 million tons in 1960-61. From then onwards it has declined and the estimate for the crop for 1963-64 is only 77 million tons. There seems little chance of India achieving the original third five year plan target of a 100 million tons of foodgrains and it is less than likely, following current trends, that she will even achieve the reduced target of 95 million tons by 1965-66. Such increases in production as have been made in the last decade or so, are mainly due to the extension of the acreage under the plough and by added irrigation facilities. The latter is equivalent to doubling the original acreage as it allows two crops to be grown where one grew before.

The Widening Gap

The gap between the anticipated indigenous production based on the current trends and the demand for foodgrains to feed the growing populations at the present level of consumption is illustrated by the graph on page 15.

The curve of current trends shows that the production of foodgrains at the end of the third five year plan in 1965-66 will be 80.1 million metric tonnes, while the demand at the present level of nutrition will be 92.8 million tonnes. Similarly, at the end of the fourth five year plan in 1970-71, the production of foodgrains—according to the current trends curve—is anticipated to be 83.4 million tonnes whereas the demand for foodgrains to feed the increased population will amount to 103.4 million tonnes.

The gap between the demand for foodgrains and indigenous production has been filled for some years now by imports, and these figures tell a story of their own. Foodgrain imports varied from 700,000 tonnes to 3.8 million tonnes until 1959, but since then India has been importing foodgrains to the tune of about 5 million tonnes every year. This year, the Government has announced its intention of importing 6 million tonnes of wheat alone. From the current trends curve, it appears that foodgrain imports will have to increase to 12.7 million, 20 million and 29.4 million tonnes in 1965-66, 1970-71 and 1975-76, respectively, unless some drastic steps are taken to raise the rate of growth of indigenous production and population control measures are intensified. This then is the widening gap—the growing cleavage between the increase in population and that of agricultural production.

Dependence on Imports

Seventeen and a half years after independence and after 14 years of the planned economy in a predominantly agricultural country, India has come to a sorry pass where she still has local famines as in Rajasthan this year and is more dependent than ever on the import of foodgrains to keep the wolf from the door. Agricultural productivity has barely increased. This is a matter of fundamental importance, for, while there is still scope for the extension of irrigation facilities, further reclamation of fallow land will be marginal. The proportion of arable land in India to the total land area is high as it is, and leaves little room for further extension. Substantial increases in food production can only come from enhanced agricultural productivity.

The problem will, of course, have to be tackled on both fronts and while, in parenthesis one may observe that the outlays on family planning in the second and third plans (Rs. 27 crores in the third plan for family planning, against Rs. 92.4 crores for *Ambar Charkha*) are grossly inadequate and beg the issue entirely, the main concern of this article is with food production. Population control is still a matter of controversy and whatever the allocation for it in the fourth plan, it is unlikely that there will be any significant fall in the rate

EXPERIENCE AND INGENUITY BUILD BETTER COAL HANDLING PLANTS

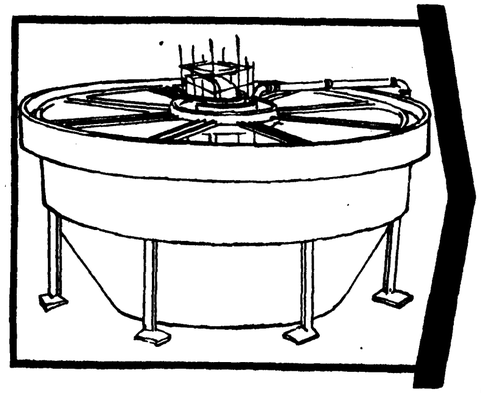
McNALLY-BIRD

can harness both for your project.

Engineers at McNally-Bird are constantly developing the performance of their coal handling plants. Now, McNally-Bird's coal handling equipment are capable of loading out a rake of over thirty wagons in three to five hours.

In design, supply and commissioning, McNally-Bird bring you the best in experience, skill and resources to ensure top performance through years of tough operation. For your next coal handling job, call in McNally-Bird the biggest in the field in India.

McNally-Bird offer the following services :



- COMPLETE "TURN KEY" PROJECTS
- COMPLETE COAL PREPARATION PLANTS
- AUXILIARY EQUIPMENT FOR MATERIALS HANDLING
- MATERIAL HANDLING SYSTEMS FOR ALL BASIC INDUSTRIES
- AUTOMATIC SAMPLING
- CRUSHERS AND BREAKERS
- CAR HANDLING SYSTEMS
- COAL CLEANING
- CONVEYOR IDLERS
- CENTRIFUGAL DRYERS
- CENTRIFUGAL PUMPS AND VALVES

BIRD'S CENTENARY YEAR

Note:
(1) The present trend of foodgrains production conforms to the equation $Y = 46.86 + 27.6237 \log x$ where x stands for number of years counted from the base year 1950-51 and Y is the predicted production.
(2) The future demand for foodgrains at the present level of *per capita* consumption is calculated on the following bases:
(a) Rate of increase in population: 2.2 per cent a year.
(b) *Per capita* requirements of foodgrains: 365 lbs a year.
(c) Requirement for seed, feed and wastages: 12½ percent of the total production.
(3) In the first and second five year plans, the targets of production were mainly based on the production potentials due to increased irrigation, use of fertilisers, etcetera. In the third five year plan, the targets were related to the requirements of growing population and the production potentials were adjusted accordingly. The fourth five year plan targets will probably be based on similar considerations.

of population growth over the next decade or so.

Given that there will be no significant fall in the rate of growth of population, that further reclamation will be marginal, that increases in the irrigated area will be gradual and inadequate in themselves to ensure a sufficient level of food production, what should this country do to bridge this widening gap? The obvious answer lies in increasing agricultural productivity. Of the several factors that make for efficient farming, such as better seed, judicious crop rotation, use of improved implements, and the control of pests and diseases with insecticides and fungicides, nothing is of greater significance than the use of chemical fertiliser. In soils such as India's which have been cultivated from time immemorial, where the natural plant food resources have been thoroughly depleted, there is no answer but to rejuvenate them and restore their nutrient status by the massive, systematic and balanced use of chemical fertiliser.

Using Chemical Fertilisers

Although chemical fertilisers have been used in India in miniscule quantities for 40 years, the industry is still in its infancy from the point of view of both consumption and production. As the accompanying figures show, the consumption of fertiliser in India is exceedingly low and is, in fact, like the country's agricultural yields among the lowest in the world:

Country	Consumption a hectare in kilograms	Consumption a head in kilograms
India	2.7	0.9
Japan	270	17
West Germany	268	41
Netherlands	458	40
World average	22.2	12.2

The correlation between agricultural yields and the fertiliser consumption has been established in many countries. The experience in Taiwan shows that the more the fertiliser used, the higher is the yield a hectare.

The consumption of fertiliser in India has happily been rising. The country used 1.75 kilograms a hectare in terms of N, P & K in 1960-61, 2.25 kilograms a hectare in 1961-62 and 2.71 kilograms a hectare in 1962-63. How then is it that in the very years in which consumption increased by 54 percent, food production actually fell? It is necessary to take a closer look at the consumption figures. In 1962-63, the total quantity of plant food ($N : P_2O_5$ and K_2O) distributed in the shape of fertilisers was 495,000 tonnes. Of this quantity, on a liberal assumption, 25 percent was applied to foodgrain crops while the rest went to plantation and cash crops such as tea, coffee, rubber, plantain, sugarcane, and cotton. Assuming that one unit of plant food produces an additional ten units of foodgrains, the increase in yield of foodgrains accounted for by fertiliser application in 1962-63 was no more than 1¼ million tons or 1.6 percent of the total foodgrains production.

As such, the impact of the present fertiliser application on foodgrains production is so slight as to be easily offset by adverse seasonal conditions such as the country had in its various parts during the last few years. All that can be said is that had India used no fertiliser at all, there would have been a further fall in foodgrains production by about 1¼ million tons. It is interesting to note that on the above basis, to achieve a production of 100 million tonnes of foodgrains relying on the beneficial effects of fertiliser alone, India will have to use 2.65 million tons of fertiliser in terms of NPK, against the present application of less than 125,000 tonnes to feed foodgrain crops.

Apart from the very meagre consumption of fertiliser, there is the further complication of unbalanced fertilisation. As the figures for 1961-62 on page 17 show, the consumption in India of nitrogenous fertiliser is grossly disproportionate of P_2O_5 and K_2O.

In 1962-63, the position improved slightly in the sense that the ratio altered from 10. 1 : 2.1 : 1 to 8 : 2 : 1. Whereas the global tendency is increasingly to use NPK in a 1 : 1 : 1 ratio, except where special conditions prevail, India has not yet appreciated

the value of phosphate and potash. This is a matter of concern as the unbalanced use of nitrogen may, in the long run, lead to the deterioration of the nutrient status of the soil even below its original level.

Nitrogenous Fertilisers

Turning to production, the picture is no happier. The production of nitrogenous and phosphatic fertiliser fell far short of the targets set out in the second plan. In the first two years of the third plan, it was realised that nitrogenous fertiliser factories had a long gestation period and the Government wisely licensed production in excess of the targeted quantities. Nevertheless, due to a variety of reasons, it is unlikely that much more than about 50 percent of the third plan targets of 800,000 tonnes of nitrogen and 400,000 tonnes of P_2O_5 will be realised.

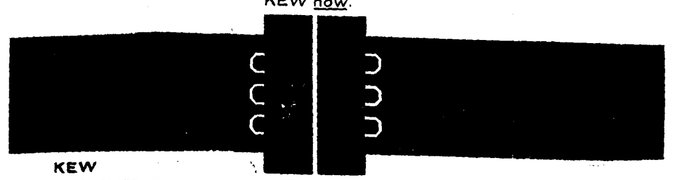
The obstacles to achieving production targets are the now familiar delays connected with licensing, finding finance in a crippled capital market, arranging foreign collaboration, etcetera. As far as the private sector is concerned, finding foreign collaborators is no easy task, as fertiliser projects call for large capital outlays with a substantial foreign exchange component. The fiscal policies of the Government in the last few years, the shortage of power and water, the difficulties connected with fertiliser movements, monopolistic distribution through co-operatives, the arrangements for rural credit, and the rigid control exercised on all aspects of the industry, have served as disincentives to potential investors.

Whatever the causes for the lags in production and consumption, it is becoming increasingly clear that the entire framework of the fertiliser industry requires overhauling, and a fair amount of rethinking is required as to the means to achieve the targets.

All supplies of nitrogenous fertilisers are at present being made through the Central Fertiliser Pool. It has been suggested that the pool will be needed till such time as the production approximates to the country's requirements and imports become marginal. But while it lasts, it is making a considerable amount of profits. It is, therefore, suggested that one good use of these profits would be to plough it back in favour of educational propaganda for greater consumption of fertiliser, so that the farmer is persuaded to use more fertilisers at a quicker rate, so as to result in higher agricultural production an acre.

Monopoly of Co-operatives

Another anomalous feature of the fertiliser trade is the monopoly given to co-operative societies in the marketing of nitrogenous fertiliser. Whatever the country's ideological predilections may be, it is concerned here with a matter of such importance that it must make use of every agency available to it to further its purpose, be it a co-operative society, a departmentally operated godown or a private *mandi* merchant. Giving co-operatives a monopoly not only militates against their own efficiency, but also denies the farmer millions of potential stocking points all over the country. A society run on sound co-operative principles, and there are many such in India, will never need to fear competition from private parties.



Apart from the structural framework, the two basic factors inhibiting the rapid spread of fertiliser use are the lack of credit and the lack of publicity. Although the Reserve Bank has made a start by providing some credit for fertiliser, the scale of operations so far has been small and such credit as has been made available has been channelled entirely through co-operative societies. Furthermore, the credit is used almost entirely for the sale of nitrogenous fertilisers. A scheme on a much grander scale channelling credit through both co-operative societies and private distributors and making it available for nitrogenous, phosphatic and potassic fertilisers is now urgently required.

As far back as 1960, the Fertiliser Distribution Enquiry Committee set up at the instance of the Central Government, recommended the establishment of a Central Fertiliser Marketing Corporation for distribution, storage, sales promotion, soil testing, etcetera. No action has so far been taken on this recommendation made by an expert committee. Although the present writer veers to the view that distribution and storage should be attended to by individual manufacturers, he is strongly in favour of a central organisation which would devote itself to the promotion of fertiliser use, balanced fertilisation based on soil tests and correct methods of application, an organisation which, in fact, would carry the message to India's thousands of villages, for a growing consciousness of the value of balanced fertilisation is the best hope to bridge the gap.

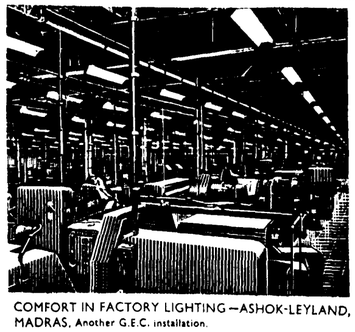
CAN WE HAVE TOO MUCH LIGHT FOR COMFORT?

For inactive type of comfort it is perhaps desirable to limit the amount of light, but for almost any form of activity it is necessary to have ample light. This is difficult to achieve, however, without introducing some discomfort which tends to nullify the benefit of the higher level of illumination.

The G.E.C technique of 'Comfort in Lighting' makes it possible to achieve the increasing high levels of illumination which efficiency and economy demand. Levels as high as 100 lm/sq. ft. can be obtained without any discomfort glare and without any impression of there being 'too much' light.

The G.E.C. 'Comfort in Lighting' fittings— Xtralite —direct the light where it is wanted and conceal the light source from all angles of normal view. The observer's attention is drawn to the objects illuminated and not to the lighting fittings.



CLARKE-SHIRAZ HOTEL, AGRA. Under-Water flood lighting of fountain is achieved by using G.E.C. fittings F69039 (L). Complete electrification by G.E.C.

AMERICAN EXPRESS, BOMBAY. Yet another G.E.C. 'Comfort in Lighting' installation. Average illumination 20 lm/sq. ft. at desk level.

WHAT DOES IT ADD UP TO?
The new range of Xtralite — the G.E.C. 'Comfort in Lighting' fittings—has been designed as a result of the study of lighting comfort and of experiments carried out by the G.E.C. Research Laboratories
and IN ADDITION

Lamp Production Increasing, but Costs Need to be Reduced

By
W.A.C.H. Bosschaart,
Chairman and Managing Director, Philips India Ltd

THE Indian lamp industry has made remarkable progress since its inception in the 'thirties when two manufacturing units were set up in Calcutta to manufacture lamps from essentially imported components. In the three decades that have since elapsed, the industry has grown in size and increased its output and the range of products. Today, there are 18 units spread all over India, of which a few new units should be going into production shortly if the industrial licences granted to them are used in setting up the factories. Apart from complete products, the manufacture of various components used by the industry is also being increasingly undertaken in the country. Here again, a number of licences have been granted for the manufacture of basic lamp components to new entrepreneurs. If these projects are implemented, it can be said that before long the industry could be truly called self-sufficient and would be free from dependence on import.

Electric lamp is today a basic need in civilised society. It has made it possible for the working day to be extended. Recreation, production and various other kinds of human activities which one takes for granted after sunset would not have been possible but for the electric lamp. A good deal of accent is being rightly placed on power generation in the country. According to the Planning Commission, power generation must be doubled every five years so that the rate of economic growth can be sustained. The third five year plan aims at achieving a capacity of 12.50 million kilowatts by 1966. By the end of the second year of the fourth plan, this figure is expected to go up to 17 million kilowatts. Along with power generation, great emphasis is being laid on bringing power to remote villages. During the second plan, 15,000 villages were electrified, while in the third plan the target is 20,000 villages with a total outlay of Rs. 105 crores.

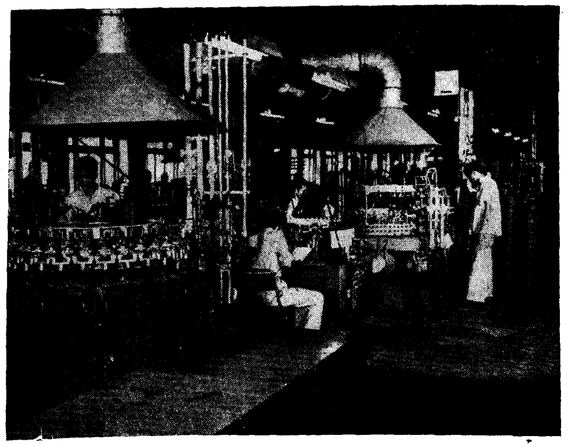
Power Generation

The lamp industry in India, as elsewhere in the world, bears a close link with the progress made in the field of power generation and distribution. This progress, together with the rapid urban and rural housing programme, contributed its share to the growth of the industry.

Realising this close link, the Indian planners have set targets which have so far been realistic and progressive. In 1951, the industry produced 15.51 million pieces of general lighting service lamps and a decade later, in 1961, the output sharply increased to 45 million pieces. In 1962 and 1963, the figures further improved and stood at 56 million and 62 million pieces, respectively. By the end of the third plan period, it is expected to touch the figure of 90 million. In 1952, the manufacture of fluorescent lamps was also started and three years later, in 1955, the production figure stood at 720,000 pieces which, by the end of 1963, reached the 3.8-million mark. Besides these two basic types, the manufacture of other types has also been taken up. Miniature lamps and mercury vapour lamps are today being manufactured in India.

General lighting service lamps Beginning with two units in Calcutta in the 'thirties, the industry today has 18 units having a total licensed capacity of 86 million pieces a year. The G.L.S. lamp manufacturing process has greatly benefited through the introduction of a high degree of mechanisation. This has resulted in higher output, a better and uniform quality and lower manufacturing costs. This fact has been mainly responsible for the industry's success in maintaining prices over a long period in spite of increases in costs on all fronts.

The importance of the cost of general lighting service lamps in the budget of a family should influence future developments of the industry in India. With the increased quantities visualised for the future, the cost of these lamps can be controlled or brought down through increased installation of economic high speed machines. Lamp making in more industrialised nations is today a highly automatic operation. Furthermore, the nature of the industry is such that a fledged integration involving the manufacture of all its components will only become economical and even feasible when the total production reaches a large volume, the more so as the manufacture of basic components for lamps is highly capital-intensive.



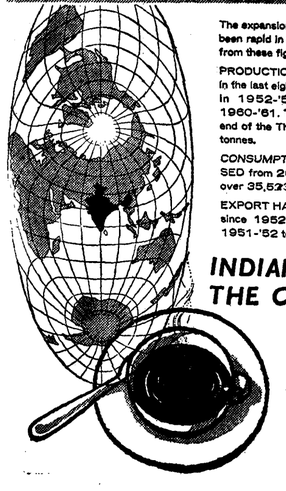
Making Fluorescent Lamps

Fluorescent lamps: Beginning with a single unit in Calcutta in the 'fifties, the industry today has three units having a total installed capacity of 3.8 million lamps. The initial capacity was 800,000 and today the production has reached the figure of 3.8 million pieces a year. It has been estimated that by the end of the present plan period, the total installed capacity of fluorescent lamps should be 8.8 million pieces whereas a target of 35 million pieces has been set for the fourth plan period.

Fluorescent lamp has found wide acceptance due to its extremely low running cost and long life. No industry today is planned without artificial lighting. When artificial lighting is being considered, the first choice is invariably a fluorescent lamp. When one considers the industrial progress of India in the future, the enormous possibilities for the fluorescent lamp industry become very obvious.

The manufacture of components for fluorescent lamps is also a complicated affair and equally capital-intensive. Unfortunately, in India, the production of fluorescent lamps has been lagging considerably behind demand with results inherent in an under-supplied market. This has led to the granting of some manufacturing licences. But it is doubtful whether all of them will be used for creating production capacity.

Other lamps: Apart from the above two main sources of light, a number of other lamps of varied applications are being manufactured in the country. The industry is making a variety of miniature lamps like torch lamps, radio panel lamps, and motor-car lamps. The demand for them is expected to rise by the end of the third plan period to the 45-mil-



Production of glow-switches for fluorescent lamp starters

The world over, people of taste prefer
INDIAN COFFEE
for its distinctive aroma

From the world's finest Coffee Plantations in India, where ideal conditions for growing superior Coffee exist, INDIAN COFFEE goes to cheer up millions of Coffee lovers in France, Italy or Germany, in U. K., U. S. A., or U. S. S. R.—in fact all over the World!

The expansion of Indian Coffee industry has been rapid in the last decade as can be seen from these figures:-

PRODUCTION HAS NEARLY TREBLED in the last eight years: from 23,943 tonnes in 1952-'53 to 67,925 tonnes in 1960-'61. The target of production by the end of the Third Five-Year Plan is 80,000 tonnes.

CONSUMPTION IN INDIA HAS INCREASED from 26,000 tonnes in 1955-'56 to over 35,523 tonnes in 1960-'61.

EXPORT HAS GONE UP FIFTEEN TIMES since 1952: from only 2,200 tonnes in 1951-'52 to 32,271 tonnes in 1960-'61.

MARTIN BURN LOOK BACK TO OVER *180 YEARS OF SERVICE TO INDIA*

...to be able to compute this service by decades, not by years alone... to recall that our creed has consistently been the development of our country's resources through engineering and allied enterprises... to take pride in planning that makes the many units in our organization fall into a rational and complementary group and each one a leader in its particular field, a position which some of them, early pioneers in India, held even in the last century. For us looking back is a worthwhile proposition —an incentive to *move forward.*

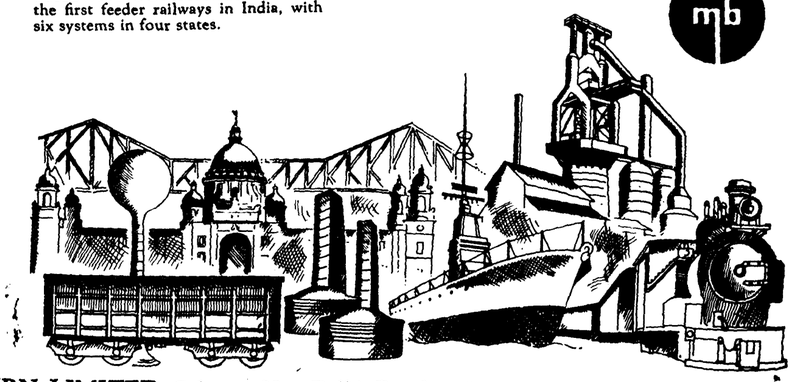
AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

THE INDIAN IRON & STEEL CO. LTD. : With a million ton integrated steel plant at Burnpur, the largest foundry in the Commonwealth at Kulti and its own collieries and iron ore mines, IISCO has an enviable record in production efficiency.

BURN & CO. LTD., HOWRAH WORKS : Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP : Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories—in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA : The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive components.



THE HOOGHLY DOCKING & ENGINEERING CO. LTD. : Established in 1819, the Company has a shipbuilding yard, a dry dock and extensive workshops at Salkia.

ROBERT HUDSON (INDIA) LTD. : A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

RAILWAY COMPANIES : Some of the first feeder railways in India, with six systems in four states.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India—serve 45 towns in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD. : A collaboration with The Vaughan Crane Company Ltd. of Manchester... Hand operated and electric overhead travelling cranes and chain pulley blocks.

MARTIN BURN LIMITED Calcutta New Delhi Bombay Kanpur Patna

MBGC-22A

Manufacture of General Lighting Service lamps

lion mark, against 22 million in 1961. To this should be added another 5 million pieces for export purposes.

Miniature lamps are being manufactured by a number of small and big units in the country. The bigger units are mainly concentrating on a few types like torch and dial lamps. The smaller units, on the other hand, are manufacturing certain specialised types, such as motor-car lamps, largely through labour-intensive and semi-mechanised methods. Considering the fact that these motor-car lamps have a vital bearing on road safety, it is felt that a greater emphasis should be laid on their quality. Furthermore, considerable work on new types and standardisation, which is progressing apace in western countries, has to be brought to the Indian industry also.

Mercury Vapour Lamps

The process of diversification went a step forward as the industry took up the manufacture of mercury vapour lamps. The latter are generally used in public lighting and for lighting in large areas like dockyards and railway shunting yards, besides high bay industrial interiors.

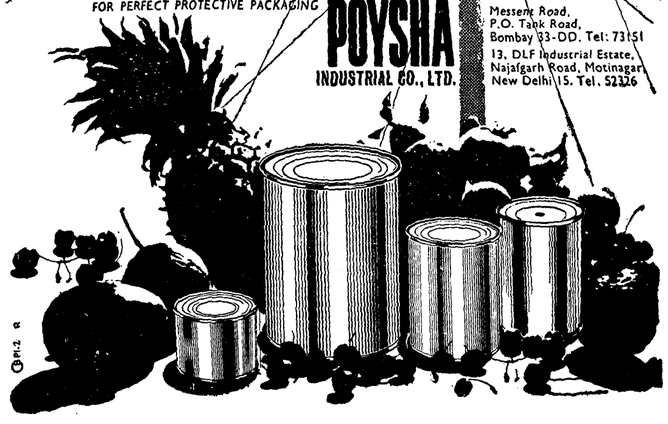
Two units have been manufacturing these lamps partially with imported components. However, a third unit is now manufacturing the quartz burners—the basic element in the lamp. Here again, the volume of production has a direct bearing on the cost of manufacture and also, to a very large extent, on the quality of the product. These expensive lamps have to have consistently high quality if their use in industry and in public lighting is to be economical.

Since its very inception, the lamp industry has been constantly at pains to explore ways and means to take up locally the manufacture of the components. A number of items like glass shells, glass bulbs, brass caps, etcetera, are already being made in this country. The demand of the industry cannot, however, be met with the supplies available so far from the indigenous sources. The ultimate goal of the industry, however, is to reach the stage of maximum self-sufficiency —a stage where it will not be necessary for the industry to have recourse to large-scale imports for the supply of its components and raw materials.

Recently, a new page in the history of lamp-making in India was turned since an integrated project for the manufacture of tungsten and molybdenum wire and tungsten coils was inaugurated by a lamp manufacturing unit in Bombay. Whereas tungsten coils are already being made in this country for some years now, indigenously-made tungsten wires are most likely to be available during the second half of the current year. Plans for the manufacture of fluorescent powder are also being expedited. With the availability of these vital components from indigenous sources, the Indian lamp industry will be well on the road to self-sufficiency.

Manufacture of Components

A few references have already been made in this article to the economics of component manufacture. It must be realised that the manufacture of lamp components will be economical only when real large-scale production is undertaken. If one studies the pattern of component manufacturing activity in various countries, it will inevitably be found that this specialised work is necessarily confined among a few competent large-scale manufacturers who have extensive research and testing facilities. In the lamp industry, it is the component that determines the ultimate quality of the product to a very large extent and its importance must, therefore, be recognised. If India has to become self-sufficient in component manufacture, it should ensure that this activity is entrusted to industrialists who are fully equipped and experienced in this line. This would further save the investment made for this purpose from waste.



The fourth plan envisages for the Indian lamp industry a manufacturing schedule of 200 million G.L.S. lamps, 35 million fluorescent lamps, 1 million mercury vapour lamps and 90 million miniature lamps. This growth potential naturally is going to spell out a very busy time for the industry in the coming years.

Efforts are continuously being made throughout the world further to improve the performance of the industry and to offset the continuously increasing cost of production by means of better production methods and higher quality. So a constant flow of information from leading manufacturers in other countries must be ensured.

This article cannot be complete without a reference to the influence that the growth of the lamp industry has on various sectors of light electrical industry as well. Ballasts and other accessories of fluorescent lamps, lighting fittings, etcetera, have all received their due importance in the past few years and their manufacture has increased considerably. With the manufacture of a number of basic components envisaged, it can perhaps be said that the Indian lamp industry has reached today the take-off stage.

IN STEP WITH TOMORROW

New processed foods, new pharmaceuticals, and many more new products are coming on the Indian market every day. They create new packaging problems ■ At Poysha, one of the leading tin container makers in the country, they are always geared to meet the requirements of their customers. In 1963 they pioneered the manufacture of 5½ oz. juice cans. Soon these will be lithographed too. Next on the agenda is a much wider expansion of the range of packaging material. What is more, plans are ready for the setting up of subsidiary factories in the heart of the fruit and vegetable growing areas to help the canners with quick and economical canning facilities. Poysha are indeed always in step with tomorrow.

Expansion of the Oil Industry: Problems and Prospects

By

DILIP MUKERJEE

INDIA will soon have to be making some hard choices in oil. With little hope of any major contribution from domestic sources of crude, the rising demand for oil must mean an increase in imports to close the widening gap. Will she be in a position to afford the import bills in prospect?

The draft report of the Energy Survey of India offers alternative estimates of oil demand basing on three different hypotheses of growth —6½ percent, 7½ percent and 8½ percent. At the lowest, India will need crude supplies of the order of 25 million tons in 1970-71, 43 million tons in 1975-76 and 65 million tons in 1980-81. The report, while refusing to be dogmatic about India's ultimate oil potential, assumes that domestic crude output is unlikely to be higher than 10 million tons within the foreseeable future. The gap to be met by imports may, therefore, be as high as 55 million tons by the end of the fifth plan, requiring something like Rs. 330 crores of foreign exchange each year as against Rs. 100 crores in 1963-64. Depending on how India's exports fare, oil imports may absorb up to one-fifth of exchange earnings in 1975-76. This may be too heavy a load to bear.

The cost apart, is it safe for India to allow herself to depend to this degree on imports to meet her energy requirements? If present trends continue, oil's share in the economy's total consumption of energy in all forms—commercial and non-commercial—may rise from around 16 percent in 1960-61 to 30 percent by 1970-71 and 45 percent by 1980-81. If non-commercial energy—farm wastes and the like—is excluded from the reckoning, dependence on oil will rise from about 40 percent in 1960-61 to 50 percent in 1970-71 and 55 percent in 1980-81. While this degree of dependence on imported energy supplies is not uncommon in today's world, can India with a balance of payments problem peculiar to the early stages of economic growth afford to take the risk? This is not an issue on which any judgment can be made except after a very careful consideration of alternatives from the political, economic and technical standpoints. One may venture, however, the comment that any fiscal measure which gives added impetus to substitution of oil by coal can scarcely be justified. In fact, it may well be necessary to give incentives to encourage the use of domestic coal and electricity in place of oil wherever this is technically feasible.

Crude Oil Resources

The starting point of a long-term energy policy must obviously be an assessment of India's crude oil resources. In 1960-61, the output of Indian wells was about half a million tonnes. By 1963, this had risen to about 3 million tonnes, two-thirds of it from Assam and one-third from Gujarat. This may go up to 7 million tonnes by 1966, according to recent estimates of the Ministry of Petroleum and Chemicals. India has an area of about one million square kilometres of sedimentary rock which theoretically have an oil potential. The available knowledge regarding the geology of these sedimentary basins is meagre and is, as the Energy Survey points out, of a very general nature. It is impossible, therefore, to make any reasonable guess at all about the future except to acknowledge that there are several promising areas, specially in Assam and Gujarat. The work that has been put in since the second plan on prospecting in Gujarat and Assam has so far yielded encouraging results but nothing like a real breakthrough. One hundred million tons of reserves, proved and inferred, have been established—almost half and half in the two areas.

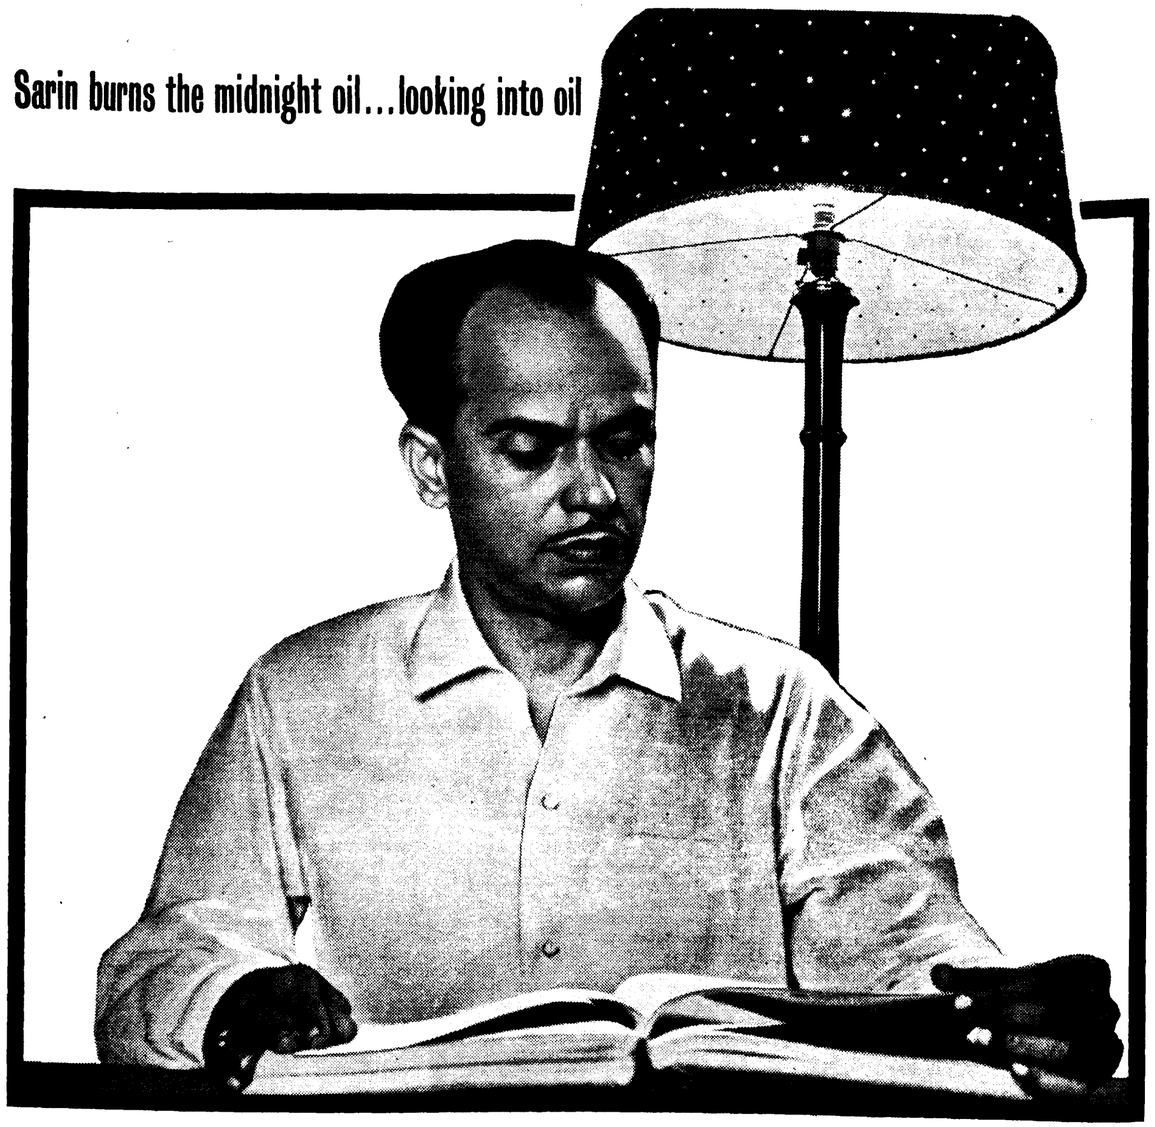
Some authorities, Indian and foreign, see no reason, however, to be despondent. Mr. O. V. Alagesan, Minister of State for Petroleum and Chemicals, referred recently to a Russian forecast of reserves on an assumption that one square kilometre of petroleum-bearing structure should contain something like 10,000 tons of oil or natural gas. This is described as a modest estimate since similar strata in the U.S.A. may be expected to yield 15,000 tons and in Russia 26,000 tons. Basing on this assumption, Rusian experts estimate India's recoverable reserve at 4,000 million tonnes. If annual raisings came to 5 percent of this reserve, India could some day hope to produce 150 million to 200 million tonnes of oil and 1,000 million cubic metres of natural gas.

Less optimistic individuals will be disinclined to take these prognostications too seriously. They will readily grant that the last word has still to be said since detailed examination of oil strata has barely begun. But the fact remains that unless major discoveries are made which change the premises altogether, India should not lightly assume that substantial quantities of crude will be forthcoming from domestic sources. This is implicitly acknowledged in New Delhi as is evident from its recent enthusiasm for extending the Oil and Natural Gas Commission's operations beyond India's shores.

Exploration Work

It will be appropriate at this point to take a quick look at O.N.G.C.'s current plans. The first point to note is the impressive increase in the tempo of its activities. Since starting work it has drilled 210 wells, almost half of them during 1963-64. In the current year it plans to drill another 150—a target which is sure to be stepped up in the following year when more equipment and personnel are placed in position. Gujarat has been the principal, and so far the most successful, centre of O.N.G.C.'s drilling. The Commission has hopes of finding more oil here, explorations at two new sites having indicated the likelihood. Drilling is also to be undertaken at Mohan, near Dehra Dun in the U.P., a location which Professor Kabir described as promising in the Lok Sabha. The Himalayan foothills of Bihar are also being explored by O.N.G.C., working through a foreign contractor. In the Bengal delta drilling will begin this year in the vicinity of Port Canning to follow up on the Indo-Stanvac project which was abandoned after a fruitless search for oil in the lower Gangetic valley. Indo-Stanvac went down 10,000 feet but expert opinion holds that the search should be extended to strata up to 20,000 feet to obtain a conclusive verdict. In the Cauvery region in south India, seismic and gravity-magnetic surveys have indicated the presence of a deep layer of marine rock formations which are to be probed in the current year. Another major task shortly to be taken up is the drilling of a well at Jwalamukhi, which will certainly be the deepest in India and among the deepest in the world, to penetrate the thick crust of fresh water rocks below which a layer of marine rocks is known to exist. It is this layer that may hold oil.

O.N.G.C. has built up a fairly large technical team of its own but its manpower resources are proving inadequate in relation to its ambitious exploration schedules. It has, therefore, obtained foreign assistance from friendly nations, among them Russia, Rumania, West Germany and France. Over 200 overseas specialists and technicians were working with the Commission during 1963-64. Other nations, particularly Russia, have helped by providing training facilities for Indian technicians. In addition to what it can do itself, O.N.G.C. has added to its capability by engaging contractors to work in particular areas, the foreign exchange cost being met often out of the official aid provided by the respective Governments. The Italian E.N.I. is working for the Commission at Raxaul in Bihar; the French firm Compagnie Generale de Geophysique started work towards the end of 1963 on a contract of seismic study in the Jaisalmer area; SNAM S.P.A. has more recently been awarded two contracts for drilling in the Ganga valley and the Punjab. A Yugoslav company, Rudis, has been engaged to work in Assam on exploratory drilling.



The work in Assam is supplementary to what Oil India, a joint enterprise of the Government with Burmah Oil Company, is doing within the area licensed to it. Currently, Oil India holds mining leases over an area of 1,210 square kilometres and exploration licence over an additional 4,700 square kilometres. While Oil India fields at Nahorkatiya and Moran are meeting the full requirements of the Digboi and Gauhati refineries, it is by no means certain that output will be sufficient to feed Barauni, a two-million-ton refinery now nearing completion in north Bihar which will later be expanded to three million tons. Any shortfall here will be due to the unfortunate delay which held up Oil India while New Delhi was trying to persuade Assam to arrive at a reasonable settlement on the royalty issue.

Importance of Local Refining

Whatever proportion of total demand that domestic crude meets, the endeavour must be to reduce the foreign exchange liability by local refining to the fullest extent possible. Import of crude is obviously cheaper than finished products, but more important is the stimulus that local refining gives to the development of other industries, as can be seen from the fillip to growth given by the two Bombay units. Full self-sufficiency is not possible, however, because of the divergence between the pattern of refinery production and of demand. According to the Energy Survey's draft report, the share of kerosene, a middle distillate, was as high as 29.3 percent of the total demand in 1960-61, but the share in refinery output was only 18 percent. The situation was exactly the reverse concerning motor spirit—demand was only 12.9 percent of the total but the product accounted for 20 percent of refinery output. Such disparities between the production and demand patterns are not confined to India, making it normal international practice to exchange the surplus products with others in deficit through the medium of world trade. Unfortunately for India, her surplus lighter fractions have limited export possibilities. This raises a difficult problem—should India take her capacity to the level where domestic production will meet in full the demand for middle distillates leaving her with a large surplus of lighter fractions or should she scale down output targets to keep the surplus within manageable proportions? New Delhi has yet to take an explicit decision on this issue but it seems to be thinking in terms of a policy of maximum local refining. This approach seems to be based on the hope that surplus light fractions will be absorbed by the economy in alternative uses. There is strong interest in utilising naphtha as a starting material for petro-chemical industries. Much of the new fertiliser capacity, for instance, is to be based on naphtha to find an economic outlet for the surplus and also because techno-economic advantages give naphtha-based plants an edge over those working from coal.

The pattern of refinery production is the least difficult of the problems of local refining. While the pattern can be settled by reference to technical limitations which admit of no dispute, several large policy issues arise

Sarin burns the midnight oil...looking into oil

The house is quiet. The family asleep. A neighbouring clock chimes midnight. One lone light glows in the room. The man in the chair barely stirs at the stroke of twelve. He is absorbed in a book on oil technology. His name is Jaswantrai Sarin. His job: Sales Engineering Representative with Burmah-Shell, Calcutta. His function: to provide technical service to fuel oil and lubricants customers.

THERE'S A GOOD CASE FOR FUEL OIL

...and Sarin talks about it convincingly. Actively engaged in fuel development work, he has played a part in introducing to India a major technological break-through: the use of fuel oil in blast furnaces—an advance in technique and application. Sarin advises customers on correct lubricants and fuel oil selection; the use of equipment. He investigates fuel and lubrication problems as they arise.

TODAY, AS EVER, PEOPLE LIKE SARIN ARE WORKING FOR YOU

Sarin frankly admits to being absorbed in his job. 'Next to my job,' he says, 'I love driving.' The call of the open road finds Sarin and his family off at weekends to picnic spots around Calcutta.

Sarin and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work...working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

BURMAH SHELL

BURMAH-SHELL are People in the service of the People

in relation to the size, ownership and siting of local refineries. The Industrial Policy Resolution of 1956 made future development in mineral oils the exclusive responsibility of the State but with a proviso that the expansion of existing private units was not precluded where national interests so required, nor was the State debarred from seeking the co-operation of private enterprise in the establishment of new units. Contrary to the impression in some quarters, this resolution has been interpreted with considerable flexibility. This is evident from the fact that the three private refineries which went on stream in the early fifties have been allowed to expand from less than four million tons before the Industrial Policy Resolution to over seven million tons in 1963.

Change in Policy

Moreover, the emphasis in New Delhi's policy on exclusive State ownership seems recently to have been reversed when co-operation with private enterprise was sought in the setting up of the Cochin refinery. Fortynine percent of the equity of the company that will run the refinery is held in the private sector, 25 percent by an American independent, Phillips Petroleum, and the remaining 24 percent by shareholders in India. Taking advantage of the escape clause in the Industrial Policy Resolution, the Government claims that the pattern adopted for Cochin does not run counter to its past professions. In fact, Professor Kabir went on to add that "the same policy" of accepting private participation "will be continued in respect of future refineries". This statement made in the course of his reply to the Lok Sabha debate on his Ministry's grants constitutes a major policy commitment suggesting that India is unlikely to seek further Soviet bloc assistance for setting up exclusively State-owned refineries.

New Delhi has been understandably anxious to play down this shift in policy. The more accommodating attitude towards private enterprise is not of a piece with the stirring declarations of socialist zeal that are made from public platforms every other day. To acknowledge the change may, therefore, be something of a political liability, a factor to be taken into account in judging New Delhi's earlier reluctance to heed western criticisms. If India was finally persuaded to change her mind, it was largely because of the World Bank which has been urging India to make maximum possible use of foreign capital available for investment in the oil industry. The team of international bankers who came to India on the Bank's behalf to make an appraisal of the third plan had firmly recommended a change of policy because exclusion of private capital was adding very considerably to the immediate pressure on India's foreign exchange resources. The view taken by the team in 1960 was endorsed by subsequent annual surveys of the Indian economy which the World Bank customarily makes in preparation for the Aid-India Club meetings.

If New Delhi was finally prevailed upon to accept the Bank's advice, it was as much because of the weight attaching to this international body's recommendations as of the change in India's situation *vis-à-vis* the international oil companies. The emergence of a surplus in world oil supplies, which still shows no signs of easing, has given great strength to large buyers. As a western observer puts it, "countries like India are well-placed to put the screws on the western oil marketer". India's realisation of her growing strength *vis-à-vis* the oil companies made her less diffident in seeking a *modus vivendi*. It was only in April 1963, however, that India tasted victory when the Cochin refinery agreement was signed. For the first time, a western oil company was persuaded to accept a minority share in the equity and to arrange in addition for loans to meet the balance of foreign exchange costs.

Offers from Oil Companies

With the intense competitive bidding now in progress for the further refineries proposed to be set up at Haldia and Madras, one may be sure that the ground gained by New Delhi at Cochin will be enlarged. The frills which some companies are offering to embellish their offers provide an interesting pointer to the changed balance of force between the buyer and the seller on the world oil scene. Changes within India have also played a part in making this rapprochement with the oil companies possible. The departure of Mr. K. D. Malaviya from the oil ministry may not have meant any change in basic policies but has certainly helped to smoothen the transition from the earlier mood of distrust. More important in some ways has been the emergence of Mr. T. T. Krishnamachari as the virtual overlord of economic ministries in Delhi. In a widely noted policy speech in Bombay at the end of last year, he said that there was no longer any justification for the "inhibitions" which made India bar foreign capital in the past from certain vital sections of the economy. It was thought at the time that he had oil and petro-chemicals particularly in mind.

Petro-chemical Industries

The growing interest in petro-chemicals is becoming a factor of importance in the evolution of India's relationship with the oil companies. The interest arises from the realisation that Indian agriculture cannot cope with the very large task of supplying food and raw materials needed for a burgeoning population without help from synthetics, among them artificial fertilisers, fibres and rubber. India is anxious to get foreign assistance for this newest of new industries from western countries because she needs not only foreign exchange for the import of plant and equipment but also technical know-how. The oil companies with their growing involvement in petro-chemicals constitute a likely source of assistance in both directions, a fact not lost upon the policy-maker in New Delhi. ESSO, for instance, is interested in setting up a steam cracker in Bombay, Shell in a solvents plant, while the independent, Phillips Petroleum, is reportedly seeking an industrial licence for petro-chemical projects involving something like $20 million in investment.

While these several factors are drawing New Delhi and the oil companies closer together, there are still a number of unresolved problems in the way. Of these, the most important is the insistence of the companies on importing crude from a source of their own choice—a feature of the refinery agreements not only of the early 'fifties but also of the latest one negotiated for Cochin. From the companies' viewpoint, their interest in refineries arises from the need to find assured outlets for their surplus crude. In the buyers' market that obtains today, this need becomes all the more acute, making it difficult for them to agree to any arrangement which limits their discretion. While this viewpoint is understood in New Delhi, misgivings persist because of the failure of the oil companies to disclose the names of the original suppliers of crude or any data on the first sale price. The Damle Committee on Oil Pricing which asked for the information, concluded from the companies' unwillingness that "the most economical use may not have been made in all cases of the foreign exchange" the Government made available for imports. An E.C.A.F.E. study was more outspoken; it held that "on account of the close links between the subsidiaries and the branches of the oil companies operating in India and abroad, the reported price of the imported crude oil may not represent the actual price paid. To that extent, the profits accruing to these enterprises, and remitted abroad, may be larger than they are shown to be. A World Bank mission, which touched upon the issue indirectly in its report, noted "the feeling in India that the pricing policies of the international oil companies have tended to be determined without reference to India's interests and it has sympathy with the Government's desire to encourage greater competition in the supply of oil."

Price Paid for Crude

The Government and the companies may yet be able to arrive at a *modus vivendi* based on a recognition of each other's difficulties. The companies may be able to retain a considerable measure of discretion in choosing crude supply sources if a more satisfactory basis is found for establishing the actual price paid by them to their original suppliers. This raises an issue which, because of its international complications, cannot be settled all at once and progress may, therefore, have to be gradual. To India it is of no consequence where the crude comes from as long as she has assurance that the pricing is fully competitive. This aspect will undoubtedly engage the attention of the new price enquiry to be undertaken by a committee headed by Mr. J. N. Talukdar.

Another outstanding issue relates to the future of the marketing companies in view of India's unwillingness to allow fresh foreign capital into purely trading operations. To the oil companies, marketing is just one part of their integrated activities extending over many fields. Their disinclination to see their rôle in marketing abridged may arise from the economics of integration, which India's reluctance may seem to disrupt. While the long-term outlook is uncertain, it is safe to assume that the existing marketing companies will evolve a pattern of co-existence with the State-owned Indian Oil Company. The agreement between Mobile Petroleum Inc. of New York and Indian Oil for setting up two blending plants for automotive and industrial lubricants is a pointer to the future. Indian Oil's share of the market is still insignificant, being largely confined to distributing imported products from Russia and the small output of the Gauhati refinery. It should, however, expand rapidly as new State refineries go on stream. In this situation, it is hard to imagine that New Delhi will be willing to allow new foreign capital entering industry to take an ancillary interest in distribution—one of the ten demands made by the team of 40 U.S. investors who were recently in India.

Russian Influence

In any equation which emerges between New Delhi and the oil companies, the alternatives offered by Russia will still have considerable influence. While India may not seek any further Soviet bloc assistance for setting up State-owned refineries, she will obviously retain a strong connection with the Russians as a counter weight to the rapprochement with the companies. One may expect that an amicable solution will be found to end the dispute that developed with Moscow over prices at which Russian products are to be imported after the expiry of current contracts. As Indian officials say in private, prices are notional where Russia is concerned and an adjustment should not be difficult to reach in a situation in which both countries are anxious to avoid a conflict in deference to their larger interests.

In conclusion, it is reasonable to foresee that India's ties with western oil will grow in coming months even though she continues to cultivate Soviet interest to strengthen her bargaining power. The Cochin deal will set the pattern although it is fairly certain that India will want better terms than she got out of this deal. The price agreed upon for the refinery has, for instance, been the subject of much criticism, as also several other financial aspects of the contract. The wrangling for more favourable terms should not obscure, however, the decisive shift that Cochin marks from exclusive State enterprise to a new policy of co-operation with the private sector.

Cochin also brings home the advantage of setting one company off against another, particularly an "independent" against the "majors". The seven international oil giants to whom the label of "majors" applies do not always act in concert yet they are always clubbed together in any discussion of the industry because their interests (and consequently their attitudes) tend to coincide. The "majors" control all the private-sector capacity in India, a fact which is adduced to support the view that New Delhi should seek to encourage independents like Phillips in the interests of promoting healthier competition. This is an issue on which a decision has still to be taken.

Developing Alloy Steels Industry in India: Making Up for Past Neglect

LOOKING retrospectively at the first five year plan, one would no doubt notice the rather lukewarm approach towards the establishment of the alloy, tool, special and stainless steel industry in India. The plans for the production of these steels were hardly in the forefront. Some half-hearted measures designed to promote the special and alloy steel industry were discussed from different platforms. Indeed it was almost at the end of the first plan that the National Metallurgical Laboratory organised an international symposium on "production, properties and applications of alloy and special steels", in February 1956, which succeeded in arousing the interests of those concerned in the static state of the alloy and special steels industry in India then at the blueprint stage.

It was at the above international symposium that the author had put forth planned estimates for the alloy and special steels requirements, emphasising that the minimum demand of the special and alloy steels in relation to ten million tonnes of mild and plain carbon rolled and structural steels a year would be 500,000 tonnes at the very minimum, and could be much more in relation to the economic development programme for the second five year plan. It was then argued at the *N.M.L.* symposium that if India were to take her rightful place in the comity of nations as a modern, powerful and industrialised republic (as justified by her mineral resources), it was appropriate to plan on the higher side of the estimates.

By

Dr. B. R. NIJHAWAN

Director, National Metallurgical Laboratory

Potential Exporter

It should not be overlooked that India can be a potential exporter of alloy and special steels to south-east Asian and Far Eastern countries, where such specialised products prove valuable bargaining counters for the import of mineral resources and material products in which India is deficient. As such, an annual target of 1 million tonnes of alloy, tool, special and stainless steels at the end of the third five year plan and at the start of the fourth five year plan was then projected by the author early in 1956; the fact that those estimates were indeed realistic would be borne out by the target figures now projected and accepted by the National Council of Applied Economic Research, and other authorities engaged in planning and executing the approved projects. At the end of the fourth five year plan, a production target of 18 million to 20 million tonnes of non-alloy steels is to be attained; the corresponding annual target for alloy, tool, special and stainless steels would be 1.8 million to 2 million tonnes, and even these estimates may prove to be somewhat on the lower side for the highly specialised and indispensable requirements of the industrial era to come.

Table I gives the break-up of the alloy, tool, special and stainless steels estimates at the end of fourth five year plan. These estimates form the basis of current planning:

Table I

	Finished tonnes a year
(a) Alloy constructional steel	250,000
(b) Stainless and heat resisting steels	80,000
(c) Electrical steel sheets	180,000
(d) High speed steel, tool steel and die steel	86,000
(e) Spring steel	134,000
(f) Free cutting steel	200,000
(g) Low alloy high strength steels	200,000
	1,130,000

(or, say, 1,130,000 tonnes corresponding to an annual ingot production of 1.89 million tonnes).

If the production of low alloy high strength steels is planned on an integrated steel works, and not classified as special and alloy steels for the purpose of above estimates, the targets for alloy, tool, special and stainless steels to be achieved by the end of the fourth five year plan would be 930,000 tonnes of annual finished alloy steel output, equivalent to 1.55 million tonnes of ingot alloy steel output a year.

The Durgapur Plant

At the Durgapur alloy steel plant of Hindustan Steel Ltd, which is being put up by the Government of India, in the initial phase, 14,500 tonnes of tool steel, 25,000 tonnes of constructional steel, 18,000 tonnes of stainless and heat resisting steel and 2,500 tonnes of other alloy steels, giving a total of 60,000 tonnes of finished steel, corresponding to 100,000 tonnes of ingot alloy steels, will be annually produced. The Durgapur alloy steels plant will ultimately be expanded to 300,000 tonnes a year when the product-mix will be 25,000 tonnes of tool steel, 75,000 tonnes of constructional steels, 60,000 tonnes of stainless steels mainly in sheet form and 20,000 tonnes of other special steels, giving an annual total of 180,000 tonnes of finished alloy steel production.

The production of substitute alloy, tool and stainless steels based on indigenous alloying elements will also be taken up at some of the alloy steel plants, such as of the nickel-free austenitic stainless steels developed at the National Metallurgical Laboratory and other substitute compositions like 202 stainless series, etcetera. Likewise, research and development themes on substitute tool steels, creep resistant alloys, etcetera, are being actively pursued at the National Metallurgical Laboratory for implementation on an industrial scale in due course.

The total tonnage of alloy steels for which industrial licences have been granted by the Government of India would amount to about 470,000 tonnes of output a year at present as shown in Table II.

The Mysore Iron and Steel Works in Bhadravati now being converted into an integrated alloy steels plant, would annually produce about 77,000 tonnes of finished alloy constructional steels. It was early in 1963 that the proposal to convert the Bhadravati plant into an integrated alloy and steel plant was accepted. Messrs Demag have proposed a three-phase scheme for the conversion of the Bhadravati plant; in the first phase, the plant will annually produce 42,000 tons of alloy steels and 38,000 tons of mild and structural steels. In the second phase, the total annual output of 77,000 tons will be of alloy steels. An additional 36,000 tons of mild steel will be produced in the plant annually during the third phase of conversion and expansion projected with technical collaboration of Messrs Bohler of Austria. The main production will be of low alloy constructional steels and spring steels. The total estimated cost for this plant is about Rs. 17 crores.

The erection of the Durgapur alloy steels plant is now making good progress and with the supply of equipment from a Japanese consortium of firms, a small part is scheduled to go into production in October 1964, when a 10-ton furnace, a part of the forge shop, and some of the maintenance facilities, will be completed.

Private-sector Projects

In the case of the private sector, among the licences issued in 1959, the erection of three alloy steel plants was started in 1963, while another five had received licences for the import of equipment during 1963. Mahindra and Mahindra of Bombay (15,000 tons licensed capacity) and the Bagla Project in Kanpur (20,000 tons licensed capacity) have obtained French technical assistance. The third project of 7,000 tons annual capacity well under way is in Madras. Even so, it is evident that the output in 1965-66 will be far short of the targets, as most of the proposed plants will be in production only by 1967-68. In order to meet some of

the urgent requirements of special steels, the Bhilai steel plant of Hindustan Steel Ltd is likely to produce 150,000 to 200,000 tonnes a year of special steels covering some 41 categories of steels.

N.C.A.E.R. Estimates

The National Council of Applied Economic Research's annual estimate of demands for tool, alloy and special steels is 960,000 tonnes; the Steering Group rounded this figure to 1 million tonnes. The general plans now accepted after taking into account different estimates prepared by different bodies including the National Metallurgical Laboratory, cover the following:

(i) The annual demand for finished alloy steels, including low alloy high strength and electrical steels, was likely to be 1.03 million tonnes, against 26,000 tonnes estimated by the N.C.A.E.R. The estimates made by the N.C.A.E.R. and the Steering Group are compared in Table III.

(iii) Studying the possibilities of production in existing plants, including the Durgapur alloy steels plant, of the Government of India, the Mysore Iron and Steel Works, Bhadravati, and other units licensed in the private sector, it has been estimated that production by 1970-71 would be about 334,400 tonnes; the demand, production and deficits during the same period are indicated in Table IV.

Possibilities which suggest themselves of meeting this deficit under study by the Steering Group relate to the following:

(a) Expanding the Durgapur alloy steels plant to its optimum economic size, that is, the plant could expand from its present planned annual capacity of 60,000 tonnes to 180,000 tonnes of finished alloy steel (that is, an increase of 120,000 tonnes).

(b) Encouraging those alloy steel plants licensed in the private sector

Table III

	Finished alloy steels	
	N.C.A.E.R.'s estimate (tonnes)	Committee's estimate
(a) Alloy constructional steels	200,000	250,000
(b) Stainless and heat-resisting steels	80,000	80,000
(c) Electrical steel sheets	176,400	180,000
(d) High speed steel, tool steel and die steel	86,100	86,000
(e) Low alloy high strength steel	100,000	100,000
(f) Spring steel	132,900	133,000
(g) Free-cutting steel	116,000	200,000
	891,400	1,029,000
Stocks (one-twelfth of total)	74,300	—
	965,700	1,029,000 or say 1,03,000

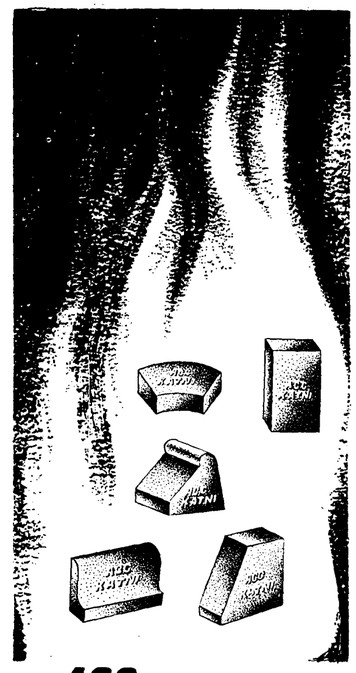
(ii) Of the estimated annual demand of finished alloy steels of 1.03 million tonnes, 100,000 tonnes of low alloy high strength steel and 180,000 tonnes of electrical steel are "tonnage" steels which may well be planned for production in the larger integrated steel works; which would leave a net demand of 749,000 tonnes a year.

and which have made good progress to expand their plants to economic sizes,

(c) Additional licensing capacity in the private sector.

(d) Further expansion of the Mysore Iron and Steel Works, Bhadravati.

There could also exist some possibility of meeting some demands from the proposed steel plant in the Neyveli-Salem area.



Ferro-alloy Industry

The capital requirements estimated to push the above projects for the alloy and special development projects have been put at over Rs. 210 crores, excluding the basic ferro-alloys industry's establishment. It would hardly be possible to present the current status of the ferro-alloy industry in India in relation to past needs, current requirements and future projected demands and plans, in this article. The author holds distinct views on the necessity of establishing the ferro-alloys industry in India early, without which, all plans of alloy, tool, special and stainless steel industry in this country would represent a superstructure with an alien base, or perhaps without any base at all. Attention was drawn to this important subject of ferro-alloys at the international symposium on the "ferro-alloy industry in India" organised by the National Metallurgical Laboratory in February 1961 when the author put forth some firm estimates of the ferro-alloys requirements in the country and which have now formed the basis of the projects taken up during the third five year plan and those planned for the next quinquennial period.

Table IV

(Finished alloy steels)

	Estimated demand	Production from licensed schemes	Deficit
A. Main producers, the Mysore Iron and Steelworks and some special steel plants:			
(a) Alloy and other machinery constructional steels such as En 8, En 16, En 18, En 32, etcetera	200,000	100,000	100,000
(b) High carbon and silico-manganese spring steels	103,000	60,000	43,000
(c) Free-cutting steels	200,000	31,000	169,000
	503,000	191,000	312,000
B. Special steel plants, including Durgapur alloy steels project and Mysore Iron and Steel Works:			
(a) High speed, tool and alloy steels including ball-bearing steels, high carbon high chromium steels, magnet steels, etcetera	86,000	38,500	47,500
(b) Stainless and heat-resisting steels	80,000	45,000	35,000
(c) Alloy spring steels, such as En 47, En 50	30,000	20,600	9,400
(d) High alloy constructional steels such as En 21, En 23, En 24, En 28, En 33, En 40, etc.	50,000	39,300	10,700
	246,000	143,400	102,600
Grand Total	749,000	334,400	414,600

Making Better Raw Materials– To Meet Growing Demand

In India's rapidly developing economy important new basic industries are emerging... established ones expanding. UNION CARBIDE India are contributing to India's industries by making a wide range of polyethylene resins and industrial chemicals at their plant at Trombay Island, Bombay.

UNION CARBIDE polyethylene resins and compounds go to make an almost endless variety of finished products with numerous applications in agriculture, irrigation, building construction, telecommunications and power distribution. Polyethylene products also help to furnish the home and make household chores easier.

UNION CARBIDE industrial chemicals — Butyl Alcohol, Butyl Acetate, Acetic Acid and Ethyl Acetate — serve as solvents and intermediates in the manufacture and processing of a wide range of products—from antibiotics and drugs to paints and lacquers...from artificial pearls and photographic films to textiles and dyestuffs.

By ceaselessly seeking to create better raw materials, UNION CARBIDE India is helping others to make new and more dependable end products.

Dyestuff Production Rising, but More Intermediates Needed

By

J. RUSHTON

IN attempting to outline the problems and prospects of dyestuffs manufacture in India as viewed from within the industry, it is doubtful whether any really useful purpose would be served by marshalling and representing statistics which are generally available to the interested parties in the Government, industry, and the public at large for the various purposes which they are required to serve. Nevertheless, a few figures may perhaps be quoted to set the stage.

It is believed that the organised sector of the industry will have installed by 1965-66 perhaps 80 percent to 85 percent of the manufacturing capacity for finished products, totalling some 14,000 tonnes a year, which has been licensed under the third plan. By that time, azo acid, basic, azoic, direct, sulphur, vat, and pigment dyestuffs together with optical whitening agents will be represented in the combined ranges of about 20 major manufacturers. National requirements in 1970-71 are unlikely to be put at a level in excess of 15,000 tonnes to 16,000 tonnes a year, and the main deficiencies in the fourth plan will probably relate to vat dyestuffs, special dyestuffs, and optical whitening agents.

Imports Reduced

Imports of dyestuffs into India during the year ended February 1964 totalled some 1,700 tonnes; these included alizarine, chrome, disperse, reactive, and vat dyestuffs. While these show a valuable reduction in comparison with the imports of about 3,000 tonnes in 1961-62, and 2,100 tonnes in 1962-63, exports have remained on a comparatively insignificant scale in the period 1961-63, for although steadily increasing, they totalled less than 100 tonnes in this three-year period.

The output from the organised sector has been running steadily at a level of about 5,000 tonnes a year during the last three years. To this may be added the output of the small-scale sector, amounting to approximately 2,000 tonnes a year. Today more than half of the 200 dyes commonly used in India are being indigenously produced, but the total output is only about one-fifth of the U.K. output, about one-sixth of the German output, or about one-tenth of the U.S. output. The production and consumption of dyestuffs a head of the population in India is clearly far below the levels obtaining in western countries, although the demand is being met and will doubtless continue to be met, with less recourse to imports in the future. The cost of production, however, is high, being two to three times that obtaining in countries with well-developed industries, largely because of the comparatively high cost of the primary chemicals in India. Many organic primary and intermediate chemicals continue to be imported, at a total c.i.f. value estimated currently to be of the order of Rs. 4 crores a year.

Against this background, some problems of the Indian dyestuffs industry may be seen to emerge more clearly. The approach to these problems may perhaps be most appropriately conceived in the light of the vital contribution the industry can make for the expansion of the country's economy.

Based as it is on organic chemistry, the dyestuffs industry is not easily defined—or rather, perhaps, the chemical bricks of which it is built are also used in the structures of allied industries, *e.g.*, organic agricultural chemicals, pharmaceuticals, plastics, rubber chemicals, and synthetic fibre. In other countries, new industries have arisen from the fruits of research carried out in the dyestuffs field. In these countries, the discovery of new dyestuffs, the development of suitable methods for their industrial application, the devising of economic manufacturing processes, and the design of plant for production purposes have entailed countless thousands of man-years of technical skills of many descriptions. While the technologies are being continuously evolved—and refinements are constantly being introduced under strong competitive pressures—it remains broadly true that, in comparison with some of the modern industries to which it has given birth, the dyestuffs industry makes comparatively simple demands on plant in engineering terms considering the chemical complexity of the processes involved. The technical know-how is of much importance; for this reason, processes are widely patented on an extensive scale, and royalties are reasonaly sought for their operation under licence by competitors.

A country such as India newly entering dyestuffs production on a national scale with the objective not only of becoming self-sufficient but also of competing in world markets requires to protect its industry during the formative years. However, the protection so afforded should be used by the industry, with Government guidance and assistance where necessary, to secure an integrated base for speedy economic development of new production. This problem—complex in itself—is accentuated by the need to take national defence considerations into account, for it has been clearly demonstrated in two world wars that the resources of a well-developed dyestuffs industry are of key importance in a national emergency, particularly in that plant can often be quickly adapted on an improvised basis for the production of other chemicals, *e.g.*, medicinal intermediates.

Simpler Processing

There has been a certain, and in a sense, logical inevitability about the shape which the industry has assumed in the last decade, in that manufactures have been mainly composed of the simpler types in terms of processing and largely based on imported intermediates. To the extent that the dyestuffs being made fulfil and will continue to fulfil genuine and basic national needs, their manufacture is justified, but it must be recognised that indigenous production of intermediates at present imported is almost necessarily implied, and, on a long-term basis, the manufacture of these intermediates and the derived dyestuffs must be economic by world standards if consumers, *e.g.*, in textiles, are not to be at a disadvantage. Here, further, the long-term intrinsic need in India for dyestuffs processing, the highest fastness properties in textile applications, should be remembered.

The economic manufacture of products of the requisite type implies, in turn, the availability of raw materials in adequate quantity at the right price. Included in the dyestuffs manufactured in India are the simpler azo, azoic, and sulphur dyestuffs, which are not possessed of the highest light and wet fastness properties and for which there is, in general, excess productive capacity in the world today. However, in so far as the plant required for the manufacture of these products can for the most part be relatively easily adapted for the manufacture of dyestuffs with superior properties, the economy is unlikely to be adversely affected.

Nevertheless, the present opportunity to give the right national shape to the industry will not recur. The ranges of products made should, in general, offer the best commercial value to the ultimate consumer, and in this connection it is to be noted that the cost of the applied dyestuff usually forms a very small proportion of the price of the finished goods. The products should be commercially viable in world trading. The plants in which they are made should be essentially versatile in the interests of both the manufacturer and the nation. The manufacture should preferably be closely integrated on a technical basis to contain capital expenditure within reasonable bounds, since spare capacity in individual units of similar nature in various locations can be costly. The scale of production should be conceived realistically in terms of both national needs and ever-changing technologies, but not to the point that they are under-sized by world standards.

Although thsee observations may be regarded as obvious, the points at issue cannot be and are not left to the manufacturers to decide in a controlled economy. The handicap imposed on the Indian industry by its late start relative to the dyestuffs industries in other countries is offset in one very important respect. The know-how can, and, at this stage of development, must indeed be purchased, and there is clearly abundant opportunity to install the most modern equipment in the world. However, to make the most of these unrivalled opportunities, not only must the right choice of the type of investment be made, as already indicated, but the scale of the manufacturing facilities installed must be correctly and perhaps courageously conceived. The estimated national requirements of 15,000 tonnes to 16,000 tonnes a year, although making allowance for the expected growth in the country's population, presuppose no improvement in living standards.

Progressive industrialisation of other countries has brought changing fashions in its train, and there is plenty of evidence to show that the world is becoming increasingly colour-conscious and demanding. In India too, there are signs of this trend, which, if accelerated, particularly in relation to men's clothing, would make for significant increases in the requirements of dyestuffs. Moreover, the growth of the plastics and synthetic fibres industries, to name but two, will diversify the demand for colouring matters. At present, the ranges of products manufactured are mainly directed to the dyeing of cellulosic and silk fibres and for various pigmentation purposes.

Domestic Market

Clearly, the domestic market in India is potentially one of the largest in the world, and very much larger on a long-term basis than past growth

BEL DIODES AND TRANSISTORS IN COLLABORATION WITH PHILIPS (HOLLAND)

The Transistor is a mighty midget with immense potentialities in the field of science and technology. Much smaller in size than a valve this versatile device lasts longer and consumes less power. BEL manufactures a series of Germanium Diodes and Transistors with which a complete radio receiver can be designed. The series selected for production in BEL are the latest types in vogue in U.K., Europe, and Japan. Rigid quality control ensures superior performance and reliability. Manufactured with the technical collaboration of PHILIPS of HOLLAND. BEL-made semi-conductor devices are equal to the best made anywhere.

Type	Application		
AC 125	Medium gain p-n-p Transistor for pre-amplifier and driver stages	AF 114	Alloy diffused p-n-p Germanium Transistors for R.F. Amplifier and Mixer-Oscillator functions in a short-wave receiver
		AF 115	
AC 126	High gain Germanium p-n-p Transistor for pre-amplifier and driver stages	AF 116	
		AF 117	Also ideally suited for use in IF Amplifiers
AC 128	High gain Germanium p-n-p audio output Transistor. Matched pairs can be supplied for push-pull output	OA 79	All-glass Diodes for AM Detection circuits
		OA 70	All-glass Diodes for Video detection

BHARAT ELECTRONICS LIMITED BANGALORE-13

or provisional estimates for the next five or seven years would appear to suggest. Taking the population of India as approximately one-fifth of the world's population excluding Russia and China, India's current requirements of dyestuffs are seen to be comparatively small in relation to an annual consumption of some 200,000 tonnes in all countries, except Russia and China. The disparity can only be explained by the prevailing lower standard of living. Therefore, the principal factor affecting the future growth of the industry in India is the rate at which the living standard can be raised. The Government alone can regulate the conditions for the growth of the economy, and long-range planning is required for the industry in common with other industries if the production capacity of the right type is to be available at the right time to meet the nation's needs.

In the future, it seems likely that there will be a progressive trend towards dyestuffs of better quality. The industry will doubtless become increasingly self-sufficient in relation to intermediates supplies. In these developments, there will be new opportunities for research conceived outside rather than inside the field which has been extensively explored elsewhere.

In relation to the existing output in India, and by comparison with the dyestuffs industries in other countries, there appears to be an excessively large number of individual manufacturing concerns for economic production. This condition reflects the fact that to-date the manufacture of dyestuffs has been almost wholly dependent on the use of imported intermediates. As indigenous production of intermediates is developed, the 120 small manufacturing concerns will find it increasingly difficult to compete with the larger companies except in the manufacture of the simpler dyestuffs.

The rationalisation of manufacturing facilities which has taken place in other countries in the face of world competition must, it seems, inevitably be reproduced in India. This rationalisation will doubtless take the form both of vertical integration within individual manufacturing units, and of an increasing scale of manufacture within a smaller number of units. The benefits accruing from the centralised production of the primary materials on a scale commensurate with national needs under the Hindustan Organic Chemicals (H.O.C.) scheme would undoubtedly be dissipated by multifarious conversion to the intermediates required by the industry. The basic economic considerations which underlie the H.O.C. scheme are relevant in appropriate measure to the manufacture of intermediates, although the increasing diversity and complexity of the operations involved in the manufacture of several thousand products, and other considerations, militate aganist centralised production in the case of intermediates, and also of the dyestuffs themselves.

Manufacture of Intermediates

It will be appreciated from the foregoing observations that a dyestuffs industry in a country with as huge a population as India's cannot, for reasons associated with national defence, remain dependent for long on the use of imported intermediates. Therefore, the lack of progress in the development of H.O.C. scheme must be regarded as a serious handicap. In economic terms, as in the case of any manufacturing project, the deferment of realisation of the benefits of the investment daily adds to the cost. The view has been expressed that the silver lining of this particular cloud is the opportunity now afforded to reconsider the source of raw materials, *i.e.*, to examine the possible use of petroleum instead of coal tar as the basic source.

At best, it seems that some sources of petroleum might supplement the requirements of the dyestuffs industry in a few respects after several years have elapsed. There does not appear to be any real justification for allowing this particular prospect further to delay the H.O.C. project. Much more can probably be gained by the earliest possible completion of the scheme without over-fine counting of the remaining cost in view of the mounting notional interest on the investment already made. There can be little doubt that the best routes to the scheduled products under Indian conditions will have been chosen from those operating in different parts of the world, and suitable provisions can be made in the design for extensions which may be required in the future.

However, the development of the H.O.C. scheme will not of itself solve the problem of intermediates supplies in the dyestuffs industry. On the one hand, it will remain necessary to reduce the prices of a number of heavy chemicals used in intermediates manufacture, while on the other hand, there is need for the provision of substantial capacity for processing the primaries, often through several stages, to the final intermediates consumed in the dyestuffs themselves. More progress has been made with a number of schemes of this type than with the H.O.C. scheme, a fact which serves to emphasise the seriousness of the delay in the latter. The problem of high cost of heavy chemicals may not be as easily solved, since it is closely connected with that of industrial expansion as a whole. Until such time as the H.O.C. scheme can be implemented, it will obviously be important to allow necessary imports of primaries to feed the new intermediates plants if the investment in these plants is to be most advantageously used in the development of the economy.

Foreign Collaboration

The advances made in the establishment of the industry in India during the last ten years would not have been possible without the technical collaboration of foreign manufacturers. Attempts to "go it alone" have not met with marked success, and the need for technical assistance becomes greater as vertical integration is pursued through the manufacture of intermediates. This is obviously reasonable when the needs of the industry are understood, particularly if tariff protection is not afforded. Time is being bought—the time devoted by scientists and technicians of many kinds in unfruitful as well as fruitful research, technical service, development, and design.

It cannot be over-emphasised in this connection that research does not always pay off directly, and that this would be the experience if research were to be undertaken in India to prepare the way for the manufacture of intermediates. In so far as it is desirable to speed up the vertical integration of the industry, it will be necessary to spend more foreign exchange in the purchase of know-how, but even so, as experience in the case of the dyestuffs themselves has shown, a net saving in foreign exchange would quickly be achieved by a reduction in the volume of imported intermediates. Continued close co-operation between the Government and industry is essential to achieve this important economic objective while retaining the confidence of the foreign collaborators.

A useful start has been made by the organised sector in providing facilities for dyestuffs research. It is believed that research of this type is best conducted within the industry, where all the relevant information is available for proper direction and prosecution.

Much effort has been made in research directed to the substitution of indigenous materials for imported materials. By and large, the heavy chemicals required by the dyestuffs industry are all available from Indian sources, although foreign know-how has had to be enlisted for the processing of most of the raw materials. Some raw materials will change with the development of the petrochemical industry, but the question of research on processes for the conversion of the new materials to heavy chemicals scarcely arises because even in industrially well-developed countries, there is an increasing tendency to purchase package plants, complete with process know-how, from specialist concerns operating internationally.

Competition in Export Markets

In the dyestuffs field proper, it is more rewarding to adapt processes to Indian conditions and materials, but at best it would seem that this approach will leave the Indian industry limping after the dyestuffs industries established in the rest of the world, particularly in the matter of competition in export markets. Encouragement to pioneers in new fields, which, given success, will alone ensure major advances in the face of competition may be derived from the reflection that several of the most important discoveries in the dyestuffs field in the past 50 years, including phthalocyanine pigments and reactive dyestuffs for cotton, wool, and nylon, have been made in laboratories in Britain, where the industry could scarcely have been said to exist at the beginning of the period.

First things must obviously come first, and it must not only be possible to finance research with the industry's own resources but scientists and technicians with the requisite skills and experience must be available to tackle the work. Nevertheless, a question which the industry will have to ask itself in the years which lie ahead is: "When will it be opportune to make a major investment in research aimed at the discovery of new products?"

Other problems, some within and some outside the control of the industry, exist; these include the multiple levy of excise duty at various stages in processing, the non-availability in India of many items of plant, the need to improve working conditions, especially in the small-scale sector, and the ways and means for achieving higher productivity. None of these problems is insuperable, but they should perhaps be regarded as of secondary importance pending the establishment of an integrated industry on a broader base.

In every modern industrial enterprise, there is a man who specialises in buying. He is a man of experience and is constantly posted with information on the performance of the products he buys. He demands an uncompromising standard of quality —whether in machinery, raw materials, accessories or other equipment.

Dunlop products are sure to interest such a discriminating buyer.

Tyres and Tubes for automobiles, aircraft, earthmoving and construction equipment, tractors, animal drawn vehicles, trolleys, barrows; Accessories, repair and retread materials; Cycle Rims ; Conveyor, Vee and Transmission Belts ; Braided Hoses ; Industrial Adhesives ; Dunlopillo cushioning.

Big Scope for Rubber Products Industry, but Not Enough Technical Personnel

By

A. T. MATHYOO

IN writing about the rubber industry, it is possible to paint a rosy picture. Such a delineation of the industry will not perhaps be quite wrong but to conclude from rubber consumption figures alone that the industry as a whole has achieved results and is on the way to achieving greater kudos for itself will not be quite correct. To say so is not to belittle the industry's efforts in the past or its plans for the future. Rubber consumption figures of the last few years are no doubt impressive :

	Tonnes
1959 ...	43,694
1960 ...	52,502
1961 ...	57,919
1962 ...	62,185
1963 ...	71,833
1964 (Est.) ...	82,000

These show an increase of roughly 100 percent in 1964 over the figure for 1959. The Association of Rubber Manufacturers in India in a recent report has stated that of the 12 motor-vehicle tyre manufacturing units visualised under the third plan, eight are at present in operation. The total production of motor-vehicle tyres and tubes by these units during 1963 has been 1.88 million and 2 million, respectively. The capacity of the 12 separate tyre manufacturing plants sanctioned under the third plan is as follows:

Region	State	No. of units	Capacity (Nos.)
Eastern	West Bengal	2	1,079,400
		2	1,450,000
Western	Maharashtra	1	510,000
		1	300,000
Northern	Punjab	1	300,000
	Uttar Pradesh	1	905,400
	Rajasthan	3	600,000
Southern	Madras	2	1,110,000
	Kerala		1,505,400
Total		12	5,144,800

But the Rubber Development Wing has estimated that the domestic requirement will be only 3,538,000 tons, and export requirement covers, another 354,000, making a total of 3,892,000.

Production of other rubber manufactures during 1963, compared with the previous year's, was as follows:

		1962	1963*
Bicycle tyres	('000 Nos.)	11,940.0	13,410.2
Bicycle tubes	('000 Nos.)	11,562.0	13,038.4
Footwear	(Lakh pairs)	498·0	483.0
Hoses (radiator and vacuum brake)	('000 Nos.)	1,318.8	2,043.6
Other types of rubber hoses	(000 metres)	5,050.8	4,843.6
Belting (fan)	('000 Nos.)	981.6	1,178.0
Waterproof fabrics	(000 metres)	4,166.4	6,029.4
Rubber-covered cables	(Lakh metres)	2,708.4	3,170.2
Latex foam	(000 kilograms)	1,683.6	1,392.2
Rubber components of railway fittings	('000 Nos.)	1,080.0	1,261.4
Dipped rubber goods	('00,000)	3,076.8	2,813.0

(* based on January-June actuals)

This production is accounted for by nearly 740 manufacturing units in operation in the country, but it must at once be stated that 535 of them consume less than 10 tonnes of rubber a year, 41 account for 100 to 500 tonnes, and only six units for 500 to 1,000 tonnes and eight for over 1,000 tonnes a year.

The tyre industry accounts for roughly 65 percent of the rubber consumption of the whole manufacturing industry. Its 1963 consumption, for a production of 1.88 million covers and 2 million tubes that year, was, therefore, 42,500 tonnes of rubber (excluding the quantity of reclaim used). When the third plan targets (as outlined in the above table) are achieved, the tyre section should account for a consumption of 125,000 tonnes, and the whole rubber industry's consumption would then be at an annual rate of 200,000 tonnes. Although these targets were expected to be achieved by the end of the third plan period, that is, by the middle of 1965, the general setback that most industrial targets of the third plan have suffered will reflect on the rubber—and tyre—manufacturing industry also.

Scope in Fourth Plan

The rubber industry's scope in the fourth plan will, however, be still more imposing, for without an adequate development of road transport, the country's entire development will stagnate. Road transport includes the tyre manufacturing industry as a most vital part, so that the fourth plan must fix such targets of tyre production as are commensurate with this increased tempo of industrial activity.

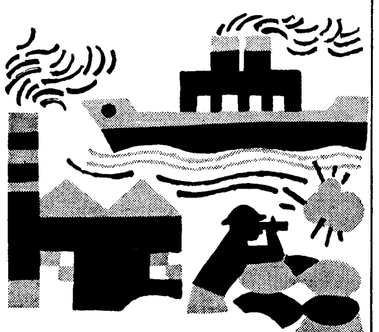
The prospects, therefore, for the rubber industry are no doubt quite good and bright, if some of the hurdles which beset it can be overcome. The days of *laissez-faire* having gone, perhaps, for ever, one has to contend with the many restrictions that are imposed in one form or another on all industries generally by the Government. What, however, can be avoided in the case of the rubber industry is the confusion resulting from the control exercised on it by various departments with no co-ordination among one another. For instance, problems relating to natural rubber as a principal raw material are handled by the Central Ministry of International Trade whereas synthetic rubber, an equally important raw material, is expected to be under the charge of the Central Ministry of Petroleum and Chemicals. The Rubber Development Wing comes under the Department of Supply, and the Central Ministry of Industry holds sway over yet another aspect of the rubber industry; other minor and major departments also have to be tackled by the industry for the redress of its problems and the net result is confusion worse confounded.

Granting, however, that this is only a passing phase of the present situation, where does the rubber industry go from here? The output of the various categories of rubber goods, enumerated above, will, like motor-vehicle tyres and of course tubes, increase because the country is progressing rapidly—socially and economically—and with it, its industrial and domestic demands are going up. Thus in general terms the scope of the rubber industry in the future—immediate and distant—can be expected to be very great indeed. Besides traditional items of rubber goods, numerous new uses are also being developed here as elsewhere. To cite an example of how these new uses may catch up in India as they have done elsewhere in the world, one may consider how rubber bands, which may be small but are big business, were produced last year to the tune of more than 16,000 million numbers in the U.S.A., that is, more than 80 bands for each person in that country.

Wide Use of Rubber Bands

No longer are the rubber bands limited to office use, but they have uses in homes and schools, in industry and in agriculture. India is on the threshold of developing in a big way the fibre-foam industry which may have a big scope, particularly because of its cheapness. The coconut growers of Kerala will be pleased at the prospect of a larger offtake of coconut fibre by this section of the rubber industry. For the first time in India, a factory to manufacture carpets by machine is being set up in Delhi which will be using back-sizing compounded latex—an entirely new field of rubber manufacture in this country. Dipped rubber goods have been hitherto made on a cottage industry basis, but a new factory has recently come up in Madras which will make a major contribution to the birth control drive. These developments connote the wider scope, hitherto unknown or untapped, presenting itself anew to the rubber industry.

The rubber-growing industry in south India has catered to the manufacturing industry's requirements of natural rubber ever since the Dixie Rubber Factory Ltd, Calcutta, as the first rubber manufacturing unit in India, was set up in 1920 to make general rubber goods. That factory has long since ceased to function, but others have come into being in its place. The production of natural rubber has not kept pace with the spurt of manufacturing activity of these later years, and today, natural rubber production proceeding at the rate of approximately 40,000 tonnes a year is far short of the country's total requirement of this raw material. A synthetic rubber plant planned and set up at a time when there was a surplus of sugar alcohol available in Madhya Pradesh—which alas! is no longer so—is now in production in Bareilly and supplements the manufacturing industry's requirement of raw rubber, although, for various reasons, which need not be dilated upon here, not to the entire satisfaction of the rubber manufacturing industry.



Reference, however, may be made in this context to an immediate problem by quoting from the speech of the chairman of a leading firm of mechanical rubber goods manufacturers at its recent annual general meeting. "The Central Government's Budget proposals for 1964-65", he said, "have not imposed any substantial burden so as to increase the cost of raw materials appreciably, barring a few items, namely, high carbon steel wire, cotton and rayon cord, steel sheets and plates. But the rubber manufacturing industry is seriously perturbed at the recent decision of the Government of India linking the grant of import licences for natural rubber with the use of indigenous synthetic rubber which, coupled with the abolition of the maximum controlled prices of Indian natural rubber (while the minimum prices are retained) is sure to raise the cost of the basic raw materials for the industry, that is, of natural and synthetic rubber. Besides, such a decision has been enforced at a stage when all the units of the industry are not equipped to make full use of synthetic rubber due to the varied nature of their product lines or due to the lack of technical facilities and standardisation".

Dearth of Technical Personnel

Many plans are in hand for further developing the industry, but there is a woeful lack of management and technical personnel. There is as yet no technical institution in the country which can train rubber technicians and until this state is improved, the output of perhaps the majority of the manufacturing units now in operation will not be what a quality-conscious consumer will fully approve. Japan's improvement of the quality of her industrial output, for instance, which she has achieved in a remarkable way in the postwar years, both of goods meant for the domestic market as well as export, is something which India has yet to make a start in emulating as a general rule. That it is a basic issue is no doubt apparent to those aware of the competition they meet in export markets where quality and price are the deciding factors unlike in India itself where competition from imported rubber goods is completely non-existent.

INDIA FOILS

SPECIALISTS IN ALUMINIUM FOIL PACKAGING

FOR INDUSTRY AND THE EXPORT MARKET

For over five decades, India Foils have been the leading specialists in the manufacture of foil packaging which today, is used in one form or another by a whole range of essential industries—the result of the closest co-operation between industry and research facilities of India Foils.

THE GROWTH OF FOIL PACKAGING IN INDUSTRY

It began a long time ago when it was discovered that foil packaging countered the detrimental effects of heat, light, dust, moisture and insect infestation on products which were susceptible to these influences. In time, with the help of continuous research, it became possible to laminate and reinforce foil with Paper, Board, Plastic Film and Resin, each of which not only enhanced the protective quality of foil packaging but also expanded its field of application to a diverse range of industries.

FOIL PACKAGING: A MAJOR FACTOR IN THE GROWTH OF INDUSTRIES

Packed in aluminium foil in 1963 were 450 million kilograms of Tea, 2,500 million Cigarettes, 30 million Pharmaceutical tablets, 35 million litres of Milk, 13.5 million Biscuits and, for the manufacture of Electrical Capacitors, India Foils supplied 52,000 miles of condenser foil.

FOOD PRESERVATION

The Research Team of India Foils has developed a special type of foil packaging which will keep food fresh and flavoursome for the Jawans in extreme conditions over long periods. For dehydrated vegetables—peas, cabbage, carrots and many others, India Foils have created a foil laminate that has made this Industry possible.

PACKAGING FOR EXPORT

To meet the rigorous standards of foreign buyers, to cater to the special pulls of impulse buying, India Foils provide specialised protective material to Indian exporters to package a range of products including condiments, biscuits, soap and tea packets. The value of Indian products including bulk tea packed in aluminium foil exported in 1963 was over Rs.150 crores. The markets of the world have, and will have even more, Indian products that can match the best that other countries have to offer.

EXPORTERS OF FOIL

India Foils export a range of foil to foreign markets which conform in price and quality to exacting international standards that are demanded.

PROTECTING PUBLIC HEALTH

The good health of the nation is its biggest asset and, India Foils Vial caps and Strip packs ensure absolute purity and protection against adulteration of Pharmaceutical products.

FAMILY PLANNING

India Foils play a vital role in this project by providing a safe and hygienic pack for contraceptives.

ELECTRICAL INDUSTRY

For the manufacture of capacitors that are an essential part of radios, fans and telephones that are manufactured in India and are exported, India Foils supply condenser foil by the mile. For critical electronic equipment, India Foils have produced a sturdy material against moisture and mould growth and are engaged in research of foil applications in cables and other screening applications.

FURTHER RESEARCH AND EXPANSION

In collaboration and association with the world renowned Reynolds Metals Co. of America, and Aluminium Foils Ltd., U.K., India Foils are devising new applications of foil packaging which is enabling a diverse group of industries to market their products more effectively and at lower costs for all round consumer benefit.

Role of Packaging Industry in Export Promotion

THE recent announcement that the Government of India is contemplating the establishment of an institute of packaging is one of several welcome indications that this industry is being given the serious consideration which has been long overdue. But the recognition of packaging as a function vital to scientific marketing has come in the main from the national effort to diversify exports into non-traditional fields. This is evident from the fact that the proposed institute of packaging will concentrate primarily on raising the nation's export packaging standards. Already, packaged consumer goods exports have risen to some Rs. 28 crores each year: *vanaspati*, canned fish, cashewnuts, confectionery, toilet preparations, paints and varnishes and many others.

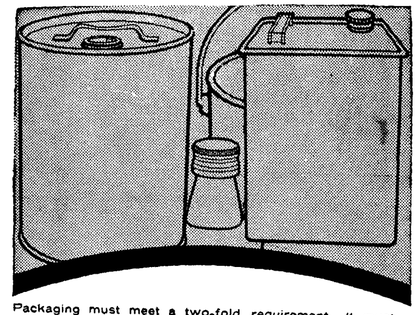
The dramatic rise in Kerala's exports of canned shrimp from Rs. 1 lakh in 1955-56 to almost Rs. 8 lakhs in 1962-63, constitutes a fine example of the type of earnings which be-

By

A SPECIAL CORRESPONDENT

comes possible when India's products are processed, packaged and presented to world standards. Major targets for India's prawns are the highly competitive markets of the United States, Canada and western Europe. Such indirect exports apart, the packaging industry has also made a significant advance in the direct export of empty containers and closures, components and related machinery: over Rs. 40 lakhs were exported in 1962-63 to markets in south Asia, west Asia, east Africa and even as far afield as the Caribbean countries.

Packaging Standards



While the national situation demands that our sights be trained on export markets, the standard of export packaging is in itself directly dependent on the packaging standard maintained in the domestic market. The economics of package-making are based squarely on large-scale operation: it is virtually impossible on the same equipment to maintain a high quality for export markets and a separate utility standard at home. As newcomers in export fields, we naturally have no assurance of volume. Export markets alone cannot justify the installation of up-to-date package-making equipment nor the development of ancillary raw materials essential to an international standard of finish. These are by definition expensive propositions and only the sum total of home and export demand can warrant such investment. What we need to do, therefore, is to pitch our domestic standards high so that our products become increasingly worthy of exports.

In getting to the targets set for consumer products in the five year plans, consumer packaging today makes a significant contribution. The scientific package transports the fruits of planning—essential products, each with their set production target—to the ultimate consumer; protecting its contents through transport over long distances, climatic extremes, insect infestation, contamination, pilferage and a lot of other hazards inevitable in the marketing situation. With an output of Rs. 107 crores, the industry enabled the marketing in 1960-61 of packaged consumer goods amounting to Rs. 2,870 crores—fully 12 percent of the aggregate value of supplies in the country during that year. By one estimate, packaging media valued at Rs. 213 crores will be required to market consumer goods worth Rs. 6,620 crores. Employment in the industry at the end of the third plan totalled some 100,000 persons in 1960-61; this is estimated at 150,000 by 1965-66. The industry, its raw material suppliers and its customers participated in the collection of Rs. 250 crores of tax revenue in 1960-61 or 19 percent of the total Central revenue in that year.

Essential to Defence

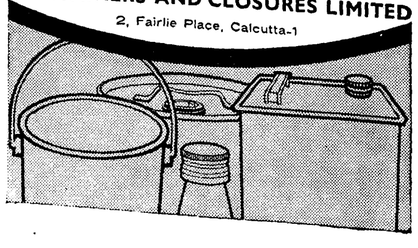
The industry is also as essential to defence as to development. During the present emergency, package manufacturers have been called upon to divert a significant portion of their capacity to the manufacture of various ordnance stores: a switch made possible by the inherent diversity of package manufacture. This is apart from making continuous supplies for defence—the open top can for processed foods is, for example, very often the sole means of transporting food to frontier forces.

Perhaps the most characteristic feature of modern packaging is its specialised character. Precision, mas production methods alone can main tain a high and consistent standard c quality. To take one instance, a ca for processed foods must be manufac tured to tolerances within one-thou sandth of an inch. Manufacturin capacity must be flexible to meet suc den expansions in demand, the rul rather than the exception in India predominantly agricultural economy The customer must be serviced wit research, marketing and technic development facilities. And the indu try must offer all this—and packagin media at prices low enough to assi in the development of mass consum markets. To keep pace with the demands, and to act as a competiti advantage in the export effort, pack ging requires technology of a hi order. It is essential, therefore, th

Packaging must meet a two-fold requirement. It must protect and preserve the product—and catch the attention of the ultimate buyer. Containers and Closures offer all this and much more!

With experience, technical know-how and modern facilities, engineers at Containers and Closures offer close individual attention to your packaging Orders are promptly accepted and undertaken almost immediately. *The result?* No waiting lists but quick delivery time. Also available—expert printing and assistance on package designing to make your product outstanding on the shelf!

DURABLE AND ATTRACTIVE PACKAGING SELLS



Whatever the shape or size...whether it be a steel drum, keg, tin container or pilfer-proof closure...your product can be packaged to exact specifications.

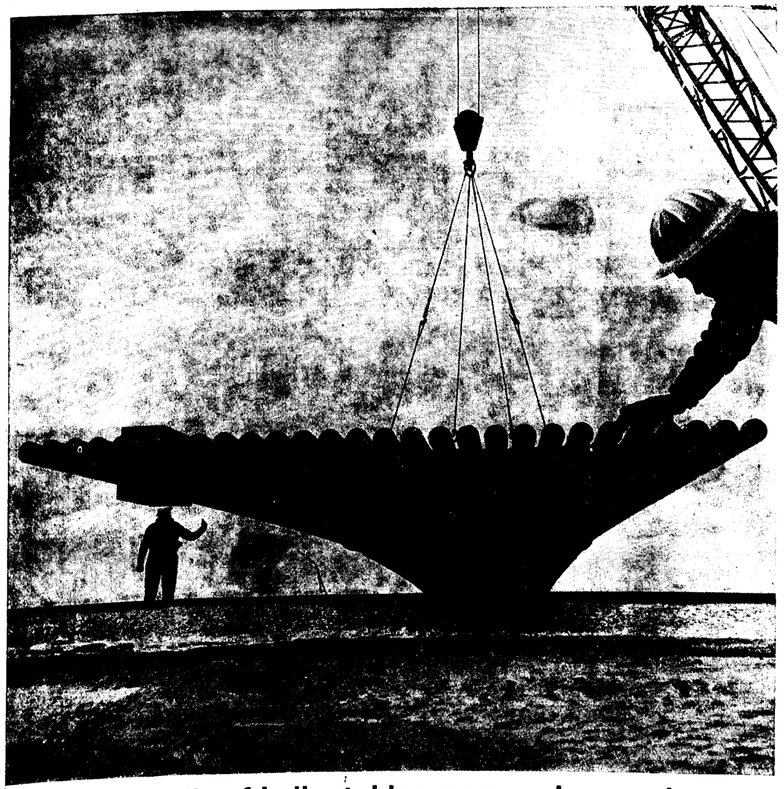
India keep herself in the mainstream of world packaging development.

Packaging Technology

Advances in packaging technology have brought about an incredible expansion in the range of packaging materials and package types (cans, laminated flexible packages, collapsible tubes, treated cartons, etcetera). These advances overseas are reflected in the current packaging scene in India where they become highly relevant to packaging's essential contributions to consumer protection, prevention of wastage and export promotion. An interesting example is the vast field of flexible laminated packaging developments resulting from combinations of plastics, metal and paper. The laminated package, such as the strip pack for pharmaceutical tablets, has streamlined distribution methods by providing an ideal low-cost protective medium. While convenience has been the principal advantage of laminated packages overseas, here they combine convenience with a low-cost single-unit packaging and protection against contamination, atmospheric spoilage, breakage and substitution. In addition, the heat-sealed laminated pack is tamperproof, carrying indelibly printed trade names and trade marks: three essential weapons in the fight against spurious and sub-standard products.



The world over, package manufacture is located in the organised sector requiring as it does large-scale investment in complex machinery, long-term research and development and close scientific collaboration among package-makers, raw material suppliers and manufacturers of consumer products. As the N.P.C. Productivity team observed: "The packaging industry in the countries we visited operated on a very large scale . . . . We were informed that small-scale units were virtually non-existent. In modern packaging, it is virtually impossible for small-scale units to cope with the multifarious requirements such as development and research, package design, quality control, service before and after sale". Economies of scale are basic to package manufacture and a high price may have to be had if these are ignored. Opportunities exist, however, for utilising small units for supplies of components to the organised sector. The largest container makers in this country annually purchase more than Rs. 60 lakhs of goods and services from small-scale suppliers. Besides, the majority of any package makers' customers are small-scale manufacturers. To them, a specialised packaging service backed with research and technical development facilities is an invaluable aid, witness once again the successful prawn export industry in Kerala.

Raw Material Problems

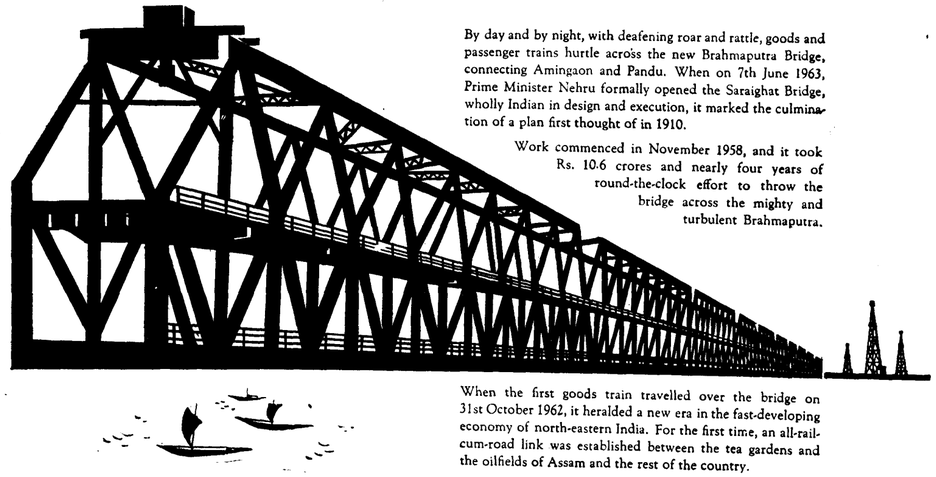
Every Indian industry today faces raw material problems and packaging is no exception. For its primary raw material, tinplate, the Indian industry is still heavily dependent on imports. According to estimates formulated by the National Council of Applied Economic Research, the tinplate demand in 1970 will rise to 524,400 tonnes against 261,800 tons in 1965-66, the last year of the third five year plan. Indigenous availability by 1965-66 will be some 145,000 tons rising to 338,000 tons by 1970. Demand will, therefore, remain well ahead of indigenous supplies for many years. This may well have an immediate inflationary impact for the simple reason that many essential products depend on tinplate packages for safe distribution. If tinplate is so short that packaging supplies are seriously curtailed, the distribution of cooking media, baby foods, processed foodstuffs, pharmaceuticals, lubricants, paints, etcetera, and many others will suffer with obvious repercussions on prices. The danger is aggravated by the fact that by the end of the third plan there will be a shortfall in paper, board and polyethylene powders.

While the packaging industry must, of course, operate within the framework of national priorities and the restrictive foreign exchange situation, in the short term there is no alternative to imports. Taking tinplate, the prime raw material, there is no sizable prospect of replacing the can with substitute packages. All over the world, despite the enormous growth in competitive packaging materials, tinplate has maintained its prime position. With the extremes of temperature and humidity, shelf-life and protective considerations, tinplate will remain for a long time to come the most efficient packaging material. In allocating scarce foreign exchange, one needs to keep in mind that Rs. 1 crore spent on tinplate imports serves the distribution of Rs. 17 crores of essential consumer goods (and assists in the collection of Rs. 5 crores of tax revenue). Apart from the inflationary impact (already experienced at the time of the Korean war and again in the foreign exchange crisis of 1958), the implications of a tinplate shortage are particularly serious when 40 percent of fruit and vegetable production in the country are already deteriorating for want of preservation facilities—and food imports cut heavily into the country's foreign exchange resources.

In sum, packaging is an essential industry—essential for development, for export promotion, for defence. All three activities can be severely inhibited unless the industry is fostered in a planned and comprehensive manner. The improvement in packaging standards already evident in India is a welcome reflection of rising living standards, for packaging is an integral part of modern civilised life.

A quarter-mile of boiler tubing goes up in one piece. That's why B&W membrane wall cuts erection costs.

Babcock & Wilcox membrane furnace wall is made of tubes welded to metal bars to form rugged, lightweight sections.



The sections are delivered in 8-foot wide panels, up to 60-feet long complete with headers and other attachments. Shop assembly is maximized. This speeds erection, and the boiler goes on the line sooner than conventionally constructed units.

All B&W UP, Radiant, SPB, PFI, and SS boilers are now built with membrane wall.

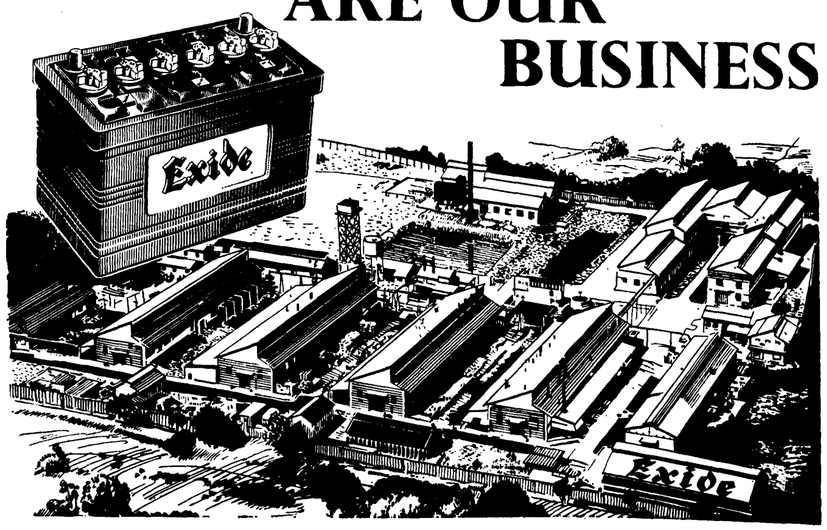
THE BRIDGE OVER THE BRAHMAPUTRA

By day and by night, with deafening roar and rattle, goods and passenger trains hurtle across the new Brahmaputra Bridge, connecting Amingaon and Pandu. When on 7th June 1963, Prime Minister Nehru formally opened the Saraighat Bridge, wholly Indian in design and execution, it marked the culmination of a plan first thought of in 1910.

Work commenced in November 1958, and it took Rs. 10.6 crores and nearly four years of round-the-clock effort to throw the bridge across the mighty and turbulent Brahmaputra.

When the first goods train travelled over the bridge on 31st October 1962, it heralded a new era in the fast-developing economy of north-eastern India. For the first time, an all-rail-cum-road link was established between the tea gardens and the oilfields of Assam and the rest of the country.



No less than 4.2 million cubic feet of concrete, 40,000 tons of cement and 14,000 tons of steel were used to build the 10-span, two-tier bridge with a roadway on top and rail tracks below. Of about 11,000 tons of vital mild and high tensile steel required to build the girders of the bridge, about 60 per cent came from the steel works at Jamshedpur. This is yet another example of Tata Steel in the service of the nation.

RAW MATERIAL SHORTAGE HAMPERS TUBE MANUFACTURE

By A. W. F. HAMILTON

BEFORE 1955, steel tubes were not produced on any significant scale in India, except for a short period some years earlier when a small butt-weld plant was operated near Calcutta. The year 1955 saw the commencement of production by the Indian Tube Company (1953) Ltd and Kalinga Tubes Ltd. In both cases, production was initially restricted to butt-welded tubes which are now covered by the Indian Standard 1,239. These are commercial tubes with a black or galvanised finish, screwed and socketed, for the conveyance of fluids at relatively low working pressures in industrial, commercial and domestic applications.

Kalinga Tubes were initially licensed for 30,000 tonnes a year on two-shift working for the size range ½" to 2" n.b. and the Indian Tube Company for 90,000 tonnes a year in the size range from ½" to 3" n.b. Although this capacity was greatly in excess of previous imports, the output of these Companies met with a ready demand and substantial order-books were soon built up. Selling prices were generally based on the equivalent cost of imported material at the time.

Present Capacity

Since the start made in 1955, there have been a series of developments. The Indian Tube Company now makes electric resistance weld tubes up to 3" o.d. for use in boilers, superheaters, transformers, etcetera, and makes seamless tubes up to 6⅝" o.d. for high-pressure applications and for the oil industry. The size range of Kalinga Tubes now goes up to 6" n.b. A number of newcomers have entered the field, and the picture has changed from one of entire dependence on imports to one of massive indigenous production with the potential for substantial exports.

The following tube mills are already in production and have a total installed capacity of 248,700 tonnes a year for welded tubes. In addition, the Indian Tube Company (1953) Ltd has an installed capacity for seamless tubes up to 6⅝" o.d. for 30,000 tonnes a year. This list is exclusive of several units which produce limited quantities on a small-scale basis: The Indian Tube Company (1953) Ltd, Kalinga Tubes Ltd, Zenith Steel Pipes Ltd, Gujarat Steel Tubes Ltd, Shri Ambica Tubes Ltd, Tube Products of India Ltd, Premier Automobiles, and Godrej and Boyce Mfg. Co. Ltd.

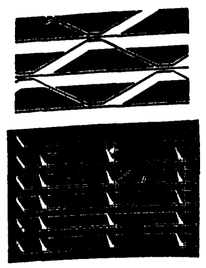
Further licences are held for 486,000 tonnes of welded, and 217,000 tonnes of seamless tubes. This capacity, which excludes the capacity of the Rourkela plant of the Hindusthan Steel Ltd, has not yet been installed.

Towards Self-sufficiency

The Government has recently stated that further applications for industrial licences for welded tubes will be refused. This attitude is fully justified, if indeed the decision has not been long delayed. The small demands for steel tubes to specifications other than those covered by the existing licensed capacity do not, at this stage of development of the Indian economy, justify the diversion of funds from other more basic needs.

At the time of writing, the effective demand for screwed and socketed tubes, for boiler, superheater and flue tubes for the railways and tubes for land boilers, steel poles, bicycles, furniture, transformers, scaffolding and structural applications, for steampipe and for many other quantitatively minor demands is being met from indigenous sources. The Rourkela plant has already supplied substantial tonnages to the oil industry for its pipeline schemes with pipes above 8" diameter. For the oil industry's demand up to 6", the Indian Tube Company is already quoting deliveries which compare quite favourably at site with those offered by foreign manufacturers and is equipping itself to meet the demand for casing and tubing to A.P.I. standards, including adequate screwing and other finishing equipment. It is clear that the investment already committed puts the steel tube-making industry well ahead of the average tempo of industrial development in India.

Some Problems



The phase of encouraging new investments being complete for some years to come, the present stage demands the efficient use of the sanctioned capacities. There are two main aspects to this problem, namely, raw materials and distribution.

No steel tube manufacturer in India has been able to obtain for the asking the quantity and quality of steel, which is his basic raw material. The pattern of production in the strip-using processes has had to be governed by the pattern and amount of supply.

The electric resistance weld and the seamless tube-making processes demand very high standards of steel specifications. To Indian steel makers, these specifications are comparatively new and a great deal of experimenting has had to be done before satisfactory standards could be achieved. The difficulties have been largely overcome, but a great deal still remains to be done before the quality

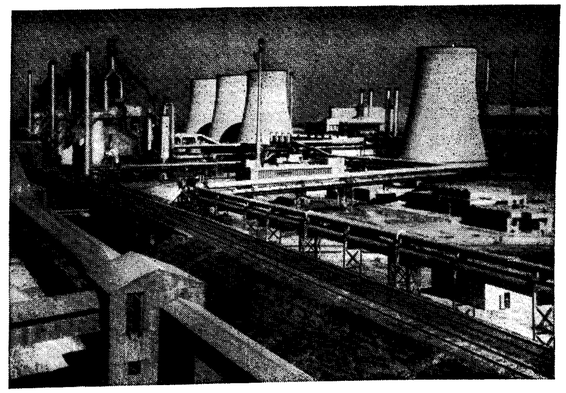
of steel ceases to be a problem to the tube-makers.

The other major raw material is zinc for galvanising, the supply of which for some time has been acutely short. The entire requirement has to be imported; and until the foreign exchange position becomes easier, the tube industry will not be able to galvanise a higher proportion of their production to meet fully the demand for galvanised tubes for water services.

While the industry has had the co-operation of the railways during a difficult period, it has all along had to face irregular wagon supplies and vexatious restrictions. The decision to convert rolling stock to centre couplings has now led the railways to demand that at least 50 percent of the industry's output should be despatched to one destination at a time in block rakes of box wagons. This is all very well for iron ore and coal but immensely difficult to arrange in the case of steel tubes!



Apart from difficulties in booking their consignments, customers have often had to agree to pay repeated increases in prices resulting from the controlled price of steel going up from time to time. The controlled price of skelp (hot rolled strip) has gone up from Rs. 635 a tonne to Rs. 831 a tonne in the period of two years from April 1962.

The attitude of the Indian Tube Company towards the pricing policy has been generally followed, and the practice has been *not* to increase prices of tubes on the ground of wage increases, higher operating costs or rise in the price of raw materials other than steel, but to claim an increase in prices only to the extent of the rise in the price of steel. The industry, one must agree, has done its bit in helping to hold the price line.

Variable Costs Rise

The performance of the industry should be viewed in the context of the difficulties which it has faced from the beginning. The present level of output will then reveal the real measure of achievement of the pioneer tube-makers in India. When they started, they did so at green field sites with inexperienced labour, an acute shortage of trained supervisory staff, and with uncertain supplies of raw materials. They had to cope with shortages of transport, with railway packing conditions unsuitable for tubular products, great difficulties in obtaining maintenance supplies from abroad and with onerous obligations in the matter of labour welfare and housing.

Since 1955, practically every variable cost has risen significantly, and in many cases repeatedly, necessitating a considerable increase in the working capital employed. At the same time, manufacturers have had to contend with the tremendous pressure of demand throughout the period

A view of a steel plant

of their teething troubles, and it is a tribute to the fairness and efficiency of the distribution systems that the Government refrained from imposing any control over the distribution of steel tubes even when practically every other category of steel was distributed under Government supervision and control.

Although production costs in India are very low, the steel selling prices are among the highest in the world. Some relief has been given in the form of export incentives, but the Indian tube-making industry is still in a grossly uncompetitive position in the international market and is eagerly awaiting further and effective Government action to remedy this situation. Although the export of steel tubes is not a commercial proposition yet, about Rs. 34 lakhs worth of tubes were exported in 1963. In the years to come, more ambitious figures are likely to be achieved.

Export Prospects for Electric Transformers Depend on Cost Reduction

By

S. K. SRIVASTAVA

THE electric transformer performs an essential function in distributing electricity by stepping up the voltage at generating stations and stepping it down at consuming points. With the accelerated pace of industrialisation and electrification, the transformer has become an indispensable equipment, and is, therefore, widely in demand in all countries, whether developed or developing. Imports of power and distribution transformers and other transformers in India were to the tune of Rs. 3.2 crores in 1961-62, compared with Rs. 3.5 crores in 1960-61. In 1962-63, the imports were a little over Rs. 2 crores. The decline in imports is significant. Demand for distribution transformers is now being met largely from indigenous production. This has been possible because of the rapid development of the domestic electric transformer industry during the successive plan periods. In fact, the recent emergence of the transformer in India's export list of engineering products is a measure of the industry's successful development.

Early Start

The foundation of the power and distribution transformer industry in India was laid as early as 1936-37, when the Government electric factory was set up in Bangalore. Between 1941 and 1943, three new units came up in Bombay, Calcutta and Lahore. The electrical machinery and equipment panel set up by the Government in 1945 had assessed the total power capacity of transformers manufactured in India at 80,000 kVA a year in 1946. After independence, the industry began to take rapid strides. According to the Tariff Commission's first enquiry, in 1951-52, there were seven factories and their total annual rated capacity was 370,000 kVA. The first plan visualised an annual rated capacity of 485,000 kVA. Additional undertakings were accordingly set up, and by the close of 1955-56, there were 13 large-scale units in production with a total capacity of 657,000 kVA. During the second plan, five new units with a total annual rated capacity of 261,000 kVA went into production. Eight of the existing units expanded their capacity by 486,000 kVA. Thus, by the end of the second plan, there were 18 factories with a total capacity of 1.4 million kVA. As capacity increased, production rose from 195,000 kVA in 1951 to 919,000 kVA in 1956 and further to 1,722,000 kVA in 1961. Last year, the production was 2,356,800 kVA. The 18 large units are located as follows: in Maharashtra (five), West Bengal (five), Madras (three), Mysore (two), and in Kerala, Bihar and Uttar Pradesh (one each).

Requirements of power and distribution transformers are expected to rise to 3.5 million kVA by the end of the third plan (1965-66). Accordingly, a capacity of 4 million kVA on a double-shift basis is visualised. Recently, one more unit has been licensed for the manufacture of transformers. Ten of the existing units have been permitted to expand their capacity. With the implementation of these schemes, capacity is expected to rise to 4.19 million kVA a year on a single-shift basis. By working on multiple shift basis, a production level of 3.5 million kVA will be achieved by the end of the third plan.

Manufacture of high-rated transformers has since been taken up by the heavy electricals equipment factory in Bhopal which went into production in July 1960. The industry is also now capable of producing special-purpose transformers such as nitrogen sealed, non-inflammable dry and silicon insulated types.

Export Performance

Having regard to the recent expansion and the large-scale development programme for the industry, a gradual reduction in the volume of electric transformer imports and a steady increase in exports in future may reasonably be visualised. The export figures for the last three years are shown below :

	Export of electric transformers (Numbers)	Value (Rs.)
		Rs.
1960-61	38	3,190
1961-62	18	6,613
1962-63	19	14,614

The Indian electric transformer has been exported to Thailand, Britain and other countries. An idea of the overseas markets for Indian engineering goods is both necessary and helpful. This country's largest market is in south-east Asia (Pakistan, Burma, Singapore, South Viet-Nam and Malaya). Exports of Indian engineering goods to these countries in 1962 were of the value of over Rs. 4 crores. Next is West Asia (Kuwait, Aden, Saudi Arabia, Iran, Iraq and Afghanistan). Exports to these countries were about Rs. 2.5 crores. African countries (Egypt, Tanganyika, Kenya and Nigeria) absorbed Indian engineering products worth Rs. 1.75 crores. European countries led by the U.K., West Germany, Italy and Russia had an intake of Rs. 1.2 crores. The U.S.A. and other American countries bought this country's engineering goods worth Rs. 1 crore. Thus, India's markets extend not only to the under-developed countries, but also to some of the highly industrialised ones.

But as already observed, the export of electric transformers from India has commenced only recently. Its present level is, therefore, not of much immediate consequence. What is really important at this stage is the prospect of export and India's ability to raise the present level, as production goes on increasing. There is a close connection between the level of export and the competitive position of industry. The lower the unit cost of production, the stronger is the competitive position, and, consequently, the larger is the export possibility. This brings one to the crux of the problem, namely, the structure of cost and prices.

Data relating to the cost of production and prices are available from the reports of enquiries conducted by the Tariff Commission in 1952, 1956 and 1960. The necessary information culled from the above reports is presented in Table 1 above. Only a few selected categories of electric transformers have been taken up for study by way of illustration. The percentage content of materials, indigenous and imported, has also been shown as it has a bearing on the cost and prices.

The following conclusions emerge from table I:

(1) Compared with 1951-52, the cost increased in 1955-56 and the fair ex-works prices were accordingly computed higher. This increase was attributed by the Tariff Commission to two factors, namely, "the increase in the prices of materials like steel and copper and the increase in wages and salaries."

(2) In 1958-59, there was a decrease in the cost and prices of two varieties

Table I

TARIFF COMMISSION'S ESTIMATE OF COST AND PRICES OF CERTAIN SELECTED CATEGORIES OF TRANSFORMERS

Transformers (1)	Year	Fair ex-works price in rupees (2)	C.I.F. price in rupees (3)	Materials as percentage of ex-works price		
				Indigenous (4)	Imported (5)	Total (6)
25 kVA	1951-52	2,364	1,830	26.02	36.47	62.49
	1955-56	2,542	—	21.10	35.77	56.87
	1958-59	2,478	1,960	29.51	26.00	55.51
50 kVA	1951-52	2,749	2,360	27.18	39.93	67.11
	1955-56	3,220	2,984	32.66	47.51	80.17
	1958-59	3,134	2,533	57.97	24.57	82.54
100 kVA	1951-52	4,127	3,340	24.15	38.99	63.14
	1955-56	4,654	3,891	34.42	46.04	80.46
	1958-59	4,938	4,360	59.62	18.67	78.29

of electric transformers, but there was a slight increase in the third.

(3) There has been a significant increase in the indigenous content of the electric transformers manufactured in India.

(4) The ex-works price has been fairly above the c.i.f. price up to 1958-59. It is indicative of the unfavourable position of India's cost and price structure *vis-à-vis* other countries' during the above period.

Cost Structure

From the *Annual Survey of Industries (A.S.I.)*, reports of which have been compiled by the Central Statistical Organisation (Industrial Statistics Wing), Calcutta, for the years 1959 and 1960, it is possible to have some further idea of the cost structure in the electric transformer industry. The A.S.I. classification of industry is, however, broader and relates to electric equipment for generation, transmission and distribution (including transformers). Nevertheless, transformer being one of the important, allied products of the industry, the cost structure of the industry as a whole may be expected to give a reasonably correct picture of the position relating to transformers as well. In table II below, accordingly the ratio of different items of cost to every hundred rupees worth of output, is given:

Table II

MANUFACTURING COSTS AND GROSS OUTPUT IN ELECTRICAL EQUIPMENT INDUSTRY FOR GENERATION, TRANSMISSION AND DISTRIBUTION (INCLUDING TRANSFORMER)

Item	Year 1959	Year 1960
(1)	(2)	(3)
	Rs.	Rs.
A. Gross value of output	10,69,41,244	12,32,03,265
B. Manufacturing cost:		
1. Value at factory of fuels, lubricants, electricity, etcetera, consumed	(100)	(100)
(a) Amount	11,17,141	12,45,473
(b) Unit cost (percentage)	1.04	1.02
2. Value at factory of raw materials, chemicals, packing materials, etcetera, consumed		
(a) Amount	6,75,76,000	7,62,00,471
(b) Unit cost (percentage)	63.18	61.85
3. Work done by others		
(a) Amount	7,88,085	16,72,645
(b) Unit cost (percentage)	0.74	1.35
4. Depreciation		
(a) Amount	20,30,152	29,88,870
(b) Unit cost (percentage)	1.89	2.42
5. Total input		
(a) Amount	7,15,11,378	8,21,07,459
(b) Unit cost (percentage)	66.85	66.64
6. Salaries wages and benefits paid to employees		
(a) Amount	2,09,92,892	1,97,87,861
(b) Unit cost (percentage)	19.63	16.06
7. Total manufacturing cost (5+6)		
(a) Amount	9,25,04,270	10,18,95,320
(b) Unit cost (percentage)	86.48	82.70

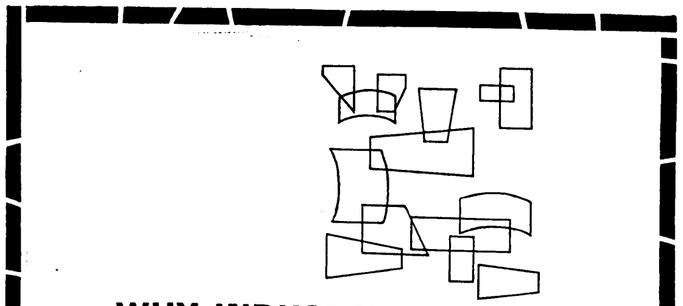
N.B.—The unit cost has been worked out by dividing the respective amount of cost by the value of gross output and is expressed in percentage.

An examination of the data presented in Table II shows the following salient features of the cost structure:

(1) Compared with 1959, the material cost shows a decline of 1.33 percent in 1960. The labour cost, on the other hand, shows a slightly greater fall of 3.57 percent. There is, however, a minor increase in the value of work done by others and depreciation charges. The overall decrease in manufacturing cost is, therefore, 3.78 percent. This is a definite improvement over the earlier position. This process of cost reduction should continue.

(2) The extent of reduction in cost achieved by the industry in later years cannot be indicated for want of data. But it appears that the process has continued. The emergence of the export of transformers in these years and the increase in the export figure of 1962-63, lend support, indirectly of course, to this presumption.

(3) The little increases in the work done for the industry by other concerns are due to the growth of the sub-contracting activity—a recognised feature of the modern industrial complex, and in depreciation charges are due to greater mechanisation introduced in the industry. Both should be welcome.



(4) There is no doubt need for further reduction in the production cost. As data for earlier years show that production cost in the past has been much higher than that of other countries and in that context, the extent of reduction in cost achieved is not likely to add much to the industry's competitive position. A continuous cost reduction programme for the industry is thus clearly indicated.

As an incentive to export, there is, of course, provision for the drawback of import duty and rebate of excise duty on raw materials used in the manufacture of electric power and distribution transformers on their export. Further export promotion measures are, however, needed and will be helpful.

More Indigenous Parts

As already seen from Table I, the indigenous content of transformers has steadily increased. Imported materials are, however, still required. At present, part of the industry's requirement of silicon steel sheets, copper wires and strips, cooling tubes, transformer oil and insulating materials are met from imports. It is, therefore, necessary to ensure their adequate supplies either by liberalised imports or by augmenting the indigenous sources so that the industry's unit cost of production does not get affected nor are its current and future plans of expansion interrupted at any stage.

The quality of product is also no less important than its competitive price for export. According to the Tariff Commission's enquiry (1960), the manufacturers "have carried out improvements in the technique of production and have arranged for rigorous tests of transformers at each stage of manufacture and before delivery". The Development Wing (now the Director-General of Technical Development) has observed that "the industry has made considerable progress and the quality of transformers manufactured in the country is generally satisfactory".

WHY INDUSTRY PREFERS

- The modernisation of machines and methods at KFS ensures firebricks of excellent quality and greater durability.
- Quicker deliveries of standard and regular shapes. Plus, a depot in Calcutta and stockists in other major industrial centres offering immediate supply.
- Complete sets of firebricks to suit the needs of industry.
- Technical after-sales service.
- Specialists in Moderate Heat Duty and High Heat Duty Fireclay, Silica Sillimanite, Acid Proof and Insulating Bricks or Cements.

1. BACKWARD CURVED, LIMIT LOAD FANS TYPE "LLA" (Single Width Single Inlet), and Type "LLA/DW" (Double Width Double Inlet) for Air Conditioning, Ventilation and other duties involving the use of cold clean air at static pressure upto 3" water gauge.

2. BACKWARD INCLINED, LIMIT LOAD, MEDIUM PRESSURE FANS TYPE "BCA" (Full Width Single Inlet) and Type "BCA/DW" (Double Width Double Inlet) and Type "BCB" (Narrow Width Single Inlet) for Forced Draught, Medium Pressure Ventilating Systems and all other duties involving cold clean air at pressures upto 20" water gauge (24" w. g. for Type "BCB" Fans).

3. FORWARD CURVED, MULTI-VANE VOLUME FANS TYPE "FCA" (Full Width Single Inlet) and "BCB" (Narrow Width Single Inlet) for all applications involving cold clean air upto pressures of 5" water gauge and 10" water gauge respectively.

4. PADDLE BLADED, SINGLE WIDTH, SINGLE INLET FANS TYPE "PBF" (Forward Tipped Blades), Type PBB (Backward Tipped Blades) and "PBR" (Radial Blades) for High pressure Ventilating Systems. Dust Extraction, Pneumatic Conveying and all other heavy applications involving dust-laden air at pressures upto 24" water gauge. These Fans can be manufactured in Stainless Steel or Abrasion-resisting Steel as available or could be Metal-sprayed or Rubber-lined to resist the corrosive action of fumes.

5. SELF-CLEANING FANS TYPE "SC" FOR DUST EXTRACTION and High pressure Systems involving pressure upto 30" water gauge.

6. INDUCED DRAUGHT FANS of heavy constructions with Heat Dissipating Discs and Roller Bearings according to gas temperature. These Fans can be of the Forward Curved Design Type "FCA/ID" Paddle Bladed Design Type "PBF/ID" or Selfcleaning Paddle Bladed Type "SC/ID" according to working conditions.

7. NARROW WIDTH MEDIUM AND HIGH PRESSURE SINGLE INLET BLOWERS KBS/R (Belt-driven) or KBS/S (Direct-coupled) or KBS/E (Impeller on Motor shaft) for high or low volume applications such as Oil Atomisation, Forced Draught to Solid Fuel Furnaces, Smithy Fires and Cupolas and similar applications.

8. MULTI-STAGE CENTRIFUGAL TURBO BLOWERS for high pressures upto 8 lbs. per square inch.

B. AXIAL FLOW FANS

1. Axial Flow Cased Type Fans for pressures upto 3" water gauge for Withering Tunnel, Workshop Ventilation, Auxiliary Mine Ventilation and all other applications involving cold clear air.

2. MULTI-STAGE AXIAL FLOW CASED FANS [illegible] STATIC ROTATING TYPE or the same applications as under item 1, but involving static pressures upto 10" water gauge.

3. AXIAL FLOW WALL MOUNTING EXHAUST FANS for pressures upto 3" water gauge.

4. AXIAL FLOW CASED TYPE PORTABLE MAN-COOLING FANS.

5. AXIAL FLOW WALL-MOUNTING PATTERN FANS for Forced Draught Cooling Towers.

6. Axial Flow Streamlined Reversible Fans for Mine Ventilation.

C. PROPELLER FANS

1. Wall-mounting Propeller Type Exhaust Fans upto 72" diameter for operation under free intake and discharge conditions.

2. Diaphragm-mounted Propeller Fans for operation against low static pressures upto 1/2" water gauge.

D. AUXILIARY EQUIPMENT FOR FAN APPLICATIONS

A complete range of Cyclones and Filter Bag Type Dust Collectors Aerodynamic Dust Collectors, Ductwork, Air Washers and Filters. Pneumatic Conveying, Dust Extraction and similar plants.

E. OIL FIRING EQUIPMENT & INDUSTRIAL FURNACES

1. Low Pressure Type Oil Burners for Metallurgical & Heat Treatment Furnaces, Tea Drier Stoves, Kilns and other purposes with a complete range of accessories such as Oil Filters, Oil Preheaters, Oil Pumps and Storage Tanks.

2. Industrial Heat Treatment Furnaces, Oil, Gas and Solid Fuel Fired, for Case Hardening, Annealing, Normalising, Forging and other purposes.

F. MATERIALS HANDLING EQUIPMENT

1. A complete range of Belt Conveyors and Bucket Elevators.

2. Screw Conveyors.

3. Pneumatic Conveyors, Etc.

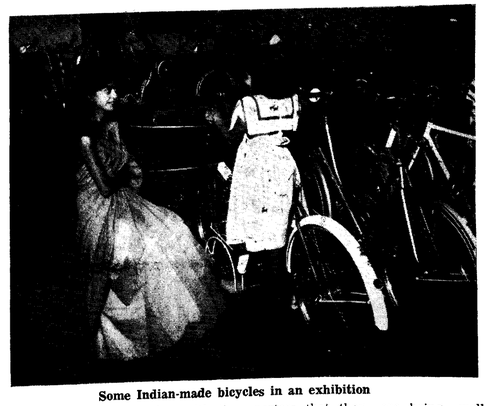
Bicycle Production Rising: Need to Cut Manufacturing Costs

THE importance of the bicycle as a common man's conveyance cannot be overemphasised. The five year plans aim at achieving a faster rate of economic growth by linking numerous villages by a network of roads for the expansion of trading opportunities. In terms of output and consumption during the decade 1951-61, the bicycle industry experienced a continuous boom. Its performance has been consistently satisfactory right through the first ten years of planned development. High output targets were set and were exceeded. The target of 2.5 million bicycles fixed for the industry by the Planning Commission at the end of 1965-66 is yet another evidence of the importance given to it.

At present, the apparent annual consumption of bicycles made up of indigenous sales minus exports,

By



A SPECIAL CORRESPONDENT

amounts to 1.15 million. In view of further development of industrial townships and road facilities in both urban and rural areas, the use of bicycles as an economical mode of transport is expected to increase. Out of the total requirements of 2.5 million bicycles in 1965-66, 2 million are allocated to the organised sector and 500,000 to the small-scale sector. To achieve the production target of 2 million bicycles for the organised sector, an annual capacity of 2.2 million bicycles is sought to be created by the implementation of the existing schemes. But the present capacity itself would be sufficient to produce up to 3 million bicycles by working two shifts and in some cases three, if raw materials are made available without difficulties. One of the problems confronting the industry is the inadequacy of supplies of different categories of iron and steel, which constitute the basic raw materials for the industry.

Raw Material Supplies

Apart from the availability of raw materials, the question that crops up initially is whether the country would be able to produce the specific type of steel during the third five year plan period. Its availability in plenty would no doubt enable the industry to exceed the targets assigned to it. But the industry is still dependent to a large extent on the import of such materials as nickel anodes, brass wires, and chemicals for polishing, brazing, electroplating and heat treatment. This has hindered the expansion of production. The industry is optimistic that cold-rolled strips, free cutting materials and steel wire would be obtained from indigenous sources in the not-too-distant future. As a consumer article, the bicycle need not be relegated to a low priority among industries, particularly when efforts are made to improve the living standards of the people. The industry has a large employment potential and its products can be exported. In spite of the continuous increase in production costs, due to the high cost of raw materials and the increase in excise and import duties, sales tax and railway freight, the price of a bicycle has generally been kept within the range of Rs. 180 to Rs. 200. The impact of such Governmental levies is heavy on a product which is the common man's conveyance. For keeping down prices in spite of all-round increase in costs and for developing an export market, it is necessary to maintain the rising trend in production. But this cannot be achieved unless raw materials are available in adequate quantities and at reasonable prices.

This industry has proved to be a good foreign exchange earner. Exports are rising, proving that India is capable of offering bicycles of international acceptable standards as far as quality and specifications are concerned. The part played by the Indian Standards Institution in laying down standards and quality control methods have contributed a great deal to creating confidence among overseas buyers. Yet the export of bicycles from India has had to face competition from other countries. The grant of many an incentive has not helped solve the problem and the difficulty is mainly due to the high cost of raw materials in this country, compared with that in other countries. The competing countries —fully conscious of the foreign exchange difficulties encountered by India—exploit the situation by trying to bring down prices as low as possible by even putting one seller against the other. But with a fund of goodwill existing all over, India can plough the export markets more deeply only if the raw materials are available in abundance and if quality goods are sold at competitive prices.

Some Indian-made bicycles in an exhibition

It is, however, hoped that with the manufacture of more steel in India, it may be possible for Indian bicycles to be competitive in the export markets.

Promoting Exports

For a sizable increase in exports, special steps are required, since India is a newcomer in a field which has so long been ruled by industrially advanced countries. The soundest approach perhaps would be to restudy the country's claims in markets where it has already had a foothold. Bicycles have found a good market in the neighbouring countries of south-east and west Asia and Africa. A market survey in order to study the impression which Indian bicycles have already made would help in expanding the market, not only for bicycles but also for spares and offer opportunities for after-sales service. This will create a feeling among importers that they are being well cared for and that exporters have not simply dumped their goods as a means of exploiting an opportunity in the market. This would by itself help in expanding sales.

Apart from directly influencing the export markets, exporters should participate in international fairs and exhibitions which provide not only sufficient scope to show the entire range of manufactured products, but also offer an opportunity to compare their products with the competitive brands. An exhibition of this sort invites the attention of the retailer and consumer and present to the people who really matter in industry a true image of what the industry has to offer. Apart from conducting regular market surveys of this nature, it would also be worth while to study how the importing countries have assessed the Indian products.

Raw Material Shortage Hampers Growth of Machine Tool Factories

By

N. C. SUKHARAMWALA
Head of the Engineering Department, the Mysore Kirloskar Ltd

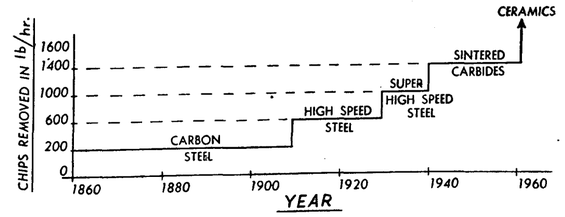
THE birth of the machine tool industry was undoubtedly induced by the needs of the early textile, mining and civil engineers, who demanded new and better means of production than those available from within their own resources. Industrial revolution was thus started in western countries which are today regarded as industrially advanced nations. Prior to the second World War, India had only a few established industries. But not only the equipment used by these industries but also the machine tools required to repair the equipment were imported.

India was forced to develop the machine tool industry during the second World War to keep her textile and sugar industries going. With most of the sea and air transport diverted to meet war requirements, there was no chance of importing the required machine tools, so arrangements had to be made to satisfy the demand for at least simple type of machine tools from indigenous sources. The House of Kirloskar started the industry in India in 1941 by establishing the first machine tool factory in Harihar.

Initial Development

The Harihar factory started with making machine tools of very simple types. Initially, the production included cone-pulley type centre lathes. To satisfy the country's requirements, the factory had later to take up the manufacture of planing and milling machines, hydraulic presses, shaping machines, etcetera. Although these machines were made to the international quality standards, production costs were high since a variety of components had to be used in small uneconomical quantities. In a short period of five years, some more units came up for the manufacture of machine tools. Thus at the starting stage, the industry had the problem of going into the manufacture of small quantities of different types of machine tools, even though it called for a great wastage of the installed capacity and national resources. The limiting factors at this stage were technical know-how, skilled labour, special types of materials, plant capacity and inadequate market.

With the advent of independence, India's industrialisation was accelerated, and the demand pattern started changing at a very fast rate. Various machine tool factories came into existence, each one of them specialising in different types of machine tools. A number of factories today specialise in the manufacture of centre lathes alone. There are others specialising in the manufacture of shaping machines, drilling and planing machines, sheet metal and plate working machinery, etcetera. These machines are the ones incorporating the presently known machining processes. Some other processes have been developed since the second World War, and they are being incorporated by foreign manufacturers in their latest designs.



Major Problems

The major problems faced by the industry relate to the non-availability of power, skilled labour and suitable raw materials, collaboration delays, trade union activities and difficulty in getting import licences for machinery and equipment.

The Government had a big plan for increasing the power generation capacity, but along with it, the increase in domestic use as well as the real requirement of the industries was not perhaps correctly estimated. The result is idle capacity of the installed plant and machinery. If the Government is not in a position to meet the demand for power, the installation of generating stations in the private sector by individual establishments should not only be allowed, but subsidised if required.

With more and more factories coming up, the supply of skilled labour has become scarce. The increase in the wages of skilled operators has added to the cost of production. Furthermore, rights and benefits have been given to the labour unions. An increase in the wages has had to be given without any bearing on the productivity of an individual. The demand for high wages, even though it may be justified on other grounds, only adds to the direct cost of producing machine tools and makes it difficult to sell them at home and abroad.

The availability of suitable types of raw materials in sufficient quantity and at the right time is another problem facing the industry. For castings, coke as well as pig iron are in short supply and, as a result, quality castings required for producing machine tools are scarce. There is also a shortage of special steels. If the quality of Indian machine tools is to be improved, it is necessary to have an adequate supply of these materials.

It is common knowledge that to accelerate the pace of industrialisation, India requires more machine tools either indigenously manufactured or imported. The procedure of getting an import licence is so time-consuming that by the time one gets such a licence, the original factors leading to the decision to import might have changed considerably. This calls for a further increase or change in the import requirements and as a result there is further delay. The Government has to guide the industry in providing such data as are required to expedite the granting of licences.

To reduce the time for developing new types of machine tools in India, many manufacturers enter into collaboration arrangements with the leading foreign machine tool manufacturers. Here again, the Government's procedure takes a long time which deprives the nation of the added advantage of using the better types of machines at an early date. Whenever such a collaboration is necessary, delays should be avoided at all costs. The Government should also evolve a procedure by which all the requirements resulting from a collaboration agreement, such as import licence, Reserve Bank permission, and Industrial Finance Corporation loan should be granted simultaneously to avoid delays.

Making Simple Tools

India today is only engaged in the manufacture of simple types of machine tools. It is true that many other industries have also just been started. The range of machines to be produced in the future will have to take care of the requirements of such industries as sugar, textiles, paper, chemicals and plastics, boilers, mining, jute, earth-moving equipment as well as of building and construction, defence, motor-cars and the requirement of the machine tool industry itself to produce cheaper and better machines. A manufacturer of a product such as a washing machine, a turbine, a lorry, or a steam roller, wants to improve his product. At the same time, he wants to reduce production costs so that he can bring the better product within the buying reach of more people and thereby obtain a broader market. That is always his primary objective in buying better machine tools. Hence, any future development in machine tools has to overcome the limiting factors of the product utility and cost.

Machine tools available today are suitable for high speed steel or carbide tools only. The graph on this page will give the relative picture of the rate of metal removal with different tool materials. The higher cutting speeds available through the use of these

...always finds something new. New developments in welding make constant demands on the skill and knowledge of the welder. He now works in a specialised industry the basis of which is an exact science.

Organised research has made the maximum use of such elemental powers as heat, light, sound, water and electricity. The result is a series of complex welding processes in various stages of development—Plasma Arc, Mig, Tig, Laser, Friction Welding, Electroslag, Ultrasonics, Fine Wire Mig and Electron Beam.

The pioneer of this industry in India, Indian Oxygen is occupied today in introducing the latest processes, thus leading the industry and the men behind it to greater recognition.

IOL

INDIAN OXYGEN LIMITED

IOC 80

materials will begin a revolution in machine tool design. The successive developments of tool materials have caused a remarkable increase in machining speeds and it is this speed which has offset the relationship between the machining time and the idle time within a manufacturing cycle. The demands of industry have called for increases in the rate of output. To a considerable extent, these increases will have to be met by the design of special machines with a restricted range of duties.

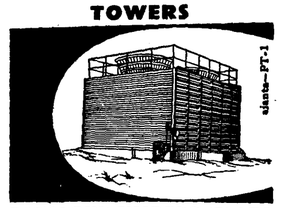
Improvements in Design

The basic improvement in machine tools design have to come in the direction of greater stability, greater power and greater flexibility. Stability will be ensured by paying attention to the bed structure, to power transmission systems and to the design of gears and bearings. It will not be out of place to mention here that the tendency in Britain to build robust machine tools proved an invaluable asset during the war, especially when these machines were forced to operate day and night, often in the hands of semi-skilled labour and usually with a minimum of maintenance. Power is improved by increasing the gross power available and by conserving it by a more efficient design of transmissions. Flexibility is conferred by wider special ranges, by faster traversing or indexing and by improved work handling.

The greatest promise of growth of the machine tool industry will come from defence requirements which will lead to the development of many highly sophisticated mechanisms, including electronic, hydraulic and optical equipment together with a wide range of entirely new materials. These are the techniques which do not become economical to develop without the Government's help. The availability of new materials and new processes will also have a great impact on the future of the industry. Two new machining techniques have been developed during recent years in western countries. The introduction of spark-erosion has been welcomed in various fields of production. This process makes use of the stock-removal action of electrical discharges, whereby any desired shape can be imparted to the conductive materials. The other process is ultrasonic drilling which has made possible the drilling of odd shapes and the drilling of hard materials. Ultrasonic machining is performed by a cutting tool oscillating approximately 20,000 times a second in an abrasive solution. The tool drives the abrasive grains against the work piece, chiselling away minute particles. Machine tools incorporating these and other techniques will have to be produced in India as the demand increases.

Once the basic raw material is made available by the indigenous manufacturers, real competition will come into play in the industry. Every manufacturer will be forced to increase his productivity and make the best use of his manpower, capital equipment and other resources. The Mysore Kirloskar Ltd is manufacturing the well-known Harihar lathes on a line production basis to met the ever-increasing demands for them.

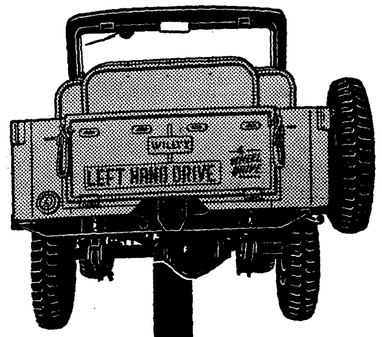
It has been made possible today to export machine tools from India to various countries. The fact is that the country has already developed certain markets for machine tools in Asia, Central and Latin America, Africa and the Middle East countries. With the favourable delivery position and good quality of Indian machine tools, the country has very bright prospects of selling its machines in foreign countries.



Research and Development

The greatest need of the machine tools industry is continuing research and development. It is in this field that the country has made the least progress. There is no use starting a couple of Government centres for this purpose. In England, the aircraft industry is subsidised by the Government for research and development in order to produce new types of aircraft. Similarly, after studying the progress of the Rusian machine tool industry, the English machine tool manufacturers have asked for subsidies from the Government for research and development. The Government of India has to take note of this and give subsidy to leading machine tool manufacturers in the private sector.

While India has started the programme of industrialisation, the western countries are on the verge of the second industrial revolution because of the development of automation. The linking together of individual machine tool so that work can pass progressively from machine to machine without human investigation raises a new set of problems concerned with work handling, quality control, fault detection and machine regulation. It is expected that a greater use will be made of pneumatic, electrical and electronic equipment for the control of automatic lines. If India is to come up to the standard of living of the advanced western countries, automation will have to be introduced wherever it is found economical. Similarly, other developments like numerical control, programme control, which are relatively cheaper compared with automation, will have to be incorporated by the machine tool industry in India.



Thus, the industry in India has diversified its production lines. Today there are different units producing different types of machine tools. But this is just the beginning, and more and more types of machine tools like chucking automatics, bar automatics, bear cutting machines, jig borers, etcetera, are to be introduced in the manufacturing lines. Defence requirements will give a boost to the development of the industry. This will lead to all-round development in the field of pneumatic, electrical and electronic equipment. With a big home market that waits to be exploited, the industry has bright prospects for expansion.

Substantial Rise in the Output and Exports of Plastic Goods

By

K. K. MODY

PLASTICS are a big creation of science and technology. They are widely used in the infinite pursuits of science. Plastics are man-made materials which can be transformed into various shapes and forms by application of heat and pressure.

The family of plastics covers a large and still growing number of items. They differ in characteristics and properties. Although various materials are used in manufacturing plastics, they are mainly grouped under two heads, namely, thermo-plastic and thermo-setting. Thermo-plastic materials undergo only physical change during moulding. The heat causes the material to flow and the pressure from the moulds gives them shape. These can be re-used after some processing. In the case of thermo-setting materials, they undergo a chemical change and cannot be reused. Injection moulding and extrusion are most commonly used for producing thermo-plastic products. Different moulding conditions are used according to the properties of various plastic materials. For producing thermo-setting plastics, the method most generally used is compression mouldin. Transfer moulding is a variation on compression moulding in which heat and pressure are applied to the moulding material outside the mould. In injection moulding, the material is fed into the hopper of the moulding machine. The material is injected under high pressure into the mould where it takes the shape of the mould. In the extrusion process, the powder or granular material is fed through the hopper into a heater barrel where it is plasticated by heaters on the barrel. The plasticised material is forced by a moving screw through a die and continuous material comes out in various forms and shapes. Thus the material from granular or powdered form is softened and shaped by moulding or by extrusion.

Unlimited Variety

Plastic products may be moulded, extruded, pressed or cast into an unlimited variety of shapes. Three techniques—injection moulding, compression moulding and extrusion account for the major part of the plastic products. The performances of plastic products depend on many factors. They mainly depend on the basic properties of the material. Before choosing the material, the characteristics of the materials should be properly understood. Plastics, because of the wide scope in colour and pliability, are preferred to traditional materials in many fields. Nowadays in one form or the other, plastics are used in every industry. Its application in the second World War was more significant than any other. That is an indication of the tremendous potential in store for plastics in the years to come. The plastics industry is growing and changing rapidly. New plastics are discovered and old ones improved.

The present era is one of many astonishing industrial developments. Probably no industry has undergone such rapid developments as plastics. Around a modern household, one finds many applications of plastics with more to come in the future. One cannot fail to appreciate its versatility if one sees its uses in the daily life. On rising, one starts with a tooth brush. Whether it is comb, socks, modern clothing, personal accessories like belts, wrist bands, women's purses, shoes, umbrellas, rain coats, buckets, kitchen wares, bottles, containers, jewellery, buttons, steering wheel of a motor-car, pen, ball pen, spectacle frames, all made of plastics, are common features of today in the urban life, although their uses have not developed much in the rural areas.

Preference for Plastics

Plastics are preferred as against many of the traditional materials like wood, metal and glass in numerous fields, not only because they are cheaper but also because they are longer lasting and easy to maintain. It is common knowledge that plastic funnels, nylon bristles, etcetera, whether in industry or home, are better and wear much longer than those made from other materials. The increased interest of builders and architects for plastic moulding panels, exterior surfacing roofing, etcetera, and the significant trend of production of moulded reinforced plastic bath rooms, motor-car bodies, boats, tubs, one piece showers, portable T.V. sets, portable record players and other equipment, both successful in cost-saving and improved performance, are some of the recent new features. The application of plastics in the motor-vehicle industry has increased tremendously. The aviation industry, too, is making a wide use of plastic. In the world of sports and recreation, plastics has played and will continue to play an increasingly important part. Football helmets, playing cards, fishing reel seats, fishing nets, fish baits, chess-men, toys, sun glasses, radio parts and many other articles are now made from plastics.

It is reported that taxies with an overall length of 14 feet and 6 inches, with 5 feet 9 inhces width and a height off the ground of 6 feet 1½ inches in four doors—designed for easy entry and exit with entirely moulded bodies from reinforced plastics and weighing only 27 cwts—are plying in London for hire. Newspapers say an experimental all-plastics house was erected recently in Moscow. The impact of plastic fibres and other newly developed items in daily life has become so extensive that it is reported that one-third of all chemists and chemical engineers in the U.S.A. are directly or indirectly engaged in them.

Phenomenal Progress

The U.S.A. is leading other countries both in its development and application. Japan in the past few years has achieved fantastic growth in the production of plastics. In the period of 1956-61, Japan increased its production in this field by 587 percent while the increase in the U.S.A. was 86 percent, the U.K. 90 percent and West Germany 233 percent for the same period. Japan stands third among the biggest producers of the world, the first being the U.S.A., and second West Germany. Japan is also ahead of other countries in technological know-how, in the manufacture of raw materials and equipment. What is of special interest is that Japan sells a large number of plastic items in the U.S.A.

The plastics industry in India developed only in the last decade and a half, but a major growth has taken place in the last ten years. Today there is in the market a wide variety of articles in attractive colours, made from various grades of plastic raw materials. Although they are in use in household and industry, their penetration in the latter is far behind other important countries of the world. The plastic industry can be divided into two main branches—processing and fabricating. The first turns the moulding powder, etcetera, into finished articles. The second subjects the intermediate products to further fabrication.

In India, the processes generally followed in the plastic industry are injection moulding, blow moulding, vacuum forming and extrusion. Of these processes, injection moulding and extrusion are major lines. Articles like buckets, bowls, bazar baskets, toilet seats, etcetera, are made of the injection moulding process. The extrusion process is used for polyethylene films, tubes, pipes, threads, etcetera. Polyethylene and polystyrene occupy an important position in the production of plastic articles in the country. P.V.C. has been mainly used in the manufacture of leather cloth unlike in other countries. But this material is bound to make a big headway in various applications, specially in the industrial field.

Unplanned Growth

After the second World War, although plastics have shown impressive growth in India, its growth is unco-ordinated, unplanned and sporadic. As a national industry, by present standards, the growth of plastics is very modest—it is still a young industry. Good machinery is very important for any modern industry. Second in importance to machinery for the growth is the improvement of production techniques which help in not only improving the quality, but also decreasing production costs. The high rate of technical development which is essential to the plastics industry can be attained only if the Government takes keen interest in the problems of this industry. Such an attitude would help other industries immensely also, because plastics has the potentiality of freeing valuable metals and other materials to better use in the national development and defence.

India's plastics exports have shown a steady increase for the past few years. It stands at Rs. 1.95 crores for 1963-64, although it was only about Rs. 74 lakhs in 1959-60. The export of plastics goods in a few months of 1963-64, the value of which is over Rs. 75 lakhs, is a good improvement over the corresponding period in 1962-63 which was below 20 lakhs. Indian plastic goods are mainly exported to the south-east Asian and African countries and the U.K., etcetera. But exports to America or rupee-account countries have so far remained meagre. Recently, a delegation sponsored by the Plastics and Linoleum Export Promotion Council returned to India after visiting the U.S.A., the U.K., Nigeria and Iraq It is interesting to know that they have secured orders for more than Rs. 10 lakhs worth of bangles, etcetera.

Because of peculiar conditions prevailing in the country, it is true that the industry has no difficulty in finding customers within the country for the present. But this is a temporary phenomenon. India's experience in international markets has shown us that she has to make considerable improvement in a large number of her products, if she is to sell. Every customer wants good value for his money. It is not enough to win a customer, but his patronage has to be retained.

Acute Raw Material Shortage

While the output and exports are quite impressive, there is an acute shortage of raw materials in the country. The production of polyethylene does not keep pace with the demand, and few among the established organisations are in a position to run their plants to the full installed capacity. Alcohol which was said to be plentiful, it is now realised, is too scanty, and it is not available to plastic raw material manufacturers. There is also a shortage of items like phenol, benzene, and ethylene.

It is well known that many industrial units are now working much below capacity on account of raw material shortages or inadequate supply or lack of imported components. Without the full utilisation of installed capacity, the rate of growth in national income is bound to be poor and it is sure to cause inflationary tendencies due to the shortage of goods. Unless remedial steps are taken without further delay, such industries will suffer serious setbacks as a result of forced idleness. Many processing units all over the country are already on the verge of closure. The responsibility to arrest the deterioration of the situation and for the sustenance and development of such industries lies with the Government under the present conditions.

Shortage of Equipment Hampers Growth of Dairy Industry

By C. D. DASTOOR

THE dairy movement in India received a fillip after independence, when industrialisation and public awakening precipitated the need for establishing organised city milk processing and distribution schemes. The industry's growth, however, was soon inhibited when the import of equipment raised serious problems due to the foreign exchange shortage.

A few units had already taken up the manufacture of dairy equipment within the country during the war years and had achieved considerable success in the manufacture of simple equipment like flash pasteurisers, surface coolers, hand-operated butter churns and milk cans. Although elementary in nature and scope, this presented a nucleus to build around the super-structure of dairy machinery manufacture in the country. In 1958, when the need for establishing such an industry on an organised scale became more obvious, the Government of India granted industrial licences under the Industries (Development and Regulation) Act, 1951, to Larsen and Toubro Ltd, Bombay, and A.P.V. Engineering Co. Ltd, Calcutta. Subsequently, two more units, Alfa Laval and Vulcan Trading Company of Bombay were also licensed. Today, the total licensed capacity of these four units is of the value of Rs. 2.9 crores.* In addition, there are a number of small units in the non-licensed sector which manufacture simpler types of equipment.

Basic Problems

Like all nascent industries, the dairy machinery industry had its share of basic problems. Initially, these were: negotiation of foreign collaboration agreements, obtaining trained personnel, organising adequate workshop facilities, importing specialised "mother" machines, developing ancillary service facilities and other allied problems. The crucial problems that persist are, however, largely those of policy, procedure and manufacturing limitations and call for a thorough reappraisal in the interest of the industry's progress.

(a) *Import of components:* When the organised manufacture of dairy equipment was initiated in India, considerable developments had already taken place abroad and a minimum standard of equipment was in demand. To manufacture such sophisticated equipment without foreign collaboration was not possible, so a phased programme of manufacture was taken up, involving the import of certain items from the collaborating companies. The implementation of this programme has, however, suffered as the import of even essential components was subjected to cuts. This has naturally restricted production and increased the costs of local manufacture.

In certain cases, part of the value of import licences granted is tied to imports from specific countries. This has resulted in non-utilisation of licences as components have necessarily to be imported from countries with whose manufacturers the local units have entered into collaboration.

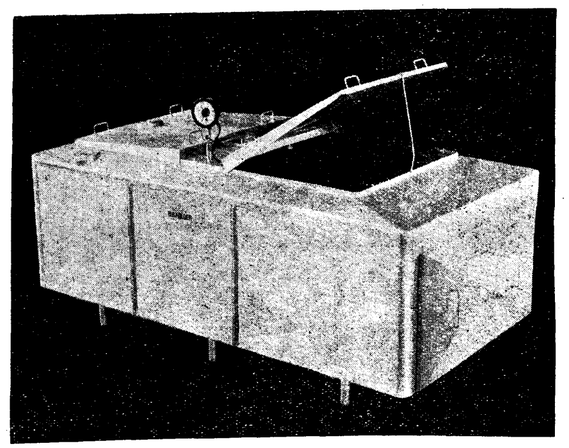
(b) *Import of raw material and instruments:* The quality and degree of sophistication of dairy equipment is largely dependent on the availability of: (1) stainless steel material of a certain quality, finish and gauge; and (2) instrumentation and automatic controls. As these items are not manufactured in India, the industry has to import them. Import restrictions and procedures being what they are, they have hindered the industry's progress.

(c) *Import of capital goods:* The manufacture of specialised dairy equipment calls for the import of specialised "mother" machines. Here again import restrictions and procedural delays in the processing of import licences have held up the speedy expansion of the industry.

(d) *Volume and nature of demand:* The actual implementation of the dairy schemes has not kept pace with the plan targets while local manufacturers have, by and large, "keyed" the expansion of their capacity to these targets. In the second plan, only about 75 percent of the total allocation earmarked for dairy development was used, but a breakdown of the use in relation to machinery would work out to even less. In the third plan, out of a total provision of Rs. 36 crores, it is estimated that during the first three years of the plan only Rs. 17.5 crores have been used.

Secondly, the types and specifications of equipment required are individualistic and diverse with the result that manufacturing costs are high and delivery periods long. The Indian Standards Institution, however, is seized of the problem; and in close liaison with the dairy machinery committee, manufacturers and consumers, it is making a valuable contribution towards standardisation.

(e) *Procedural delays:* The inevitable delays involved in the processing of import licences for components and raw materials and the ever changing restrictions throw production and order-book schedules out of gear. This is a problem common to most industries.



(f) *Import tariff:* Clearing equipment, components and raw materials through Customs is another hurdle. There are instances of duty being levied on items that should have been cleared duty-free. The classification of dairy equipment in the import trade schedule is unsatisfactory and lends itself to different interpretations creating additional problems.

Customs and Excise Levies

There is then the high rate of Customs and excise levies on components and raw materials imported for the local manufacture of equipment, while the import of complete items of equipment do not attract such levies. These levies increase the cost of locally manufactured equipment by about 10 percent as can be seen from the examples cited below.

Nomenclature of equipment	Indigenous price ex-godown, Bombay	Imported price ex-godown, Bombay
10,000 litres insulated tank with inner and outer shells of stainless steel with standard fittings	54,000 (5,500*)	42,000
15,000 —do—	68,500 (6,800*)	55,500
500 litres batch pasteuriser with inner and outer shells of stainless steel with standard fittings	14,815 (1,350*)	10,410
1,820 litres bulk cooler with inner and outer shells of stainless steel with standard fittings	30,200 (2,850*)	21,800

(g) *"Aid-covered" imports:* Another factor which is impeding the progressive manufacture of indigenous dairy equipment is the import under foreign aids of substantial quantities of such items of dairy machinery for which licensed manufacturing capacity exists within the country. On a conservative estimate, equipment worth about Rs. 10 crores was imported under foreign aids during the last ten years. In the early period, when local manufacture was still in its embryonic stage, import of such equipment was necessary to set the tempo of dairy development. That this was possible under foreign aids, made it all the more welcome. Today such imports represent lost opportunities to the local industry. It is estimated that in the last three years, equipment worth about Rs. 1 crore, which could have been fabricated in the country, was imported under foreign aids. Annexure "A" details the range of equipment presently manufactured within the country.

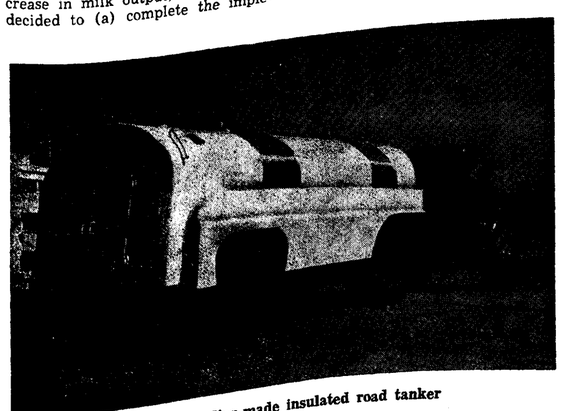
(h) *Raw materials:* The possibility of obtaining within the country in the near future the quality, finish and gauge of stainless steel required by the industry is not entirely heartening. And stainless steel is one of the basic needs of the industry. Local output is thus inextricably linked with the availability of this raw material.

(i) *Ancillary industry:* Every major industry is supported by an ancillary complex, and the development of such a complex related to the dairy machinery industry is rather discouraging. Until the ancillary industries, particularly instrumentation, make headway, it will not be possible for the local industry to turn out sophisticated equipment without relying on imports.

Raising the Milk Yield

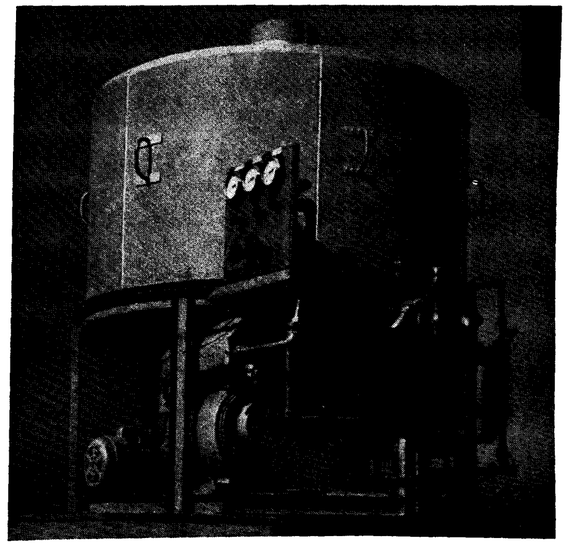
The total milk yield in India in 1961 was estimated at 22 million tons, or a *per capita* consumption of 4.9oz. a day, against a minimum requirement of 10oz. recommended by the Nutrition Advisory Committee. The third plan aims at achieving a 22.5-percent increase in the total milk yield to assure a consumption of at least 6oz. a day an adult as a first step towards meeting the minimum requirements recommended. To handle the planned increase in milk output, it has been decided to (a) complete the implementation of dairy projects initiated during the second plan, (b) expand existing dairy schemes, (c) establish milk schemes in 100 towns, each with a population exceeding 50,000; and (d) establish 30 rural creameries, ten milk product factories and two cheese factories to tap rural milk pockets which are not conveniently located in relation to large consuming centres.

It is estimated that the cost of dairy equipment, exclusive of auxiliary equipment (like boilers, refrigeration plant, and electricals) required for the implementation of these schemes would be of the order of Rs. 2.5 crores in 1965-66, rising progressively to Rs. 5 crores in the subsequent five years.* The present licensed capacity of the local dairy machinery industry is Rs. 2.9 crores and the planned capacity in 1970-71 is Rs. 5 crores.* It is planned to achieve this increase in capacity by expansion of the existing licensed units.* In the near future, the industry expects to cover a wider range of equipment to be manufactured within the country, the details of which are given in Annexure "B".



For the healthy growth of the dairy machinery manufacturing industry, it is necessary to sustain demand at least at the level of the industry's licensed capacity. Thus it is necessary to ensure that actual development of the industry keeps pace with the physical targets set out in the plans.

It also follows that the import of such equipment as can be manufactured within the country should not be allowed even under foreign aids, to make inroads into the potential market of the local industry. The non-utilisation of the industry's licensed capacity is considerable. In 1963-64, it is roughly estimated to have been as high as 65 percent. This, by any standards, is wasteful and a developing country such as India's cannot really afford it.



Impressive Progress

In spite of these problems, the dairy machinery manufacturing industry has made an impressive progress, influenced no doubt, by the dynamism of the country's five year plans. The industry's challenge is to provide the requirements of the various dairy schemes for the handling of the increased milk yield as indicated by the plan targets. The industry is aware of its responsibilities and is fully geared to meet the growing demand.

An Indian-made insulated road tanker

An automatic rotary can washer made in India

The various Government departments and agencies have their own problems and the problems facing the industry are not really of their creation, rather they are problems of growth. However, the solution of these problems is important to the future development of the industry. It should, therefore, be the endeavour of the manufacturers, consumers and the Government jointly to evaluate these problems and seek their solution.

Annexure "A"

Dairy equipment being presently manufactured in India

I. Milk reception, cooling and storage

Receiving tanks, drip savers, centrifugal pumps, plate and surface type coolers, uninsulated, insulated and cold walled storage tanks.

II. Can washing

Can washing troughs, steaming blocks, rotary automatic can washers.

III. Processing

Batch and plate type pasteurisers for milk and cream.

IV. Bottling

Manually operated bottle washers and fillers and automatic crate washers.

V. Butter and "ghee" making

Manually operated cream separators, power operated cream separators up to 550 litres an hour, cream ripening tanks, wooden butter churns—manually and power operated, butter-trolleys, butter handling accessories and *ghee* boilers.

VI. Cheese and casein making

Cheese and casein vats, cheese knives, curd mills, hoops, presses. (Only in certain types and sizes).

VII. Bulk milk handling

Bulk milk coolers, transportable milk tanks, insulated road and rail milk tankers.

VIII. Washing and sterilising

Milk pipe washing and sterilising chests, C.I.P. units.

IX. Milk testing

Manually and electrically driven centrifuges, lock stoppers, laboratory fittings, glassware. (Only in certain types and sizes).

Annexure "B"

Dairy equipment planned to be manufactured by the end of fourth plan.

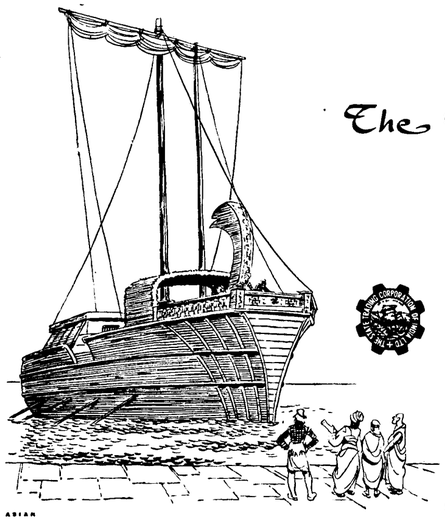
I. Can washing

Straight trough automatic can washers.

II. Processing

Milk condensing equipment, milk spray drying equipment, sterilised milk plants.

II. Bottling



Automatic bottle washers, fillers and conveyors for bottles and crates.

IV. Butter making

Stainless steel power operated butter churns.

V. Ice-cream making

Batch and bar freezers.

The Glories that were India

Soap Industry Makes Steady Progress, but Rising Costs Worry Producers

OVER the years, the organised sector of the soap industry in India has made steady progress. Current production is running at the rate of about 160,000 tonnes a year, compared with the 1951 output of 85,000 tonnes. Its growth has, in fact, been more rapid than the rate of increase in the *per capita* income. During the decade covering the first two five year plans, the annual growth rate of the large-scale sector of the soap industry was about 6 percent while the *per capita* income was going up by only 1.7 percent a year.

The industry has been passing through a difficult phase since 1961 when the Government began to impose drastic cuts on the actual user licences granted to soap manufacturers for the import of essential raw materials like palm oil, copra and coconut oil. The practice of issuing

By

S. SRINIVASAN

Public Relations Manager, Hindustan Lever

these licences was totally discontinued during the following year. Palm oil, copra and coconut oil are now being imported under incentive licences which have to be earned by the soap manufacturers by exporting at a loss items like groundnut oil, refined oil and *vanaspati*. There has thus been a sharp increase in the landed cost of imported raw materials. Furthermore, excise duties on washing and toilet soaps have gone up by 79 percent and 66 percent, respectively, during the last three years. Higher transport costs, an increase in the prices of chemicals like caustic soda and indirect taxation on packing materials have also had their share in pushing up the production cost of factory-made soap. Such adverse conditions notwithstanding, the large-scale sector of the industry has emerged with its head "bloody, but unbowed" with an annual growth rate of about 3 percent during the last two or three years.

The development of a fiercely competitive consumer goods industry just does not happen. It is the result of planned, unremitting effort. Soap does not belong to the category of luxury goods, but it is not an absolute necessity like rice or wheat, the demand for which is not sensitive to changes in income. It is a household article that figures in the family budgets of millions, but at the same time is way down the shopping list and might get scored out if the consumer is forced to economise. In a near-subsistence economy like India's, soap is perhaps nearer to the class of luxuries than of necessities.

Right Soap at the Right Price

No doubt, non-income factors like an increase in population, urbanisation, increase in the level of literacy and the villager's urge to emulate the habits of his cousin from the city, do provide a favourable climate for the expansion of the soap market in India. But favourable climate alone cannot push up the active demand for soap. A catalytic agent is necessary which can take advantage of the prevailing conditions to spread the soap-using habit among the millions in this country by offering a right product at the right price, at the right place, and at the right time. This precisely has been the rôle of the more aggressive units among the large-scale manufacturers in the industry.

Barely 20 years ago, the typical large-scale manufacturer's activities were confined to one of booking and executing orders from among customers in important cities and towns who cared to buy soap. In other words, the industry was just "selling" soap, not marketing it. The latter term implies the creation of active consumer demand and its eventual satisfaction. The first step towards broadening the market for soap was taken by the leading units in the industry when they decided to widen and streamline their distribution system. Instead of merely executing orders from customers, the manufacturer began by appointing recognised wholesalers in various cities, whose duty it was to stock and sell soap at reasonable prices and to redistribute supplies in appropriate quantities to retail outlets and feeder markets at regular intervals.

The manufacturer's salesman became a regular visitor to the various wholesale and retail outlets. He booked orders, saw to it that the point-of-sale advertising material was properly displayed, arranged the stocks in the shelves in such a manner as to attract attention and trained the trade strictly to observe the "first in first out" principle in the matter of storing and selling stocks.

Nor was this all. The manufacturer helped the wholesale and retail trade to establish an optimum level of stocks which would not strain the merchant's financial resources, but at the same time, avoid the risk of his running out of supplies. This was of mutual advantage. On the one hand, the manufacturer was able to make a more efficient use of his capital by reducing his pipeline stocks while, on the other, the merchant achieved a given turnover with a smaller investment. Development of road transport and establishment of depots and appointment of clearing and forwarding agents at strategic centres helped this process considerably.

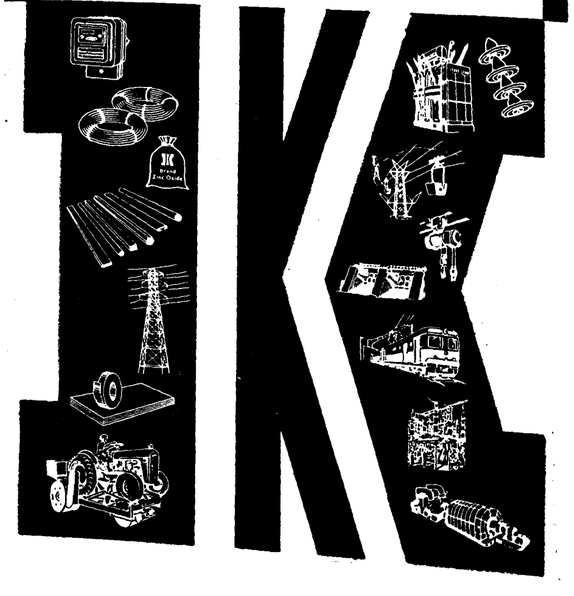
Steady Expansion of Market

Then came the intensive penetration of markets. Starting from towns with a population of not less than 50,000, the manufacturer began to extend his coverage steadily until towns with a population of just 5,000 and over are among his regular markets. Opening up small town markets is not all beer and skittles. Intensive propaganda with the aid of touring vans equipped with loud-speakers, consumer sales off the van counter, practical demonstrations and selling the idea of keeping stocks to the small trader were necessary before people in the town took to buying and using soap regularly. This was an expensive, time-involving process and demanded a great deal of patience and ingenuity on the part of the manufacturer. Once this campaign began to make headway, the merchants in these places became feeders to the shops in still smaller towns and villagers who now and again came to the town for supplies. Planned distribution was supported by persuasive advertising using such diverse media as the Press, posters, point-of-sale publicity material, hand-bills, propaganda vans for the rural areas and films.

Publicity about the existing products alone was not enough. Customers, present as well as potential, had to know all about the new lines manufacturers were bringing into the field and also about the constant efforts to improve the existing products. There was also the question of breaking down the customers' prejudices. The manufacturer's answer to these problems was the introduction of sales promotion schemes including free sampling and door-to-door demonstrations in selected markets. Sales promotion schemes were more or less tailored to the specific needs of a situation. Sometimes it was the customer who needed to be offered an incentive. At other times, the trade required a certain amount of stimulation. A product was selling very well in one part of the country, but was meeting with either trade or consumer resistance in another for various reasons. As for washing demonstrations, it was the most effective way of convincing the housewife that the claims made in the advertisement were not of the tall variety.

Introduction of New Lines

It is not often that the consumer is content to use the same product for long. The industry is only too well aware of this, as can be seen from its efforts to introduce new lines and improve existing ones. It is for ever trying to offer soaps with a better



KAMANIS IN THE MARCH TOWARDS INDUSTRIAL SELF-SUFFICIENCY

Rapid industrialisation is the need of the day. Kamanis are proud to be active partners in the efforts to make India industrially self-sufficient.

IK

eye appeal, quality, perfume, colour and packaging. To ensure the economical use of the soap tablets, the housewife was in the habit of slicing the cake into small flakes or chips. The manufacturer was quick to notice this and introduced soap flakes and chips. The next stage was the appearance of soap powder which, when dissolved in water, did the job as efficiently as a cake of soap which has to be rubbed vigorously on to the garment, thus involving a certain amount of physical strain.

From soap powder the industry has now advanced to the stage of offering to its sophisticated customers a synthetic detergent which is very efficient in its performance. It has the added advantage in that, unlike soap, it lathers freely in hard water. From a mere 126 tonnes in 1957 the production of synthetic detergents has risen to about 4,000 tonnes in 1963. Current production capacity for detergents approximates to 20,000 tonnes a year, which also happens to be the target fixed for the third five year plan.

The growing popularity of detergents is a matter of significance to the national economy. First, it will release supplies of edible oils, which are now used in soap manufacture, either for edible purposes or for export. Secondly, it will form a useful outlet for some of the products of the petrochemical complex, which are being planned, and thus stimulate the growth of this vital industry.

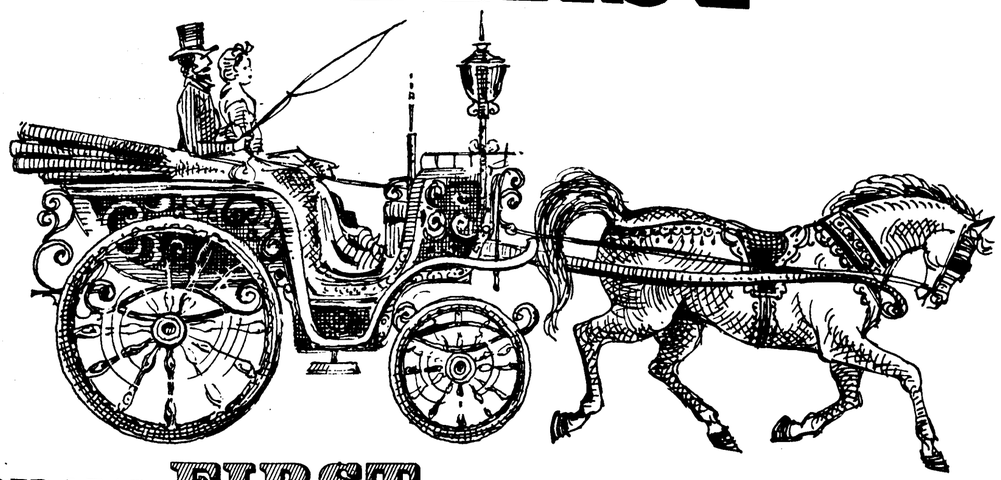
Marketing Research

Finally, the essence of marketing lies in the manufacturer's ability to anticipate what the customer is likely to want tomorrow, next year or a few years hence. To find reasonably satisfactory answers to these baffling questions, the manufacturer had to organise at intervals elaborate, expensive and time-consuming surveys of population and income trends, consumer habits, attitudes, motivations and likes and dislikes. Marketing research has thus become an indispensable weapon in the marketer's armoury.

Impressive as the soap industry's progress has been during the last decade and a half, the scope for its future expansion is immense. As can be seen from the table at the end of this article, the *per capita* consumption of detergents in India today is a mere fraction of what it is in developed countries; it is, in fact, very much lower than the consumption figures shown against many developing countries. The leeway to be made up is there for all to see.

It would seem that two sets of attitudes or beliefs are likely to impede the rapid growth of the industry. The first is the naïve but unfortunate view that regards money spent on marketing and advertising as unnecessary expenditure which only pushes up the price to the consumer. This is a dangerous fallacy. The industry owes its prseent stature to the adoption of modern marketing techniques; nor can any significant expansion of the Indian soap market be visualised without a considerable outlay on publicity, marketing research and a well-organised distribution system.

It is seldom realised that such expenditure constitutes only a small percentage of the total cost. Even if all these expenses were saved to reduce the price, the production cost will not come down by more than a naya paisa or two for each cake of soap. Expenditure devoted to marketing and advertising, on the other hand, is vitally necessary not only for retaining the existing market, but for increasing it progressively over a period of years. What is more, marketing and advertising encourage mass consumption which, in turn, makes possible economies of scale, which ultimately tend to reduce the unit cost.



Distribution of Capacity

The second impediment relates to certain notions about the distribution of production capacity among manufacturers. As is the case with many a consumer goods industry, the rate of utilisation of capacity is by no means uniform among the various units. The more go-ahead of them have naturally lesser idle capacity than the others. The organised sector's registered capacity is arrived at by adding the capacities of individual units. On this basis, current capacity is 227,000 tonnes of soap a year. The current production is 160,000 tonnes. Taking into account past experience and current trends, the demand for soap produced by the organised industry at the end of the fourth plan, at a realistic estimate, will be around 270,000 tonnes. Therefore, it is necessary to allow substantial expansion for the industry to meet the future demand. As it takes time to build new capacity, the sooner the expansion is allowed, the easier it will be for the industry to plan economically and efficiently. Undue delay in the granting of permission for raising capacities will only harm the consumer, the industry and the national economy.

Paint Output Rising: Raw Material Shortages the Main Worry

THE coming decade offers the paint industry possibly its greatest challenge and opportunity. This is because the projected demand by 1974 is of the order of some 400,000 tons, while present production is only a quarter of this figure.

Paint is an ancillary product, as something has to be made first before it can be painted. It is essential for the protection of steel and for decorative purposes. Every million tons of steel require 15,000 tons of paint and every million tons of cement use 3,000 tons. Thus the projected output of about 18 million tons of steel by the end of the fourth plan will alone require over 250,000 tons of paint, while 150,000 tons will be needed for new

By

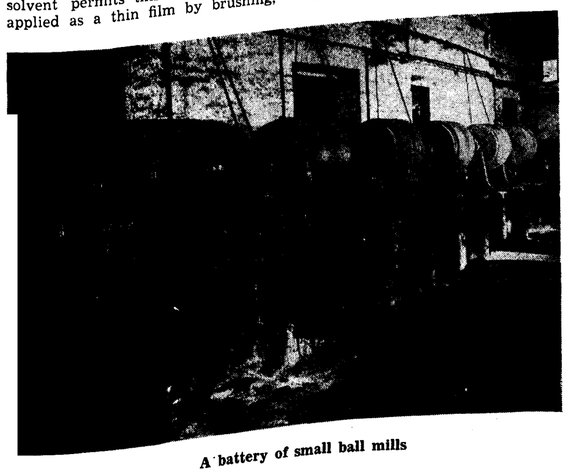
F. H. KAPADIA

constructions and for maintenance of existing structures.

The paint industry has grown at an approximate rate of 10 percent, and the recently assessed production in both the scheduled and small-scale sectors for the years 1957 to 1960 is as under:

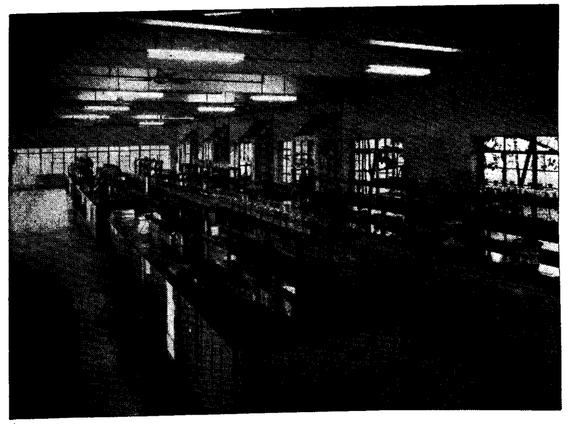
Year	Tons
1957	55,942
1958	61,387
1959	67,842
1960	72,470

The production for 1963 is estimated at 90,000 tons, and it is expected to exceed 100,000 tons this year.



Paint may be considered to be made up of three essential components—pigments, resins and solvents. Driers constitute the fourth essential, but their use depends on the nature of the resin. The resin binds the pigment particles together and the solvent permits this mixture to be applied as a thin film by brushing, spraying, flowing, dipping, etcetera. The solvent evaporates leaving the thin film of paint which hardens into a coating that protects and beautifies the surface on which it is applied.

The manufacture of paint involves the dispersion of pigments in the combination of resins and solvents. The pigment is introduced as a finely ground powder, and the purpose of the machines is not to grind the pigment further but to put in the energy required to separate the individual particles of the pigment and to coat each particle with the combination of resin and solvent. Only surface forces are involved, and modern technology uses many additives in small quantities to assist in the wetting and suspension of the individual particle and in maintaining it in that stage until applied.



The performance of a paint thus depends on the properties of the pigments and resins used in its manufacture, and it is essential that both these meet the requirements of the end-user. Thus it is not possible to use acid resisting resins with non-acid-resisting pigments (or *vice-versa*) and expect to get an acid-resisting product. An acid-resisting resin can only give a transparent coating, without any colour, while the pigment by itself is only a powder and cannot adhere. Only raw materials of the proper quality can produce a proper paint.

Resins

The term "resin" was originally applied only to the natural exudations from trees which formed a hard mass. These resins were soluble in water or vegetable oils, and when dissolved in water gave gums and when cooked in oil gave varnishes. Casein from milk and shellac can also be termed resins, though not of plant origin. With the advance of chemistry in the latter half of the 19th century, a great number of chemical compounds were identified and attempts to reproduce the processes of nature gathered momentum. Silk was a prized product and the idea to produce it from cellulose nitrate, a modification of another natural fibre, cotton, led to the great artificial fibre industry of today.

A battery of small ball mills

Laboratory attached to a paint factory

But the manufacture of synthetic resins eluded scientists till the turn of the 20th century when Baekland found that phenol and formaldehyde reacted to give a resinous mass that set upon further heating to a hard, insoluble infusible substance. Following this, natural pine rosin was modified with phenolic resin to give products of higher melting point not affected by water. Alkyd resins, involving the combination of glycerine and phthalic anhydride, with varying ratios of vegetable oil came as an improvement over the oil alone. The combination of urea with formaldehyde to give resins similar to phenol formaldehyde, but water-white in colour was followed by the discovery that melamine gave still better products.

All these developments took place as the chemical industry developed and new chemicals became available in high purity at reasonable rates. Research led the way and found new uses and as the demand grew special plants came up offering more and more of these chemicals at progressively lower prices.

The second World War greatly accelerated the development and growth of the chemical industry in Europe and the U.S.A. and the period that followed saw the introduction of many new materials. The synthetic resins field was revolutionised by "plastic emulsions", and a variety of products such as acrylics, vinyls, epoxies, silicones and polyurethanes, made it possible for the paint technologist to formulate coatings for the most stringent requirements. It was suddenly no longer impossible to offer paints capable of standing temperature of 500°C to 600°C, or of withstanding intermittent immersion in concentrated nitric acid or chromic acid.

Developments in pigments have not perhaps been as great as in the synthetic resin field, but colours of excellent stability and very high resistance to chemicals have been made available such as the phthalo-cyanine blues and greens. The most rapid growth has been that of titanium dioxide, and in spite of a tremendous increase in production the world over, the demand still grows for this excellent white pigment which has proved most versatile in use.

Synthetic Resins and Pigments

Rosin modifications were manufactured just before the war and today there are about a dozen large manufacturers making a variety of products. The total capacity of all manufacturers is of the order of 15,000 tons and of this about 75 percent is in resins used for surface coatings. The balance is for plywood glues, special resins such as polyesters, etcetera.

Local manufacture satisfies the requirements for alkyd resins and rosin modifications, but substantial quantities of the newer resins have to be imported to meet India's growing requirements. These imports are essential until the chemical industry grows to the stage of making available the various products used in the manufacture of these products. In planning for this, it should be remembered that the usage of resins will increase rapidly and will be much more than proportionate to the increase in paint output. An example is provided in the U.S.A. where the production of resins in 1930 was of the order of 5,000 tons, but by 1955 it had exceeded 350,000 tons and is today double this figure. Similarly, on the assumption that current consumption is 8,000 tons in a total production of 90,000 tons, it would be reasonable to estimate a usage of

80,000 tons in a total production of 400,000 tons.

The manufacture of pigment colours commenced very recently, and this industry has acquired a reasonable amount of know-how within the last decade. Progress has been impressive in chrome yellows and greens, and in iron blues, and a reasonable range of organic pigments has become available. Titanium dioxide demand has continued to outrun local manufacture, and the recent expansion of capacity to 18 tonnes a day does not satisfy the needs of the paint industry, which is the major customer. The reported decision to set up an extension with a capacity of 50 tonnes a day will considerably help matters if it is expedited, as very substantial imports will be needed otherwise.

Raw Materials	Production (in tons) 1953	1958	1963

Brunswick green	12	95	190
Ultramarine blue	—	902	2,312
Industrial solvents (butyl alcohol, butyl acetate and ethyl acetate) coal tar solvents (in thousand litres)	1,731	5,900	24,522
Plasticisers (in thousand litres)	—	—	1,130

The growth of the pigment colour industry is tabled below along with figures for industrial solvents and plasticisers:

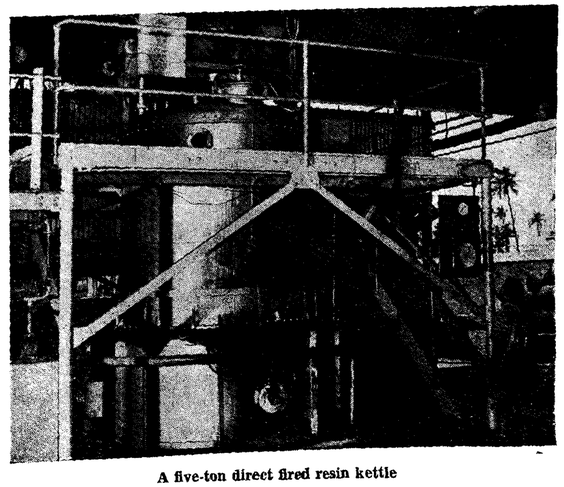
Manufacture of Machinery

The manufacture of various types of machinery has progressed considerably with the establishment of various ancillary industries manufacturing components. The initial manufacture consisted of items such as simple types of horizontal and vertical mixers and ball mills and edgerunner mills. The ball mills were, however, of the unlined mild steel type, and not very satisfactory.

Recently, there appears to be considerable interest among foreign manufacturers of paint machinery to produce these items in India. A U.K. firm has already established by subcontract and assembly the manufacture of horizontal and vertical mixers, water-cooled manganese steel lined ball mills, steatite lined pebble mills, kinetic mixers, etcetera.

There has been a considerable advance in the production of paint manufacturing machinery, and equipment used in Europe and the U.S.A. consists of turbine agitators, high-speed mixers, in-line and circulating mixers, attritors, sand grinders, etcetera. All these have been designed with a view to occupying smaller space, continuing lesser power consumption and reducing the processing time. So they offer considerable economies.

As India's economy progresses, the paint industry will continue to grow and will have to keep pace. Today the industry can meet the exacting demands of its more sophisticated customers in the engineering industry, in chemical and fertiliser plants, irrigation and power projects, refineries, railways and in harbours and shipping. But to continue to meet this demand it is essential that the raw materials are available. It is amazing how readily a chain of events can be started even if some minor material is missing—for want of a nail the battle can be lost.



Unirolls used for manufacturing enamels

The list below shows the main consumers:

Currently the paint industry is experiencing serious shortages. Tinplate has become scarce, and container manufacturers cannot meet their commitments. The same is the case with essential lead and zinc pigments; copper pigments used in marine paints have also become unavailable. The shortage of lead and zinc is also reflected in inorganic pigments where chrome yellows and zinc chromate cannot be made due to the shortage of metals. It is to be hoped that prompt arrangements for raising the imports will be made by the authorities.

The Indian paint industry today has the necessary know-how and personnel to cater to a very wide variety of requirements. It offers over 2,000 different products and uses about 500 different materials in their manufacture. Given these materials in sufficient quantities, it can meet all the demands adequately.

Aluminium Output Rising: Need to Increase Capacity Further

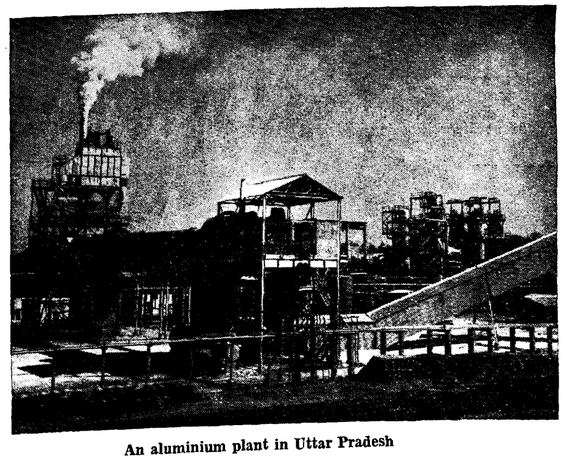
By
A SPECIAL CORRESPONDENT

ALUMINIUM has made gigantic strides in recent years. What was once a costly curiosity for emperors and scientists has now become a highly useful tool for the development of modern industry. It has lent its versatile qualities to the manufacture of a fascinating variety of capital and consumer goods. India has now definitely entered the aluminium age. So a critical assessment of the problems and prospects of the industry should merit serious attention. Although the aluminium industry in India is only about a quarter century old, it has a record of impressive progress and a promising future. The development of the industry since 1950 is indicated in Table II on this page, which shows the estimated primary production, secondary production from scrap, net imports, and apparent consumption of aluminium in India during 1950-63.

It will be observed that the progress up to 1958 was somewhat uncertain, but since then the industry has been developing steadily. In the context of the acute shortage of indigenous ore resources, for the production of other non-ferrous metals, which are largely imported (involving a continuously increasing drain of the country's chronically meagre foreign exchange reserves), it is in the national interest to encourage the growth of the aluminium industry and the replacement of other metals and materials by aluminium, for the production of which India has abundant raw materials.

It is interesting to note that the industry in India has undergone a dramatic transformation in recent years, adapting itself to the changing needs. At one time, aluminium was almost entirely a "pots and pans" industry, used for the manufacture of utensils. Today, it is a vital raw material required for the electrical industry, transportation, canning and packaging, building and construction, other industrial and engineering equipment (including food, textiles, chemicals, sewage, mining, nuclear engineering, etcetera), defence and ordnance, and miscellaneous uses, in addition to its use for utensils and household appliances. Aluminium has not only come to stay as a basic industry, on which depends the development of a host of industries producing a wide range of capital goods, consumer goods and services, but it has consolidated its position by successfully competing with and displacing numerous other metals and materials from their established markets. New uses are developing in spite of competition with a host of alternative materials, old and new. Aluminium utensils are competing very satisfactorily with cast iron, steel, stainless steel, copper, brass, enamelware and earthenware.

Aluminium roofing, panelling and structurals are competing with asbestos-cement, galvanised iron, steel and timber in building and construction, transportation and other industries. Aluminium foils, container sheets and impact extrusions are good substitutes for tin, lead, paper and plastics, in the field of canning and packaging. Aluminium coins are in the process of being substituted for small denomination cupro-nickel currency. Aluminising is being introduced in place of galvanising. And, by no means least, aluminium conductors and cables are fast replacing copper.



Uses of Aluminium

The uses of aluminium are determined by the following attributes (and especially their versatile combination) which explain its consumer-appeal: (i) extreme lightness and mobility: (ii) high strength, with very high specific tenacity or strength-weight ratio (There are aluminium alloys with ultimate tensile strength as high as 42 tons a square inch or 66.15 kg/mm², far exceeding that of mild structural steel which has a tensile strength of about 30 tons a square inch or 47.25 kg/mm²); (iii) high-corrosion-resistance, and hence long economic life and low maintenance cost, as also high scrap value; (iv) non-toxic, hygienic character and resistance to moisture, light and heat; (v) high thermal and electrical conductivity; (vi) high reflectivity of radiant heat and light; (vii) non-magnetic and non-sparking properties; (viii) ease of machining and fabrication (for casting, extrusion, machining, cold forming, forging, joining, surface finishing, arodic oxidation, electroplating and painting); (ix) extremely attractive brightness, finish and colour-anodising; and (x) comparative cost advantage on a long-term basis.

Table V on page 71 incorporates the 1965-66 and 1970-71 pattern of estimated demand for aluminium in India, with break-up of both industrial end-uses and product-mix requirements.

The total demand for aluminium has been estimated at 125,000 tonnes for 1965-66, and 259,000 tonnes for 1970-71. This signifies a growth rate of about 16 percent a year during the fourth plan period. The industrywise pattern of demand and the *per capita* consumption of aluminium in India are compared with those in the U.S.A., the U.K. and Italy, in Table III on the following page.

Having analysed the demand for aluminium, one should turn to the supply position. Table V gives the estimated demand for aluminium on a productwise (as also industrywise) basis. Table VI on page 71 analyses the relationship between the demand and supply of aluminium semi-fabricated items. A provision of about 10 percent for 1965-66 and about 8 percent for 1970-71 has been made for additions to stock and production reserves, on top of the estimated con-

An aluminium plant in Uttar Pradesh

Apparent aluminium consumption* ..	11.0	12.5	12.0	11.0	17.5	27.0	25.5	33.0	32.0	42.0	47.5	52.0	80.0	84.0

* Additions to stock and production reserves will have to be deducted from the figures of apparent aluminium consumption shown.

sumption. While estimating the installed production capacity required, a provision of about 12.5 percent has been made for unused capacity (due to power cuts, raw material shortages, mechanical faults, labour unrest, etcetera) and loss of metal during fabrication, etcetera, which has been added to the total demand for primary metal.

Installed capacities in 1965-66 and 1970-71 for the production of primary aluminium are expected to be as shown in Table I on the previous page.

Primary Output Capacity

As against the requirement of about 145,000 tonnes of installed primary production capacity in 1965-66, the expected availability is only 93,000 tonnes, leaving a shortfall of about 52,000 tonnes. The 1965-66 requirement of about 316,000 tonnes compares with a fairly certain supply of about 113,000 tonnes, which may go up to about 188,000 tonnes, if one takes into account the projects which are still in an uncertain position. In any case, the gap to be filled is huge, which calls for immediate attention to the need for licensing and installing additional manufacturing capacity, as it takes considerable time for units to go into production, even after the licences are sanctioned.

It is necessary to point out that the smelting and fabricating facilities should be properly inter-related, and the supply should conform to the market specifications. Otherwise, one will find a recurrence of the unenviable situation, where primary producers have unsold stocks (adding to their cost of production), the fabricators have idle capacity for want of the metal in the required shape and specifications (thereby increasing their manufacturing costs), and the consumers have to pay unnecessarily higher prices for whatever little material is available for supply.

The overall cost of production of aluminium in India is much higher than that of leading producers abroad, on account of the following factors: (i) Non-optimum size (small) manufacturing units, with high overheads; (ii) high cost of electric (especially thermo-electric) power and inadequacy of power supply (which constitutes nearly 25 percent of the production cost of aluminium); (iii) high cost of imported machinery and equipment, and high depreciation costs; (iv) inadequacy of transport facilities and high freight rates and (v) low productivity, due to lack of adequate technical know-how and underdeveloped techniques of management and work study.

Table III

SOME INTERNATIONAL COMPARISONS OF ALUMINIUM USE

	U.S.A. 1961	U.K. 1961	Italy 1961	India* 1960-61	1965-66	1970-71
National income (Rs./a head) figures at 1952 53 prices	12.500	6,500	2,800	325	380	450

	100.0%	100.0%	100.0%	100.0%	100.0%	100.0%
Plus exports as percentage of domestic use ..	7.1%	17.1%	5.5%	—	1.6%	12.9%

* Estimated

While setting up additional manufacturing units, account should be taken of the fact that an aluminium producing unit, in order to run economically, should have a capacity of at least 30,000 tonnes a year, if not higher. Comparative installation costs at various production levels are shown in Table IV on this page.

The position concerning the cost of electric power, supply of power, cost of machinery and equipment, transport facilities and freight rates is expected to improve gradually, with greater Government attention to the importance of the aluminium industry. Meanwhile, it is necessary to improve productivity, through more stress on product development, specialisation, standardisation of processes; market, consumer, and product research to ensure correct quality standards; process planning and research to ensure correct selection of machines and correct operation of processes; production and material control to plan the work content and raw material supply suitably; personnel policy to ensure proper selection, proper incentives and improved working conditions; organisation and method study, and management and worker-training to improve working methods; and, above all, proper co-ordination of men, machines and materials at all stages.

Table IV

COMPARATIVE INSTALLATION COSTS* OF ALUMINIUM PLANTS OF VARIOUS CAPACITIES

(Installation cost in Rs. a tonne)

	For 10,000 metric tonnes a year unit	For 20,000 metric tonnes	30,000 metric tonnes	60,000 metric tonnes	100,000 metric tonnes

Programme for Manufacture of Heavy Electrical Equipment

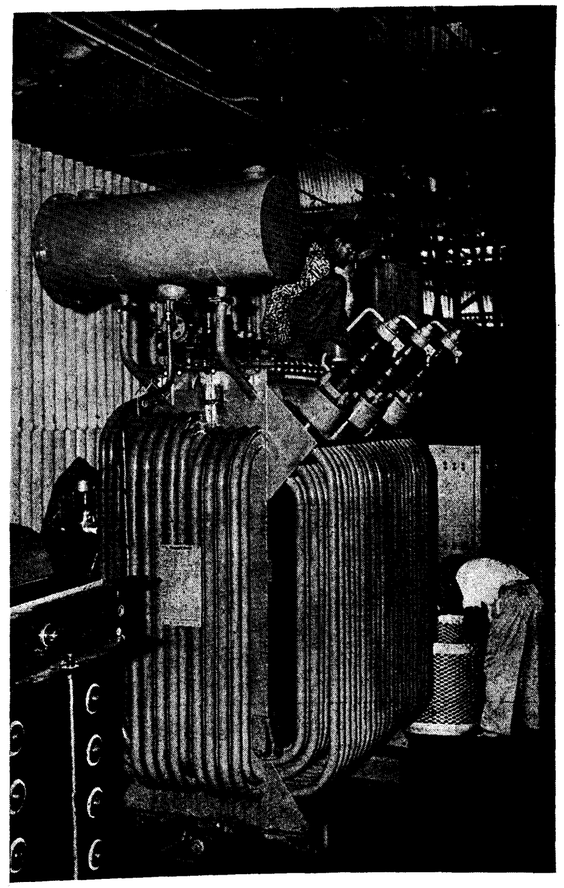
THE heavy electrical industry, by and large, caters for equipment required for the generation and transmission of power and also for power-consuming devices in large industrial establishments. These include turbines and generators, power transformers, switchgear, large industrial motors, and power rectifiers. The light electrical industry provides equipment required for the distribution and consumption of electricity and includes such items as small transformers, motors, cables, fans, and lamps. At the present time, the manufacture of heavy electrical equipment has been entrusted largely to the Heavy Electricals (India) Ltd, which is a Government-owned undertaking with factories located in Bhopal, Hardwar, Hyderabad and Tiruchy. The Bhopal factory has already started production in certain lines while the other three are still under construction.

A few factories in the private sector have also been licensed to manufacture a limited range of heavy electrical equipment mainly for transformers and switchgear. However, the whole of light electrical equipment manufacture has been entrusted to private companies, and a major part of the country's need for these items is already being met by them.

By
S. SWAYAMBU,
Director (Technical) and Chief Engineer, Heavy Electricals (India) Ltd

Power Development Plans

The demand for heavy and light electrical equipment closely follows the programme of power development in the country. The total power generation capacity which was 1.1 million kilowatts at the beginning of the first five year plan will rise to about 12 million kilowatts at the end of the third plan, that is, March 1966. This rate of growth is indeed very high from any standard and is an essential requirement for the rapid economic growth of the country. Side by side, with the increase in power generation, extensive transmission systems are also developing all over inter-connecting State grids. This has brought about the adoption of higher transmission voltages. Many power systems have commissioned 220 kV lines and it is almost certain that 400 kV lines would be constructed in the fourth plan.



The Government of India decided towards the end of the first plan period that a heavy electrical industry should be established in Bhopal for the manufacture of large transformers, switchgear, capacitors and traction motors. The scope was then extended to cover the manufacture of large industrial motors and generators and also hydraulic and steam turbines. This factory will be capable of manufacturing annually 3 million kVA of power transformers with possibilities for further increase to 6 million kVA. The combined output of hydro and thermal turbines with associated generators is planned for a million kilowatts with scope for increase to 1.5 million kilowatts a year.

Since 1961, power transformers of varying sizes numbering over 120 with an agregate capacity of over 1,000 MVA have been produced in Bhopal and shipped to 14 electricity undertakings. Most of them have been installed and are working satisfactorily. The sizes range from 1 MVA to 75 MVA. for voltages up to 132 kV. As skill and techniques are learnt, the programme of manufacture will be restricted to larger sizes for higher voltages. Plans are being made to take up 220 H.E.L. transformers for size up to 200 kVA. An essential feature of the transformer programme consists of the manufacture of condenser bushings and on-load tap changers, which are really intricate accessories made for the first time in India. Similarly, various units of switchgear complete with instruments and relays have been supplied to several electricity systems and the range includes 11 kV metalclad gear, 33 kV and 66 kV bulk oil breakers and 132 kV air blast circuit breakers with the necessary instrument transformers and other accessories.

Capacitors manufactured in the factory for a total of 84,000 kVA at a medium voltage have been supplied to a number of industries. Preparations are being made for the manufacture of high voltage capacitors in due course. As for traction motors, the factory has recently completed over 75 numbers 1,500 volts D.C. machines for the railways in the Bombay region. The railways have already started constructing an extensive 25 kV A.C. traction system. They are also setting up a diesel electric locomotive factory in Varanasi. The electric motors, generators and controlgear for these programmes will be made in Bhopal, and the annual output for these machines would grow to about 2,000 pieces during the next five or six years. Preliminary designs and production planning for large industrial motors for sizes up to 5,000 horse-power are in hand. The manufacture of hydro-electric generating plants for two power-stations, one in U.P. and the other in Punjab has commenced already and are scheduled to be completed during 1967.

Three New Factories

The programme of production in these three factories is as follows:

A power transformer ready for use

Hardwar: (Production to commence in 1967)

(i) Hydro-turbines and Generators in unit sizes up to 100 MW ...	Capacity a year	1,200 MW
(ii) Steam-turbines and generators in unit sizes 100 and 200 MW	,,	1,500 ,,
(iii) Medium-sized and heavy A.C. and D.C. machines up to 9,000 kW in size	,,	515 ,,
The total annual output in	value = Rs. 40 crores.	

Hyderabad: Production to commence in 1965.

Steam-turbine and generators in unit sizes of 55 and 100 MW	Capacity a year	800 MW
Total annual output ...	= Rs. 14 crores	

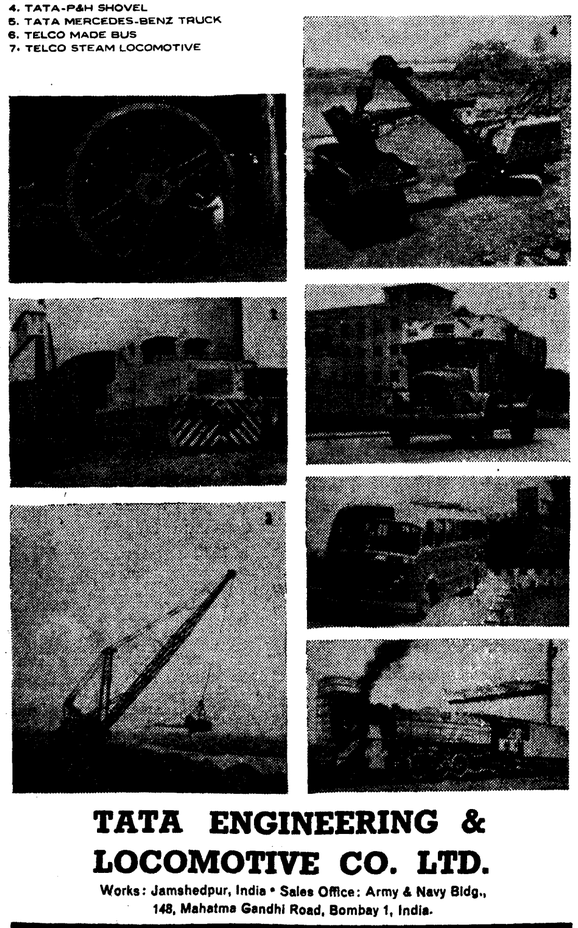
Tiruchi: Production to commence in 1965.

Hight pressure boilers for power-stations to match the generating plant made in Hyderabad ...	... ... Rs. 20 crores.

MADE BY TELCO
to speed up the nation's industrial progress

LOCOMOTIVES—Over 700 steam locomotives for goods and passenger traffic on metre gauge supplied to the Indian railways.

INDUSTRIAL SHUNTERS—Diesel driven, specially designed for steel, cement and power plants, tube, paper and textile mills, and for collieries, mines, docks and railway marshalling yards. Suitable for both broad and metre gauges.



TATA MERCEDES-BENZ—Trucks and buses—transport leaders on Indian highways—over 75,000 on the road.

TATA-P&H EXCAVATORS—Sixty already supplied to major projects in India. Available with diesel or electric power.

FOUNDRY PRODUCTS—Castings of steel and alloy iron made in India's most modern foundry—up to 10 tonnes individual weight, to customer's specifications.

All TELCO products are available for export.

1. QUALITY STEEL CASTING FROM TELCO

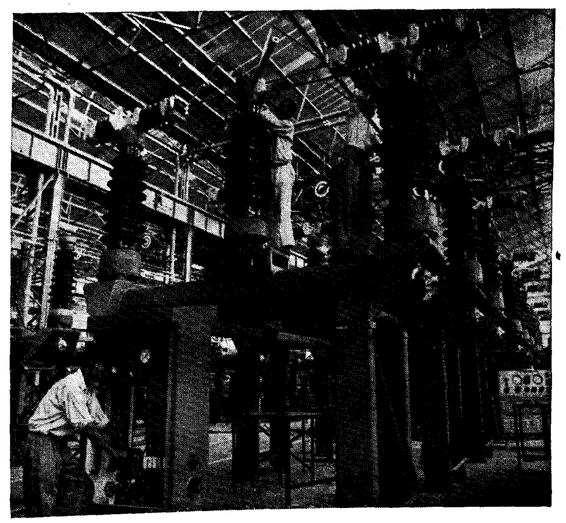
The planned turnover annually in the boiler plant would be about 42,000 tons of material for production of complete boilers for a total output of over 750 MW.

In the private sector, a boiler plant has been set up in Durgapur for the manufacture of large-size boilers for power-stations. A number of firms have started the manufacture of medium-size power transformers. Practically the entire requirement of distribution transformers are being met by a large number of firms and actually during the period 1960 to 1963, the output of distribution transformers has risen from about 100 MVA to 2,500 MVA a year and further expansion is also foreseen. Similarly, the output of small and medium electric motors has risen from 700,000 H.P. in 1960 to 1,200,000 H.P. in 1963 in 27 units so far licensed. This rate of development is also true in a number of other light electrical industries such as electric fans, lamps, cables, and domestic appliances.

Outlook for the Future

The heavy electrical industry is by its very nature a complex one involving many materials, processes and testing procedures which call for a high standard of technology. Skills involved will have to be built up over many years. Similarly, the design and manufacturing know-how will have to be acquired over a long period of time. The establishment of large factories requires an enormous amount of capital and would require close collaboration with other countries which are advanced in their techniques. Essentially, the build-up of the industry is a slow process. Even as India begins to manufacture machines of certain sizes, the demand for larger and more sophisticated machines will arise at a rapid pace.

Similarly, research will bring about rapid changes in technology which call for change in the designs and processes. For example, during the last 20 years, the pressures and temperatures used in steam turbines have increased many times and at the present time single units of 500 MW and 750 MW at working pressures of over 3000 p.s.i.g. are being manufactured in advanced countries and such changes bring about improved economy and efficiency and hence continuous change is inevitable. This, in turn, would call for changes in the production programmes in the heavy electrical industry from time to time and would also involve large additional investment.

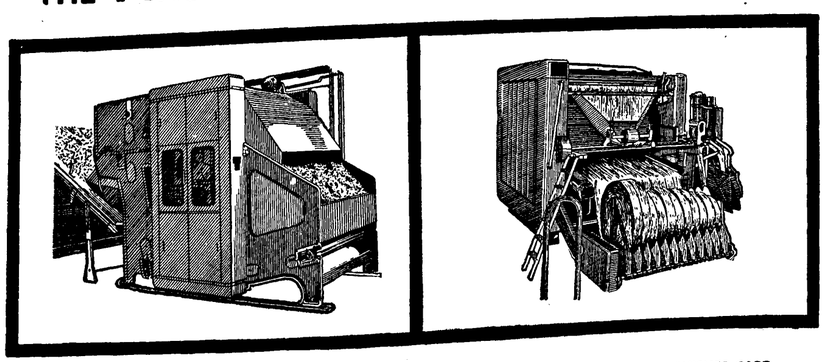


Because of all these considerations, it is difficult to foresee a condition when India could claim to be self-sufficient in this field, particularly in relation to the higher ranges of heavy equipment. However, it should be possible to become self-sufficient in small and medium ranges of equipment and possibly India can also develop to a certain extent in export of such items.

Research and Development

In order to sustain a large programme of manufacture it is most essential that research and development programmes should be well established. This would also reduce the country's dependence on the import of know-how from other countries. In fact, the extensive use of foreign licences and technical collaboration is likely to retard initiative to design and develop the indigenous machines. Even when a start is made on the basis of foreign collaboration, efforts should soon be made to develop further types and new models of equipment by Indian scientists and engineers so that the saving in royalties and fees would be substantial. Furthermore, such efforts alone would bring about the wider use of indigenous raw materials and substitutes for imported components and materials.

A heavy and light electrical industry should, therefore, pay adequate attention to this aspect and set up units in every factory for the development of research and the standardisation of work. A good deal of "back-up" research would also come from allied National Laboratories and from the Power Research Institute of the Central Water and Power Commission, who are operating two research centres, one in Bangalore and the other in Bhopal, the latter being exclusively devoted for switchgear testing and development. For the maximum benefits in the field of applied research, a close collaboration between the industry and the research institutions is most essential.



As the heavy electrical industry makes progress, it is inevitable that the country should enter new fields of activity, such as the manufacture of equipment for nuclear power-stations, electronically controlled industrial drives, and controls and many other modern fields of application which are fast developing.

An air blast circuit breaker being assembled in Bhopal

The trend of growth in the power supply industry would warrant the setting up of many more plants of the size of Bhopal during the next ten years. Not only should the volume of output from this industry be increased, but the equipment should also incorporate the latest progress in science and technology. With the growth of engineering education and the establishment of higher technological institutions, there is every hope that the country would achieve this objective.

Planning TOWARDS
A BETTER PORT

As the life-line of Eastern India's trade and commerce, the Calcutta Port faces recurring problems every year. The emphasis on industrial progress in the Plan period has considerably changed the type of cargo to be handled. Steel and mechanical equipment, heavy machinery and huge plant form a considerable bulk of the import. On the export front it is coal or ore.

To-day's well-equipped Port needs be made into a better Port to-morrow. But this is possible not by more equipments alone. The Calcutta Port needs most the whole-hearted co-operation from all fronts—from those who use and also from those who serve it.

STATE INTERFERENCE MAY HAMPER PROGRESS OF PHARMACEUTICALS

RECENT Press reports on threatened abrogation of drug patents in India have turned the spotlight on the pharmaceutical industry, and have caused people in many walks of life to ask whether the accusations are true. Is it a fact that the public are being held to ransom by unscrupulous manufacturers of medicines? Is it true that the prices of medicines in India are higher than in more developed countries? If it is, is it true that the manufacturers are making vast profits out of people's misfortunes?

If these accusations are true, is it the answer that the production of medicines should be diverted to the public sector? Will such action automatically lower prices, bring life-saving medicines within the reach of the poor people, and make India self-sufficient in this essential field? To examine these questions properly, it is necessary to clear away the heat and haze of emotion, to ignore the publicity-seeking cries of the self-interested and the well-meaning appeals of the uninformed, and to examine the history of the pharmaceutical industry, its achievements,

By

A. W. LEWIS

its present position in India and elsewhere, its future, and the vital connection between the industry and India's continuing development.

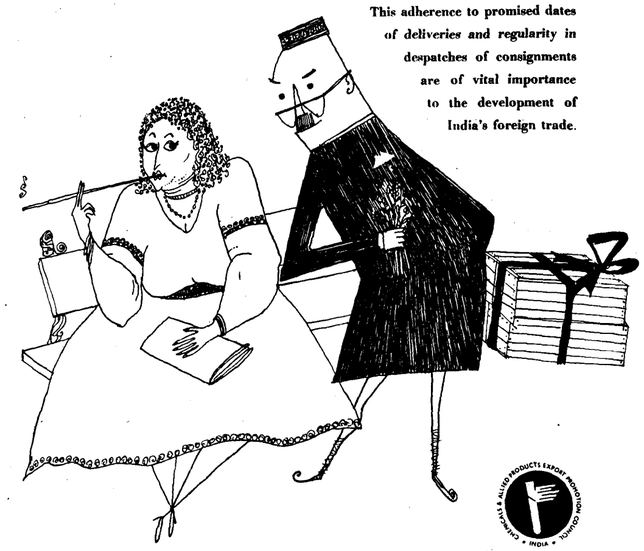
Foreign Interests

First of all, let us examine the statement frequently made that the Indian pharmaceutical industry is "dominated by foreign interests". There are, of course, many ways of putting this, depending upon the effect required. Let us try saying "the progress made by the pharmaceutical industry in India is largely due to international know-how, investment and collaboration". And then let us see if India has been "victimised" or assisted. The pharmaceutical industry is essentially international in character. It has been so since the days of the apothecaries and the spice traders. Every race and region in the world has contributed to the traditional *materia medica*.

It is the same with modern drugs. The discovery of the aniline dyes in England led to the great dyestuffs industry—and research into dyes produced chemotherapeutical agents. The Swiss chemical industry progressed from the treatment of textiles to the treatment of human beings. Prontosil—the first of the sulphonamides—was invented in Germany but "deciphered" chemically in France, with "M. and B. 693" produced in Britain as a result. Penicillin was discovered in Britain, but made widely available at the right time with the assistance of American technology. Rauwolfia was an Indian ayurvedic drug which was chemically "realised" in Switzerland. And there are many more examples of the feed-back from research to development, and from development to research, and from country to country.

Throughout the world, in very many countries, the pharmaceutical industry is of international structure, and this situation exists for a very simple reason. It is that, in a developing country, local industry starts many years behind, and cannot hope to start off at the level which has been achieved in other more advanced countries. In India, therefore, the main sources of knowledge for the production of newer drugs have been the research laboratories abroad of international companies which have established factories in this country, or have collaborated with Indian firms.

The pharmaceutical industry in India has grown at a fantastic rate in the past 25 years, and particularly in the last 15 years it has expanded from a Rs. 10-crore industry to a Rs. 100-crore one. In spite of the increase in local production, India's requirements of imported pharmaceuticals also increased considerably because of the growing use of, and demand for, modern synthetic drugs.



By a coincidence, the outbreak of the second World War almost coincided with the "pharmaceutical revolution" which started in 1935. Not a revolution in the industry, but a revolution in advances in medicine. In Britain, for example, the industry's output in 1935 was £19 million. By 1958—in 23 years—the output was £162 million. The discovery of the sulpha drugs, in fact, started the "pharmaceutical revolution". The breakthrough of the sulphonamides was the result of the scientific enterprise of the pharmaceutical industry. From this start, the industry found cures for pneumonia, leprosy, tuberculosis and many other killing or crippling diseases. About this time, also, the early work on antibiotics was in progress, and in 1940, the value of penicillin was first clinically demonstrated by a team in Oxford. It was, of course, the first of the antibiotics and was followed in 1943 by streptomycin. The search was really under way by this time and in 1947, chloramphenicol was found from a

Sri Raptanikari...

he keeps his date

He concludes a deal with an importer abroad. First consignment goes. The foreign buyer builds up the market. Demand increases. Repeat orders are placed. Sri Raptanikari knows that to keep the demand alive goods should be supplied regularly and strictly according to schedule. Any failure to do this would result in disappointment to consumers and their consequent switch over to substitutes from elsewhere. Ultimately the market for Indian goods would be lost. Sri Raptanikari, therefore, keeps his dates of supplies. His consignments are regular, shipments strictly on schedule.

This adherence to promised dates of deliveries and regularity in despatches of consignments are of vital importance to the development of India's foreign trade.

Great Discoveries

So, from 1935 onwards, the whole face of medicine changed and within the next 15 years, a tremendous number of world-shaking discoveries were made, which completely altered medical treatment in most areas. The point is that India's move into large-scale local production of pharmaceuticals more or less coincided with a fantastic expansion of demand for medicines arising from a series of conquests of diseases which were formerly accepted as crippling or killing.

Nearly all these conquests were the result of research and scientific work on the part of the established pharmaceutical companies in the U.K., Europe and the U.S.A. These companies have, as a result, become international in nature, since they have been in constant competition with each other and have set up manufacture wherever the demand for their products has warranted it. India has been no exception and many of the largest companies here originated elsewhere. This means, in effect, that India gets the benefit of research conducted in all nations of the free world. Some part of the price of every drug sold here is India's contribution to new research by private enterprise and to further new life-saving medicines.

Pattern of Development

The pattern in India has closely followed that in other countries. More and more local manufacturers have progressed through the stages of (1) import of packed pharmaceuticals ready for use; (2) import of the products in bulk for local packaging; (3) import of the active ingredients for local manufacturing into pharmaceutical presentations; (4) manufacture of the active ingredients from imported intermediates; (5) manufacture of the active ingredients from imported basic raw materials and (6) local manufacture of basic raw materials.

Considering the relatively short period of time referred to previously, the progress made by the pharmaceutical industry in India has been phenomenal. Very few pharmaceutical preparations are now imported as finished products, and the saving in foreign exchange has, therefore, been considerable. There are at present about 1,500 companies engaged in the pharmaceutical industry in India, but about 75 percent of the total production comes from a relatively small number. These are the 120 or so who are on the list of the Directorate-General of Technical Development and who, together, have an estimated capital investment approaching Rs. 60 crores. Incidentally, something less than Rs. 18 crores of this is foreign capital. Does this indicate that foreign interests dominate the industry?

No less than 55 of these 120 major companies produce basic pharmaceuticals which they either make available to other manufacturers or manufacture themselves into finished pharmaceutical preparations. These larger companies employ a total of about 40,000 workers, including about 4,000 technical staff. The balance of pharmaceutical production in India comes from the smaller companies whose output is mainly formulations of drugs obtained from other manufacturers.

It is, therefore, on the companies which are on the list of the Directorate-General of Technical Development that India's present advanced state of pharmaceutical development, and future progress, depend. They are the firms whose equipment, manufacturing standards and control methods are equal to those in the more advanced countries of the western world. Among the essential drugs already coming from basic manufacture, or planned for the near future, are the broad-spectrum antibiotics, analgesics, sulpha drugs, antimalarials, oral anti-diabetics, insulin, anaesthetics, vitamins, antihistamines, tranquillisers, steroids, cardiac glycosides, and a host of other products most of which have resulted from research and discovery by the pharmaceutical industry.

Expensive Research

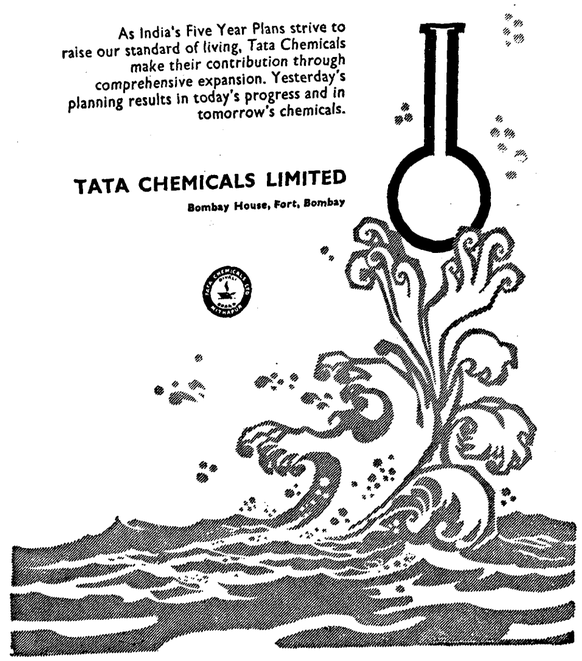
Research in 1962 cost the international pharmaceutical industry more than Rs. 190 crores. To research and develop a new and efficacious drug normally costs, on average, around Rs. 1.3 crores. Some drugs have cost much more. Out of every 3,000 new substances examined only one, on average, is marketed. The others are discarded after up to five years' research work, because they have been found too toxic, too difficult to administer, or no better than existing therapy.

Critics say that, these days, medicines are more expensive than they used to be. It is not surprising. Modern medicines are completely different from the old therapies. They are effective. They save lives. Obviously, it is not possible to sell a modern motor-car at the same price as a bullock cart. That is a fairly exact comparison of therapeutic value.

So there is a combination of circumstances which, inevitably, thrusts the activities of the pharmaceutical industry in India into the spotlight. There are (1) a developing country in which the economy is under constant pressure; (2) a huge population, increasing at a faster rate than the national development can take care of; (3) a fairly recent revolution in medicine arising almost wholly from the research activities of the pharmaceutical industry; (4) availability, as a consequence, of medicines far superior to anything ever available previously, but naturally enough, costing more.

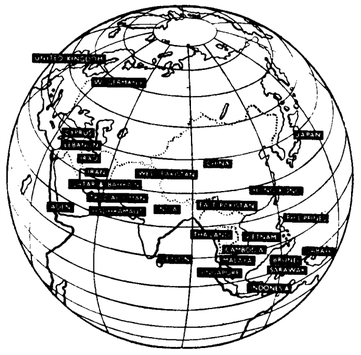
In a country where hundreds of millions of people have a very low level of income and are unable to buy medicines as they would wish, it is not surprising that attention turns to the cost of medicines. The per capita consumption of pharmaceuticals in the country works out to just over Rs. 2 a year. In other words, the average Indian is not able to buy even one bottle of tonic in a whole year. It is not surprising, perhaps, that there is a tendency to criticise the manufacturer, and that the public is receptive to the speaker who urges that the prices of medicines be brought down, but conveniently forgets many of the factors which contribute to the costs.

Costs of Industry



The *Report of the Development Council for Drugs and Pharmaceuticals for 1962-63*, published by the Department of Technical Development of the Government of India, includes reports by technical subcommittees on the costs of basic

For over 20 years Tata Chemicals have been helping Industry and Agriculture with bounty from the sea. The task of churning the sea is not yet over. The men at Tata Chemicals are busy discovering, experimenting with and producing more and more Marine Products and Pharmaceuticals, which they know will help the country in its fight with the demons of Poverty and Backwardness.



The sea yielded 14 gifts

As India's Five Year Plans strive to raise our standard of living, Tata Chemicals make their contribution through comprehensive expansion. Yesterday's planning results in today's progress and in tomorrow's chemicals.

chemicals, etcetera, and finished pharmaceutical preparations manufactured in India.

Among the factors examined were the following: (1) higher prices of imported raw materials and intermediates due to incidence of Customs duty; (2) prices of indigenously obtained raw materials are 150 percent to 200 percent of those prevailing in other countries; (3) in many cases the quality of indigenous raw materials is inferior, resulting in higher production costs; (4) solvent losses are high, due to high temperatures; (5) excise duties, and procedures insisted on by the excise authorities in handling the stores which involve special insurance premiums, bank commissions, etcetera, amounting to additional expenditure equal to the total value of the landed cost of the raw materials; and (6) not only is the cost of imported equipment 35 percent to 40 percent higher than in foreign countries, due to all the charges involved, but the cost of indigenously fabricated equipment is even higher, in many cases.

There are many other factors which apply to the finished preparations, quite apart from the raw materials. Packing materials, manufacturing and packing charges, quality control, distribution, and formulation research, all figure in the final cost of the finished medicine. The cost of these operations is often much more than the cost of the basic drug content. Yet the reports says: "Despite the fact that the cost of basic drug is usually higher in India than in other developed countries, the cost of finished preparations is in most cases much less than the domestic prices of similar products in foreign countries". This can mean only one thing—that the profit made by pharmaceutical manufacturers in India is appreciably *less* than in those foreign countries.

In fact, the same report says: "The difference between the consumer prices and the ex-factory cost of the finished preparations is much less in this country than in most of the more developed countries". How can the pharmaceutical industry in India be criticised, then, as responsible for the "high prices of medicines"?

Without any profit the pharmaceutical industry, both private and public, would cease to exist. There would be no investment, no research, no industry. Without the research which has been carried out by the industry many of the readers of this article would not be alive today. And their expectation of life is now greater than that of their fathers when they were their age—because of the fantastic advances in medicine made by the research workers of the pharmaceutical industry.

Future Prospects

And what of the future for the industry in India? Will it be encouraged to progress, as it has done throughout the free world, or will it be subjected to so many restrictions, frustrations, hobblings, disincentives and deliberate counter-actions that the companies which have done so much for India already will reluctantly reduce their operations and look elsewhere for a reasonable and legitimate return on investment? India *needs* a strong and progressive pharmaceutical industry, run by free enterprise and backed by the vast scientific resources of competitive private industry.

How else would the doctors, nurses and hospitals be waging the present successful battle against malaria, tuberculosis and leprosy? From the pharmaceutical industry, sometimes working in close collaboration with research workers in universities, have come the weapons against poliomyelitis, typhoid, cholera, smallpox, dysentery, hook-worm, vitamin deficiencies, venereal diseases and a hundred other conditions which, if not prevented or treated, could reduce the forward march of the nation to a slow, crippled shuffle. In a praiseworthy but uninformed effort to bring prices down, a number of suggestions have been made. A couple of these may be examined in the light of facts.

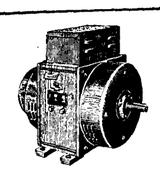
"Do away with drug patents": This, it is suggested, would bring down prices because all and sundry would then be able to manufacture the previously patented drug without licensing arrangements and royalties and, hey presto!, the cost would be halved. In the first place, there has been a compulsory licensing provision in India for the past ten years which would have allowed local manufacturers to take up foreign patents if they so wished. This writer knows of no instance in which advantage has been taken of this provision. A lot of noise is made about the influence of royalties on the prices of medicines. Few figures, if any, have been quoted however, and it is probable that the overall effect of royalties on drug prices in India is very small indeed—certainly, nothing like the effect of the many and varied taxes and duties which affect medicines from raw material to consumer.

Italy Introduces Patents

Italy is often quoted by the protagonists of "no-patents" as an example of what can be done. While Italy may, in fact, be exporting some drugs cheaply, domestic prices are a very different matter and are, in fact, higher than in the U.K., France, Germany, etcetera. It has been clearly shown also that, in terms of man-hours of work required to be able to purchase medicines, the Italian worker is considerably worse off than his counterparts in other European countries and the United States. Furthermore, as a result of the absence of patent protection in the pharmaceutical industry in Italy, no worthwhile new drug has come from that country since before the war.

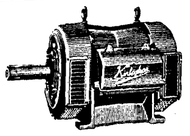
The Italian pharmaceutical industry, far from being happy with its utopian no-patent state, is now pressing hard for the *introduction* of patents, and a Bill for this purpose is now under consideration and likely to become law.

"Nationalise the drug industry": It is competition which stimulates research. No new drug has come from Russia since 1917, when the State supplanted private enterprise, although a number of claims have been made. Only recently the Russians announced that they have evolved "a new process" for the manufacture of Vitamin B_{12}—which was isolated in industrial research laboratories in the West years ago, and has been in constant use ever since. In fact, it can be said that not a single really novel drug in any field of pharmaceutical science has come from the countries where drug research is completely State-controlled.



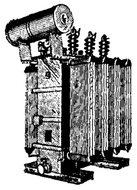
It is difficult, is it not, to imagine a civil servant who will take the risk of spendng a crore of rupees on the development of a drug which may lead to no result? This explains why Russia, with impressive advances in the field of surgery, has to rely upon the western world for advances in medicine.

Opposition to Nationalisation



Professor Ernst Chain, F.R.S., Professor of Biochemistry (Imperial College of Science and Technology, London), Nobel Laureate, and one of the original workers on penicillin said, in the Trueman Wood Lecture to the Royal Society of Arts in June 1963, that those who wish to replace the industrial pharmaceutical research laboratory by nationalisation "must know that in taking such steps they are conjuring up a major health hazard, much more dangerous than a virulent epidemic. No pharmaceutical industry—no new drugs; this, in a nutshell, is the situation".

This from a world-renowned scientist who has spent his whole life in academic non-industrial laboratories, cannot be lightly rejected.



A healthy pharmaceutical industry is essential for India's development. Only the competition arising from free enterprise can stimulate research, bring down prices and encourage exports. Investment must be encouraged by all means, not discouraged by threats and destructive criticism. This country, with its natural resources, brilliant research workers and skilled technicians can develop its own pharmaceutical industry, capable of taking its place alongside any in the world. But India must not jettison the future for the sake of possible but improbable short-term benefits.

Shortage of Molasses Main Problem of Alcohol Industry

THE alcohol industry in the country came into being as a means of providing supplementary motor-car fuel during the second World War, and this consideration held good in the establishment and organisation of the industry up to the first five year plan. The development of the alcohol industry is no longer circumscribed by the need to sell its product as gasolene. During the second and third five year plans, with the manufacture of several chemicals like drugs, dyestuffs, high polymers, and solvent insecticides in India, alcohol has become indispensable as a raw material and it is no longer used as motor-car fuel. In fact, the scheme for the production of power alcohol has already been withdrawn and distilleries are producing industrial alcohol.

The main raw material for the industry is molasses, which is a by-product of the sugar industry and,

By
A SPECIAL CORRESPONDENT

to a small extent, of *khandsari* manufacturers, although some quantities of alcohol is also produced from *mahua* flowers. The production of molasses in the sugar industry is, on average, 35 percent of the sugar produced, and approximately 53 gallons (0.193 tons) of alcohol can be obtained from a ton of molasses. Production of alcohol, therefore, primarily depends on the quantity of molasses that will be coming forth from the sugar factories during any season. The perennial cycles of surplus and shortage in sugar output have had a direct impact on the production of alcohol.

The production of alcohol between 1954 and 1962 has been as follows:

Year	Production (in million gallons)
1954	12.6
1955	15.6
1956	14.5
1957	15.2
1958	15.0
1959	15.4
1960	19.9
1961	32.2
1962	34.9

In 1955-56, the last year of the first five year plan, with sugar production exceeding the plan target of 1.8 million tonnes (output was 1.86 million tonnes), the output of alcohol increased sharply from about 12.6 million gallons in 1954 to 15.8 million gallons in 1955. Therefore, for the next four years, with sugar production fluctuating around 1.9 million tonnes, alcohol output remained practically static till 1959-60 when, with the increase in sugar output to 2.45 million tonnes, alcohol production rose to 19.9 million gallons. The record sugar production of 3.028 million tonnes in 1960-61 led to an increase of about 62 percent in the alcohol production. The increase in alcohol output has been arrested following the progressive decline in sugar production in the following years. Due to the big shortfall in sugar output in the last year and the depressing outlook in the current season, the distilleries are facing an acute shortage of molasses, particularly those in U.P. where last year they were faced with closure for a period of four to six months.

First and Second Plan Targets

During the first five year plan attention was concentrated on the production of power alcohol and the targets for capacity and production were set at 21.2 million and 18 million gallons a year, respectively. At the commencement of the second plan there were 19 power alcohol distilleries with an annual capacity of about 14.9 million gallons of power alcohol and 2.9 million gallons of industrial alcohol. In addition, there were 24 distilleries producing potable and industrial alcohol; their capacity for industrial alcohol was estimated at 9.3 million gallons a year. The total capacity for industrial alcohol in the country was thus 12.2 million gallons and that for both power and industrial alcohol was 27.1 million gallons.

In the course of the second plan, seven new distilleries came into existence. Four of the existing distilleries were regularised and ten completed their expansion schemes. The total capacity for power and industrial alcohol at the end of the second plan stood at about 40 million gallons, compared with the target of 36 million gallons initially visualised. The State-wise distribution of capacity was as follows:

State	No. of distilleries	Annual capacity (in 100 bulk gallons)
Uttar Pradesh	20	21,923
Andhra Pradesh	6	4,254
Maharashtra	6	4,258
Bihar	4	2,208
Punjab	3	1,816
West Bengal	3	1,550
Kerala	3	600
Mysore	2	1,680
Rajasthan	2	497
Madhya Pradesh	2	420
Madras	1	720
Gujarat	1	187
Total	53	40,103

Against the capacity target, as already pointed out, the target for alcohol production was 30 million gallons. This, however, could not be achieved and the output was only around 19.9 million gallons. Internal demand for alcohol also did not increase to the extent visualised in the plan. With a view to disposing of the surplus and earning much-needed foreign exchange, exports were encouraged. There was a spurt in exports from 1960 onwards, as is evident from the following:

Year	Exports (in lakhs of rupees)
1957	7.7
1958	6.2
1959	8.8
1960	28.8
1961	28.65
1962	33.61

The internal demand for alcohol has increased after 1962 following the setting up of the synthetic rubber factory in Bareilly and the styrene monomer plant in Bombay. In fact, at present supplies are not sufficient to meet the demand of alcohol-based industries, and the prospects of exporting are virtually nil.

Third Plan Programme

The target for sugar production in the third plan having been fixed at 3.5 million tonnes, it is expected that about 1.225 million tonnes of its by-product, *viz.*, molasses will be available. Assuming that the power alcohol industry will get 90 percent of the estimated molasses output, the production of alcohol will be 58.5 million gallons. Adding to it the production of another one million gallons from *mahua* flowers, the total production of alcohol during the third plan may be placed at about 60 million gallons. Of this, about 10 million gallons will be required for use in the manufacture of potable spirits and ordinary denatured spirits. Thus about 50 million gallons will remain for utilisation as raw material for alcohol-based industries. According to the present trends in demand, there should be no difficulty in using this alcohol. The Planning Commission has also estimated that the overall demand in 1965-66 will be 60 million gallons.

The Petro-chemical Committee has arrived at the following estimates of demand for industrial alcohol by 1965-66 and 1970-71:

(In tons)

Usage	1965-66 Qty. of product	1965-66 Alcohol requirement	1970-71 Qty. of product	1970-71 Alcohol requirement
1. Butadiene and styrene for S.B.R.	30,000	70,000	30,000	70,000
2. Polythylene	8,500	17,000	8,500	17,000
3. Styrene for polystyrene	14,000	10,000	21,000	15,000
4. N. butanol and N. buty-raldehyde for octanol	11,000	17,000	27,000	42,000
5. Acetic acid for cellulose acetate	17,000		25,000	
For other acetates	4,000		10,000	
Acetic anhydride for other uses	2,000	32,000	4,000	57,000
Vinyl acetate	2,000		6,000	
Chloracetic acid	1,500		3,000	
Drugs, dyes, textiles and other uses	4,500		9,000	
6. Chlorinated derivatives including chloral, D.D.T., chloroform ethychloride, ethylene dichloride and P.V.C.		10,000		16,000
Mainly D.D.T.—6,000 tons				
E.D.C.—2,400 ,,				
P.V.C.—6,000 ,,				
7. Potable spirits, drugs, liquor, ordinary denatured spirit		30,000		45,000
8. Other uses in chemicals and processing industries including acetone and others		12,000		20,000
		198,000		282,000

In considering the above demand estimates, the Planning Commission has placed the third plan alcohol production target at 60 million gallons. Taking into account the inherent difficulties in operating the alcohol industry continuously at full capacity due to the seasonal character of the supplies of its main raw material, *viz.*, molasses, and difficulties in procuring it, the capacity target has been fixed at 72 million gallons.

Licensing of Extra Capacity

In addition to the capacity of about 40 million gallons existing at the end of the second plan, a capacity of 24 million gallons has hitherto been licensed—12 expansion schemes (7,722,000 gallons) and 12 new distilleries (16,200,000 gallons). An additional capacity of 8 million gallons, therefore, remains to be licensed to achieve the third plan target of 72 million gallons. It is estimated that an investment of over Rs. 4 crores with a foreign exchange component of Rs. 40 lakhs will be required for this purpose.

Before licensing additional capacity in any area the prospects of supply of molasses should be carefully assessed so as to ensure full utilisation of capacity. At present in certain States like U.P., the capacity is not fully utilised. To some extent transport difficulties, for moving both molasses and alcohol, have prevented optimum working. Simultaneously, effective utilisation of available supplies of molasses should be ensured. While the use of molasses as raw material for alcohol is higher in U.P. being about 70 percent, the utilisation in other States is low and on an all-India basis about 58 percent of the molasses produced in 1960-61 was used by the distilleries.

As already indicated, the Petro-chemical Committee has placed the

demand for industrial alcohol by 1970-71 at 282,000 tonnes. For achieving this output, sugar production will have to be about 4.32 million tonnes, assuming that about 1 million tonnes of alcohol will be produced from *mahua* and 90 percent of the molasses output will be available to the alcohol industry. It should be possible to achieve this alcohol output in so far as the fourth plan sugar production target has been placed at 4.5 million tonnes and there are indications that this may be stepped up to 5 million tonnes. However, according to more recent estimates, the demand for alcohol by the end of the fourth plan period may be higher than that visualised by the Petro-chemical Committee, being about 356,000 tonnes. To match this revised demand for alcohol, a production of about 5.53 million tonnes of sugar will be necessary. Assuming a sugar production target of even five million tonnes, there will be a shortage of as much as 33,000 tonnes of alcohol by 1970-71. It is necessary that research should be conducted for evolving other raw materials such as *mahua* and tapioca for fermentation.

The development of the basic organic chemical industry is absolutely necessary for the industrial progress of the country as chemicals help produce essential commodities like drugs, dyes, synthetic rubber, plastics, fertilisers, etcetera. For producing organic chemicals alcohol is an essential raw material. It is true that coal carbonisation products obtained as a by-product from coke ovens in the iron and steel industry, and natural gases and surplus naptha obtained from petroleum refineries can be utilised for the production of organic chemicals. But the products obtained from coal carbonisation are mainly of the aromatic group having a limited use; though the chemicals derived from the petroleum sources can be utilised, the development of the petro-chemical industry is still in the nascent stage and it will take some time before it is established on a firm footing. However, it would be useful to assess as to what extent the demand for alcohol will be affected by chemicals derived from chemical sources.

Ensuring Supplies of Molasses

For developing the alcohol industry and the industries which consume alcohol as raw material, it is of paramount importance that adequate supplies of molasses and alcohol should be ensured. While molasses is produced during the cane crushing season only, it has to be stored throughout the year. Sufficient and good storage facilities should, therefore, be provided at the sugar factories and distilleries to avoid wastage and pollution. Provision of such facilities would require money, which the sugar factories and distilleries will not be able to provide from their meagre resources. So they should be given suitable financial assistance to put up storage tanks.

Apart from storage, the movement of molasses and alcohol also presents problems. Because of stringent excise rules, alcohol cannot be stored anywhere. The storage capacity at the distilleries being limited, when despatches of alcohol are not satisfactory either because of non-availability of tank wagons or because of slack demand, the storage accommodation at the distilleries becomes full and sometimes production has to be discontinued. Storage and movement are, therefore, interconnected and the railways can be of great help by providing sufficient number of tank wagons for speedy transport.

Transport Difficulty

At present the supply of tank wagons is inadequate and their placement is very irregular. At times, they are placed far in excess of the loading capacity of the factories and at others they are not placed for days together. To add to the problem, most of them are old and leaky. Besides, the tankers are not properly stencilled for measurement and overloading as well as underloading, compared with capacity, are common. In case of overloading, through no fault of the despatcher, the wagon is returned for draining out excess quantity leading to unnecessary delays in movement. With the development of the alcohol industry the transport problem will be aggravated. The railways should, therefore, pay urgent attention to the problem and plan sufficiently in advance so that transport bottlenecks do not arise and thwart the progress of the industry.

For achieving the desired production of alcohol during the third and fourth plan periods, not only will the capacity of the existing plants have to be raised, but some new plants will also have to be established. Recent developments in the field could be used to advantage in designing new plants. Except for a few imported plants, most of the existing distilleries have been designed and erected by Indian personnel. There is also the possibility of automation and modernisation of existing plants. The alcohol industry should be suitably assisted by the Government in view of its national importance and the vast potential which exists for expansion.

NOW A PARTNER IN INDIA'S PROGRESS ON STEEL

Travelling beyond the field of thermal power generation in India, where giant power plants bear witness to its technological finesse, Kuljian has long since become active in the field of steel and metallurgy. Already technical consultants for the Mahindra-Ugine Alloy Steel Plant at Khopoli near Bombay, and for the Punjab Government's Steel Casting Plant, Kuljian offers all or any of the following consultancy services to the steel industry with the same confidence as it has been displaying in the field of power generation for the last 15 years.

■ MINING AND BENEFICIATION OF ORES AND FUELS ■ INTEGRATED STEEL PLANTS ■ EXTRACTIVE METALLURGY ■ ELECTRIC SMELTING OF IRON AND FERRO ALLOYS ■ BLAST-FURNACE IRON PLANTS ■ NON-FERROUS METALLURGICAL PLANTS ■ FOUNDRIES AND MACHINE SHOPS.

Rapid Development of the Man-made Fibre Industry: Prospects for Further Expansion

By

T. R. RAMACHANDRAN

IN the context of today's ever-growing need for the Central Government to find more money and the inability of the private sector to contribute as much as is demanded, the man-made fibre industry has much to grumble about. The imposition in the new Budget of an excise duty on rayon and other man-made fibres, which has gained successively high incidence since 1956, has led to a stage where the levy can neither be cheerfully borne nor easily passed on. In the first place, it is difficult to be borne by the industry. The total increase in the tax incidence so far comes to as high as 627 percent in the case of fine yarn. Secondly, the levy cannot be transferred to the consumer, *i.e.*, the weaving mills, as the price of yarn shows little sign of picking up in spite of decontrol last November.

Under the circumstances, the additional tax burden, obviously, is a deterrent to the industry's growth. The question remains whether it is advisable to ignore the evil effects of the cumulative tax, especially when the industry is assuming a greater importance than ever before in satisfying a human need that ranks next to that of food.

The man-made fibre industry today serves the needs of a large number of people, especially in urban areas. An alarming population increase estimated to rise to 555 million in the next decade, clearly underscores the importance of developing this industry as a vital adjunct to cotton textiles. As the Association of Man-Made Fibre Industry has estimated, if cotton textiles alone were to meet the needs of the country in the next ten years, 2,000 million more yards of cotton fabrics will have to be produced. This would mean that the country will have to devote more acreage to cotton cultivation or, alternatively, spend valuable foreign exchange in importing fibres. Being a substitute and a blend for coton, man-made fibres can meet the nation's textile requirements without affecting its food production.

The performance of the man-made fibre industry in India already has improved the scope for saving, as well as earning, foreign exchange. In the case of fabrics alone, India's exports amounted to 90 million metres, valued at Rs. 10.4 crores in 1963, an increase 22 times over the decade at an average rate of expansion of 200 percent every year. The fibre industry, too, launching on a phased programme of production of viscose filament yarn and staple fibre, accounted for a saving in foreign exchange of nearly Rs. 15 crores in 1963. The record of progress of the industry is shown in the following table:

Year	Production of viscose filament yarn (In million kilograms)	Foreign exchange saved at Rs. 3.3 a kilogram (In lakhs of Rs.)	Production of staple fibre (In million kilograms)	Foreign exchange saved at Rs. 1.43 a kilogram (In lakhs of Rs.)
1950	0.12	4		
1951	2.45	81		
1952	3.65	1.21		
1953	4.48	1,48		
1954	5.02	1.66	3.09	44
1955	5.83	1,92	5.71	82
1956	7.57	2,50	7.92	1,13
1957	9.71	3,21	8.02	1.15
1958	13.43	4,44	13.96	2,00
1959	15.10	4,98	20.39	2,92
1960	18.98	6,27	21.82	3,12
1961	21.43	7,07	26.00	3,72
1962	26.23	8,66	32.38	4,63
1963	31.17	10,29	32.25	4,61

Taxation Curbs Incentive

This spectacular progress of the industry within a relatively short period calls for a proper assessment of the regressive tax measures imposed on it. Anticipating a yield of Rs. 4.7 crores by way of additional excise duty on rayon and synthetic fibre and yarn, the Finance Minister has justified an increase in the rate by 50 percent on filament yarn of cellulosic origin and 100 percent on other synthetic fibres and yarn of non-cellulosic origin. Relating the excise duty to the basic ex-factory selling prices of yarn, the heavy incidence under the current Budget will be evident from the following:

(In rupees a kilogram)	deniers 150	deniers 120	deniers 100
Basic ex-factory price exclusive of excise duty	8.26	7.64	6.94
Total excise duty including additional excise	6.00	4.00	4.00
Ratio (percentage) of excise duty to basic ex-factory price ...	72.6	52.4	57.6

It is unfortunate that the basic selling price of yarn has remained almost constant since 1956. Even after the decontrol in November 1963, the spinners have failed to realise higher prices, mainly because the weaving mills have refused to pay more than the controlled rates. In the circumstances, the industry, burdened with additional duty this year, hardly has the incentive to expand.

Moreover, as in previous years, the yield from the levy to the Central Exchequer has been grossly underestimated. This is shown in the table below:

(In crores of rupees)

Year	Budget estimate	Actual collection	Difference or under-estimate
1959-60	1.93	2.02	0.09
1960-61	2.30	2.82	0.52
1961-62	4.39	5.58	1.19
1962-63	7.35	9.71	2.36
1963-64	11.33	12.67	1.34
1964-65	18.50*	21.76**	3.26

* Includes Rs. 4.70 crores as estimated in the Budget.

** Estimate.

As the actual collection every year has exceeded the Budget estimates, the Association legitimately feels that the same error of under-estimate has crept in this year's calculation of the Exchequer. While the Finance Minister has reckoned the collection from basic and special excise duties this year at Rs. 4.7 crores, the Association forecasts the additional yield to be not less than Rs. 7.96 crores. Even assuming a compromise figure for additional collection at Rs. 6 crores this year, there is a strong case for reducing the duty imposed in this year's Budget.

Production Problems

Also, a comparison of the domestic prices of rayon yarn in India with those of other countries shows how much more the Indian consumer has to pay for his requirements of yarn. In the case of yarn of 100 deniers, the selling price of yarn in India is Rs. 15.50 a kilogram, compared with Rs. 5.66 a kilogram in Japan, Rs. 9.42 a kilogram in Britain, and Rs. 12.39 a kilogram in the U.S.A. This disparity is striking, particularly when it is imagined that the purchasing power of the Indian consumer is much lower than that of his counterpart. It is obviously the impact of the high level of excise duty that is the chief contributing factor to the higher prices.

Apart from tax, production costs too have gone up. Higher prices of raw materials, electricity charges, maintenance expenditure and wages and salaries have contributed not a little. Even the 1961 export promotion scheme designed to earn more foreign exchange added to the discomfiture of the spinning industry by arranging the sale of yarn to weaving units at concessional rates. Lastly, the high obsolescence of machinery in this industry is striking. The use of sulphuric acid, carbon-di-sulphide and caustic soda at different stages of production of rayon yarn shortens the life of machinery and equipment. Unlike in the coton textile industry, the manufacturing process for rayon is a continuous round-the-clock operation throughout the year, which results in greater wear and tear.

Expansion of Rayon Units

It is nevertheless interesting to recount how, in the face of besetting odds, the man-made fibre industry has forged ahead with a number of expansion plans. It was only a few months ago that commercial production commenced in a large integrated plant of the Indian Rayon Corporation in Veraval, in Gujarat State. Started with an initial capacity of 5.2 tonnes a day of viscose rayon filament yarn, the plant has been expanded and is expected to produce about 10 tonnes a day. Collaborating with a well-known U.S. firm, Von Kohorn International, the Indian Rayon industrial complex also manufactures its raw materials, such as sulphuric acid, and produces the basic raw material

Rayon and synthetic fabrics at the Indian pavilion in a Bangkok fair

for rayon yarn, namely, cellulose pulp. Also, the Company plans to install facilities with a capacity of 25 tons a day for the manufacture of staple fibre.

Another viscose rayon yarn plant put up by the Baroda Rayon Corporation is also in Gujarat (Udhna). Although the plant has a rated capacity of 6.3 tons a day, the actual production during last year has been at the average level of 9 tons, thus reflecting the efficiency of its operations and also marking an important step towards the attainment of the viscose rayon production target.

Simultaneously, with the increase in the number of rayon plants and their increased production in all varieties, including viscose, acetate and staple fibres, the rayon industry has been in constant search for local sources of basic raw materials. An important outcome is the discovery of the use of bamboo in making rayon grade pulp. This was a great economising factor, as the traditional sources of pulp, namely, spruce and beechwood, are scarce, being grown only in the heights of the Himalayas. The credit for putting up the first plant for the manufacture of rayon grade pulp with the use of bamboo, goes to Gwalior Rayon. Its new plant, with the present capacity of 150 tons a day, went into production a little over a year ago in the Kerala State—not far away from India's first rayon unit, Travancore Rayons, established in 1950. A few more industrial licences for the manufacture of wood pulp from bamboo have also been given.

Progress of Synthetic Fibres

Aside from rayon, the manufacture of non-cellulosic synthetic fibres has given a new turn to the growth of the man-made fibre industry and a large variety of synthetic and blended fabrics is being produced. The progress towards the diversification in manufacture reached a new stage with the recent establishment in Bombay of a new Company, called Chemicals and Fibres of India Ltd, for the manufacture of polyester staple fibre to be sold under the registered trade mark "Terene". The construction of the Company's plant is now going ahead in full swing in Thana, near Bombay, and it is expected, that the plant will be commissioned early in 1965. Set up in collaboration with the pioneers in synthetics, Imperial Chemical Industries Ltd, U.K., at a cost of Rs. 5.85 crores, the plant has an initial capacity of 4.5 million lbs a year of polyester staple fibre. The Company has already approached the Government for further expansion of its capacity.

In addition to this plant, schemes are under way to set up a few more plants for the manufacture of polyester fibre. The Central Government has already given licences for four such projects. Of these, the project for setting up a plant in Madras in collaboration with a leading U.S. firm, has reached an advanced stage of fruition. It is estimated that the proposed plant to be put up at a cost of Rs. 3.5 crores, will have a rated capacity of 2 million kilograms a year.

Nylon Production

The development of synthetic fibres in India is by no means confined to polyester. In fact, nylon projects have already stolen a march over those for polyester fibres. Two nylon plants, one put up by Nirlon Synthetics in Bombay and the other by J. K. Rayons in Kanpur, have already started regular production, besides one unit for nylon fishing nets of the Garwares, Bombay. These plants have come up in the short span of the last two years. Reflecting the increasing contribution of these plants, India's total production of nylon yarns in 1963 touched a peak of about 1.6 million lbs, compared with only 400,000 lbs in 1962.

Production, it is expected, will go up still further in the years ahead, because of ambitious plans for expansion and the prospects for the establishment of new plants. Among the new projects on the anvil, particular mention may be made of the plant which the Century Spinning and Manufacturing Company proposes to set up near Bombay, for the large-scale manufacture of nylon fabrics. For this purpose, a new Company is being formed in collaboration with two leading overseas textile groups from West Germany and Holland.

Expansion of Nirlon Synthetics

Among the existing nylon manufacturing units, the Nirlon Synthetics, commissioned a year ago, has already taken on hand an ambitious scheme for expansion at a total cost of Rs. 10 crores. Under the programme, the Company will increase its capacity from 2 tons a day to 5.6 tons a day, which will cover stretched yarn for hosiery industry. The Company has also been given a licence to manufacture, for the first time in India, the principal raw material for nylon, cuprolactum, in addition to nylon tyre cords. Besides these plants, the Central Government has given three industrial licences for the establishment of new nylon plants.

Admittedly, the establishment of these industries bids fair to transform the present textile position into one of plenty. This development should be welcomed not merely in the domestic front, but also for exports. While, on the one hand, dependence on the import of rayon yarn is now considerably less, the export of art silk fabrics has gone up by leaps and bounds. India's exports of rayon and synthetic fabrics today go to as many as 80 countries, and in spite of increasing foreign competition, continue to scale new heights. Encouragement to the domestic fibre and fabric industry should come from the Government both by way of reduction in taxes and by liberal provision of foreign exchange for all essential purchases like machinery. In fact, most of the machinery now being used in the weaving industry was originally intended for cotton, but was converted to process yarn. This now poses the problem of rehabilitation and modernisation. Unlike cotton, a meagre foreign exchange allocation will suffice for the production of man-made fibres. India has already imported cotton and other fibres worth about Rs. 250 crores in the past three years. As the Association claims: "A fifth of the sum will exceed the capital costs needed by the man-made fibre industry to expand and fulfil India's entire textile needs".

RAILWAY AT YOUR DOOR-STEP

The Eastern Railway's door-to-door street collection and delivery service both for inward and outward consignments has been functioning in Calcutta. At a small surcharge over the usual freight, this service can be yours. An advice, sent 24 hours in advance, to the Railway's authorised contractor, Messrs. Road Carriers, 20, Mullick Street, Calcutta-7 (Phone Nos. 33-6886 & 33-7894) or to his Officers-in-Charge at Howrah and Sealdah Stations, will bring the service to your door step. The hours of delivery are between 8 a.m. and 6 p.m. and those of collection between 8 a.m. and 3 p.m. on week days. The service is generally not available on Sundays, but by special arrangements, delivery of perishables only can be effected on Sundays. If a consignee wishes to avail himself of this service in respect of consignment not initially booked for street delivery, arrangements can also be made for such delivery, if convenient to the Railway, on application to the carrying contractor.

The scheme covers the entire city divided into the following eight zones:

KIDDERPORE
BALLYGUNGE
BELIAGHATA
SHAMBAZAR
TOLLYGUNGE
PARK STREET
BOWBAZAR
COSSIPORE

Progress of Heavy Chemical Industry: Vast Scope for Development

By A. GUPTA

INDIA has already passed through two five year plan periods, during which the foundation for planned economic growth has been laid. One of the main objectives of the third plan is the expansion of basic industries like steel, chemicals, fuel and power. In a developing economy, the chemical industry plays a very important rôle. In the production of different commodities, numerous chemicals are needed, and these basic chemicals should be available at a reasonable cost so that the final product can be offered at a competitive price. Since the second World War, the population of India, in particular, and of the world in general, is increasing at a rapid rate, and there has been a steadily widening demand for improved living standards. This demand can only be met with a quick and steady growth of the chemical industry because it plays a vital rôle in the production of the commodities needed in everyday life, such as drugs, plastics, synthetic fibres, fertilisers, dyes, detergents, insecticides, etcetera.

The heavy chemical industry or the basic chemical industry can be broadly defined as one which is not a finishing industry as such, but produces chemicals from natural resources, which are in turn used by various other industries as their raw materials. In the developed countries of the West, there was no systematic planning for the development of this industry. It grew up spontaneously along with scientific discoveries and technological developments. With the advance in living standards, the demand for commodities also increased rapidly, generating an economic pressure which in turn stimulated great advances in technology. This is the natural evolutionary procedure, but India cannot afford to rely on the natural evolutionary process, but must plan a steady development programme.

Broad Divisions

The basic chemical industry can be broadly divided into two sections, inorganic and organic. The inorganic heavy chemicals are mainly acids, alkalis, fertilisers and industrial gases. On the organic side, there are basic chemicals derived from coal carbonisation, from petroleum sources and alcohol through the fermentation process. There are many other industries which could be termed as heavy chemicals, because their manufacturing processes involve chemical operations such as extraction of minerals from ores and processing of cellulosic materials for the paper and rayon industries. However, the term "heavy chemical industry" is commonly used, although perhaps not correctly, to represent the industries under the inorganic group of chemicals like acids, alkalies, fertilisers, etcetera. For the purpose of this article, it is proposed to deal with only this branch of the chemical industry.

Sulphuric acid: For many years, sulphuric acid has been considered as the yardstick of a country's industrial progress. Its production is not only considered as an index of the growth of the chemical industry, but also of the overall industrial growth of the country. The first sulphuric acid plant in India was erected by Messrs D. Waldie and Company on the banks of the Hooghly river in 1890. This was followed by a plant by the Bengal Chemical and Pharmaceutical Works in Calcutta in 1905, Perry and Company in Ranipet in 1904, and Eastern Chemicals Ltd in Bombay in 1913. The industry made considerable progress after the second World War, and more factories came into existence for the manufacture of sulphuric acid. In India, sulphuric acid was manufactured only by the Chamber process until 1935, when the Tata Iron and Steel Company established a contact process plant in Jamshedpur.

Rapid Progress

Since then this industry has made rapid progress, both in the total production as also in the size of individual units. At the beginning of the second plan period, the annual rated capacity of 39 units producing sulphuric acid was 253,888 tons expressed in terms of 100 percent acid. The figure at the end of the second plan was 525,884 tons. The total number of units working by the end of the second plan period was 43, against 39 at the beginning. Hence it can be seen that with an increase of only four new units, the production capacity has increased to about 273,000 tons. This has been achieved through the establishment of new units with bigger capacity and reassessing some of the old units. The distribution of the plants capacity-wise in 1961 is shown in the following table:

Units with a daily capacity of	Number of units	Aggregate annual capacity in 1961 (tons)
Less than ten tons	6	8,168
From ten tons to less than 25 tons	14	48,200
From 25 tons to less than 50 tons	11	125,046
50 tons and above	12	344,470
Total	43	525,884

This trend of increasing the capacity of the plants to the minimum economic unit level has not only increased the efficiency by reducing the cost of production, but also has put this industry on a sound footing. It can be rightly said that in India today the "take-off" stage for the sulphuric acid industry has been reached. Not only has the country become self-sufficient in this line of production, but also the manufacture of the catalyst and the fabrication of sulphuric acid plants is being indigenously undertaken, and not much money and foreign exchange need be spent on machinery and capital investment.

Manufacture of Sulphuric Acid

The main uses of sulphuric acid are fertilisers, pickling of finished steel, rayon yarn, fibres, petroleum refining, industrial explosives and for the manufacture of various inorganic salts, etcetera. Against the estimated requirement of 470,000 tons of acid in 1960-61, actual consumption was about 360,000 tons. The lower offtake is mainly due to the shortfall in superphosphate production. The overall demand for sulphuric acid, it is expected, will go up to about 1.5 million tons by 1965-66, representing an overall increase of more than 300 percent over the 1960-61 level. The fertiliser production will account for more than 1 million tons of this total. An industry-wise distribution of the offtake in 1960-61 and the estimate for 1965-66 according to the Planning Commission's report, is given in the following table:

Items	Consumption of sulphuric acid in 1960-61 (tons)	Estimated consumption of sulphuric acid in 1965-66 (tons)
Fertilisers (ammonium sulphate, superphosphate, ammonium phosphate, nitrophosphate, etcetera)	210,000	1,090,000
Pickling of finished steel	26,000	30,000
Rayon yarn and staple fibre	59,000	135,000
Aluminium sulphate and other inorganic salts	24,000	40,000
Petroleum refining	8,000	15,000
Miscellaneous (including industrial explosives, titanium dioxide, acid, dyestuffs and others	33,000	190,000
Total	360,000	1,500,000

The main hindrance in the smooth running of the sulphuric acid plants in the country is the absence of the indigenous raw material, which is sulphur. In this country, the manufacture of sulphuric acid is entirely based on imported sulphur. It is estimated that in 1960-61, about 120,000 tons of sulphur were used for the manufacture of sulphuric acid, amounting to about Rs. 3 crores of foreign exchange, which will rise to about Rs. 10 crores according to the estimate of production for 1965-66.

Assuming that the current international price of sulphur is stable at the present level, this is not a happy situation, because the production of many of the vitally important chemicals are dependent on sulphuric acid, such as fertilisers, and explosives for defence. It is also essential for the steel industry. Apart from the consideration of national strategy, the import of sulphur constitutes a heavy burden on the country's foreign exchange reserves, which are themselves a matter of great concern. Two alternative sources of raw materials available in the country for the production of sulphuric acid are (a) extraction of sulphur from copper and zinc smelter gases, and (b) from pyrites. The amount of sulphur which could be recovered from the smelter gases in India will not be very large, and can only provide for small units for limited local consumption. Since the beginning of the first plan period, the Government has been actively considering the exploitation of iron pyrite deposits in the country. Fortunately, it has been conclusively established that a very large deposit of iron pyrites is located in Amjore in the Shahabad district of Bihar. The initial estimate of the Geological Survey of India amounted to a total reserve of 60 million to 70 million tons, but recently, it has been found that the reserve is about 1,000 million tons, spread over an area of 48 square miles (Report of the Development Council of Heavy Chemicals, 1962).

Considering these facts, two plants have already been licensed: (1) a 100-ton a day capacity plant in Sindri in the public sector; (2) one is proposed to be set up in Dalmianagar near the pyrite deposit in the private sector. The Amjore pyrite contain about 38-40 percent of sulphur, which is suitable for the manufacture of sulphuric acid.

It is desirable that to attain self-sufficiency in the production of sulphuric acid in future, emphasis should be placed more on the pyrites process to save foreign exchange than to import virgin sulphur for the manufacture of sulphuric acid in the country.

By-product of Caustic Soda

Hydrochloric acid: The requirement of hydrochloric acid in India is not large at the present time. The main source of hydrochloric acid is as a by-product of electrolytic production of caustic soda. In the electrolytic production of caustic soda, chlorine is liberated, which when reacted with hydrogen produces hydrochloric acid. The old process of manufacture of hydrochloric acid from common salt with the help of sulphuric acid is still being used for small-scale production. The production of hydrochloric acid in recent years, according to the Tariff Commission's report, is as follows:

	(Hydrochloric acid 100 percent in tons)
1956 ...	10,584
1957 ...	11,400
1958 ...	11,064
1959 ...	10,491
1960 ...	10,082
1961 ...	15,385
1962 ...	15,400

The major industrial use of hydrochloric acid is for the production of fertilisers like ammonium chloride, bone gelatine, dyestuffs and dicalcium phosphate. The other uses are of small quantity. The demand for

hydrochloric acid by different industries is given in the following table:

Consuming industry	(In metric tonnes) 1954	1960-61
Ammonium chloride	Nil	3,333
Ossein	Nil	2,682
Rare earth compounds	505	1,341
Dyestuffs	Nil	1,004
Caustic soda and soda ash factories	335	670
Zinc chloride	600	670
Inorganic chlorides	168	1,006
Miscellaneous	168	335
Total	1,776	11,041

Nitric acid : The main use of nitric acid is in the production of fertilisers and explosives. The demand for nitric acid for civilian consumption was low in India, and production was so long organised only on a small scale from imported sodium nitrite. In recent years, the production of nitric acid has gone up considerably due to the coming into stream of various public-sector projects. At present, Sindri, Nangal and Rourkela units of the Fertiliser Corporation of India and the Indian Explosives Ltd in Gomiah are producing nitric acid by the ammonia oxidation method. The first three are linked with the production of ammonium nitrates and nitro-chalk for fertilisers and the fourth one is linked with the production of high blasting industrial explosives. The production figures of nitric acid for different years are given in the following table:

Year	No. of units	Capacity in tons	Production in tons
1956	23	4,290	1,360
1957	22	3,790	1,370
1958	22	3,790	1,539
1959	21	3,650	1,668
1960	22	7,047	5,248
1961	23	281,278	35,980
1962	23	N.A.	40,511

As the demand for nitric acid is mainly linked with the production of fertilisers, there is going to be an appreciable increase of production as the various fertiliser projects go into operation.

Most Important Alkali Industry

Soda ash : Soda ash or sodium carbonate is the most important of the alkali industries, and like sulphuric acid, the growth of the industry has been considered as a measure of the growth of the chemical industry of the country. It is used in the process of manufacture of various important commodities, such as the production of caustic soda, sodium bicarbonate, the glass industry, textiles, paper, sodium bichromate, etcetera. India has not yet reached self-sufficiency in this sector of the industry, but according to the production estimates, India may be able to produce enough of this chemical for her domestic requirements during the next plan period.

The overall capacity of the soda ash plants in operation at the end of the second plan is rated at 230,000 tons a year. The production and import of soda ash in the third plan period is given in the following table:

(Figures in '000 tons)

Year	Estimated output in the plan	Actual production	Imports* Quantity	Imports* Value (Rs. crores)
1956-57	85	84	91	2.01
1957-58	90	92	85	1.07
1958-59	120	89	51	2.37
1959-60	175	94	127	1.95
1960-61	230	145†	109†	

* For calendar years. † Metric tonnes.

The lag in the production was due mainly to the teething trouble of the newly installed units, and the lack of production of heavy soda ash, which is mainly used by the bichromate industry and glass manufacturers. But steps are being taken in the third plan period so that this handicap is overcome. There are mainly two processes employed in the manufacture of soda ash in the country. Most of the bigger units use the standard Solvay process for their production and some new units have been licensed for the production of soda ash by the modified Solvay process, whereby ammonium chloride is obtained as a by-product, which is used as a fertiliser. The economic advantage of this process has not been fully assessed yet, but it is accepted that with the increased use of ammonium chloride as the fertiliser for paddy growing, there will be no difficulty in achieving an economic balance.

The third plan sets a capacity target of 530,000 tons a year for the industry to achieve a production target of 450,000 tons a year. Out of this, capacity for 476,000 tons has already been licensed and are in the process of being installed. The estimated consumption in the third plan period will be 450,000 tons a year, out of which, the main items are the glass industry, 140,000 tons, caustic soda and other chemical industries, 50,000 tons, laundries and other miscellaneous users, 165,000 tons, paper industry 20,000 tons, and the silicate industry 30,000 tons.

Tariff Commission Enquiry

The Tariff Commission reviewed the industry's position in August 1961, and on its recommendation, protection has been continued till 31st December, 1964. The target of investment under the third plan for this industry is Rs. 12 crores, with Rs. 6 crores as the foreign exchange component. All the raw materials needed for the industry are available in India, such as salt, limestone, ammonium sulphate, ammonia, coke and coal.

It is expected that with the installation of economic units of production and rationalisation of production methods, the price of the soda ash produced in India will be stabilised and the country will be self-sufficient in the production and utilisation of soda ash in India with some surplus for export to neighbouring countries.

Caustic soda : The capacity and production target of the caustic soda industry under the second plan was 150,000 tons, and 135,000 tons, respectively, compared with the target set for the first five year plan of 37,000 tons. The rated capacity of the 12 units in 1954, of which four were attached to paper mills, was 39,700 tons. During the second plan period, six new units have gone into production. Thus, at present, there are 18 factories, of which six are attached to paper mills and one to a rayon factory. Two units produce caustic soda from soda ash, 11 units adopted the diaphragm process and five units, the mercury amalgam process. The total production in 1960 was 118,000 tons and the total consumption was 171,000 tons. The balance of 53,000 tons was imported at a cost of Rs. 2.8 crores.

Under the third plan, the capacity target has been placed at 400,000 tons, against an estimated demand of 340,000 tons a year, which will meet the total demand of the country. The selection of the type of plant used for the production of caustic

WELDING GENERATOR TRIODYN K 320

Modern welding techniques and electrodes place stringent requirements on current sources. These sources up until now were being imported from abroad at considerable cost in foreign exchange. The appearance on the market of the TRIODYN K-320, a welding source made in this country is, therefore, a major event in the sphere of welding. The TRIODYN K-320 is a portable mobile D.C. output electric arc welder. The current is continuously variable from 30 A to 320 A in two overlapping ranges. The choice of the two open circuit voltages is available, making the source versatile. A detachable current regulator provides for remote control of the welding current by the operator—a convenience which will make for accurate current settings and hence, better job quality. The TRIODYN K-320 is made by the Company that makes the finest range of welding electrodes.

PNB offers complete range of domestic as well as international Banking Services through its over 438 offices in India and correspondent Banks throughout the world.

PNB *the Oldest Name in Modern Indian Banking*

JWT-PNB 3165

soda depends mainly on the nature of its use and the availability of cheap power for the electrolytic process. The main problem of the electrolytic process is the ' disposal of chlorine by-product. In India, about 270,000 tons of chlorine is expected to be available by 1965-66, when the projects for making caustic soda by the electrolytic process are implemented. At the beginning of the third plan, the utilisation of chlorine improved substantially. The demands were created by the introduction of consuming industries like ammonium chloride for fertilisers, ossein and dicalcium phosphate, bleaching powder, hydrochloric acid and insecticides like D.D.T. and B.H.C. Taking all these into account, the Planning Commission has recommended that a certain amount of production of caustic soda by the chemical process should be installed, amounting to about 32,000 tons by 1965-66.

As for the different types of cells, the installation of mercury cells suffers from the disadvantage that the capital cost is very high as the mercury has to be imported from abroad. In the case of diaphragm cells, the initial expense of foreign exchange is less, but the fuel consumption is rather too high. The advantages and disadvantages seem to cancel out each other, and the choice is left to the entrepreneur's convenience.

The demand target for caustic soda in the second plan was about 140,000 tons. The estimated demand for the third plan is about 340,000 tons. The break-up of the estimated demands, industry-wise, is given in the following table:

Industry	Estimated by Tariff Commission for 1961 (in tons)	Target demand under the third plan
Soap ..	39,852	48,000
Textile ..	44,280	50,000
Paper* ..	43,886	94,000
Rayon ..	49,200	80,000
Vanaspati ..	3,149	4,000
Aluminium ..	4,920	25,000
Miscellaneous industries** ..	13,284	38,000
Total ..	198,571	339,000

* Includes 3,000 tons for newsprint;
** Includes petroleum refining 2,200 tons and chemicals including dyestuffs 4,000 tons.

Production of Fertilisers

Fertilisers : The fertiliser industry is most vital for the country's economic progress. Since 1920, India has been importing food from abroad to feed the growing millions. Since 1950, this country has been planning to increase the productivity of the soil by various means, mainly by applying fertiliser to the soil which has been starved of its nutrient matters. Over 70 percent of the population being engaged in agriculture, it is imperative that this country must increase the productivity of the soil as quickly as possible to support the annual population growth of more than 27 percent.

Two types of fertilisers, which India is planning to produce on a large scale, are nitrogenous fertilisers and phosphatic fertilisers. The current third five year plan has set up a target of consumption of fertilisers to be achieved by 1965-66 : nitrogen (N) 1 million tons, phosphorous (P_2O_5) 400,000 tons and potash (K_2O) 200,000 tons.

In the case of foodgrains in most parts of India, it has been found that 1 lb of nitrogen as fertiliser gives an yield of 10 lbs of grains. Cash crops like sugar, cotton, potatoes, tea, etcetera, give different types of responses. It is hoped that this ratio of nutrient to the production of foodgrains will be reached with the present condition of the soil ; it could go up to 1:15 with the proper knowledge of modern agricultural methods and techniques of fertiliser application. Unfortunately, the above targets for the third five year plan is unlikely to be achieved, judging from the present position of production and imports. The targets of indigenous production, import and total supply of nitrogenous fertilisers are given below:

	Indigenous production			Imports			
Nutrient years	Plan target for consumption	Plan target	Actual production	Plan target	Actual imports	Total availability (Cols. 4 & 6)	Total distributed
Nitrogen(N)		—	99,928	N.A.	121,090	221,018	212,638
1960-61	370,000	140,000	145,820	260,000	286,320	286,320	290,598
1961-62	400,000	200,000	182,258	325,000	242,855	424,855	360,944
1962-63	525,000						

At present, altogether 18 nitrogenous fertiliser plants have been licensed which have either gone into production or are being constructed. A list of the same is given below:

Government-owned plants (location)	Product and annual capacity
Sindri (Bihar State)†	Ammonium sulphate, ammonium sulphate-nitrate, urea, 70,000 tons N.
Rourkela (Orissa State)†	Calcium-ammonium nitrate, 80,000 tons N.
Nangal (Punjab)†	Calcium-ammonium nitrate, 80,000 tons N.
Alwaye (Kerala)†	Ammonium sulphate, ammonium phosphate, ammonium chloride, 30,000 tons N.
Trombay (Bombay)	Urea and nitro phosphate, 90,000 tons N.
Gorakhpur (Uttar Pradesh)	Urea, 80,000 tons N.
Katni (Madhya Pradesh)	Urea, 100,000 tons N.
Namrup (Assam)	Urea and ammonium sulphate, 45,000 tons N.
Neyveli (Madras)	Urea, 70,000 tons N.
Privately-owned plants, location and company	
Andhra Sugars Ltd, Kothagudam (Andhra Pradesh)	Urea, 66,000 tons N.
Visakhapatnam (Andhra Pradesh) Coromandel Fertilisers Co. Ltd	Ammonium phosphate, 365,000 tons : urea, 116,500 tons.
Baroda (Gujarat State)* The Gujarat State Fertilisers Co. Ltd	Urea, 90,000 tons ; ammonium phosphate, 125,000 tons ; ammonium sulphate, 200,000 tons.
Ennore (Madras State)†	Ammonium phosphate, 16,500 tons N.
E.I.D.-Parry Ltd Tuticorin (Kerala State)	Ammonium phosphate, 64,000 tons N.
Kothari and Sons Mangalore (Mysore State)	Urea, 99,000 tons ; ammonium phosphate, 123,750 tons ; ammonium sulphate, 99,000 tons.
Shaw Wallace and Company and Rallis India Ltd Varanasi (Uttar Pradesh)	Ammonium chloride, 10,000 tons N.
Sahu Jain Group Durgapur (West Bengal)*	Urea, 132,000 tons.
Durgapur Fertilisers and Chemicals Ltd. Hanumangarh (Rajasthan)	Ammonium sulphate, 80,000 tons N.
House of Jalan (B. L. Jalan)	

* To be owned jointly by the Government and private industry.
† In operation.

Main Raw Materials

The main raw materials for the production of nitrogenous fertilisers are nitrogen derived from air and hydrogen derived from either petroleum and coal, or electrolytically. The production of electrolytic hydrogen is very expensive and can be ruled out for the future expansion programmes. India has an abundant supply of coal in the country and most of the plants are designed to produce hydrogen from coal. The cost of production of nitrogenous fertilisers in a coal-based unit is much higher than one based on petroleum or natural gas sources. At present, this country has certain surplus naphtha in the petroleum refineries, the utilisation of which has become a problem. Therefore, greater emphasis for the production of ammonia in future should be placed on surplus naphtha from petroleum refineries and natural gases and associated gases available from the oilfields of Assam and Gujarat.

Phosphatic fertilisers : Application of sufficient quantities of suitable phosphatic fertilisers to the soil along with nitrogen is essential for the maintenance of soil fertility and increased crop yield. In 1960-61, the actual production was only 52,000 tons of P_2O_5, against a target of 120,000 tons. The table below shows the capacity, production and consumption of phosphatic fertilisers in the country:

(Tons P_2O_5)

	1960-51	1955-56		1960-61		1965-66
		Targets	Actuals	Targets	Actuals	Targets
Capacity	20,575	34,892	33,200	120,000	95,600	500,000
Production	9,072	33,333	12,365	120,000	52,391	500,000
Consumption	6,900 (1951)	33,000	14,218	120,000	52,816	500,000

The low target of production of P_2O_5 fertiliser has been mainly due to the lack of popularity of these fertilisers in the country, and the shortage of raw materials like phosphatic rocks and sulphur for the production of sulphuric acid used in the process. Both of these have to be imported from abroad. The end-products of the phosphatic fertilisers are mainly triple superphosphate, dicalcium phosphate, nitro-phosphate and ammonium phosphate. The major raw materials required for this industry are rock phosphate and sulphur for the production of sulphuric acid. The annual import of rock phosphates are given in the following table:

Year	Quantity (in '000 tons)	Value (in crores of rupees)
1957	115.0	1.55
1958	121.3	1.13
1959	185.9	1.10
1960	236.2	2.07

To achieve self-sufficiency in phosphatic fertilisers, new sources of raw materials have to be found in the country. As already stated, iron pyrites available will be a good raw material for the production of sulphuric acid. A certain amount of rack phosphates are available in the Deccan plateau and other parts of India. A serious and concentrated effort should be made by the Geological Survey of India to explore the availability of phosphatic rocks in the country.

"WG" BRAND WIRED AND FIGURED GLASS

Now

Manufactured in India by Special Annealing Process in Collaboration with Messrs Cekop Centrala Handlu Zagranicznego, Warszawa, Poland.

FIGURED GLASS

For privacy, beauty, even and diffused lighting

'WG' Brand Figured Glass is available at moderate cost in many attractive designs. Ideally suited for residential buildings, hospitals, offices, schools and commercial buildings.

WIRED GLASS

For safety, beauty, even and diffused lighting

'WG' Brand Wired Glass with special steel wiremesh embedded between the layers. Provides safety in the event of any breakage—wiremesh holding the broken pieces. Special annealing process gives additional resistance. Ideally suited for north lights, steel windows, skylights or wherever safety and light are required.

Production of Non-ferrous Metals Rising but Demand Exceeds Supply

By
P. C. JAIN

NON-ferrous metals, although known in India from early ages, have a very brief past of about two decades of development on modern lines. The fixed capital employed by the semi-manufacturing and subsidiary industries is placed at over Rs. 130 crores or Rs. 140 crores. It employs a labour force of over 50,000 and the annual production of different sections is estimated to be over Rs. 140 crores. Its wage bill comes to about Rs. 10 crores, while it pays about Rs. 15 crores a year as indirect taxes. The annual sale value of export metals and metal products has reached about Rs. 2.40 crores. These figures give, in brief, an idea of the size of the industry and the rôle it plays in the economic life of the country.

Most countries in the world are not self-sufficient in their requirements of major non-ferrous metals, namely, aluminium, copper, lead, nickel, tin and zinc. In India, the supply varies from abundance in the case of aluminium to deficiency in the case of copper, lead and zinc and the total absence in the case of nickel and tin.

Rapid Progress

The non-ferrous metals industry, like the engineering industries in India, got impetus for development during the second World War when other channels of supply were cut off. The progress was rapid and it consolidated its position in the postwar period. The development under the first and second plans suffered to a great extent due to the Government's preoccupation with the setting up of steel plants. Production and capacity in all sections of the industry have expanded continuously, while the manufacture of some new items has been undertaken indigenously since 1950. An idea of capacities in 1956 and at present and production in different sections in 1956, 1960, 1961, 1962 and 1963 can be had, respectively, from Tables I and II.

The growth has been particularly spectacular in the case of aluminium, zinc sheets and strips; aluminium extrusions; brass and copper sections; non-ferrous alloys; aluminium conductors; winding wires; electrical cables; aluminium foils, linings and container sheets. The decline in some sections is attributed to either the expansion plans on hand or the scarcity of foreign exchange enforcing economy in the metallic raw materials; the Government's policy of restricting the use of some metals and the shortages of basic metals.

With the development of indigenous production, the imports of various products declined. Although the entire requirement of finished and semi-finished items, excepting some very specialised ones, could be met from indigenous sources, imports were sometimes undertaken due mainly to the lack of co-ordination between producers and consumers and also due to lack of proper assessment of the requirements. As is the case the world over, imports of primary metals increased with the progress of industrialisation. An overall idea of imports can be had from Table III. The import bill which is placed around Rs. 60 crores now, is expected to be of the order of Rs. 340 crores by 1975-76.

Although the industry in India is, in the main, import-oriented, it is aware of the need for expanding exports. An idea of the exports, which were estimated in 1963 to be Rs. 2.40 crores, can be had from Table IV. Exports are still not sizable, but efforts are being made in this direction. The prospects of exports, however, appear to be slender. except in the case of small quantities of alloys and semi-finished products. The objective of export promotion will, therefore, have to be achieved by exporting household goods and more indirectly by exporting engineering goods all of which consume some amount of non-ferrous metals.

Rising Demand

The consumption of non-ferrous metals in India has been steadily increasing and is sizable in terms of tonnage. It is expected to rise further by the end of the third plan and will increase at a much speedier rate during the next plan period. The estimated demand during 1965-66, 1970-71 and 1975-76 is as follows:

(In '000 tonnes)

	1965-66	1970-71	1975-76
Aluminium	180	260	400
Copper	140	235	300
Lead	67	145	220
Nickel	5	25	45
Tin	8	11	15
Zinc	187	225	350

In 1975-76, therefore, the total demand would rise to 1.3 million tonnes from 900,000 tonnes in 1970-71. The total import bill in 1975-76 may amount to Rs. 340 crores, against Rs. 230 crores in 1970-71. The demand for some non-ferrous metal products is estimated as follows in 1965-66:

	(In tonnes) 1965-66
Aluminium and alloy sheets, circles and strips	40,000
Aluminium and alloy extruded products	10,500
Aluminium foils	9,000
Castings (including cable and electrical accessories)	10,000
Aluminium E. C. rods	68,000
Brass and copper sheets, circles and strips	50,000
Brass and copper rods and sections (extruded)	10,000
Brass and copper pipes and tubes (extruded)	9,000
Copper base alloys and castings	30,500
Lead sheets and strips	2,500
Lead pipes and tubes	3,000
Zinc sheets and strips	7,500

There will thus be a considerable gap between the indigenous production and demand which alone should emphasise the need for developing the primary metallurgical industry at a much more rapid rate. The question whether it should be in the public or private sector is of less importance than expanding it fast by prospecting and proving expeditiously the located deposits of minerals; by accelerating mining, smelting and refining operations; by using the resources and experience of the existing producers and by removing other difficulties. The development of mineral and metal industries in future will depend also on fiscal and other levies. The trend of growth could be speeded up by providing to these industries speeial incentives which are normally available in other countries. These include treating of prospecting and development expenditure as revenue expenditure and charging it against profits during the year or against future profits; depletion allowances of wasting assets; liberal depreciation allowances on mining and smelting plant and machinery; complete tax holiday in the initial years, etcetera.

Inadequate supply and high prices of power add to the difficulties of the industry which is highly power-intensive. While the cost itself is comparatively high, shortages are bound to create graver problems. The whole question of power for metallurgical industries, therefore, needs to be dealt with keeping in mind bulk consumption and the cost. This could, to some extent, be solved if a certain percentage of hydel power which is the most inexpensive in India, is earmarked for these and the question of using middlings for generating thermal power by making them available from coal washeries at nominal prices is favourably considered.

Simultaneously, the removal of transport bottlenecks; simplification of provisions of mineral concession rules; speedy disposal of obligations for the renewal of leases; sanction of leases taking into account the sizes of the plants instead of statutory limit of 10 square miles, etcetera, would considerably contribute to the industry's progress.

Raw Material Shortages

Yet another handicap in the production of primary metal in India has been the non-availability of raw materials as well as machine tools of required quality and in sufficient quantities at competitive prices. This, to some extent, could be removed by undertaking the production of some of the raw materials taking into account the needs of the industry. The processing section which can claim an all-round progress and which now caters not only to the daily household needs but also to various complicated industrial requirements has also experienced a number of difficulties. Main handicaps have been the excess of capacity and the shortage of raw materials.

The manufacturing capacity in some of the sectors had reached saturation points by the beginning of the second five year plan which, in the main, included sheet rolling,

Table I

INSTALLED CAPACITY

Unit: metric tons	**1956**	**1963**
A. *Virgin metals:*		
Aluminium	7,620	53,340

alloying and casting, etcetera, where a good portion remained unused. The survey undertaken by the Government of India of a number of engineering industries, including some of the non-ferrous metal industries, had placed utilisation in 75 industries at below 65 percent and in some of the non-ferrous metals industry at as low as 2 percent.

The Government is aware of the situation and most of the sections have now been included in the list of industries where application for industrial licences under the Industries (Development and Regulation) Act may be rejected without even reference to the Licensing Committee. Yet licences have been sanctioned for the setting up of new units in sections where a sizable proportion of the installed capacities had remained idle. Although it is expected that the capacity should be somewhat in excess of the requirements, in order to create a spirit of healthy competition and progress, idle capacity of the order available in many cases assessed on a single-shift basis cannot be conducive to the economic production and it resulted in wastage of valuable foreign exchange as well as internal resources which could have otherwise been channelised in other directions.

Another factor which has contributed to the under-utilisation and has recently aggravated the problem is the undertaking of captive production by some of the big engineering projects without due consideration to the existing idle capacities in merchant plants and the plants set up in advance to meet the requirements that might arise in future, due to the growth of various engineering industries. The diversification of production by the existing units which could have been done at a much lower capital cost would have also resulted in the use of some proportion of the idle capacity. Yet another factor which has contributed greatly is the encouragement to the small-scale sector without paying attention to the difficulties of the organised sector. This approach not only denied the industry of the economies of mass production but also created apprehension and doubts in its minds as to the advisability of undertaking the manufacture of new items to cater to the anticipated future requirements as well as to specialise in any one particular line.

Large Overheads

The net effect of the under-utilisation is the blocking of large capital investments, particularly foreign exchange, while large overheads affected the competitive capacity of Indian goods in the international market. A detailed consumerwise survey of the big projects coming up should reveal the scope for the diversification of production as well as provide an opportunity to the processing sections of the metallurgical industry to use its resources properly.

The second problem faced for quite some time is the supply of raw materials to the existing units which, to a great extent, is linked with the problem of over-capacity. It is recognised that due to the foreign exchange shortage, the quantity imported is to be limited but if it remains constant, the supply can be increased to one sector only at the cost of the other. The basic question, however, is not only of the shortage of foreign exchange but of the principle itself, as allocations are made not on the basis of requirements of the finished or semi-finished items but on the basis of past consumption and production. It is particularly illogical in an economy like India's where attempts are being made for an all-round development and it is most so in the case of the non-ferrous metals industry which is the feeder industry to all engineering industries.

It is also well known that the prices of non-ferrous metals in the international markets have constantly been rising. The prices were, however, more unfavourable in the U.S.A. and the hesitation of the U.S. producers to offer against D.L.F. aid coupled with the scarcity now faced in that country, has added to the difficulties. These, to some extent, could be solved if scraps were allowed to be imported under the D.L.F. aid which would be of particular advantage to the alloy makers, since it was the international practice to upgrade the scraps and use them for the manufacture of alloys. Linked with the shortages is the question of issue of licences after a considerable period which gains particular importance in view of the acute shortages and non-availability of scraps in the indigenous markets.

Besides these, excise and other fiscal levies is another factor of great consequence to the production and future development of the industry. This, apart from other handicaps caused to the industry due to procedural irregularities, is not uniformly levied throughout the country. The multi-point character of the levy is possibly one of its greatest drawbacks which had pushed up the cost of production and appropriated the benefits of better efficiency achieved over the years. The variations in procedure and an interpretation of different clauses add to these difficulties.

Table III

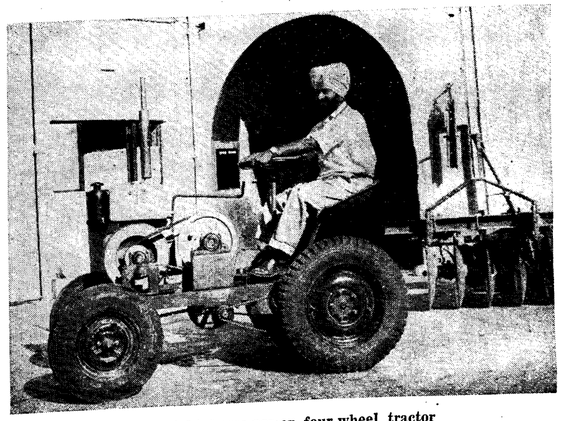
MORE TRACTORS NEEDED FOR FARM MECHANISATION

By



ROLAND C. HEATH

ONE of India's great problems in her desire to save foreign exchange is that she has to start where manufacturers in other countries had started, instead of beginning where they have left off. There are instances of equipment being designed and basic principles being studied and problems being faced which have already been ironed out by manufacturers in other countries. It would seem that Government policy often demands this, although it is penny-wise and pound-foolish. This does not necessarily apply to the manufacture of tractors, but it does to ancillary equipment. The slogan for India should be "mechanise or die". But in producing more tractors, manufacturers should ensure that adequate servicing facilities are provided to keep pace with the increased tractor population. It is useless, however, for farmers to complain of the shortage of tractors and blame the manufacturer because, at the moment, manufacturers, with the exception of two, exist only on paper and even these two have been unable to achieve their production targets because of their inability to secure the necessary phased components from outside to complete their manufacturing programmes. The following are some of the reasons hindering production:

(a) There is a shortage of raw materials to produce the high-grade components which are required for manufacturing a tractor.

(b) Due to the continued import of tractors from varied sources, concern has been created in the minds of manufacturers about the lack of protection for their investment by the Government.

(c) The Government has been hesitant in giving licences to private companies who are willing to proceed immediately with manufacture and who possess the knowledge of handling agricultural machinery and industrial know-how. Considerable loose thinking has been going on for a number of years on the manufacture of what is named as the power tiller. They are in fact two-wheel tractors, but because of the name given to them, a number of organisations have been or will be licensed to make them. These two-wheel tractors will be ideal for wet cultivation, but their use under dry farming conditions will be disadvantageous for two reasons. Firstly, the operator takes the whole of the torque reaction and the two-wheel units under dry conditions are harder to manipulate than a pair of bullocks. The margin available in terms of discount or commission is such that the possibilities of service to the farmer will be limited. In relation to the workload, the whole unit is unlikely to stand the rigours of dry land cultivation.

An eight horse-power four-wheel tractor

Use of Trailer

Secondly, unless this piece of equipment has a suitable arrangement for trailer and this attachment is made available, the farmer will have to keep his bullocks for transportation and will thus derive little advantage from mechanisation.

There are 40 million farms in this country, and the total number of tractors is of the order of 40,000. The progress is indeed poor. India should be absorbing approximately this figure a year. But this will mean large imports which will cause a very serious drain on foreign exchange and, therefore, some long-term policy for manufacturing tractors must be considered and implemented. Mechanisation of India's agriculture is a "must" if the country aspires to raise agricultural production.

To rely on the public sector for everything is both unnecessary and uneconomic. It is also unlikely to lead to any concrete result. Not because the people associated with it or working in it are not capable, but because the form of the organisation does not create a sense of urgency and enthusiasm. The future of mechanisation of Indian agriculture must be in the hands of private enterprise with assistance from the Government in the form of extensive loans to every farmer who applies for them, irrespective of his acreage. These loans should be long-term ones.

The total production in India of agricultural tractors last year was under 2,000 and the prospects of a large increase this year is extremely remote. The reason is that the problems of the manufacturer are not either understood or if they are, assistance required is not forthcoming.

There is no doubt a demand for two-wheel tractors for wet cultivation. There is also demand for a small tractor of 8 to 12 horse-power, a tractor of 12 to 18 horse-power, 25 horse-power, 35 horse-power and 45 horse-power, and also a 60 horse-power track-laying tractor. The present writer's estimated figures in terms of requirements are as follows:

Power tiller for wet cultivation	10,000
8 to 12 H.P. four-wheel tractor	25,000
12 to 18 H.P. four-wheel tractor	10,000
25 H.P.	5,000
35 H.P. tractor	3,500
45 H.P. tractor	1,000
60 H.P. track-laying tractor	Between 250 and 350

How is one going to get these produced? There is oniy one sensible way of doing this and that is to benefit from the experience of other countries. Why must India always carry out experiments and go through all the troubles and problems that other countries have had instead of starting basically where they have left off? One does not know.

A prototype of an eight horse-power two-wheel tractor

The right thing to do is to encourage production by any company or organisation with the right financial backing and experience in handling the import, distribution or servicing of agricultural machinery. They should be allowed to import components up to 60 percent of the value of each tractor to a figure to be agreed upon for the first two years. In the third year, they should be allowed to import 30 percent of components and raw materials and the balance of 30 percent during further two years. After this, raw material should only be allowed to be imported and nothing else.

Commercial Production

One would find that there would be quite a rush to produce some type of tractors and such men would either live and prosper or they would go out of business. One would, by this means, find a normal commercial economic level at which tractors would be produced at reasonably economic price in the quantities that they are required. Things like this always find their own level and in view of the urgency and the colossal demand for mechanised farm equipment, India should choose this way. It does not really matter at this stage whether or not the capacity in the country on paper is for a million tractors a year; nobody is going to produce them if they cannot sell them. Nobody is going to invest in a project if it is not profitable.

A lot of criticism has already been levelled at the manufacturers or part manufacturers of tractors. It should be realised that it is far more simple to produce a motor-car or a stationary engine than it is to manufacture tractors. The rolling resistance on most farming equipment is extremely high or non-existent, and the stresses that are set up on the land vary from every foot that it travels when cultivating. So design problems, steels, grades and qualities are of vital importance if the tractor is going to

stand up under normal farming conditions.

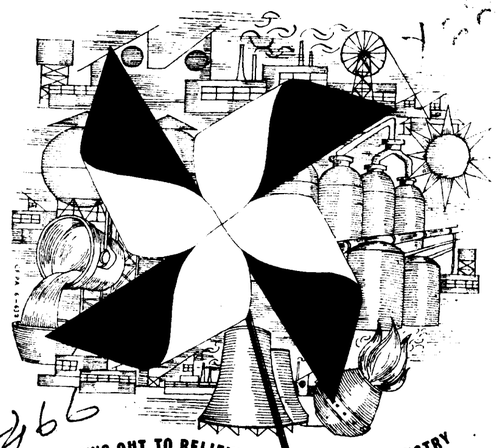
Basic Equipment

One of the most important farming operations in India is sub-soiling, particularly in Punjab. This cannot be undertaken under any circumstances by animal power. All farms should have certain basic equipment according to the size suitable for the holding, that is to say, tractor, plough, trailer and belt pulley. Pools should be established at various strategic positions throughout the States by either Government or private enterprise through contractors from which farmers might hire, on a day-to-day basis, such auxiliary equipment as threshing machines for rice and other cereals; shellers for maize; binders and mowers for harvesting; seed drills; seed cleaners and winnowers; and barn machinery such as chaff cutters, hammer mills and grass deriers.

The development of agriculture and high productivity of primary produce in such countries as Australia, America and Canada were not achieved without financial investment by the Governments of these countries. Land grants were made available to the farming community and substantial loans were given to farmers (by the Government, rural banks and finance houses) to enable them to develop their agriculture.

India must do the same, although in this country legislation, under which farmers are protected in so far as collection of any debts incurred by them are concerned, preclude the granting of loans by any bank, insurance company or finance house. Therefore, financial assistance to the farmers of India will have to be made available through a Government organisation run on commercial lines, and working in close co-operation with the Revenue Department.

It is also vitally necessary for hire-purchase facilities to be made available to the farming community as quickly as possible. This should be done through an "All-India Rural Credit Corporation". A sum not exceeding Rs. 50 crores would be sufficient to cover all expenditure and commitments. It should help to operate an adequate hire-purchase scheme on the following lines: When a rural credit corporation is set up, a recognised bank should be appointed as its all-India agent, and all financial arrangements in connection with the purchase of agricultural machinery and equipment should be made through that bank. (In the first instance, the facility or loan should be restricted to a maximum of Rs. 10,000 a farmer.)

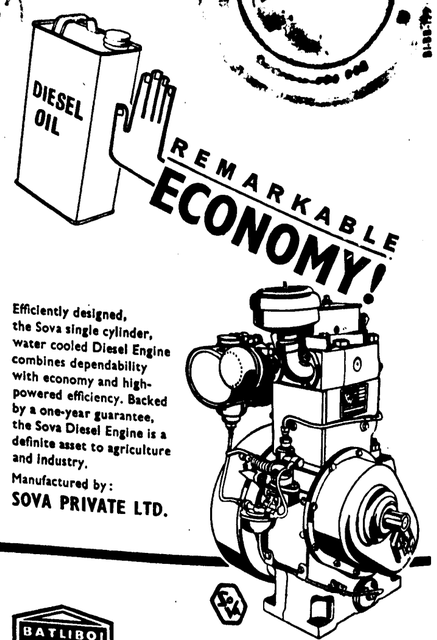


Filling in Forms

First of all, farmers would be required to fill in a form declaring the extent of their holding, their assets, situation and crops grown, etcetera, and before any further action is taken, this form should be sent to the Revenue Department which would be required to certify that the information it contains is correct. After scrutiny and acceptance, the form would be returned by the Revenue Department to the farmer concerned with instructions that he should now present it, together with a *pro forma* invoice from a dealer licensed by the Government to trade in agricultural machinery, to the bank acting as the agent of the rural credit corporation. This bank would thereupon execute an agreement as between the farmer and the corporation (such document incorporating not only the customary clauses and undertakings usual in transactions of this description, but providing also for full insurance coverage, etcetera). On completion of the formalities connected with the execution of this hire-purchase agreement, the bank would authorise the farmer to purchase the equipment specified in that agreement and would at the same time give him a voucher addressed to the dealer whose *pro forma* invoice has been accepted and from whom the equipment is to be purchased. This voucher would constitute an order to supply the equipment. On completion of delivery in accordance with the instructions given by the bank, the dealer would present the voucher—together attached documents including farmer's written acknowledgmen correct receipt—to the bank payment.

When the entire transaction been completed, that is to say, fication of the correctness of for declaration, execution of the purchase agreement, collection of initial instalment, delivery and ment of machinery, the bank w forward the hire-purchase agreem and connected documents to the credit corporation, whose respon lity it would be to collect subsequent instalments with the operation of the Revenue Departm which would have first claim o debts.

The equipment would of course main the property of the rural c corporation until full payment been effected by the hire purcha and the corporation would of co enter into a separate agreement the dealer concerning service during the hire-purchase period.



What would be achieved thr this new approach and encouragem to mechanisation? The coun agriculture would have been m nised and it would have been the opportunity of producing food at less cost and at a price all could pay.

FANNING OUT TO RELIEVE THE STRAIN ON INDUSTRY

The history of Calcutta Fan, pioneers in the ventilation, is a mirror of their growing to the industrial progress of India. The best of SKILL AND RESOURCES were harnessed Engineers to solve diverse problems of industrial Barauni, Durgapur, Rourkela, Belpahar, Perambur, Alwaye, Trichinapalli, Bangalore. The wide range of Calcutta Fans so superior in performance can relieve the strain on any field of industrial contribution INDIGENOUS by Calcutta Fan ventilation—at Jamshedpur, Hirakud, Bhadravati etc. design and industry.

WE CAN DESIGN AND BUILD PLANTS FOR THEM ALL AND OTHERS ON TURNKEY BASIS

Progressive expansion and diversification into many fields of heavy and medium engineering has long been the order of the day at Simon-Carves. Throughout the world Simon-Carves have designed, built and commissioned industrial undertakings for many purposes. In India Simon-Carves have already made a substantial contribution to the country's industrial progress and have a number of "Firsts" to their record.

The recently formed Indian Company is well equipped to carry the tradition of Simon-Carves in India. Having available the long experience and specialised 'know-how' of the member companies of the Simon Engineering Group and of other overseas associates, Simon-Carves India Ltd. can offer a wide range of Industrial and Chemical plants on a turnkey basis, if required.

Being well equipped and experienced in general engineering "SCIL" can provide a complete engineering service for managing and engineering any type of project to clients' requirements.
