THE RESOLUTION on the food situation passed by the All-India Congress Committee at Guntur was, in line with similar past resolutions, uninspiring in the sense that it threw no new light on the subject. All that it did was to endorse the official policy regarding the fixation of the producers' prices, the decision to establish a foodgrains corporation and the imposition of an ordinance to punish the profiteers and the corrupt colluding officers. Realising that these steps were not sufficient, Mr. C. Subramaniam, the Union Food Minister, announced that "a final shape would be given to the food policy at the meeting of the Chief Ministers in Delhi on November 17 and 18." At a time when distress signals are being received from various parts of the country — and food riots have been reported from Kerala — to continue to postpone the taking of vital decisions is a symptom of indecision which is likely to aggravate the position still further. The tangle between the surplus and the deficit States still remains to be resolved, the surplus ones refusing to surrender a sizeable portion of their produce. Great reliance is now being put on the next bumper harvest, though Mr. C. Subramaniam hastened to caution the members that the relatively improved crop is not likely to ease the situation altogether and that the Government would have to evolve a food policy extended over the next four or five years.

As was expected, the Chinese blast of the atom bomb created a sharp division in the party on the question of nuclear armaments and there was a strong section which wanted the country to join the nuclear armament race. A firm declaration by the Prime Minister that India would in no

circumstances manufacture or use the atom bomb sealed all speculation and criticism. The resolution on foreign affairs was passed unanimously and all amendments to it were withdrawn. Most of the leading Congressmen participated in this debate and laid stress on the moral commitment of this country to the policy of peace and non-violence, which could not be reversed because it would amount to betrayal of the policies laid down by Mahatma Gandhi and the late Prime Minister, Mr. Jawaharlal Nehru. Moreover, the atomic race involved stupendous expenditure and the country was not in a position to afford such vast sums for the manufacture of the atom bombs. Great reliance was put on arousing the conscience of the world through UN against the manufacture of nuclear weapons not only in China but in other countries as well.

At the concluding session of the All-India Congress Committee, some non-official resolutions were also discussed, the most important being the one relating to a ceiling on urban property. Some of the members stressed a ceiling on urban property on the analogy of the ceiling imposed on agricultural land. The amended resolution stated that "suitable legislation be enacted to introduce a ceiling on urban property commensurate with the ceiling imposed on agricultural land in terms of the election manifesto of 1962."

EVASION OF TAXES

IN A PRESS Conference at New Delhi last week, the Chairman of the Direct Taxes Board, Mr. J. P. Singh, outlined the measures which the Government had decided to take in order to catch the tax evaders. Broadly, there are two kinds of

(Continued from page 913)

the UK and the USA, it should be pointed out that Section 37(1) of the Indian Income Tax Act permits the deduction of payments to political parties for computing the chargeable income. This has the result of reducing the tax receipts to Government along with an increase in the contributions to political parties by companies. Since the rate of company taxation changes every year and the deduction of contributions to political parties affects the highest tax slab of the income of companies, it is always possible for the Government in power, by increasing the tax rates at the highest slabs during the pre-election year, to increase company contributions to political parties.

In the United Kingdom there has never been any legal or other restriction on political contributions by companies. The Labour Party in the UK which has been returned to power is, however, pledged to change company law so as to require the disclosure of companies' contributions to political party funds. When the payments become open, according to them, it will be subject to taxation. In India, by Section 293A (2) of the Companies (Amendment) Act, 1960, "Every company shall disclose in its profit and loss account any

amount or amounts contributed by it under sub-section (1) to any political party or for any political purpose to any individual or body during the financial year to which that account relates, giving particulars of the total amount contributed and the name of the party, individual or body to which or to whom such amount has been contributed". By disclosing the amount in the Profit and Loss Account, we are already ahead of Company Law in the UK.

On the other hand, in the USA there is a total ban on contributions to political parties by corporate bodies and restrictions on these by individuals in several States. This, in some cases, has led to indirect transfers of corporate monies to political parties in several ways and it cannot be said that the legislature has fully succeeded in its objective.

In conclusion, it is possible to argue that the cause of clean politics as well as clean business may perhaps be best served in this country not so much by banning or even by restricting further corporate donations to political funds as by legislating for the full and open admission and accounting of such receipts by the political parties concerned.

SUMMARY TRIALS

THE PRIME MINISTER, Mr. Lal Bahadur, had promised at the recent meeting of the National Development Council that summary trials of profiteers in foodgrains and other essential commodities and the corrupt public servants would be instituted without much delay. The President has now promulgated an ordinance to amend the Essential Commodities Act, 1955, and the Criminal Law Amendment Act, 1952, in order to arm the executive with powers for summary trial of dealers and public servants for listed offences under the Essential Commodities Act. The ordinance has provided for the maximum sentence of imprisonment of one year. The most objectionable part of the ordinance relates to the summary trials of alleged hoarders and profiteers who have not been given the right of appeal against a sentence of imprisonment not exceeding one month or a fine not exceeding Rs. 2,000. The ordinance has empowered all Magistrates (First Class) and Presidency Magistrates to try "in a summary way" all offences relating to its contravention.

Apart from the fact that the ordinance is likely to breed corruption, it has a number of other defects. It has, for example, failed to define a profiteer and, at the same time, it has violated the basic tenet of the Constitution which guarantees freedom to the individual to follow his profession. It amounts to denying the "rule of law" to the citizen. While the problem of shortages in foodgrains and other consumer goods will be solved only through increased production, the ordinance has further accentuated the situation in discouraging the normal channels of distribution to be able to function in a routine fashion. The fear of being hauled up and sentenced summarily is in itself a deterrent and will stand in the way of all the traders extending their activities. Reduced volume of activity will have an unfavourable effect on supplies, thus leading to further hardship to the consumer.

Wide Powers

The ordinance will apply not only to the dealers in foodgrains, but also to the dealers in edible oil and oilseeds. It will rope in not only the dishonest traders but the delinquent and corrupt officials also who operate in their nefarious activities in collusion with the traders. The Magistrates who have been given these vast powers will have to use them with caution so as not to cause harassment to honest and law-abiding citizens. There is considerable scope for mischief in the case of summary trials and its successful operation in the national interest rests on the degree of caution which they are able to observe.

The new controls on distribution have imposed certain burdens on the traders especially those relating to maintenance of accounts. Because of the harsh nature of the new ordinance, it is in the interest of the traders to maintain these accounts properly even if it enhances their costs. At this hour when the country is passing through a food crisis, the traders must act patriotically and extend their full co-operation to the Government in maintaining the price level and even to reduce the profit margins. In its present mood the Government will unmistakably deal with a heavy hand any trader or public servant who refused to behave. There are reports of a bumper food crop in the next harvest and as when foodgrains start flowing into the markets, prices will sag, making the rigorous ordinance useless and without purpose. Till that time the traders will have to conduct their business cautiously, putting up with the harshness of the ordinance which, no doubt, will be on the Statute Book for a short period only.

tax evaders. To the first category belong those who have taxable incomes, but have so far not been brought into the network of the taxing machinery. The second category is of the assessee who do not disclose their true incomes and, thus, are able to evade a part of the taxes due to the Government. Taking both these categories together, the volume of evasion is variously estimated — one estimate puts it at more than Rs. 200 crores per annum. Wild guesses apart, there is no denying the fact that there has been some tax evasion in this country though nobody can vouchsafe with confidence the approximate level of this anti-national activity. The Government is, no doubt, justified in its efforts to track the evaders down, but in its search for tax evaders the activities of the Tax Department have bordered on witch-hunting.

Searches and raids on the basis of suspicion have been intensified and given wide publicity in recent months. Mr. Singh stated that these activities were being intensified; higher incentive was being offered to the people who would give information leading to the detection of large-scale evasion. Hitherto, the reward to such informants was only 2.5 per cent of the extra tax realised, but it will now be raised to 7.5 per cent of the additional tax realised by the Government. In certain cases where the informant has taken extraordinary risk for securing the information, the reward may be raised to 10 per cent of the additional tax realised. The reward will not be subject to income tax and all efforts will be made to keep the identity of the informant a secret. The Commissioner of Income Tax will be empowered to sanction as a reward upto Rs. 10,000 without any reference to the higher authorities.

Door to Door Survey

One of the methods adopted by the Department to trace the tax evaders is to conduct door to door surveys and in this regard some progress has been made in the big cities. The Ministry of Finance is confident to track down not less than 5,00,000 new assessee during the current calendar year as it has already spotted not less than 3,50,000 new assessee. An assurance has been held out that the Income Tax Department would be lenient to all such people who make voluntary disclosures of their concealed incomes. The Department would be lenient in regard to the penalty and no prosecution would be launched against such people.

It was revealed at this Conference that the recent searches and raids organised by the Department had yielded about Rs. 93 lakhs of concealed income. It was in the shape of jewellery, ornaments and cash. The total number of such searches so far conducted was 60. The enthusiasm for these searches, according to Mr. Singh, had not abated. He said that the Department had, on the other hand, intensified its activities, the only change being that under the instructions of the Ministry, publicity of these raids had been reduced.

Mr. Singh also pointed out that tax administration and legislation had undergone some drastic changes in the current year's Finance Act, giving the Department powers to bring the tax evaders to book. The secrecy provision in the Income Tax Act had been abolished and the provision relating to imposition of penalty for evasion of taxes had been tightened. If an assessee under-estimated his income by more than 20 per cent as assessed by the Department, the onus for establishing that the under-estimation was not deliberate now lies on the assessee.

While it is to be conceded that evaders of income tax should be brought to book, the activities of the Department should not lead to unnecessary harassment of the people.

WINDOW ON THE WORLD

Britain's Import Cuts

PAUL BAREAU

LONDON:

THE FIRST ten of the first hundred days in which the Labour Government was to change the economic face of Britain have not been altogether reassuring. The bustle and activity have been impressive. More than a hundred ministers have been appointed, a total never before reached in British history. A large number of experts and economists, some of them highly controversial, have been brought into the Government machine from outside. But as regards deeds, the record so far is not particularly impressive.

The scope for action was admittedly restricted and defined by the vast balance of payments gap which the new Labour Government found on its ministerial doorstep. The latest estimates make it "not less than £700 million and perhaps £800 million for 1964" and smaller, though still quite unacceptably large for 1965. This is no compliment to the previous Conservative administration. It reveals real shortcomings in the art of timing its economic moves.

It is without a doubt the price which the country is paying for postponing the election from June to October and thus creating a period of four months during which every instrument of economic policy was necessarily put in neutral gear. The size of the deficit, the strain which it had put on the gold and convertible currency reserve and the extent to which it had already compelled Britain to borrow from other central governments, made it absolutely necessary to take measures that were both severe and quick acting.

The immediate initiative falls under two heads. The first is a modest subvention for exports. This takes the form of the right given to exporters to reclaim from the revenue an appropriate proportion of the amount paid by them in certain excise taxes. This will come as a welcome bonus to firms which are already heavily involved in export trade. It is unlikely to be sufficiently attractive to induce many smaller firms to leave the lush pastures of the domestic market for the much tougher going abroad.

Drastic Effect

The major item in the measures is, however, the special 15 per cent import duty. Its effect on the balance of payments is expected to be drastic. The estimate is that it will cut our import bill by £200 million in a full year. This may be severe and even brutal but the brutality has been reserved almost exclusively for our foreign customers. The storm of resentment and complaint that has been stirred up by this can be readily understood. No country with which we trade is protected from this initiative — not even countries like India whose modest exports of manufactured goods will have to

bear the new duty. The main victims are the industrial countries of Europe and North America. In the case of the six countries of the Common Market, no less than 60 per cent of their exports to Britain are affected.

What has sharpened the edge of foreign criticism is the fact that these increases in import duties constitute a technical breach of a number of international agreements including the General Agreement on Tariffs and Trade, the convention of the European Free Trade Association and a number of Commonwealth trading agreements. The GATT, the basic document, allows a country in balance of payments difficulties to protect itself for a time by introducing quantitative restrictions on its imports but subject to some form of prior consultation. Great Britain has thus breached the agreement in two respects. It has introduced an across-the-board tariff surcharge which is not specified in the GATT escape clause. Furthermore, it has done so without apparently indulging in any prior consultation but facing all countries concerned with the "fait accompli". The first of these technical breaches can be excused. It arises from the fact that when the GATT was written quantitative restrictions were the only effective measures by which countries in balance of payments difficulties protected themselves. The tariff surcharge is in fact a much fairer and less discriminatory way of achieving the same objective and were the GATT being rewritten today the relevant clause would no doubt be adjusted.

Serious Breach

It is the second breach which is the more serious. It has rubbed salt into foreign wounds. It has already aroused a violent wave of complaints from our trading partners in the Common Market and EFTA. It may well undermine the cohesion of EFTA and encourage its members, some of whom have already been flirting with the Common Market, to join that community and leave Britain in splendid isolation in Europe.

What makes this offence to our foreign customers more immediately threatening is the fact that we depend on them for financing a part of our deficit. Already Britain is reputed to have borrowed more than the equivalent of £150 million from European and the US central banks under the so-called swap arrangements. These loans must be repaid in the very near future. In the normal course they would be repaid by drawing on our standby credit with the IMF. A difficulty has however arisen. The Fund is not altogether satisfied with the assurances given by the British Government about the method by which it proposes to deal with the balance of payments deficit.

Moreover, the currencies which Britain needs to borrow

Each of the symbols above represents an industry in which McKee-WKE engineers have a successful record of long, world-wide experience. In the highly competitive field of engineering and construction, McKee has long maintained a leading position by providing advanced design, thorough, efficient engineering and sound, practical construction. The results of McKee engineering and construction services are reflected in the operating efficiency and economy of plants and facilities throughout the world. McKee-WKE engineers can produce equally valuable results for India's steel industry.

are the German marks, French francs, Dutch guilders, Italian lire, etc. which must be provided by the countries which have taken greatest offence at the new import duties. Those currencies will have to be provided under the General Agreement to Borrow by which the ten most important countries in the IMF set up a special fund equivalent to \$6 billion. Under that agreement the countries which lend retain the right to exercise some supervision over the manner in which their credit facilities are used. Britain, therefore, is not wholly certain that credit facilities that will enable it to finance its continuing deficit will be readily forthcoming.

The main objection to the Government's measures lies, however, in their likely impact on the domestic economy. Increased protection will make the domestic market still easier

and more attractive for British industry. This is decidedly not the way in which the edge of our competitive efficiency can be further sharpened. Rather will it be blunted if this 15 per cent surcharge endures for any length of time.

The final verdict on these measures cannot, therefore, be wholly favourable. Drastic initiative was justified by the nature of the emergency that had to be met. But that justification will only endure if supplementary steps are taken that will make it possible to withdraw rapidly this damaging protection of British industry and the domestic market. In any case the measures, however temporary and justified, should have been brought into operation with a great deal more tact and consideration for countries on whose financial support we are at present depending.

Voters Endorse Johnson Economic Policies

GUY SIMS FITCH

WASHINGTON:

IN THE usual post-election parlance, President Lyndon B. Johnson has received a mandate from the American people. This means that the policies of this administration, and those of the late President Kennedy before him, have won overwhelming popular approval. Much of this approval undoubtedly stems from recognition that the American economy is in good shape. The economy, which was lagging when President Kennedy took office in January 1961, has been moving ahead for more than three and one-half years. Jobs and incomes, profits and purchasing power have been climbing to ever-higher peaks, and the fruits of this sustained and dramatic growth have been widely shared among the people.

This has not been the result of accidental good fortune. Well-timed and carefully formulated public policies, coupled with responsible action by private capital and labour, have helped release the nation's tremendous productive forces, bringing United States closer to realizing its ever-growing economic potential. In voting for President Johnson, and for his Vice-Presidential running mate, Senator Hubert H. Humphrey, the American electorate was in effect accepting this view of the socio-economic system. It is not a planned, totalitarian system, nor is it 'laissez-faire' system in which impersonal market forces alone determine economic performance.

What the electorate was ratifying is the healthy combination of private initiative and public co-ordination which has been evolving in the United States for more than 30 years in its own peculiarly pragmatic way. This combination has endowed the nation with the vigour and flexibility to grow economically and to adapt to changing conditions and requirements—in technology, in urban and rural development, in social relationships, in world affairs, in everything that goes into the making of a modern and enlightened society. In this system the American people have been able to do more than achieve unparalleled levels of prosperity, important as that may be. They also have been able to aspire to ever-widening horizons of personal fulfilment and well-being.

Fiscal Policy

In more specific terms, economic issues once considered controversial have been winning increased acceptance by an informed public opinion. Perhaps the outstanding advance in the past four years of the Kennedy and Johnson administrations has come in the realm of fiscal policy. No longer, for instance, is a balanced budget considered "prudent" 'per se'. In voting for President Johnson, Americans were in effect expressing their approval of a major tax cut even in the face of an unbalanced budget. This cut went beyond earlier thinking in that it was not aimed at countering a recession—which did not in fact exist. It was designed openly to stimulate further the growth of an economy which, despite its gains and

its acknowledged pre-eminence, still was operating below its capacity and was not utilizing fully its manpower and material resources. Such a course would have been unthinkable, except perhaps to some of the experts, even a decade or two ago.

In a larger sense, when Americans were casting the r votes for Mr. Johnson they also were casting their votes for the concept of what he has called "The Great Society." This is a society in which public policy and private activity would work together to achieve ever-rising standards of living for the people, in which want would finally be eliminated, in which every person would have a chance to play a productive role free of any remaining shackles of discrimination because of race, creed, colour or other factors extraneous to American ideals of equal justice and opportunity for all.

This concept is not confined to purely domestic interest. In supporting President Johnson, Americans also support that aspect of the great society which sees the United States continuing to play a responsible role around the world through expanded programmes of international co-operation.

Eastern Economist 20 Years Ago

NOVEMBER 17, 1944

With the prospects of an early end of war, at any rate in the European theatre, looming large, Britain is already turning her attention for the resumption of an export drive at the earliest. With her deteriorated international economic position, she reckons that her exports must be stepped up at least 50 per cent above the pre-war level in order to enable her to have an undiminished volume of imports. At the same time, on account of the inexorable demands made by total mobilization for war, she has been unable to spare sufficient man-power and resources for export industries, and it is estimated that her exports have declined by 60 to 75 per cent during the war. On the other hand, there has been a large increase in the exports of the United States, apart from lease-lend aid rendered during this year and already she is making massive plans for partial diversion of resources for ordinary commercial purposes. This has led to an insistent demand in Britain that her Government should also plan ahead and responsible quarters have urged that "the moment has been reached when industry must be given an idea of the future in general terms and when moreover it should be allowed the staff and equipment to undertake at least the first stages of market research, design and in the engineering field, prototype for work".

LISTENING POSTS

The State and the Food Trade

By Our Special Correspondent

NEW DELHI:

THE UNION Government has decided to rename the proposed Foodgrains Trading Corporation as the Food Corporation of India so that, when necessary, its scope may be widened to deal with foodstuffs other than foodgrains. Legislation for the establishment of FCI is expected to be introduced early in the ensuing session of Parliament.

The available details of the bill to be introduced in Parliament suggest that the Union Government will have complete control over FCI. It will nominate its Board of Directors, consisting of a Chairman, a Managing Director, three directors representing the Union Ministries of Food, Finance and Co-operation, the Managing Director of the Central Warehousing Corporation and six others. The Secretary will also be appointed by the Union Government in consultation with the Board of Directors of the Corporation. The broad policy to be followed by FCI will be laid down by the Union Government. If any doubts arise on whether an issue is policy matter or not, the decision of the Government will be final.

The headquarters of the Corporation will be at Madras. Its entire capital — Rs. 100 crores to begin with — will be provided by the Indian Government. The legislation will empower FCI to set up subsidiaries in States. The capital of these subsidiaries will be made available by FCI or the Union Government. The management of State corporations will vest in boards of managements whose members will be appointed by FCI in consultation with the Union Government and the State Governments concerned.

★ ★
The U.S. Agency for International Development (USAID) is understood to have informed the Union Government about its decision to extend credits to the tune of \$8.5 million for the Ramgarh coalmine-cum-washery project. No decision, however, has yet been intimated on the request of the Government of India for extension of loans by USAID to cover the foreign exchange component of the cost of implementing four other coal mining projects, namely Singrauli I, Umrer, Singrauli III and West Bokaro.

Following the indication given by USAID about the Ramgarh coalmine-cum-washery project, the Union Ministry of Steel and Mines has asked the State-owned National Coal Development Corporation to go ahead with the implementation of the scheme. The project report prepared by an American firm for this development programme has already been approved by the Ministry.

Meanwhile, utilisation of the Rs. 16.67 crores loan made available by the World Bank for allocation to private companies to meet their foreign exchange requirements for import of machinery to carry out the programmes of expanding existing facilities and opening new mines for increasing their annual production from 44 to 61 million tons during the third Plan period, is understood to be picking up well. Up to September 30, 1964, import licences under this loan had been issued for an aggregate amount of Rs. 19.03 crores. Licences for Rs. 2.65 crores, however, have since been cancelled. Orders have been placed for imports by collieries involving a total amount of Rs. 14.71 crores. More import licences had been

issued than the loan available as about 10 per cent of the licences granted were not expected to materialise.

With a view to fully utilising this World Bank loan expeditiously, the Union Ministry of Steel and Mines invited fresh applications from the industry in August last. The response is stated to have been encouraging. Applications seeking import licences for an aggregate amount of Rs. 1.41 crores had been received by the Coal Controller by August 31. The feasibility of acceding to these requests is being considered.

★ ★
The fourth blast furnace under the Bhilai steelworks' third Plan expansion programme is expected to be commissioned into production this month. The latest indications confirm that the expansion of the Bhilai steelworks to 2.5 million tonnes ingot capacity will be completed by the end of the current Plan period.

Production in the various sections of the Durgapur steel plant is picking up very encouragingly. The rated capacity or near-rated capacity outputs were obtained at this plant in the coke ovens and blast furnaces last month. The pig iron casting machine exceeded the rated capacity and the output at the steel melting shop reached 91 per cent of the capacity. The merchant mill gave an outstanding performance and was working well over the rated capacity. The section mill covered a wide range of sections and achieved several new day and shift records. The output of the sleeper plant also showed marked increase during October over the previous month. The despatch of pig iron at 48,427 tonnes was the highest achieved so far.

The following were the outputs of the various sections of the Durgapur steel plant in October, 1964: Coke 128,610 tonnes; Hot Metal 109,290 tonnes; Pig Iron Casting Machine 45,404 tonnes; Steel Ingots 76,164 tonnes; Merchant Mill 23,700 tonnes; Section Mill 15,778 tonnes; Sleeper Plant 6,059 tonnes; Despatch of salable iron and steel products 106,830 tonnes; Total Despatches 113,000 tonnes.

★ ★
The Union Government is understood to have decided to raise the ceiling rates of additional duties on petroleum listed under the Mineral Oils (Additional Duties of Excise and Custom) Act and to add lubricants, asphalt and bitumen to the list. A Bill to amend the existing Act is expected to be introduced in the Lok Sabha during the ensuing session.

The need to amend the Act has arisen as the present ceiling rates of duties in the case of most of the products have already been reached. The raising of the ceiling rates will enable the Government to mop up additional earnings of the oil refineries resulting from any further decline in the posted prices of petroleum products as well as in freight rates.

★ ★
The Barauni refinery, the first one million tonnes crude throughput capacity and the first stream of the kerosene refining unit of which went on stream a couple of months ago, will be formally inaugurated by the Prime Minister, Mr. Lal Bahadur, on January 15 next. The second one million tonnes atmospheric vacuum unit and the second stream of the kerosene unit of the refinery are expected to be completed by the first quarter of 1965. The lubricating complex, which will produce 40,000 tonnes of lubricating oils, will be commissioned

by September next. The refinery is expected to reach three million tonnes throughput capacity by the middle of 1966. The Union Ministry of Petroleum and Chemicals, it is learnt, has decided in principle to set up a fertilizer factory near the refinery.

The Union Cabinet last week approved the proposal of the Ministry of Petroleum and Chemicals to set up a 2.5 million tonnes capacity refinery at Haldia. Work on this refinery will start by the middle of next year so that it can be commissioned into production by the end of 1968.

The offer of the National Iranian Oil Company and its US partner, the American International Oil Company, for collaboration in setting up the 2.5 million tonnes capacity Madras refinery has been approved in principle. Further negotiations are now envisaged with NIOC and AIOC to thrash out the details of the collaboration agreement and to iron out some outstanding differences on the crude oil price and the financial arrangements proposed. This refinery is expected to be brought on stream by the end of 1967.

★★
The informal Working Group set up by the Government of India in March last to examine the extent of the variation between the data of the Directorate-General of Commercial Intelligence and Statistics and the Reserve Bank of India, has presented its report. The Group consisted of the representatives of the Ministries of Finance, Commerce and Industry, with Dr. Pinto of the Reserve Bank of India as Chairman. It had also been asked to review the present arrangements for the compilation of trade and payments statistics with a view to improving them.

The Working Group, in its report, has set out at length the basis and methods of compilation of the custom and exchange control data in order to show the reasons for the differences, some of which are inherent in the respective systems of recording the data. It has been recognised that differences in the two sets of data cannot be eliminated completely as there are built-in peculiarities which centre round the manner in which exports and imports are recorded by the two agencies. It has been pointed out that all comparisons for short

periods would be misleading and should not be attempted. The major factors for the differences relate to territorial coverage, merchandise transactions by parcel posts exports for which there is a waiver of G.R. forms formalities, imports which do not involve payment, re-export, non-cash investments, imports under note-pass system, valuation, difference in the coverage of commodities, consignment exports, timings, conversion rates, etc.

The report contains important recommendations for narrowing down the area of differences between the two sets of figures to the maximum extent possible. These recommendations are now being studied by the Government.

★★
An agreement has been signed between the Governments of India and Canada concerning the construction of Stage III of the Kundah Hydro-electric Project in Madras. Under this agreement, the Government of Canada will contribute a sum not exceeding \$22.2 million (Canadian) to meet the foreign exchange component of the cost of constructing three additional power houses with a total installed capacity of 190,000 kw., the addition of an extra generating unit in each of the two existing power houses to increase their combined capacity by 55,000 kw., the construction of additional storage and diversion works in the Kundah river and its tributaries, and the erection of transmission lines and sub-stations.

In 1956, the Government of Canada assisted in the construction of Stages I and II of this project and contributed a sum of \$22 million (Canadian) for meeting the foreign exchange component of their costs.

The Government of Canada has also agreed to the use of rupee counterpart funds generated by the sale of commodities received from Canada under the Colombo Plan to the extent of \$5 million for the first two stages and \$25 million for the third stage of the project.

★★
An agreement envisaging drawing up of the project report for the Korba aluminium plant by Hungarian experts is expected to be signed towards the end of this week. The Hungarian experts are stated to have completed their survey of the plant site.

Private Sector : A Positive Role in the Economy

From Our Correspondent

BOMBAY:

THE PRIME Minister, Mr. Lal Bahadur, has come and gone after a brief three-day visit. He re-erred to the food problem at almost all his meetings. While not minimising the gravity of the situation, he assured the people that the Government would take all the necessary steps to meet the food requirements of the people. Putting the problem in proper focus, he said that food was the first and foremost problem staring the country in the face and that its solution would mean solving three-fourths of our problems and also stabilising our economy. It is a measure of the degree of firmness of the Prime Minister that, in spite of the very good foodgrains crop prospects in the current year — nearly 88 million tons, according to unofficial estimates — and the free availability of US wheat aid under PL 480, he was not prepared to reconsider either his decision to introduce food rationing or his proposal for summary trial of offenders against food laws. The Prime Minister also expressed the hope that the measures proposed by him would ensure that there was no anxiety on the food front for at least the next three years.

Inaugurating the third mill of Anil Hardboards, Mr. Lal

Bahadur made the notable point that while industries had to grow up with the help of the Government, the initiative lay with private entrepreneurs. Both at this function and at the reception by the business community of Bombay, he expressed concern at the slow growth of industrial production and said that something had to be done to expand production by setting up new industries and improving the efficiency of the existing ones. Saying that somewhere things were not moving as well as they ought to, the Prime Minister said that this matter had to be carefully examined. Meanwhile, he did not hesitate to own Government's procedural delays in examining and scrutinizing new projects and issuing licences. He did not single out any Ministry for blame for this, but he was sporting enough to admit that he too was responsible collectively for these delays, and promised to eliminate them in future.

The Prime Minister made it very clear that he wanted industries to prosper because, he said, they provided employment to lakhs of workers. In this connection, he said it was essential that there was perfect co-operation between the public and the private sectors, for each had its distinct role to play in the great venture of building a new and prosperous

India. "Since private sector has a role to play in the nation's economy", Mr. Lal Bahadur said, "there should be no confusion about it. The private sector should know its role, its extent and the attitude of the Government towards it. All this should be clearly defined". At the same time, he went on to say, the Government should set up consumer goods industries in the public sector, in order that there should be no shortage of basic necessities of life and insinuated that there was not enough initiative from the private sector. It is worth recalling here what he said at the last National Development Council: "In the context of rising prices and the difficulties the common man has to face about basic consumer goods, it would be necessary to develop some of the consumer goods industries also in the public sector." He specifically mentioned textiles, sugar, cement and drugs.

If the Prime Minister had merely stated that it was necessary to increase the supplies of these essential goods and that, therefore, the Government would have to start a few units of its own, his thesis would have been unexceptionable. But giving a dog a bad name to hang it in the process as he has done by holding the private sector responsible for the shortfalls in the production of these goods is, to say the least, most unfair, especially in the prevailing circumstances. Whether it is the size of the unit, or the price of the raw material, or the rate of wages, or the price to be charged to the consumer, let alone the return to the entrepreneur, it is the Government that has all the say in the matter, as everybody knows. Further, before levelling the charge of profiteering, one must compare the extent of rise in the prices of these commodities with these of other commodities, inasmuch as all have been equally affected by inflation. In a number of cases where capacity has not been increased or productive mechanism not modernised, the concerned industry is not so much to blame as the ideological or unrealistic official policy involved, as, for instance, in the textile industry. And, above all, it is yet to be established that a public sector unit can sell its goods cheaper than the private sector units, particularly after the stipulation that public sector units also must yield a minimum return of at least ten per cent on the capital employed.

Pragmatic Approach

Perhaps the most refreshing reference to our five-year Plans that was ever made by an important Government spokesman was made by Mr. Lal Bahadur in Bombay, when he stressed the vital need for making a success of the rest of the third five-year Plan in order that the fourth Plan would be put through effectively. Few others have said more emphatically than he that, if there was stagnation in the third Plan, it would affect the fourth Plan also. Similarly, he displayed a thoroughly pragmatic approach when, whilst addressing Congress workers, he said with reference to the investment suggested in respect of the fourth Plan, that it did not matter even if our goal was not high. It should be our endeavour to attain the goal and accomplish more than what we initially aim at. How one wishes this realistic approach informed all actions and policies of the authorities.

Some practical suggestions on education also were made by the Prime Minister during his visit to Bombay. Inaugurating a Junior Technical School, he referred to the need for more skilled workers and said that education for rural boys in the elementary stage should include vocational training for about a year, so that they could become skilled workers. More important was his advice to those in charge of education to avoid causing frustration among students. He was dead right in holding that frustration amongst students causes all demonstrations and unrest. And his advice for bringing about better discipline was that we should change

the conditions which he pointed out, could be done by ascertaining the aptitude of students before they join universities.

In regard to both technical education and medical education, Mr. Lal Bahadur indicated his unequivocal rural bias. He actually stressed the need for a wider dispersal of medical colleges and hospitals which are now concentrated in cities. He was critical too of the comfort-loving medical graduates who are averse to going to villages, and this, he added, explained why some 2,000 rural dispensaries happen to lack qualified doctors. Presumably, to remedy this, he urged Hakims as well as Homoeopaths, in addition to allopathic doctors, to practise in villages.

The firmness of Mr. Lal Bahadur was nowhere in greater evidence than when he referred to the criticism of his suggestion for the promulgation of an ordinance against profiteering for drastic penalties, including imprisonment, without the right to appeal. The Government attaches the highest sanctity to the ideals of freedom. People have every right to talk, to act the way they like. But, if anyone tries to instigate violence for solving problems, the Government will not tolerate it. The Government is determined to take all the steps to mitigate the hardships of the people. There is no sympathy for those who want to profit at the cost of the lives of our people. But, at the same time, there is a feeling that the doing away with the right of appeal, especially where summary disposals are involved, is going a little too far. There is also a school of opinion which wonders whether the Government is at all right in making a distinction between different types of offences in the matter of the right to appeal.

★★

The Textile Commissioner has, in a special notification, stated that he may, if necessary, recommend grant of advance licences for import of art silk or synthetic yarn to manufacturers or exporters of art silk fabrics and hosiery articles (made out of art silk or synthetic yarn) provided they satisfied some of the basic conditions. The first condition requires that the applicant for grant of advance licence should be duly registered as a manufacturer-exporter under the export promotion schemes for art silk fabrics or hosiery articles made out of art silk yarn. The request for grant of the advance licence should be for import of the raw materials required for effecting export of the fabrics or hosiery articles against firm contracts with overseas buyers; this should be supported by irrevocable letters of credit. It must also be proved that the applicant is in need of the raw materials for executing the overseas orders received by him and that the stock of raw materials with him is inadequate for honouring the export commitment. Lastly, the applicant will be required to provide to the Textile Commissioner the details of the contracts entered into by him with the overseas buyers, including the particulars relating to the fabrics contracted for export. In all such cases, the period of time within which exports of the contracted quantity have to be completed, will have to be indicated.

The Textile Commissioner has further stated that the recommendation for grant of advance licence shall be limited to 50 per cent of the total value of the entitlement (implying 50 per cent of 70 per cent of the f.o.b. value) subject to three considerations. The first consideration is that the applicant for advance licence must execute a bond with the Joint Chief Controller of Imports and Exports, Bombay, if he is interested in the export of art silk fabrics produced on power looms and hosiery articles. For the export of art silk fabrics produced on handlooms, the bond shall have to be executed with the Joint Chief Controller of Imports and Exports, Madras. The value of the bond shall be not less than 50 per cent of the

value of the advance licence recommended to be granted and should be supported by a bank guarantee from a scheduled bank. Only after the applicant has executed a bond in these terms will the advance licence be granted by the licensing authority. The applicant shall also be required to furnish an undertaking to the effect that he will forward to the licensing authority concerned periodical statements showing the details of the quantity and value of the goods exported by him from time to time. In no case will these statements be submitted later than a week from the date of each shipment of the goods. They will be continued to be furnished until the completion of export of the entire quantity of the goods covered by the export contracts for which the advance licence has been granted. When the obligation for export is discharged, the balance import entitlement would be issued to the applicant concerned after adjusting the value of the advance licence. Against exports to Nepal, Sikkim and Bhutan, no advance licence will, however, be granted.

While the Textile Commissioner has decided to issue advance licences in good faith, he has, however, failed to assess its impact on the art silk yarn prices prevalent in the domestic market at present. It will have an unfavourable reaction on the prices of both the indigenous yarn and the imported yarn, creating a crisis in a market where yarn prices have touched the new low levels in recent months. Because of the premium on import licences, it is feared that unscrupulous exporters may obtain the advance import licences and even furnish the bank guarantee which they would be prepared to forfeit by lapse on the export front because in the overall bargain, they would still be at an advantage. The very objective of granting this concession may be, thus, lost. While the aim of earning foreign exchange through exports of art silk goods may not be attained, the country may in fact spend unnecessarily valuable foreign exchange which could be used for a worthwhile objective elsewhere.

★★

With a view to examining the pig iron needs of various industries from the qualitative point of view, the Government of India has decided to set up a study team consisting of technical experts from the pig iron and foundry industry and from the National Metallurgical Laboratory. This was disclosed by the Union Minister for Heavy Engineering, Mr. T. N. Singh, while addressing the fifth annual general meeting of the Textile Machinery Manufacturers' Association in Bombay on November 7, 1964. As pig iron was at present manufactured only in large blast furnaces the available quantity of foundry grade pig iron was limited. In future, therefore, the Minister said, it would be necessary to set up small pig iron plants for producing specialised varieties. He held out the assurance that immediate needs of the industry would, however, be met by imports.

Referring to the future growth of the textile machinery industry, Mr. Singh pointed out that even with the expansion of the existing units there would be a gap of about Rs. 75

crores between the likely availability and the estimated demand for textile machinery during the fourth Plan period. At present, when the imports were permitted only in those cases where the indigenous industry showed its inability to meet the demand, the country was importing textile machinery worth Rs. 25 crores every year. In view of this, the Minister emphasised, the objective of achieving a fair degree of self-sufficiency in textile machinery by the end of the fourth Plan period should be pursued with persistence. He, however, expressed doubts over Mr. Prabhu V. Mehta's contention that the industry would be able to reach an installed capacity of Rs. 45 crores worth of machinery by the end of the third Plan. Production during 1963 was around Rs. 20 crores against Rs. 15 crores in 1962. If this tempo was maintained, it would be possible to attain not more than Rs. 22 crores worth of production by the last year of the third Plan, the Minister added. Mr. Singh also expressed concern over the large capacity lying idle in certain sections of the industry. The waiting period for carding engines and ring frames was 20 to 40 months while the idle capacity in carding engines was of the order of 704 numbers per annum and for ring frames 686 numbers. The shortage of raw materials could not be the only reason for the idle capacity, Mr. Singh opined.

Technical Know-How

The Minister also disclosed at the meeting that the proposal of the Planning Commission regarding the technical know-how being obtained from abroad in bulk through a centralised agency instead of obtaining the same for individual projects, had not found favour with the Government of India. He suggested that the bigger units in the industry should make available their technical know-how to the new entrants in the field. This would involve smaller payments to foreign collaborators of the bigger units than what would have to be paid for new collaborations, he added.

Replying to Mr. Mehta's suggestion that the textile machinery branch, which was attached to the Textile Commissioner's Office in Bombay, should not be transferred to the Directorate-General of Technical Development in New Delhi, the Minister said that as the decision to transfer the department had already been taken there was no going back on the issue.

In his presidential address, Mr. Mehta had suggested that a committee of secretaries of the various Ministries connected with the textile machinery industry should frame policy for the industry for a period of two years and that the same should be communicated to the administrative sections of the concerned ministries for quick and expeditious implementation. Referring to the exports of textile machinery Mr. Mehta said that the Association had organised exports of complete textile mills. The recent joint ventures in textile machinery in East Africa and other parts of the world would give an opportunity to the Indian textile machinery manufacturers to export machines worth a couple of crores in the next one year or so, he added.

Demand for Jute Goods in 1970

From Our Correspondent

CALCUTTA:

THE INDIAN jute industry, which is at present assailed by doubts and uncertainties about its future prospects, may derive some comfort from the F.A.O. forecast of demand for jute goods up to 1970. According to this U.N. body's calculations, the demand will go on rising steadily, just as it has done during the period between the immediate post-war period and early 1960's. During the latter period, the F.A.O. study on trends and prospects for jute goods in world markets says,

the production of jute and allied fabrics more than doubled, from 1.4 million metric tons in 1946-48 to over 3.2 million metric tons in 1963-64. This represents an average annual growth of some 115,000 tons. If this rate of increase is continued in the next seven years, jute goods production may well reach the level of 4 million metric tons, or a rise of 25 per cent.

How is India expected to fare in the next seven years? Increasing competition from Pakistan and the growing in-

roads of substitute packaging materials into its fields, especially in the United States, coupled with its own raw material problems at home, have been worrying the industry for some time. These dangers are unlikely to lessen in future. If the demand for jute goods in world markets is expected to increase, so is competition from the rivals, especially Pakistan, and to some extent, from the European mills. During the decade between 1954 and 1963 India has increased her jute goods output by 350,000 tons, but her share of the total world production has gone down from 55 per cent to 42 per cent, although according to 1962 statistics, this country had more than half the total world loomage of 1,50,000. It is, therefore, fair to conclude that most of the additional demand for jute goods has gone to the competitors, especially the newly established industries in Pakistan and some communist countries.

Modernisation Imperative

It also stands to reason to say that India may not be able to share in the growth of the world jute goods markets to any appreciable extent unless she is able to reorganise her industry on a fully competitive basis. This means that the industry must modernise its plant and equipment with the latest machinery available. This also means that internal raw jute supplies should be ensured to manufacturers in adequate quantities, at right prices and, what is more important, the quality of fibre should be good. At present India has to import some fibre from Pakistan. The quantity admittedly is small, but it is of strategic value, for without this import India will not be able to make some of the finer grades of gunnies. It should now be the endeavour to produce all the jute at home that the industry needs. Stability of raw material prices is another major objective for the authorities. Thanks to the prompt intervention of the Jute Commissioner, raw jute prices had been subsequently brought down to around Rs. 36 per maund (basis Assam Bottoms), but in recent weeks the price has started moving up again. That this should happen in spite of the quota system guiding mill purchases, is somewhat surprising. In a month like October, raw jute prices usually come down. During this month arrivals increase as the growers sell from their stocks to raise funds for the Puja season. Arrivals have increased in recent weeks, but the prices have remained sticky around Rs. 40 per maund (basis Assam Bottoms). This is attributed to the boom in the gunny market and the belief in market circles that raw jute supplies this year are bound to be less. The authorities' point of view is that since this year's jute crop plus the carryover from the last season should be sufficient for mill consumption during 1964-65, there is no justification for any untoward increase in fibre prices. Futures dealings have been severely curbed and mill buying regulated strictly in accordance with market arrivals. Yet the fact that the prices have not fully responded to official measures should show that something more effective needs to be done.

Under the fourth Plan proposals for the jute industry, raw jute production is visualised at 10 million bales, corresponding to a rise in goods production by 400,000 tons to 1.7 million tons. Of this additional production, half is meant for exports. If the growth in world demand during the past decade has been at the rate of 115,000 tons, India's export ambitions would appear to be too high. A good feature of the export strategy, however, is that India is not planning any addition to her existing loomage, but proposes to concentrate on the modernisation of existing facilities. The additional production proposed will be obtained through working existing equipment on a multiple shift basis, which will involve only some additional preparatory and spinning machinery.

★★
The Calcutta Stock Exchange, as the other leading share markets in the country, is passing through a dull phase. The

dullness is due to several causes, but the main one apparently is the proposed amendment to the Companies Act in order to restrict the currency of blank transfers of shares to six months in the case of those traded on recognised stock exchanges and to two months for those outside. In the market authorities' view, this restriction is unnecessary since the Companies Act as it is, and the Securities Contracts (Regulations) Act, 1956, are quite adequate to deal with the evil which the blank transfer system might have given rise to. By enforcing the further curbs, the Government will deprive the stock exchange mechanism of its essential qualities of liquidity and stability, as the free negotiability of shares will be seriously impaired. It would therefore produce sharp fluctuations as price continuity would be hard to maintain. It is also possible that when the holder is either ill or dead or abroad, or when the transfer deed is lost or stolen, or there is some unexpected delay in the transit, serious uncertainties will arise about what is to be done about the shares concerned. Above all, the restrictions could well make the financing of corporate activities more difficult as the supply of bank and other credit facilities might be further curtailed.

Vivian Bose Enquiry

All these arguments could still be rejected if the supposed evil could be completely stamped out. It is worth recalling here that the proposed amendment to the Companies Act is based on the recommendation of the Vivian Bose Commission which enquired into the affairs of Dalmia-Jain concerns. In recommending the restrictions, the Commission gave the following grounds: (1) the system leads to concealment of beneficial owners' identity behind their nominees; (2) leads to tax evasion as those making secret profits find a safe outlet in blank transfer holdings; (3) encourages window-dressing of balance-sheets through manipulations and substitutions of inter-company advances and other transactions; and (4) leads to the creation of fictitious investment losses. In the opinion of stock exchange authorities, these evils could still be there in spite of the new restrictions. Blank transfers are not the same as nominee holdings. The latter exist independently of the blank transfer system. The proposed restrictions would not bring about any disclosure of beneficial interest. Nor would the problem of nominee holdings be solved. Moreover, restrictions on currency of blank transfers may succeed in stopping investment of secret profits in shares, but they cannot stop unaccounted money going into other channels, so tax

INSIDE GOA

evasion cannot be checked. Gilt-edged securities in the form of promissory notes may provide yet another outlet for secret profits. They can be transferred just by endorsement and are quite safe forms of holding unaccounted money. These are as good arguments against the proposed restrictions on the blank transfer system as any that can be advanced. Since the Government is professedly interested in the growth of the private sector, it must do nothing which cripples the stock exchange mechanism, the heart of the capital market for private enterprise.

While the market has remained subdued, some of the leading Calcutta-based companies have substantial plans of expansion. Philips India has approached the Controller of Capital Issues for consent to issue 400,000 rights ordinary shares of Rs. 10 each at a premium of Rs. 6. Its foreign collaborator and parent company, N. V. Philips' Gloeilampenfabrieken of Holland, will take 100,000 shares, although on the basis of present holdings it is entitled to 309,090. (The ratio is three new shares for every five ordinaries held). The proceeds of the issue will be used to finance the company's modernisation and expansion programmes. Its factory near Poona is now firmly established as the main concern in India making radio sets and components. The company has a light factory also, which is making incandescent lamps, fluorescent lamp starters and burners. Other manufacturing activities of the company include the production of tungsten, molybdenum and tungsten coils which used to be imported hitherto. Now it is building a new factory near Bombay to produce different kinds of lamps and components from next year.

Another company which is expanding its capital base is Goodyear India. The company proposes to issue 400,000 rights ordinary shares at a premium of Rs. 7 for each share of Rs. 10, in the ratio of eight shares for every four held. Incidentally, this issue will raise the share of holdings by Indian investors from the present 20 per cent to nearly 40 per cent. The company's expansion plan involves an increase in production from the existing level of 210,000 tyres to 310,000 tyres by 1965. The overall industrial licence for the company has also been renewed to make 510,000 tyres until December 1968.

Oil Refinery for Madras

From Our Correspondent

MADRAS:

MR. LAL BAHADUR'S recent visit to Madras State might well prove to be the harbinger of new happy developments in the regional economy. The Madras State Government has already acquitted itself creditably and it is generally accepted that the progress recorded in the three Plan periods has been outstanding and it is indeed a notable achievement that the per capita consumption and availability of electricity is more than double the figures relating to the other three southern States. There is naturally anxiety that the tempo of economic development should be sustained and that the State's resources in men and material should be even more effectively exploited in the coming years. The Prime Minister took advantage of the opportunity to visit the State as he had to attend the session of the All-India Congress Committee at Guntur in Andhra Pradesh. The two functions in which he participated related to the inauguration of construction work on the Tuticorin deep sea harbour and the opening of the Wet Dock in Madras Harbour. But the third development also has great significance for the regional economy. Just before his arrival in Madras City it was announced that an

The US parent company, Goodyear Tire and Rubber Company, will provide a dollar loan equivalent to Rs. 80 lakhs for importing the necessary foreign plant and machinery.

Simon-Carves India Ltd. (which was incorporated as a joint stock company during February last year) has just offered 599,993 shares of Rs. 10 each for subscription at par. Simon-Carves Ltd. of the United Kingdom have been offered 350,000 shares for considerations other than cash. The latter is also subscribing 100,000 shares for cash. As is well known, Simon-Carves is a leading firm of mechanical, civil, electrical and constructional engineers in Britain, and the Indian subsidiary will specialise in these fields in India with technical assistance from the parent company.

★★

The study by the National Council of Applied Economic Research of the coal, iron and steel traffic in the country's steel belt lying in Bihar, Orissa and Madhya Pradesh, is very interesting. The main burden of the traffic has fallen on the railways, which carry 50 per cent of the total originating traffic in the entire country. With further industrialisation and development of these industries, the burden on the railways will increase still further. But they may not find it easy to handle such enormous growth in traffic with the efficiency they have been doing for the past few years, without serious strain, congestion and even dislocation. It is, therefore, necessary to encourage road transport in the region so that the burden on the railways can be lessened and a measure of rational distribution of traffic between the railways and road transport services can be achieved. This can be achieved, as the Council rightly suggests, by suitable increases in railway freight rates and further improvement in railway operations. Side by side, road transport services should be further strengthened, particularly in colliery areas. Railways are of course the most suitable means of transport for carrying commodities like coal, iron and steel, but the traffic can be shared over short distances. In fact, there are distinct advantages in carrying these commodities by road over short distances. There is also much to be said in favour of the Council's suggestion that the railways should be relieved, as far as possible, of the burden of carrying industrial materials meant for general consumption.

oil refinery would be erected near here with the collaboration of the National Iranian Oil Company-American International Oil Company. A decision in this regard had been expected though there was a feeling that the Ministry of Petroleum and Chemicals was taking an unduly long time in choosing the foreign collaborators. There was no doubt some difficulty in determining the balance of advantage as two offers had really attractive features and it was known that there was a serious difference of opinion between the Secretaries' Committee and the Union Minister for Petroleum and Chemicals, Prof. Humayun Kabir, on the evaluation of merits of the various proposals.

The decision had naturally to be taken at the highest level. Even during Cabinet discussions there was no general agreement and a Cabinet Sub-Committee, consisting of Mr. T. T. Krishnamachari, Mr. Swaran Singh and Mr. G. L. Nanda, was asked to examine the proposals and select the collaborating firm. It is not known why NIOC-AIOC has been ultimately selected. But it is stated that the firm has offered to supply crude oil on a cheaper basis and also agreed to equity participation to the extent of 25 per cent against 49

per cent insisted on by BOC-Shell International. A higher level of equity participation has its own merits in the sense that the servicing of foreign exchange obligations would not present any problems immediately. But it has also its demerits in the sense that the dividends paid to the foreign collaborators would be much higher than the interest charges that would have to be actually incurred. Apart from the controversy about what should be exactly the extent of equity participation, the prospect of this country being able to secure an opportunity for off-shore oil exploration in Iran and purchasing crude oil supplies on a cheap basis seems to have been responsible for the final decision.

So far as the Madras State is concerned, the controversy has no great relevance as the oil refinery will be administered by the Central Government and what is really important is the prospect of this refinery, which will have a capacity of 2.5 million tonnes, coming up near Madras within a period of 24 to 30 months. The various details are yet to be finalised. But it has been tentatively estimated that the cost would be around Rs. 15 crores. There will naturally be an increase in capacity after some time especially if the efforts now being made to locate oil reserves in the Cauveri basin prove to be successful. That may not be an immediate prospect but the possibilities cannot be excluded. As for drilling in the Karaikal area, there seems to be growing confidence that oil can be struck and that it would be necessary before long to undertake drilling in the off-shore region as well. The present programme is to bore three wells in the Karaikal area in order to have some idea of the scope for finding oil and gas.

Fertilizer Plant

While discovery of oil in the State might be helpful in meeting the requirements of the new refinery, of greater importance in the immediate context is the likelihood of a number of projects coming up around the refinery. It has already been proposed that a large fertilizer factory for producing different types of nitrogenous fertilizer should be erected using naphtha as the basic raw material. This fertilizer unit will probably cost about Rs. 25 crores. There is besides a scheme for manufacturing synthetic fibres based on by-products of the oil refinery as is being done by Chemicals Fibre India Limited in Bombay. There are then proposals for producing polyvinyl chloride based also on naphtha. It is expected that it may even be possible to produce carbon black ultimately and the refinery complex will require an aggregate outlay of Rs. 100 crores! As it is expected that great emphasis would be laid on the development of petro-chemical industries in the fourth Plan period, the commissioning of an oil refinery in 1966 should prove to be very timely.

★★

The Tuticorin deep sea harbour also has immense potentialities of its own. The cost of the project in the first stage has been placed at Rs. 14 crores and the capacity of the port will be doubled to 2 million tons. Even now there is a large trade in salt, foodgrains, coal and other items and 1 million tons of cargo are being handled annually in spite of the fact that ships have to remain on anchor five miles from the shore and loading and unloading operations are being carried out with the help of lighters.

The inauguration function was only formal as an expenditure of over Rs. 1 crores has been already incurred on the construction of the project and it is programmed that the first stage should be completed in a period of six years. There will be six along-side berths in an artificially created basin. The harbour will be linked with the metre-gauge railway system and there will also be express highways connecting

important centres in Tirunelveli district. It is hoped that the hinterland will benefit on account of the availability of an all-weather port.

What is equally important is the indication by the Prime Minister that the work on the Sethusamudram Project should be taken up at an early date. Since this scheme also would require a long period to be completed, it should be taken up in a short period. Apart from the benefit that would be derived by the region after the completion of the Tuticorin Harbour, the large expenditure incurred on both the schemes can very well prove to be self-financing in character if the Sethusamudram Canal is opened up without much delay. The indirect saving in foreign exchange will consist in the shortening of the route for coastal traffic while there is the prospect of a large number of foreign ships calling at Tuticorin for bunkering and unloading facilities, since serious difficulties are experienced at the Colombo Port on account of dock labour trouble and during the monsoon weather ships are obliged to wait for a long time. The Tuticorin Harbour and the Madras oil refinery have, therefore, great significance to the State's economy, each from its own point of view.

★★

The visit of the Prime Minister was also utilised to inaugurate the wet dock, named after the late Jawaharlal Nehru, which has cost Rs. 6 crores and which is part of the expansion programme for the Madras Harbour. With the construction of this huge dock six more berths have become available and it is anticipated that huge bulk carriers, having a draft of even up to 36 feet, can enter the port and be helpful in handling a much larger volume of bulk cargo. There are now in all 18 berths and the cargo handled at the port can increase to 10 million tons annually from 4.4 million tons at present. There is even now a large export trade at one million tons yearly in iron ore. But it has been found that the loading of ships has been unduly prolonged as the existing semi-mechanical loading facilities are not adequate for the purpose. It is, therefore, felt that a fully mechanised ore-loader should be constructed. As a result of the efficient execution of the expansion programme the port authorities have been able to effect a large saving in foreign exchange expenditure and there is a balance of Rs. 1.5 crores out of the \$14 million loan that was granted by the World Bank for this expansion scheme. It has been suggested that a fully mechanized ore-loader, capable of handling 3 million tons annually in the initial stages and double this capacity ultimately should be erected at a cost of Rs. 2.5 crores. The necessary permission for implementing this project is awaited. It is needless to say that unnecessary delay in the implementation of the project will cost heavily in terms of reduced foreign exchange earnings.

The Madras port has assumed greater importance on account of the proposal to locate the refinery here. Since large quantities of imported crude oil would have to be handled, it has to be examined how a big oil terminal can be constructed north of the existing harbour, so that oil can be directly pumped from ships to the refinery site. This work also will have to be taken up immediately as the oil jetties will have to be ready by the time the refinery goes on stream in 1966.

POYSHA IS ONE OF INDIA'S TWO LARGEST CAN MAKERS

Poysha's excellent metal printing results from this modern wet varnishing process unit. Soon a new two-colour printing unit will also be operating.

Quality control is strict! Cans even undergo laboratory check-ups...to meet Poysha's own high standards.

Poysha has advanced automatic machinery. This high-speed bodymaker line, for instance, mass-produces over 300 cans a minute.

This completely automatic air tester checks cans under air pressure to ensure that they are perfectly leak-proof and airtight containers.

WILL SOON GROW LARGER... WITH 3 NEW FACTORIES

By 1965-66, Poysha will be taking its advanced can-making know-how into the heart of the industrial centres of India with 3 new factories. The largest, at Dighe (Bombay), will serve industries in Western and Central India. The second, at Cochin, will serve the fishing, pineapple and other industries in the South. The third, at Ghaziabad (Delhi), will serve vast fruit, vegetable and industrial areas in Northern and Eastern India.

It will mean a capacity increase to one crore cans a month for Poysha...which will raise its Paid-Up Capital from Rs. 25 lakhs to Rs. 110 lakhs shortly.

Other Industries

The Rs. 200 million Birla-Kaiser aluminium project at Renukoot, near Rihand, in U.P., has, since December 1962, attained and surpassed the initial target capacity of 20,000 tonnes per annum. While the Renukoot plant is already the biggest integrated aluminium manufacturing complex in India, Hindalco is forging ahead with its programme of rapid expansion, for raising the primary aluminium capacity to 60,000 tonnes per annum (and to provide fabrication facilities totalling 37,000 tonnes per annum), to help the country's fast growing industries in their march towards progress and prosperity.

The moving finger writes

FIVE WEEKS (since this Diary last appeared) is not a long time and I am really surprised that even within this short period this country's economic affairs have managed to deteriorate as much as they have done. The fact that I myself had been spending those weeks in communities abroad which, whatever their political or economic systems may be, have a habit of applying both common sense and purposiveness to their tasks, has not exactly helped me to reconcile myself to the mess we seem to be bent on making of our national affairs.

Communist China has staged a nuclear explosion. We for our part have had a grand display of fireworks, literal as well as verbal, at the AICC Session at Guntur. I do not know whether the fireworks set off at Guntur were all of indigenous make or whether any of it was imported, perhaps from China. But it is obvious that there is nothing original in the reaction of the leadership in the Government or the Congress to the fact of Communist China having become a nuclear Power. There may be a sound case for India not setting out to make the Bomb — personally I think there is one —, but neither the Prime Minister nor any of the other Congress stalwarts seems to have come anywhere near making out that case. If the Congress leadership or the Government believes that the case against an Indian Bomb can be established merely in terms of our peaceful, non-violent and otherwise virtuous selves, it has got another guess coming.

The country cannot continue to be patient indefinitely with woolly thinking where national security is concerned. Those who ask for an Indian Bomb can only be countered effectively with a positive alternative policy for ensuring the country's defence. The question is whether the Government is on the way to such a policy. It is curious that our Defence Minister has been showing greater concern for ensuring the annexation of Goa to Maharashtra than for reassuring the nation that some new thinking is being done on the political and military implications for this country of the Chinese nuclear explosion.

After this it is not at all surprising that Sheikh Abdullah should be threatening to start a jihad in Kashmir after he returns from his projected pilgrimage to Mecca. It seems to me that this country has an exaggerated idea of its capacity to let people play with its safety and while Sheikh Abdullah, at least, could go to Mecca for spiritual refreshment for his political ambitions, Mr. Patil and Mr. Chavan have to make do with Panjim.

Evidence of the Government's mismanagement of the economy is, no doubt, accumulating day by day with the result that any fresh proof is losing its power to shock or surprise us. Even so the recent directive to sugar industry to increase its output by producing inferior grades of sugar makes me lose what little respect I might still have for the powers that be. Earlier an attempt was made to deal with the wheat shortage by asking flour mills to mill "coarse", but that does not seem to have eased the situation in any way. Now, in the case of an industry the re-equipment and modernisation of which is being continually emphasized and the export potential of which is stated to be important to the nation, the Government is asking the manufacturers to dilute quality deliberately. I have little doubt that this step will be no more successful

in relieving the sugar situation than was similar action taken with regard to wheat. The sixth triennial General Assembly of the International Organization for Standardisation is meeting here at the time of writing. It is odd that a Government, which deems it proper to advise one of the nation's foremost consumer-goods industries to bring down the quality of its product, should have the temerity to aspire to play host to a gathering of this kind. All over the world economic and industrial expansion is assumed to flow from increased demand stimulated by falling costs and improving quality. The Government of India, in its wisdom, seems, however, to be determined to rescue this country from scarcity and make it prosperous by ensuring that the people get less and less of goods which are becoming worse and worse in quality as well as more and more expensive in price.

I see that "The Statesman" in its editorial of November 9 has committed itself to the proposition that Field-Marshal Ayub Khan is the best President that Pakistan can have. "The Statesman" may be right — and I see that so far some 18 people have died in the polling brawls in West Pakistan while trying to prove (or disprove) "The Statesman" dictum. I for my part am certainly impressed with the emphasis "The Statesman" places on "stability and continuity" as arguments in favour of the Field-Marshal. It is, of course, true that elsewhere in the world — for example, Moscow or London — a certain preference has recently been shown for Change, but then in Moscow, at any rate, editorials in newspapers are seldom given an opportunity to advise; they may merely be permitted to approve.

INTERNATIONAL STANDARDISATION

AT THE invitation of the Indian Standards Institution (ISI), the International Organisation for Standardisation (ISO) is holding meetings of its sixth Triennial General Assembly (meeting for the first time on Asian soil), its Council, the 7 administrative bodies and 27 of its technical committees in Vigyan Bhavan from November 8 to 21, 1964. The General Assembly was inaugurated by the Vice-President of India, Dr. Zakir Husain, on November 9, 1964. The International Organisation for Standardisation came into being in 1946 as a successor to the International Federation of the National Standardisation Associations, with the object of promoting development of world standards so as to facilitate international exchange of goods and services and to develop mutual co-operation in the sphere of intellectual, scientific, technological and economic activity. The ISO, therefore, (a) takes action to facilitate co-ordination and unification of national standards and issues necessary recommendations to member-bodies for this purpose; (b) sets up international standards provided, in each case, no member-body dissents; (c) encourages and facilitates, as occasion demands, the development of new standards having common requirements for use in the national or international spheres; (d) arranges for exchange of information regarding the work of its member-bodies and of its technical committees; (e) co-operates with other international organisations interested in related matters, particularly by undertaking, at their request, studies relating to standardisation projects. The membership of the ISO consists of national standards organisations of different countries such as the Indian Standards Institution. At present, 50 such organisations from 50 countries constitute the ISO.

Considering the vital importance of standardisation for industrial development and promotion of international trade, particularly for the developing economies, India has been taking an active part ever since ISO's inception in 1946. The ISI represents India in 78 of its technical committees, mainly because the growing economy of India requires standards in all these fields, and if international standards are developed on lines commensurate with Indian needs they will help expand our overseas trade. This wide-scale participation has led to ISI being called upon to shoulder a good deal of the administrative burdens of ISO. For example, ISI has been continuously elected as a member of ISO's governing council ever since its start except for one year, and the ISI Director, Dr. Lal C. Verman, was elected as the ISO Vice-President for two consecutive terms spreading over six years. Dr. Verman is currently the Chairman of the ISO's Planning Committee and member of certain other administrative groups. Besides, India provides secretariats for three of the ISO's technical committees for lac, mica and pictorial markings for handling of goods, and for four sub-committees and six working groups.

The technical field in which international standardisation is being considered at the Delhi meetings includes subjects of primary interest in India, such as agricultural food products like spices, condiments and stimulant foods, steel, rubber, vetiver oil, screw threads, bolts, nuts and accessories.

INDO-U.S. JOINT VENTURES

At the conclusion, last week, of its seven-day visit to India, the 15-member delegation of American businessmen, industrialists and entrepreneurs was able to reach "basic agreements" with Indian industrialists for establishing joint ventures in India in the spheres of pharmaceuticals and machinery manufacture. The delegation, sponsored by the Action Committee for International Development which represents over 2,000 business houses in the USA, comprised the heads of US

medium-scale industries in the field of pharmaceuticals, electronics, steel forgings and castings, hotel industry, aircraft and agricultural implements. The delegation expressed great satisfaction at the talks they had with Indian businessmen and officials, particularly in the matter of allaying their fears concerning procedural difficulties which the new units in India have to face. The members of the delegation also expressed the view that minority foreign participation would be no hindrance for the flow of American capital into India. They said that, as a matter of fact, they would welcome a sizable share of the capital being raised through public issues in India.

In view of the success of the delegation's visit, more members of the group are likely to come to India in the near future for exploring further possibilities of collaboration. A group sponsored by the Action Committee for International Development would visit India in February 1965 to explore the possibilities of establishing joint ventures in the hotel industry.

STAPLE FIBRE EXCISE MODIFICATIONS

Although the changes in excise duty on staple fibre, as recently announced by the Union Ministry of Finance, are on the right lines, the reduced duty is still quite high for the industry. This view is held by Mr. J. J. Asher, Director of the Gwalior Rayon Silk Mfg. (Wvg.) Co. Ltd., who, while addressing a press conference in Bombay on October 30, 1964, said that if the consumption of staple fibre had to be increased to replace foreign cotton, what was needed was not just a reduction but a complete removal of excise duty. Under the new rules, (covered in these columns in "Eastern Economist" dated October 30, 1964), all staple yarns (counts below 16 being free from excise duty) will pay the same duty as is applicable to cotton. The synthetic yarns and mixed yarns have come in for higher duties.

Explaining the implications of the excise modifications, Mr. Asher said that it would now become more economic to spin staple fibre yarn of 16s in place of 20s, as at present. This would result in a saving of 40 Paise per Kg. on staple fibre, 20 Paise per Kg. on yarn duty and 10 Paise per Kg. in spinning cost. It would thus become an attractive proposition for spinners to spin yarn of 16s so as to derive the maximum benefit from the modifications in duty. For composite textile units, Mr. Asher said, it would become economical to spin medium counts of 28s, 38s and 44s by blending 16 per cent or more of staple fibre with Indian cotton to produce superior yarns which could be used in the manufacture of fabrics comparable in physical properties to any cotton fabrics — perhaps even better than cotton fabrics in appearance and feel. Another variety that could now be economically manufactured was a combination of cotton warp and staple weft (particularly 16s plain and fancy) which would especially appeal to consumers of fancy fabrics, tapestry and dress material. If the staple content in the fabrics was over 60 per cent, no excise duty would be payable on the fabric in the grey state because it would fall in the category of art silk. In this case, only processing duty at the rate of 9.7 Paise per square metre would be payable. Mr. Asher drew the conclusion that the recent changes in excise duty would popularise yarn of 16s in the Indian market and encourage blends of staple fibre in cotton, woollen and polyester spinning on a large scale. The market for staple fibres might, therefore, be expected to be brighter than ever before.

Mr. S. V. Bhende, Technical Officer, Gwalior Rayons, also addressed the conference and said that the company at present produced 100 tons of staple fibre per day and that it hoped

are still ruling at high levels and great hardship is experienced by the consumers of mustard oil in the country, the Government of India, by its notification dated November 5, 1964, has banned forward trading in non-transferable specific delivery contracts as well in the aforesaid commodities throughout the country. As a result, all outstanding non-transferable specific delivery contracts in mustardseed and rapeseed or toria, which were entered into between parties who are members of a registered association, are deemed to be closed out at the rate at which such contracts were entered into. The Government has also banned forward trading in taramiraseed and taramiraseed oilcake in non-transferable specific delivery contracts throughout the country.

TRADE TEAM FOR JORDAN

A three-member trade delegation, led by Mr. S. Than, Director of Foreign Trade, Ministry of Commerce, left New Delhi for Jordan on November 9, 1964. Besides holding talks for trade arrangements with Jordan for 1965, the delegation will explore the possibilities of Indo-Jordanian joint industrial ventures to be set up in Jordan. At present the annual trade between India and Jordan is of the order of Rs. one crore each way. The main item of import from Jordan is phosphates. Exports to Jordan include tea, jute goods, textiles and engineering items.

UTILISING PL 480 FUNDS

The Governments of India and the United States are jointly considering schemes for utilising the vast rupee resources which have accumulated to the credit of the US Embassy in India, under the P.L. 480 programme. During the last 10 years India signed nearly a dozen agreements with the United States for the supply of surplus agricultural commodities to India of the total value of about Rs. 14,000 crores. Under the terms of the agreements, 87 per cent of the rupees accruing out of the sale proceeds of the commodities are given back to the Government of India, partly as a loan and partly as outright grant for the financing of the mutually agreed upon projects. The remaining 13 per cent is reserved for use by the American Embassy in India. According to this arrangement, the funds for the use of the Embassy come upto Rs. 182 crores. Moreover, these funds would keep on increasing as and when the Indian Government pays interest on loans and returns the principal in instalments over a period of time. The annual requirements of the Embassy being limited, the problem arises about the disposal of such large amounts of money. Among the various proposals under discussion by the Indian and the US Governments for the utilisation of these funds, is the setting up of a joint agency of Indian and the US Governments or the establishment of a development foundation on the lines of the Ford Foundation or the Rockefeller Foundation. The approval of the US Congress would ultimately be necessary for the utilisation of the funds.

INDO-CZECHOSLOVAK TRADE

An Indian Trade Delegation led by the Union Deputy Minister, Mr. S. V. Ramaswami, which visited Prague last month, negotiated with the Czechoslovak authorities trade plan for the years 1964 and 1965. Both the sides agreed upon increasing and expanding trade between the two countries during the year 1965. As a result, some more tea, tinned fruits, fruit juices, tyres and tubes would be exported from India to Czechoslovakia. India will import more of tractors, machine tools and capital goods from Czechoslovakia. Further possibilities of trade in non-traditional goods, including hand tools, batteries, rolling stock and shoes, have also been explored.

5 PER CENT MADRAS STATE ELECTRICITY BOARD BONDS, 1976. FOR RS. 300 LAKHS.

(PAYMENT OF INTEREST AND REPAYMENT OF PRINCIPAL, GUARANTEED BY THE GOVERNMENT OF MADRAS.)

The Bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act. The Bonds will be treated on par with Government Securities for the purpose of advances under Section 17 (4) (a) of the Reserve Bank of India Act, 1934.

ISSUE PRICE Rs. 99.75 PER CENT.
REDEEMABLE AT PAR ON THE
16TH NOVEMBER, 1976.

Subscriptions will be received in cash or cheques from the 16th November 1964. But the lists will be closed without notice as soon as the total subscriptions amount to approximately Rs. 300 lakhs and in any case not later than the close of business on the 21st November 1964.

Applications will be received at all branches of the State Bank of India within the State of Madras and at the State Bank of India at Madras, Bombay, Hyderabad, Calcutta, Delhi, Bangalore and Bangalore City.

Copies of the Notification announcing the terms of issue and application forms are available at all the receiving offices mentioned above, at all treasuries and sub-treasuries in the State of Madras and at all offices of the State Electricity Board.

WESTERN INDIA PLYWOODS LIMITED are the largest suppliers of aircraft plywoods in India

Aircraft is one of those highly specialised industries that demand highly specialised plywoods engineered to meet the requirements of lightness, strength and flexibility to withstand high flying pressures. The 3-ply, 0.8" thick 'WESTINDPLY' plywoods that go

into India's gliders and other aircraft are meeting these requirements exceptionally well.

Western India Plywoods, the largest manufacturers of processed woods in India, make numerous varieties of specialised 'WESTINDPLY' plywoods to

meet the industrial, architectural and defence needs of our country. They also manufacture 'WESTON' Hardboards, 'WIPEX' Paper laminates, Flushdoors and Block Boards.

* * *

Special aircraft plywoods engineered to meet the demands of lightness and strength, go into the gliders and other aircrafts built in India.

'Westindply' plywoods are made available in a wide variety of veneers to add colour and prestige to the reception lounge.

Chairs, table tops, panels, shelves, cupboards, flooring—infinite is the scope of 'Westindply', 'Weston' and 'WipeX'.

THE WESTERN INDIA PLYWOODS LIMITED

P. O. BALIAPATAM, CANNANORE DISTRICT, KERALA STATE

to get a licence to produce 50 tons daily of polynosic variety of staple fibre which would replace cotton to the extent of 60 per cent in the manufacture of cloth. He pointed out that staple fibre could be blended with cotton to the extent of 16.7 per cent without any material difference in the quality of fabric, while at the same time enhancing its feel and appearance. Similarly, fabrics made of wool and staple fibre mixtures would be very cheap and suitable for our climate. Wool and staple fibre could be blended to manufacture suit.ings, blankets and even knitting wool. Blends of staple fibre and terylene gave the appearance of worsted material, he added.

TAX REGULATIONS FOR FOREIGN INVESTORS

The Government of the Federal Republic of Germany has instructed the Research Institute for International Revenue Law in Munich to study tax regulations in 51 developing countries. In an announcement last month, the Bonn Ministry for Economic Co-operation, which is in charge of German development aid policies, said that an all-embracing expertise on tax regulations, to be worked out by the Institute, would greatly help prospective capital investors from Germany to assess overseas investment markets.

INDO-SOVIET ECONOMIC TIES

The Soviet Ambassador in India, Mr. I. A. Benediktov, while making his first public speech on Indo-Soviet relations after Mr. Khrushchev's resignation, at the signing ceremony of an agreement for the supply of Soviet equipment and material for the Harduaganj Thermal Project in Uttar Pradesh, said in New Delhi on October 5, 1964 that the Soviet Government would treat the problems of India with due understanding. There was no doubt that economic co-operation between the two countries would grow and expand in future, he assured.

The agreement, which was signed by Mrs. N. P. Uljanova on behalf of Machinexport of the USSR and Mr. B. B. Lal, Chairman of the Uttar Pradesh Electricity Board, provides for the supply of equipment and materials worth about Rs. 6 crores for the Harduaganj B. Thermal Power Station. The Rs. 14 crores project, which will have an initial capacity of

100 MW., will comprise two units of 50-55 MW. and will have scope for further expansion up to 300 MW. This project will meet the power demand for industry and agriculture of 26 districts in the western and central U.P. The Soviet Union had earlier helped the State of Uttar Pradesh in setting up the 250 MW Obra Thermal Plant to meet the demand of the eastern districts of the State. The Harduaganj project covers the training in the Soviet Union of engineers of the Uttar Pradesh State Electricity Board. The Soviet Union will also provide technical assistance in the erection and commissioning of the equipment the major part of which will be supplied next year. The first 100 MW. unit of the power station will be commissioned during the third five-year Plan, i.e., before April 1, 1966. All the major items of the equipment, to be delivered by Machinexport, have been specially designed for high seismicity, loose ground and tropical conditions of the Harduaganj area. Payment for the equipment will be made in rupees. The Indian specialists will actively participate in the designing of this power station and many important items of equipment and materials will be manufactured by the Indian industry.

Mr. Benediktov described the agreement as one more step in the development of trade and economic relations between India and the Soviet Union. The trade between the two countries, he said, was an important channel in the total flow of help by the Soviet Union to India in the expansion and strengthening of its industry and agriculture. The export of machinery and equipment from the USSR to India created an important basis for developing the industrial potential of India, especially in its public sector, added Mr. Benediktov.

FORWARD TRADING IN OILSEEDS

With effect from June 1, 1964, the Central Government banned forward trading in mustardseed and rapeseed or toria throughout the country. During the past few months there has been a tendency for the diversion of speculative activity to non-transferable specific delivery contracts in mustardseed and rapeseed. As the prices of mustardseed and rapeseed

f the general reserve. The additional provision for depreciation of Rs. 11.52 lakhs has been made necessary for the last year for the third shift, which is permissible equivalent to the 50 per cent of the normal depreciation. During the year under review additions to the plant and machinery and land and buildings have been made to the extent of Rs. 43 lakhs. The new spinning building to house additional 45,000 spindles is getting ready and is expected to be commissioned before June 30, 1965. The company has placed orders for plant and machinery of the value of Rs. 7.75 lakhs.

SIRPUR PAPER

The Sirpur Paper Mills Limited has recorded good working results for the year ended June 30, 1964. According to the preliminary report issued by the company, the net profit after providing Rs. 40.89 lakhs for depreciation, Rs. 53 lakhs for statutory development rebate reserve and writing back development rebate reserve of Rs. 41 lakhs, amounts to Rs. 1.73 lakhs against only Rs. 3.03 lakhs in the preceding year. The directors have transferred Rs. 3 lakhs to contingency reserve and Rs. 11 lakhs to general reserve, carrying forward a balance of Rs. 77,350 to next year. There is no tax liability for the year in view of the carry-forward of unabsorbed depreciation and development rebate of the preceding years. A dividend of 85 paise a share is recommended on the ordinary shares, excluding the interim of 35 paise a share already paid, making a total of Re. 1.20 a share, less tax. This compares with a taxable dividend of only 5 per cent paid previously.

THAKUR PAPER

Although the company started production from February 1, 1963, Thakur Paper Mills Limited could not reach its target during the year ended December 3, 1963, mainly due to inconsistency in the supply of electricity and the delay in commissioning the pulp section. As the position regarding the supply of power has now improved considerably, the company is maintaining progressively its target. Meanwhile, the accounts for the year under review reveal a loss of Rs. 7.03 lakhs as against a loss of Rs. 4.39 lakhs incurred in 1962. No depreciation is provided. The directors state that the working result will improve in the current year due to increased production, turnover and the reduction in the rate of electricity by the Bihar Government.

NUBOARD MANUFACTURING

Nuboard Manufacturing Company Limited, a new company formed for the manufacture of particle board, will

shortly enter the capital market to raise Rs. 6.13 lakhs by public issue. The authorised capital of the company is Rs. 50 lakhs divided into 500,000 equity shares of Rs. 10 each. The issued and subscribed capital will be Rs. 25 lakhs out of which shares worth Rs. 6.37 lakhs will be taken up by the Indian promoters, their friends and shares worth Rs. 12.50 lakhs will be subscribed by the non-resident directors. Shares worth Rs. 6.13 lakhs will be offered to the public and the whole public issue is expected to be underwritten. It has secured an industrial licence for the manufacture of 7,200 tons of chip-board per annum. It has already made substantial progress and the building of the factory at Rampur in U.P. has been completed.

PODAR RIGHTS ISSUE

Podar Mills Limited will enter the capital market on November 16 with a public issue of Rs. 80 lakhs — Rs. 40 lakhs in equity shares and Rs. 40 lakhs in (9.5 per cent) cumulative redeemable first preference shares. The entire issue has been underwritten. The existing shareholders will be given preferential allotment. The list will close on November 30. The proceeds of the issue are to be utilized for setting up a new cotton mill at Jaipur and a processing house in Bombay.

COMPANY REGISTRATIONS IN SOUTHERN ZONE

During the quarter ending September 30, 1964, 58 companies with an authorised capital of Rs. 818.49 lakhs were registered in the southern region consisting of the States of Andhra Pradesh, Kerala, Madras and Mysore. Out of these companies 12 are public companies with an authorised capital of Rs. 545 lakhs and 46 are private companies with an authorised capital of Rs. 273.49 lakhs, and one is an association not for profit. Out of these registrations 9 public limited companies and 20 private limited companies were registered in Madras State, two public limited and 8 private limited companies in Andhra Pradesh, one public limited and 13 private limited companies in Mysore State and one public limited and four private limited companies in Kerala State. The total increase in the paid-up capital of the companies rose during the quarter by Rs. 306.79 lakhs and the major increase took place in public limited companies. 33 companies with a paid-up capital of Rs. 2.07 lakhs were struck off on the section 560 of the companies Act, 1963, while 22 companies with a paid-up capital of Rs. 13.95 lakhs went into liquidation.

BETTER THAN THE BEST IN 50 YEARS

INAUGURATE THE FIRST SENDZIMIR MILL IN INDIA

For a Sendzimir Mill can roll ferrous and non-ferrous metals to thinner gauges while greatly reducing the dimensional tolerance.

Better accuracy and uniformity of gauge, superior finish and appearance of parts acquired by 80% closer micro-inch control, more reduction per pass and the elimination of intermediate annealing are some of the more important advantages of a Sendzimir Mill.

The new U. S. manufactured Sendzimir Mill will be yet another step by Devidayal's - pioneers in India for 5 decades in the manufacture of cold rolled non-ferrous metal sheets and strips - to give the best of their expert knowledge and inside resources to the manufacturing units they feed.

With the commissioning of the Sendzimir Mill - the first of its kind in India and the only one between Yugoslavia and Japan, Devidayal's will be able to meet the demand for high precision metal sheets and strips for radiator core and cylinder head gasket manufacturers, to defence production units and factories making precision parts for use in aircraft and electronic devices.

DEVIDAYAL

METAL INDUSTRIES

REAY ROAD, DARUKHANA, BOMBAY-10

Maintains precise gauge across the width and along the length of strip.

Metal strips can be rolled as thin as the paper in your hand, or less... i.e., .0010 of an inch with tolerance of + or -.0001 of an inch.

Company Affairs

INTERNATIONAL TRACTOR ISSUE

THE INTERNATIONAL Tractor Company of India Limited, an Indo-US collaboration for the manufacture of tractors, tractor equipment and implements will soon enter the capital market to raise Rs. 61 lakhs. The authorised capital of the company is Rs. 4 crores divided into 4,000,000 equity shares of Rs. 10 each. The issued capital of the company is Rs. 1.5 crores. Out of the issued capital, 255,000 equity shares have been subscribed at par by the foreign collaborators, — International Harvester Company, Chicago, USA. Another 255,000 equity shares at par have been subscribed by Mahindra and Mahindra Limited and 124,940 equity shares of Rs. 10 each, partly paid in cash at the rate of Rs. 5 per share, have been subscribed by the directors, friends and associates of Mahindra and Mahindra Limited. Voltas Limited, their directors and friends have also subscribed 255,000 equity shares. The balance of 610,050 equity shares of Rs. 10 each are to be offered for public subscription. The entire public issue has been underwritten. The company holds manufacturing licence for 3,500 tractors and matching implements per annum. The entire foreign exchange requirements for the import of plant and machinery is covered by the contribution of the American collaborators by way of equity participation and long-term loan.

INDIAN EXPLOSIVES ISSUE

Indian Explosives Limited proposes to enter the capital market shortly to raise Rs. 37.30 lakhs. The present issue is being floated with the object of providing the rupee finance required for the erection of a new plant to manufacture plain and electric detonators. The authorised capital of the company is Rs. 4 crores divided into 4,000,000 equity shares of Rs. 10 each. Of this, 3,000,000 equity shares of the value of Rs. 3 crores are already subscribed and fully paid-up. The present issue of 430,000 equity shares of Rs. 10 each is being offered at a premium of Rs. 12.75 per share. Of the present issue, 57,000 equity shares of Rs. 10 each at a premium of Rs. 12.75 per share are intended to be reserved in the first instance for the directors and employees of Indian Explosives Ltd. and for the directors, employees and distributors of companies associated with it. The shares not taken up by them will be available for meeting the applications from the public. The balance of 373,000 equity shares of Rs. 10 each at a premium of Rs. 12.75 per share will be offered for public subscription.

The company manufactures a range of commercial explosives and ancillary products, with the exception of detonators which are at present imported. Imperial Chemical Industries Ltd., at present, holds 80 per cent of the equity shares capital in Indian Explosives Ltd., the Union Government holds the remaining 20 per cent of the paid-up capital. After this issue, Imperial Chemical Industries will hold 70 per cent of the paid-up capital, the Union Government 17.5 per cent and the public 12.5 per cent.

BOMBAY BURMA TRADING

A setback in the earnings of the Bombay Burma Trading Corporation Limited during the year ended May 31, 1964 has been attributed to the cessation of its timber operations at the Wallace Bay branch since January this year. The activities of this branch have been taken over by a subsidiary of the company known as Wallace Bay Limited. As a result the gross trading receipts of the company declined from Rs. 592.79 lakhs to Rs. 537.47 lakhs. Sales of timber came down from Rs. 270.81 lakhs to Rs. 207.20 lakhs. Sales of coffee, tea and manufactured goods, however, increased, but even then the gross profit was slightly lower at Rs. 149.18 lakhs as against Rs. 150.57 lakhs last year. After providing Rs. 18.63 lakhs for depreciation, Rs. 60 lakhs for taxation, the net profit was Rs. 70.56 lakhs. The

directors have transferred Rs. 24.78 lakhs to various reserves and other accounts and proposed the payment of dividend on equity shares at the rate of 18 per cent, taxable, which is higher than last year's distribution of 16.8 per cent. The proposed dividend absorbs Rs. 48.15 lakhs as against Rs. 44.94 lakhs last year. A bonus of 3.2 per cent, taxable, was paid last year which absorbed Rs. 8.56 lakhs.

MYSORE KIRLOSKAR

A new unit for the manufacture of drilling, milling and special purpose machines is proposed to be promoted by the Mysore Kirloskar Limited in collaboration with Messrs. James Archdale & Co. Ltd. of the UK with an authorised capital of Rs. 1 crore out of which a capital of Rs. 60 lakhs will be issued initially. The British collaborators will subscribe 40 per cent of the initial capital of the company, which will be registered on finalisation of collaboration agreement. The Mysore Kirloskar will contribute 30 per cent of the capital and the balance will be offered for public subscription. The directors of the company have sought the sanction of the shareholders of the Mysore Kirloskar to the proposed investment not exceeding Rs. 20 lakhs in the new company.

SWASTIK RUBBER

Swastik Rubber Products Limited has proposed to increase its authorised capital from Rs. 1 crore to Rs. 2 crores by increasing 50,000 equity shares and 50,000 redeemable cumulative preference shares (9.3 per cent) of Rs. 100 each. The new shares will be offered in the first instance to the existing shareholders. The proposed increase in capital is meant to finance the growing requirements of the company as a result of an increase in its business activity. The company, which has received orders for combat boots, ground sheets and other defence requirements, proposes to construct new buildings for its factory. It also proposes to invest a sum not exceeding Rs. 7 lakhs in the share capital of industrial Glass Fibre Private Limited, a new company which is permitted to manufacture annually 720 tons of glass fibre.

KERALA RUBBER AND RECLAIMS

The Kerala Rubber and Reclaims Limited will enter the capital market shortly to raise a part of the finance required to establish a factory for the manufacture of reclaim rubber by the 'reclamator process' patented by Messrs. U.S. Rubber Reclaiming Company Limited. This will be the first time that 'reclamator process' will be adopted to reclaim rubber in India. The factory will be established near Cochin in Kerala in collaboration with the US company. The authorised and issued capital of the company will be Rs. 30 lakhs out of which shares worth Rs. 10 lakhs are to be taken up by the directors and their friends. Underwriting arrangements to cover the balance shares worth Rs. 20 lakhs are being finalised. The foreign exchange loan of Rs. 11 lakhs has been sanctioned by the ICICI to meet the entire foreign exchange requirements for the purchase of machinery.

MORARJEE GOCULDAS SPG. & WVG. COMPANY

The working results of the Morarjee Goculdass Spg. & Wvg. Company Limited for the year ended June 30, 1964 reveal a gross profit of Rs. 51.22 lakhs. After making adjustments, there is a sum of Rs. 44.72 lakhs for disposal and the directors have proposed to provide Rs. 40.37 lakhs for depreciation, Rs. 2.25 lakhs for taxation and Rs. 2.10 lakhs for development rebate reserve. The directors have recommended the payment of dividend on cumulative preference shares at the rate of Rs. 6.43 per share subject to tax, and on equity shares at the rate of Rs. 15 per share, subject to tax. The payment of dividend to the extent of Rs. 8.87 lakhs is to be paid out

Thermocole keeps your room so cool, so gay!

THERMOCOLE is foamed polystyrene: the lightest rigid insulation material. It is available in white slabs, as well as in gaily patterned tiles that make attractively gay false ceilings.

THERMOCOLE is efficient. Its closed cells provide an effective barrier against heat, noise and moisture. In fact, one inch of THERMOCOLE insulates better than four feet of concrete.

THERMOCOLE is versatile. It is ideal for insulating roofs, walls and floors in all kinds of buildings. It is also excellent for fabricating light-weight insulating partitions and doors.

THERMOCOLE is feather-light yet strong, durable and easy to work with. It cuts structure and labour costs. Efficiency with economy—that's the insulation THERMOCOLE provides.

Plan Mathematics

Capital Formation and Economic Development: Edited by P. N. Rosenstein-Rodan; George Allen & Unwin Ltd., London; 1964; Pp. 164; Price 30 Sh.

Reviewed by **D. KRISHNASWAMI RAO**

THIS BOOK is the second in the series of 'Studies in the Economic Development of India' brought out by P. N. Rosenstein-Rodan, Director of the India Project at the Center for International Studies, Massachusetts Institute of Technology. It is a collection of papers on mathematical methods in planning for development as applied to India's third five-year Plan.

The first paper in the volume is on 'The Mathematical Framework of the Third Five-Year Plan' by S. Chakravarty who attempts to formulate the different hypotheses in the models used in Indian planning and to unravel "the essential interconnections implicit in the planning calculations." He makes the useful point that the foreign trade aspect has not been clearly dovetailed with the other facets of the economy, attention having been devoted only to the inflow of foreign capital needed to finance the trade deficit expected to arise during the Plan.

Next is P. N. Rosenstein-Rodan's note on 'Alternative Numerical Models of the Third Five-Year Plan of India' in which is pointed out the dangerous optimism of assuming a capital-output ratio of 2.2:1 and an alternative ratio of 3:1 is suggested as being more realistic under Indian conditions. The marginal rate of saving in the economy is also put at a figure lower than the estimate that underlies the Plan.

In the next paper S. Chakravarty outlines a mathematical method of programme evaluation which would deal with a 'whole constellation' of inter-related projects rather than individual projects independently, because that would better bring out inter-sectoral dependence. The same writer also considers in another paper the use in programme evaluation of 'shadow prices,' that is, the marginal value productivity, of factors of production in preference to their current market prices, because in underdeveloped countries structural shortages and the absence of perfect competition make market prices of factors deviate considerably from their marginal productivity. He claims that the use of even approximate shadow prices would conduce to a more efficient allocation of resources.

S. Chakravarty and R. S. Eckaus are the joint authors of a paper on 'Choice Elements in Intertemporal Planning.' They discuss four such elements: (1) the proportion of output from

initially available resources which can be diverted from consumption to capital formation; (2) the choice of a time horizon for planning; (3) the rate at which consumption is to be permitted to grow during the planning period; and (4) the economic goals which it is sought to achieve at the end of the planning horizon. The significance of alternative decisions on these options in long-term planning are then illustrated by examples that approximate to Indian planning. In another contribution these two writers present a mathematical model of multi-sectoral intertemporal planning.

A paper by R. S. Eckaus and Louis Lefebvre works out in mathematical terms a model to show some of the elements involved in the accumulation of capital. In view of the recent accent on 'realistic' rates of interest in our country, much interest will attach to their observation that "the role of the rate of interest is to guide allocation of effort between producing consumption goods and capital in each time period toward the fulfilment of an ultimate goal. The latter can be determined exogenously, that is, independent of the rate of interest, or endogenously, in which case the rate of interest will be a partial determinant of the goal as well as a guide to its attainment." (Page 94).

Louis Lefebvre's paper on 'A Simple Optimizing Planning Model,' that is, one that tries to find the best possible pattern of allocation of resources over a period and among different sectors, and the essay by S. Chakravarty and R. S. Eckaus appraising alternative planning models will have considerable appeal for the econometrically minded. So will the concluding paper in the volume — Chakravarty's on an optimum savings programme (originally published in *ECONOMETRICA*).

One is constrained to point out in concluding, however, that Indian planning experience seems to offer to-date little ground for reliance on mathematical formulations of the type that are presented in such profusion in this book. In a country where the quantification of even the basic economic aggregates is at best so approximate and the imponderables so great that no reliable correlation could be worked out even between the level of developmental expenditure and the rate of growth of the economy, econometric methods would have more severe limitations than elsewhere. In the simile that Keynes had used in speaking of another set of economic theorists, the mathematical economists might in the Indian context turn out to "resemble Euclidean geometers in a non-Euclidean world who, discovering that in experience straight lines apparently parallel often meet, rebuke the lines for not keeping straight — as the only remedy for the unfortunate collisions which are occurring."

Readers' Roundtable

PRICES AND PLANNING

Sir, — The National Development Council discussions and official pronouncements on the fourth Plan make sad reading. They show that despite the bitter experience of rising prices and decline in the tempo of development owing to wrong planning strategy adopted in the second and third Plans, an air of unreality still persists in our efforts towards planned economic development.

The way decisions are taken on the Plan is amusing, were it not also alarming. National needs and overall perspective have been altogether lost sight of.

If this haphazard approach to planning continues and the projected Rs. 21,500-crore plan is attempted to be put through, then with the resulting distortions in the economy and inflation

— the most cruel form of taxation — the fixed income groups are likely to be decimated.

Experience since 1956 (inception of second Plan) has demonstrated beyond doubt that bureaucrats and politicians cannot deliver the goods on the economic front. But the planning strategy and targets indicate that they will force upon the country their ideas of production, distribution and consumption of goods instead of democratically allowing the people to give the necessary direction to the economy. The tragedy will be magnified by the entry of the state into consumer goods industries field, whereas much better results could be ensured if only the heavy hand of the fiscal authorities and irksome controls on existing private industries are removed.

RECORDS AND STATISTICS

Financial Resources for the Fourth Plan

ON THE basis of preliminary estimates, it is anticipated that resources of the order of Rs. 21,500 crores would be available for financing the fourth Plan outlays, of which about Rs. 7,000 crores are expected to be mobilized by the private sector. The estimate of resources for the public sector is based on the assumption that a number of policy measures will be taken to keep down non-Plan expenditure and maximise revenues at the existing rates of taxation: that, very tentatively, a credit of Rs. 2,500 crores may be assumed for budgetary receipts corresponding to external assistance; and that additional resources mobilisation of the order of Rs. 2,500 to 3,000 crores may have to be undertaken in the fourth Plan period. These additional resources will be secured through increased taxation, reduction of tax avoidance and evasion and adjustment of prices charged by public sector undertakings specially for this purpose. Preliminary estimates of resources, which are at present under closer scrutiny, will be reviewed further after the Budget for 1965-66. Provided the growth rates actually achieved in the initial years of the fourth Plan are sufficiently high, it should be possible to mobilize even larger resources than what has been assumed here.

Domestic Resources

A basic condition for mobilization of financial resources on this scale is that the physical programmes, especially in the productive sectors, will be implemented with speed and efficiency and the outputs from them realised on schedule. The estimates are based on the view that at the present tax rates, tax revenues may be expected to go up by about 8 per cent per annum. The realization of this increase in tax yields will depend on the achievement of production levels as anticipated, particularly in industries such as petroleum, sugar, steel, cement, paper and cotton textiles; and greater responsiveness of income and corporation taxes, sales tax, taxes on motor vehicles and the like to growth in production and incomes.

Non-tax revenues of the public sector as a whole are also expected to grow at a rate of around 8 per cent per annum if certain measures are taken to ensure their realization. Interest receipts are a major component of non-tax revenues and efficient recoveries of loan advances and interest payments are necessary to ensure larger resources. Similarly, enhancement of contributions to Government revenues from public sector undertakings, as also of surpluses available with those undertakings for financing the Plan, will require special efforts to keep down costs and improve efficiency. Public sector undertakings will have to pay considerably greater attention than in the past to the reduction of inventories, economy in the use of raw materials and optimal utilisation of the labour employed.

Efforts at securing larger revenues by the Government will not automatically enlarge the finances available for Plan purposes if strict discipline is not exercised on the expenditure side. For working out the first estimate of financial resources for the Plan, it has been assumed that, as a matter of deliberate policy, the Central and State Governments will restrict the growth of administrative expenditure on tax collection, general administration etc. to 5 per cent per annum and of non-Plan development expenditure (other than committed expenditure) on revenue account to 3.5 per cent per annum. The State Governments would be making their proposals to the Finance Commission on the levels of their non-Plan expenditure. In order that resources for the Plan are not reduced below the

level anticipated at present, it will be necessary for them to ensure that the proposals which they present to the Finance Commission conform to these percentages. It is further assumed that there will be no large increase in Defence expenditure over the levels presently planned and that food subsidies and non-Plan expenditure on displaced persons will be kept down to a minimum. It is also essential that all outlays on projects of a developmental nature should be undertaken only within the framework of the Plan.

The resource estimates indicated above take credit for a substantial step-up in receipts from market loans, small savings provident funds, annuity deposits and miscellaneous capital receipts. These, again, will require special efforts such as intensification of the small savings drive and a major expansion of the scope of provident funds and adoption of new instruments for promoting voluntary savings at all income levels. As a matter of sound fiscal policy, it will be necessary for the Central Government to limit its borrowings from the Reserve Bank to an amount justified by the increase in the demand for money as a result of higher production and increase in monetization of the economy. On their part State Governments will need to avoid any continuing use of over-draft facilities with the Reserve Bank of India.

Fiscal Discipline

It will be seen, thus, that for securing financial resources of the order mentioned above, it is imperative that tax administration should be rendered more effective and strict fiscal discipline observed by all public authorities for avoiding unnecessary or wasteful expenditure. Over and above this, steps will have to be taken for ensuring larger resources mobilisation since the preliminary estimates of likely resources fall short of the requirements of the minimal programme necessary in view of the economy's needs. Ways and means of securing adequate financial resources for the Plan are being further examined and it will be some time before the lines along which specific actions needed to be taken are worked out. Nevertheless, even at this stage, certain directions of policy emerge for consideration. Since the Plan visualizes a substantial increase in agricultural incomes, the scope for mobilization and adequate operation of it for development purposes requires urgent consideration. In this context, the linking of additional receipts from taxation on agricultural income to local developmental works would be a useful step to take. There is scope for examination of schedules of sales tax rates with a view to raising the burden on non-basic consumer goods; in this field, as with regard to direct taxes, the reduction of avoidance or evasion can make a sizable contribution to revenues. The proper valuation of urban property would also secure additional revenues, and the possibility of further taxation of increments in the value of urban property deserves serious consideration.

Reference has been made earlier to the need for public undertakings to bring down costs with a view to providing resources for the Plan. In a number of instances, it will also be legitimate for the undertakings to charge higher prices with the specific objective of raising resources. Capital is a scarce resource and the prices of public enterprises must be so set as to provide an adequate return on the capital employed in them. A return of 12 per cent on the invested capital would be an appropriate criterion for determining the price policy of most public undertakings. There is need for a quick and

systematic examination of the present financial position and prices charged by various public sector undertakings with a view to pre-adjusting the prices in such a way that the rate of return on capital mentioned above becomes realizable. A committee has recently studied the rates charged for electric power and concluded that there is need for increase in electricity prices in almost all the States.

The mobilization of additional resources on the scale required for the programme outlined is a difficult task. There can, however, be no escape from a major national effort in this respect. If the Plan is to be put through without accentuating inflationary pressures in the economy, State Governments as well as local authorities, equally with the Central Government, have to contribute their utmost in this effort. In order that the sharing of this responsibility is equitable and the measures taken are complementary to one another, steps should be taken as early as possible to evolve broad national policies for administration of complex measures like urban land and property taxation, taxation of agricultural incomes, pricing policies of public undertakings and so forth. Finally, the scope for mobilizing local resources for local development works should be fully explored in the case of both urban and non-urban public authorities.

Private Sector Resources

The programme envisages the mobilization of resources by the private sector for financing investment of the order of Rs. 7,000 crores over the five-year period. The expectation is that, with the anticipated increase in national income, savings of this magnitude will become available for corporate and non-corporate investments. It will, however, be necessary for private enterprises to make special efforts for enlarging their surpluses through cost-reduction and increased efficiency, and augmenting the profits retained for re-investment. Similarly, it will be necessary for households, especially those in the higher-income brackets, to reduce inessential expenditure and save more. New institutions and instruments that can be utilized for promoting larger savings by the private sector and making these savings available for investments according to Plan requirement are being examined. What needs to be recognised at this stage is that in the private sector, as in the public sector, all possible steps will have to be taken to ensure that the required resources are generated.

One of the critical constraints in formulating the fourth Plan is the need to ensure that supply of foreign exchange from exports earnings and foreign aid will be sufficient to cover the requirements of imports (for maintenance and for investment) and for meeting the obligation on account of interest and amortization of foreign loans.

On present indications the total earnings from commodity exports during the fourth Plan are expected to be of the order of Rs. 5,100 crores. The requirements of commodity imports exclusive of PL 480 imports, are tentatively estimated at about Rs. 7,200 crores. It is, however, difficult at this stage to indicate precisely the allocation of aggregate imports between capital equipment for fourth Plan projects and materials and components needed for maintenance of production. The details will become clear only after the sectoral plans have been formulated in terms of specific projects and their phasing. The volume and composition of imports will also depend in large measure on the course of actual indigenous production, particularly of metals, machinery and chemicals.

Subject to these qualifications, the deficit on merchandise account during the fourth Plan is at present estimated at about Rs. 2,100 crores. In addition, resources will have to be

found for payment of interest and repayment of principal on foreign debt. The obligations on this account during the fourth Plan are placed at Rs. 1,000 crores—Rs. 500 crores by way of repayment of debt and Rs. 600 crores by way of interest. The receipts and payments in respect of invisibles in the balance of payment accounts (other than debt servicing) may be more or less in balance.

Thus, the gap between total payments and the total receipts of foreign exchange during the fourth Plan may be of the order of Rs. 3,200 crores. This gives a measure of the volume of external assistance which will be needed during the fourth Plan in the form of aid from foreign governments and international agencies, as well as in the form of private foreign capital both in the public and the private sectors.

A necessary condition of keeping the aid down to this figure is the obligation to step up exports as planned. To secure export earnings of Rs. 5,100 crores during the fourth Plan would by no means be an easy task. It would require an intensification of the export drive in many directions; export programmes should have the first claim on available resources even if as a result a measure of sacrifice on the part of the domestic consumer becomes necessary. Detailed studies have to be undertaken concerning the various measures that would be required in terms of production, restraint on domestic consumption, reduction of costs, attainment of high quality and standards etc., to ensure that exports do in fact get a high priority.

A sustained and planned effort to build up the industrial structure in a manner which makes it possible progressively to reduce dependence on imports of commodities which can be produced economically within the country is an equally essential condition for ensuring a viable balance of payments. This in fact has been the guiding consideration in determining the pattern and priorities of industrial programmes in the fourth Plan. The possibility of executing a steadily growing investment programme and sustaining a rising tempo of domestic production without the balance of payments problem becoming unmanageable is directly linked with the success of this strategy.

Employment

The performance of the third Plan in terms of employment, as estimated on the latest data available, will be in the neighbourhood of 13 million as against 17 million employment opportunities required to match the growth of the labour force during the third Plan period. A re-assessment of unemployment, as at the beginning of the third Plan showed an over-estimate to the extent of about a million in the estimate quoted in the third Plan. Thus, with an estimated backlog of 8 million from the second Plan and a deficiency of 4 million employment opportunities under the third Plan, the fourth Plan may have to start with a backlog of unemployment nearing 12 million. With a 23 million addition to the labour force during 1966-71, the employment problem for the fourth Plan can be considered as sizable, that is, 36 million employment opportunities.

On an outlay ranging from Rs. 21,500 crores to Rs. 22,500 crores in the fourth Plan, the employment potential on the non-agricultural side is estimated to be of the order of 15.5 million to 16.2 million.

The third Plan target of 14 million employment opportunities includes an estimate of 3.5 million employment opportunities in agriculture on the basis of physical targets of additional area brought under irrigation, soil conservation, land

reclamation and schemes of a similar nature. It was also suggested that more employment opportunities would be possible under these and other programmes for increasing agricultural production, but these additional work opportunities would help relieve pressure on under-employment. On similar assumptions, it seems possible that employment opportunities in agriculture during 1966-71 will be of the order of about 4.5 million. Thus, on current thinking, it will be possible to justify for the Plan of this order, an employment potential of 20 million to 21 million as against the original target, namely, 23—25 million.

As will be appreciated, it is not possible to be categorical about employment opportunities arising out of a given totality of investments. The crux is the tempo of economic activity in the early part of the Plan which can have a multiplier effect in the second half. The structural pattern of industrial development is equally important, for instance, a big spurt of agro-processing and small-scale industries, as now contemplated, may lead to much larger generation of employment than has been estimated. It is also possible that the massive step-up of the agricultural production programmes and the subsidiary foods may create more employment opportunities which cannot be foreseen at this stage. On the whole, the position appears to be that the employment potential contemplated in the fourth Plan will be nearer to the equivalent of new entrants to the labour force than in the past.

It will be seen that, on such estimates as can be made at present, there may be a gap between the increase in the labour force over the Plan period and the anticipated increase in employment opportunities. There is, besides, the estimated backlog of employment at the end of the third Plan. In the circumstances, at a later stage in the preparation of the fourth Plan, it will be necessary to consider whether and to what extent provision should be made for a supplementary rural works programme. In working out the details of programmes in different sectors, specially in the plans of States, every effort should be made to ensure that areas in which there is considerable unemployment and under-employment receive due attention and that Plan provisions are utilised so as to make the maximum possible contribution to the creation of new employment opportunities and the relief of existing unemployment and under-employment. When this has been done it would be necessary to assess the size and composition of the residual problem of unemployment in rural areas and to identify those areas in which a supplementary rural works programme could make a significant contribution. At this stage, therefore, the scheme of Plan allocations makes only a small token provision for Rural Works.

The addition to the labour force in the fifth Plan will be of the order of 30 million. Unless, therefore, employment can be provided to 23-25 million persons in the fourth Plan, the task in the fifth Plan will be correspondingly heavier.

Agricultural Production

The third Plan accorded the first priority to increase in agricultural production. It also provided for resources, material and financial, for agricultural development which, it was thought, would make it possible to achieve a high rate of growth. These expectations have not been fulfilled during the past three years. To an extent the shortfalls may be traced to the fact that progress in physical terms in irrigation, soil conservation and other programmes has been smaller than the Plan had envisaged. It is also true that the supply of the Plan had envisaged. It is also true that the supply of material inputs, specially fertilizers, has been appreciably below the levels contemplated in the Plan. Unfavourable weather conditions too have played a large part. Nevertheless, the setback in agriculture since the end of the second

Plan is a cause of deep concern and has, in turn, led to fresh consideration of the assumptions, methods and techniques as well as the machinery of planning and plan implementation in the field of agriculture. This examination has not yet been completed. However, it is possible to indicate the broad lines along which agricultural plans have to be reoriented, so that there may be more adequate preparation for the larger tasks of the fourth five-year Plan.

Scientific Agriculture : During the past decade and more, substantial investments have been made in agriculture, irrigation and allied programmes of development. The results achieved have been significant enough but, having regard to the growth of population, the larger demands for food, agricultural raw materials and improved standards of consumption, they cannot be described as commensurate with the requirements of the economy. While there is evidence of progress in a number of directions it is yet true that there has been a marked lag in the application of the results of scientific research, in the adoption of better implements and more scientific methods of agriculture and, generally, in the extension of imported agricultural practices. The proportion of cultivators who have taken to scientific agriculture is still quite small. No doubt, due to the slow implementation of measures of land reform, the structure of the rural economy has not changed to the extent postulated in the earlier Plans.

Economic Incentive

At the same time, in those parts of the country in which a growing number of farmers have begun to adopt scientific methods, the need to strengthen and extend the existing facilities for agricultural research and its application is being increasingly felt. It is crucial to the success of agricultural plans and the growth of the national economy as a whole that the utmost emphasis should now be placed on the transformation of agriculture from a predominantly traditional way of life into an industry, based more and more on the adoption of science and technology making efficient use of the resources available, providing the necessary economic incentives for greater investment on the part of the farmer, and giving him a fair measure of protection against price fluctuations, unduly high costs and, to the extent possible, against risks of crop failure on account of national calamities. In other words, having regard to the experience of recent years, all possible steps have to be taken to create a more favourable technological and economic environment for rapid advances in agriculture and the strengthening of the rural economy as a whole.

Estimates of Demand : In view of the growth of population and allowing for some improvement in consumption standards, the demand for foodgrains at the end of the fourth Plan is estimated at around 120 million tonnes. Requirements of oilseeds are reckoned at about 12 million tonnes, of sugarcane (gur) at about 13 million tonnes, of cotton at about 9 million bales and of jute at about 8 million bales. At the end of the third Plan, on present anticipations, the level of foodgrains production may be of the order of 90 to 92 million tonnes, of oilseeds about 7 to 8 million tonnes, of sugarcane (gur) about 11 million tonnes and of cotton and jute at over 6 million bales each. Shortfalls in relation to the original targets of the third Plan make the task of attaining the levels of output required by the end of fourth Plan specially difficult. In drawing up the outlines of the fourth Plan, to the extent possible, the aim must be to ensure inputs such as would support increase in agricultural production at a rate of not less than 5 per cent per annum. Even this rate of growth will not be adequate in all respects. The existing gap in supply is considerable and, with all the efforts that may be made, the possibility of unfavourable weather conditions cannot be disregarded. It is important that the Plan for agriculture should remain sufficiently flexible to permit a larger

effort wherever there are prospects of achieving a breakthrough or wherever greater intensification is feasible. In this sense the resources provided for agricultural development in the Plan are to be regarded as a general frame within which the most intensive possible effort has to be organised. At whichever point it may be possible to strengthen this effort, the aim should be to make the necessary material and financial resources available. It should be emphasised here that the physical target to be achieved in agriculture have to be largely built up from below, through detailed work in the States, specially at the district and block level. A fuller picture will, therefore, emerge only when States have been able to complete their agricultural plans and these have been considered in co-operation with them. From this aspect, it will be desirable to arrange for consideration of agricultural programme between the Central Government and the States well ahead of the series of discussions next year on the draft plans of States for the fourth Plan period.

Approach of Intensive Areas : One of the principal lessons stressed in the Mid-term Appraisal of the third five-year Plan was that much greater emphasis should be given to the development of scientific and progressive agriculture in an intensive manner in areas with relatively favourable agricultural conditions. In particular, in areas with irrigation and assured rainfall, everything possible should be done to secure high yields per acre. This was considered essential if, over the country as a whole, despite unfavourable seasonal conditions here and there, a steady and continuous increase in agricultural production was to be realised from year to year. Accordingly, in January 1964, at the suggestion of the Planning Commission, the Agricultural Production Board agreed that about 1500 development blocks, covering roughly 20 to 25 per cent of the cultivated area of the country, should be selected for intensive agricultural development. The fifteen districts in which the Intensive Agricultural District Programme was in operation covered about 300 development blocks with a total area of more than 8 million hectares. In addition to these, about 1200 development blocks were to be selected and brought under intensive development over the three years 1964-65, 1965-66 and 1966-67. While these areas might be selected with due regard to their predominant crops, the scheme of intensive development should take into account the entire crop economy of each area. This decision of the Agricultural Production Board was followed by the appointment in the Ministry of Food and Agriculture of a Director-General of Intensive Areas. So far about 600 development blocks have been selected in 75 districts, but more systematic planning of programmes of development, supplies and credit in each of the intensive areas is an urgent necessity.

Intensive Agriculture

For achieving substantial increases in production it is necessary to select the blocks for intensive development on the basis of careful study. It is desirable to take up in each district all the blocks which present favourable prospects and satisfy the criteria of selection, as this would make it easier to provide the higher level scientific and technical personnel needed to guide and assist extension staffs in the development blocks. The agricultural programme for any area selected for intensive development has to be closely related to its special conditions and possibilities. Thus, areas with assured water supply, whether from irrigation or rainfall, areas enjoying protective irrigation from canals, tubewells and other sources, areas with good underground resources and dry areas will call for different combinations of agricultural programmes. It is, therefore, important that in developing agricultural programmes in detail the requirements of each area should be gone into in detail and, generally speaking, schematic formulations such as have been frequently proposed in the past from the national or State level should be tested on the ground and modified to meet local conditions. In other words, each area should be regarded as a 'project' for which appropriate

programmes are worked out, the necessary inputs are made available, and programmes for the utilisation of existing irrigation, development of new irrigation, soil conservation, plant protection, improved agricultural practices and other methods of raising yields per acre are carried to the farthest extent practicable. In these areas the extension machinery has also to be strengthened, both in numbers and in quality, as this is an indispensable condition for achieving a significant impact.

Briefly then, agricultural programmes for the fourth Plan have to be formulated in terms of (i) a systematic effort to extend the application of science and technology, (ii) creation of more favourable economic environment, (iii) strengthening of the machinery for extension and community mobilisation for agriculture, (iv) assuring adequate supplies and resources, and (v) intensifying agricultural programmes to the maximum extent possible in areas with irrigation and assured rainfall where there are fair prospects of achieving rapid increase in production.

OUTLAYS ON AGRICULTURE IN THE PUBLIC SECTOR (Rs. crores)

Head of Development	Anticipated Third Plan Outlay	Proposed outlay for the Fourth Plan		
		Total	Investment	Current Outlay
Agricultural Production	226.07	774.00	276.44	497.56
Minor Irrigation	178.76	450.00	403.33	46.67

they do not consider sound but which they must nevertheless agree to administer.

With the stage thus set for the Chief Ministers' Conference on Food later this month, a Gilbertian situation is being created and it is, therefore, up to Parliament to try to rescue the country from the consequences of the Central Government's folly. This it can do only if, during its current session, it resolves and manages to discuss food policy not as an issue of party policy but as a basic national interest. Here a very great responsibility clearly rests on the Government. Granted that the nation's food difficulties have been aggravated by opposition groups attempting to exploit them, it follows that no Government policy for food, however sound in itself, has a fair chance of succeeding unless a proper political climate is created for it in the country. It would be wishful thinking on the part of the Home Minister to imagine that such a climate can be secured by breathing fire and brimstone against opposition politicians. The only constructive opening left to the Government is to avail itself of the opportunity of the current session of Parliament for obtaining consensus in favour of a demonstrably sound food policy. The Government should be all the more ready to seek this consensus on a national basis since the ruling party itself is by no means of one mind on the wisdom of some of the major proposals for food management emanating from the Cabinet. We have no hesitation in

declaring that the massive, mechanical majority which the ruling party commands in Parliament would be of no relevance at all as a sanction for the Government's food policy so long as the soundness of that policy continues to be debated not only in the country but also within the ruling party itself. We, therefore, recommend strongly that Parliament, in its present session, should be given all reasonable opportunities by the Government for a full and frank discussion of all major issues of food policy so that a consensus could be evolved as a guide to the Government's management of the nation's food affairs. This process of constructive consultation between the Government and Parliament will become really fruitful if a representative but compact committee of legislators is constituted to sit with the Ministers concerned for a businesslike discussion of the essential issues of food policy so that the members of this committee could subsequently participate more effectively in discussions on the floor and guide them along practical and purposive lines. It is often said that India is a poor country; and Parliament is certainly an expensive institution. The people, therefore, have every right to expect of the Government and the legislators that they co-operate among themselves in order to ensure that this session of Parliament, which is meeting at a time when the country is faced with so many grave and urgent problems, turns out to be something more than a talking shop.

The Bomb and the P.M.

AT THE A-ICC session at Guntur, the Prime Minister returned a categorical and imperative 'no' to the clamour that this country too should go to work on the making of an atom bomb since Red China has now succeeded in forcing an entry into the club of nuclear powers. While his firm stand against the Bomb has received general support among Congressmen as well as in the country at large, it is too much to hope that he has succeeded in killing the controversy before it has had time to gather force. On the contrary, it is very likely that the Bomb will figure in the forthcoming session of Parliament as an alive and lively item on the agenda. It is consequently a matter of some importance that this issue should be discussed in relevant and adequate detail.

This purpose, however, will not be served if sentiment is allowed to be mixed with sense as was the case at Guntur. We do not see what useful purpose is served by pleading India's alleged addiction to peace and non-violence as an argument for never making the Bomb. These ideals have certainly — and rightly — not come in the way either of our having a standing army or employing it or expanding it for the purpose of defending our country. It is true that in the matter of protecting our national security we have not been as successful as

we should have been. But this has nothing to do with any idealistic partiality on our part for the principles of peace and non-violence. On the contrary, errors in political or military judgments have had to do more with the defects or deficiencies in our defence than any abstract pursuit of Virtue for Virtue's sake.

Leaving, then, idealistic protestations aside, we should opt for the more useful exercise of considering the problem of the Bomb in strictly pragmatic terms. Here a point of some relevance would be the stand which this country has been taking on international platforms on the issue of the use of atomic energy for destructive purposes. It is well known that the Government of India has frequently declared itself to be against the spread of nuclear armament. Although, here as elsewhere, much was owed to the inspiration of the late Jawaharlal Nehru, it is not possible to dismiss this national stand on nuclear armament as any particular individual's personal credo. Actually, the present Prime Minister, as Prime Minister, has committed himself and his Government to this policy on nuclear weapons every whit as firmly as his predecessor.

Thus, as recently as in August last, Mr. Lal Bahadur, in a message to the United Nations International Con-

ference on the Peaceful Uses of Atomic Energy held in Geneva, declared solemnly for the benefit of this country's conscience as well as the world's that "India believes today, as it has always believed, that atomic energy should only be used for peaceful purposes and for the welfare of humanity and is resolved to use it only in this manner as far as its own efforts are concerned". This is a serious undertaking seriously given from a world forum and it is obvious that this country cannot lightly depart from it without doing grave injury to its name and reputation in the community of nations.

We are, of course, not suggesting here that because in certain circumstances India has given on its own a certain pledge to world conscience, it cannot reconsider it in any event or, more particularly, even when it has become necessary that it should do so for the strict purpose of self-preservation. But we do maintain that a deliberate statement of national policy, which in this case amounts also to an international commitment, cannot be discarded unless it has become demonstrably the case that certain new developments have taken place which compel a reconsideration of the old attitude on the ground that otherwise the nation's very existence might be imperilled.

The issue, therefore, is whether the nuclear explosion which China has now managed to set off is really in the nature of such a new development. The answer, in our view, is that it is not. Peking after all had been known to be working on a nuclear bomb project for some time now and India's commitment to employ atomic energy solely for peaceful purposes has been made in the full knowledge of this fact. It is true that there has all along been a tendency to depreciate Chinese progress in nuclear technology and it does seem to be the case that China has managed to set off a nuclear explosion much earlier than what the rest of the world believed likely. It seems also to be the case that Peking has not only anticipated the time-table which other countries have been patronisingly setting for its nuclear programmes, but has also reached a stage of sophistication in nuclear bomb technology which, even more than the earliness of the explosion, seems to have surprised some hitherto cynical commentators. The fact remains, however, that Chinese intentions and efforts in the field of nuclear bomb-making have been well and widely known, and consequently all other countries of the world which have an interest in this matter should have been prepared for China sooner or later achieving some success in this project. It follows that if India has nevertheless been repeatedly declaring that it will not use its atomic energy resources or potentialities for making a Bomb, it has been doing so in clear awareness of the possibility that China, at whose hands it has already experienced aggression and from whom it must be prepared to meet

further aggression in the coming years, may well come to equip itself with a nuclear weapon system in the foreseeable future.

It is, therefore, reasonable to assume that the Indian policy of abjuring the atom bomb is based on the judgment that the development of nuclear weaponry by Red China need not necessarily mean that the military power pattern subsisting between China and this country is altered in such a way as to make a retaliatory nuclear armoury an unavoidable necessity for our defence or self-preservation. We submit that if this, indeed, is a correct evaluation of the Government of India's thinking, there is sufficient warrant for the Prime Minister taking the stand he did at Guntur. To start with, China does not need a nuclear weapon system to establish its military superiority over this country. That superiority is an admitted fact even in terms of conventional armament. It may be argued, of course, that China could flourish the big stick of a nuclear bomb to dictate to this country in the matter of the border dispute or otherwise try to bully it into a position of political submission. But the short history of nuclear weaponry in world politics has already been able to demonstrate the strict limitations of the bullying power or potential of the Bomb. In an interesting broadcast talk, Dr. H. J. Bhabha pointed out recently that the importance of the possession of a minimum supply of nuclear weapons coupled with an adequate delivery system is that it confers on a State capacity to destroy more or less totally the important cities and industrial centres in another State, thereby enabling the former to deter another nuclear power from using nuclear weaponry against it. While this argument may certainly be used in favour of this country seeking a nuclear equation with China's military power, the more important implication of Dr. Bhabha's point seems to us to be that such political and military advantage which China may expect to achieve in due course with the development of a nuclear weapon system would largely be in the direction of its being able to bargain better with the great nuclear world powers, such as, the United States and the Soviet Union, for a place of power and prestige in the world political system. Without a nuclear armoury China may feel vulnerable and exposed in its attempt to establish an acceptable political equation with other world powers, but with it, its negotiating powers could considerably improve. In our view, this is the most likely direction in which the political and diplomatic aspects of China's nuclear weapon strategy are likely to develop. In other words, we do not believe that the major or particular repercussions of the Chinese nuclear weapon programme would be felt in the military or political power relationship between China and this country. It stands to common sense that, if China is arming itself with nuclear weapons, it must be doing so more in terms of its relations with other great powers

"CUPPACHA?"

Besides adopting the Indian word for tea, the U.K. in the month of March 1964 alone, also took Rs. 1.04 crores worth of tea. The rest of the world took Rs. 4.89 crores worth. A year's export of tea will earn enough foreign exchange to finance a project twice as large as the nuclear power plant at Tarapur. That's how important tea exports are — how important exports are to India.

Food and Parliament

THE NATION'S Parliament now in session has a serious responsibility in the matter of evolving a sound national policy for food. The Government having so far failed to provide able and adequate leadership to the country in this matter, it has now become the duty of Parliament to attempt to do so.

Unfortunately, this important task before Parliament has not been rendered any the easier by the public statements of the Prime Minister and the Home Minister who have been in an indecent hurry to blame Kerala's food troubles on the agitational tactics of Communist opposition groups. Mr. Lal Bahadur may, indeed, be justified in blaming opposition parties for instigating dock workers in Cochin to go on a strike thereby causing arriving grain shipments to be held up at the port. Mr. G. L. Nanda, again, may have cause for denouncing attempts at exploiting food shortages for political purposes by inciting people to looting and lawlessness, but it is surely not the case that, even if the behaviour of opposition politicians had been at its angelic best, the disgraceful food muddle in Kerala would not have been perpetrated. It is just not possible for the Prime Minister or for the Home Minister to gloss over the fact that the Governor of Kerala, who is a senior member of the ruling party, has said publicly that the responsibility for the food crisis in that State must rest squarely on failures in the Central Ministry of Food and Agriculture. Mr. V. V. Giri's charges cannot be lightly regarded because there is also other evidence showing that the Central Government had not been adequately prepared for maintaining even minimum flows of grain into deficit areas in the South in the critical weeks before the arrival of new crops.

In these circumstances, if the Prime Minister were to yield to the temptation of looking for scapegoats in opposition parties, he would clearly be doing no service to the country since his attitude would cause both provocation and justification for the inevitable discussions in Parliament on food being turned into destructive and purposeless inter-party mud-slinging. This would be a waste of Parliamentary time which the country just cannot afford at the present time. On the contrary it is a vital national interest that a proper climate should be created and maintained for a constructive discussion in Parliament of the requirements of a national food policy. It is no secret that the ruling party is sharply divided over major issues of food policy. Thus, although the Central Government seems set on a scheme of limited State trading through a statutory public food corporation, it is by no means the case that this proposal enjoys the support or confidence of the ruling party as a whole. Differences of opinion among Congressmen seem to be even more pronounced with regard to the wisdom of introducing rationing in the country. It is a pity that at the recent session of the A-ICC at Guntur, there was not enough of free and frank discussion in the party of these differing points of view. As it is, it has been left largely to the Chief Ministers of State Governments to import a critical element into the discussions of the Centre's proposals or projects. Strangely enough, the Chief Ministers, instead of being complimented on their pragmatism, are being condemned in the Press and elsewhere for alleged non-co-operation with the Central Government. In the last few days one unthinking commentator after another has been calling upon the Prime Minister to assert the authority of his office and drag on the State Governments in support of policies which

A small cost at the initial stage in analysing the marketability of the product is worthwhile instead of repenting after millions of rupees have been sunk.

The ICICI attempts to strengthen a project through its scrutiny. The promoter is asked to obtain assurances regarding supply of raw materials, power and transport. He is also required to enter into or obtain modifications in technical collaboration arrangements. All these are necessary requirements which some of the promoters do not like. The criteria now evolved by the ICICI are the outcome of the past experience. Mr. Mehta explained that "an institution like ours has to have uniform criteria for all projects; flexibility is exercised in relation to and not at the cost of these criteria."

Discussing the equity-debt ratio, Mr. Mehta said that in many of the proposals received by the ICICI, the equity of a company is much smaller than the debt proposed by it. Many reasons impel the promoter to keep the equity smaller in relation to loans. The ICICI has always insisted that the new projects should have a high initial equity-debt ratio so as to tide over the early difficult period. If the equity basis is small, there is every possibility of the project running into difficulties at the early stages for paucity of funds. Exceptions are, no doubt, made and in this regard he gave the case of the aluminium industry which is highly capital-intensive. It has also been found that the promoters tend to underestimate the cost of the project. They ignore the preliminary and the operative expenses which very often go up to 30 per cent of the project cost estimates. Promoters need assistance and advice in this regard; the technical knowledge which the ICICI has is made available to the promoters.

Mr. Mehta stressed the need for co-ordinating the activities of the various financial institutions which are currently in the field. Many of the projects in recent years have come into being with the support of not only the ICICI, but also the Life Insurance Corporation, the Industrial Finance Corporation of India, the National Development Finance Company, the International Finance Corporation, etc. All these institutions have the same objective of determining the viability of the project. Their procedures are not uniform. Some common code needs to be laid down so as to "co-ordinate the approach to these institutions to avoid delay in arranging finance."

The ICICI, according to Mr. Mehta, has so far assisted more than 300 companies; the total assistance amounted to a little less than Rs. 100 crores. Many of the industries which have received assistance from the ICICI are non-traditional ones. The ICICI saw to it that not only the projects were successfully completed but also that they have long-term growth and prosperity.

CALLAGHAN'S LITTLE BUDGET

THE NEW Chancellor of the Exchequer in Britain, Mr. James Callaghan, has announced certain taxation proposals in a Supplementary Budget which have been termed as his "Little Budget". The proposals include an increase in both direct and indirect taxes. The standard rate of income tax will be raised by 6d from April 1, 1965, thus, taking it to 8s. 3d. in the pound. It is estimated that this raise in the standard tax will increase the revenue of the Government in the 1965-66 financial year by as much as £122 million. The Chancellor has also announced an increase of 6d. a gallon in the duty on petrol, hydro-carbon oils and diesel oil. The yield from this fresh impost is estimated at £32 million in the current year and £93 million in the next financial year. He also stated that he was planning to introduce a far-reaching capital gains tax next year which would apply to gains from all assets. The tax would not exceed the difference between the value of any particular asset on budget day in 1965 and the amount realised when it was eventually disposed of. No reliefs to capital losses would be provided. Another measure would be a new Corporation tax which would replace the income tax and profit tax on the income of com-

panies. The rates of taxation will be decided according to the economic climate next year. The new Corporation tax would bring about a cut on the current rate of taxation on undistributed profits. He expressed the hope that these reforms would tone up the economy so as to face the future. Another important announcement made by the Chancellor was that the 15 per cent surcharge on imports of manufactures would be valid until November 30, 1965. Earlier, when he imposed the 15 per cent surcharge, he had indicated that it was a temporary measure and that it would be scrapped as soon as the balance of payments position of the country improved. He has now named a firm date when the surcharge would be withdrawn.

LINK LANGUAGE

WHEN THE Union Education Minister, Mr. M. C. Chagla, announced the appointment of an Education Commission in July this year (see "Eastern Economist" dated July 24, 1964) to look into the various aspects of the educational problem in this country, it was known that the Commission will have to spend a number of years in order to do full justice to all the terms of reference. It was also expected that the Commission would be asked from time to time to submit interim reports regarding those facets of the problem which demanded immediate action. It has now been made known that the Education Minister has sought an interim report from the Commission on two aspects of the language question, besides the one relating to the medium of instruction in the universities. The Commission has been asked to report on the working of the existing three-language formula and give its opinion if it has worked well. If not, the Commission has been asked to suggest the changes required to make it workable. The Commission has also been requested to prepare a report on the importance of a link language in India and to give its opinion if Hindi can play that role efficiently. The Commission will state the steps which should be taken for a smooth change-over to Hindi. Further, it will investigate if it will be necessary to continue with English as the link language till Hindi can completely take over.

"Let me in; I want to ask for a grain of rice to paint his portrait on."

On Legalisation of Abortions

DR. KAMAKSHI SUNDARAM

WHILST THE Government of India certainly deserves to be congratulated on its decision to seek the advice of an expert committee on the question whether abortion should be legalized, it is necessary to point out that the committee could carry out its assignment properly only if its scope and purposes are properly defined.

It is not yet clear, for instance, whether abortion is to be considered as a method of family planning or as the last resort for those who, by sheer mischance, are faced with an unwanted pregnancy in spite of their having adopted family planning methods. Time and again we have come across people who have been fully motivated to plan their families but who, on account of method failure (from lack of proper understanding of the method) or because of the non-availability of the required contraceptives or through carelessness, have to countenance an unwanted conception. The question that baffles the family planning workers is whether women who have conceived thus should be persuaded to accept their lot or whether the medical authorities should be authorised to extend the facility of legalised abortion. While the law of the land remains unchanged in this regard, the affected couples are forced to find their own means of terminating unwanted pregnancies. In the process, the women are invariably found to have contracted some infections or are so badly bruised as to require hospitalisation. One of the most painful experiences for the medical profession in our hospitals is the endless parade of cases awaiting treatment for the consequences of crudely or amateurishly contrived miscarriage. It cannot be denied that people resort to abortion irrespective of the preventive laws and it is very often the case that those who perform the operation are normally not qualified to do so. Actually, the prevalence as well as the acceptance of the procedure raises the question whether it is not permissible to emphasize its reality as a family planning method and thereby facilitate its easy administration.

It is not widely known that abortion, in certain circumstances, is already legal in this country, but it is possible only when the cause is therapeutic. By therapeutic abortion is meant an abortion induced in a woman under strict surgical supervision in an operation theatre by qualified personnel on grounds of the medical unfitness of the mother to continue to the strains or hazards of the pregnancy. If family planning is considered essential for the health of the mother, then it follows that the incidence of too frequent pregnancies could properly be cut short by terminating them as they occur. Naturally, surgical precautions and aseptic conditions are absolutely necessary to rescue the pregnant woman from the resulting infection, tetanus, etc. If the reasons for therapeutic abortion can be stretched so as to include cases of recent deliveries, heart diseases, T.B., hereditary and contagious diseases etc., the medical profession may be able to

assist the programme in an authorised and guiltless manner.

There have been a few haphazard studies of attitudes towards abortion. It is known that neither education nor religion nor economic conditions have hindered the truly motivated person from resorting to such a procedure with a feeling of justification. All that can be done in such circumstances is to assist such a determined person with medical care which she can get if abortion is legalised.

Educating Public Opinion

How far will society accept "legalised abortion" to its full extent? There are bound to be vehement objections in this country to the killing of an embryo. This will call for education of the public opinion and the clarification of procedures. Opposition could be minimised by emphasizing the safeguards against the abuse of the facility. Thus persons seeking the relief may be required to give an undertaking that other family planning methods will be followed more carefully in the future. This also involves an efficient system of education in the abortion ward itself and thorough follow-ups of the "aborted" cases. It will be appropriate to mention here that abortion refers to the termination of pregnancy prior to the 28th week, for the child is not viable until that stage of pregnancy is reached.

Any committee examining the legalisation of abortion will have to consider the following questions:

Whether abortion is to be used as a means for cutting down the birth rate as in Japan?

Should abortion be limited to those women who are already practising family planning and have suffered a method failure or is it to be made possible for everyone who seeks abortion for purposes of restricting the size of the family?

Is the induction of abortion to be restricted to married persons only or to unmarried persons as well?

Will there have to be restrictions on the number of abortions practised on a woman?

Will easy abortions make man indifferent to family planning techniques and can this be avoided by restricting the number of abortions?

Will restriction result in one "open" abortion being followed by surreptitious ones unless a well-regulated follow-up programme is initiated?

There are bound to be "conscientious objectors" amongst the doctors, nurses and others who are expected to participate in this programme — are they to be forced to acquiesce?

Are the Primary Health Centres in the rural areas to be equipped to take on abortion cases under strict aseptic circumstances?

Legalised abortion will no doubt attract some evils but in the case of its adoption as a means of curbing India's population increase, the committee of experts will have to devise ways and means for controlling the opportunities for abuse.

which are already entrenched in powerful nuclear positions than in terms of its relations with this country which not only has no nuclear armoury but has also disavowed any intention of ever embarking on a nuclear bomb project.

There has been some interesting discussion on the economics of bomb-making. Dr. H. J. Bhabha has attempted to counter the popular impression that none but the major world powers could really afford nuclear bombs. Explaining that plutonium for nuclear explosions could be obtained as a by-product from the nuclear power stations which are being constructed or are planned in many countries, including ours, he estimates that a stockpile of some 50 atomic bombs could be built within an expenditure of under Rs. 10 crores, while even a stockpile of 50 two-megaton hydrogen bombs may not cost very much more than Rs. 15 crores. He points out quite rightly that these expenditures would be small compared with the military budgets of many countries. But, at the same time, it should not be ignored that a nuclear weapon system would mean much more than a stockpile of nuclear bombs. As Dr. Bhabha himself has noted at another place in his broadcast, an adequate delivery system is an integral part of a nuclear weapon project. There is also the fact that a country thinking in terms of a nuclear striking force for itself must necessarily and simultaneously be prepared with a system of interception and defence against a nuclear attack on itself. The point is that a military strategy conceived in terms of nuclear weaponry may be an altogether different one from that based on conventional weapons. The aggregate cost of such a military strategy has therefore to be evaluated in much larger terms than that of what it merely costs to build a minimum stockpile of nuclear bombs. Unless this more comprehensive exercise is satisfactorily executed, the country can have no reasonable opportunity of learning what a nuclear weapon system would really cost it. In these circumstances, the amounts of Rs. 10 crores or Rs. 15 crores mentioned by Dr. Bhabha as the cost of Bomb stockpiles constitute information which is not only inadequate but which may be altogether misleading.

At the same time, it must be conceded that the question of cost in the ultimate analysis cannot be a decisive consideration. There can really be no financial argument against the country aiming to provide adequately for its safety. This country has a five-year defence programme aiming at an annual rate of spending of some Rs. 1,000 crores on the nation's defence preparedness. Apart from the fact that it might be possible to accommodate a nuclear weapon system within this or a slightly larger military budget, there is also the possibility that should this country decide in favour of a nuclear weapon project, it would naturally have to reconsider and redesign its ideas and attitudes on such matters as military alliances — in which case it would

become possible surely to ensure that this country does not have to bear the entire burden, in terms of financial or physical resources, of its nuclear armoury. It may not, however, be useful — and it is certainly not necessary — to pursue the question of cost further at this point since the answer in our view to the basic issue whether the Bomb has become a military necessity for us must clearly be in the negative.

It is important to add, however, that while there is no need for us to imitate the Chinese in nuclear bomb-making, it would be a mistake to conclude that no new political or diplomatic initiatives are called for. The arrival of an aggressive nuclear power at our door-step has certainly heightened the importance and urgency to ourselves of real and early progress towards world nuclear disarmament. If there is any point at all to Dr. Bhabha's thesis on the relative inexpensiveness of nuclear bombs or the reasonableness of the temptation to countries generally to seek to provide themselves with nuclear armoury as a deterrent to nations stronger than themselves, it is that there must be renewed international activity on a large and vigorous scale for committing the world and the world's entrenched nuclear powers to the employment of nuclear technology solely for peaceful purposes. India has always been playing a great role in this effort and she can respond best to the Chinese nuclear explosion by redoubling her exertions. While it is true that nuclear disarmament is something which can be effected only by nuclear powers, it is equally true that the promotion of a world conscience and the generation of the pressure of world opinion in favour of nuclear disarmament can best be undertaken by countries such as ours which are not only in the position of not having become nuclear powers yet but have also pledged themselves not to become nuclear powers ever.

Eastern Economist 20 Years Ago NOVEMBER 24, 1944

The International Business Conference, which concluded its sessions at New York last week is, in many respects, a unique one. It is the first non-official conference in the international field, being sponsored by influential bodies of American business opinion and represented by business spokesmen of fifty-three nations. Official conferences there have been, for instance, on security, monetary stabilization, aviation and post-war relief, which have attempted to attain some measure of combined action in the international sphere, but on the fundamental question of the right commercial policy on which depends future world prosperity, governments are still fighting shy of taking the initiative, even though they all talk idealistically of expanding international trade. Meanwhile business men from different nations, thanks to American initiative, have come together in conference to exchange ideas and see whether a consensus of opinion on international economic issues cannot be created at least among those engaged in business.

Highlights of the Week

FOOD CORPORATION

MR. C. SUBRAMANIAM, the Union Minister for Food and Agriculture, introduced in the Lok Sabha this week a Bill providing for the establishment of the Food Corporation of India — an autonomous body — to undertake "trading in foodgrains in a commercial manner but within the framework of an overall Government policy". The Government found it necessary to set up such a Corporation in the interests of both increased agricultural production and the common consumer. It is of the opinion that only by the establishment of such a Corporation will it be possible to implement effectively any official policy of ensuring that the primary producer obtains the minimum price fixed from time to time and the consumer is protected from the "vagaries of speculative trade".

Outlining the objectives of the Bill, Mr. Subramaniam stated that the establishment of the Food Corporation of India is one of the essential and important steps in the implementation of Government's policy. The Corporation will be the first organised attempt to take up State trading in foodstuffs on an appreciable scale; it will also be used to build up gradually the vitally-needed buffer stocks. The Corporation will "engage itself in the purchase, storage, movement, distribution and sale of foodgrains." If necessary, it will also deal in other foodstuffs. In consultation with the Central Government, the Corporation will also discharge certain incidental functions. It is anticipated that it will have a strategic and commanding position in the foodgrains trade of the country. Since it is necessary that the Corporation must work with the active and continued co-operation of the State Governments and their machinery, the Bill has provided for the setting up of boards of management and State Food Corporations to secure such co-operation.

The initial capital of the Corporation will not exceed Rs. 100 crores, though its quantum will be fixed by the Central Government and will be provided by it from time to time after Government approval is made by the Lok Sabha. The Bill has provided for increasing the capital of the Corporation by the Central Government, if need be. The Bill has also provided that the capital of a State Food Corporation should not exceed Rs. 10 crores; the exact quantum of the capital of each State Food Corporation will be fixed by the Central Government after consultation with the Food Corporation of India. The capital of State Food Corporations may also be increased by the Central Government in consultation with the Food Corporation of India. The Bill has provided for the guarantee by the Central Government of the repayment of principal and the payment of interest etc. in respect of loans and advances made to a Food Corporation by a scheduled bank or any other bank or financial institution against stocks of foodgrains. The Bill has empowered the Food Corporation to guarantee any money lent by a scheduled bank or other financing agency to a grower of food crops on the basis of agreement entered into by that Corporation with the grower of foodgrains for the purchase of foodgrains. The management of the affairs and business of the Corporation shall remain in the hands of a Board of Directors authorised to exercise all such powers provided in the Bill.

The Head Office of the Corporation shall be at Madras. The Corporation may establish offices or agencies at other places inside or outside India.

SUGAR PRICE POLICY

THE GOVERNMENT of India has announced the new ex-factory prices of sugar in different regions which, according to the official communiqué, have been fixed after taking into account the increases allowed in the cane price and estimates of duration and recovery for the 1964-65 season. The prices fixed for sugar of ISS Grade D-29 are: Rs. 118.00 per quintal for factories in the Lucknow Division of Uttar Pradesh, Ma-

harashtra and Mysore; Rs. 118.75 per quintal for factories in East Uttar Pradesh, Rohilkhand and Agra Divisions of Uttar Pradesh, North Bihar, West Bengal, Gujarat and Andhra Pradesh; Rs. 121.25 per quintal for factories in Dehra Dun and Saharanpur districts of Uttar Pradesh; Rs. 123 per quintal for factories in Madhya Pradesh, Orissa, Madras, Pondicherry and Kerala; Rs. 129.25 per quintal for factories in Meerut, Muzaffarnagar and Bulandshahr districts of Uttar Pradesh, Punjab, South Bihar and Rajasthan; and Rs. 126 per quintal for the factory in Assam.

The maximum fall in price in relation to the preceding season has been in the case of Rajasthan from Rs. 138 per quintal to Rs. 129.25 per quintal. The other areas for which the new prices are lower than the prices in the last season are Punjab, Lucknow Division of Uttar Pradesh, East Uttar Pradesh, Rohilkhand and Agra Divisions of Uttar Pradesh, Dehra Dun and Saharanpur districts of Uttar Pradesh, Meerut, Muzaffarnagar, Bulandshahr districts of Uttar Pradesh, North Bihar, Madhya Pradesh and West Bengal. The prices have remained unchanged in the case of Maharashtra and Mysore while there have been marginal increases in the case of the remaining areas. The new prices have thus been lower than the prices in the preceding season for a major proportion of the sugar factories.

The case of the industry is currently being investigated by the Tariff Commission. Till the report of the Commission is completed, it is not possible to arrive at an objective conclusion regarding prices but, prima facie there is a case for raising the ex-factory sugar prices if the larger objective of increasing production is to be attained. The total installed capacity of sugar factories at the moment is around four million tonnes while production in the next season is not likely to be more than three million tonnes. If this downward revision in prices had not been done but, on the other hand, a further incentive had been given to the industry, there is no doubt that production would have come up to expectations. The vicious circle of soaring sugar prices consequent upon inadequate production can only be broken by increased production which, in turn, will emerge only if the industry is allowed sufficient room for manoeuvrability in its competition with the gur and khandasari producers. By lowering the ex-factory sugar prices, the Government has increased the difficulties of the sugar producers who will not be able to attract sugarcane by offering competitive prices.

HINTS FOR ENTREPRENEURS

AT THE conference of ICICI constituents last week at Bombay, Mr. G. L. Mehta made some interesting points in his welcome address. He not only traced the achievements of the ICICI during the last decade but also gave some useful hints for the entrepreneurs seeking loans from the financial institutions. The ICICI had, according to Mr. Mehta, endeavoured to keep the procedures simple and the requirements minimum in order to ensure "a quick and viable decision." Certain elementary considerations, however, need to be borne in mind, the most important being the viability of the project in the long run. Despite the best efforts of the ICICI to scrutinize carefully each and every project presented to it for financial assistance, many of them have during the last two years faced a variety of problems. Some of them are having teething troubles at the operation level; some faced raw material or skilled labour shortage; some others have come up against marketing problems. The emergence of marketing problems in the case of some of the projects is a significant pointer because there is a common belief in this country that the size of the Indian market is enormous and any and every product which is produced in the country will be sold. In view of this experience, the ICICI rightly expects from the promoter a market analysis for the product he proposes to manufacture.

able the Ministry to keep ready some coke oven projects so that they can be implemented expeditiously when exigencies arise.

Broadly speaking, the proposed study will contain material regarding the various sites considered suitable for setting up coke ovens, having regard to the availability of coal from indigenous sources, land, water, power, transport facilities, etc. It will also indicate the production processes, by-product utilisation and capital and operating costs. The sites will have to be recommended in order of priorities with reference to cost, materials, production and distribution of end-products.

★★

A 38-member team of West German business men and industrialists is expected here about the middle of January next for exploring new avenues of Indo-West German collaboration. The team, it is understood, will include representatives of West German banks and large and medium-sized concerns dealing in or manufacturing such items as machine tools, pumps, precision instruments, gelatine, radio and tele-communication equipment and garments. An official each of the West German Association of Machine-builders and the German Bank for Reconstruction, will be included in the team.

The team is expected to remain in India for about three weeks. During their tour of the country, the members of the team will hold discussions with the Union Government, organisations of industry, trade and banking and prominent industrialists.

Dr. Herman J. Abs, who headed the team of "three wise men" which visited India four years ago to assess the foreign exchange requirements of the current Plan, is also expected here towards the end of January for assessing India's fourth Plan foreign exchange requirements and how West Germany can assist in meeting them.

★★

A seven-member international team of experts in foreign trade, consisting of Dr. Robert J. Clark, Mr. Masayuki Katoh, Mr. William Thomas Pearce, Mr. Alexander O. Stanley, Dr. Elio Tosarelli, Mr. Herbert William Vallender and Mr. Minora Yoshida, has arrived here to study India's export efforts and to suggest improvements in them. The study will cover the practices and techniques of foreign trade, working of trade organisations in India and trade representations abroad, commercial intelligence, market survey techniques, product and commodity research, export organisations, product adaptation, quality control and testing, and manpower and training for foreign trade.

In its study, the team would be assisted by an Indian group of experts under the leadership of Dr. P. S. Lokanathan, Director-General, National Council of Applied Economic Research. The other members of the counterpart Indian group will be Mr. B. N. Adarkar, Additional Secretary, Ministry of Finance, Mr. G. L. Bansal, Secretary-General, Federation of Indian Chambers of Commerce and Industry; Mr. H. D. Shourie, Director-General, Indian Institute of Foreign Trade; Mr. S. Hamid, Joint Secretary, Ministry of Commerce; Mr. S. S. Marathe, Economic Adviser to the Government of India; Mr. S. Subramanian, Chairman, Tariff Revision Committee; Dr. R. M. Hanavar, Officer on Special Duty, Ministry of Commerce and Mr. C. R. Krishnaswamy Rao Sahib, Joint Director of Export Promotion.

Meanwhile, the Union Ministry of Commerce has proposed to set up a Federation of Export Organisations in the country. The Federation will co-ordinate and supplement the activities of individual export promotion bodies.

According to the information received here, the UK Government has exempted Indian kips from the 15 per cent surcharge levied on imports into Britain. The Union Government has approached the UK Government for grant of similar

exemption to jute goods, handlooms and coir manufactures. It is hoped that some concessions will be made by the UK Government in the case of these exports from India in the near future. During his visit to London next month, the Prime Minister, Mr. Lal Bahadur, is expected to discuss with the British Prime Minister, Mr. Harold Wilson, the adverse impact of the 15 per cent surcharge on India's exports to Britain.

★★

The five-member trade delegation, consisting of Mr. S. V. Ramaswamy, Deputy Minister for Commerce (Leader), Mr. S. Ramachandran, Deputy Secretary, Ministry of Commerce, Dr. H. Shah and Mr. P. L. Sehgal, Industrial Advisers, Chemicals and Engineering, respectively, in the Technical Directorate, and Mr. B. L. Sahay, Regional Director, STC, which toured Czechoslovakia, Rumania, Bulgaria and Hungary for four weeks ending November 14, 1964, has negotiated stepping up of trade with these countries in 1965 by about 25 per cent from the current year's level. The most significant achievement of the delegation, however, is that it has inculcated interest in the East European countries for purchase of heavy engineering goods from India. Czechoslovakia and Hungary are likely to buy a fairly large number of railway wagons. A delegation each from these two countries has arrived here for finalising the details of purchase of this non-traditional item on India's export list.

The trade with Czechoslovakia, currently around Rs. 15 crores each way, is expected to be raised next year to Rs. 24 crores each way. Czechoslovakia has agreed to utilise all the rupee funds accumulated by her for purchase of goods next year. She will buy from here increased quantities of tyres and tubes, tea, tinned fruits, etc. Besides showing interest in importing railway wagons, she has also expressed desire to import Vitamin intermediates and Hormones intermediates.

The trade with Rumania is expected to be increased to Rs. 8 crores each way. Rumania has agreed to buy fairly large quantities of Indian iron ore for her Galatz Steel Plant in spite of competition from Brazil, and Egypt and Indian textiles to the tune of Rs. 1.5 crores, including handlooms worth Rs. 50 lakhs. She will supply to India 10,000 tonnes of caustic soda and a similar quantity of heavy and light soda ash, Rs. 40

WINDOW ON THE WORLD

“Political” Economy in Britain

PAUL EINZIG

LONDON:

THE TERM “political economy” has ceased to be fashionable during the present century and has been replaced by “economics” or “economic science”. Its use should be revived, however, in connection with Socialists’ economics that is gradually emerging from the policies and actions of the new Labour Government in Britain. For the economics of that Government is nothing if not political. In other words, political considerations prevail in its economic policies over economic considerations.

It would be idle to deny that the Labour Government has inherited a strongly unfavourable situation from its predecessor. Mr. Maudling, who was easily the worst Chancellor of the Exchequer in my long experience, had completely abstained from taking any steps to correct the balance of payments deficit and to mitigate the overload on the economy. His only excuse — and it was a very poor one — was that the Labour Government had behaved in exactly the same way in 1951. Lord Attlee’s Chancellor of the Exchequer, Mr. Gaitskill, candidly admitted that he did not even keep himself informed about the heavy outflow of gold during the election campaign, let alone do anything about it. But earlier in the year he did impose some unpopular charges on National Health Services in an attempt to mitigate inflation.

Returned to power, the Labour Government, having forgotten nothing and having learnt nothing during the 13 years out of office, is now making a valiant effort to out-Bourbon even the Bourbons, and to beat its own record as well as that of the Conservative Government in irresponsible behaviour in face of growing inflation. In 1951 Lord Attlee’s Government, faced with a balance of payments crisis, adopted at any rate some National Health Service charges. In 1964 Mr. Wilson’s Government, faced with an even graver balance of payments crisis, is actually removing those self-same charges! At the same time it is actually increasing other social service benefits. Admittedly, such increases are overdue. But to choose for them precisely the moment when the balance of payments crisis has to be dealt with as a matter of urgency illustrates the extent to which political considerations outweigh economic considerations in the Labour Government’s policies.

Elementary Economics

It is a matter of elementary economics that when a country is over-importing it has to curtail its domestic consumption. Admittedly, for the time being imports will be checked by the 15 per cent surcharge imposed on them by the new Government. But the adverse reaction to that move in foreign opinion has exceeded expectations, and there is bound to be irresistible pressure from all over the world for its early removal. The only justification for the surcharge is that it gives the new Government a breathing space during which it could apply measures to curtail consumption if it wished to do so. Instead of doing just that, Socialist “political” economy pursues precisely the opposite course. It is embarking on a large-scale redistribution of incomes through increasing the purchasing power of the lower income groups and through increasing taxation of the high income groups.

Is it possible that Mr. Wilson, who is after all an economist in his own right, and his twin economic advisers, Dr. Balogh and Dr. Kaldor, have forgotten their elementary Keynesian economics, according to which a more equal distribution of incomes makes for inflation? Such a measure

would have every justification if the economy were under-employed, but it is out of place in existing conditions when the economy is already over-employed. All economic arguments are against the timing of the measures, but it seems that political considerations will prevail.

Admittedly, the Government would be able to get away with such ill-advised economic policy, if only it could persuade the trade unions to agree to the adoption of an incomes policy and to a removal of their restrictive practices. It would increase the output and would thus obviate the necessity for curtailing consumption. It might even justify the policies resulting in an increase in consumption. Unfortunately the way in which the Government has set about to achieve that end is fated to failure. Having given away his bargaining weapons by renouncing the use of “stop-go” methods and by undertaking to soak the rich even before the trade unions have committed themselves to a promise on the principle involved, there is very little inducement for the latter to comply with the Government’s wishes.

Profits: a Residual Item

When the appointment of Dr. Balogh and Dr. Kaldor was announced it gave rise to hopes that, even though they are essentially political economists, they would keep the Government on the right lines on such elementary economic matters as the impossibility of limiting profits. It seems, however, that they have failed to explain to their Ministers — if indeed they have tried to do so — that profits are a residual item which are bound to be subject to fluctuations. In order that they should be treated similarly to wages in an incomes policy it would be necessary that wages, too, should go down when profits go down, and that is clearly inconceivable. To try to explain this even to Labour leaders, let alone to the rank and file of their supporters, would be good economics but bad politics. Therefore, it seems that any concessions to be made by the trade unions will have to be paid for in the form of measures which are bound to be detrimental to expansion of production.

The only way in which the immediate consequences of such “political” economy could be mitigated, in the short run at any rate, would be by allowing inflation to proceed unhampered. Amidst rising prices there would be some inducement to increase production notwithstanding the discouraging effect of efforts to keep profits down. Such a policy would aggravate, however, the balance of payments crisis. In order to be able to inflate with comparative impunity, the Government will feel impelled to resort to economic isolationism. In view of the probable reluctance of foreign countries to bolster up British domestic inflation by means of granting credits to support sterling, there would be no choice but resorting to exchange controls, to be followed by bilateralist trade methods.

Beyond doubt the new Government would deserve every sympathy in a genuine effort to clear up the mess it has inherited. But instead of doing that, it seems to have set out to aggravate the difficulties by disregarding economic considerations for the sake of political considerations. To spend in advance what the Socialists hope to earn through raising productivity in the future is as inflationary as the issue of paper money in Faust by the Emperor on the advice of Mephistopheles, secured on gold in the bowels of the earth, to be recovered in the future.

LISTENING POSTS

“Wages in Kind” Scheme Shelved

By Our Special Correspondent

NEW DELHI:

MEETING HERE last week, the Standing Committee on Industrial Truce Resolution approved the outline of a Bill seeking to make it compulsory for employers, both in the public and private sectors, to set up fair price shops at which would be supplied to the low-paid employees rice, wheat or wheat substitutes and sugar at controlled prices and cotton textiles, cooking media and pulses at wholesale prices. The Bill will cover only such industrial establishments as employ 300 or more persons.

The Committee felt that it was not necessary to proceed separately with the scheme of payment of wages in kind. However, the various benefits which were to accrue to the employees under this scheme should be incorporated in the Bill for fair price shops. A sub-committee was appointed to examine the draft Bill clause by clause.

The Committee accepted the definitions of fair price shops and industrial establishments given in the draft Bill. An industrial establishment will include a factory, any railway, tramway or motor omnibus service, dock, jetty and mechanically propelled inland vessel, mines, oilfields, quarries, plantations, banks, insurance companies, etc.

The Committee recommended that a worker should be entitled to buy from a fair price shop commodities of the total value amounting to 40 per cent of his monthly earnings or Rs. 150, whichever is less. Such fair price shops will be set up under rules made for the purpose by the Government.

It also recommended that certain consumer articles, in addition to the six items mentioned above, might be sold at these fair price shops. The additional items will be decided by joint committees of management on which workers would be represented. Another recommendation of the Committee was that a fair price shop would be set up provided a minimum of 200 employees opted for the scheme for a period of at least six months.

The Committee approved that there should be a provision in the Bill to the effect that where an employee asked for it, the employer should sell the commodities stocked in the fair price shops on credit and notwithstanding anything in the Payment of Wages Act, the employer would be entitled to recover the dues by deduction from pay at the rates prescribed.

The Committee agreed to the penalty clause in the draft Bill. This clause proposes imposition of a penalty on the offending employers in the shape of fine on conviction and enhanced penalty for a continuing offence. By another provision in the draft scheme, protection would be given to the existing benefits under any arrangement or agreement or award which are greater than what this Act would confer.

★★

The Union Ministry of Steel and Mines is understood to have planned a crash programme for prospecting and development of minerals, especially non-ferrous metals, in which the country is sorely deficient at present. Called the “Operation Hard Rock”, the scheme envisages embarking on an intensive survey of mineral resources through airborne surveys so that favourable prospecting areas within the Indian geosynclines are pin-pointed from the air by aeromagnetic, electromagnetic and radiometric methods. The zones thus located will be further examined by exploration field teams, suitably staffed and equipped for the requirements of parti-

cular areas. Subsequently, the selected areas will be subject to ground geological, geochemical and geophysical examinations. In the event of the likelihood of finding economic deposits, diamond drilling, test pitting and other conventional methods will be used.

The “Operation” will require about Rs. 2 crores, including approximately Rs. 94 lakhs for contractual airborne survey and the salaries of the foreign experts who will be appointed by contractors, nearly Rs. 47 lakhs for contractual diamond drilling and about Rs. 24 lakhs for purchase of equipment.

The U.S. Agency for International Development is understood to have indicated willingness to advance a loan of about \$3.5 million to cover the foreign exchange cost of the programme.

When all the details are finalised, the scheme will be submitted to the Union Finance Ministry and the Planning Commission for clearance.

★★

According to an agreement reached last week between the Union Ministry of Steel and Mines and the Hungarian Aluminium Delegation, the Hungarian Foreign Trade Company Chemikomplex, has been entrusted with the task of preparing a detailed project report, in collaboration with the Indian organisation, the National Industrial Development Corporation for the aluminium plant to be set up in the public sector at Korba, in Madhya Pradesh. The plant will have a capacity to produce 120,000 tonnes of alumina per annum, which would yield 60,000 tonnes of metal. The alumina to be manufactured at the Korba plant, in the initial stages, may be supplied to the existing aluminium manufacturing units in the country. It may partly be used for feeding a 30,000 tonnes aluminium smelter which is proposed to be set up at Korba. No firm decision in this regard has, however, been yet taken.

The preliminary project report will be submitted by the Hungarian company in about 10 months and the final report in 18 months. The plant will be commissioned into production in about 30 months after the acceptance of the preliminary project report by the Union Government. The total cost of setting up the plant will be \$25/30 million (Rs. 12/14 crores). Hungary will be extending a credit for financing the foreign exchange component estimated around 25 per cent of the total cost.

The Hungarian Delegation is understood to have told the Union Ministry of Steel and Mines that it is satisfied with the prospects of aluminium production in Madhya Pradesh. The work on the project report is expected to begin early next month.

The Hungarian Delegation has indicated to the Union Government that besides designing of the plant, Hungary can participate in the delivery of equipment, training of Indian technicians and construction and start-up of the plant right up to the aluminium manufacturing stage.

★★

The Union Ministry of Steel and Mines is understood to have decided to commission a study of the possible sites for the locations of coke oven plants intended to produce hard coke and various valuable by-products. As in the case of the feasibility studies already commissioned for the establishment of pig iron manufacturing units, the main objective of this study is to en-

apprise the Government of their findings. In this connection, he regretted the fact that there was not adequate co-operation between the bankers and the Government. Bankers, some in their superior wisdom may think, know only to collect deposits and advance money, but this was not correct, he said, as bankers come into close contact with people in different walks of life and have many opportunities of studying the people and their problems.

Mr. Birla availed himself of the occasion and referred to the important role of not only the Dena Bank, but of banks generally in the economic development of the country. During the last few years, he said, Indian banking institutions had registered tremendous progress and drew attention to the spectacular growth of deposits (nearly three times since 1948) and advances (more than four times since 1948) alike. Indian banks had rendered great service to the growth of the Indian economy, trade and commerce and had helped the country achieve its targets, he said, and this, he was sure, the public at large also appreciated. But, he went on, there were some who did not take so pragmatic a view and demanded nationalisation of banks. Personally, he thought the banks would render greater service in the days to come. As the country moved to more difficult times, as seems inevitable, the experience of bankers is bound to come in very handy. Had there been closer collaboration between the bankers and the Government, he believed, many of the mistakes committed in the past could have been avoided. At any rate, there would have been no occasion for a pattern of credit squeeze policy such as the present that had to be planned, replanned and modified, all during the past 12 months.

It is only appropriate that, on this occasion, something must be said about the progress of the Dena Bank over the past 25 years. At the end of this period, the Dena Bank finds itself as a strong, stable and dynamic institution. To quote from the tribute paid to the Bank by a former Governor of the Reserve Bank, "this Bank has made rapid strides, particularly during the last few years, and has now become one of

the major banking institutions in the country... Without sacrificing soundness, it is showing itself receptive of new ideas and new procedures."

25 YEARS' PROGRESS AT A GLANCE

	1938		1964
1	Number of Offices	147	
156	Number of Accounts	Over 3 lakhs	
Rs. 6.25 lakhs	Paid-up Capital	Rs. 1 crore	
—	Reserve Funds	Over Rs. 1.10 crores	
Rs. 5.19	Deposits	" " 64.66	"
Rs. 7.51	Investments	" " 18.86	"
Rs. 3.62	Advances	" " 43.13	"
Rs. 18.14	Working Capital	" " 75.46	"
Rs. 2,000/-	Net Profit	Over Rs. 26 lakhs (in 1963)	
21	No. of Shareholders	Over 2,400	
22	No. of Employees	3,300	

With this notable record to the credit of his Bank, Mr. Lalitchandra C. D. Nanjee, the present Chairman of the Bank, could justifiably claim: "The pulse of the banking system today is very sound and vigorous. It has been beating quite satisfactorily in accordance with the normal trends of healthy and enduring growth". He also said: "The banks have been acquitting themselves creditably, as the artery of the nation's finance, in the beneficent work of rendering assistance in a substantial manner to nation-building programmes both in the private as well as in the public sectors. All this success has been because of the dynamism displayed by the present banking system, functioning as a free arm under the concept of mixed economy, accepted as the most suitable for conditions of economic growth in India. Banks will have to continue to play a more dynamic and a varied role as the perennial source of finance required for our developing economy".

lakhs worth of urea (46 per cent nitrogen) and Rs. 90 lakhs worth axle oil required for Indian Railways.

The trade with Bulgaria is expected to go up to Rs. 5.5 crores each way. India will be importing more caprolactum from Bulgaria next year. As against this, Bulgaria will import more iron ore from here. Bulgaria has also promised to quickly fulfil her commitment of exporting Rs. 30 lakhs worth zinc to India this year.

The trade with Hungary will be raised to Rs. 14.5 crores each way. Besides exporting railway wagons, India will sell to Hungary larger quantities of cotton textiles, leather footwear, chemical products and engineering products. Hungary will increase her exports of chemicals and various kinds of drugs, including sera and vaccines, but curtail exports of wheels and wheel sets as these are due for production indigenously at Durgapur.

★★

The two Houses of Parliament re-assembled this Monday for the winter session. No legislative business was transacted on the first day as both the Houses adjourned after paying homage to the memory of the late Union Minister for Industry, Mr. H. C. Dasappa. The proceedings in the Lok Sabha on Tuesday opened on an ominous note with both the Opposition and Congress members exercised over the acute food situation in Kerala. The Opposition seized the opportunity and pressed forth an adjournment motion which was admitted as the Treasury Benches made no serious attempts to resist it. With the overwhelming majority of the ruling party in the House, the motion, however, met the expected fate — it was defeated by 180 votes to 42.

During the debate on the adjournment motion, member after member from Kerala, without regard to party affiliation, gave vent to his feelings of sorrow at the miserable conditions created in the State by the rice shortage. They lashed out at the Government for its failure to avert the crisis and referred to the Kerala Governor's reported statement (blaming the Centre for having let down the State and urging a probe to fix the responsibility for the muddle), time and again. As

Credit Squeeze Has Hampered Production

From Our Correspondent

BOMBAY:

IF FOR the Devkaran Nanjee Banking Co. Ltd., Bombay, its Silver Jubilee last week was a great occasion to celebrate, which it no doubt did in a truly grand scale at the Royal Western India Turf Club, it was for the others present on the occasion a rare opportunity to hear Mr. G. D. Birla. There must have been many speculations on what the theme of Mr. Birla's presidential address on this important occasion would be, but few anticipated his categorical castigation of credit curbs. Whatever may be the theoretical justification for the present credit squeeze policy he felt convinced that it would not help the country hold the price line. "In the prevailing scarcity conditions", he maintained, "the only remedy to bring down prices is to increase production. You must create a glut of goods," he said, and "unless there is a glut of all kinds", he added, "prices will not come down, nor will the country be able to build up exports".

How important price stability is does not still seem to be appreciated by all in this country, certainly not by those whose primary responsibility it is to hold the price line. If they have done so, as they claim, the steps taken by them so far do not support it. It is time that, at least in responsible quarters, the implications of Mr. Birla's sombre remark that "political stability and everything else depends on the stability of prices" are pondered over.

Reviewing the course of prices in recent years, Mr. Birla

the debate progressed, its original tempo, however, was not kept up and repetitive arguments detracted very much from the desired effect. Specific charges made by the Opposition were comparatively few considering the tempo of the House. Mr. Hiren Mukerjee, the Communist leader, pointed to the lack of co-ordinated policy and failure to deal effectively with hoarders despite the fanfare with which the emergency powers had been assumed by the Government. The S.S.P. leader, Mr. S. N. Diwedi feared that the Food Corporation of India would create a new type of anarchy and could not be expected to straighten the matters out. The Swatantra leaders, Mr. N. G. Ranga, differed from both the Communists and the Socialists on the need for controls and suggested resort to subsidy for the distribution of stocks procured internally.

The Union Food Minister, Mr. C. Subramaniam's reply to the debate was candid. He fully accepted the moral responsibility for the Kerala crisis, and shared the anguish of the critics.

In a lengthy statement laid on the table of the House, he frankly told the true story even though it did not present the Government in a favourable light. He described how the arrangements made for free movement of rice in the four southern States did not work. The Andhra and Madras Governments imposed formal restrictions on the movement of rice to Kerala because the price control was not observed there. Later on, the Madras Government could not supply the promised quantity of rice because of its own difficulties. Nor did the movement from Andhra Pradesh take place as expected. Mr. Subramaniam also referred to the go-slow attitude of labour in the Cochin Port to which two wheat ships had been diverted.

With the remedial measures being taken — rushing of food supplies from Andhra Pradesh and elsewhere in the country — the situation in Kerala, the Minister said, was improving. He hoped that the recent unhappy experience of Kerala would not be repeated — neither in this State nor anywhere else in the country. He told the Rajya Sabha earlier that if he failed to bring the food situation under control, he would not hesitate to pay the political price.

recalled how, from 1957 to 1962, prices had remained stable in spite of the fact that money supply had gone on increasing but how thereafter there was a reversal of this trend, especially after the "momentous budget" of 1963. Though he could not pin-point from when precisely it began, this budget, he said, affected industrial production. And when, at the same time, agricultural production also was not maintained, there was a spurt in prices and the Reserve Bank proceeded to arrest it by its credit squeeze policy. But the result of this policy so far has only been to slow down production and create scarcity conditions. What is necessary today, on the other hand, is to increase production and augment supplies of goods. There is force, therefore, in Mr. Birla's viewpoint that credit curbs have proved ineffective as weapons to hold down prices, inasmuch as they have hindered production and have thereby only helped aggravate the prevailing scarcity.

It is possible to argue that it is too early yet to pronounce any verdict on credit curbs and also that there are other imponderable factors, besides, that have to be taken into account. Even so, here is enough provocation for those that care to go into this question to examine this viewpoint, and Mr. Birla did well in urging bankers to devote attention in particular as to why industrial production has started falling since 1963. What is more important — and he was at pains to stress this — is that bankers should examine the question and frankly

CARBORUNDUM UNIVERSAL

COATED ABRASIVE SLEEVES

Mounted on expandable mandrels and used on high speed pneumatic or electric grinders, these coated abrasive sleeves have countless uses. They are virtually indispensable for grinding and polishing hard-to-get-at corners, grooves, shoulders of moulds, dies, etc. The abrasive sleeves are available in sizes ranging from $\frac{1}{2}$ " to $4\frac{1}{8}$ " diameter, and in various widths as required.

received during the initial sale period from July 1 to August 14, 1964, was more than 125,000. Even though the Trust had planned the processing of these applications through mechanisation, the facilities available in Bombay City were found to be inadequate to cope with the volume of work involved. Arrangements had, therefore, to be made at other centres and the work is now reported to be in full swing. The despatch of certificates to unit holders commenced on October 24, 1964; certificates at the rate of several thousands per week are being despatched. The Trust also commenced repurchase of units from November 16, 1964, according to the terms of the scheme. The repurchase price of the units for November 16 was fixed at Rs. 10 per unit while the sale price of the units was fixed at Rs. 10.50 per unit, indicating that the difference between the two prices was exactly 5 per cent.

★★

It is to be hoped the statement of Mr. Manubhai Shah, the Union Minister of Commerce, at a Press conference in Bombay recently, that the Textile Control Advisory Committee reviewed the position as regards controlled varieties of cloth and was satisfied, truly reflects the present position. This is not improbable, considering that the Additional Textile Commissioner and his assistants have been busy visiting every important textile-producing centre and making personal appeals to the interests concerned to make a success of the new scheme of statutory controls which replaced the long-condemned Voluntary Price Regulation Scheme on October 20.

From what Mr. Shah told the Press conference, controlled cloth has been coming to the market in sizable quantities which may be expected to increase further in the next two or three weeks. This should also materialise, inasmuch as, with the extension of the control to prices and production of drill, there would be an addition of some 40 million metres more to the controlled category of cloth. It is not clear whether the Union Commerce Minister's estimate of quarterly production of controlled varieties of cloth at 450 million metres, as against 410 million metres prior to October 20, is inclusive of these 40 million metres of drill or not. One perforce has to content oneself by assuming that the annual output of controlled cloth would be anywhere between 1,800 million metres and 1,960 million metres, that is between a little over 40 per cent and 44 per cent, respectively, on the basis of the actual production

by the mills of 4,428 million metres in 1963. In either case, the total quantity of controlled cloth as a percentage of the net internal civilian packings (that is, after allowing for exports and defence supplies) should be nearer, if not more than, 45.

Prerequisites of Control

The success of statutory cloth control will primarily depend upon what this 45 per cent of total mill production will mean to each mill. Prima facie, it is evident that some mills will find themselves obliged to produce a relatively higher percentage of their total output in the controlled varieties than others, and the higher this percentage happens to be, the more difficult it will be for the mills concerned to make the required adjustments in production schedules. Adequate availability of the right type of cotton supplies and abolition of all obstacles to replacement and renovation are the other prerequisites to successful implementation of statutory control. It is to be hoped that the authorities would bear all these in mind before rushing to any hasty assessment of the behaviour of the mill industry. While, in this connection, the assurance of Mr. Shah to the industry and the trade that the Government would do its best to rectify any defects or maladjustments as and when these are brought to the notice of the Textile Control Advisory Committee (Naik Committee) and the offer of Mr. V. P. Naik, Chairman of the Committee, welcoming suggestions to overcome practical difficulties are helpful as far as they go, one wonders whether the threat of Mr. Naik to extend controls to other varieties (non-controlled varieties) also (in the event of there being a rise in prices) was at all called for, at any rate at this stage when the Union Minister for Commerce himself has expressed his satisfaction with both the flow of controlled cloth and the price trend thereof. No law-abiding mill would mind effective enforcement of the statutory control, but it is equally imperative that the control authorities should enable mills to conform to the control by helping them along the lines indicated earlier. At least this much they ought to do, if they are unable to do anything about the reduction in their so-called scientifically worked out multipliers and their after-thought restrictions on combing allowances for Indian cotton, which have been strongly criticised by the mill industry. For this, surely, they do not have to wait till April next when the minimum obligation of the industry is proposed to be revised.

Third Place for Iron Ore Exports in 1970-71

From Our Correspondent

CALCUTTA:

IRON ORE earned Rs. 20 crores of foreign exchange in 1963-64, and thus became the fourth item in the country's export list, coming after jute goods, tea and cotton textiles in that order. According to Mr. Manubhai Shah's export plans, it may overtake cotton textiles by the end of the fourth Plan if the country succeeds in exporting 30 million tons (a two and a half times increase compared with the present level) by 1970-71. Whether the plan would really materialise, would depend upon a number of factors not all of which are within this country's control. World iron ore markets are becoming increasingly competitive, as new sources of supply are being discovered in some of the Latin American countries. Most of the major steel mills in the United States now possess captive mines in their own country as well as in South American countries, and those which do not, are trying to develop theirs. In the circumstances, the market keeps narrowing for India's iron ore exports. The future for this line of export would, therefore, lie in India's ability to advertise the fact that her iron ore is mostly of the superior grades, and also in such long term supply contracts as she may secure from major im-

porting countries like Japan. Fortunately, this is the strategy for iron ore exports which the authorities, or more precisely the Metals and Minerals Trading Corporation, now follow, and the fully mechanised iron ore mine at Kiriburu which the Vice-President, Dr. Zakir Hussain, opened last week, represents a major effort in this direction.

The Kiriburu iron ore mine is a public sector project belonging to the National Mineral Development Corporation. It was conceived as a result of the recommendations of the Japanese steel mission which came to India in 1958, largely to explore the possibilities of importing more iron ore from this country. But as Mr. Manubhai Shah pointed out at the inauguration ceremony, the vision of Pandit Nehru provided the chief motive force. This country's estimated iron ore reserves of roughly 22,000 million tonnes are nearly one quarter of the world total, yet India's exploitation of the mineral until 1958 was very small indeed, largely confined to the requirements of the country's none-too-large steel industry at that time. As it became clear that the country's reserves were not only sufficient to support a large iron and steel industry but could be exported on a substantial scale over a fairly long period, a

sustained search for markets abroad was undertaken. The long-term contract with Japan to supply 2 million tons from the Kiriburu project and another 4 million tons from a similar venture at Bailadila, represents a major success of the effort.

The Kiriburu iron ore reserves lying on the Bihar-Orissa border along a mountain range are estimated at more than 300 million tonnes. The huge crushing plant installed there is capable of handling about 1,200 tonnes of ore per hour. After crushing and screening and after the fines are separated from the ore — all mechanised processes — the sized ore is carried by a conveyor belt to the point where it is loaded in railway wagons, to be carried to Visakhapatnam, which is some 770 kilometres away. The actual export of ore to Japan from Kiriburu however is not starting right away. This is because the installation of the mechanical ore handling plant at Visakhapatnam port has not been completed. It may take another six to seven months. Till then the ore export programme from the Kiriburu mines will have to be held up. This mechanical ore loading plant being installed at Visakhapatnam port is also linked with the Bailadila project, the other public sector venture from which 4 million tons of iron ore will be supplied to Japan annually. Work on the Bailadila ore mining as such will take some time to start. The Japanese iron ore mines survey team which came to India some time in the middle of 1963 has submitted a report suggesting mining methods which require to be studied by Indian technicians thoroughly. The mining methods are practised in Japan, but not anywhere in India now. Some Indian technical officers were deputed to Japan to study first-hand the mining methods in question, and the feasibility and economics of the method being adopted in India. These officers have since returned and submitted their project report to the Government of India, laying down the principles under which 4 million tons of iron ore will be mined annually according to the specifications given in the agreement with Japan. Now that Kiriburu ore will also be used for the Bokaro steel plant when the first stage of that steel works goes into production, it is possible that more than 4 million tons of ore will be raised from Bailadila and that the work on this project will be expedited.

When 6 million tons of iron ore are actually exported from the Bailadila and Kiriburu mines, India's total exports will have gone up to nearly 18 million tons including a little more

than one-third of this quantity from Goa. The trend of exports during the past six years has shown a steady increase also, as the table below shows, (the figures exclude Goa):

	(Million tons)
1958-59	2.163
1959-60	3.10
1960-61	3.01
1961-62	3.111
1962-63	3.738
1963-64	4.2

During these years, exports from Goa have averaged 6 million tons, and by the end of the current Plan, exports from Goa and the rest of Indian Union are likely to have gone up to 13 to 14 million tons. In the circumstances, Mr. Manubhai's fourth Plan target of 30 million tons does not look over-ambitious. But the uncertainties of the world market apart, there are a number of physical shortcomings in the country itself which will have to be overcome, the chief of which is the lack of adequate mechanical handling facilities at different Indian ports. The Government has now put through a programme of improving port handling facilities at the various ports and a World Bank team of experts is also looking into the matter. Apart from the mechanical ore loading plant at Visakhapatnam which has been financed from the US President's Asian Economic Development Fund, a large ore handling plant at a cost of Rs. 1.32 crores will be installed at Paradip port, to be financed largely from US aid and West German credit. At one of the new wet docks at Madras port, a mechanical ore loading plant at a cost of Rs. 2.5 crores will be installed, and the World Bank is expected to provide finance for it. Similar facilities will be provided at Haldia port, the existing facilities at Mormugao will be strengthened to handle 10 million tons of ore per year and at Mangalore, where a major port is under construction, at least one of the berths will be equipped with the facilities to handle iron ore loading.

The facilities at the ports apart, other necessary measures like a well-co-ordinated and planned development of the mines, strengthening of the transport capacity and the gradual acquisition of an ore carrier fleet will have to be taken. The Ministry of Commerce proposes to set up a high-powered inter-Ministerial board with a full-time chairman of the status of a

UTTAR PRADESH STATE ELECTRICITY BOARD

The Uttar Pradesh State Electricity Board has resolved to float a loan of the nominal value of Rs. 400 lakhs redeemable at par at the end of 12 years. The bonds will carry interest at 5 per cent and will be issued at Rs. 99.75 per cent. The issue will open on November 23, 1964 and will be closed on November 28, 1964 or earlier. Subscriptions will be received at the Head Offices of the State Bank of India at Calcutta, Bombay, Madras and New Delhi and at all branches of the Bank at district headquarters within the State of Uttar Pradesh. The Head Office of the State Bank of India at Calcutta will be in charge of the issue and management of the bonds. The Head Office of the State Bank of India at Calcutta will be in charge of the issue and management of the bonds. The bonds are fully guaranteed by the Government of Uttar Pradesh in regard to the repayment of the principal and payment of interest. The bonds will be trustee securities under the Indian Trusts Act, 1882 and also approved securities for the purposes of the Insurance Act, 1938 and the Banking Companies Act, 1949. The bonds will also be treated at par with Government Securities for the purpose of advances to Scheduled Banks and State Co-operative Banks under Section 17(4)(a) of the Reserve Bank of India Act, 1934 (II of 1934). The Electricity Board will be providing in each financial year from sums as, together with interest thereon, will amount to the total nominal value of the bonds by the time the repayment of the bonds becomes due.

- All sections of the investing public are requested to extend full support to the bonds now under issue.
- The issue is in terms of the Bond Prospectus, copies of which can be had from the aforesaid offices of the State Bank of India.

B. B. LAL, ICS.,
CHAIRMAN
UTTAR PRADESH STATE ELECTRICITY BOARD,
LUCKNOW.

No Shopping List for Reddy!

Venkata Reddy's memory is good at work and at home. Mrs. Reddy never needs to write a shopping list. Just one telling... and the day's shopping list is clear in his head, down to the smallest chilli. Memory matters too in playing cards; the winner of many bridge tournaments, he enjoys the game. The same patience, concentration and an eye for detail that make Reddy a good bridge player, provide him with the basic qualities required as a draughtsman with Burmah-Shell, Madras.

EVERY ITEM MUST TALLY

He helps keep records of the Company assets throughout Madras Branch. Hundreds of details and data collected from blueprints, completion certificates, amendment sheets, items for sanction or

disposal. Every item must tally—a plug, a culvert, a godown—description, cost, site. Sometimes his search takes him to 1928 for records; but often the figures he needs are in his head.

TODAY, AS EVER, PEOPLE LIKE REDDY ARE WORKING FOR YOU

Reddy comes from Razampet in Andhra. He has a farm there and when he goes on leave, he relaxes amidst orchards and paddy fields, or at leisurely rubbers of bridge.

Reddy and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work... working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

BURMAH-SHELL are People in the service of the People

A great beginning...

In 1907, when India could not even produce a decent pin, the House of Tata announced its intention to build a modern steel works in India. There were not a few who doubted that the project would ever be a success.

Yet, shortly afterwards, India's first steel works was set up at Sakchi, as Jamshedpur was then called, and the first steel ingot was successfully rolled in February 1912. This event not only marked the birth of India's steel industry but also proved that India had the necessary potential in terms of iron ore and other raw materials to sustain an ever-expanding steel industry on modern lines.

The steel that has flowed out of Jamshedpur for over 50 years has helped India to take her first steps on the road to industrialization. And Tata Steel will continue to play an important role in our developing economy now poised to produce atomic power and manufacture steel plants to make more steel.

November 20, 1964

EASTERN ECONOMIST

secretary or additional secretary to the Government and consisting of secretaries or other senior officials of the Ministries of Mines, Railways and Transport for the co-ordination of all relevant development activities. The board will have to see that there is a synchronised fulfilment of programmes to enable the targets to be achieved. It will also report periodically to the Cabinet, the Planning Commission and the Ministries concerned. The cost of all the connected schemes devised to raise India's iron export potential by another 14 to 16 million tons has been estimated at Rs. 250 to 300 crores. The foreign exchange component is calculated at Rs. 60 to 70 crores. In view of this large investment required, it is perhaps worthwhile to enquire whether India should go in for this just at the moment when the world market price of iron ore has been declining, or some modified programme of development commensurate with the return expected should be taken in hand.

★★

To implement its fourth plan involving a total outlay of Rs. 600 crores, West Bengal is likely to press strongly for a greater volume of Central assistance. Its case for more help is based on the argument that because of the essential industrial character of its economy, further large investments will have to be made to achieve a rate of growth in the per capita income in keeping with the growth of its population and the massive in urban unemployment among the educated. But West Bengal appears to have overlooked the fact that the higher rate of growth achieved by States like Maharashtra and Madras, especially the former, are on account of the fact that they have encouraged private investment in their territories in as many ways as they can. There is considerable scope in West Bengal for the development of industries like vanaspati, radio-making, rayon, paper pulp, sugar, engineering and several others, all of which are open to private enterprise. If the State can ensure the necessary power supply, there will be at once a big incentive for private entrepreneurs to venture into these fields. The State Government has constituted an advisory industrial development committee consisting of representatives of the Government and leading industrialists to review industrial

projects in the State and to suggest removal of bottlenecks. It is also expected to help private enterprise in the matter of new industrial ventures as well as the development of existing ones. But the State Government must openly encourage private enterprise and not continue to give the impression that all major industrial developments in the State will be only in the public sector.

Loan for Development

Meanwhile, the State Government's Electricity Board has floated a market loan of a little over Rs. 1 crore to finance some of its development schemes. Its biggest scheme of the third plan, the Bandel power station, has made sufficient progress, and the first of its four 82.5 MW units is likely to start functioning by the middle of next year. Its responsibility in the fourth Plan will increase several fold if the project at Santaldih to instal a 1,000 MW plant is taken up according to present schedule. It is however reported that the Central Water and Power Commission which is advising the State Electricity Board regarding the Santaldih super-thermal power plant project, has now suggested that the scheme should not be taken up in four 250 MW units as planned, but initially, four 120 MW units should be set up, gradually raising the capacity to 1,000 MW, so that the products of Bhopal Electricals Ltd., which is likely to manufacture 120 MW generators soon, can be used for the Santaldih Scheme. The next few weeks will show what the final shape is. But the country's foreign exchange difficulties would seem to support the CWPC's view. Another ambitious project of the State Electricity Board is to expedite rural electrification in West Bengal, from some 5 per cent of the villages at the end of the third Plan to 20 per cent by the end of the fourth Plan. Apart from conforming to the all-India target of electrifying 20 per cent of the country's villages by Mahatma Gandhi's birth centenary in 1969, the Board has produced a convincing economic argument for its rural electrification plan, which is that electrification at this stage can be linked to the programme of sinking power-driven big diameter tube-wells, and thus save a lot of capital cost.

Wanted: Additional Wheat Through Fair Price Shops

From Our Correspondent

MADRAS:

THE FOOD picture in the South is confusing and even baffling as there is serious concern over the availability of rice in the next two months. The new crop is no doubt expected to be satisfactory but large supplies may not be received before January - February. However, what is intriguing is the chaotic situation in Kerala in spite of the protestations by the Andhra Pradesh Government that despatches during this year up to the end of September from its area were considerably in excess of those in the corresponding period in 1963. It has actually been admitted by the Kerala Government that additionally 131,000 tons of rice were received in the first nine months of 1964. Also, in Madras which is regarded as self-sufficient in respect of its requirements and even having a slight surplus, the State Government has been obliged to adopt emergency measures and stop exports out of the kuruvai crop to Kerala. There has been no attempt so far to take an overall view and find out the reasons for the unexpected bad turn in the food situation in a zone which was believed to be comfortably placed in regard to the availability of rice and coarse cereals. Indeed, it was not long ago claimed that there was a record rice crop and the position was uncomfortable only in regard to supplies of wheat.

It cannot be argued that there has been a sudden increase

in the demand for rice and other cereals and that the situation in the southern States is unmanageable. Slowly the impression is gaining ground that Andhra Pradesh is the villain of the piece and that the situation in Kerala got out of hand as the Madras Government was compelled to ban exports of kuruvai rice because of the non-receipt of its quota of supplies from Andhra Pradesh. Usually, the kuruvai crop is exported mainly to Kerala and corresponding imports are effected from Andhra Pradesh. In spite of the fact that the latter Government has repeatedly stated that its commitments to Madras and Kerala have been fulfilled, the State Governments in these two regions have been pointing out that arrivals from Andhra Pradesh have slowed down and that the holding back of about 200,000 tons of rice in this area has been mainly responsible for the critical situation that now prevails in both Madras and Kerala. The difficulties in regard to movement from Andhra have related to the periodic ban imposed by the State Government and the recent decision to carry on inter-State trade at Government level.

The Andhra Pradesh Government got probably upset over the damage caused to the standing crop by the recent heavy floods in the Krishna river and its tributaries. At one stage it was even suggested that the damage would be about 400,000 tons of rice. Latterly, however, Mr. Balarama Reddi,

the State's Food Minister, and even the Chief Minister, Mr. Brahmananda Reddi, have been issuing statements to the effect that large quantities of rice are available in their region and that the needs of the deficit areas can be easily met. Actually, they have emphasised that the period of crisis is over. The caution displayed by the Andhra Pradesh Government cannot be considered unjustified though the Centre had a definite responsibility in this matter. It should have ensured that, in the absence of regular supplies from Andhra Pradesh, there were corresponding releases from Central stocks to Madras and Kerala on the understanding that supplies from Andhra Pradesh at a later date would be used to replenish the Central stocks.

The main difficulty has arisen on account of the decision taken by the Chief Ministers to carry on inter-State trade only at Governmental level. This led to an underestimation of availability and delays in finalising arrangements for movement of rice by road and rail through nominated dealers. As it has been reported that the yield of the rice crop in Andhra Pradesh has been satisfactory and the kuruva crop in Thanjavur District constituted a record, there cannot be any serious difficulty in meeting the requirements of the four States if only available supplies could be pressed fully into consumption. Unfortunately, the recent developments have distorted the whole picture and a scare has been created with the result that there has been hoarding by growers, traders and even consumers. In the present situation, even the holding back of supplies for about 200,000-300,000 tons might upset all calculations and it would be no exaggeration to say that with the mobilisation of stocks of rice for this amount and liberal release of wheat the situation can be easily managed.

Satisfactory Position

Statistically, the position is not alarming in any sense. The total output of rice in the four States was 10.47 million tons in the last season and that of other cereals 6.51 million tons. This quantity would be sufficient to afford an availability of 15 ounces per day per head assuming, of course, that about 800,000 tons of wheat would be released from Central stocks to Kerala and Madras. Andhra Pradesh has a surplus of about 800,000 tons of rice and Madras 100,000-200,000 tons of the same cereal. These surpluses will take care of the deficit for Kerala and Mysore to a great extent. As Kerala does not grow coarse cereals in any appreciable quantities, the balance of the requirements has necessarily to be met by the supplies of wheat by the Centre. This is the reason why the Governor of that State has asked for a monthly quota of 60,000 tons of wheat over and above rice availability of two million tons for the whole year. If wheat is not absorbed to the extent of at least 500,000 tons by Kerala there would be necessarily reduced availability of rice in the other two States. While Andhra Pradesh has been charged with a tendency to exploit a difficult situation, it has been rumoured in some quarters that the excess supplies to Kerala were made because of the fantastic prices offered by the merchants. Also, it has been suggested that there has been even some smuggling of rice to Ceylon. It cannot, therefore, be argued that Kerala has unnecessarily been penalised. The availability of two million tons of rice will result in a ration of rice which is even in excess of that available to consumers in Andhra Pradesh and Madras which are supposed to be better placed. With the pooling of stocks in all centres, it should thus be possible to get over the next three months which are considered critical.

The decision to introduce informal rationing in Madras City has been taken with a view to preventing the issue of rice to the same people in the queues many times. But after the present confusion has subsided and the true situation has revealed itself, it would be worthwhile to examine whether

informal rationing should be extended to other areas and whether there could be a better understanding between the four States in the Southern Zone. It is hoped that Mr. C. Subramaniam's visit to Hyderabad will lead to smoother relations and a better appreciation of the food situation in the South. The recent developments have clearly brought out the fact that the whole situation is precariously balanced and even a temporary hold-up in movement can have an exaggerated effect. If large supplies of wheat could be issued through the fair price shops and there is better co-operation between the State machinery and the trade, the country need not be stampeded into spending large sums on imports of rice at a time when foreign exchange is so scarce.

★★

The results of two major engineering units for the last accounting period have been encouraging. Ashok Leyland particularly has acquitted itself very creditably, there being a more than doubling of profits for the year ended September 30, 1964. Apart from substantial allocations to the reserves the dividend in equity capital has been raised to 9 per cent from 7 per cent. The company has started deriving benefit out of the expansion scheme recently completed. It is even emphasised that output can be raised significantly if the raw materials were available. The efficient operation for the sister unit, Ennore Foundries Limited, has been greatly helpful. Immediately after the completion of the earlier expansion plans, arrangements are being finalised for implementing a further big expansion scheme under which heavier trucks and more powerful industrial engines will be manufactured. The spectacular performance of the company has led to keen enquiry for the company's shares especially as it has been pointed out that the directors have decided to increase the dividend even when there is need for raising fresh capital. An announcement in this regard is expected at an early date. It is estimated that the new plans will cost about Rs. 4 crores in three years. No difficulty will be experienced in regard to foreign exchange for importing plant and machinery. Apart from the subscription to a new issue of capital by the parent company, credit is being secured from other sources.

5 PER CENT WEST BENGAL STATE ELECTRICITY BOARD BONDS, 1976

For Rs. 125 Lakhs

(Payment of Interest and Repayment of Principal Guaranteed by the Government of West Bengal).

The Bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.

ISSUE PRICE RS. 99.75 PER CENT
REDEEMABLE AT PAR ON THE 23RD NOVEMBER, 1976

SUBSCRIPTIONS will be received in cash or cheques. Applications will be received at the head offices of State Bank of India at Calcutta, Bombay, New Delhi and Madras from 23rd November, 1964 to 28th November, 1964 both days inclusive. But the list may be closed earlier without notice if the total subscription is reached.

Copies of loan prospectus and application forms are available at all the offices mentioned above and at the Head Office of the State Electricity Board, 1, Hastings Street (7th floor), Calcutta-1.

The moving fingerprints

THE HONEYMOON of the Press with the Prime Minister seems to be ending earlier than expected. Thus a redoubtable columnist of one of our national Dailies finds himself provoked to ask "Is Government in the normal sense becoming impossible in the country?" and he provides his own answer by demanding that the "vicious circle" should be broken "of a Government which does not attend to its first task of governing with efficiency generating a mass psychosis of insecurity which pressure groups exploit to force the Government into policies which will not work but have to be accepted both as a political necessity and in the delusion that mere activity in laying down new policies is the hallmark of progress". As an indictment this is certainly a mouthful, and since this particular writer is justly famous for his crisp and compact style, it is obvious that here he has been writing under considerable emotional strain. I would, however, be the last person to suggest that the intensity of feeling displayed by him is unwarranted; nor would I dispute the verdict of another commentator in another equally important Daily, who holds that "matters have been allowed to drift to such an extent that the confidence of more than five months ago has given place to foreboding" and proceeds to suggest that "the dominant mood is one of gloom and disquiet".

It is certainly a fact that the nation seems now to be faced with more serious problems demanding solutions more urgently than was the case this time last year. The stagnation of the economy has become more pronounced, prices are becoming even more unmanageable, prospects of increased production and expanding industrial activity are becoming less certain and worst of all the Government's policy to cope with these problems is becoming more and more open to doubt. It is bad enough that things are not going well; it is worse still that the Government seems to have no idea of how to go about preventing things from going from bad to worse. It is, of course, true that there has been a great deal of verbal and administrative activity in the last few months, but the net effect of it all has been to undermine the people's faith in the administration rather than reassure them or restore their confidence in the competence of the Government. Why is this so? Could it be because the Government has repeatedly failed to come forward with clearly positive measures for dealing with any of the difficulties with which it or the country has been confronted? It is indeed a sad state of affairs that whether it is food or prices or economic expansion, everything that the Government has attempted to do has tended to be confused and controversial. Surely, when so much is at stake, it ought to be possible for a Government ruling in the name of the largest political party in the country and with the support of tremendous majorities at the Centre and in the States, to formulate a few major policies or programmes which the country could accept as relevant and realistic and proceed to co-operate with.

★★

The Governor of Kerala may have a genuine grievance against the Central Food Ministry, but the wording of his complaint is calculated to cause amusement rather than secure him sympathy. Mr. V. V. Giri is reported to have said that the Kerala Administration trusted the Centre for rice and got the Kerala Administration landed in the soup. I should have thought that the best thing landed in the soup. A more appropriate phrasing of Mr. been landed in the soup. A more appropriate phrasing of Mr. Giri's grievance would perhaps have been that the Kerala Administration had been left high and dry. A bounty of soup

is certainly not to be sneezed at when the people are crying for gruel.

★★

I do not pretend to be an expert on the arcana of official protocol and I am therefore considerably mystified by a News Agency description of Mr. B. R. Bhagat's recent presence in Moscow as an "unofficial visit". Could it be that Mr. Bhagat was spending his own good money instead of the tax payer's on this journey? Again, if the visit was an "unofficial" one, was the Luncheon given by the Indian Ambassador in Moscow in honour of Mr. Bhagat, and which was attended by many high officials of the Soviet Government, also an "unofficial" one? In which case, could it be assumed that Mr. T. N. Kaul was footing the bill himself? Perhaps I am cavilling too much. Whatever might have been the precise status of his visit, it must be conceded that the Minister of State for Planning seems to have managed to transact a good volume of more or less official work. It has been disclosed, for instance, that he met the Soviet Vice-Foreign Minister, Mr. Lapin, and the Chief of the Soviet Committee for Economic Relations with Foreign Countries, Mr. Skatchkov, and discussed, — "unofficially", I presume — prospects of further Soviet assistance to this country's development programmes.

★★

While Mr. Bhagat seems to have been able to achieve more than he perhaps planned to during his unofficial visit to Moscow, Mr. C. Subramaniam seems to have been less fortunate in his journey to Manila last week to attend the regional conference of the United Nations Food and Agriculture Organization. Whereas he had originally programmed to return to New Delhi on November 14, he had in the event to come back a day earlier since, during his absence from the country, Kerala, in the words of its Governor, had got "landed in the soup". The question, of course, is whether it had not been possible for Mr. Subramaniam to have taken steps to ensure that too much soup did not flow in the direction of Trivandrum, before he left New Delhi for Manila on November 9. We, who have had occasion to wait for our soup in New Delhi restaurants, know only too well that soup cannot be conjured up in a trice. It does take time, certainly, to cook a good soup and preparing the very large quantity of soup that would have been needed to drown the Administration in Kerala could not have been accomplished within the few days between Mr. Subramaniam's departure for Manila and his rushing back to refloat Mr. Giri's Administration fast drowning in its bowl of soup. I suggest that a clause should be incorporated in the Food Corporation Bill to provide for an intelligence agency in the Central Food Ministry which would provide the Food Minister with adequate advance information against incipient threats from soup to the dignity of Governors in States under President's Rule.

★★

The nation remembered Jawaharlal Nehru lovingly last Saturday on his 75th birth anniversary. With him so recently gone from our midst, the occasion had its poignancy, and was evocative of sentiment. Even so, I wonder what precisely Inder Malhotra (in "The Statesman" of November 13) had in mind when he wrote "the nation for which he (Nehru) did more than any man for any people.....". How precisely do we make these comparisons? How, for instance, does one weigh Nehru's services to this country against Gandhi's or what Churchill has done for Britain?

V.B.

Trade Winds

KIRIBURU PROJECT

AN OPEN invitation has been extended to Japan to set up a steel plant in India. Extending the invitation at the time of the inaugural function of the Kiriburu Iron Ore Project at the site on November 12, the Union Minister for Steel and Mines, Mr. Sanjiva Reddy, pointed out that Japan had the distinction of producing the cheapest steel in the world from the imported iron ore. The Minister said that there was no reason why Japan should not help India to produce cheap steel by Japanese techniques.

The Rs. 11.22-crore Kiriburu project, which has been set up with financial assistance from Japan and the USA to supply iron ore to the steel mills of Japan, was inaugurated on November 12, 1964, by the Vice-President of India, Dr. Zakir Hussain, who described the enterprise as one projecting the image of a planned industrial India. The Kiriburu mine has the distinction of being the first fully mechanised iron ore mine in the public sector. This project, which was conceived six years ago as a multipurpose project, is situated in a hilly area lying on the border of Bihar and Orissa States, on the south-east of Rourkela. Besides boosting the country's export trade, the project entails the provision of a rail link between Sambalpur and Titagarh and between Bimlagarh and Kiriburu, designed to open up the interior of Orissa, and the mechanisation and expansion of facilities at Visakhapatnam port to provide an outlet for the export of the ore. Despite the installation of all machinery at the site and its readiness to start full production immediately, the mine will not go into operation till the Visakhapatnam port acquires adequate ore-handling facilities which are expected to be completed by the middle of the next year.

The Kiriburu project is the first to be completed of the National Mineral Development Corporation's four projects, the other three being (i) the Bailadila Iron Ore Project, Madhya Pradesh, (ii) the D'amond Mining Project, Madhya Pradesh, and (iii) the Khetri Copper Project, Rajasthan. The work on the Kiriburu project was started in May, 1960, with loan assistance from Japan, the US President's Asian Economic Development Fund and the US Export-Import Bank. As a matter of fact, the project was undertaken by India in terms of the long-term agreement (dated March 19, 1958) under which Japan agreed to take about two million tons of iron ore per annum for a period of ten years in the first instance, additional to Japan's normal purchases from India.

The proved reserves of iron ore in the Kiriburu mines where the metallurgical convertibility of iron ore is considered to be the best in the world, total 314 million tons. The mines are spread over an area of 11.5 sq. miles, 790 to 880 metres above the sea level. According to Mr. Leonard Kaiss, Counsellor for Economic Affairs at the US Embassy in New Delhi, India's iron ore reserves are eight times more than those of the United States. The high-grade iron ore reserves of the country are estimated at 22,000 million tons while those of low-grade ores are placed at nearly four times this quantity. The estimated world reserves of high-grade ore are in the neighbourhood of 250,000 million tonnes. The figures given below illustrate the comfortable position which India enjoys in respect of iron ore vis-a-vis other major producing countries.

Country	High-grade reserves (million tonnes)	Ferrous content (Percentage)
U.S.S.R.	35,000	37
USA	5,000	53
Sweden	2,400	62
India	21,800	60
Brazil	1,600	50-60
Peru	3,000	60-75
Chile	n.a.	63

Speaking on the occasion the Chairman of the Japan Iron and Steel Federation, Mr. S. Nagano, said that Japan looked upon Kiriburu as one of the largest sources of supply of iron ore in the future. India's Minister for Commerce, Mr. Manubhai Shah, however, reminded Mr. Nagano that the price that Japan was paying for the Indian ore needed upward revision because the existing price was uneconomical to India.

INTERNATIONAL MARKETING TECHNIQUES

On the exports side the country will more than fulfil the targets set in the third Plan. This was stated by Mr. Manubhai Shah, the Union Minister for Commerce, while inaugurating in New Delhi on November 9, 1964 the first training course on "Techniques of International Marketing" organised by the Indian Institute of Foreign Trade. Mr. Shah said that at present practically one-fourth of the total exports from the country were covered by the quality control enactment which imposed compulsory pre-shipment inspection before the exports took place. With the extension of the pre-shipment inspection to important products such as jute, there would be further increase in the total value of the exported goods brought under compulsory quality control and pre-shipment inspection. The Minister also emphasised that in the presentation of commodities and products from India to the world markets, the packaging must necessarily be of the highest quality. An institute of packaging, he added, would soon be set up in Madras by the Government of India. As regards the trade policies of the Government of India, Mr. Shah assured that they would remain unaltered for the next seven years i.e., till the end of the fourth Plan period and would continue to yield greater benefits to industry and trade. He suggested to the Indian Institute of Foreign Trade to undertake specific studies in relation to export assistance with a view to determining the concrete benefits to the country's economy as a result of the adoption of the present policies.

The training programme is specially designed to suit the practical needs of senior executives from industry, trade and the Government. Among those attending the training course are Indian Government's commercial representatives abroad, representatives of the Ministries of Commerce and External Affairs as well as representatives from export promotion councils, commodity boards and leading export houses. It will be a four-week training course and will include such subjects as "world trade patterns", "problems of India's trade in the context of world trade", "planning and programmes for exports", "export strategy and sales promotion", "export sales management", "institutional arrangements to promote exports", "export-import procedures", "export assistance", "export finance and insurance", "transport", and "legal aspects of foreign trade". Group discussions will be arranged to provide opportunities to the participants to exchange mutual experiences of handling export problems.

SEPTEMBER SPURT IN EXPORTS

The total exports from India in September 1964 were worth Rs. 75.5 crores. This was Rs. 12 crores higher than the total exports of Rs. 63.5 crores in September, 1963. It is the highest figure for exports in any single month and it is hoped that if the September tempo is maintained the country would easily achieve a total export figure of Rs. 900 crores per year. The exports of almost all commodities recorded extraordinary increases in September, 1964. Tea, jute, textile, mineral ores, tobacco, cashew, cardamom, coffee, chemicals, plastics, handicrafts, jewellery, coir products, fish and fish products, raw cotton, engineering goods and other manufactured articles have all contributed to this phenomenal rise. Sugar, vegetable oils and black pepper were the only items of India's export trade which did not register sizable increases in September.

The total exports during the first six months of the financial year 1964-65 were Rs. 380 crores, compared with Rs. 360 crores in the corresponding period of 1963-64.

It's 9.30—let's listen to the National Programme

Long before the power cables brought electricity to India's villages it was possible to listen to the radio—thanks to the battery-operated set.

Union Carbide India were the first to manufacture radio batteries in India. And they were the first to make special batteries for transistor and electronic equipment.

Electrical appliances need no longer depend exclusively on mains plug points because of these versatile 'Eveready' radio and transistor batteries. Their exceptionally compact construction and capacity to recover power between uses make them ideal for portable radios, gramophones, tape-recorders, electric shavers and a whole range of electrical equipment.

Union Carbide India's battery manufacturing plants are but a few of the seeds of industry that the Company have sown in India. The variety and value of products made by Union Carbide India today show how the resources and know-how of a world-wide organisation can serve the needs of a developing economy.

Acid-resistant lacquer for prawns? No!

To keep prawns eatable, cans must be coated with a sulphur-resistant lacquer. It's plum cans which need one that is acid-resistant. Anyone can tell you that—anyone at the Metal Box Research Division.

Scientists attached to this Division help create the right package for every product... make certain that the right finishes are developed to preserve the contents and protect the package.

Yet it would be wrong to think that Metal Box scientists are concerned only with basic developments in packaging. They work all the time with customers to solve individual packaging problems...help suppliers to develop improved materials.

And their discovery of many indigenous substitutes for imported raw materials helps save valuable foreign exchange. As does the work of the Metal Box Technical Development Division. Metal Box have designed and built in India can-closing and bottle-sealing machinery that used to be imported and cost the country a pretty penny.

Metal Box spend about Rs 10 lakhs every year on Research and Technical Development. That's a lot of money—but it pays rich dividends to the Company as well as the nation. Take just one instance. Enterprising packers in Kerala have won growing export markets for canned prawns in recent years. Metal Box know-how and the world-wide acceptability of Metal Box containers have helped to make this export success possible.

Yes, research is at the root of all progress.

JWTFMB 1242A

ancial year 1964-65 (April to September) were worth Rs. 415 crores. This was Rs. 38 crores higher than the exports worth Rs. 377 crores in the corresponding six months of 1963-64. In spite of the fact that prices have tended to rise in the past few months, this export performance is remarkable, and owes a great deal to the co-operation and concerted efforts of the various export promotion councils, commodity boards and the exporters of different commodities.

The exports of engineering goods in September, 1964 were of the value of Rs. 1.55 crores — a record for any month. In the same month in 1963, engineering goods worth only a crore of rupees were exported. The value of the total exports of engineering goods in the first nine months of 1964 (January to September) also touched a record figure of Rs. 11.2 crores compared to Rs. 8.5 crores in the first nine months of the previous year.

Exports of Indian cashewnut in September this year were also the highest on record for any single month. 4,300 tons of cashew kernels were exported in September, 1964, earning a foreign exchange of Rs. 2.5 crores. In the first 9 months of the current year (January to September, 1964) exports of cashew kernels totalled 39,300 tons, valued at Rs. 19.25 crores, i.e. Rs. 2.75 crores higher than the total earnings from cashew exports during the corresponding period in 1963. Exports of cashew shell oil also registered a great increase in the first nine months of this year when 10,200 tons of cashew shell oil were exported earning a foreign exchange of Rs. 1.5 crores, as compared to 5,900 tons worth Rs. 73 lakhs exported during the first nine months of 1963.

EXPO-'67 EXHIBITION

Addressing a press conference in New Delhi on November 13, 1964, Mr. Pierre Deputy, Commissioner General of the Universal and International Exhibition to be held in Montreal, Canada, in 1967 said that the exhibition would follow the pattern of major exhibitions of which the last was the Brussels World Fair held in 1958. The exhibition, which will be referred to as Expo-'67, will have as its central theme "Man and His World" and will be divided into six sectors: (i) Man and the Polar Regions, (ii) Man and Space, (iii) Man and the Sea, (iv) Man the Producer, (v) Man the Creator and (vi) Man and the Community. The exhibition will cover an area of 950 acres covering the St. Helen's island near the city of Montreal. Forty-one countries including the USA, the UK, Mexico, France, West Germany, Belgium, Netherlands, Luxembourg, Lebanon, Iran, Ceylon and Japan have already agreed to participate in the exhibition. Mr. Deputy, however, expects that about 30 more countries including India will participate in the exhibition which is expected to be attended by 30 million visitors. Invitation was extended to 123 countries, excluding China. It will be a nicely planned exhibition costing \$167 million to the host country. This does not include the expenditure that will have to be incurred by the participating countries on the designing and construction of their pavilions. Free transport would be provided, at the exhibition, to the visitors whose number will be about 70,000 to 80,000 per hour. Economic information bureaux run by the host country will be set up in each pavilion. Mr. Deputy expects that the cream of world businessmen, numbering about 6,000, would be represented at the exhibition which will last six months from April 28, 1967 to October 27, 1967.

STANDARDISING METRIC CONVERSIONS

The first meeting of the sub-committee of the International Organisation for Standardisation (ISO) on procedures for inter-conversion of values from one system of units to another (ISO/TC 12/SC 1) was held in New Delhi on November 10, 1964 under the chairmanship of Dr. Lal C. Verman, Director, Indian Standards Institution. The meeting was attended by delegates from Cuba, Denmark, India, New Zealand, Sweden and the UK. The sub-committee agreed to restrict its scope

of work to the standardisation of general procedures for converting numerical values of physical quantities from one system of units to another, preserving the significance and accuracies of the original values in the converted values. It was further decided in the meeting that the draft ISO proposal on interconversion of values should be mainly based on the Indian standard on the subject (IS: 787-1956, guide for interconversion of values from one system of units to another). The sub-committee further agreed that the document should contain all the principles and explanations necessary for elucidating the various problems to make it self-explanatory and useful for educational purposes as well. The work assigned to this sub-committee assumes great importance in view of the definite universal trend towards metric system; 58 countries representing nearly two-thirds of the world have already adopted the metric system.

A draft ISO recommendation on metric sizes for thicknesses of sheets and wires (No. 324) was also finalized at the third plenary meeting of the sheet and wire gauges (designation of diameters and thicknesses) technical committee of ISO (ISO/TC 62) held in New Delhi on November 9 and 10, 1964. The purpose of this recommendation is to specify a basic set of sizes (in millimetres) for thicknesses of sheets and diameters of wire to replace the existing gauge system of measurement. Because of the multiplicity of currently used gauge numbers, which may vary from industry to industry and from country to country, the gauge system of designating thicknesses of sheets and diameters presents several difficulties.

CEYLON EXHIBITION

India will participate in a big way in the Ceylon Industrial Exhibition scheduled to open in Colombo on January 15, 1965. The Indian pavilion at the exhibition, which will last one month, will occupy a floor space of about 8000 sq. ft. There has been great response from trade and industry in India for participation in the exhibition. A very large number of engineering items and the products of small-scale industries have been offered for display. The limitation of exhibition space in the Indian Pavilion may necessitate rotational display of some of the items offered by the participating firms. Although Ceylon's import policy has been restrictive, India is still one of the principal sources of supply of consumer and engineering goods to the Ceylonese market. Some of the items that would be of interest to Ceylon are: plywood and plywood products, wood working machinery, textile machinery, metal working machinery, rubber goods machinery, workshop machinery, food processing equipment and a wide range of machines used in small-scale industries. A representative range of these items is expected to be on view in the Indian Pavilion at the time of the exhibition. The exhibits are being despatched by sea both from Bombay and Calcutta. Side by side with the industrial exhibition, there will be a film festival in which various countries, including India, will participate. An Indian cultural troupe is expected to take part in the cultural programme at the exhibition theatre.

E.R.W. BOILER TUBES

For trouble-free steam raising in all applications calling for rigid specifications, Electric Resistance Weld tubes are in every respect equal to corresponding seamless tubes. High frequency current ensures efficient welding, and normalising is carried out in controlled atmosphere furnaces to produce a ductile tube with a smooth, blue finish.

LOCO

We supply E.R.W. loco boiler and superheater tubes from our Jamshedpur Works to meet the bulk of the Indian Railway's demand. These tubes meet all the technical requirements of Indian Railways.

MARINE

Our E.R.W. tubes meet all the tests specified by Lloyd's Register of Shipping. Indian Tube is on Lloyd's Register of Shipping's list of approved manufacturers.

LAND

Our E.R.W. tubes for land boilers are accepted by the D.G.S. & D. and comply with the Indian Boiler Regulations. We also carry ready stocks of this category at our Warehouses.

Company Affairs

CALCUTTA ELECTRIC SUPPLY

MR. I. A. MACPHERSON, Chairman, the Calcutta Electric Supply Corporation Limited, reviewed the progress of the Corporation during the year ended March 31, 1964 while addressing the annual general meeting held in London recently. He was of the opinion that the regulative measures adopted by the Government to ensure the optimum utilisation of power available with the Corporation could be relaxed completely towards the latter half of the next year because the Corporation would be in a position to supply electricity more freely to its clients. The developments that are likely to help the Corporation towards this programme are the commissioning last October of the 50 MW extension to its New Cossipore Generating Station and more recently of its Southern Receiving Station which have already resulted in the relaxation of several restrictions. Towards the end of this year, when the output of further generating plant will be put at the disposal of the State Board, off-take of the Corporation's Southern Receiving Station will be stepped up to 80 MW which will further relieve the situation. The Corporation expects the commissioning of its Benar Receiving Station designed to take in 100 MW of power from the State Board's Bandel Generating Station towards the first half of the next year. Mr. Macpherson was of the opinion that the commissioning of these two receiving stations, provided they are backed by adequate State Board resources, should enable the Government to relax the remaining restrictions.

The rate of growth in terms of units sold has been considerably high during the last five years 1959-60 to 1963-64 when it recorded an average growth of about 8½ per cent. Revenue from the sale of electricity and for meter rents amounted to £14.8 million and was 13 per cent more than last year. This revenue was much higher than the increase in the units sold because the sales included coal surcharge revenue arising from the increased delivered cost of coal. The Chairman indicated that the estimated tax liability on profit of the year was reduced due to development rebate claimed on new plant commissioned during the year. This saving resulted in the appropriation of £201,021 to the development reserve. He emphasised that the appropriation to plant expansion and contingency reserve, which has been increased to £550,000 together with the development rebate as also the depreciation of over £1 million, played a major part in financing the extension of the undertaking during the year.

Mr. Macpherson made a pointed reference to the financing of the recent £3.50 million extension at the new Cossipore station which under normal circumstances would have been achieved by an issue of shares or debentures or both. In view of the possibility of the company being taken over by the Government of West Bengal or by the State Electricity Board on January 1, 1970, financing through capital issues was not found practicable. On seeking clarification, the Government told the Corporation that repayment would be guaranteed in the case of its being taken over by the Government. The company has now been able to go ahead and arrange a loan from the State Bank of India. This loan of £3.50 million, repayable on December 30, 1969, will be utilised towards the total expenditure of £18.50 million on the new Cossipore extension. The company proposes to finance the remaining amount of £15 million through internal resources, provided it can continue to earn its reasonable return.

HINDUSTAN FERODO ISSUE

Hindustan Ferodo Limited proposes to enter the capital market in the middle of the next month with a public offer of 546,800 equity shares of Rs. 10 each at a premium of Rs. 17

per share. It is a company jointly promoted by Asbestos, Magnesia and Friction Materials Limited, Manchester and Turner and Newall Limited, Manchester, UK. The company has purchased the undertaking and asset of Asbestos, Magnesia and Friction Materials Ltd., which is presently manufacturing in Bombay brake and clutch linings, asbestos textiles and friction materials, etc.

The company has been licensed to raise its capacity of brake linings from 1,064 tonnes to 2,160 tonnes, clutch facings from 500,000 to 1,000,000, asbestos textiles from 600 tonnes to 775 tonnes and substantial expansion in other fields. The construction of the additional factory buildings has commenced and the proposed expansion is expected to be completed by October, 1966. The cost of this expansion is estimated at Rs. 291.47 lakhs and is to be met partly by the capital issue and partly by borrowings.

SANDOZ (INDIA)

Sandoz (India) Limited proposes to enter the capital market next month with a public issue of Rs. 30 lakhs in equity shares. An affiliate of Sandoz Limited of Switzerland, it has an authorised capital of Rs. 2 crores divided into 2,000,000 equity shares of Rs. 10 each. The issued and paid up capital is Rs. 75 lakhs. It proposes to issue a further 750,000 equity

shares of Rs. 10 each of which Sandoz Limited, Switzerland will be allotted shares worth Rs. 23.60 lakhs partly for cash and partly in consideration for the planning and development of the company's medicinal herbs scheme and extraction plant. Shaw Wallace and Company Limited will take up shares worth Rs. 7.50 lakhs and the existing shareholders, directors, employees and friends will be allotted shares worth Rs. 13.90 lakhs. The balance of Rs. 30 lakhs will be offered at par for public subscription.

In addition to financial participation, the Swiss company will continue to provide benefit of research conducted by it as also the technical know-how and assistance for the manufacture and marketing of the products in India. The proposed issue will be utilised to finance a part of the capital expenditure and working capital of the Sandoz dyestuff project, the expansion of agrochemical plant, the expansion of auxiliary plant and any future expansion. The total additional requirements of Rs. 170 lakhs will be met partly by the issue of capital and partly by loans.

INDIAN ALUMINIUM

The directors of Indian Aluminium Company Limited have reported that it has been proposed to maintain the interim dividend for the year ending December 31, 1964 at 7.5 per cent.

J. K. STEEL

The directors of J.K. Steel Company propose to maintain the ordinary dividend for the year ended June 30, 1964 at 15 per cent to which level it was raised last year from 10 per cent paid for 1961-62. The gross profit at Rs. 31.46 lakhs is slightly lower than last year's figure of Rs. 32.27 lakhs. The provision for depreciation amounts to Rs. 3.50 lakhs and for taxation Rs. 13.44 lakhs. The directors have added Rs. 2.54 lakhs to the development rebate reserve and Rs. 5 lakhs to general reserve. The preference dividend at 9.1 per cent absorbs Rs. 91,000 and the ordinary dividend absorbs Rs. 6 lakhs.

INDIA AIR GASES ISSUE

India Air Gases Limited, a new company floated for the manufacture of oxygen and acetylene gases, has been granted an industrial licence to set up a factory at Varanasi, U.P. The licensed capacity of the factory is 36 million c. ft. of oxygen and six million c. ft. of acetylene. The total capital outlay on the project is estimated at around Rs. 61 lakhs to be licensed by the issue of capital to the extent of Rs. 31 lakhs and loan of Rs. 25.25 lakhs from the Industrial Finance Corporation. The issued capital will be made up of Rs. 23 lakhs in equity shares and Rs. 8 lakhs in preference shares. The directors, their friends and associates have agreed to take up equity shares of the value of Rs. 10 lakhs. The Industrial Finance Corporation has already sanctioned a rupee loan of Rs. 8.09 lakhs and a dollar loan of the value of Rs. 17.16 lakhs. It has also agreed to underwrite shares worth Rs. 2 lakhs. The company is in contact with various financial institutions including the U.P. State Industrial Corporation and the L.I.C. for grant of loan and the underwriting of shares. It expects to enter the capital market with a public offer towards the end of this year and has been granted a licence for import of plant and equipment from U.S.A. and Poland.

VOLTAS

The directors of Voltas Ltd., proposed to issue 102,000 rights shares of Rs. 100 each for cash at a premium of Rs. 25 per share and the company had received sanction from the Controller of Capital Issues in May last. But in view of the company's financial requirements, the directors have found it possible to defer the issue till the second half of 1965. They

propose to consider it in the second half of next year after obtaining the sanction of the Controller of the Capital Issues.

GLOBE AUTO

Globe Auto Electricals Ltd., proposes to issue 3,000 redeemable cumulative preference shares of Rs. 100 each carrying a taxable dividend of 9.5 per cent. The issue, which will be taken up wholly by the Oriental Fire and General Insurance Co. Ltd. has been necessitated by the shortage of working capital as a result of an increase of about Rs. 3 lakhs in the estimated capital cost of its Maralli project. The increase is attributed to a rise in the customs duty on machinery and higher indigenous tooling and construction charges.

INDIA PAPER PULP

India Paper Pulp Co. Ltd., proposes to raise debenture capital of Rs. 40 lakhs to finance its expansion programmes. The debentures, in units of Rs. 1,000 each, will carry interest at the rate of 7 per cent, taxable, and are repayable in 1967-77. Of these debentures, Rs. 20 lakhs will be allotted on a firm basis to the underwriters and their friends and the balance of Rs. 20 lakhs will be offered for public subscription. The subscription list will open on November 30 and will close on December 9 or earlier, but not before December 2. The company has at present three paper-making machines and a pulp unit. The production of paper and paper board during the year ended March 31, 1964 was 16,636 tonnes. It is proposed to raise the paper-making capacity to 23,000 tonnes a year by undertaking renovation and speeding up of each of its paper-making machines progressively from the middle of 1965 to 1967. Besides, the company has obtained an industrial licence to expand its pulping capacity using jute sticks as the raw material. The new jute stick pulp plant which is under erection will be commissioned in the first half of 1965 and which together with the production of bamboo pulp from the

ESSAY COMPETITION

The Board of Editors of "Finance & Commerce", a monthly journal devoted exclusively to Company Law and Taxation, have decided to hold an Essay Competition and to give away prizes of Rs. 251, Rs. 151, Rs. 101 respectively for essays coming in first, second and third places in order of merit. The judges appointed for this purpose are:

- (1) Sri M. P. Chitale, F.C.A., Vice-President, Institute of Chartered Accountants of India;
- (2) Sri D. D. Kalra, FICWA, President of Institute of Cost and Works Accountants of India.

Essays should be on any aspect relating to "Company Accounts — Financial or Costing". They should not exceed 4,000 words and should be typed in double space on one side of the paper and should deal with only one aspect of the Company Accounts, for example, "Provision for Depreciation in Company Accounts from Law and Accountancy Angles", "Inventory Control in a big sized company", "Management Accountancy — a necessity for a modern company", "Provisions relating to Accounts under the Companies Act", "Suitable form for a company Balance Sheet and Profit and Loss Account", "Cost Audit under proposed Section 233B" etc.

There is no entry fee. The essay in quadruplicate should reach the Editor,

CAPITAL ISSUES

The Travancore Sugars and Chemicals Limited Trivandrum, is to issue bonus shares of the value of Rs. 6 lakhs on capitalisation of its share premium account. The bonus shares will be issued in the ratio of 1 for 5 shares held.

The Mysore Stoneware Pipes and Potteries Ltd., Bangalore, is to issue further capital of Rs. 60,000 divided into 6,000 equity shares of Rs. 10 each to be issued as fully paid bonus shares to the existing shareholders of the company in the ratio of one bonus share for every 10 equity shares held, on capitalisation of the company's share premium account to a like extent.

N. and N. Cutting Tools Limited, Bombay, is to issue Rs. 52.50 lakhs capital — Rs. 37.50 lakhs equity and Rs. 15 lakhs preference — in shares of Rs. 100 each. All the shares will be issued for cash at par. The money will be utilised for the manufacture of twist drills, taps and dies.

Appeejay Structurals Limited, Calcutta, is to issue capital of Rs. 65 lakhs for cash at par consisting of Rs. 50 lakhs in equity shares of Rs. 10 each and Rs. 15 lakhs in 15,000 9.28 per cent cumulative redeemable preference shares of Rs. 100 each. Out of these, such number of shares as will entitle the scrip to be listed on the recognised stock exchanges will be issued to the public by prospectus. The capital will be utilised for the manufacture of steel structurals. This is in supersession of an earlier consent.

Hindustan Organic Chemicals Limited, Bombay, a Government of India undertaking, is to issue further capital of Rs. 17 lakhs divided into 1,700 equity shares of Rs. 1,000 each at par. The money will be utilised for financing the company during 1964-65.

Philips India Limited, Calcutta, is to issue further capital of Rs. 40 lakhs (nominal) in equity shares of Rs. 10 each at a premium of Rs. 6 per share. Out of this, 1,00,000 equity shares will be offered to the company's foreign collaborators N. V. Philips Gloeilampenfabrieken Netherlands, partly for cash and partly for consideration other than cash. The balance of 3,00,000 shares will be offered to the Indian shareholders for cash in the ratio of three new shares for five shares held. The consent is valid up to April 30, 1965.

Sandoz (India) Limited, Bombay, is to issue further capital of Rs. 75 lakhs, divided into 7,50,000 equity shares of Rs. 10 each, at par. Of this, shares of the value not exceeding Rs. 23.6 lakhs (Rs. 13.6 lakhs for cash and Rs. 10 lakhs for consideration other than cash) will be offered to company's foreign collaborators, Sandoz Limited, Basle (Switzerland). The balance (including shares of a value not less than Rs. 30 lakhs by prospectus) will be offered to the public for cash. The money will be utilised on the company's expansion scheme.

Suraj Textiles Mills Limited, Malout Mandi, District Ferozepur, (Punjab), is to issue further capital of Rs. 30 lakhs divided into 15,000 equity shares of Rs. 100 each and 15,000 preference shares of Rs. 100 each. The capital will be utilised for financing the expansion programme of the company.

Bharat Collieries Limited, Calcutta, has been granted consent to postponement of the date of redemption of debentures of the value of Rs. 30 lakhs from October 31, 1964 to October 31, 1972 and to the increase in the rate of interest thereon from 6 per cent to 7½ per cent per annum effective from November 1, 1964 subject to the agreement of the debenture holders and subject to the further condition that such of those debenture holders who want to be repaid in cash shall be so repaid within a period not exceeding three months.

I.O.B. is big enough to serve you...

...and small enough to know you.

HINDALCO ALUMINIUM

FOR THE DEVELOPMENT OF INDUSTRIES

The Rs. 200 million Birla-Kaiser aluminium project at Renukoot, near Rihand, in U.P., has, since December 1962, attained and surpassed the initial target capacity of 20,000 tonnes per annum. While the Renukoot plant is already the biggest integrated aluminium manufacturing complex in India, Hindalco is forging ahead with its programme of rapid expansion, for raising the primary aluminium capacity to 60,000 tonnes per annum (and to provide fabrication facilities totalling 37,000 tonnes per annum), to help the country's fast growing industries in their march towards progress and prosperity.

Planning Without Production

LAST WEEK in Lok Sabha the Finance Minister returned significant answers to a number of interesting questions relating to the economic development of the nation. The National Development Council, at its meeting held last month, had been inclined to favour a fourth Plan outlay ranging between Rs. 21,500 and 22,500 crores. Of this, the investment in the private sector was put at Rs. 7,000 crores, which would leave an outlay of between Rs. 14,500 and 15,500 crores for the public sector. Mr. Krishnamachari explained the need for talking of the outlay in the public sector in terms of two figures, a lower and a higher one, by disclosing that the higher investment target would be attempted through stepping up investments in the second half of the Plan provided the national economy had, in the meanwhile, improved sufficiently to permit mobilization of additional resources. This does not, however, mean that uncertainty regarding resources is confined only to the difference of Rs. 1,000 crores between the lower and the higher limits of projected outlay. On the contrary, as the Finance Minister readily conceded, there was a gap of Rs. 3,000 crores between resources and requirements as estimated by the Working Group which had studied this matter. He also allowed that the assessment of resources could be assumed to be correct only within the order of Rs. 1,000 crores.

It is plain from all this that there is a very large element of Micawberism in the formulation of the fourth Plan. The Finance Minister's declaration that the Government had decided to abrogate deficit financing almost completely from budgeting for the fourth Plan cannot, therefore, be altogether reassuring. The cynic would certainly point with delight to the comfortable adverb "almost" with which the Finance Minister has adroitly qualified his caveat against deficit financing. But skilful semantics apart, it must be bluntly stated that neither the Finance Minister nor even the Government as a whole is at present really in a position to give a valid undertaking that a fourth Plan of the dimensions now being sought will not involve substantial deficit financing.

Mr. Krishnamachari, indeed, had spoken bravely of exploring other ways and means of raising the extra Rs. 3,000 crores. But such arithmetic as he was able on the occasion to advance was not only vague but misleading. He referred, for instance, to the recent increase in foodgrain prices which, in his view, would be adding Rs. 200 crores to income in the agricultural sector. The Finance Minister's argument was that to the extent some of those Rs. 200 crores could be got at through savings or other means as contribution to Plan finances, the resources position was bound to benefit. The weakness of this contention is that it ignores the vital point that the Rs. 200 crores supposedly accruing to the agricultural sector as additional income would only be in the nature of transfer of funds from the rest of the community to the farm population. In other words, the expansion of incomes in the agricultural sector may not represent any net improvement in the aggregate resources available within the community. All that would have happened is that the distribution of the national income has been slightly influenced in favour of the farming community. This diversion does not necessarily facilitate mobilization of resources for the Plan. On the contrary, to the extent that it is notoriously difficult to generate or mobilize savings in the farm population, the availability of resources for the Plan would have deteriorated rather than improved by virtue of the larger payments which the non-farm population would be

making to the farm population because of increased agricultural prices.

We strongly urge that, with the salutary experience of the third Plan to profit from, the Government should now resolve to be realistic. There is really no escape for the nation from the necessity that, foreign aid apart, it could hope to invest in the fourth Plan no larger resources than it could currently generate within the economy through increased production. We should have thought that this truth is so clear and compelling that the formulation of the fourth Plan would have been wholly brought under its wholesome discipline. Unfortunately, this does not seem yet to be the case.

Hindustan Antibiotics Limited

THE HINDUSTAN Antibiotics, which commenced production of wonder drugs such as potassium penicillin first crystals towards the end of 1954, tetracycline in July 1961 and streptomycin in February 1962, appears to be one of those enterprises which have brought credit to public sector projects. It is proposed to examine the working of the company during the last four years ending March 1964 from the data published by the enterprise.

Table I shows the progress of the company revealed by certain important indicators during the last four years.

TABLE I.
PROGRESS DURING 1960-61 TO 1963-64

	1960-61	1961-62	1962-63	1963-64
Production — Target m.m.u.	35.00	45.00	50.00	52.00
Actual m.m.u.	40.24	45.53	50.17	51.54
Gross Sales (Rs. lakhs)	343	356	430	482
Profit before taxation (Rs. lakhs)	146	140	140	145
Income tax provision (Rs. lakhs)	65	64	70	70
Transfer to General Revenue (Rs. lakhs)	79	19	5	39
Transfer to Export Promotion Reserve (Rs. lakhs)	—	—	9	9
Transfer to UNICEF Reserve (Rs. lakhs)	—	32	23	—
Depreciation (Rs. lakhs)	16	18	36	53
Dividend Distributed (Rs. lakhs)	—	16	16	25
Loans from Government	—	—	—	—
Employees on Roll	1205	1412	1818	1892

It will be seen that the company has recorded an all round progress during the last four years. The actual production has, on the whole, exceeded the targets and the value of sales has continuously increased. The profit before taxation in 1963-64 of Rs. 145

lakhs, although higher than the previous year by Rs. 5 lakhs, is slightly less than the profit of 1960-61. The reason for the fall in profits during 1961-62 to 1963-64, in spite of the fact that the value of sales has improved is to be found in the reduction of prices of its products announced in January 1961. Besides, the company had charged to its 1961-62 and 1962-63 accounts the working expenditure on its streptomycin plant, whereas sales of dihydro-streptomycin commenced only in March 1963. The company has not borrowed any funds from Government during the last four years, but has instead paid the total dividend of Rs. 57 lakhs.

Table II shows the summarised balance sheet of the company as at March 31, 1964.

TABLE II.
BALANCE SHEET AS AT MARCH 31, 1964
(In Rs. lakhs)

Liabilities		Assets	
Paid-up capital	247	Gross fixed assets	578
Reserves & surplus	436	Less depreciation	189
Sundry creditors for purchases	53	Net fixed assets	389
Sundry creditors for deposits	6	Inventories	223
Sundry creditors for others	40	Sundry debtors	108
Provision for taxation	19	Loans & Advances	58
Proposed dividends	25	Cash & bank balances	48
TOTAL	826		826

The balance sheet of the company reveals a very sound financial position. It has no borrowings either from Government or from any bank or from any financial institution. On the other hand, its paid-up capital and reserves exceed its net fixed assets by Rs. 294 lakhs suggesting that a considerable part of its working capital has been financed from these two sources, thereby dispensing with the need for resorting to borrowings.

finance it. For this sound position, the accumulated profits of the company during the previous years, represented by Reserves and Surplus of Rs. 436 lakhs was the main contributing factor.

The rate of profit earned by the company during the last four years measured by three standards, viz., the rate of profit before tax on sales, total capital employed and net worth is given in Table III.

TABLE III.
(Percentage)

	1960-61	1961-62	1962-63	1963-64
Rate of profit before tax on sales	42.6	39.4	32.5	30
Rate of profit before tax on total capital employed	19.9	16.2	17.3	17.5
Rate of profit after tax on net worth	15.6	13.1	11.0	10.9

It would be seen that the company has been making a fairly high rate of profit during the last four years. A profit margin of over 30 per cent on sales of vital life saving drugs no doubt calls for a reduction in prices of these products. But the point worth noting is that the price of one of its main products, viz., streptomycin, has been fixed at Rs. 175 per kilogram although the actual cost of production was high, to keep it practically on par with the rate at which imported streptomycin was being sold and to ensure that there was no increase in the ultimate price to the consumer. It would, therefore, appear that the buyers of penicillin, the other main product of the company, have been made to pay for the increase in the cost of production of streptomycin.

One important reason for the relatively lower rate of profit margin on sales during the last three years was the agreement under which the company supplied free to UNICEF a total quantity of 6 million megounits of penicillin in vials. Further, towards repayment of the cost of machinery and equipment provided by UNICEF, the company agreed that supplies on this account should be made at a concessional price which was 35 per cent below the list price. Both the supplies were intended for free distribution to hospitals, primary health units and other institutions in this country. The financial implication of these proposals to the company was Rs. 69.4 lakhs.

Since the hospitals in the country had benefited by free supplies made by the company, the real profit earned by the company was higher than what Table III indicates. In looking for an explanation for the higher rate of profit earned by the company, it would be useful to examine once again the figures in Table II. It would be seen from the table that of the total capital employed of Rs. 826 lakhs, as much as Rs. 683 lakhs represented

paid-up capital and reserves, on which the company was not bound to pay any return unless it earned a profit. The company had no borrowings on which it had to pay any interest and the remaining finances for the company had been obtained from sundry creditors. Thanks to a wise policy of retaining a considerable part of the profits, even the reserves of the company were higher than the net fixed assets.

Table IV gives the main constituents of expenditure in relation to the value of production during the last three years.

The total expenditure which stood at Rs. 213 lakhs or 61 per cent of the value of production in 1961-62 increased to Rs. 271 lakhs or 64 per cent in 1962-63 and to Rs. 320 lakhs or 71 per cent in 1963-64. Thus apart from the free supplies to UNICEF, another reason for the lower rate of profit is to be found in the higher rate of growth in expenditure, compared to the value of production.

TABLE IV.
PATTERN OF EXPENDITURE
(In Rs. lakhs)

	1961-62	1962-63	1963-64
Consumption of goods	118	134	145
Operating expenses	48	73	85
Research expenses	3	4	5
Selling expenses	5	6	8
Other expenses	21	19	25
Depreciation	18	35	52
TOTAL	213	271	320
Value of production	347	420	448

The Government of India, while approving the doubling of streptomycin plant capacity and sanctioning foreign exchange component involved in the scheme, had stipulated that the company should export penicillin and streptomycin, subdivided products etc. and earn foreign exchange to the extent of Rs. 34 lakhs in two annual instalments in the years 1962-63 and 1963-64. The company has not been able to export during both the years since the international price of antibiotics is lower than the company's cost of production. Even in the Middle East and South-East Asian countries, the ruling prices of imported penicillin — mostly from the UK and the USA—are lower than the cost of production of Hindustan Antibiotics Limited. In order to enable the company to export at a lower price, the company appropriated Rs. 8.50 lakhs each in 1962-63 and 1963-64 from the surplus and credited it to export promotion reserve. In effect this would mean that the company is obtaining Rs. 34 lakhs worth of foreign exchange for Rs. 51 lakhs of rupees. This, of course, is a practice peculiar neither to India nor to the export merchandising of antibiotics alone.

INDUSTRIES RELY ON PREMIUM QUALITY **Mobil** PRODUCTS NOW SUPPLIED BY INDIANOIL

For over 70 years, Indian industries have trusted world-famed MOBIL lubricants bearing the familiar Flying Red Horse symbol. Today, these same products are brought to you by INDIANOIL.

INDIANOIL Lubrication Engineers recommend from a wide range the right MOBIL lubricant for the machine and the job so that your machinery investment pays for itself through extended years of service.

Highlights of the Week

MILITARY AID

MR. Y. B. CHAVAN, India's Defence Minister, stated in London on November 19 that he would not be returning home empty-handed after talks with the British Government on defence and economic matters. The communique issued by the Commonwealth Relations Office on the following day indicated that Mr. Chavan's visit to the United Kingdom had been, by and large, a success. Britain has signed a loan agreement for the sum of £4,700,000 which would be made available over the next four years to finance the rebuilding of the Mazagon Dockyard and the construction of three Leander frigates. These frigates would take some time to be completed while the problem of replacing the aging ships of the Indian Navy is assuming urgency. An assurance has been held out that Indian requirements would receive further consideration by Britain, especially when it finalised the review of its own defence policy. Again, Britain has offered assistance — foreign exchange, loans and technical know-how — for building a submarine in India, though confirmation in this regard is lacking. A Royal Navy submarine "for a period each year" would be provided to India for imparting anti-submarine training to Indian officers. Even though details in this regard have not been disclosed, the construction of the submarine will fulfil a long outstanding ambition of the Defence Minister.

Earlier, Mr. Y. B. Chavan stated in London that the total cost of India's defence needs was about Rs. 5,000 crores out of which Rs. 680 crores only would be from external sources. "The freedom of our country", said the Defence Minister, "must be defended by our own efforts, our own blood. The people of India are determined to protect their independence at any cost".

It is reported from Karachi that Britain has assured Pakistan that its military aid to India would be deployed only against China.

BANK RATE RISE IN BRITAIN

THE BANK rate in Britain was raised from 5 per cent to 7 per cent on Monday, November 23, 1964. Considerable pressure had been building up on the pound as gold and foreign exchange were flowing out of London faster than even during the election. The Wilson Government had no option but to stem this tide by raising the bank rate by 2 per cent at one go. Britain will also have to avail of the stand-by arrangements with the International Monetary Fund which can provide up to £357 million. Both these measures are likely to save the pound from devaluation.

Looking back at the economic policy of the Labour Government, it may be said that it has not proved popular either at home or abroad. The 15 per cent surcharge has been disliked by the EFTA countries, the common market countries and the developing countries in the Commonwealth. At home, the Labour Government's decision to raise income tax and impose new corporate taxes has not been approved by the people.

Under similar circumstances, the Conservative Government in Britain had also raised the bank rate to 7 per cent twice; once in 1957-58 for about six months and at another time in 1961 for about two months but as soon as the balance of payments position improved, it had been again brought down. Now that this drastic step has been taken, the feeling exists that Britain will be able to withdraw the surcharge of 15 per cent on imports.

The sharp rise in the bank rate assumes poignancy in

view of the fact that the Labour Government did not believe in monetary methods of correcting the economic disequilibrium. Even the election manifesto of the Labour party had given its opinion against a rise in interest rates. The fact that it had to take this drastic measure shows that it was not willing to operate the still sharper lever of devaluation of the pound.

In India, the increase in the bank rate is viewed as a measure which will make collaboration agreements with Britain costlier since the cost of credit in Britain has risen. The terms of collaboration offered to Indian parties will, no doubt, be stiffer than they have been hitherto. Again, the British banks which are operating in India, would prefer to raise credit in this country instead of raising it in Britain because of the difference of two per cent between the bank rates in India and the United Kingdom.

COLOMBO PLAN

THE COLOMBO Plan has sometimes been described as a big envelope containing the development plans of the South-East Asian countries. It is a fact that planning of the economies of these countries through national efforts has taken considerable strides since 1950 when the Colombo Plan to assist these countries first took shape. It was to run for a decade in the first instance but was later extended by five years so as to run up to 1966. At the meeting of the Consultative Committee of the Plan at London on November 20, the announcement was made that it would be extended for a further period of five years until 1971. Its further renewal would be considered again in 1969. Even after 15 years of continued assistance to these countries, the annual report has stressed the need for undiminished aid in order to raise the living standards of the people in these countries. The communique issued at the conclusion of the meeting stated that the total aid covered by Britain, Australia, Canada, Japan, New Zealand and the United States to the Colombo Plan countries since 1950 had risen to \$14,864 million. In 1963-64 alone the total value of aid given to these countries was as high as \$2,165 million. These figures do not include the aid provided by the regional members to each other.

Substantial increases in development expenditure took place in many countries of this group during 1963. There had been an increase in expenditure under other heads as well, particularly defence. Efforts needed to be intensified to pursue policies which would maintain financial stability while investment in essential development would continue to be made. Despite massive investments both from indigenous and external resources, the level of public expenditure on development per head over the Colombo Plan countries as a whole remained relatively low. While the rate of rise in population needed to be moderated, measures were required urgently to be taken to accelerate the rate of investment. The only streamline in the whole picture was the encouraging fact that aid on a large scale would continue to be given by the signatories to the Colombo Plan so that the region as a whole would be able to finance its development programmes as well as its current imports.

A review of the aid problems of the Colombo Plan countries by the Committee showed that some members had taken steps to make aid available "on easier terms during the past year." Also, the resources of the International Development Association (which includes several members of the Colombo Plan among its major contributors) had been increased. While bulk of the aid provided to these countries continued to be tied to purchases from the donor countries, the propor-

tion of untied aid had also been increased. Some further facilities will have to be provided in order to tackle the problem of accumulation of external debt.

A special topic for discussion by the Colombo Plan countries this year was the development problems of the rural areas in the region. It was noted with concern that while the demand for food continued to rise because of increase in population as well as high incomes, the improvement in food production hardly kept ahead of population growth. It was, therefore, imperative that agriculture should be given the highest priority though it was suggested that Governments should not think of rural development in isolation but should aim at achieving a balanced growth between agricultural and industrial sectors. At next year's meeting of the Consultative Committee, the special topic of regional interest for discussion will be "The Relationship between Population and Economic Development in the Colombo Plan Area."

LONG-RANGE SUGAR POLICY

AT THE fifth annual general meeting at New Delhi of the National Federation of Co-operative Sugar Factories, Mr. C. Subramaniam, the Union Minister for Food and Agriculture, stated that the Government hoped to evolve a long-range policy in regard to the sugar industry which would be beneficial to all the parties concerned. Earlier, Prof. D. R. Gadgil had pleaded for a long-range policy of the sugar industry. He said that during the last 1½ decades, official policy in relation to sugar production and price of sugarcane and sugar had been formulated exclusively on short-term considerations which had resulted in wide fluctuations and had added to the prevailing difficulties in the industry. The Minister held out the assurance that the proposed long-range policy would seek to resolve the conflicting differences amongst producers, cane growers, workers and consumers through an integrated and balanced approach.

An additional annual capacity of 800,000 tonnes of sugar

would be licensed shortly, according to Mr. Subramaniam. Licences for new factories would be issued and some of the old factories would be allowed to expand. A large number of applications had already been examined by the Screening Committee for the expansion of the existing units as well as for the establishment of new ones. He further stated that licences for expansion would be issued soon while establishment of new factories — mostly in the co-operative sector — was under consideration.

Reviewing the progress of the co-operative sugar factories in the country, Mr. Subramaniam said that the number of such factories had risen to 48 in 1963-64. Four additional factories in the co-operative sector were likely to be established in 1964-65. This speedy growth in the co-operative sector had been made possible by the deliberate policy of the Government to provide preferential licences and liberal financial assistance. He urged the Federation of Co-operative Sugar Factories to see to it that sugar was made available to the people at an economic price. He said that it would be possible for the co-operatives to do so if they would not be tempted by the charm of temporary gains. The co-operatives must think in terms of increasing the production capacity and economising in production and overhead expenses.

Prof. D. R. Gadgil, while reviewing the progress of the co-operative sugar factories, stated that the production in this sector in 1963-64 was 598,000 tonnes as against the total national output of 2,567,000 tonnes. The co-operatives had played a major role in the implementation of the Government's policy regarding the production of raw sugar for export. He regretted that the interim report of the Sen Commission had not been published. Mr. S. K. Dey, the Union Minister for Co-operation and Panchayati Raj, put forward the suggestion that inter-State and inter-factory visits by the management cadre and the agriculturists should be arranged so as to develop technique and administrative standards.

"Someone should tell him about State Bank Travellers Cheques!"

Armed guards can cost a lot of money. Why not carry all the cash you want in the form of State Bank Travellers Cheques? They're absolutely safe, and much more convenient.

The State Bank of India issues its own Rupee Travellers Cheques in denominations of Rs. 50/- and Rs. 100/-. These can be cashed at any of the 1700 Offices of the State Bank of India and its Subsidiaries. They are also encashable at encashing Agents at airports, and hotels and shops; in India and abroad. They're good anywhere, anytime, even after banking hours.

No irksome formalities. No risk. If lost, these cheques can easily be replaced.

Don't take risks.

Take State Bank Travellers Cheques.

STATE BANK OF INDIA

Food to the Fore

By Our Parliamentary Correspondent

NEW DELHI:

ALTHOUGH THE adjournment motion seeking to censure the Government for the mishandling of the food situation in Kerala was defeated by the Lok Sabha by an overwhelming majority on the second day of its working during the current session, the food problem continued to be the centre of attraction in the proceedings of Parliament last week, the occasion being provided by the debate in the Lok Sabha on the Food Corporation Bill. The other highlight of the week's proceedings was the statement made by the Minister for External Affairs, Mr. Swaran Singh, on the international developments since the last session of Parliament. The hostile Nagas' demand for independence also created a good deal of furore.

The Food Corporation Bill received general approbation, but encountered stout opposition from the Swatantra group whose main spokesman, Mr. N. Dandekar, feared that by securing monopoly in foodgrains trade, the operation of the Corporation would be detrimental to the interests of both the producers and the consumers. Compulsory procurement of foodgrains by the Corporation, Mr. Dandekar argued, would mean that producers would not get a remunerative price for their produce. Mr. Dandekar also expressed misgivings about the Corporation's ability to carry out the enormous task of trading in foodgrains on a nation-wide scale. The leader of the Swatantra group, Mr. N. G. Ranga, wanted a provision in the Bill to protect the interests of kisans. A former Union Minister for Food, Mr. A. P. Jain, welcomed the setting up of the Corporation and opined that in the present circumstances there was no alternative to State trading in foodgrains. He favoured monopoly procurement only in the event it was inevitable for the successful working of the Corporation. He, however, wondered why Madras, situated in one corner of the country, had been chosen as the Corporation's headquarters. Bombay or Hyderabad, he suggested, would have been a better choice. Mr. Jain regretted that the single southern zone for rice, which had served the region well in the past, should have been disturbed and each of the four States comprising it, namely, Andhra Pradesh, Madras, Mysore and Kerala, should have been made into separate zones. Mr. Bibhuti Mishra (Congress) suggested that the Corporation should be renamed as "Agricultural Produce Corporation of India". The independent member, Mr. Kashiram Gupta, wanted that farmers as well as consumers should be represented on the Board of Directors of the Corporation. Dr. M. S. Aney, another independent member, expressed the opinion that the Corporation should work in a commercial spirit, consistent with the interests of both the producers and the consumers.

Sound Basis

In his reply to the general debate on the Bill, the Union Minister for Food and Agriculture, Mr. C. Subramaniam, assured the House that the Corporation would be built on a sound basis and run on commercial lines. Only a reasonable margin of profit would be charged by it. Mr. Subramaniam regretted the behaviour of the trade and observed that it was only this behaviour that was responsible for compelling the Government to set up the Food Corporation. He emphasized that the establishment of the Corporation was not intended to

destroy the existing channels of trade. Mr. Subramaniam was also not in favour of vesting the Corporation with monopoly procurement rights. But if the trade did not behave, he would have no hesitation in clothing the Corporation with powers to function on a monopolistic basis. Appropriate powers, the Minister said, would be given to the Corporation under the Essential Commodities Act and the Defence of India Rules. With a view to enabling the Corporation to function on commercial lines, the Institute of Management would be appointed as its consultants. Mr. Subramaniam defended selection of Madras as the headquarters of the Corporation on the ground that in the initial stages it had to trade primarily in rice. He accepted Mr. Ranga's amendment that the Corporation should bear in mind the interests of producers as well as consumers. The original draft had merely mentioned "public interest". Although the House sat for extra time on November 21, the Bill could not be adopted for want of quorum. The clause-by-clause consideration of the Bill had to be postponed.

Chinese Bomb

Reviewing the international developments since the last session of Parliament, the Minister for External Affairs, Mr. Swaran Singh regretted the explosion of atomic bomb by China within a few days of the non-aligned nations' declaration in Cairo, which deprecated nuclear armament; he stated that it not only constituted a flagrant disregard of the hopes of the world generally, but was also a developing threat to humanity and civilisation. He reiterated Government of India's policy to develop atomic energy only for peaceful purposes. Mr. Swaran Singh expressed gratification at the fact that the gathering at the Cairo Conference had unanimously endorsed the policies of non-alignment, peaceful co-existence, settlement of differences by peaceful means and the inviolability of the frontiers of States as they existed at the time of their independence. Citing the assurance given by the new Soviet Government, he expressed the view that the recent political changes in the Soviet Union would not affect Indo-Soviet relations. Mr. Swaran Singh also referred to the Labour Party's coming into power in Britain and India's relations with Ceylon and Pakistan. The recent agreement on settlers of Indian origin in Ceylon, he said, had removed the one irritant to the cordial relations between the two countries. He was sorry that the Indo-Pakistan Home Ministers' Conference to be held in Rawalpindi this week had been postponed and expressed the hope that it would take place soon. Replying to questions on the Naga problem and the hostile Nagas' claim for independence for the Nagaland, the Minister for External Affairs asserted that the Nagaland was Indian territory.

The Lok Sabha last week passed the Anti-corruption Laws (Amendment) Bill which sought to amend the Indian Penal Code, 1860, the Code of Criminal Procedure, 1898, the Criminal Law (Amendment) Ordinance, 1944, the Delhi Special Police Establishment Act, 1946, the Prevention of Corruption Act, 1949, and the Criminal Law (Amendment) Act, 1952, in the light of the recommendations of the Santhanam Committee with a view to ensuring speedy trial of cases of bribery and corruption. The Rajya Sabha adopted the Seeds Bill and the Registration of Births and Deaths Bill. The Seeds Bill aimed

at improving the quality of seeds for agricultural purposes. The Registration of Births and Deaths Bill sought to regulate the registration of births and deaths in the country.

The Finance Minister, Mr. T. T. Krishnamachari, introduced in the Lok Sabha a Bill to amend the Mineral Oils (Additional Duties of Excise and Customs) Act, 1958. The Bill seeks to enhance the existing ceilings on the rates of additional duties leviable on petroleum products and to include in the list of petroleum products subject to these duties items as bitumen, asphalt, etc. The new ceilings proposed are (the present ceilings in brackets): motor spirit Rs. 165 per kilolitre at 150C (Rs. 56.05); kerosene Rs. 80 per kilolitre at 150C (Rs. 26.80); refined diesel oils and vaporising oil not otherwise specified Rs. 100 per kilolitre at 150C (Rs. 33.55); diesel oil not otherwise specified Rs. 60 per tonne (Rs. 19.70); furnace oil Rs. 60 per tonne (Rs. 19.70); asphalt and bitumen Rs. 50 per tonne (Nil); other products Rs. 300 per tonne (Nil). The Deputy Minister for Social Security, Mr. Jagannath Rao, introduced in the Rajya Sabha a Bill to amend the Trustees Act, 1913. This Bill seeks to reverse, in the light of the Law Commission's recommendations, the qualifications for official trustees and to remove certain inconveniences experienced by them. The Minister for Labour and Employment, Mr. D. Sanjivayya, introduced in the Rajya Sabha a Bill to amend the Indian Trade Union Act, 1926, with a view to eliminating bogus trade unions by prescribing certain essentials for their functioning and restricting undesirable persons from occupying offices. By virtue of the amending Bill, persons convicted by a court for offences of moral turpitude will be debarred from holding offices in recognised unions for a period of five years. The Bill also seeks to amend Section 28 of the present Act for making it compulsory for a registered trade union to file annual returns on the basis of membership for the calendar year.

Supplementary Demands

The Finance Minister presented to the Lok Sabha supplementary demands for grants involving an additional expenditure of Rs. 102.64 crores — Rs. 2.64 crores on revenue account and Rs. 100 crores on capital account. The main items of additional expenditure on revenue account were Rs. 2 crores for payment of subsidy to the Indian sugar industry for meeting the losses on export of sugar, Rs. 33.87 lakhs for atomic energy research, Rs. 18.4 lakhs on account of increase in salary and daily allowance of the Members of Parliament consequent on the enactment of the Salaries and Allowances of Members of Parliament (Amendment) Act, 1964, and Rs. 9.93 lakhs on account of pay and allowances of the staff of the Ministry of Rehabilitation consequent on the conversion of the Department of Rehabilitation into a Ministry and augmentation of its staff. The increase of Rs. 100 crores in expenditure on capital account was for the purchase of foodgrains. The total additional requirement of Rs. 102.64 crores, however, will be set off to the extent of Rs. 75.10 crores on account of receipts and recoveries from the sale proceeds of foodgrains. The net outgo from the Consolidated Fund of India arising from these supplementary demands will, thus, amount to Rs. 27.54 crores.

Question Hour

Income, Prices and Consumption: The Union Finance Minister, Mr. T. T. Krishnamachari, told the Lok Sabha on November 21 that the question of evolving a co-ordinated policy in regard to the income, prices and consumption patterns for the fourth Plan was under examination. The Finance Minister revealed that although additional resources to the tune of Rs. 3,000 crores had to be raised for financing the fourth Plan, the idea of deficit financing had been completely abrogated from the official thinking. Any addition to the

money resources created by the Government would only meet the increased demand for currency to the extent of Rs. 100 crores. The burden of raising additional resources for the fourth Plan, the Finance Minister said, would have to be shared both by the Centre and the States.

Demonetisation: Mr. T. T. Krishnamachari informed the Rajya Sabha on November 18 that demonetisation as a measure to bring out unaccounted money in the country had been ruled out. There was no cast iron method of preventing the earnings and flow of unaccounted incomes and money. A number of legislative and administrative measures had been taken to ensure that unaccounted incomes were brought within the tax net. These included abolition of the secrecy provision in the direct taxes acts, strengthening of the power of the departments in regard to search and seizures, provision for notification to the Income Tax Department of immovable property transfers and contracts for construction above a certain minimum limit and an intensive drive to identify new assesses. The Finance Minister promised to examine the proposal put forth by Mr. A. D. Mani that the Government should legislate with a view to prescribing reasonable amount of cash that a citizen should possess.

Ordnance Factories: The Minister for Defence Production, Mr. A. M. Thomas, disclosed in the Lok Sabha on November 20 that two of the six new ordnance factories decided to be set up under the five-year defence build-up programme, had been excluded from the defence plan for the present because of foreign exchange shortages, high investment-output ratio and the small scope of converting them into units for producing civilian-use products during peace time. These two factories were intended to produce explosives and propellants. As an alternative, it had been decided to increase the present stockpiles of explosives and propellants through imports and to raise production slightly by modernising the existing factories. Of the remaining four ordnance factories, one — for the manufacture of small arms ammunition — was being set up with the US assistance. This factory had already commenced production. The British Government had agreed to help in the establishment of two factories — one engineering factory and the other filling factory. Because of the urgent need for small arms, it had been decided to use free foreign exchange resources for setting up the fourth ordnance factory.

Newsprint Manufacture: The Deputy Minister for Industry, Mr. B. Misra, told the Lok Sabha on November 20 that the present 30,000 tonnes per annum capacity of the Nepa Paper Mills would be raised to 75,000 tonnes by the end of the fourth Plan period. The extended capacity would meet up to 50 per cent of the restricted demand for newsprint in the country. Mr. Misra further informed the House that the Government had already issued licences for the establishment of two more units for the manufacture of newsprint to a combined capacity of 90,000 tonnes a year. The implementation of these two schemes, however, had been slow; they were not expected to materialise before the fourth Plan. The possibilities of licensing more schemes for the manufacture of newsprint were also under the consideration of the Government. Every effort was being made to achieve self-sufficiency in newsprint in the near future.

Shipyard Output: The Minister for Transport, Mr. Raj Bahadur, told the Rajya Sabha on November 17 that the Hindustan Shipyard at Visakhapatnam had been advised by the Government to step up its output from the present three ships a year to six ships a year. The Government, he added, was not considering any proposal for setting up a third shipyard. It was, however, planned to raise the capacity to construct ships in India to 3.5 million GRT by the end of the fourth Plan.

Market Research in Air Transport

DR. G. P. KHARE

AIR TRAFFIC, both domestic and international, has increased considerably during the last decade. The rising trend is likely to continue in the years to come. With rapid economic development the rate of increase in air traffic is bound to be higher. Such rapid growth produces problems of its own. Matching supply with demand, most effective utilisation of available resources, exploring new markets and developing existing ones are some of the issues which assume great importance. In the initial stages, when the demand is significantly large, the operators (especially when there is only one national operator) are not faced with many problems. Even bad planning or lack of planning is not disastrous to begin with though it may be fraught with dangers in the long run. If planning is ignored even at subsequent stages, either there may be too many idle aircraft or too many passengers waiting for their turn to catch a flight. Such an expensive but quick means of transport loses its attraction if one has to book one's seat days in advance.

The assessment of future traffic is, therefore, a must for every airline and the aviation industry in general. Being a costly industry, planning needs to be done years in advance also because the aircraft are not available as and when one needs them nor can airport facilities be developed overnight. Answers to many of these problems are provided by market research.

Air transportation is like any other service and its market also depends on consumer preferences. The demand function for air transportation may, therefore, be regarded as depending on personal satisfaction of the users which, in turn, is two-sided. It depends on the passenger's ability to pay, the value of his time, his preference for air over other modes of transport and similar other considerations. The choice for air transport also depends on what the airline has to offer for the fare. The facilities offered have to be attractive; timeliness of services has to be assured; risk has to be minimised and in general the efficiency of the airline has to be up to accepted standards. In case of freight, quick and sure transport, least risk of pilferage, reduced expenditure on packing and minimum perishability (of fresh consumer goods) are some of the considerations that weigh in favour of air transport.

Vast Potentialities

Broadly, air travel market may be divided into five categories: Domestic air passengers; International air passengers; Air freight; Air mail; Aerial operations. These markets have their own separate peculiarities and are amenable to different types of disciplines. In order to look into the problems of each, separate studies have to be undertaken. The last category of air market, though not yet fully developed in India, has vast potentialities taking into account the various agricultural programmes and also those connected with the oil and other industries.

Examining the past trend (see table overleaf) we find that the period 1947 to 1963 may be divided into four parts:

- (i) 1947 to 1951, during which a number of air companies came into being. These were the first comers in the field of aviation which captured a good share of traffic and consequently there was a persistent increase in air traffic during this period.
- (ii) 1952 to 1953. This short period of two years was marked by stagnation on account of unhealthy competition or on account of unco-ordinated activities of

different airlines. Air transport was nationalized in India in August 1953.

- (iii) 1954 to 1958. The year 1954 was the year of recovery which showed an increase of 10 per cent in traffic. The 1951 mark was crossed and a regular trend of rise set in.
- (iv) 1959 to 1963. This was a period of steady rise in traffic and except for 1959, the annual increase in tonne kilometres flown during this period was about 15 per cent.

From the figures pertaining to last four years it is seen that a stable position has been reached and during the next ten years, there may be an annual increase of about 15 per cent in the total tonne kilometres flown. At this rate it is calculated that the total tonne kilometres flown may be 440 millions in 1968 and 890 millions in 1973. The rate of increase in traffic may, of course, be accelerated if the markets so far untapped are tackled successfully and the activities of the corporations are guided by the results of continuous market research.

Development Pattern

Roughly, the pattern of development of aviation industry is such that most of the forecasts can be related to a decade. In other words, the above forecasts based on past figures and market research studies are likely to be reasonably valid for another ten years. Of course, this does not exclude the feasibility of long-term projections but, in that case as in others one will have to be very cautious in drawing conclusions. Planning being a continuous process, studies made in 1965 will be valid for the decade 1965-75. Similarly, 1966 studies will have reasonable application for the period 1966-1976 and so on.

Air market surveys in India may be undertaken either on the population basis or on a regional basis. Which categories of Indian population (or more precisely, people in which income group) take to air travel will be the leading question in population studies. Most of the air-minded people are probably drawn from bigger cities and towns or big industrial and business centres. A detailed study of such regions is likely to be helpful in making estimates about the future potential. Best results may be obtained by combining the two methods.

It is essential to determine the economic and demographic conditions which explain the decisions resulting in air travel. Air travel may be personal travel, motivated by personal considerations unrelated to business activities or it may be business travel undertaken in furtherance of one's professional activities.

In the case of personal air travel, various factors of importance are age, occupation, income and education. In order to determine what percentage of the total population avails of air transport as a matter of personal convenience, demographic tables will need to be prepared giving age in relation to occupation, income and education at different levels. An estimation of the proportion of people in different cells given to personal air travel as also the average number of trips taken by each will enable us to forecast for the years to come.

In the case of business air travel, industry, occupation and income are the determining factors. From the point of view of air travel, industries may be grouped as high, medium and low travel groups. In each group it is persons with certain

status and falling in certain income groups who are allowed by the business houses to travel by air. So, in case of industries we must find out the number of establishments in high, medium and low travel groups and in each of these we have to determine the number of persons in important positions under different income groups. The pattern of classification has to be by industry, occupation and income. The study of the population in each cell will lead to the estimation of business air travel in the future. It will not be enough to find out only the percentage of people using air travel in different groups. To estimate the total volume of air travel, it

will be necessary to ascertain the average number of trips taken by persons in each cell.

Market research studies in the field of aviation must be correlated with other studies pertaining to economic growth, industrialisation and increase in business activities. These studies must take into account estimated population growth in the future, employment pattern in different occupations and industries, rate of increase in national income, and extent of benefit to different economic strata from rise in national income.

A LOW-COST PAINT THAT GIVES A MILLION-DOLLAR FINISH!

Here is a paint that gives your walls a superb matt finish at an unbelievable low cost! Supplied in an economical paste form, Blundell's 'Eomite' Latex Wall Paint is so easy to apply. Just dilute it with water and paint away with roller, brush or spray. Eomite Latex Wall Paint spreads smoothly, dries quickly and adheres to surface-dry plaster. It takes to lime and cement plaster, concrete, brick-work, asbestos sheeting, and building board. This opaque and washable wall paint is ideal for your interior walls and ceilings. Choose now from 12 pleasing, intermixable shades.

S. & L. AND SUGAR PLANTS

For many years S. & L. have been supplying complete pipework installations for the Sugar Industry, and also supply their annual requirements of pipework. S. & L.'s reputation in this vital industry is second to none, as mill owners all over India will testify.

Recognised as the leading manufacturers in India of fabricated pipework, S. & L. offer a complete service from design to commissioning, with all materials and workmanship of the traditional high standards associated with S. & L.

WINDOW ON THE WORLD

Freer Trade: Spur to Economic Growth

GUY SIMS FITCH

WASHINGTON:

INTERNATIONALISM in the realm of economic affairs is a concept which has been gaining increased acceptance in the United States. This view of inter-dependence of nations and markets is shared by private businessmen as well as government policy makers. The national foreign trade convention, sponsored each year by the National Foreign Trade Council, is by far the largest and the most representative of American private groups of its kind. Its membership is vitally concerned with all aspects of international economic activity. The convention this year focussed its attention chiefly on the combined role of trade and investment in fostering economic growth and development around the world. The final declaration of the convention clearly reveals this overriding interest in international progress.

The main tenor of the declaration — which represented a broad consensus among those present — is the proposition that the best and the surest way toward the more abundant life is through expanding the flow of trade and capital. Behind this approach was the frank appraisal that despite the outpouring of public and private wealth by advanced countries, the pace at which growth is taking place falls short of satisfying the aspirations of emerging nations.

Key Challenge

Indeed, the convention saw the meeting of development needs as perhaps the key challenge of our time. "Neither security nor sustained prosperity," its declaration noted, "is to be found in isolation." Production and trade are at their peaks, science and technology have made rapid strides, but still deficiencies exist and purchasing power in many countries is inadequate or limited. As businessmen, the delegates see an important role for private initiative and action if these challenges are to be successfully met. Their approach is based not merely on theoretical considerations, but also on their actual operating experience.

But these American businessmen are by no means insensitive to the creative role that governments also can play. The declaration sees government setting the broad policy and programme courses through which private trade and investment can best be mobilized to serve the needs of people. In this sense, as the declaration notes, governments and private business emerge as partners in progress. It should come as no surprise, then, to find the private business convention in New York giving whole-hearted support to the efforts of governments in Geneva to achieve the objectives of the Kennedy Round of multilateral negotiations under the General Agreement on Tariffs and Trade (GATT) — namely, the substantial reduction of tariffs and other barriers to international trade.

The delegates stressed the importance of these negotiations as a means of achieving real economic gains around the

world, and of sustaining the impetus toward freer trade which has marked the post-war years. In its declaration, the convention called on government negotiators to obtain "as broad and as deep a reduction in international tariffs and restrictions as may be feasible."

It is significant that a report by a U.S. Government official just returned from Geneva, to the effect that the atmosphere surrounding the GATT negotiations is more encouraging than some reports might have indicated, elicited from the assembled businessmen a spontaneous and notably warm demonstration of approval. The convention supported the adoption of trade policies which will permit a freer flow of products between the less developed and the industrialized nations. Its declaration specifically urges that the industrialized nations at the GATT conference jointly agree to relax discriminatory trade restrictions and to liberalize the treatment accorded to imports from less developed countries without requiring full reciprocity. It further called upon all industrialized countries to implement the GATT programme which would help achieve these ends — a programme accepted at the GATT ministerial meeting of May 1963.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)

5% RUPEE DEBENTURE STOCK, 1970

INTEREST FOR THE HALF-YEAR ENDING

31ST DECEMBER, 1964

Notice is hereby given that interest at the rate of Rs. 25/- (less Indian Income Tax) per Rs. 1,000/- of Stock will be paid on 1st January, 1965 to Debenture Stockholders registered in the books of the Company on 18th December, 1964. Applications for transfers received at the Company's Office at Victoria House, Post Box 304, Chowringhee Sq., Calcutta, up to 18th December, 1964 will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above interest.

Debenture Stock Transfer Books will be closed from 19th December, 1964 to 31st December, 1964 both days inclusive.

By Order of the Board,

Indo-Soviet Trade: A Big Leap Forward

By Our Special Correspondent

NEW DELHI:

THE INDO-SOVIET trade is to be raised next year by 50 per cent — to Rs. 125 crores each way from Rs. 80-85 crores each way this year. An agreement to this effect was signed here last week by Russia's Deputy Minister for Foreign Trade, Mr. B. A. Borisov and Secretary, Union Ministry of Commerce, Mr. D. S. Joshi.

This big jump in Indo-Soviet trade next year will mean that the target agreed to between the two countries for 1966 under the three-year trade agreement signed last year, will now be reached one year in advance. This has been interpreted in the official circles here as a positive proof of the assurances given by the Soviet Union about continuation and further strengthening of Indo-Soviet co-operation in the economic field.

The most noteworthy feature of Indo-Soviet trade next year will be that the Soviet Union will be purchasing from India nearly Rs. 50 crores worth manufactured goods. It has shown interest in buying many new items. These include electrical transformers, air-conditioners (indoor), water-heaters (household), accumulators, textile machinery, knitting machines, twist drills, BHC powder, zinc phosphide, mercurial seed dressings, calcium carbide, bleaching powder, detergents, chrome pigments, wire enamels, rosin, woollen knitwear, men's shirts, spectacle frames, linoleum, sports goods, sheets and turkish towels, dyed handkerchiefs, tarpaulins, etc.

Traditional Items

India will also supply to the Soviet Union next year larger quantities of her traditional items of exports, such as textiles, tobacco, jute goods, tea, coffee, spices, cashew kernels, leather footwear, deoiled cakes etc. Textile exports are now envisaged to be raised to Rs. 2 crores, exports of shoes to about a million pairs; of tobacco to 35,000 tonnes and of jute goods to nearly Rs. 25 crores. The pattern of exporting hides and skins will undergo a material change. More of tanned goat-skins and less of raw goat-skins will be exported. The percentage of tanned and semi-tanned skins to be purchased by the Soviet Union will be increased to 55.

The Government of India has also requested the Soviet Union that it should send some specialists to advise the Indian industry in the preparation of tanned skins, sheep-casings, bananas and shellac so that the Soviet Union's requirements of these commodities should be met according to its standards and specifications.

The Soviet Union's exports to India will comprise mainly machinery, equipment, spares and components for the Soviet-aided projects, included in which are the Harduaganj, Pathratu and Balimela power stations, irrigation projects, Bhilai Steel-works, Ranchi Heavy Engineering Complex, Hardwar Electrical Project, etc. The Soviet Union will also supply more than a million tonnes of petroleum products, 15,000 tonnes of zinc and lead, 100,000 tonnes of pig iron, 6,000 tonnes of tin-plat, 80,000 tonnes of rolled steel products and fairly large quantities of ammonium sulphate. (60,000 tonnes of ammonium sulphate will be shipped by the Soviet Union immediately).

The Soviet Union's decision to abolish customs duties on imports from the developing countries from the beginning of next year has been welcomed by the official circles here.

With a view to fostering India's trade with the East European countries, the Union Ministry of Commerce has decided

that India will in future participate in every trade fair held in these countries. For giving further fillip to Indo-Soviet trade, the Soviet Union has been requested to allow setting up of an exhibition of Indian industrial products in Moscow and shop windows in four or five other provincial towns. A proposal has also been mooted to organise mobile exhibitions of Indian products in the USSR.

★★

The inter-governmental agreement between India and the Soviet Union for the establishment of the Bokaro Steel Plant is expected to be signed here next month. The draft of this agreement, it is understood, has already been forwarded to the Soviet authorities for further perusal and scrutiny. It is based on the principles agreed to by the Union Ministry of Steel and Mines and the Soviet experts' delegation which visited India last month. A team of Russian officials will visit New Delhi to sign the inter-governmental agreement.

In view of the fact that the Soviet experts are to prepare a fresh project for the Bokaro Plant according to their specifications and this will leave a very limited scope for the association of Dasturco with the setting up of the steelworks, the Government of India is likely to accede to Mr. Dastur's request that this technical organisation should be taken over by the Government. A decision in this regard is expected to be taken at the highest level in the near future.

★★

The Union Government has received a joint proposal from two foreign firms — one British and the other American — to establish a petro-chemicals complex at Koyali, in Gujarat. The proposal covers manufacture of synthetic rubber, plastics and a variety of intermediates and the establishment of a naphtha cracker unit. The project is estimated to cost Rs. 50 to 55 crores, half of which will be the foreign exchange component. This was disclosed by Mr. O. V. Alagesan, Minister of State in the Ministry of Petroleum and Chemicals, on Sunday last while he was speaking on his recent tour of the United States, Canada and Japan, undertaken to explore the prospects of foreign collaboration in the development of petro-chemical industries in India. Mr. Alagesan said that a number of leading firms of these three countries had shown keen interest in entering into financial and technical collaboration with India for the development of petro-chemicals.

During the discussions abroad, the Minister said, he had made it clear that while India welcomed foreign participation in petro-chemicals, she would hold the controlling interest in the basic units so that the cream of the profits was not carried away by the collaborators. Private Indian participation in the Koyali petro-chemicals complex would also be welcomed. Negotiations in this regard were expected to be started in the near future. The Government, Mr. Alagesan added, would not generally insist on controlling interest in down-stream units producing end-products.

Mr. Alagesan disclosed that a Canadian firm had promised to send the team in January to study the possibilities of collaboration in setting up a synthetic rubber plant in India. A Japanese firm had shown interest in setting up a unit to produce industrial solvents and resins. Another proposal likely to emerge soon was for the establishment of a plant with U.S. assistance for production of insecticides.

Referring to fertilizer manufacture, Mr. Alagesan said that the latest production techniques evolved in the US could reduce ammonia production cost by about 50 per cent. The

Bechtel Corporation would be making use of these latest techniques in the fertilizer plants they have proposed to set up here. The Bechtel Corporation, the Minister revealed, had also shown interest in producing triple superphosphate by importing phosphorous acid.

Mr. Alagesan further stated that he had also talks in the United States and Japan for eliciting collaboration in oil prospecting in India. An American company had intimated to the Union Government that it would be sending its experts in the middle of next month to explore the possibilities of Indo-US collaboration in off-shore drilling. Some Japanese firms had also evinced interest in exploration and development of oil in this country.

★★

The chances of Indo-Kuwaiti collaboration in the development of the oil refining and setting up of petro-chemical complexes in India and oil exploration in Kuwait have brightened as a sequel to the discussions held here last week between the Prime Minister, Mr. Lal Bahadur, and the Crown Prince of Kuwait, Sheikh Sabah Al Salem Al Sabah. A good deal of general ground was covered in these discussions. The officials from the two countries will meet in course of time to draw up concrete proposals.

★★

The Indian Bureau of Mines has located 22 coal seams, some of superior quality with coking property and appreciable thickness, in the Ramgarh area in Bihar. The seams have been located by the Bureau after detailed exploration by intensive drilling in four notified blocks comprising a total area of 70.84 sq. kms.

The location of these seams is considered important in view of their proximity to the proposed site for the Bokaro Steel Plant. Besides, the exploitation of these seams will help in achieving the production targets of coking coal during the third and the fourth Plan periods.

The Bureau has till now established systematic correlation of 16 out of the 22 coal seams. Out of the 22 workable coal seams, four have attracted special attention for their superior quality, coking property and appreciable thickness. These seams have moderate-to-strong coking properties and are of selected grade to Grade II in quality.

On the basis of the investigations carried out, the 22 seams located by the Bureau are estimated to contain coal reserve to the tune of 270.351 million tonnes. Nearly 82.223 million tonnes of coal are quarriable. The rest of the deposits can be exploited by underground mining. Of the total reserve of coal, 70.574 million tonnes are of good quality (selected Grade to Grade II) and the remaining 199.777 million tonnes of inferior grade (Grade III A and inferior).

As a result of the encouraging results of this detailed exploration, it has been decided by the National Coal Development Corporation to develop open-cast mines in the area to a projected production target of 1.5 million tonnes of coal per annum during the third Plan period. Production will be raised to 4 million tonnes during the fourth Plan period.

It has also been decided to set up in the area a coal washery with American assistance. This washery will be linked to the Marapahery railway station on the Chandrapura-Muri section of the Eastern Railway near the proposed site of the Bokaro Steel Plant so that washed coal from this coalfield can be moved directly to the steel plant.

★★

The National Council of Applied Economic Research paid tributes to its first President, the late John Matthai, and its second President, the late V. T. Krishnamachari, on October 21, when, before a distinguished gathering, the President of India, Dr. S. Radhakrishnan, unveiled the portraits of those

two distinguished men at the request of the present President of the Council, Mr. Asoka Mehta.

The NCAER has, indeed, come far since December, 1956 when it was inaugurated by the late Rajendra Prasad. Financed by grants from the Ford Foundation and the Government of India, which are supplemented by membership fees and fees charged to sponsors of research projects, the NCAER, under the leadership of its eminent Director-General, Dr. P. S. Lokanathan, has built up for itself a respectable position in the intellectual life of the country generally and particularly as a practical guide to economic thought and policy-making in government and business. Its progress is not a little due to the interest which the late John Matthai and the late V. T. Krishnamachari had taken in its vision and work in its formative years. The Council has at present 142 corporate members; of these 110 are business houses, 14 State Governments and 18 public sector undertakings. This is in addition to the 29 ordinary members, one Life Member and the Founder Members.

The Council undertakes projects on sponsor basis or on its own initiative. For every project undertaken, a team is constituted from among the members of the staff with a leader assisted by senior and junior officers. Its field of activities includes economic planning and growth, area surveys and regional development, demand studies, savings, industrial econo-

Eastern Economist 20 Years Ago DECEMBER 1, 1944

About three-fourths of the crop area is under food-grains, and yet not enough food is produced to meet the physiological requirements of the people. In 1933 Sir John Megaw reported, on the basis of an enquiry into conditions in a number of villages, that the population has been increasing much more rapidly than the output of food with the result that in nearly 40 per cent of the villages surveyed, the population was excessive in relation to the food supply and that periods of food scarcity had been occurring in one village out of every five during a ten-year period in which there had been no exceptional failure of the rains. Attempts have been made to estimate the extent of the deficit in food production for the country as a whole and whatever may be the objections to any particular calculation as being an over-estimate or the reverse, the reality of the shortage itself cannot be denied and is, to some extent, expressed as under-nutrition of a large section of the country's population. Sir John Megaw's survey revealed that of over 7 million persons examined, only 39 per cent could be said to be adequately nourished, while 41 per cent were poorly so and as high a proportion as 20 per cent were "very badly nourished." Again, field dietary surveys have shown a condition of gross under-feeding among the lower income groups both in the rural and in the urban areas. Thus, the average daily calorie intake per consumption unit or adult men value of a group of poor villagers in south India was found to be 1,700 and that of poor families in a Madras suburb 1,800, as against the 2,500-2,600 calories, which nutrition experts have postulated as the physiological minimum for a person engaged in easy going agricultural or manual work. In 1937, when conditions were relatively normal, some 50 per cent of the families constituting a cross-section of a village in south India were found to have a calorie intake per consumption unit, which was below 2,300.

TODAY A NATION SHAPES ITS TOMORROW

The people of India are planning in a big way for a prosperous future. Giant Steel Works, great dams and irrigation projects, huge industrial enterprises and thousand other plans for industrial development are rushing the country to its day of prosperity. In all these activities Kirloskar Lathes are everywhere shaping the plans to their successful completion. Pilots of progress, Kirloskar Lathes, have been in the forefront of country's industrial development for nearly a quarter century.

mics including economics of small industries, taxation and fiscal problems, transport, energy, etc.

In the period of about 8 years of its existence, the Council has already completed 99 projects, 41 of them having been sponsored by private business houses and banks including 17 by public bodies, 46 by Central and State Governments and 12 on the Council's own initiative.

The projects in progress include the Techno-Economic Surveys of Nagaland, NEFA and Pondicherry. Other studies include All India Rural Household Saving Surveys; Survey of Consumption Pattern in Developmental and Non-developmental Areas, Survey of Ancillary Industries in the different States; Demand Studies for a number of products, including fertilizer and shellac; Industrial Programming of the different States for the fourth Plan; Regional Transport Study in Madras State and Pondicherry; Study for the Assessment of Flood Damages in North Bihar; Study of Maintenance Imports; Debt Management in India; Export Prospects for Selected Commodities; India's Balance of Payments Problem; Pricing Policy in Public Sector Undertakings; State and District Incomes; Under-Utilization of Industrial Capacity, etc.

Sponsors have come from different spheres: private trade and industry, Ministries of the Central Government, State Governments, Chambers of Commerce, Foreign Embassies, etc. Increasing demand is being made on the Council's services by private business houses.

★★

At a press conference in New Delhi, Mr. Merkwitschka, Director of the G.D.R. Leipzig Fair Office, stated that no less than 70 countries were likely to participate in the 800th anni-

versary of the fair to be held in March next. The fair will open on February 28, 1965 and will continue till March 8, 1965. The commodities to be displayed at the fair will cover industrial machinery and equipment, semi-finished products of the basic industry, consumer goods, durables and foodstuffs. Metallurgy, chemicals, chemical plants, machine tools, products of mechanical and electrical engineering will receive special attention. India has always been, at the Leipzig fair, the largest overseas participant. At the Jubilee fair also, it is expected to be, once again, the largest overseas participant. The floor-space booked by India will be around 1,600 square meters.

In an exclusive interview with "Eastern Economist", Mr. Merkwitschka stated that the combined Indian pavilion will cover 1,016 square meters, while individual exhibitors spread out in the various Halls will take 300 square meters. Another approximately 300 sq. meters have been set apart for TELCO — this will be mostly open space — for the display of trucks. Mr. Merkwitschka also stated that India has been participating in the Leipzig fair for the last 140 years in the sense that Indian goods have been exhibited there for nearly one and half centuries. Indian participation after World War II started in 1956 when the Government of India sponsored Indian participation. The jubilee fair, according to him offered splendid opportunities to Indian industries to explore new buyers of their products. Mr. Merkwitschka also stated that all the European countries have been participating in this fair and all of them, without exception, expect to participate in the Jubilee fair. An interesting feature of the fair in 1965 will be that new products will be exhibited; for example, the British Crane and Excavation Corporation has informed the fair authorities that it will exhibit auto-cranes with lifting

THE MATERIALS-MANAGEMENT JOURNAL

(Incorporating The Eastern Purchasing Journal)

D-409, Defence Colony, NEW DELHI-3.

all the more convincing when the system of informal rationing introduced in the whole of Greater Calcutta appeared to function successfully. Back from New Delhi, the Chief Minister has been devoting his attention to the question of introducing statutory rationing in Greater Calcutta from January next, modified rationing in other urban centres of the State and maximum procurement in the next harvesting season which will be arriving soon. He feels encouraged by the fact that the rice crop in the State this year is reported to be a good one, as it is reported to be good in the entire country also. It remains to be seen how Mr. Sen's Government, which enjoys no particular reputation for efficiency or imagination, will set about the task, which, to all accounts, is going to be very exacting. Mr. Sen's idea at the moment, so a newspaper report says, is to appoint a suitably qualified army officer to head the food administration in West Bengal. With his stock with the Centre at the moment so high, he may succeed in obtaining the services of an able man from the Army, but it would be a bit too naive to rely on the competence of only one individual however gifted and whatever might be his ability to get things done. The food distribution machinery as a whole needs to be overhauled.

Better Seeds

A praiseworthy aspect of Mr. Sen's food policy is the emphasis it places on increasing food production in the State. There is little room for extending cultivation in West Bengal, which has the lowest man-land ratio in the whole country, but a greater volume of food output can be obtained from the existing acreage through a better crop pattern and more intensive cultivation of land. The starting point for any plan of agricultural development has to be the production of better seeds. This is what the West Bengal Government wants to concentrate on at present. It is now engaged in the preparation of a scheme under which some 1,000 villages will be developed exclusively from the seed production point of view. The output target by the end of the fourth Plan is 1.5 million maunds. With better seeds distributed to farmers through State agencies, it is hoped that a great need of the peasant community will have been removed. West Bengal is encouraged by the effort in Punjab where a 500-acre seed farm is run very successfully by a business house from Calcutta. The West Bengal Government would like some such farms being started in the State by private enterprise through the application of principles on which organised industry is run, but it would prefer the job of quality seed production to be taken up by small cultivators. The idea is feasible, but in the absence of details it is not possible to offer further comment.

Having ideas is one thing. Implementing them is another. The West Bengal Government has been considering all sorts of schemes to nationalise the distribution of the essentials of life, and to raise food production in the State in as many ways as possible. It cannot complain of lack of funds which other States, notably Bihar, frequently do with or without justification. It has been lacking the administrative machinery to accomplish many of the things that it wishes to be done. The State Government is about to take over many fisheries in the neighbourhood of Calcutta city. After the take-over, it proposes to spend some Rs. 4 crores for the development of the fisheries with a view to obtaining some 500 maunds of quality fish and carp daily after about three years. Very appalling if one considers the present chaotic conditions in Calcutta's fish markets, but what has been the record of the Fisheries Department in the matter of fish supply to Calcutta? Its price control scheme has been a farce, it is hard to get fish at controlled prices and subsequently, Calcutta had to go without fish for days. Will this department be able to manage both production and distribution of fish? It probably has no better administrative machinery than the Government's Department

of Agriculture which has been able to execute schemes worth only Rs. 9 crores so far out of a total third Plan allocation of Rs. 37 crores. The Government now wants to double this allocation in the fourth Plan, nearly half of which will be spent on minor irrigation works. A good idea again, but will the Government be able to implement it?

As the jute industry has justifiably declined to implement the Bonus Commission's recommendations for its labour, the workers have repeated their threat to go on a token strike on December 1. The workers are clearly resorting to pressure tactics. Their leaders conveniently omit any mention of the terms under which the Wage Board for Jute Industry's awards are being implemented. When the Wage Board was going into the question of determining the jute workers' wages, representatives of labour had urged that a scheme of guaranteed bonus should be introduced and that the question of any bonus of any other kind could be re-examined later after the expiry of the period during which the Board's recommendations would remain in force. On this basis, the employers' representatives and the Wage Board not only agreed to a guaranteed bonus but also to a general wage increase. It is worth mentioning that the workers' representatives had agreed to the award when they were fully aware that the Bonus Commission's report was impending. This should make it clear that the Bonus Commission's formula would not apply to the jute industry as long as the Wage Board's award remains operative. In fact, the Commission specifically exempted the jute industry from the purview of its enquiry because of this agreement.

The audit report 1964 of the Orissa Government does not

Decline in Tea Output

From Our Correspondent

MADRAS:

THE OUTPUT of tea in the whole country in 1964 may be satisfactory as the estates in Northern India are reported to have gathered a large crop in the past few months. The estates in the South, however, are not so happily placed as the serious drought that prevailed in the second quarter of this year withered the bushes and it was estimated that in the first six months, the output had declined by nearly 20 million lbs. The North Indian estates are probably coming to the rescue of the country as their counterparts in the South did in 1963. However, serious efforts are being made to overcome the deficiency of earlier months and a good number of large estates have succeeded in wiping out the earlier deficits. The favourable conditions during the South-West Monsoon have been helpful and it is even hoped that, with a favourable North-East Monsoon, new records would be established in a good number of cases. Even so, it is doubtful whether the total output will be in excess of the record figure of 1963.

There was naturally a decline in exports for a time and many estates could not realise satisfactory prices, even with a smaller crop, as the availability was not affected to any great extent because of larger despatches from Assam and West Bengal. Latterly, however, there has been a pick up in exports from Cochin and it has been estimated that in the first nine months of this year exports amounted to 25.23 million kg. against 32.98 million kg. Some part of the deficit may be wiped out in the remaining months of this year. The net volume of exports may still be smaller than in the previous year.

The decline in output of tea companies, in the Nilgiris

exactly flatter this Government's management of its finances. The report even suggests misuse of money out of the Orissa Contingency Fund. This Fund was initially fixed at Rs. 35 lakhs, but was later raised to Rs. 5 crores in November 1962 to meet various expenses, under the Emergency, of the State Government. The expenses could be defrayed as the need arose, but each item of expenditure has to be authorised by the Legislature subsequently. Expenditure of money out of this Fund has been sanctioned indiscriminately with the result that there has been a wide gap between the amount sanctioned and the amount actually spent. If nothing else, this shows how casual the Government has been in incurring "Emergency" expenditure. Of the other departments of the Government, Works and Tribal and Rural Welfare have come in for sharp criticism. In the former department, amounts specifically sanctioned under the Budget have been exceeded without proper authorisation and in some cases, there was no authorisation whatsoever. In the latter, several lakhs of rupees spent for housing a fair proportion of the poor Adivasi population of the State have gone waste, largely through faulty execution of programmes and inefficient implementation of housing schemes. The Department of Agriculture is also found guilty of negligence. Of the several seed farms run by it, not one is considered efficient and most are running at a loss for reasons directly attributable to bad planning. Yet the surprising thing is that the State Government is not particularly worried about its poor financial condition. It is making no attempt to collect its revenue arrears which are estimated around Rs. 10 crores, and shows an equal degree of unconcern about realising its advances and loans which are calculated at another Rs. 10 crores.

particularly, has had an adverse effect on the earnings of many companies. Those which were obliged to close their accounts in June or later, covering the period of drought were affected most. In some instances, the dividend payments on equity capital have had to be reduced. It is, however, hoped that the prospects for the subsequent year will be much brighter and it would be possible to raise larger crops and earn higher profits.

The decisions taken by the Chief Ministers at the Conference held in New Delhi about the food situation have not come as a surprise. It had been known earlier that many Chief Ministers were opposed to statutory rationing and that they were anxious to fix the responsibility on the Centre for supplying the needs of the deficit areas. Under the new arrangements, the Southern Zone will remain intact but it will be a zone only for purposes of calculating total availability of foodgrains in the four States of Andhra Pradesh, Madras, Mysore and Kerala. The inter-State movement of foodgrains will be carried out on a government to government basis, perhaps under the directions of the Centre, as recent experience has not been satisfactory. While there was an anxiety on the part of the surplus States to underestimate their ability to export rice, the deficit areas exaggerated their requirements from outside sources. The Andhra Pradesh Government has now agreed to supply 800,000 tons of rice in a year which must be regarded as reasonable. Madras State too may be able to export a net quantity of 100,000 tons. It may thus be possible to supply Kerala 800,000 - 900,000 tons from these two States while the Centre may probably agree to release 200,000 tons from its stocks. But the total requirements of Kerala have now been estimated at 2,720,000 tons

capacity of 112 tonnes. Such a crane has never been displayed in any industrial fair. Top ranking officials of various Governments, including those from India, are expected to visit the fair.

In addition to the promotion of international trade, the Jubilee fair will be a useful forum for exchange of technical experience. A scientific conference is being held at Leipzig at the time of the Jubilee Fair which will discuss the "Effect of the technical revolution on human society." Two symposia will be held separately which will discuss specific problems, including the one dealing with the trade between the two world systems. Special lectures are being arranged for new methods of production.

In order to accommodate the rush of visitors — the fair authorities expect a record number of visitors to take part in the Jubilee celebrations — no less than four hotels are under construction. About 80,000 persons can be accommodated in Leipzig as paying-guests. The fair will bring together buyers, technicians, scientists, economists, journalists etc. from different lands since Leipzig is well-known as a sample fair, with an international character.

DCM : Three Quarters of a Century

Speaking on the occasion of the 75th anniversary of the Delhi Cloth Mills, the Prime Minister, Mr. Lal Bahadur, urged the industrialists to spread out and build a prosperous India. He emphasised the significance of co-operation between the private sector and the public sector which, he believed, should work together to achieve the maximum possible industrial expansion in the country. The corporate sector, he added, should try to maintain reasonable prices and profits so that the consumers did not suffer and the industry flourished for the benefit of the common man.

Mr. Bharat Ram, Chairman, the Delhi Cloth and General

Mills Company Limited, indicated that it was in 1889 that a small spinning mill was established at Delhi which has now grown into an organisation of substantial size with various industrial units branching into many fields of manufacturing activity. The first major fillip to the company's growth came during the World War I, when it started the manufacture of tents for defence requirements. Later on it established three textile mills in Delhi, a fourth at Lyallpur, two sugar works at Daurala and Mawana, in addition to a distillery and a confectionery unit at Daurala. A small sulphuric acid plant was set up during World War II, which formed the nucleus of the chemical unit. Today the D.C.M. is one of the biggest manufacturers of chemicals such as sulphuric acid, caustic soda, chlorine, nitric acid and superphosphates. In addition to having a large spinning unit at Hissar, the company established a few months ago a PVC plant and a rayon tyre-cord plant at Kotah, involving an investment of nearly Rs. 12 crores. A new Division has also been developed for designing and supplying of chemical plants.

The growth of the company in financial terms may be gauged from the fact that in 1939, just 25 years ago, the capital and reserves amounted to Rs. 1.44 crores; and the total annual turnover was Rs. 1.99 crores. During 1963-64, the last completed year, its capital and reserves amounted to Rs. 13.33 crores and the annual turnover was Rs. 46.78 crores. One of the significant factors which helped in the unbroken progress of the company has been the stress laid on the employee-employer relations by the organisation. It has kept high standards of labour well-being and has provided facilities for gratuity, provident fund, bonus, medical aid, schools, as well as recreational and religious activities, well in advance of contemporary practice. The company has provided for a director on its board of directors entirely elected by the workers since the year 1939.

Sugar Factories Demand Increased Prices

From Our Correspondent

BOMBAY :

THE RECENT fixation of ex-factory prices of sugar has sorely disappointed the Deccan sugar factories, so much so that the Deccan Sugar Factories' Association has sent an urgent telegram to the Union Minister for Food and Agriculture seeking an interview for a thorough discussion of the question. That such a discussion is called for is obvious, as no account seems to have been taken by the authorities concerned of the problems of the sugar industry, especially of the joint-stock sector, in Maharashtra. The price fixed for Maharashtra sugar, as per the announcement on November 12, 1964, is the same as that notified on May 22, 1964. Even at that time, sugar factories in Maharashtra had drawn attention to the fact that the sugar prices then fixed had not provided fully for actual costs. Since then the position has worsened and costs have gone up further.

For one thing, this year, sugar factories are required to pay cane price, inclusive of transport and harvesting charges, which works out much higher than the cane prices fixed by the Union Government, thanks to the pressure of the State Government and the high gur prices. And, even so, they cannot be sure of adequate cane supplies, because co-operative units pay a relatively higher price, that is an ex-field price of Rs. 59 per quintal, excluding the transportation and harvesting costs. The latter can afford to do so as the cultivators, being themselves the shareholders of these co-operatives, prefer this to a higher dividend as they know they stand to benefit in another way, namely by way of tax relief on the entire price of cane paid by them. Apparently the implications of this difference in the financial structure of joint stock sugar factories and co-operative sugar factories are not ade-

quately appreciated. Then, again, sugar factories in Maharashtra have to meet the increase in dearness allowance granted to workers since last October according to the Wage Board recommendation. In consequence, costs have gone up so much that it is not difficult to appreciate the apprehensions of the D.S.F.A. that the patently uneconomic price for Maharashtra sugar factories now fixed by the Union Government will only further worsen the plight of these factories which are in a precarious position even as it is.

The authorities may say that the prices will again be revised at the end of the current sugar season, as was done last year, but this cannot be taken for granted, the more so because the Tariff Commission has been asked to make an exhaustive study of the cost structure of the sugar industry and recommend fair prices payable for sugar produced in the different regions, and the Government may well take the stand: "Let the Tariff Commission make the recommendations; we shall revise the prices thereafter". In the circumstances, the least that the Union Government can do, if it does not want the country's total sugar production to suffer, is to announce an interim increase in the price of sugar payable to factories in the Deccan so as to cover at least the higher cane prices and the increased dearness allowance.

The Indian Roads and Transport Development Association (I.R.T.D.A.), Bombay branch, has drawn pointed attention to the inadequate provision for road construction in Maharashtra. It may be recalled that the National Council of Applied Economic Research (N.C.A.E.R.) has recommended an outlay of Rs. 129.5 crores for the construction and improvement of 19,200 miles of roads for the 1961-71 decade. As against this,

the Building and Communications Department seems to favour an allocation of only Rs. 75 crores for road construction during the 1966-71 period. Adding Rs. 27 crores apportioned for the 1961-66 period, the total works out to just Rs. 102 crores for the 1966-71 decade, or a shortfall of nearly as much as the provision during the current Plan period.

The need for an intensive road development programme in Maharashtra is clear from the very poor road density figure for the State. As against 11.9 miles of road per 100 square miles in States like West Bengal, Maharashtra has barely 2.7 miles of road per 100 square miles. The inadequacy of roads has not made itself felt as keenly as it would have, by reason of the relatively lower vehicle population in the districts of the State. And the lower vehicle population, in turn, is the outcome of the onerous tax burden on motor vehicles. Next to Madras, taxation on motor vehicles in this State is the highest in India. But, if the surcharge on diesel-driven vehicles, which seems to be the sole prerogative of Maharashtra in India, is also taken into account, there may not be much to choose between Madras and Maharashtra.

Failure of Management in Ranchi

From Our Correspondent

CALCUTTA :

THE INDIGNANT questions in the Lok Sabha about the disastrous fire in the plant of the Heavy Engineering Corporation and the enquiry report of Mr. Justice B. Mukerji which follows, were fully justified considering the revelations which have been made through the judge's report. The heavy machinery complex, which has come up in this part of India in collaboration with Russia and Czechoslovakia, is not only a great show-piece of the public sector, but by its very nature, the enterprise occupies a pivotal position in the scheme of planned industrial growth. The enquiry report has squarely fixed the entire responsibility for the fire on the failure of the management to foresee the possibility of sabotage when the labour situation was getting increasingly difficult. The management had only thought that the labour situation was volatile. This kind of thinking did not indicate that the management was quite aware of the explosive possibilities. As Mr. Justice Mukerji has rightly said: "In my judgment, the management's great failure had been their slackness in security arrangements — a false sense of security appears to have been generated when there was nothing like proper security in the area. . . . There should have been, I feel, sufficient security consciousness all round the administration and every effort should have been made to see that whatever was required to make the security arrangements perfect and to make the security impregnable, was done. There was but a vague consciousness in the Heavy Engineering Corporation that some sort of security arrangements were necessary. I have a feeling that, to most men in the Heavy Engineering Corporation the security personnel existed only to guard against thefts, but even in this they have not been very successful. Possibly no one had any clear conception that security was necessary to guard the stores and the plants against sabotage also." But while the administrators were not overmindful of the need for proper security arrangements, they were engaged in what Mr. Justice Mukerji has described as a "scramble for places in every quarter." This he considers as a great misfortune. He has further added: "The schism in the administration started and grew to unseemly dimensions because of this scramble so that steps have to be taken to eliminate this danger to the extent it is reasonably possible — public criticism, as also the greater part of the dissatisfaction in the ranks of the employees was due to this."

The persistence of the Maharashtra Government in continuing the surcharge on diesel-driven vehicles certainly becomes a worthier cause. At least until 1956 when diesel oil was duty-free, one could understand this surcharge, but after that year, when the Government of India imposed an excise import duty on diesel oil (this averages about Rs. 1.99 per gallon today), the State Government should have withdrawn the surcharge and contented itself with the levy of 25 paise sales tax. But it is difficult to get any Government to give up a tax, more so State Governments which are now being asked to tap all sources to find funds for the next Plan. Be that as it may, another occasion presented itself to the State Government to do away with the surcharge, without, at the same time, losing any revenue. This was when the State Government imposed laden weight restrictions, which have more than compensated the Government for any potential loss due to withdrawal of surcharge. So far, however, the Maharashtra Government has not done anything, but now that its attention has been drawn to this anomaly, as also the adverse effect on dieselisation of road transport, it is to be hoped the authorities would lose no more time in righting a glaring wrong.

Another aspect to which Mr. Justice Mukerji has drawn pointed attention is the attitude of the officers of the Government of Bihar in whose territory the heavy machinery complex is situated. The judge rightly thought that they were reflecting the attitude of their masters, and hazarding a guess, he found a few reasons. One was that the Government of Bihar never liked the appointment of Dr. A. Nagaraja Rao as chairman, but when the then Union Minister for Steel, Mines and Heavy Engineering took a firm stand in this matter, the Bihar Government could do nothing about it, but it smarted under a sense of defeat. This kind of attitude on the part of State Governments, if persisted in, or if it becomes a common pattern, would lead to many complications in the future, so the judge has advised the Government of India to give its fullest consideration to this matter. Since the report was published, there have been some changes in the top bracket of the HEC's administration. A new chairman (from the private sector) has been appointed and some other top officials have been replaced. Only a few dealt with in the report remain, including the Director of Finance. The former chairman, Dr. Nagaraja Rao, it seems from the statement of Mr. T. N. Singh, Minister in charge of Heavy Engineering, had left the service even before the enquiry by Mr. Justice Mukerji started. He is now an adviser to the Planning Commission. Even so, he had been asked to submit his reply on some of the points raised in the enquiry report. Dr. Rao has since submitted his explanation and the Government is now studying it. This sort of reply apparently has not satisfied the House, the Speaker especially, who has promised that he will allow a special debate on the subject on a later date.

★ ★

If West Bengal's Chief Minister, Mr. P. C. Sen, sees something of a personal triumph in the new food distribution policy of the Centre which the latter has decided to adopt in consultation with State Chief Ministers, he will not be far wrong. The proposed cordoning off of "big cities which suck in vast quantities of food from rural areas," and the statutory rationing in them, inter-State movement of foodgrains only at the Government level and some amount of Central responsibility for supplying foodgrains from the surplus to deficit States as well as from its own stocks, are the ideas which had been conceived by Mr. Sen. His advocacy of these measures became

V.B.

CORPORATION MEETING

INDIAN OIL CORPORATION LIMITED

Speech of Shri P. A. Gopalkrishnan I.C.S.,

Chairman, INDIAN OIL CORPORATION LIMITED

at the Annual General Meeting on November 24th 1964

ANOTHER YEAR OF PROGRESS AND ACHIEVEMENTS

Gentlemen,

The Balance Sheet and Profit and Loss Statement of the Indian Oil Company are in front of you for your ratification. These documents throw a flood of light on the transactions of the Company but I shall confine myself in this statement only to certain salient features.

1. The sale of oil products has gone up to 1.17 million kilolitres as against 6,29,639 kilolitres in 1962-63. The sale of Petroleum Coke was 11,498 metric tons in 1962-63 but it is 26,488 in 1963-64.

2. The operational cost per kilolitre has come down to Rs. 29.21 as against Rs. 30.16 in 1962-63 and Rs. 31.68 in 1961-62.

3. The profit before taxation is Rs. 104.77 lakhs as against Rs. 62.41 lakhs in the previous year. The return on equity capital is 21.1 per cent as against slightly less than 20 per cent in the previous year.

4. The profit would have been very much higher but for two important items of expenditure which the Company had to bear. One is the under recovery of railway freight of Rs. 55.71 lakhs on account of the location of the Gauhati Refinery. Government have fixed ceiling selling prices for all oil products on the basis of import parity and companies are allowed to charge only up to these ceiling prices plus freight to the consuming point from the relevant port.

Since many of the consuming points are situated farther away from Gauhati than from the port, the Indian Oil Company had to bear the excess railway freight which it could not recover from the consumers. Burmah Oil Company's share of this unrecovered freight has been taken as Rs. 19 lakhs in our accounts as approximately this amount is due to us from them.

The second item of expenditure is the under recovery of Central Sales Tax amounting to Rs. 26.92 lakhs. This is collected at the rate of 2 per cent on sales outside Assam but accrues to the State Government, as it has not exempted inter-company transactions on oil products from sales tax as some other State Governments have done. The State Governments who have exempted such inter-company transactions from sales tax are Maharashtra and Andhra Pradesh. Kerala has also agreed to grant this exemption.

A word of explanation is necessary in respect of both the items. They refer to all the Gauhati products sold by the

Indian Oil Company either to consumers or to other oil companies. The latter have refused to pay their share of the under-recovery of freight as well as of central sales tax, on the ground that these are not recoverable from the consumer and they are allowed to sell products only at the ceiling selling prices fixed by the Government on the basis of import parity. References have been made to Government on these two matters for the last two years but to no effect. The Company had therefore no alternative but show these amounts as reductions from the profit made.

In spite of the two serious handicaps mentioned above, the Indian Oil Company has made a handsome profit in 1963-64 and the net profit (after taxation) gives a return on equity capital of 16.8 per cent.

The increase in sales has been made possible because the Company increased its tankages at installations and depots and built many new depots during 1963-64. The facilities of the Company have grown enormously and it can tackle a sale of more than two million kilolitres at the present time.

By an order of the Government, the Indian Refineries merged with the Indian Oil Company on 1st September 1964 and now the combined organisation is known as the Indian Oil Corporation Limited.

The Indian Refineries include the refinery at Gauhati and the one which has now gone on stream in Barauni. The third refinery at Koyali in Gujarat which is under construction by the Oil & Natural Gas Commission will also merge with the Indian Oil Corporation shortly.

The Corporation has at present two divisions, the Refineries Division and the Marketing Division. It will have two more divisions in future, the Pipelines Division and the Petro Chemical Division.

As I have already mentioned more than once in the statements that I have made before, this Corporation is likely to become the biggest oil organisation in the country in six or seven years.

Finally, I thank all the Directors of the Board for their co-operation and advice and thank all those officers and staff who have worked hard to make the year successful.

BOMBAY, 24th November, 1964.

NOTE: The above does not purport to be a report of the proceedings of the Annual General Meeting.

Trade Winds

WORLD TRADE AND ECONOMIC DEVELOPMENT

THE GUISES in which major economic problems are presented change from time to time, not unlike the varying fashions in more aesthetic aspects of our culture. This was pointed out by Mr. Pierre-Paul Schweitzer, Managing Director of the International Monetary Fund, while referring, in his address to the National Foreign Trade Convention in New York on November 16, 1964, to the various problems of economic development that have been continually highlighted in discussions on world trade in recent years. Economic development, of course, is not a new subject, but it has been discussed in recent years from a new angle — the raising of the standards of living of the poorer countries in the world "through the richer and poorer nations acting in concert." The developed countries are continuously receiving appeals from the developing countries in various international forums around the world, to do more and more to assist them in their efforts. This thrust has had its most obvious demonstration in 1964 at the United Nations Conference on Trade and Development. At this conference, one welcome feature was the emphasis put on trade rather than aid. Particular stress was laid on the need to improve access for the developing countries to markets in the industrial countries, particularly for their manufactured goods. This is a field in which much remains to be done in certain countries in Europe than in the United States.

A further important contribution to the solution of the problems of the developing countries can, in the opinion of Mr. Schweitzer, be made by the developed countries through policies directed towards maintaining high levels of demand and employment and a satisfactory rate of growth, thereby creating optimum conditions for rising imports from the developing countries. Such policies are, of course, directly in the interest of the developed countries themselves, but they sometimes encounter obstacles when high levels of demand exert undue pressure on costs and prices or give rise to balance of payments deficits, or both. The necessary conditions for ensuring prosperity in the developed countries can be created only through effective international co-operation in the formulation of economic policies pursued by the International Monetary Fund and other international organisations. This problem, of course, is also bound up with that of maintaining international liquidity at an appropriate level.

According to Mr. Schweitzer, a major problem for the world in the years to come will be how to find mutually acceptable ways of assisting the developing countries. A great deal of understanding will be needed on both sides: on the part of the industrial countries, there will be a need to appreciate more fully the sense of urgency which confronts a nation whose per capita annual income may be as little as \$100 or even less. On the part of the developing countries there will be a need to appreciate more fully that foreign aid cannot be the only concern of the major powers and that it is subject to the same processes as other decisions in democracies relating to the use of a nation's resources. If, however, one takes a long-term view, comparing the postwar period as a whole with other similar periods in history, one striking fact is the degree to which world prosperity has been promoted through effective international co-operation. Thanks to such co-operation, international co-operation, or even any serious recession in the world economy since the end of the war, and the growth of international trade and of national economies has generally been at an unprecedentedly high rate. Mr. Schweitzer feels confident that, in spite of different attitudes

and opinions among countries on particular questions, this co-operation will continue to strengthen and will provide conditions which will further enhance the growth of the world economy and the expansion of international trade.

GERMAN INDUSTRY DELEGATION

Headed by West Germany's most prominent banker, Mr. Hermann J. Abs, a 30-member top level German industry delegation is scheduled to tour India between January 15 and February 5, 1965. Coming in the wake of the recently concluded Indo-German investment protection agreement, the delegation will probe into general conditions and problems affecting the expected flow into India of German private capital which is hoped to play an increasing part in India's development during the fourth five-year Plan. After their visits to Bombay, Madras and Calcutta, the German industry executives will discuss with the Government authorities in New Delhi such topics as Indian tax impediments to foreign investment, the policy on foreign expert personnel, bank incentives and rupee stabilization. The findings of the delegation are awaited eagerly in German industry circles, as it is known that there exists considerable interest in foreign capital investment conditions in India, especially since repeated statements from Bonn Government sources in the recent past pointed out that government-to-government aid cannot be increased and that, therefore, German private capital should step in to help accelerate India's economic development.

The delegation will also pay a visit to the German-aided Rourkela steel works where practical application of German aid policies will be investigated, while at Kanskahall the German industrialists will study the effect of India's investment climate on the Utkal Machinery Ltd. which is German industry's biggest single private investment venture in India.

EXPORT FEDERATION

At a meeting in New Delhi on November 16, 1964 of the chairmen of export promotion councils, commodity boards and other important trade organisations, it was decided to establish a "Federation of Indian Export Organisations" in order (i) to promote the development of export trade; (ii) to sponsor study teams and trade delegations abroad, and to invite foreign importers, in connection with the export efforts; (iii) to undertake commodity and market surveys and disseminate market intelligence; (iv) to undertake publicity in support of exportable products of India and to participate in trade fairs and exhibitions; (v) to open foreign offices and branches and to establish liaison with trade associations abroad; (vi) to prepare, print, publish any papers, periodicals or reports and to further the aims and objects of the Federation by holding lectures, conferences, seminars and by other means; (vii) to provide common services for the benefit of Indian exporters and to act generally as the forum of exporters; (viii) to provide facilities for the prompt and equitable settlement of disputes arising in the course of foreign trade; (ix) to co-ordinate the export promotion activities of its constituents; (x) to co-operate and associate with other organisations with similar aims and objects; etc. Presiding over the meeting, the Union Minister for Commerce, Mr. Manubhai Shah, said that the proposed federation would be an integral part of the Federation of Indian Chambers of Commerce and Industry and that functions of this federation and other trade organisations would not overlap. He particularly emphasised the point that the functioning of the proposed federation would not come in the way of the various export promotion councils and commodity

Company Affairs

ODDH SUGAR

THE ODDH Sugar Mills Ltd., has reported encouraging results during the year ended July 31, 1964. The gross profit has risen from Rs. 79.39 lakhs to Rs. 103.96 lakhs and the net profit from Rs. 14.56 lakhs to Rs. 30.29 lakhs. The directors have, however, proposed to maintain the equity dividend at Rs. 20 per share of Rs. 100 each. The provision for depreciation and development rebate is higher at Rs. 12.48 lakhs against Rs. 10.43 lakhs and that for taxation at Rs. 60.79 lakhs against Rs. 53 lakhs. The directors have transferred Rs. 10 lakhs to general reserve and Rs. 5 lakhs to renovation and renewal reserve. The dividends will absorb Rs. 15.50 lakhs. The company crushed 117.65 lakh maunds of cane during 1963-64 and the sugar recovery was 10.18 per cent. The production of power alcohol and spirit has risen from 1.42 million gallons to 1.45 million gallons. The cane production on company's own farms has shown a rise from 3.13 lakh maunds to 5.51 lakh maunds. Vanaspati production totalled 16,900 tonnes.

MYSORE KIRLOSKAR

The Directors of Mysore Kirloskar Ltd., have indicated in their annual report for the year ended June 30, 1964 that the company recorded a profit of Rs. 22.39 lakhs after making provisions for taxes, depreciation, development rebate and gratuity. They have proposed the payment of Rs. 12.22 lakhs towards general reserve, Rs. 5.00 lakhs towards debt redemption reserve, Rs. one lakh towards contingency reserve and Rs. 4.40 lakhs towards replacement and rehabilitation reserve. An amount of Rs. 9.31 lakhs, being surplus to the statutory requirement in development rebate reserve, has been transferred to the dividend reserve out of which dividend has been paid on equity shares at the rate of 12½ per cent per annum, absorbing Rs. 7.54 lakhs.

It is indicated that the company continued to make good progress in the manufacture of existing lines as well as the Capston and Turret Lathes. Sales during the year under review were higher at Rs. 306.36 lakhs as against Rs. 223.20 lakhs during the last year, and this increase was witnessed almost uniformly in the entire range of its products. Apart from the Capston and Turret Lathes, the company has taken on hand the manufacture of grinders and monomatic lathes and it is hoped that it will be possible to place them in the market by about 1966. The directors have proposed to pay bonus equal to 25 per cent of the basic earnings of all employees of the company for the year under review.

BHARAT BIJLEE

Bharat Bijlee Ltd., which has maintained the dividend for the year ended June 30, 1964 at eight per cent on an increased capital, proposes to raise additional capital to finance its expansion programme. It is proposed to issue 30,000 cumulative preference shares of Rs. 100 each carrying interest at 9.3 per cent and redeemable after 12 years from the date of issue but not later than 15 years. These shares will be offered to the public through prospectus without being offered to the existing equity shareholders. The company proposes to issue additional equity share as rights to the existing equity shareholders in the ratio of one for one. The present equity capital of the company is Rs. 30 lakhs. The company's proposal to offer 20,000 equity shares of Rs. 100 each to Siemens Schuckertwerke, A.G. has not been approved by the Government of India. Agreements have been finalised to obtain a foreign exchange loan of over Rs. 30 lakhs from the foreign collaboration for the expansion of the company's motor and transformer departments. The company's order position is said to be satis-

factory and sales during the current year since July 1 have shown a rising trend. The company has taken possession of the land at Kalwe and development work will commence shortly.

NEW SWADESHI SUGAR

The New Swadeshi Sugar Mills Ltd., for the year ended June 30, 1964, has recorded a higher gross profit of Rs. 22.25 lakhs compared to Rs. 20.30 lakhs for the previous year. After providing Rs. 3.09 lakhs for depreciation, Rs. 32,000 for development rebate and Rs. 8.50 lakhs for taxation, the net profit has risen from Rs. 9.19 lakhs to Rs. 10.34 lakhs. The directors have declared a dividend of Rs. 29 per share of Rs. 100 each and Rs. 7.25 per share of Rs. 25 each, the same as in the previous year. A sum of Rs. 3.50 lakhs has been transferred to renovation and renewal reserve, and Rs. 3 lakhs to general reserve, while the dividend will absorb Rs. 3.94 lakhs. The amount carried forward is Rs. 6,000 against Rs. 16,000 brought in. The company crushed 31.71 lakh maunds of cane during 1963-64 compared to 17.67 lakh maunds in 1962-63 and the sugar recovery was 10.32 per cent against 9.78 per cent last year.

REMINGTON RAND ISSUE

Remington Rand of India Limited proposes to enter the capital market in January, 1965 with a public issue of Rs. 30.99 lakhs in equity shares of Rs. 10 each at a premium of Rs. 18 per share. The authorised capital of the company is Rs. three crores and issued, subscribed and paid-up capital is around Rs. 110.58 lakhs. Out of the present issue, 16,310 equity shares of Rs. 10 each have been reserved for allotment to the whole-time directors and employees of the company at a premium of Rs. 18 per share. The balance of 3,09,890 equity shares are to be offered for public subscription at a premium of Rs. 18 per share.

The company requires funds to finance the raising of the annual installed capacity of the standard model typewriters from 24,000 units to 36,000 units and also to increase the indigenous content of the typewriter being manufactured at the Howrah factory from 95.8 per cent to 99.15 per cent. It also has plans of quality improvement and cost reduction and at the same time to produce a new model typewriter. The company also manufactures and markets a wide range of other office equipment such as Kardex cabinets, filing cabinets, card index cabinets, files, ribbons and duplicators. The company is wholly owned subsidiary of Sperry Rand Corporation and after the present issue the parent company will hold 65 per cent of the equity share capital. Sperry Rand Corporation also holds 50,000 preference shares issued by the company.

FRICK INDIA

Frick India Ltd., a collaboration of Bombay Ammonia Private Ltd. and Frick Co., Waynesboro, Pennsylvania, proposes to manufacture industrial refrigeration machinery. The factory building of the company situated near Delhi is nearing completion and imported as well as indigenous machinery has already arrived at the site. Installation will start soon under the guidance of American technicians and the factory is expected to go into full production by March, 1965. In the first year of its production, it will manufacture industrial refrigeration machinery worth Rs. one crore and the output will be increased gradually in five years to reach an annual value of Rs. eight crores.

The company will shortly enter the capital market to raise nearly Rs. 10 lakhs by the issue of equity shares. The Indian directors and their friends are likely to subscribe to the extent of Rs. 2.50 lakhs and Frick Co. of Pennsylvania

boards; the federation would only co-ordinate and supplement the activities of the individual export promotion bodies.

The meeting also decided to set up a standing committee of 30 members representing major chambers of commerce (such as the Federation of Indian Chambers of Commerce and Industry, the Associated Chambers of Commerce and the All India Manufacturers' Organisation), export promotion councils and commodity boards. Mr. P. A. Narie.wala was elected President of the committee. A small committee was also elected to draft the constitution of the proposed federation.

INDO-AUSTRALIAN TRADE TALKS

A nine-member delegation of Australian businessmen led by Mr. A. J. White, had a meeting in New Delhi on November 16, 1964 with the Union Minister for Commerce, Mr. Manubhai Shah, and the senior officials of his ministry. The talks mainly concerned the expansion of trade and economic co-operation between India and Australia and the establishment of joint ventures by Australian entrepreneurs in India. The scope for increasing the export from India of items like tea, coffee, jute, black pepper and manufactured goods, and the import from Australia of tallow, wool, raw hides and skins, was discussed. The starting of joint enterprises in India making use of raw hides and skins and of Australian tallow and import of wool for commission combing and commission spinning for re-export were considered. Various other aspects of India's policy of welcoming foreign capital and technical know-how participation in approved enterprises within the framework of India's Industrial Policy Resolution and five-year Plan programmes were also discussed.

The delegation also had a meeting with Mr. T. N. Singh, the Minister for Industry and Heavy Engineering. Matters relating to industrial policy and development programmes were discussed. Mr. Singh pointed out that the five-year Plans had left ample scope for development of industries in the private sector and that the Governmental regulation of industries in India was aimed at ensuring development in certain desirable directions of high priority.

ISO ON METALS AND MANGANESE

The means by which recommendations on the mechanical testing of metals formulated by various technical committees of the International Organisation for Standardisation could be aligned, were considered at a meeting of the ISO Co-ordinating Committee on Mechanical Testing of Metals (ISO/METESCO) held in New Delhi earlier this month. It was agreed that all technical committees concerned with mechanical testing of metals should reconcile the differences which existed in the different methods recommended for testing of different metals and that in order to make the committee more effective the drafts prepared by various technical committees of ISO should be placed before it at the earliest possible opportunity and the technical committees need not wait till they had been finalised. The co-ordinating committee will hold its next meeting in the UK during the last quarter of 1965.

The draft ISO proposal on methods of sampling manganese ores (Part II, Sampling of Ores not Loaded in Wagons) was discussed at the fifth meeting of the ISO technical committee on manganese ores (ISO/TC 65) held in New Delhi earlier this month. The draft would considerably help in the formulation of more rational and economic sampling procedures for manganese ores. The committee agreed that as far as possible samples should be drawn from "ores in motion" so that reliable conclusions could be drawn about the quality of the material sampled. It was further agreed that sampling from "stationary ores" may be resorted to only if sampling during motion is not possible. The recommendations laid down in Part II would be applicable to all types of manganese ores (except to those

loaded in wagons) both by mechanical and non-mechanical means. It was also decided to draw up a second draft proposal on the subject in the light of the decisions reached at the meeting.

BOLD GRAIN SUGAR

The Indian Sugar Mills' Association, Calcutta, has voiced serious concern at the decision of the Government to ban the manufacture of sugar of grain sizes 'A' and 'B'. (This decision was reported earlier in 'Eastern Economist' dated November 6, 1964, Page. 878). In a telegram addressed to the Union Ministry of Food and Agriculture the Association has pointed out that the sudden ban on the production of bold grain sugars is wholly unwarranted since factories have already commenced crushing operations for the season 1964-65. It is feared that this sudden prohibition will seriously dislocate the working of the factories, especially the carbonation factories numbering 36 whose production capacity will be adversely affected. These carbonation factories have installed costly plant and equipment for producing bold grain sugars for which there is considerable demand in the country due to the great preference therefor shown by consumers, including bulk industrial consumers. Besides, bold grain sugars have established markets and command a premium in normal free trade. As such, the Association points out, there is hardly any justification for the sudden prohibition on manufacture of bold grain sugars due to temporary difficulties experienced under controlled distribution which in itself is a temporary feature. It is hardly fair that Government should introduce such sudden measures of far reaching consequences which will seriously undermine the economy of a large number of sugar factories. Besides, Government's decision will sap the initiative in the industry for quality production. The Association has, therefore, urged the Government to reconsider the matter and if at all it is decided to prohibit the manufacture of 'A' and 'B' grain sizes, adequate time of at least two years should be given to the concerned factories to effect necessary changes in plant and machinery so as to guard against any dislocation in their working and thereby ensuring that output of these units is not affected.

According to the Indian Sugar Mills' Association, the total sugar production in the month of September, 1964, was about 18,000 tonnes as against 15,000 tonnes produced in September 1963. This brings the total production during this season till September 30, 1964, to 25,33,000 tonnes as against 21,25,000 tonnes during the corresponding period last season. The off-take of sugar from factories during the month of September 1964 (including 12,088 tonnes despatched for exports) was 1,95,000 tonnes as against 2,02,030 tonnes (including 6,289 tonnes despatched for export) during September 1963. The total despatches in 1963-64 season till September 30, 1964 were 23,60,000 tonnes (including 2,58,935 tonnes despatched for exports) as against 28,04,000 tonnes (including 4,95,610 tonnes despatched for exports) during the same period last season. The total closing stock of sugar with the factories on September 30, 1964, was 3,24,000 tonnes as against 3,15,000 tonnes on the same date last season.

INTERCONTINENTAL QUADRIJET

Air France has placed an order with "Boeing" for the latest and mightiest version of the "Intercontinental" quadrijet 707-328B, which has a range of 110,000 km. non-stop. Air France already operates a fleet of 24 Boeing 707-328's. Number 25th on the order book will be delivered in the second half of 1965. The latest order will thus bring the Air France's "Intercontinental" fleet to a total of 26. The company has 40 Caravelles, the world's largest fleet of such jets, and the largest Caravelle network, 52,707 miles of routes to 51 cities in Europe, North Africa, and the Middle East.

Cashed in a Minute!

And that is precisely what we mean. It takes no longer than a minute to cash your cheque at any PNB office with the Teller System.

The streamlined Teller System eliminates tokens, queues, and tedious and unnecessary waiting and delay.

PNB was the first bank to have introduced the Teller System as far back as 1954. Today, PNB has 90 branches operating this system and plans to introduce this on-the-spot service in 60 more branches throughout the country.

THE PUNJAB NATIONAL BANK LTD.
The Oldest Name in Modern Indian Banking

JWTFNB: 1022 C

around Rs. 12.50 lakhs out of which foreign components will be purchased. Imported machinery is likely to cost around 15 per cent of the capital expenditure. The company has been assured financial assistance to the extent of Rs. 25 lakhs from the Cooley Funds. Mr. John M. Seabrook, Chairman, Frick Company Inc. USA, who was here for a short visit, indicated that industrial refrigeration in India has great possibilities.

RANE (MADRAS)

Rane (Madras) Ltd. has proposed to issue rights shares. It is planned that steering linkage for TMB trucks will be made in collaboration with a German firm. Additional capital to the extent of Rs. 20 lakhs is needed and the directors decided after the recent meeting to issue during this year 1,22,569 equity shares of Rs. 5 each, and 65,000 — 9.1 per cent (taxable) 'A' preference shares of Rs. 5 each in the ratio of one ordinary share for every two shares held and one preference share for every four ordinary shares held. The issue of preference shares is underwritten by the Madras Industrial Investment Corporation. The company paid a dividend of 17.5 per cent on the ordinary capital for the year ended March 31, 1964. It may be recalled that the company increased its capital by a rights issue of one to three in 1960 and made a bonus issue earlier in 1956.

ORIENTAL POWER CABLES

Oriental Power Cables Ltd., proposes to increase its production capacity of paper insulated cables from 960 km to 1,600 km per year as also manufacture 640 kms of PVC cables per year. The company's collaborators, Sumitomo Electric Industries Ltd., Japan, have agreed in principle to capital participation for the expansion subject to the approval of the respective Governments. The details of the programme are being worked out. Till the end of October the company has secured orders worth about Rs. 2 crores for the supply of various sizes of cables from Government and semi-government bodies.

WEST COAST PAPER

The directors of the West Coast Paper Mill Ltd. have proposed the payment of dividend at the rate of Rs. 13 per equity share for the year ended June 30, 1964 as against a dividend of Rs. eight and Rs. eleven paid for the years 1962 and 1963, respectively. The production during the year under review touched a new peak at 30,213 tonnes as against 27,252 tonnes in the previous year. The turnover for the current year was higher at Rs. 4.44 crores as against Rs. 4.00 crores

last year. The increased production, sales and performance have resulted in a higher gross profit at Rs. 1.49 crores as against Rs. 1.10 crores last year, out of which provision for depreciation was Rs. 49.8 lakhs, development rebate Rs. 50,000 and taxation Rs. 51.00 lakhs. The results are considered favourable in view of the fact that there has been a continued increase in the cost of production due to rising prices of raw materials, essential chemicals like caustic soda, chlorine, railway freight, labour, wages, etc. while the selling prices of paper have been frozen for a long time.

R. H. WINDSOR (INDIA)

The factory of R.H. Windsor (India) Ltd. at Thana was inaugurated by Mr. K. Raghuramaiah, Minister of Supply and Technical Development, Government of India, recently. The first injection moulding machines under production in the new factory were on show for the first time following the inauguration. The company has a phased programme of production so that it will gradually increase its output and will also introduce larger sizes of moulding machines incorporating screw plasticisers, extrusion machines and take-off equipment, in line with the increasing growth of the plastics industry. The factory is equipped with latest machine tools and heat treatment facilities required for the production of the highly advanced precision components required for these machines. Engineers from R.H. Windsor Ltd., England, have already arrived in India and are assisting in the initial period of production in establishing proper manufacturing technique and quality control and also the training of the workers.

HINDUSTAN CONSTRUCTION

The directors of the Hindustan Construction Co. Ltd., a wholly-owned subsidiary of the Premier Construction Co. Ltd., have proposed a substantial increase in equity dividend to 50 per cent for the year ended August 31, 1964, after maintaining it at 20 per cent for the previous four years. The substantial rise in the dividend distribution follows a sizable improvement in the company's earnings. Preliminary reports indicate that the company's gross profit has moved up from Rs. 1.83 crores to about Rs. 3 crores for 1963-64. The net profit of the company is placed around Rs. 80 lakhs against Rs. 31 lakhs for the previous year. Of the total equity paid-up capital of Rs. 72 lakhs, equity shares of Rs. 71.63 lakhs are held by Premier Construction. The gross dividend income of Premier Construction from the holdings of Hindustan Construction shares will amount to Rs. 35.82 lakhs against Rs. 14.33 lakhs in the previous year.

COMPANY MEETING

DELHI CLOTH & GENERAL MILLS CO. LTD.

Speech by Dr. Bharat Ram, Chairman, Board of Directors, Delhi Cloth & General Mills Co., Ltd., delivered at the 76th Annual General Meeting of the shareholders of the Company on the 24th November, 1964, at Bara Hindu Rao, Delhi-6.

Friends,

It is a great pleasure for me to welcome you all to this 76th Annual General Meeting of your Company. Since we met last year a great tragedy overtook the country. We lost our respected Prime Minister, Pandit Jawaharlal Nehru. Indeed few people in any country at any time have contributed so much to enrich the lives of their countrymen. He was not a man of the moment, but an architect who shaped the destiny of India. He conceived things in a big way, and it is his farsightedness that made India embark upon a massive programme of social and economic development. Let us pay our humble homage to this great son of India and observe silence for a minute.

We are gratified that the void created by the loss of such an eminent personality has been repaired by exemplary democratic means. We now have as our Prime Minister, Shri Lal Bahadur Shastri. With his great attachment to social values, devotion to the cause of the common man and personal integrity, I have every hope that he will lead the country to greater and greater prosperity.

At the moment, however, the problems appear to me to be getting out of hand. In a single year, prices rose by more than 15 per cent, though this rise is mainly confined to agricultural commodities. There is no doubt that the spurt in the price level was occasioned, on the one hand, by short falls in agricultural production, and on the other, by excessive spending on the part of the Government on non-productive uses. The food shortage evinces rather clearly that our agricultural policy has not been working in the right manner. There have been failures in the administration of policy at village and block levels and incomplete co-ordination between different departments in Government. The impact of these shortages has been exaggerated by restrictions on free movement of food-grains imposed by State Governments. An artificial scarcity has been created in so-called deficit areas.

Thus, to a large extent the present rise in prices has been self-imposed and can be very much improved by removal of restrictions. We have been helped by timely assistance from foreign countries particularly the USA. While such assistance is of great importance to overcome temporary difficulties, we cannot depend on such assistance for all time. It is absolutely necessary for the country to become self-sufficient in food production and the administrative structure and policy to be reoriented towards this goal. It is no use diverting the public attention by placing blame at the door of one section of the community or the other. No system of distribution will be effective if production itself remains at a low level. There should be adequate incentives for the farmer to produce more and he should be provided with adequate facilities at the right time. Uptill now industrialists have not taken direct interest in agriculture. I feel that such interest is absolutely necessary; at least by those who run industries primarily based on agriculture. If I may say, it should be possible to impart to agriculture the techniques that make the successful running of industries. Our experience will be useful in this behalf.

The food shortage has created many problems not only in the economic sphere, but in others on which the very social order depends. Mischievous elements in society have taken

advantage of the explosive sentiments and aggravated what would appear to be minor handicaps. There are disturbances everyday in some part of the country or the other. Scenes of lawlessness in which even students are participating have become common. Strikes are organised at vital points like docks which have to clear food imports.

All this is happening when we are programming the Fourth Plan with a comparatively faster growth. It is reported that the Fourth Plan will be designed in a manner which will help rapid growth of agricultural and industrial output. The problem, however, is not one which merely calls for greater expenditures. Unless effort is concentrated on specific factors which promote productivity directly, it is difficult to see how it would be possible to increase production and control the price level. So in the Fourth Plan outlays must be such that they will augment productivity. A balance has of course to be secured between short-term and long-term yields. It will be dangerous to dissipate resources in non-productive fields.

There is a contradiction in the present economic situation. While on the one hand there is a rapid increase in prices of commodities, there is, on the other, almost a continuous decline in the level of share prices. It is more natural to expect that prices of shares provide hedge against inflation. But not only have they failed in this respect, but have even declined by a substantial margin. This shows that there is certainly something wrong in the financial policy which has tended to divert larger parts of investible funds from the people to Government. This aspect is again revealed in smaller contributions to new issues. Even good companies are finding it difficult to raise rupee resources. A great many of the new issues are underwritten and a large part of the issue is held by the underwriters themselves. This situation is not conducive to rapid industrial development. Unless there is a free flow of finance from people to industry it is not possible for industry to secure the necessary balance between different types of finance consistent with considerations of risk and profitability.

The major factor which led to freezing of the flow of finance from the public was additional taxation, particularly in the Budget for 1963-64. Considering the measures adopted in the last four years the yield from additional taxation will be about Rs. 2,500 crores over the Third Plan — Rs. 800 crores more than the Plan provision. This unprecedented draft on private income has naturally depleted the investible funds in the hands of the private sector. What is worse is that a

large part of the resources mopped up by additional taxation was dissipated by Government over uses which did not increase the productive capacity of the country. In the first three years of the Third Plan alone over Rs. 600 crores have been absorbed by purposes unrelated to the Plan. To this extent the growth in national income was suppressed and the generation of investible finance was lessened. It would have been more proper for the Government to secure finance for investment by borrowing on the capital market. This would have not only promoted better use of resources but indicated the urgency of the investment in different sectors of the economy. But to replace taxation by borrowings would again require the revival of the market for Government securities. Thus, on the whole, it would appear that fiscal and monetary policies have tended to mitigate the growth of private industry by creating scarcity of finance. Establishment of newer financial institutions will, if anything, deter the growth of normal channels which alone can sustain development. Industry cannot be made to depend only on financial institutions in which case these institutions will virtually assume an unhealthy dominant position. Looked at from any angle, it is imperative that the savings in the hands of the individual must be encouraged.

In this connection, I would like to refer to the much talked about 'unaccounted money'. This has been made to appear the principal villain in the present crisis. Let me be clear that I would not justify any wrong business practices, but at the same time, I would not like the business community to be wrongly blamed. Government have organised raids to unearth this unaccounted money, but often the raids have not resulted in any tangible results. They have only created an atmosphere of suspicion which does no one any good. On the contrary, the tensions which follow and the distrust which is shown lead to inaction and only hamper the growth of industrial activity. I, therefore, hope that Government will show greater understanding and ensure greater security and individual freedom. The punishment of the guilty, I feel, cannot be justified by harassment of the honest.

I must here refer to the tacit assumption of Governmental thinking that in proportion as the State interferes more and more with established institutions, it will approach nearer and nearer to perfection. Only this can explain the plethora of laws, rules, regulations and directives. I submit that this idea that the problems of the country can be solved by the exercise of political power should be abandoned. It is time that Government adopted a purposive policy which will evoke from the community at large wholehearted, instinctive, spontaneous response to programmes of development. Unless, we are able to solve the problems quickly by releasing productive forces, I venture to express the fear that the democratic way of life itself will be in jeopardy.

I feel that the greatest handicap from which we are suffering is the way in which policies are implemented — or rather not implemented. When it comes to the stage of implement-

ation, there is so much of vacillation and delay. It appears as if our administrative machinery is loathe to move. Everyone is only too painfully aware of the gap between programmes and performance. I am of the view that this state of affairs could be remedied if only the Government would see that in all areas of activity those who do not produce results will not be tolerated, whether at the ministerial or administrative level.

I have briefly referred to some of the economic problems facing the country, and if immediate steps are not taken, the danger is that these problems may become even more difficult of solution.

Coming to the Company's affairs, as you are aware, the Company has completed 75 years of its successful and progressive working. To mark this happy occasion, your Directors have recommended a special dividend of 2 per cent on Ordinary shares. It is not necessary for me to review in detail the progress of the Company; but suffice it to say that starting from a very small beginning today we are ranked among the seven biggest companies in the country. This fine record of progress and good name of the Company has been made possible by the co-operation and dedicated efforts of generations of our team of workers and Managers who have been, and will continue to be, the Company's most valuable asset. It is also not necessary for me to recall again the part played by the late Lala Shri Ram who in fact has been the chief architect of D.C.M.

As you will observe from the Balance Sheet, while the gross profits of the Company have increased from Rs. 3,39,22,290 to Rs. 3,94,00,334, the net profits have gone down. This phenomenon is not unusual or unhealthy and may continue as long as the Company continues to invest large amounts of money in new industries because of the heavy initial depreciation and development rebate on new investments.

All the units of the Company have done well in the last year except the Sugar units which, like all other Sugar mills in our area, have suffered due to shortage and low quality of cane. Even in the current year, the prospects do not appear to be very bright for the Sugar industry. You will be pleased to know that the P.V.C. Plant of the Company is now in full production and the Rayon Tyre Cord Plant is expected to start very shortly. Unfortunately, there is a danger of the P.V.C. Plant having to reduce its production due to a cut in the electricity by the Rajasthan Government. However, the Company is making efforts to find an alternative solution.

In the end, I would like to place on record our sincere appreciation of the wonderful work of all our workers and staff whose efforts have enabled us to achieve such good results during the year.

NOTE: This does not purport to be a record of the Proceedings of the Annual General Meeting.

OBJECTS AND PROPOSED ACTIVITIES

The Company proposes to engage in the world-wide tramp- ing and coastal trade. With this end in view, the Company has, in the first instance, ordered five bulk carriers of about 38,100 DWT each from Bremer Vulkan Schiffbau und Maschinenfabrik, Bremen, West Germany, suitable for carriage of bulk cargoes, from light grains to heavy ores. The vessels are to be built to the design and specification approved by Sir Joseph W. Isherwood and Company Ltd., London, one of the world's most renowned firms of Naval Architects and Consultants, specially in ship design and supervision of construction of ships. The first bulk carrier is expected to be delivered about November-December, 1965 and others at an interval of three months each thereafter.

APPLICATIONS:

Copies of Application Forms and Prospectus can be obtained from the Company's Registered Office, from any of the above mentioned Underwriters, Brokers and Bankers to the issue named in the Prospectus or any of their main branches at the addresses given in the Prospectus.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 2-12-1964 AND WILL REMAIN OPEN UNTIL THE CLOSING OF BANKING HOURS ON 9-12-1964, UNLESS CLOSED EARLIER OR LATER AT THE DISCRETION OF THE DIRECTORS BUT NOT BEFORE 7-12-1964.

Readers' Roundtable

TORONTO STOCK EXCHANGE

Sir, — Here are a few observations about the Toronto Stock Exchange which, I am sure, will interest your readers.

I had an occasion to see recently the latest methods and mechanics at work in the Toronto Stock Exchange in Canada. Efficiency and speed have been attained there with great understanding so as to stimulate business activity in an ever increasing measure. No wonder that the volume of trade in this stock exchange has been rising up at the rate of 10 to 15 per cent annually during the last few years.

The latest installation is an electronic computer which has been assembled for this exchange by Ferranti Packard at a cost of about Rs. 50 lakhs (one million dollars). By boldly investing in this very complicated but highly efficient instrument, the members of this stock exchange who are also subscribers to this special service will now be able to get information "on any stock listed in the stock exchange" within two seconds. Into its magnetic tapes will be stored the history of all the listed stocks and each of these will have a code number; the subscriber who pays Rs. 750 (\$150) a month will be provided with special teletype and he has simply to dial the code number of the stock regarding which he desires to have information and in exactly two seconds, the computer will type back the latest information on the stock, including (i) the latest price; (ii) the highest and the lowest prices the stock has been traded on that particular day; (iii) the number of shares traded and (iv) the highest and lowest prices for the year. This system will work not only within the stock exchange building but also in the offices of stock brokers in Toronto and elsewhere in Canada and the United States, covering long distances. The authorities of the stock exchange told me that they were planning to connect it to the regular telex system of the world through which they hope to make it possible for anyone, anywhere in the world to dial the exchange's code numbers and get the requisite information within seconds. This is by far the most advanced system adopted anywhere in the world. Another interesting feature is that the dialling system will work round the clock and not during the Exchange's normal trading hours only (between 10 a.m. and 3-30 p.m.).

Yet another good point about this system is that it de-

livers in about six minutes, tape for newspapers' teletype-setting machines containing complete reports of the day's activities, showing all the stocks traded, their high and low prices, their closing prices and the change in price in relation to the preceding day. To start with, a few Canadian papers and the Canadian Press, Canada's co-operative news agency (corresponding to India's PTI and UNI), have adopted this system.

For making it foolproof as regards the information that is constantly transmitted, the tapes of this system are checked automatically by another component which scans them and compares them with the information recorded in the computer at the rate of 312 characters a second — much faster than the human eye can read. The information contained in the computer can be printed as required at the rate of 120 lines a minute to show the variations in the stock prices.

In another part of the exchange, the record of every transaction is stored in punched cards which are stocked in fire-proof, water-proof vaults and kept for 10 years; they can be run through the machines to trace the whole history of the price movements.

Though the Toronto stock exchange was started as early as 1852, it received formal recognition only in 1878; its rapid growth started only from 1934. Today it is the third largest stock exchange in the world, the first two being New York and London. It is, however, the world's largest trading centre for mining shares.

Over 1,000 different companies are listed in this exchange; their total market value is more than \$85,000 million. Last year, a total of 800,000 shares were traded valued at \$2,000 million. On the average, about 20,000 different transactions involving about 4 million shares take place every day. On exceptional days, however, it is different. When the news of a rich zinc-copper-silver strike in North Canada came in one day, a total of more than 28 million shares (seven times the normal level) were traded in one day.

K. S. RAMANUJAM.

MADRAS.

BOOKS BRIEFLY

Statistical Handbook 1964: Published by the Engineering Association of India, India Exchange, Calcutta-1; Pp. 131; Price Rs. 5.

THE FIRST issue of "Statistical Handbook 1964", published recently by the Research Department of the Engineering Association of India, contains a wealth of statistical information portraying the different facets of the Indian economy with special emphasis on the engineering industry. The booklet covers a wide range of subjects such as national income, manufacturing, basic metals, foreign trade, power, transport, labour and prices. Besides giving a full picture of the engineering industry, it also contains some significant statistical tables such as "cases of satisfactory utilization of capacity",

A Rich Fare

"cases of under-utilization of capacity", "acute cases of under-utilization of capacity", demand forecasts for energy, pig iron, alloy steel and a host of other interesting tables. Another feature of the publication is that a complete section has been devoted to international comparisons. Agriculture has, however, been completely left out in this publication. A separate section on planning, highlighting the progress achieved under the three Plans, and some general tables giving basic data on population, demographic trends, external assistance, direction of trade, etc. may also be included with advantage in future editions. Apart from its pleasing get-up, good printing and fair presentation of data, this pocket edition will be useful as a book of ready reference to all students of economic affairs.

RECORDS AND STATISTICS

The Profit Motive—I

PROFIT IS a much-discussed subject. Often been misunderstood, it has even more frequently been misinterpreted. No here has the profit motive been more fiercely pilloried than Communist, fellow-travelling or dogmatic socialist literature. But, despite political persecution, the presence and the power of the profit motive have persisted in economic systems all over the world — and now 'Pravda', the organ of the Soviet Communist Party, has donned sack-cloth and daubed ashes all over itself and conceded that even the centrally-planned and totally-controlled economy of the Soviet Union must at last learn to come to terms with the indispensable indispensability of the profit motive as the motive power of economic progress. aid 'Pravda', in a recent editorial:

"The plans of production of consumer goods are very often approved without taking into consideration the demands, trade organisations and the requirements of the population".

This practice, says 'Pravda' solemnly, "is a wrong practice" and it proceeds to call upon consumer industries to plan their production on a basis of profitability. 'Pravda' asserts: "It is time to give more independence to the enterprises so that they will be economically interested in producing high-quality goods popular among the customers".

PROFIT : *Whatever you call it, however you count it, profit is basic and indispensable to all societies, including Crusoe's and Khrushchev's.*

Profit is implicit in all major societies and political systems in every period of history. Most of us think of profit in familiar and immediate terms, with reference to the modern day operations of businesses we know and patronize. However, there is a far broader frame of meaning surrounding the word, and it is only within this larger context that the role of profit and the profit motive can be understood.

Profit is accounted not only in dollars, but also in rupees, pesos and lire. It can also be measured, with less convenience but equal precision, in head of cattle or bushels of grain. It is intimately connected with the complex economic life of every 20th Century metropolis, but it functioned as powerfully in the operation of a pre-Christian Greek trading port. Its significance was no less to Robinson Crusoe, operating his island economy with a single helper, than it is to the 185 million residents of the United States. It is, in short, a function of the human condition, not to be associated with a single time or social group.

There are many ways to define profit, some so complex as to be valuable only to professional economists. Here, one of the briefest of classical definitions serves best. Profit is what is left when the costs of some activity are deducted from its revenues. A simple equation, it is subject to a vast amount of misinterpretation. As a sum left over at the end of the calculation, it has acquired such unfortunate designations as "residual" and "remainder," words devoid of constructive implications. In truth, profit is the margin for growth, and

WIDE OPTION : *Through the marvellous and sensitive mechanism of profit, society gains many alternatives, and self-interest is transformed into public interest.*

Every economic system needs some regulatory device. There may be a way to decide what to make and when, how to distribute it and to whom, and what the terms and amount of reimbursement are to be. In the free society, that regulatory mechanism is the profit motive. It provides guidelines for the substantial majority of all economic activity in the

The prophets or the high priests of the Soviet Communist system have presumably started learning from their mistakes. A desirable development, no doubt; but still a costly process. Unfortunately, example in these matters seldom serves. Experience, it appears, has to be gathered the hard way — by a personal repetition of other people's mistakes to be regretted in retrospect. Hence, perhaps, the amazing statement by the Prime Minister, Mr. Lal Bahadur, that the Government proposes to relieve shortages of consumer goods by setting up or expanding the production of those goods in State undertakings. The argument here apparently is that the profit motive of normal industry and commerce has failed the people and that, therefore, the latter must seek refuge in nationalised industry allegedly activated by some vague philanthropy.

In the circumstances, 'Eastern Economist' believes that it would be doing a public service by presenting in its columns some recent discussions, responsible and realistic, of the dynamic role of profit in promoting economic growth, high standards of living and expanding welfare. Follows, then, an extensive reproduction of passages from a pamphlet "The Profit Motive" published by E. I. Du Pont DE NEMOURS & COMPANY, the well-known American firm and a world leader in the chemical and allied industries:

the energizing agent of production. It is the reward to the venturesome, the return for effort expended. To the corporate manager it may be dollars in a bank; to the Soviet farm minister, the seed grain in a warehouse; to the nativelander, the racks of dried fish stored against the future. Whatever its form, profit is vital to any society.

Many times, societies or fragments of societies have tried to divorce themselves from profit. Every attempt has failed. In Europe, Utopians, Owenites, socialists, communists, and Marxists tried appeals to patriotism, love of family, nationalism, idealism, and sense of duty as substitutes for the profit motive. In America, the Jamestown and Plymouth settlements were first intended to operate as "anti-profit" societies. More than 100 other communal experiments were tried in the subsequent century. Noble as some of these appeals were, none of them produced solutions to the basic economic problems of providing food, clothing and housing.

The only such communities to survive, here or in Europe, were those which abandoned such economic theorizing and embraced the profit motive. The outstanding examples are the Soviet Union. Committed to maximum production, zealous in its drive to save and invest in industrial facilities, the USSR today is perhaps as "profit" minded as any country. That nation's economic objective is to make goods cheaply and sell expensively, investing the difference in State-run industrial facilities, and in military and propaganda programmes.

US, and has proved uniquely effective as an instrument of progress.

There are a number of alternate ways to guide economic life, and they have been tried many times in different places and centuries. Commissars and production czars have been

appointed to control labour and divide its output. Hereditary monarchs have issued codes under which goods are to be made and consumed. Numberless dictators ranging in shades of autocracy from monstrous martinets to benign, almost selfless shepherds, have attempted to make the market-place do their bidding. Whatever the individual nuances of these systems, all are variations on a common theme. One man directs others in the conduct of economic affairs; in the last analysis, compliance can be assured only through the use of troops.

Apart from their political cannottations, these controlled economies must be judged as partial successes. Mankind has at least survived the worst of its economic mistakes, and recorded some advance in centuries to which the concept of the free market was as remote as the doctrine of political liberty. No alternative, however, has proved nearly as effective as the profit motive in stimulating and regulating economic activity, and in turning the fruits of enterprise to the service of society.

It is in the large and open market, catering to a staggering variety of needs, whims, and differences of opinion, that the profit motive meets its major economic test and performs most brilliantly. (It works as well in a small, static society, but that is hardly a measure of its present utility). Sprawling and variegated, the economies of such nations as the United States may seem too disorganized to respond to the balance wheel of profit seeking. None of the millions of business units in the US holds final say in the market, nor is there any central purchasing office or scheduling agency to bring order to their individual efforts.

PROFIT SEEKERS : *One of the strengths of the US system is the dispersal of the quest for profit among millions of business units. Large and small, local and national, they all must seek customer favour. Unless they gain it, they can have little or no hope for any profit.*

Broker and banker, contractor and clerk, landscape gardener and lawyer — all share the common ambition to realize a profit. The diffusion of the profit motive among this widespread assembly is one of the great strengths and traditions of the US economy. The American's quest for profits is entirely voluntary, undertaken despite numerous risks and hazards. There is a healthy individualism about it, for each of the millions who participate has different contributions to offer. It is the experience of these individuals that establishes the milestones and guide posts of our market-place for, in sum, the deeds of the profit seeker and his customer 'are' the nation's economy.

Representatives of the Wilmington, Delaware, marketplace are but a small cross section of that city's business group, and their numbers could be multiplied many times over by drawing upon other communities throughout the US. Diverse and gigantic as the open market is, the many participants in it all are striving to make a profit, either on their own behalf or to the account of their sponsors. Their willingness to cope with the problems of business, to provide all manner of special goods and services, and to bear the burdens of such responsibility is simply based on the hope of earning a suitable return.

The US economy is predicated on the belief that buyer and seller alike are promised gains in the marketplace. In the long run, the seller can hope to survive only when he can satisfy the needs and expectations of the buyer. The converse also is true. The buyer will have access to the goods and services of the seller only if there is some gain to be realized from the sale. In the absence of fiat or subsidy to make his stay in the

This, though, proves to be the virtue of the profit system. There are as many listening posts as there are businessmen. The voice of the consumer is heard in the place where it will do the most good, in the stores and offices wishing to attract him as a customer. Thus it is that an automaker determines what sort of transportation equipment he can sell most readily. Thus it is that each of the thousands of communities in the nation receives approximately as many gallons of milk, crates of lettuce, carloads of carpeting, miles of electrical cord, bundles of magazines, and cartons of shoelaces as it happens to want, without notable gluts or shortages, without benefit of a central clearing-house, and with remarkable dispatch.

Because vendors and producers are always mindful of the profit or loss that attends their decisions, the market remains almost instantaneously sensitive to fluctuations in demand and changes in preference. It responds more readily, and often more rapidly, than could any economic czar or State commission. Inevitably, some mistakes in judgment are made. In any society, some unwanted goods are produced; inefficient or inadequate distribution processes sometimes are prescribed. When the power of economic decision is vested in the hands of one man or a few, such errors are serious, for they affect at a stroke whole segments of society. However, in the open market, errors tend to be minor in scale and self-correcting. One firm may ignore or misinterpret its customers' wishes, but as its sales and profits decline, it is likely to draw few imitators. The open market, frankly and avowedly dedicated to the profit of individual units, is the most versatile and responsive of economic mechanisms, as well as the only one parallel to the concept of political and personal liberty.

marketplace permanent, the profit seeker is obliged to close his doors when his business ceases to be profitable

The quest for profit is most familiar in the direct proprietor-customer exchange. However, active proprietors of unincorporated businesses represent less than 10 million people in the nation's labour force of 75 million persons. What of the clerk in the department store, the white-collar worker in the large corporation, or the mechanic in an industrial complex? Indirectly, their activities and aspirations are as profit-centred as those of the grocer, butcher, or television repairman.

The profit seekers in these larger business units are not all found at the top of the executive echelons, or among the ranks of the leading stockholders. The clerk in the accounting offices, the designer in the engineering laboratories, and the foreman in the production plant, if not equally close to questions of profit and loss, stand to gain themselves only if their company operates profitably. In the final analysis, all are concerned with the profit motive to some degree, for their jobs and future prospects depend on the company's profit.

As long as the opportunity to profit is present, the profit seeker will go about his daily occupation voluntarily, and very large numbers of people will continue to be attracted into business with the hope of reaping gains. With such a wide distribution of people, there is no end to the variety of products and services to be presented to the market. The selection will always be large, and growing, as each profit seeker tries to demonstrate his community of purpose with the customer.

UTILITY OF PROFITS : Profits perform an immensely practical function in a capitalistic society. In a way, they serve both as its rudder and engine.

In 1776, the year America declared its independence, a Scottish economist published his own testament to freedom. His book, one of the most influential treatises in history, set forth the thesis that a profit-minded, competitive economy contained its own control valves and compass, and could best serve society if left to its own devices. The economic structure of the free world has changed greatly since Adam Smith's time, but the essential wisdom of his doctrine has only been reinforced by the passage of time.

There is, as he noted, an "invisible hand" which turns the self-interest of the individual to projects "most agreeable to the interests of the whole society." That guiding hand is the quest for profit. It motivates men to work in activities of which the community approves, stimulates investment in enterprise, and controls the allocation of energy and capital.

Left to its own devices, the market will find the most suitable proportion of farmers, cobblers, engineers, and architects. Should more enter one field than society deems suitable, the price of their products or services will fall, and some will be driven from contention. By the same token, a shortage of talent will make the pursuit of a career more profitable and

hence more attractive, automatically drawing more practitioners.

Just as this happens with people, it occurs with savings and products. Both gravitate towards the locale or section of the market where they can attract the highest profit. The rise and fall of profit tells investors and producers how well they have served the market in the past, and suggests their course for the future.

Almost any commercial organization which has been in business more than a few years could supply confirmation. A particularly good illustration is the Du Pont Company, which has operated continuously since 1802.

During its first century, Du Pont made only explosives. This was one of the primary needs of the young nation, not only for defence but also for road building, for clearing land, and for mining. With the advance of technology, other opportunities began to look profitable and appealing, and were pursued. Today, Du Pont makes more than 1200 products or product lines, and only a small segment of its operating investment and sales can be attributed to explosives. The promise of profit originally put the Du Pont Company in business, and expanded the product portfolio as the nation's needs changed.

The Rs. 200 million Birla-Kaiser aluminium project at Renukoot, near Rihand, in U.P., has, since December 1962, attained and surpassed the initial target capacity of 20,000 tonnes per annum. While the Renukoot plant is already the biggest integrated aluminium manufacturing complex in India, Hindalco is forging ahead with its programme of rapid expansion, for raising the primary aluminium capacity to 60,000 tonnes per annum (and to provide fabrication facilities totalling 37,000 tonnes per annum), to help the country's fast growing industries in their march towards progress and prosperity.

When the Monarch Trades

IN THE life of a government as in that of an individual there sometimes comes a moment when a thing is done not because it is the right thing to do but because something has to be done. The project for Food Corporations falls in this category. While sponsoring the related Bill in Parliament, the Central Minister for Food and Agriculture naturally attempted to make out a positive case for the measure. He said that a Central and possibly State Food Corporations were needed to ensure remunerative prices to the farmer and reasonable prices to the consumer by rescuing both from the rapacity of parasitical middlemen. He also argued that the proposed machinery was necessary for building up a government buffer stock which would even out violent fluctuations in supplies or prices over a period. But it is clear for all to see that had the Government's policies relating to agriculture been even moderately successful over the last 15 years, there would have been no need for the kind of State trading in foodgrains which is now being attempted. The Food Corporations project, in other words, amounts to a plain and simple confession forced from the Government of the failure of its farm policies. By the same token, it is only so long as food production fails to improve that the pretext could be kept up that continued State trading in foodgrains is in the national interest. We must therefore hope that, in the next few years, sound policies will be pursued for increasing food production and that, as a result, State trading in foodgrains will find itself put out of business.

Meanwhile it is fortunately quite in order to give a word of praise to the hard-working Minister for Food and Agriculture. It is good to see that he is determined to organize the State trading body in such a manner that it functions as a commercial organisation. How far his intention is realized would depend on the machinery and methods which the Corporations actually employ. The Bill itself does not shed much light on this point and Mr. C. Subramaniam has so far not been particularly forthcoming either. We hope the Central and State Food Corporations, when set up, would function through private trade channels and commercial banks as far as possible. A project of this kind could easily come to grief if an army of administrative, clerical and field staff is allowed to prey on it.

The Minister has said that it is planned to buy about three million tonnes of rice in the new crop year through the proposed State trading organisations. A decision about wheat is to be taken in the new year in time for the Rabi harvest. The quantity of rice proposed to be bought presumably includes the amount of 1.95 million tonnes which surplus States have agreed to make available for distribution among deficit States. To the extent that the presence of the Central Food Corporation and its subsidiaries or agencies could better equip the Central Government to ensure that the governments of surplus States are sufficiently co-operative, the country may derive a limited short-term advantage in the difficult days ahead. But even here — and even more in the matter of its long-term virtues — the projected State trading in foodgrains will be watched critically in the country. As it is, the food economy of the nation is in shambles and the first duty of State trading would be to take care that it does not make confusion worse confounded.

Film Finance Corporation

ONE OF the leading industries of India, the financial problems of which are quite different from those of the manufacturing industries, is the film producing industry. An important feature of this industry is that the main security that it can give to its financiers is the picture negatives which are a good security if the picture hits the box office, but they are worthless if the picture fails. The film industrialists are also confronted with the problem of unforeseeable expenses, making budgeting a complex problem. Sometimes, to give a free hand to the artistes for creative work, the producers exhaust the entire available finance before the picture is even half-way complete. The film producers have also to pay the stars much above the contracted amounts. They are also at the mercy of the film distributors in view of the shortage of theatres. Realising these difficulties of the film industry the Government of India set up a Central Government Film Finance Corporation in March 1960 to extend credit to the film producers and to encourage the production of films providing healthy and purposeful entertainment. It is proposed to examine the working of this Corporation for the four years ending March 1964. The rate of interest charged by the Corporation is 9 per cent but a reduction of 1½ per cent is given if the repayments are prompt.

Table I shows the disposal of the loan applications by the Corporation. It would be seen that the applications both received and accepted by the Corporation dropped in 1963-64 over the previous year. This fall is surprising and is indicative of the fact that even after three years of its working the Corporation is not receiving the right type of applicants for loans.

The total value of loans sanctioned to 48 producers since the commencement of the Corporation to March 31, 1964 amounted to Rs. 136.18 lakhs. Out of this, the Board of Directors of the Corporation cancelled in 1963-64 loans amounting to Rs. 20.05 lakhs to six applicants as they could not fulfil the conditions on which the loans were sanctioned. Therefore the effective loan amount sanctioned up to March 31, 1964 was only Rs. 116.13 lakhs.

Out of the loans sanctioned of Rs. 116.13 lakhs, the actual disbursements up to March 31, 1964 were only Rs. 59.72 lakhs. The gap between sanctioned loans and disbursed amount amounting to Rs. 56.41 lakhs, that is about half of the sanctioned loans, is due to the following reasons. In 12 cases, the loan agreements involving a sum of Rs. 31.97 lakhs were not executed up to March 31, 1964. This showed that the applicants were not perhaps serious about their applications and that the Corporation had sanctioned loans for them very much in advance of their needs. Again, sanctioned

loans are advanced not in lumpsum but in instalments in relation to the work to be done. Delay in rendering proper accounts of earlier instalments results in further instalments being held back. The Corporation's first instalment of loan does not start until the producer has invested in full his own share of the cost of the picture. In good many cases, this takes longer time than anticipated at the start. There are other factors also responsible for stoppage or delay in the release of loans such as difficulty in getting artistes, non-settlement of disputes with distributors, excessive expenditure in relation to the budgeted cost, etc.

The fact that in four years the Corporation has been able to disburse in all only Rs. 60 lakhs to producers would legitimately raise the question as to how it has been using its finances during the last four years. In the first year of its working which ended in March 1961, the Corporation did not disburse any loan to the producers of films, but instead deposited a considerable part of its paid-up capital of Rs. 20 lakhs on short-term and fixed deposits with the State Bank of India. Consequently, of the total income of the Corporation for the year at Rs. 36,857, as much as Rs. 32,440 were secured as interest on bank deposits. In the second year, the Corporation increased its paid-up capital from Rs. 20

TABLE I
DISPOSAL OF LOAN APPLICATIONS

		Applications		Applications rejected or withdrawn or where sanctioned loans are subsequently cancelled	Applications under consideration at the end of the year
		Received	Accepted		
1960-61	No.	16	1	3	12
	Amount in thousands	4834	350	1050	3434
1961-62	No.	16	8	9	11
	Amount in thousands	4863	2838	2284	3175
1962-63	No.	46	25	24	8
	Amount in thousands	15262	6729	8905	2803
1963-64	No.	36	8	28	8
	Amount in thousands	9181	1696	8395	1893
Total	No.	114	42	64	
	Amount in thousands	34140	11613	20634	

lakhs to Rs. 44 lakhs, but the actual loan disbursed during the year amounted to Rs. 11 lakhs only, with the result that during this year also a substantial part of the remaining Rs. 33 lakhs was kept as deposit with the banks. Since these bank deposits carry only a small rate of interest, the Corporation secured an interest of Rs. 56,810 only whereas on the loans to film producers of Rs. 11 lakhs, the Corporation obtained an interest of Rs. 50,937. In the third year, the Corporation increased its paid-up capital from Rs. 44 lakhs to Rs. 50 lakhs when the disbursement of loans during the year to the film producers increased to Rs. 25 lakhs. Even then, at the end of the third year's working the Corporation had a bank deposit of Rs. 23 lakhs as against the loans to film producers of Rs. 28 lakhs. The result was that in the third year of its working while the income by way of interest from film producers amounted to Rs. 1.39 lakhs, the interest on bank deposits was Rs. 1.16 lakhs. It was in the fourth year of the working that the Corporation became a lending institution to the film producers as it derived the bulk of its income from interest on loans to producers of films only. In that year the Corporation secured an interest of Rs. 3.34 lakhs as interest from producers of films against Rs. 0.48 lakhs only as interest from bank deposits. But in that year, in its anxiety to draw the sanctioned loan of Rs. 10 lakhs provided in the Government of India budget for 1963-64, the Corporation disregarded sound commercial principles. For the sanctioned loan of Rs. 10 lakhs was drawn carrying an interest of 7 per cent in the last fortnight of 1963-64, only to be deposited with banks fetching a much lower rate of interest.

Since the paid-up capital held by the Central Government was the main source of finance available to the Corporation during the four years ending March 1964, it would be interesting to see the rate of return after tax on this capital employed.

TABLE II
RETURN ON CAPITAL

	(In Rs. lakhs)			
	1960-61	1961-62	1962-63	1963-64
(i) Paid-up Capital	20.00	44.00	50.00	50.00
(ii) Profit after Tax	(—) 0.18	0.19	0.17	0.37
(iii) Interest earned from Bank Deposits	0.32	0.57	1.16	0.48

It would be seen from Table II that the Corporation incurred losses in the first year of its working while the profits were negligible in the remaining three years. It would be further seen that if the interest receipts from the short-term bank deposits made by the Corporation in view of its inability to lend money to film producers is deducted from the profits earned by the Corporation, during all the four years the Corporation

incurred losses.

Although the financial working of the Corporation during the first four years has not been satisfactory, it is gratifying to note that out of the 26 pictures in all to which loans were disbursed in full or part, 11 were released up to March 31, 1964. Six of them have won awards in India and abroad.

Some comfort can be derived from the fact that the film corporations in other countries have also not been very successful from the very beginning. Thus, the U.K. corporation after incurring huge losses for over a decade has turned the corner now. But it has still considerable losses of previous years, roughly £4.29 million, to wipe out. In France the film corporation had to be wound up owing to continued losses. But it would appear that the Indian corporation would continue to remain a drain on the exchequer so long as it is not in a position to strike a neat balance between its two apparently conflicting objectives of extending loans to film industry and encouraging the production of films, which provide healthy entertainment and at the same time are purposeful.

Eastern Economist 20 Years Ago

DECEMBER 8, 1944

There are many kinds of market research. The most typical is the investigation by sample of consumer preferences. The estimation of consumer purchasing power in the various income groups and in different parts of the country, the study of how in fact the public uses its purchasing power, the study of the marketing system including the organization of wholesale distribution as well as retail outlets, and investigations into the best sites for the location of chain stores, other shops, places of entertainment, etc., in which pedestrians passing different sites are counted and their movements studied, are some of the forms which market research has taken in the industrially advanced countries. Clearly, what type of market research can produce the most satisfactory results depends on the context. Thus, if a soap manufacturer wants to know why his rival's product is preferred in a certain area, the investigation by sample of consumer behaviour and attitudes in that locality become relevant and may help him to find out for which of its attribute exactly is his rival's product desired by the consumers in that area. Again, if it is a case of a ghee-manufacturer wishing to push up sales in a particular locality given largely to the consumption of vanaspati, it becomes necessary for him to estimate the consumer purchasing power in that locality in order to judge whether a reduction in price would have an adequate effect on the elasticity of demand for ghee and induce a sufficient number of people to consume ghee instead of vanaspati so that the reduction in profit per unit may be made worth while by reason of increased turnover.

NCB/46A

Highlights of the Week

AFRICA: WELCOME INDIANS

THE INDIAN Industrialists' Goodwill Delegation, which toured nine African countries, namely, Ethiopia, Ghana, Kenya, Malawi, Nigeria, Zambia, the Sudan, Tanganyika and Uganda, last week submitted its report to Mr. Manubhai Shah, Union Minister for Commerce, and to Mr. K. P. Goenka, President of the Federation of Indian Chambers of Commerce and Industry. The Delegation has brought the encouraging news that in all these African countries, Indian collaboration was much sought after and it was for this country not to miss the chance of active collaboration with Indian and African business men operating there, for the establishment of new industries.

Mr. A. M. M. Murugappa Chettiar, an ex-President of the FICCI, led the Delegation. At a Press Conference in New Delhi, Mr. Chettiar said that collaboration between the Indian and African business men offers both "an opportunity and a challenge." There was an urgent need for the establishment of an appropriate agency for co-ordinating the various programmes of collaboration and co-operation with these countries. The tour had a great educative value for the members of the Delegation who felt that this country could no longer rely on conventional methods of trading. "Trade can form only a part of the total economic relationship which must extend itself to other forms and collaboration in investment and technical assistance", reported the Delegation. It added that India could provide machinery and technical know-how for setting up such industries as cotton textiles, sugar, cement, jute, light engineering, tanneries, etc. The terms to be offered will have to be competitive with those being offered by other countries.

Possibilities of Expansion

The country-wise surveys made by the Delegation provide useful facts about the economies of these countries and about the possibilities of expansion in different branches of industry. The surveys provide information regarding the legal provisions for protection of private property, repatriation of capital and profits, the availability of economic benefits and various other reliefs provided in export and import duties. The general investment climate in these countries is favourable towards India and reasonable facilities are offered to collaborators. The tax laws are lenient and the return on capital employed is encouraging in relation to many other countries. It is no exaggeration to say that the capital invested in most of these countries can be had back within five to six years by way of profits. The purposeful collaboration envisaged by the Delegation will be on the basis of India deciding to provide machinery, capital equipment and technical know-how and not in terms of Indian finances which are vitally needed at home.

The country-to-country assessment made by the Delegation regarding the possibilities of setting up of new industries is an eye-opener. In Ethiopia, for example, the success of the first major industrial unit set up with Indian collaboration — Indo-Ethiopian Textiles — has created considerable confidence in the capacity of the Indians to set up new industries. The management of another existing textile mill in Ethiopia has been handed over to the group running the Indo-Ethiopian textiles. This demonstrates the high degree of confidence enjoyed by Indian business men in Ethiopia. In

Ghana, where the planning concept is very well understood, there are the possibilities of setting up industrial units in collaboration with Government on a turn-key basis; equipment may be supplied on deferred payment terms extending from seven to ten years and for running, in the first instance, with Indian managerial and technical personnel. Kenya and Malawi both offer possibilities of building up handloom textile industry. In Northern Nigeria, the Birla Group of Industries has received approval for setting up a textile mill at Kaduna. A jute mill and an asbestos cement plant are also likely to be set up by Birlas in this country. Proposals for collaboration are also under active consideration of the Nigerian Government for setting up units to manufacture man-made fibres and pharmaceuticals and for establishing a solvent extraction plant and a tannery. There is no anti-Indian feeling in Nigeria. The Sudan offers numerous opportunities of collaboration between the Indian and Sudanese business men. India can extend co-operation to the Sudan in providing turn-key jobs and in making available managerial and technical facilities. Tanganyika is awaiting collaboration from India in the establishment of its first cotton textiles mill. A favourable climate for Indian business men prevails in Uganda where an agreement was signed recently for setting up sugar factories in collaboration with Indian entrepreneurs. India can supply machinery and building equipment as well as managerial personnel in the initial stages. In Zambia an enamelware plant is being set up in collaboration with an Indian entrepreneur. This is only a brief list of the possibilities offered by these African countries.

It is gratifying to learn that the Delegation received encouraging reports regarding the performance of the Indian personnel that had been sent to the various African countries for rendering assistance in various activities such as civil aviation, railways, education, ports and harbours, etc. The Delegation gathered the impression that the Indian personnel in these countries had created a friendly climate and all the doubts about Indian technicians or Indian machinery and equipment being unwelcome were unfounded. The Delegation has stressed the fact that African personnel will need to be trained in Indian factories for strengthening the bonds with these countries. Only through this two-way traffic can the co-operation between India and the African countries be fostered.

The commercial publicity for informing the Africans about India's industrial development and potentialities, the Delegation observes, has not received the attention that was due to it. Much work needs to be done in this direction. A large number of Government officials from the African countries should be encouraged to visit India frequently so as to enable them to have negotiations both with the Government and business men here for the establishment of those industries in which India has specialised and for which she can provide not only industrial machinery but also technical know-how.

EUCCHARISTIC CONGRESS

BOMBAY PLAYED the host this week to the 38th International Eucharistic Congress in which delegates from no less than 40 countries participated. The Papal Legate, His Eminence Gregory Cardinal Agagianian, stated in his opening address that the Congress was being held in India for the first time. This country had been selected for holding the Congress because "from times beyond human memory, India had been noted for its deep religious instincts". Pope Paul VI also

participated in the Congress.

Th's gathering of Catholics from all over the world did provoke some misinformed and misguided sections regarding the purpose for which it was being held in India. The Prime Minister, Mr. Lal Bahadur, explained in the Lok Sabha that the Catholic Congress was not intended as an aid to religious conversion. Mr. Nath Pai's suggestion that "the image of India should not be marred by any hostile speeches", got support from all sections of the House with the result that considerable restraint was exhibited even by the extremist sections.

Besides focussing attention on the religious aspects for moral uplift, a separate Food Seminar discussed the problem of the race between population growth and food production in the world. Dr. B. R. Sen, Director-General of Food and Agriculture Organisation, stated at the Seminar that the world was likely to face a large-scale famine in 1980 if the current trends in population and food production continued. Even at present, according to the estimates of the FAO, nearly half the world population at about 1,500 million suffered from malnutrition. As many as 63 million persons per year were added to the world population, most of them in the poorer countries of Asia, Africa and Latin America. At this rate, population of the world is likely to double during the next 35 years. Since per capita output of food production has tended to decline over the past few years in Africa, Latin America and the Far East, the degree of malnutrition has increased.

Threat to Peace

"Deprivation on such a vast scale is not only morally indefensible but poses a serious threat to social order and international peace", said Dr. Sen. He went on to explain the role of agriculture in providing stimulus to economic growth. He said that crash programmes of industrialisation would not offer all the basic requirements of economic growth if they were not accompanied by an agricultural revolution. To this imbalance between industry and agriculture was added the pressure of adverse terms of trade for the primary producing countries. Even the recent United Nations Conference on Trade and Development failed to devise ways and means to reverse this trend. While the decision to set up a permanent body in the UN framework to continue the work of the Conference was a right one, mere creation of such a machinery would not deliver the goods if "the political will to act was absent". Discussing the case of India, Dr. Sen said that her economic difficulties were caused by stagnation in agricultural productivity and the most effective approach to increase food production was to concentrate efforts on increasing the yield per unit of land. He also gave the opinion that agricultural education and extension services needed to be allocated a much higher priority in the investment of national resources.

In the fight for raising productivity of land, Dr. Sen observed, no nation could attain success through its own efforts. The assistance of the developed nations was a necessary prerequisite because the current volume of aid provided by the developed nations to the developing nations was not adequate. The recommendation had very often been made that the developed nations must give at least one per cent of their national income by way of aid to the developing nations but even this modest target had not been achieved so far. Unless the quantum of aid was enhanced, there was little hope of improving the frustrating conditions which prevailed in the developing countries. An appeal to the "christian conscience" of the developed countries — to feed the hungry, clothe the naked and shelter the homeless — was made at the Seminar by Cardinal Agagianian, who presided over the Seminar.

Two other religious groups also held their conferences

last week. At Sarnath, the seventh Conference of the World Fellowship of Buddhists was inaugurated. The President, Dr. Radhakrishnan, addressed this Conference. In a stirring speech, the President said that "we are unworthy descendants of the great Master. We have to make ourselves different from what we are. We should follow Lord Buddha's teachings in spirit, not only in letter". Another convention, mostly of Muslims, though named the National Democratic Convention, was held in New Delhi and was addressed by Mr. G. L. Nanda, the Union Home Minister, and Mr. Morarji Desai, a former Finance Minister of India. At this Convention the Muslims were urged to identify themselves with this country and not to think in terms of narrow religious groupism. All these three conferences highlighted the fact that in secular India all religious groups enjoy complete freedom in the pursuit of their beliefs. Secularism has not meant negation of religion. It has, on the other hand, provided opportunities to all the groups to preach peacefully their respective religious faiths.

FOOD POLICY

THE UNION Minister for Food and Agriculture, Mr. C. Subramaniam, made a statement in the Lok Sabha on November 29, 1964 in which he gave the salient features of the food policy evolved at a Conference of the Chief Ministers held at New Delhi on the 17th and 18th of November. The essence of the policy is that the Government must build up buffer stocks of rice and wheat in order to meet the scarcity conditions which emerge from time to time in various parts of the country. Statutory rationing has been recommended only

"Aren't we a Nation praying devoutly with one voice: 'Give us this day our daily bread?'"

EASTERN ECONOMIST

for Calcutta. As regards other cities with a population of one million and above the State Governments have been given the option to introduce such regulatory measures as they consider necessary. The major points on which agreement was reached were:

"The present zonal restrictions on the movement of wheat may be allowed to continue and the position reviewed in March 1965 when the prospects of the next wheat crop would be known. Each State may be constituted into a separate rice zone except that the Northern Zone comprising the State of Punjab and the Union Territories of Delhi and Himachal Pradesh may continue as at present.

"Rice will be purchased on Government account in the surplus States for supply to the deficit States on a Government to Government basis. The States concerned have agreed to the following quantities being procured during the period from November 1, 1964 to October 31, 1965 for supply to the deficit States:

Andhra Pradesh	800,000 tonnes
Madras	200,000 "
Madhya Pradesh	400,000 "
Punjab	250,000 "
Orissa	300,000 "

Over and above these quantities, such additional quantities will be procured as are necessary to meet the internal requirements

of the States.

"The main objective of the procurement and import policy is to enable a sizable buffer stock of rice and wheat to be built up. This implies restraint on issues from Government stocks during the post harvest period. Statutory rationing will be introduced in Calcutta on a date to be fixed by the State Government. As regards other cities with a population of one million and over, State Governments have been given the option to introduce such regulatory measures as they may consider necessary and the Central Government would make available such supplies as are necessary for meeting the commitments in these cities. The informal rationing introduced in Kerala will continue.

"State Governments may be permitted to prohibit the export of coarse grains from their respective States except that surplus States which have traditionally been exporting coarse grains to other States should continue to allow such export on a regulated basis. All restrictions on the movement of pulses may be removed immediately except that the existing restrictions on the export of gram may continue till the arrival of the next crop and the States concerned shall allow export of 50 per cent of the stock of gram held by traders. All restrictions imposed by State Governments on the movement of oil and oil seeds may be removed immediately except that the existing restrictions on the movement of mustard seed from U.P. may be allowed to continue till the arrival of the next crop."

Abolition of Managing Agency System: The matter of gradually abolishing the managing agency system in well established industries was under examination and no decision had yet been reached, Mr. T. T. Krishnamachari, Finance Minister, told in the Rajya Sabha.

IBRD Loan Utilisation: Private sector collieries had placed orders worth Rs. 14.77 crores out of the World Bank loan of Rs. 16.67 crores. Mr. P. C. Sethi, Deputy Minister for Steel and Mines, told the Rajya Sabha that in order to facilitate utilisation of the loan, the Government had sanctioned a scheme for partial guarantee by the Government for advances to be given by credit institutions to collieries in the private sector. Other concessions, besides rise in coal prices, had also been extended to the industry.

Movement of Coal by Coastal Ships: Mr. Raj Bahadur, Minister of Transport, stated in the Rajya Sabha that coastal ships had already been carrying coal for quite a long time. The quantity of coal thus moved was about a million tons per annum till May 1961 when a revised target of 2 million tons per year was fixed due to the shortage of rail capacity. Since then, the percentage of coal carried by coastal ships to the total

quantity of coal transported by all means had been: 1961-62 — 3.05 per cent; 1962-63 — 3.45 per cent; 1963-64 — 3.07 per cent; and 1964-65 (up to September 1964) — 2.67 per cent. Due to certain recent developments, however, the Government was re-examining the position and a study was being made of the long-term pattern of production and distribution of coal with a view to taking a decision as to the quantity of coal that should be earmarked for transport by the sea route.

Jewellery for Exports: Mr. Manubhai Shah, Union Minister for Commerce, told the Lok Sabha that the Union Government was considering release of gold from the Reserve Bank's gold reserves to jewellery manufacturers to relieve the shortage of gold for the manufacture of jewellery for export. Details of the scheme were being worked out. Foreign exchange earnings from the export of jewellery, he added, had increased substantially. During 1963-64, export earnings on this account (including exports of pearls and precious stones) amounted to Rs. 11.53 crores. In the current year estimates were that they would fetch nearly Rs. 14 crores. The general policy, he added, was that unless 25 per cent of net saving was shown by a manufacturer, he would not be entitled to import any machinery or tools.

Impossible!
they said

But P & W has done it at Mandya!

It's always good news when the neglected potential of a valuable raw material is rediscovered. This was recently done for bagasse in an Indian paper mill designed, supplied and operated under the direction of Parsons & Whittemore.

Two hundred sixty tons of paper, possessing excellent strength characteristics, has been continuously produced from 100% bagasse pulp at The Mandya National Paper Mills Limited, Belagula, Mysore State.

The bagasse pulp used for this paper was produced by P&W's Pandia continuous digestion system — a system which is firmly established as most economical for cooking agricultural residues. High yields upto 47% bleached bagasse pulp were obtained with comparatively low steam, power and chemical consumption.

This achievement demonstrates clearly that, with the right equipment and proper technical control, production of paper with 100% bagasse pulp is a practical reality.

Focus on the Atom Bomb

By Our Parliamentary Correspondent

NEW DELHI :

IF THE acute food problem in the country dominated the Parliamentary proceedings last week, the nuclear explosion by China was the centre of Parliament's attention this week. The question of whether India should go in for the manufacture of the atom bomb cropped up thrice in the Lok Sabha — first on Monday during the question hour, then again on that day and the two subsequent days during the debate on foreign affairs and for the third time on Friday when a non-official resolution on the subject came up for discussion. The other highlight of the Lok Sabha's proceedings this week was the adoption by the House of the Food Corporation Bill. The Rajya Sabha debated the University Grants Commission's report and the working of the Export Credit and Guarantee Corporation.

Although the Prime Minister, Mr. Lal Bahadur, had assured the Lok Sabha during the question hour on November 23 that the Government was fully seized of the threat posed by the recent nuclear explosion by China and would consider at the appropriate time what steps should be taken to meet this menace, he apparently failed to satisfy members, both on the opposition and the treasury benches. During the debates on foreign affairs and the non-official resolution calling upon the Government of India to manufacture the atom bomb, member after member pleaded for either India developing the nuclear deterrent of her own or entering into full security arrangements with other powers, especially the United States and the Soviet Union, to meet the Chinese threat. They assailed adherence to the policy of India confining the use of nuclear energy only to peaceful purposes and concentrating on arousing world opinion against China. From the opposition benches, the bitterest critics of this policy of the Government were the Swatantra leader, Mr. M. K. Masani, the SSP spokesman, Mr. Nann Rai, the Socialist leader, Dr. Ram Manohar Lohia, the Jan Sangh leader, Mr. U. M. Trivedi, and the independent member, Mr. J. B. Kripalani. Some Congress members, though not so vehement in their criticism of the official line, also lent support to the call for India reversing her stand on the manufacture of nuclear weapons.

Nuclear Umbrella

Mr. Masani wanted India, along with such Asian countries as Malaysia, the Philippines and Japan, to seek guarantees from the US and the Soviet Union in the context of Chinese nuclear threat. He doubted that the Soviet Union would agree to the conclusion of an arrangement of this nature but suggested that an approach could be made to it. Mr. Kripalani went a step further. India, he opined, could not rely on a totalitarian country like the USSR for this purpose. It was, therefore, necessary that steps should be taken to seek assurances of help from the West. Mr. Kripalani saw no harm in the West having military bases in India. No European country, he argued, had lost its sovereignty because of military alliance with the US or installation of US military bases in its territory. Behind these observations of Mr. Masani and Mr. Kripalani, apparently, was the feeling that India neither possessed the scientific knowledge nor the industrial base for manufacturing the atom bomb. Dr. Lohia also doubted India's capacity to produce the bomb. She had neither the will nor the industrial base for developing nuclear power, he said. Mr. Nath Pai and Mr. Trivedi pleaded for India making her own atom bomb. In the debate on the non-official resolution, various members extremely drew upon Dr. H. J. Bhabha's recent broadcast and urged the Government to find out exactly how much a nuclear bomb would cost.

Despite all this criticism, the Prime Minister stuck to the declared policy of the Government — the policy of harnessing nuclear energy only for peaceful purposes — and brushed aside the demand for manufacturing the atom bomb. He asserted that a programme of nuclear armament would have a crippling effect on the country's economy; it would also mean a setback to the efforts being made throughout the world to promote nuclear disarmament. The Prime Minister received good support for the official thinking on the matter from the former Defence Minister, Mr. V. K. Krishna Menon, who said that India would be violating many international commitments if she decided to make the bomb. He described the Chinese atomic explosion as an event that added to the menace to India, to the world and to China itself. It was not a question of Chinese explosion only, but of proliferation of this weapon of mass destruction. "This country and other countries," Mr. Menon stressed, "must now enormously increase their energies and everything else to have the atomic weapon completely abolished."

Beaten Track

While initiating and replying to the debate on foreign affairs, the Minister for External Affairs, Mr. Swaran Singh, mostly retread the ground he had covered last week when he made a statement on international development since the last session of Parliament. Two new significant observations he made were in regard to the proposal of the Ceylon Government to have a separate electoral list for people of Indian origin who were to be granted Ceylonese citizenship, and the US-Soviet dispute over contributions to the UN peace-making operations. He expressed Government of India's concern at both these issues.

The Ceylonese delegation at the Delhi talks, Mr. Swaran Singh said, had made no mention of a proposal for separate electoral list for the Indian settlers who were to be granted Ceylonese citizenship. Mr. Lal Bahadur was taking up the matter with the Ceylonese Prime Minister, Mrs. Bandaranaike. Mr. Swaran Singh defended the recently-signed Indo-Ceylonese agreement and stressed its two important features which were that the 525,000 persons of Indian origin to be accepted by India were to be repatriated over a period of 15 years and that these repatriates would be permitted to bring their assets. The Indo-Ceylonese agreement, however, was criticised vehemently by some Opposition members who accused the Government of following a weak-kneed policy on the question of Indian settlers in Ceylon. The readiness of the Government of India to talk to Pakistan over the Kashmir issue also came in for criticism by many members.

Referring to the US-Soviet dispute over contributions to the UN peace-keeping operations, Mr. Swaran Singh said that Government of India was trying to bring about a settlement of the issue on a basis acceptable to both the countries. Recalling that 1965 had been declared by the UN as the international co-operation year at the suggestion of the late Mr. Nehru, it would be a sad thing, he said, if this year were to begin with apprehensions in the minds of the people all over the world about the future of the UN. Mr. Swaran Singh went on to say that it was important that the members of the UN should strive to save the world body from disintegrating on account of the dispute over contributions to the peace-keeping operations.

The foreign policy of the Government, of course, was approved by the House after rejecting various Opposition amendments questioning the soundness of the Indo-Ceylonese agreement, the propriety of continued readiness to hold talks

with Pakistan on the Kashmir issue and urging the Government to embark upon nuclear-based defence installations in the country.

The Lok Sabha adopted the Food Corporation Bill. In his reply to the clause-by-clause discussion on the Bill, the Union Minister for Food and Agriculture, Mr. C. Subramaniam, reiterated that the basic policy of the Government was to ensure remunerative prices for farmers. Till the remunerative prices were fixed by the Government on the recommendations of the Agricultural Prices Commission, yet to be appointed, the ad hoc prices already announced would remain operative. The Minister justified fixation of maximum prices also in the interest of consumers. The Food Corporation, he pointed out, would have to function within the framework of this price policy and would have to see that trade did not get an opportunity to exploit either the farmers or the consumers.

The Lok Sabha also passed the Prevention of Food Adulteration (Amendment) Bill which sought to tighten the law against food adulteration. The penal clause in the Bill, however, was softened a good deal by a last-minute official amendment. As reported by the Joint Select Committee, the Bill made it obligatory on the courts to award imprisonment up to six months for adulteration offences. In addition, there was a provision for imposition of fine up to Rs. 1,000 on the offenders. The official amendment gave the courts powers to award prison sentence of less than six months or a fine of Rs. 1,000 or both.

Warehousing Facilities

Among the other Bills passed by the Lok Sabha last week were the Representation of Peoples (Second Amendment) Bill, which sought to clothe the Election Commission with powers of a Civil Court as mentioned in the Commissions of Inquiry Bill, Act, and the Warehousing Corporations (Supplementary) Bill, which aimed at expanding the scope of activities of the Central Warehousing Corporation and the State Warehousing Corporations so as to enable them to provide storage facilities for such commodities as tobacco, lac and wool in States which pass the necessary resolutions under article 252 of the Constitution. The debate on the non-official resolution on the future of Goa and a few other territories was postponed till the next session as the issues involved were delicate and required calm and careful consideration.

The Rajya Sabha debate on the University Grants Commission's report was notable for the demand made by several members for the immediate introduction of regional languages as the media of instruction in universities. Some members also criticised the Union Education Minister, Mr. M. C. Chagla's recent statement in Ahmedabad for a "go-slow" policy in regard to the change-over to regional languages. References were as well made to the deteriorating standards of education and the growing indiscipline amongst students. Replying to the debate, Mr. Chagla gave a "solemn" assurance that he would do everything in his power to support and strengthen Hindi and other Indian languages. In the interest of national unity, he would, however, equally fight for the retention of English (as the medium of instruction in universities) till such time when Hindi could take its place. Quoting from the recommendations of the Kunzru Committee, the Inter-University Board, the Chief Ministers' Conference (August 1961), the National Integration Conference (October 1961) and various academic councils, he defended the Government's education policy and refuted the allegations that he was pro-English and did not support Hindi or regional languages. He was only trying to implement the findings of these bodies, he asserted.

The debate on the working of the Export Credit and Guarantee Corporation was highlighted by the reassuring statement of the Union Minister for Commerce, Mr. Manubhai

Shah, that the third Plan export target of Rs. 3,800 crores would be more than fulfilled. The Minister appealed to members not to exaggerate the instances of corruption, over-invoicing and under-invoicing in Indian trade as it would do incalculable damage to India's business interests in the international markets. Mr. Shah denied that India's exports were heavily subsidised. While 83 per cent of the country's export trade was unaided, only 17 or 18 per cent of the total of Rs. 800 crores of exports were subsidised, he pointed out. Mr. Shah asserted that no country's total export trade was without some element of subsidy and if India subsidised a small portion of her trade, she was not doing something contrary to international practices. In a mixed economy, the Minister said, there was room for both the public and private sectors to play their role in the foreign trade of the country. He did not agree with Mr. Bhupesh Gupta's demand of nationalisation of the import and export trade, but added that the Government was not dogmatic in this regard and if it was considered necessary in national interest, any commodity could be exclusively entrusted to the State Trading Corporation for trade purposes. Prof. Ruthnaswamy (Swatantra) made a significant point in the debate. For stepping up exports, the Government, he suggested, should constitute a cadre of commercial travellers to visit various countries for studying their tastes and requirements.

The Rajya Sabha passed the Indian Trade Unions (Amendment) Bill and referred the Banaras Hindu University (Amendment) Bill to a joint committee of Parliament. The Trade Unions Bill sought to disqualify for five years any person convicted of an offence involving moral turpitude from becoming or continuing as a member of the executive or as office-bearer of a registered trade union. The BHU Bill aims at developing this University as a unitary residential teaching institution. The non-official Bill seeking to prohibit companies from contributing any money to any political party or political fund, however, was rejected by the Rajya Sabha.

Question Hour

Revival of Small Car Project : The Deputy Minister of Industry and Supply, Mr. B. Misra, disclosed in the Lok Sabha that talks were being held with certain Indian as well as foreign parties in regard to the revival of the small car project. As these talks were in early stages, it was difficult to spell out the details, he added. The possibility of achieving substantial economies in the production of cars was through maximisation of the scale of production. With this end in view, the Government has put the following alternative proposals before the three existing car manufacturers: (i) The existing car manufacturing facilities may be integrated into a common unit to produce one or at the most two makes of cars, making rational use of available facilities and undertaking expansion in the most economic manner; (ii) One of the existing manufacturers may be selected for substantial expansion on a competitive basis with reference mainly to requirements and arrangements for foreign exchange and assurance in regard to price reduction.

The Deputy Minister also stated that the response from the manufacturers to these alternatives had not been encouraging. Two of the manufacturers had stated that even if their capacity were stepped up to 50,000 cars per annum, the reduction in price from the current level would not be more than about Rs. 750 per car. He indicated that one of the reasons for the high prices of cars was the higher cost of locally purchased ancillaries. This matter was under investigation with a view to taking remedial steps, wherever necessary.

Monopolies Panel Report : The Monopolies Commission is expected to submit its report to the Government by October-end, 1965. This was disclosed in the Lok Sabha by Mr. B. R. Bhagat, Minister of State for Finance.

Colombo Plan for Mutual Aid

G. R. KAPADIA

OUR COUNTRY should feel not a little gratified that, according to the 13th annual report for 1963-64 on technical co-operation of the Colombo Plan Council, it occupied a key position as a major Asiatic donor of training places in the region. India gave 284 places, which was 77 per cent of the total, and was also the second largest donor of experts numbering 106. This is a remarkable achievement considering our own deficiencies in the field.

The Colombo Plan is Asia's largest co-operative endeavour in the technical field, and the terms "donors" and "recipients" in the organisation are often overlapping; the majority of the countries in the region, notably India, are both donors and recipients. Thus, the terms, used only for clarifying statistical data, are usually avoided in all the discussions and deliberations of the organisation. The Plan is a unique network, multilateral in its organic structure but bilateral in orientation, as its origin and subsequent growth to the present dimensions amply bear out.

Major Donor

As most of the Asian countries are economically deficient, the Colombo Plan, as a vast Asian co-operative venture, has to be necessarily worked with the aid of developed countries. Here the major donor of training places, according to the latest report, was the United States, which provided 2,164 places or 48 per cent of the total. In financial terms, the donors had lent or given \$14,864 million of which the US alone supplied 90 per cent. Thus, stripped of all verbiage that surrounds it, the Colombo Plan cannot be worked without substantial aid from the developed countries.

Granting this outside aid, the fact remains, however, that a large part of Asia has come together to provide mutual assistance in the key sphere of technological know-how for furthering economic development. The entire project, from the beginning to date, has been conceived in the spirit of the words of Mr. J. K. Galbraith: "To see the countries of the world not as divided between the developed and the under-developed, but as spaced along a line representing various stages of development is essential for obtaining an accurate view of the problem of assistance.... The provision of aid is seen, as it should be seen, as a co-operative endeavour in which all countries may participate."

It is significant that our country's national planning and the embryo idea of the Colombo Plan started in the same

year — 1950. The Colombo Plan was born in January of that year when a group of Commonwealth nations met in the capital of Ceylon. What was initially envisaged was a loosely-knit club in which developed nations and needy Asian countries could work out bilateral aid agreements in the technical sphere.

Normally, it takes a long time for such a wide-ranging concept to develop, but in this case a Consultative Committee was soon set up to survey the needs and assess the resources available and needed for the extensive and sprawling region. Then a framework was to be built up based on these data for international co-operative endeavour.

At the original meeting of the Consultative Committee in Sydney in May 1950 only Commonwealth countries were to be included, but soon the periphery of the organisation was enlarged to include other countries as well. At a second meeting in London in September 1950, a six-year programme for the Colombo Plan was considered. The remarkable alacrity with which the original idea was pushed through by all the countries concerned was ample evidence of the crying needs of Asia in this field and the urgency of meeting them in good time if economic development was not to stall in a key sector.

Technical Development

Full 13 years after this gaping need was seen, it is still realised, as the latest report says, that "technical co-operation in the Colombo Plan region should be intensively pursued to make the most effective use of the growing resources for such programmes within the region." The words, while revealing a laudable resolution, also betray that the pace of development in the technical field has not been as expected.

The beginning was good enough. Two bodies were set up for co-ordinating the entire work of technical aid and co-operation among the participating countries. They were the Colombo Plan Council for Technical Co-operation (which meets from time to time in Ceylon's capital) and the Bureau of Technical Co-operation (a small agency permanently installed in the same place.) The former is a clearing-house of information, while the latter is a forum — a clearing-house of ideas — for discussing all plans and work relating to bilateral technical aid.

Continuous effort has been made to enlarge the scope of training within the Colombo Plan region, because talent al-

ways flourishes better in its own native environment. In 1960, the Bureau authorised to arrange, with financial assistance from the Ford Foundation, for a comprehensive survey of training facilities in the area. The so-called Mills report on the subject appeared the following year.

Disconcerting Revelations

Some of the revelations in the report were highly disconcerting. Though Asia suffers acutely and endemically from shortage of technical skill, even the existing training facilities in the area, the report said, were not being fully utilised. This was a worse case than idle industrial capacity.

According to the report, the achievement showed a decline instead of growth. In 1958-59, 321 training places were supplied within the region; in 1959-60 the number was 12 less and, in 1960-61, 35 less. The setback was sought to be rectified by what became known as the "Australan proposal" at the Melbourne meeting in November 1962. Concrete measures were suggested. The Bureau had to play a more active and decisive role in furthering the cause of intra-regional training aid. This was to be done by bringing together potential aid donors with potential recipient countries.

Diligent efforts have been made to get over the early setbacks in the Colombo Plan, but the results have still fallen short of expectations. Since the special meeting of the Colombo Plan Council in April 1963, all the emphasis possible has been on increasing technician training within the region, though this should not necessarily mean reduction in the training provided outside the region. If funds were scarce for providing training places within the region, the obvious remedy was to resort to third-country training.

Appreciable obstruction exists to such development, because some countries, with mistaken ideas of patriotism, are inclined to favour the national language as a medium of instruction and not English or French, which lend themselves

better to a thorough comprehension of the complex scientific know-how of the modern world. Living allowances of trainees in advanced countries are also attractively higher while, what does not quite square with nationalistic fervour, training in countries outside the region is still considered in many quarters as more esteemable and reliable.

Any palpable benefits accruing to the region from the Colombo Plan cannot be gauged with any precision, as technology is only one of the factors, albeit an important one, entering into national economic development. In recent times, industrial production in the region has been up by eight per cent a year, though most underdeveloped countries started almost from a scratch only a few years ago. Food output has been higher by an annual three per cent. These increases are to be set off against the population spiral at an annual rate of two per cent.

Political factors have also thwarted the economic development of a large part of the region. There are "neutralist" countries holding precarious and ever-shifting power against assailants both from the right and left. There is a marked drift towards the left in some countries under strong Communist influence. Indonesia is pitted against Malaysia, a Colombo Plan partner. "Neutralist" Cambodia cannot tolerate Thailand, which is openly anti-Communist. Over the entire region, above all, hangs the Chinese expansionist threat, with the recent atomic blast to show how real it is now, from Korea's 38th Parallel to the Himalayas.

Yet the Colombo Plan provides a network of nations comprising almost the whole of non-Communist Asia. From the original nine members, countries comprising the Colombo Plan have swelled to 22 with the admission of the Maldives Islands (off India) and Afghanistan during the past year. The conglomerate of nations may look loosely-knit, but the real wonder is that it should have existed at all for 14 years and, what is more, should hold out promise of fast growth and cohesion in the future.

WINDOW ON THE WORLD

In the Land of the Deutsche Mark

BY THE EDITOR

BETWEEN May-June, 1958, when I first visited West Germany, and October this year when I was most recently in that country, I have had opportunities of going there every other year, travelling fairly extensively and meeting leaders in business, government and the press. As a result, I have been able to accumulate a record of personal impressions of some of the aspects of the justly famous and much discussed "German economic miracle." I am, however, not going to dwell here in detail on the success story of the German economy. The facts are widely known and the statistics easily available. It would be more to the point to talk about what appeals to me as basically significant in what little I have been able to learn about the West German economy.

Striking Consensus

I have been much impressed, for instance, by the firm national consensus that there is in that country on the broad principles of the management of the national economy. It is this persisting consensus, rather than even the undoubtedly talented Professor Ludwig Erhard, which may justly be described as the architect of the German economic miracle. The credit that must belong to Prof. Erhard is that it was he who, through his policies as Federal Minister of Economics, created a climate favourable for that consensus to develop. Prof. Erhard (now the Federal Chancellor) was the architect, in other words, not so much of the economic miracle as of the national consensus which worked that miracle. This distinction in my view is an important one. It was not as if the West German people followed Prof. Erhard with blind faith in his powers as a miracle-maker. He had to earn their confidence and their support the hard way. It was only by following policies or making decisions which currently and concretely strengthened the national economy and improved the living conditions of the people that Prof. Erhard could keep the conduct of the national economy free of the plague of sterile and sectarian controversies and earn broad national trust and support. Prof. Erhard, in other words, had to demonstrate at each stage of West Germany's post-war reconstruction and development that his programmes produced results. Only then was he able to proceed to the next stage. Only thus could a national consensus for the building up of the economy have taken form and become the basic constructive factor in the growth of the West German economy from strength to greater strength over a period during which very little in the world economy has remained stable except the Deutsche Mark.

I am not suggesting here that there have never been any differences in West German views on German economic issues or questions. On the contrary, there is certainly much lively debating of economic issues. Business men, for instance, will not be business men if they do not argue that they must necessarily know better than ministers or bureaucrats what is good for the nation's business just as governments will not be governments if they do not claim that they ought to know better than business men what was good for the people. During my last visit, for instance, I heard it said so often at my meetings with West German industrialists that the tax burden, direct and indirect, was the highest in the world that I was almost tempted to buy a nice little present in West Berlin for the Indian Finance Minister to show my appreciation of the civilized humanity that Mr. T. T. Krishnamachari, by inference, might be presumed to display towards the tax-payers in his power. It was amusing too to hear West German business men protest in the same strong terms as ours do against the unimaginative restrictionism of central banking authori-

ties. To my thinking, however, such debates are inevitable in and incidental to discussions of the affairs of complex modern economies. What really matters is the basic consensus to which I have referred and which seems to dominate and discipline economic thinking in West Germany to an extent far greater than almost anywhere else in the world. This consensus consists in a clear recognition of and fidelity to certain essentials of economic policy-making and management. Thus, there is an overwhelming feeling in West German minds that there could be little that is more important to prosperity and economic progress than production — unless it be productivity.

In London, recently, I listened to Prime Minister Wilson admonishing the British people on television that the world did not owe Britain a living. I imagine Prof. Erhard never had to tell the German people this truth because they must always have been keenly aware of it. The German people know that, given their relatively small population and their heavy dependence on imports of raw materials, they could manage to live well only through ruthless efficiency in selling the products of their skills to the rest of the world. The heavy export bias of the West German economy is a constant thought and goad in the minds of all Germans who have anything at all to do in any manner with the industry or the commerce of that nation. The sharp competitiveness of German merchandise has not helped to endear West German industry to other exporting countries and chagrin, if not resentment, has often found expression in the propagation of the canard that West Germany's export boom is created by some kind of a Marxian surplus squeezed out of German workers rendered rather helpless by the absence of a strong trade union movement. I do not think that there is any substance in this allegation. It is true that the West German economy has one of the brightest national records for industrial peace in recent years, but it is not because its workers are organizationally weak.

No Marxian Surplus

It surely stands to reason that had the conditions in West Germany warranted it, a militant trade union movement could and would certainly have taken shape there. It is because policies in government and industry have been remarkably successful in distributing widely and fast the material benefits of West Germany's post-war economic reconstruction and development among the various sections of its people, including industrial workers, that the co-operative atmosphere we see in West German industry has come to be regarded as the workers' best friend besides being a good thing in itself. It is possible that over the greater part of post-war West German economic history productivity has been increasing faster than money wages. But this does not necessarily mean that the worker has been receiving less than his due. On the contrary, to the extent that the higher rate of productivity in industry has helped to find resources for larger investments on science and technology in industry itself or for the strengthening of the national economy as a whole, including its weaker sectors, such as agriculture, the West German worker has necessarily profited from the relative stability of prices, a strong national currency, competitiveness of West German exports in world markets and secure and expanding employment opportunities for himself. I have said earlier that I do not intend quoting much statistics, but I cannot resist the temptation at this point to make mention of the fact that real wages in industry have increased faster in West Germany than any other country in the world, having indeed more than doubled since 1950. To sum

up, the West German worker co-operates for the excellent reason that it has paid him and continues to pay him to do so.

This is not to say that all is contentment with industrial workers in West Germany. That country has no more succeeded in abolishing economic inequalities than any other country, however industrially advanced or otherwise prosperous. At the railway station at Frankfurt, where I had gone on an early morning walk, I tried to work up a conversation with a group of semi-skilled factory workers (one of whom happened to have picked up some English while holding a job in the Middle East). They were guzzling their beer down with their bread rolls and I for one was not at all surprised to hear quite a few sarcastic remarks from some of them about what to them was that other affluent world of bankers and big industrial barons which they could only watch from a distance. There must certainly be poor people in West Germany, as President Johnson has declared that there are in the United States. But the true meaning of poverty has to be found in terms of its economic geography and the vast majority of those who are poor in West Germany are poor only in relation to others in that country who indeed must be very rich. This is not to say that economic or social discontent in West Germany could be dismissed as illusory any more than anywhere else in the world and one political and social consequence of this discontent is, at any rate, immediately relevant to current West German politics. There is certainly a substantial feeling in the land that there is more of private affluence than the country could afford and less of public welfare spending than the people need. This is an area of political controversy where the Social Democrats, now in opposition, could effectively raise some of their more forceful challenges to the ruling party of Christian Democrats.

Productivity Gospel

There is, however, little danger that any possible sectarian conflict or conflicts among political or economic groups would seriously distract national attention pre-occupied with production and productivity. This is because the West German people as a whole do not yet seem to be quite sure that West Germany has really firmly established its status as a strong and viable economy in this complex and competitive world. There is, indeed, a genuine anxiety that the German economic miracle might turn out to have contained more than an element of the miraculous. This is partly because of historic reasons. The fact that West Germany is now the second largest trading nation in the world has not yet served to wipe out memories of a not-too-remote past when Germany had to consider itself a "have-not" power in comparison with such economically and politically powerful "haves" as the United States, Great Britain and France. It is a familiar argument in West Germany that, however rich or prosperous that country may seem now, its economic base, particularly in the matter of capital accumulations, is much more narrow than not only the American but also the British and the French. The feeling of being short of capital is in fact one of the major anxieties of West German business. This mood cannot be dismissed as an insubstantial sentiment. The German tax laws, which discriminate very markedly indeed in favour of distributed profits, have not encouraged the accumulation of corporate reserves while the high consumption trends in the national economy naturally lengthen out the process of personal savings being returned in force to investment in industry. As a result, West German businesses, whether large or small, have to look to outside sources of finance, often government institutions, to an extent greater than they feel comfortable about. Even the biggest corporations are not saved this dependence especially where their financing of any substantial investments abroad is concerned.

The sense of insecurity arising from having to operate from a relatively narrow capital base is aggravated by the

awareness that the West German economy is heavily mortgaged to international trade. The trade and balance of payments surpluses which West Germany has been piling up year after year have caused envy across the world, but in West Germany itself they are regarded with mixed feelings. Apart from the fact that their internal economic policies have to be nervously vigilant against the inflationary potential of the surpluses, the West Germans find further cause for discomfort in the circumstance that their country's foreign trade-oriented economy must necessarily be vulnerable to factors over which their own economic policy-makers can have but little control. Thus the inflationary pressures with which France and Italy, West Germany's major trading partners in the European Economic Community, have currently to cope with could set up unsettling stresses in West German economy as easily as the policies of trade and commercial restrictionism which Britain has begun practising might do.

West Germany has to import very substantially in order to keep its industry going and it has to export as considerably in order to be able to pay for what it needs to import. That it has been remarkably successful in this exercise so far is something to be grateful for, but that it may continue to succeed is not something which could, in the West German view, be taken for granted. This mood of caution could explain much of the ambivalence that is so noticeable in West German trade and aid policies. While on the one hand top policy-makers in Bonn as well as the spokesmen at world gatherings have refreshingly and repeatedly declared themselves to be in favour of liberalizing the commercial policies of industrialized nations in regard to developing countries, a marked partiality has in actual practice been shown for hastening slowly where West Germany's own performance is concerned. Similarly, although West Germany must undoubtedly be ranked among the first five countries of the world which have done most in the field of international economic aid, its spokesmen seem to have fallen into the curious habit of making it unduly obvious to the world that in this matter of aid, their country and its government are being pushed farther and faster than they would like to be. It is a familiar thesis in West German government and industry that their country must needs be on its guard against being inveigled into trade or aid commitments larger than what its intrinsic resources or prospective capacities could prudently discharge. But while a conservative and cautious assessment of the economic miracle may have served to impress on the West German mind the need for prudence in assuming external commitments, it has certainly had a very different effect, wholly tonic, on certain important attitudes in industry. I am referring here to the aggressive pursuit of technological dynamism in plants and factories. Precisely because West German business realizes that the national economy has still to go a long way before it becomes as resourceful and viable as those of certain other advanced industrial countries in the West and is simultaneously fully aware of the need to preserve a fierce competitiveness in world market, it seems to have made it its religion to go after productivity with all the skills at its command.

Two Fronts

This battle for higher and yet higher productivity is being carried on along two broad fronts. In the first place, there is the campaign for creating and raising human skill in industry through vast training programmes. The big firms and corporations have thrown themselves into this work with a vigour and earnestness which are among the most pleasing qualities of West German economic life today. Technical training establishments attached to factories and plants have now become an integral part of the national education system by serving as a bridge from basic schooling to gainful employment for the young people of the country.

Then there is the other campaign for raising to greater and

still greater heights the productivity of capital investment in plant and machinery. West German industry has always been research-minded and the status which research has now come to occupy in the board rooms of West German firms and corporations is a very exalted one indeed. Vast funds are being appropriated for the discovery of new products and processes but this activity, however attractive immediately, is not allowed to overshadow the importance attached to basic research in the laboratory projects and programmes of the top leaders in West German industry. Some of the most promising and spectacular exertions in the field of industrial research now in progress in West Germany relate to electronics including automation and nuclear power generation. Incidentally, I am greatly impressed by the fact that research scientists and laboratories in West German industry seem to be in close communication, if not collaboration, with research activities in US industry. I have also noted with interest that there is a free flow of ideas as well as pooling of personnel across and among research institutions in the country. As an example of the co-operation and understanding that exists in the scientific sphere among institutions in West Germany, I may perhaps mention the fact that the big industrial firms take care to train sufficient numbers of junior scientific workers and laboratory technicians so that no need arises for their poaching on the scientific staff of the universities or their teaching and research establishments.

To conclude, despite the consistent and colossal success of the West German economy over a period of at least 15 uninterrupted years, those who have the responsibility of keeping the economic miracle going, whether they be in government or in business, do not show any sign whatsoever of underestimating the complexities of their task. Complacency, one feels, would be the most unforgivable sin in this land where nothing seems more real and close to its people than the ceaseless call of new challenges and opportunities. For West Germany no visa is needed — for its people believe that they must keep their eyes and ears open to all the winds that blow across the face of the earth

II

MY LAST two visits to West Germany were sponsored by the Press Bureau of German Industry in India acting on behalf of the six leading West German firms — Krupps, Demag, Mannesmann, GHH, AEG and Siemens — who have participated in building the steel plant at Rourkela and who thought it useful to invite "economic journalists" from this country to assess for themselves the climate prevailing in West German industry for co-operation with India's industrialization.

The earlier of these visits was in July, 1962, when the journalist group concerned was visiting West Germany against the background of Indo-German recriminations over dislocations, disappointments and difficulties in the proper commissioning of the Rourkela steel plant. Not only the six West German firms associated with the Rourkela project but the entire West German industry and, in fact, the West German Government as well, was at that time both angry and distressed at what they considered to be unreasonable and unfair criticisms of the character and competence of West German industry from sources in this country, not excluding the Government of India. It was strongly felt that the world image of West German industry was being spoilt by the West German firms in Rourkela being made to bear the blame for the organizational, technical and managerial weaknesses of the Indian elements in the project. I do not want to make any further reference to what was after all not a very agreeable chapter in Indo-West German economic co-operation, but would only mention that the impression I got during the earlier visit was that the Indian journalists had been taken to West Germany largely in order that they might learn at first hand how much

Rourkela mattered to West German industry and what the points of view were of the West German firms concerned as well as the West German Government with regard to where, why and because of whom matters went wrong in Rourkela in those very difficult months, both before and after the inauguration of the plant.

On the second visit, which was in October this year, however, the mood in West Germany was much more relaxed. There might still be problems in Rourkela but Rourkela as such has ceased to be a Problem and the steel plant there which at one time threatened to prove the rock on which Indo-West German economic co-operation might break itself, has since been agreeably established as the most important landmark of West Germany's association with this country's industrialization and, more significant still, as the dynamic core of an increasingly ampler partnership. Consequently, I found my hosts in West German industry this time more in a mood to look ahead into the future of India's development and discuss the responsibilities which the richer nations have in the area of international economic aid. I have always held the view that even if the rigorous realism of West German aid attitudes might sometimes have irritated those, such as ourselves, who are at the receiving end, their high seriousness must always command our respect. As in everything else which concerns themselves, the West Germans tend to emphasize "results" in the aid field as well. This is not to imply that they have consciously eschewed the idealism which so powerfully colours, for instance, the basic American philosophies of international economic co-operation. But I hope I am not mistaken in suggesting that the West Germans do not suffer from any undue partiality for any vague "do-goodiness" which fails to benefit demonstrably him that takes — and, let me add, him that gives as well.

The "Scheel" View

One of the most articulate proponents of the view that aid must produce results is, of course, the Federal Minister for Development Aid, Mr. Walter Scheel, who seems to enjoy the confidence of West German industry to a greater extent than almost any other leading personality in Bonn. Mr. Scheel is a candid critic of the "prestige-thinking" which in his view dilutes the purposiveness and degrades the efficiency of much of the planning in developing countries. He is an uncompromising advocate of the thesis that the developing countries should carry out their industrialization with more deference than they are usually inclined to show and less indifference than they have been betraying for the "calculation of economies". In alignment with this line of thinking, Mr. Scheel further holds that his Government should in future confine its development aid to grants-in-aid for technical assistance and for technical training purposes as well as "soft" loans for the improvement of the infrastructure of aid-receiving countries. Mr. Scheel, in other words, is not generally in favour of West German aid finance being used by the governments of developing countries for the setting up of industrial undertakings in the public sector. It is true that such finance has been provided for the Rourkela steel plant, and it is indeed likely that similar allocations will be made as plans for further expansion of the steel plant are mutually agreed upon from time to time. But there is no mistaking the West German view, both in government and in industry, that Rourkela must be regarded as an exception, because of its vast financial dimensions, to the general desirability of inter-governmental aid not being drawn upon for the setting up of specific industrial plants — an activity which is firmly held to belong to private investment and private enterprise.

An integral part, consequently, of the "Scheel view" of inter-governmental aid are its robust assumptions regarding the potentialities and prospects of the contribution which pri-

ate capital and industry in the advanced countries could make to the economic growth of developing nations. Pointing out that even if the growth rates in the standard of living and or foreign trade fixed by the UN should come true, it would take the developing countries some 80 years to reach the present standard of living in Europe and even 120 years to reach that of the United States, Mr. Schuel argues that the going would become even more hard and prolonged for the developing economies if they do not deliberately opt for policies which enable them to make the most productive use of the capital and know-how of industrialized countries.

These and similar West German thoughts on development aid I found repeatedly expressed during discussions with representatives of government or industry. The purpose seemed to be to convey convincingly to the people of this country the message that while West Germany was as keenly interested as ever in associating itself with the industrialization and economic development of this country, it is firmly persuaded that it can do its best more by exploring opportunities in the area of private capital and private enterprise rather than by employing taxpayers' money for inter-governmental aid transactions.

Not "Tired"

It is possible, however, that this purpose could be misunderstood; and it is indeed plausible to argue that the constant harping on the issue of aid discloses a certain "India-tiredness" in the minds of the West German people. I am, however, reluctant to accept such inferences. On the contrary, I feel that West German interest in Indian development is increasing rather than diminishing. Only it is seeking new forms and new directions. It has become less philosophic and more businesslike, less vaguely trusting and more frankly insistent on results. It is, of course, fully realized that inter-governmental aid cannot be cut off all of a sudden or even substantially reduced quickly, but it is held that the emphasis should progressively shift from inter-governmental transactions to commercial activity.

Here it is necessary to bring out very clearly an important element in the attitude of West German industry towards development aid. I have referred in the earlier section of this discussion to the fact that the capital base of the West German economy is relatively small and I have also mentioned the fact that West German industry has a nagging feeling of being short of capital. Being realistic, West German industrialists are prepared to reconcile themselves to the fact that giant projects, such as complete steel plants, could be financed only with governmental aid funds — although I may mention in passing that a high executive in a heavy engineering firm in the Ruhr district, did tell me that he saw no reason why West German industry could not find from its own resources its share of the capital as a partner of international consortia of investors and industries from a number of other advanced countries (the United States, Britain, France, Japan, etc.) participating jointly in the establishment of new steel plants in this country. Being realists, again, they object not so much to West German tax money being employed to finance West German exports of plant and machinery as to this tax money being used for this purpose in the form of inter-governmental aid. In other words, West German industry realizes that its own private resources may not be adequate for a large-scale investment-cum-export effort in developing countries and is, therefore, quite keen on those resources being supplemented by West German government finance, but it demands that the West German Government should make this money available as loans to West German industries for investment abroad rather than as aid to foreign governments. Thus what is being foreseen is that, while the total flow of capital and know-how from West Germany to developing countries expands

steadily, the channelling of these resources is re-ordered and re-directed.

This naturally raises the question of how reasonable are the prospects of increased private capital in the area of West German participation in this country's industrialization. This subject was discussed quite frequently and from various angles during the stay of the journalist group in West Germany, but I am sorry to say that it has not been easy for me to identify any consensus among West Germans themselves or even only among West German industrialists. This is, of course, partly because of the "poor cousin" psychology which haunts West German thinking on capital investments abroad — a mood to which I have already referred more than once. Leading West German industrialists seem never tired of lugubriously emphasizing that their country cannot hope to be able to invest as much abroad as the United States or even Great Britain does. Consequently, few responsible West Germans are prepared to attempt any definite estimate of what could be the probable size of West German capital investments in this country on the assumption that a favourable climate is created here for this movement.

It is, of course, readily agreed, when it is pointed out from the Indian side, that there is certainly scope for a substantial improvement in the present position in which West German private investments in this country amount only to a meagre Rs. 80 crores. It is also agreed that steps should be taken at both ends to remedy this situation. Vagueness, however, promptly returns when discussion turns to what those steps might be. Even at the risk of indulging in leading questions, some of us on the Indian side found ourselves asking whether West German private investment was being inhibited by our tax policies or by our dilatory or complicated administrative procedures. German business men agree quite naturally that taxation could be less burdensome and the Government more businesslike, but an impression that was left on me was that most of the West German industrialists with whom the Indian journalist group discussed this subject seemed to have no strong feelings in the matter. It is, however, possible that this subdued sentiment may be due to the fact that detailed taxation and procedural problems are the headaches of men lower down in company hierarchies than the directors or chief executive officers who usually represented German industries in discussions with the Indian journalist group.

Investment Guarantee

Part of the explanation may also be that the West German mind, in business as well as in government, seemed obsessed with the subject of an investment guarantee agreement between Bonn and New Delhi. I use the verb "obsessed" advisedly since I could not escape a feeling that an exaggerated importance was being attached to the conclusion of such an agreement. This is not to deny that Bonn probably might have had reasonable grounds for being irritated over the time consumed in the prolonged and fastidious negotiations which the Government of India presumably considered necessary before the agreement could be finalized as it was at last done and confirmed by exchange of letters on October 15. The details of this agreement have been noted elsewhere in this issue and I may merely add here that while this document may be valuable as a reassuring support for the psychology of West German business upset by the confiscations of its assets in two world wars and, at a more practical level, facilitate the issuing of guarantees by the West German Government to its industrialists investing abroad, I see no reason for believing that this agreement could work a sea-change in the Indo-West German investment situation. After all is it not the case that many leading firms in West German industry have already come to India, without waiting for the investment guarantee agreement? It was certainly urged on the

journalist group that although the giants of West German industry may not care for the cover of an investment guarantee, their smaller colleagues might be happier for the security provided. This explanation need not be ignored, but it is interesting that many leaders in West German industry are ready to concede that it is certainly not the case that an army of small and medium West German businesses has been waiting only for the signal of the investment guarantee agreement for entering India. All things considered, the investment guarantee agreement may only be one element in the evolution over a period of a large-scale movement of West German capital and enterprise into the industrialization of this country.

In the short period, however, more may be gained by some purposive expansion on the part of the leaders of West German industry who are already here and who know their India well. I, for one, have never been able to understand why there is so little of collaboration between the big German firms and their Indian counterparts. The situation is all the more surprising because of the splendid success of the Tata-Mercedes Benz venture in the automobile industry. I found many West German business men remarking on this collaboration with pride and pleasure. There is surely scope for many more joint enterprises of this quality and on this scale in the private sector. Unfortunately, many leading West German industrialists are rather reserved in their assessment of such possibilities. I have an uneasy feeling that this is because there is not enough of mutual knowledge or mutual understanding between the bigger industrialists of the two countries.

Some Grievances

Lack of understanding, again, seems to function as a bottleneck elsewhere too. I have referred in this article often enough to the critical attitude of West German business men towards inter-governmental development aid. I must here make it clear that while those business men are certainly not overkeen on their government lending to other governments, they have no ideological inhibitions whatsoever in doing business with governments or public undertakings in other countries on a strictly commercial basis. In this context, there does seem to exist some hard feeling between the Government of India and some of the leading industrial groups in West Germany. A director of one of the leading West German corporations, for instance, complained that his company was obviously not treated with fairness in the award of contracts for a major public sector project in this country although according to him his company had offered more advantageous terms to the Government of India than the successful bidder who came from another foreign country. A director of another company which has collaborated with a firm registered in this country in setting up a heavy engineering enterprise was found to nurse a feeling that a certain contract for the erection of machinery might have gone (or be going) to another bidder because the latter had the advantage of being a "wholly" Indian firm. These are grievances the merits of which cannot evidently be assessed here but I believe that I would be within bounds if I suggest that it is important that the Government of India should always exercise the greatest thought and care in ensuring not only that discrimination is not practised but also that it is not even suspected.

Rather interestingly, New Delhi may also have its own complaints to press. I cannot obviously disclose my sources, but I have reason to believe that there is a suspicion at the highest levels of the Government that business men from certain foreign countries, notably West Germany and Japan, are rather free with under-the-counter commissions for government officials who could award contracts or influence the awarding of contracts. It is clear that a misgiving of this nature entertained in high government circles may come in the way of freer and franker dealings between the govern-

ment of this country and foreign business men, industrialists or exporters seeking to transact business with it.

Before I leave this subject I wish to emphasize that, in my view, the most important single factor which could encourage an early increase in the flow of West German investment and enterprise in this country would be a positive pursuit on both sides of collaboration arrangements between Indian and West German business men for the setting up of industries. The recent inauguration of an office of the Indian Investment Centre at Dusseldorf is a step in the right direction. I was witness to the enthusiasm which this project aroused in the business community in West Germany and I interpret this enthusiasm both as an indication of the present meagreness of knowledge among the West German business community about investment possibilities and problems in this country as well as of the desire that there is to learn more.

A project of some possibilities is the programme which is being organized for a delegation of German industrialists to visit this country early in the new year. This delegation will have 30 members and will be led by West Germany's most prominent banker, Mr. Hermann J. Abs, who is not only no stranger to this country but is one of its good friends abroad. It is to be hoped that the work of this delegation would contribute to more and more West German business men knowing about and meeting with more and more Indian business men. The West German delegation could particularly be helpful in arousing the interest of and educating managements of medium enterprises in West Germany many of which currently seem to depend for their knowledge of India or of investment possibilities here on what they hear from or are told by the directors or senior executives of top West German firms which are already established in this country. While I agree that the guidance which the leaders of West German industry thus give to their rank and file may be sound and useful, I hope it will be conceded that problems and points of view are not always common to big businesses and the smaller ones and it is therefore desirable that the latter too should have independent opportunities of analyzing and understanding situations by means additional to word-of-mouth counsel from their bigger brethren.

Million Mark Vision

Finally, I must once again stoutly refute the suggestion that criticism of development aid in West Germany implies any "India tiredness". On the contrary, I wish some of us here would show anything like awareness which I found in West German industry and its leaders of the immense possibilities of the effective demand for goods and services which the steady economic development of a nation of 450 million people must necessarily unleash over the coming years. I wish, again, that people here in government, business or, let me add, journalism, share the vision which seems so much a reality for and from the board rooms of West Germany's great firms and corporations — a vision of millions of homes in the towns and villages of this country coming to possess, item by item, a large variety of articles for common use and for comfort which science and technology are steadily being organized to produce in ever-growing measure at ever-lowering costs. West German industry, indeed, seems to know its India better than many Indians theirs. The world's most export-minded nation is certainly not going to let its interest go by default in one of the most promising mass markets which this aging century may present in its closing decades. West German industry may certainly prefer to produce in West Germany and export to India if that were possible, but since it is becoming increasingly necessary for the industrialized countries of the world to produce in India in order to be able to sell in India, I have little doubt that the cue will not be missed in the Ruhr or, indeed, anywhere else in the bustling and buoyant industrial community of West Germany.

Why British Bank Rate Had to be Raised

PAUL EINZIG

LONDON:

IN AN article appearing in the October 23, issue of 'Eastern Economist', I pointed out that it was a mistake to regard the "stop-go" policy as a relic of the past. "We shall learn it sooner or later at our cost" I concluded, "that it is as necessary as ever". In exactly a month after the publication of that article — much sooner than I anticipated at the time — the British Labour Government felt impelled by events to revert to "stop-go" by raising the bank rate to the crisis level of 7 per cent. This was deemed inevitable in order to defend sterling against a sweeping attack that was developing, even at the cost of checking the expansion of the domestic economy.

It was with the utmost reluctance that the Government departed from its repeatedly-declared determination never to revert to "stop-go". The fact that it has now adopted substantially the same policy which it denounced on many occasions in the past, and that in doing so it had to defer temporarily hopes of expanding production and raising the standard of living, must have gravely damaged the Labour Party's position in the country. That in spite of this the Government has resorted to the bank rate weapon is due to its realisation that in the absence of its use it would soon be facing a crisis of first-rate magnitude.

Beyond doubt the Government is right in claiming that it has inherited a most unsatisfactory economic situation from its predecessor. But it cannot disclaim responsibility for bringing about an aggravation of that situation by its own actions and inactions.

The Government inspired distrust abroad by adopting an attitude similar to that of Latin American dictators whose first action upon seizing power is to reward their henchmen who had rendered assistance in the military coup. The creation of many new Ministerial posts and the positively indecent haste in raising the salaries of Ministers and Members of Parliament in the middle of an acute balance of payments crisis was obviously against the public interest, because it was bound to make it more difficult to induce the trade unions to agree to an incomes policy. Everybody is aware that the Government's success in restoring the economy depends on its success in achieving an incomes policy. Yet that success was jeopardised.

Ideological Equalitarianism

The untimely increase of pensions and the abolition of the nominal charges made on certain National Health Services, and the financing of the resulting cost by means of taxing the higher incomes conveyed the impression that the Government attached more importance to ideological equalitarianism than to the solution of the balance of payments problem. This attitude is based on ignorance of the elementary Keynesian principle that more equal distribution of incomes is inflationary, ignorance which gave rise to doubts as to the soundness of the economic advice received by the Government.

The decision of the Government to press forward with steel nationalisation and with other anti-capitalist measures aggravated doubts about the priority given to the task of finding a solution to the balance of payments crisis.

Above all, the repeated declaration of the Government's determination not to revert to "stop-go" gave rise to fears for the future of sterling. By publicly renouncing the use of the most effective weapon for its defence the Government encouraged speculators in the belief that they could attack sterling without running the risk of incurring losses.

Progress towards the adoption of an incomes policy has been far from satisfactory. Although behind closed doors Ministers warned trade union leaders that unless an incomes policy is adopted it might become inevitable to revert to "stop-go", in view of the public declarations in the opposite sense these threats were not taken seriously. The Government encountered difficulties in obtaining trade union approval even for a vague "declaration of intent" which would be in any case meaningless in practice.

Even though the Prime Minister and the Chancellor of the Exchequer repeatedly declared their determination to defend sterling, these declarations carried but little conviction until they showed that they were prepared to follow up their words by action. None of the measures they adopted prior to the increase of the bank rate was very impressive. But nobody could possibly fail to be impressed by the gesture of raising the bank rate to 7 per cent. It is impressive precisely because it is in flagrant conflict with everything the British Labour Party stands for. For this very reason it should inspire confidence in the sincerity of the declaration to defend sterling at its present parity.

Faulty Advice

Unfortunately, Government spokesmen deemed it necessary to water down these declarations somewhat by promising to various industries immunity, or comparative immunity, from the effects of the higher bank rate. In this respect too, the Government does not appear to be well served by its economic advisers. Somebody ought to tell Ministers that the only reason why bank rate is effective is because it hurts, and the extent of its effectiveness depends on the extent to which it hurts.

The Government and its advisers seem to imagine that foreigners are impressed by the bank rate increase simply because the figure of seven has replaced the figure of five. But foreigners are no fools. They are impressed by the 7 per cent because they assume that it has a deflationary effect and relieves part of the overload on the economy. But if the Government should subsidise a large proportion of those who have to pay higher interest in order that they should not curtail their activities, to that extent the higher bank rate will be ineffective. The moment foreigners discover this they would cease to be impressed by the 7 per cent bank rate. It seems reasonable to assume that the unfavourable reaction that followed the sharp appreciation of sterling on November 23 was due to the indications that the Government intends to mitigate the deflationary effect of the higher bank rate.

Even so, the Government deserves high praise for a very courageous act, all the more so since it antagonises millions of its supporters throughout the country. It must not be forgotten, however, that had it not been for the Government's ill-advised and short-sighted policies, the 7 per cent bank rate would not have been necessary. In itself a Labour victory at the election did not provoke an attack on sterling. It is only when the policies of the new Government became evident that a wave of distrust came to develop. If only this experience has taught the Government a lesson that country must be placed above Party both country and the Government would greatly benefit by it in the long run.

[The upward revision of the bank rate failed to lessen the pressure on the pound. It was only when central banks of 11 countries and the Bank for International Settlements extended a credit of £3,000 million on November 26 that confidence in the sterling revived. — Ed.]

Indo - German Investment Guarantee Agreement

By Our Special Correspondent

NEW DELHI:

DETAILS ARE now available of the Investment Guarantee Agreement concluded between India and the Federal Republic of Germany in October last. The agreement is applicable to all West German investments, including those from Land Berlin, made on or after October 15, 1964, provided they are approved and authorised under the four Indian laws, namely, the Capital Issues Control Act, the Foreign Exchange Regulations Act, the Industries (Development and Regulation) Act and the Indian Companies Act, and are covered by the Federal Republic's guarantees. It will also apply to German investments made or approved between January 1, 1960, and October 15, 1964, in respect of which the Government of the Federal Republic of Germany has issued or will issue a guarantee to cover non-commercial risks. If the Government of India thinks it necessary to modify the provisions regarding authorisation of foreign investments, such modifications will be communicated to the German Government and shall govern German investments from the day they are given effect to.

The agreement provides that:

- 1(a) German investors shall in matters related to their investments not be subject to treatment less favourable than that accorded to national or other foreign investors in similar circumstances.
- (b) German investors shall be permitted after payment of taxes to transfer to the Federal Republic of Germany profits, interests, dividends and royalties derived from their investments as well as repayments of loans.
- (c) In the event of total or partial liquidation of a German investment in India, the proceeds of such liquidation may be transferred without undue delay or in such manner as may have been laid down in the document of approval or consent before the investment was made.
- (d) The Government of India does not intend, as a rule, to nationalize or expropriate approved foreign investments. Any decision to nationalize or expropriate a German investment or part of it taken by the Government of India shall be based on practical considerations and be taken in the national interest. In the event of a German investor being directly or indirectly deprived of his investment by nationalisation or expropriation, the Government of India shall pay fair and equitable compensation and shall permit its effective transfer without undue delay.
- (e) The rate of exchange for transfers under the foregoing sub-paragraphs shall be the rate for current transactions within the meaning of the provisions of the International Monetary Fund.
- (f) The Government of India will grant, in accordance with its general policy, the necessary permits to German nationals whose training or experience is specially required by an investment and who desire to enter and stay in India to carry on activities related to such investment except in so far as reasons of public order, security, public health or morality warrant otherwise.
2. If the Federal Republic of Germany has given a guarantee for an investment, and if any right or title of

the investor has by virtue of law or legal transaction been transferred to the Federal Republic of Germany in accordance with the guarantee arrangements, the Government of India will recognize the transfer of any right or title of such investor to the Federal Republic of Germany and the subrogation, by virtue of law or legal transaction, of the Federal Republic of Germany to any such right or title.

- 3(a) In the event of disputes concerning the interpretation or application of this agreement, the Government of India and the Government of the Federal Republic of Germany shall enter into consultations with a view to settling the disputes to mutual satisfaction.
- (b) If the two Governments do not succeed in settling such a dispute by agreement within a reasonable period of time, it may be referred by either Government for final and binding determination to an arbitral tribunal, provided the dispute refers to a matter or question in respect of which the Federal Republic of Germany has or had assumed a guarantee.
- (c) The arbitral tribunal shall comprise three arbitrators, one arbitrator to be named by each Government and the third to be agreed upon by the two arbitrators so chosen, provided such third arbitrator shall not be a national of either country. Each Government shall designate an arbitrator within two months of the date of delivery by either Government to the other Government of a diplomatic request for arbitration of dispute. The third arbitrator shall be agreed upon within two months. If any of the arbitrators is not designated or agreed upon within the time limits indicated, either Government may request the President of the International Court of Justice to make the necessary appointment or appointments by choosing the arbitrator or arbitrators. The arbitrators shall base their award on Article 38 of the Statute of the International Court of Justice.
- 4(a) The Government of India reserves the right to revoke or modify this agreement after a period of notice of six months. In such an event, however, the provisions of paragraphs 1 to 3 of this agreement, along with the authorisation provisions applicable at the time of approval of the investment concerned, shall continue to apply to investments made during the period of validity of this agreement for a period of five years after its expiry or 15 years after the date of any such investment, whichever is longer.
- (b) The Government of India has taken note that the Government of the Federal Republic of Germany regards this understanding as provisional and may make proposals for its amendment, particularly in the event of the conclusion of a multi-lateral convention on protection of investments or of a bilateral agreement.
- 5(a) Nothing in the agreement shall prevent the Government of India from imposing temporary restrictions on transfers referred to in para 1 above in exceptional circumstances when a transfer without undue delay would result in serious strain on India's monetary reserves taking into account India's total transfer commitments and balance of payments situation.

- (b) In such exceptional circumstances the amounts to be transferred shall be promptly determined in Deutsche Mark at the then prevailing rate of exchange (sub-paragraph c of paragraph 1 of the agreement) and the actual transfer of either shall be permitted to be made in equal annual instalments spread over as few years as possible but not exceeding one year in the case of sub-paragraph (b) of paragraph 1 of the agreement, three years in the case of sub-paragraph (d) of paragraph 1 and six years in the case of sub-paragraph (c) of paragraph 1.
- (c) If and when any restrictions of the type referred to in sub-paragraphs (a) and (b) of this paragraph are imposed, the two Governments shall, upon request of either Government, enter into consultations with a view to settling the matter to mutual satisfaction.
6. If circumstances so warrant, it shall be open to the two Governments to consult each other with a view to extending the time limits set out in sub-paragraphs (a) and (b) of paragraph 5 of the agreement.
7. With reference to sub-paragraph (b) of paragraph 3, arbitration shall cover the whole disputed amount irrespective of the quantum of liability of the Federal Republic of Germany to pay compensation under its guarantee.

★★

The Union Minister for Petroleum and Chemicals, Mr. Humayun Kabir, told the Informal Consultative Committee of Parliament last week that the question of expansion of private sector refineries would be considered only in the latter half of the fourth Plan period. The country would have by 1968-69 about 22.5 million tonnes refining capacity against an estimated demand of about 25 million tonnes of petroleum products in 1970-71. The private sector's share in the 22.5 million tonnes capacity likely to be established by 1968-69 would be about 8 million tonnes. The remaining 14.5 million tonnes capacity would be in the public sector. In the private sector, the four refineries of Burmah-Shell, Esso, Caltex and Assam Oil were currently working to a throughput of 3.75 million tonnes, 2.5 million tonnes, 1.05 million tonnes and 0.5 million tonnes, respectively. In the public sector, the Nunmati refinery was working to a capacity of 0.75 million tonnes and the first one million tonnes unit of the Barauni refinery had gone on stream in July last. The second one million tonnes unit of the Barauni refinery is expected to be commissioned by March next. The Koyali refinery would start production towards the end of 1965. These three refineries were envisaged to be expanded to one million tonnes, 3 million tonnes and 3 million tonnes, respectively. The Cochin refinery, having a capacity of 2.5 million tonnes, would also go on stream towards the end of 1965. Its capacity would be raised to 3/3.5 million tonnes by 1968. Two more refineries, one at Madras and the other at Haldia, each with a capacity of 2.5 million tonnes were expected to be commissioned in 1967 and 1968. Another refinery of 2.5 million tonnes capacity was proposed to be set up in North-West India towards 1969, but a definite decision in this regard had been deferred for the present.

The Minister felt that with the raising of the total oil refining capacity in the country to 25 million tonnes, only very marginal imports of finished oil products would be required.

Mr. Kabir indicated that decision on foreign collaboration for setting up the Koyali petro-chemicals complex was expected to be taken by March-end next year. The Union Government had received a proposal jointly from the Imperial Chemical Industries of the United Kingdom and Phillips of the United States. Two or three more proposals were expected to be received by February. (The ICI-Phillips proposal, it is under-

stood, envisages 49 per cent minority participation by the Union Government and 51 per cent majority participation by the two foreign collaborators).

The final picture of the petro-chemical industries to be set up in the country during the fourth Plan period, Mr. Kabir stated, was expected to emerge in the Middle of the next year. The Planning Group's estimates of Rs. 360 crores and Rs. 200 crores investment on the schemes to produce petro-chemical intermediates and fabrication of these intermediates into end-products, respectively, the Minister added, might undergo some changes during the revision of the Plan.

Referring to synthetic rubber manufacture, Mr. Kabir assured the Consultative Committee that production of synthetic rubber would be undertaken only to fill the gap between the demand for and supply of rubber after ensuring full off-take of the indigenous natural rubber.

The Trombay fertilizer factory, the Minister indicated, was expected to go into production any time now. The Neyveli unit would be commissioned in 1965.

★★

The US Government has extended three more loans for an aggregate amount of \$60.3 million (Rs. 28.7 crores) to India for the development of industries, transport and power generation. Agreements on these credits were signed here this Monday.

The first loan is for \$50 million (Rs. 23.8 crores). It can be utilised for financing imports by India of a broad variety of commodities such as fertilisers, steel, lubricants, machinery and machinery parts, sulphur, rubber, tyre cord, carbon black, caustic soda, insecticides, chemicals and a wide range of components required for the maintenance of the existing facilities as well as their expansion in a bid to step up both agricultural and industrial production. The Government of India will be free to set the amounts of imports within these broad categories according to the needs of the economy. With this loan the total non-project assistance extended by the United States for India's third Plan comes to \$835 million (Rs. 398 crores).

The second loan is for a sum of \$7.2 million (Rs. 3.4 crores). This is to be utilised for acquiring from the United States 25 broad gauge diesel locomotives of 2,600 H.P. each. This is the sixth loan extended by the United States for dieselisation of Indian Railways. The previous five loans provided for the purchase of 299 diesel locomotives. Under the third Plan, Indian Railways have to commission into operation 407 broad gauge diesel locomotives. This programme will be fulfilled by the production of the remainder 83 locomotives at the Varanasi factory which has also been established with assistance from the United States. The 25 diesel locomotives to be imported under this week's loan agreement will be used on the Manmad-Dhond and Dhond — Sholapur — Wadi sections of the Central Railway.

The third loan, amounting to \$3.1 million (Rs. 1.5 crores) will finance procurement and installation of the eighth generator of 89,100 kW. capacity at the Sharavathi Hydro-electric Project. The United States has already extended foreign exchange loans aggregating \$26.8 million and credits in Indian currency totalling Rs. 34.5 crores for meeting the major portion of the cost of this project.

All the three loans made available by the United States this week are to be routed through the US Agency for International Development. They will be repayable in dollars over a period of 40 years, including a 10-year grace period. The loans carry interest at the rate of three-quarters of one per cent per annum during the grace period and 2 per cent per annum for the remaining thirty years.

★★

The Industrial Credit and Investment Corporation of India

December 4, 1964

and the National Small Industries Corporation have been granted fresh credits of DM 10 million and DM 5 million, respectively, by the German Bank for Development, Kreditanstalt für Wiederaufbau. The guarantee agreements in respect of these loans were signed between the Government of India and KfW last week.

Including the two credits extended last week, the German Development Bank has so far made available to India DM 95 million — DM 35 million to the ICICI, DM 20 million to the NSIC and DM 40 million to the Industrial Finance Corporation of India. Negotiations are further going on with KfW for another DM 25 million credit for the three Indian corporations.

Following the extension of DM 5 million credit by KfW last week, the National Small Industries Corporation has decided to make available on hire-purchase to small industrialists imported machines and equipment to the tune of Rs. 60 lakhs.

Besides locating 22 coal seams, some of superior quality with coking property, in the Ramgarh area, the Indian Bureau of Mines has recently discovered 23 high grade coal seams of having a thickness of over four feet in the southern part of the Pundi block in the West Bokaro coalfield in Bihar. The Pundi seams are estimated to contain nearly 800 million tonnes of coal. A substantial portion of these deposits is of grade I and grade II qualities of coking coal. A sizable fraction of this tonnage is quarriable. On proper beneficiation, a considerable quantity of coal from the Pundi block can be used for metallurgical purposes.

★★

A 10-member delegation of the Federation of Indian Chambers of Commerce and Industry met the Prime Minister last week and discussed with him the critical food situation in the country. Following these talks, the FICCI President and leader of the delegation, Mr. K. P. Goenka, called upon the foodgrain dealers all over the country to co-operate with the Government wholeheartedly.

In a statement issued to the Press, Mr. Goenka says that the Prime Minister, on the basis of the reports received by him, carried the impression that the foodgrain traders had not so far fully co-operated with the authorities concerned in facing the critical food situation. At the same time, he was not unmindful of the wide possibilities for fruitful co-operation between the trade and the Government.

New Arithmetic for Liquidity Ratio

From Our Correspondent

BOMBAY :

ALTHOUGH IT still appears to be somewhat grudging, there has been a welcome shift in the Reserve Bank's credit policy this week. On the same day that the British Government put up its bank rate from 5 per cent to 7 per cent i.e. November 23, 1964, the Reserve Bank also announced a slight modification in its formula relating to the computation of net liquidity ratio. It is because of this coincidence, perhaps, that the modification has not received the attention that it warrants. It could not be that the Reserve Bank took this decision with a prior knowledge of the increase in the British bank rate, but it is entitled to credit even if it were so. For the position would have become intolerable, especially for the Exchange Banks, as, with effect from December 1 these banks are not allowed to transfer funds beyond Rs. 20 lakhs each from London. The increase in the bank rate of the UK has made it less worthwhile for them even to raise this small sum, pointing

to the inevitable prospect of acute stringency in the money market during the whole of the current busy season.

Mr. Goenka has expressed the view that stagnancy in food production as against the growing demand has been responsible for a spurt in prices; imbalances have developed out of proportion to actual shortage owing to various Government regulations on the movement of foodgrains as between the States or even within a single State. Full co-operation between the Government and the trade is urgently required to overcome the difficulties. Appreciating the caution exercised by the authorities in the matter of introducing rationing, Mr. Goenka has appealed that the trading community and the authorities should shed distrust of each other and work in unison in the cause of common good. He has welcomed the efforts of the Government to build up buffer stocks of wheat, rice and even maize from domestic supplies and imports.

As suggested by the Prime Minister, the Federation, Mr. Goenka says, will soon appoint committees in different States to function as liaison between the local administration and traders.

★★

The Union Ministry of Works and Housing has allotted Rs. 100 lakhs to four State Governments for advancing loans under different Housing Schemes during the current year. This amount, which has been allotted out of LIC funds, brings the total amount advanced by the Life Insurance Corporation for house-building purposes during the current Plan so far to Rs. 44.50 crores. The State-wise allocation of the latest amount is: Madhya Pradesh — Rs. 35 lakhs; Orissa — Rs. 30 lakhs; Bihar — Rs. 25 lakhs; and Punjab — Rs. 10 lakhs.

It has been decided that the amount allocated will, as usual, be in the nature of a package allocation, the States being free to utilise the allocated funds for individual Housing Schemes according to their requirements. It has also been decided that, as in the case of the earlier allocations, the loans advanced by the Corporation to the State Governments will carry interest at the rate of 5½ per cent per annum. The loans are to be paid back in annual equated instalments of principal and interest in all cases. The first equated instalments will be repayable by the four States after a year of their drawing the allocations.

The State Governments have been asked to draw their allocated funds by December 20, this year. Funds not drawn by any State by this date will be diverted to other States.

Against this background, the modification in the net liquidity ratio will be seen in its right perspective. The effect of the modification is to let the banks have some more manoeuvrability. Whether this has stemmed from a felt desire on the part of the Reserve Bank authorities, or only followed complaints from local authorities, port Trusts and other bodies that, latterly, banks had not only ceased to subscribe as freely as before to their bonds and debentures but also begun to unload them, is bound to be debated. At times, one is at a loss to follow the Reserve Bank's credit policy which, so often, seems to be contradictory. On the one hand, it talks of making available plenty of medium-term credit to industries through the banking system, while, on the other, it goes on applying brakes such as a stiff net liquidity ratio. Even the small mercy proposed now has been somewhat diluted by seeking to ex-

clude borrowings from the Industrial Development Bank which have lately begun to assume proportions, the cumulative total of this figure at present being around Rs. 35 crores.

Hitherto "approved securities" were not to be included under liquid assets for calculating the net liquidity ratio; only investments in Central and State Governments securities, less borrowings from the Reserve Bank and the State Bank of India, were taken into account. As from December 4, 1964, however, while "approved securities" are also to be included, along with Central and State Government securities, borrowings from the Industrial Development Bank have to be deducted, along with borrowings from the Reserve Bank of India, in order to arrive at the net liquidity ratio. Whatever the theoretical justification for this the fact remains that it has taken away the grace of an otherwise good gesture.

★★

The raising of the British bank rate from 5 to 7 per cent came as a complete surprise as much to the stock markets here as to those in the UK. Although opinion in financial circles in the UK seemed to regard the measures taken by the Labour Government to improve the UK's fast deteriorating balance of payments position as barely adequate, they did not — nor could they be expected to — bargain for this stiff increase to a crisis level in the bank rate. As a matter of fact, while an increase in bank rate had almost been ruled out because of the known opposition of labour to higher interest rates, there was some talk in the UK, during the previous week-end, of persistent suggestions from European countries for a slight devaluation of the pound. Indeed, some of them are even now wanting the UK to devalue the pound. But public opinion in the UK, irrespective of political affiliations, as also in the USA, is strongly opposed to this, and perhaps rightly so. The benefits of devaluation of a given currency to the country concerned are available only so long as the other currencies remain as they are, but after what followed the last devaluation of the pound, even this weapon, it is now recognised, has its limitations. Besides, it is known that world monetary authorities also do not view with favour devaluation of such important reserve currencies as the dollar and the pound, except perhaps in extreme emergencies. In the circumstances, the Labour Government, regardless of the fact that it would amount to eating its own words, chose to raise the bank rate. And, when it did so, it could not but raise the rate stiffly, both to ensure effective results and to demonstrate the new Government's earnestness to outsiders in an unmistakable manner. The drastic action is not so much a reflection of the degree of deterioration in Britain's economic conditions as of the relentless pressure from the European countries, EEC as well as EFTA in the wake of the 15 per cent surcharge on imports. How far all the measures taken by the Labour Government in the UK since it assumed office will prove effective remains to be seen. Meanwhile, the British decision to hoist the bank rate has been followed by increases in bank rates by the USA and Canada.

Financial circles here are currently debating as to what effects the British decision will have on India and whether this country also will be obliged to follow suit. While there is full appreciation of Britain's difficulties, there is no attempt at minimising the adverse effects of the higher bank rate in the UK on this country. In the first place, it will increase the cost of our borrowings from Britain. Future loans and terms of new UK collaborations will be on stiffer terms. Secondly, it will force the Exchange Banks to rely more on the Indian money market and thus add to the pressure of demand for money, particularly during this busy season. Even otherwise, there was this fear, thanks to the new restriction — with effect from December 1 — on Exchange Banks not to transfer funds in excess of Rs. 20 lakhs per bank. Thirdly, the higher UK bank rate will depress the demand for our exports, especially

of manufactured goods. But there would appear to be a surprising degree of optimism, among both bankers and businessmen, that the crisis rate of 7 per cent will not be allowed to last very long in the UK and that the bank rate in India need not necessarily be stepped up now.

★★

A public debate has been going on in Bombay currently whether there is an acute shortage of caustic soda in the country or not. Consumer interests, in particular those who have been hard put to it to get their supplies in required quantities and at prices that they regard as reasonable, seem so exasperated, to judge from the statements and press conferences of Mr. Babubhai M. Chindai (of Baroda Rayon), that they ask for additional capacity to be licensed, more imports to be arranged and a rational system of distribution (or, to put it plainly, control) to be introduced. The burden of Mr. Babubhai's complaint is that, after decontrol, not only have prices been raised by a number of manufacturers but regular supplies are hard to get and that it is a very unsatisfactory position wherein consumer industries, such as paper, rayon, staple fibre, textiles, soap, vanaspati, petroleum-refining and aluminium, are not sure of continuous availability of an essential raw material and have to pay exorbitant prices in order to obtain supplies and keep their plants (some of them with continuous processes too) going. "If the present state of affairs is to continue", he says, "no wonder that many persons would welcome a return to a position of control". In fact, according to him, there were many who felt, even at the time when 16 items were decontrolled in March, 1964, that "the decision for decontrolling the prices of caustic soda — a tariff-protected industry — which was in acute short supply in the context of the increasing demand therefor, was not a wise one."

Varying Estimates

The internal demand for caustic soda in 1961 was estimated by the Tariff Commission at 159,000 tons. By the end of 1964-65, this is expected to go up to roughly 4,00,000 tons, according to Mr. Babubhai. As against this, in the 12-month period ended May, 1964, he estimates, the actual indigenous production was only 1,68,349 tons, which was supplemented by imports to the extent of 65,000 tons valued at about Rs. 29,000,000. So far there would appear to be no serious differences, but when it comes to monthly average production, the public is faced with two estimates. One, claimed to be official, puts the production at an average of 14,600 tonnes for the first six months of 1964, as against 11,600 tonnes for the corresponding half-year of 1963, which establishes that since decontrol production has steadily gone up. The second, advanced by Mr. Babubhai, claims to give the actual production for March, April and May, 1964 and puts them at 15,353 tonnes, 14,724 tonnes and 13,977 tonnes, respectively, as against a monthly installed capacity of 16,849 tons. 'Prima facie', the production figures for the three months mentioned by Mr. Babubhai show a steady decline, but, overall, they work out to an average monthly output figure of 14,685 tonnes, which is, in fact, higher than the official average monthly production figure for the first half of 1964 of 14,600 tonnes.

Whatever conclusion one may want to draw, these figures conclusively establish that the current production is very much below the level of the existing demand and it is common ground, among producers and consumers alike, that there is shortage of caustic soda capacity in the country. Mr. Babubhai is on firm ground, therefore, when he pleads for an expansion of the production capacity in the country. From what he says, there would appear to be differences between the existing manufacturers and the new aspirants who wish to enter the field as to who should do it. Since there is scope for considerable expansion, there seems to be no justification for either wanting to have the monopoly. In the interests of

from the existing manufacturers their plans for expansion, if any, as also their ability to finance and implement them. Thereafter, the authorities could very well determine the additional available capacity and entrust it to such new entrants as are found to be in a position to deliver the goods. It is evident that the Alkali Manufacturers' Association, the members of which account for 93 per cent (leaving aside producers who consume their own products and account for a further 5 per

cent) of the production of caustic soda in the country, will not oppose any such rational approach. The Association has also called upon all industrial consumers to contact it in case of difficulty and offered its good offices in overcoming them. Since, on his own admission, Mr. Babubhai's complaints do not concern members of the Association, he should welcome the move of the Association to bring units that are not members to enter its fold.

Tea Industry Awaits Concessions

From Our Correspondent

CALCUTTA:

THE UNION Minister for Commerce, Mr. Manubhai Shah's statement in Parliament that the tea industry would shortly get some concessions and that further substantial relief would be available as a result of the high-powered committee's findings (the committee is currently investigating the financial problems of the tea industry) has been welcomed by tea interests here, although it remains to be seen what concessions the industry will shortly get. A sore point with the gardens at the moment is the second interim wage award which has been recently granted for the workers. The industry is also worried that the recommendations of the Bonus Commission if applied in the form in which they have been made would further aggravate its financial difficulties. It certainly will increase their difficulties if a minimum bonus of Rs. 40 per worker is granted for gardens which have been losing year after year. Under the former bonus formula voluntarily introduced by the gardens with the consent of tea labour, the bonus given to workers was a fixed percentage of the net profit. That was satisfactory enough, judging at least from relative industrial peace in the industry after the voluntary bonus agreement was implemented. It would help the industry enormously if another such agreement were negotiated, but that obviously would not be possible. A temporary compromise has been reached with the labour unions to pay bonus at the rate of Rs. 20 per worker in the case of gardens which are not making any profit, Rs. 25 in the case of those making small or inadequate profits and Rs. 40 for those making good profits. It is understood that the units in the first two categories constitute about 75 per cent of the total gardens in the industry. But this is only temporary, and sooner or later, labour unions are likely to put pressure on the estates to pay the full minimum of Rs. 40 once they discover that the case has sympathetic backers in New Delhi or elsewhere.

Unsatisfactory Condition

That seventy-five per cent of the tea gardens are either making small profits or suffering losses year after year, shows the unsatisfactory nature of the industry's economic condition. In the circumstances, the second interim wage increase — which combined with the first and is reported to have exceeded the actual rise in the cost of living between the time the first interim award was given and now — is bound to cause a sense of grievance in the managements. If the final award adds to the burden more heavily, which in all likelihood it will, India's tea industry will indeed find it hard to maintain its hold in overseas markets. After all, the industry is essentially agricultural in character and is necessarily labour-intensive. As an export industry, it is highly competitive. Therefore, labour wages must bear a reasonable relation to its capacity to pay. For the same reasons, taxation of the industry must be based on rational lines. At the moment, it suffers from what is ordered on rational lines. At the moment, it suffers from what is a leading planter in Assam has described as "a multiplicity of taxes". There is an excise duty on production, State agricultural income tax and Central income tax on profits, and octroi and carriage taxes (wherever they are levied) at points of

distribution. The States concerned seem to be vying with one another in taxing tea. Assam, following Kerala, has raised its rates of agricultural income tax, well in excess of the rates at which the Central income tax is levied. The land tax too has been doubled by the State Government. Mysore and West Bengal propose to follow Assam's example. And if the latter has its way it would like to levy a permanent octroi on tea, which West Bengal (in spite of the Supreme Court's judgment) seems to have succeeded in doing. The octroi or the carriage tax are definitely bad taxes, and the States should not be allowed to levy them on a commodity like tea which provides so much to foreign exchange every year. In 1962-63 it earned Rs. 128 crores; in 1963-64 it earned Rs. 121 crores as the crop during the year was a short one. During the current year, India is likely to have a bumper tea crop, and every effort should be made to promote its exports to the maximum extent possible. The States of course must have their agricultural income tax, but it must be uniform for all and should not be predatory as Assam and Kerala are bent on making.

The industry is pleased with the special treatment given to it under the Central Budget for 1964-65, but it would like the excise levy to be reduced, even if the saving that may result from any reduction is earmarked specifically for further development and expansion. It would also like New Delhi to come to an early decision on the industry's long-standing case for treating all expenditure on new planting and replanting as a revenue item rather than as a capital charge which is the current fiscal practice. This is illogical as no depreciation is allowed on tea bushes.

★★

Another Central Minister, Mr. S. K. Patil, has made a statement in Parliament on a circular railway for Calcutta, which has pleased the people in this city as well as the Government of West Bengal. The latter has been repeatedly pressing the Centre for an early decision on the project, which has been hanging fire for a long time. Meanwhile, traffic conditions in Calcutta continue to grow steadily worse. The State Government recently submitted a detailed memorandum to the Railway Minister asking for an urgent consideration of the circular railway scheme so that lakhs of people living in several suburbs would have direct rail access to their places of work in the heart of the city or in the dock area. This would, incidentally, provide some relief from the acute congestion and housing problem in Calcutta. The Government's case was considerably reinforced by the numerous questions (leading questions mostly) put in the Lok Sabha by several members from West Bengal, and the Railway Minister could have hardly avoided stating that a decision on the circular railway scheme cannot be long delayed. The only snag, according to him, is not the relatively large investment of Rs. 50 crores required, but the annual loss of about Rs. 5 crores which would be incurred by operating the proposed circular railway on the existing tariff for passenger traffic which operates for the railways as a whole. But Mr. Patil did not go into the traffic potential. He broadly agreed with Mrs. Renuka Ray that the losses would be reduced as the traffic increased. Perhaps this question of a loss has been made an excuse for sitting over a project re-

presenting an urgent need. In the opinion of local experts, the loss, if any, would be small initially, but as time went on, the railways would be able to earn a reasonable margin of profit.

Another great need of this populous city is an adequate water supply system. This is a question in which, fortunately, the World Bank has taken a close interest. But the culprit in the present instance is the State Government, not New Delhi. The former has not been able to complete the "necessary political, legal, financial and administrative measures" for the establishment of a Metropolitan Authority which would look after the city's sewerage, drainage and water supply problems, control the future land use in Calcutta metropolitan district covering an area of 450 square miles and take up schemes for the improvement and clearance of the slums in the area. Under the terms of an agreement it has entered into with the United Nations Special Fund (which has made a grant of about Rs. 14 lakhs for the preparation by the WHO of a master plan for water supply, sewerage and drainage services in Greater Calcutta), the State Government was to take the measures by 1963. Later the time limit was extended until the end of 1964, but this year is nearing its end, and the State Government is nowhere near fulfilling its commitment. However, the Chief Minister, Mr. P. C. Sen, is said to be determined to do his part as soon as possible. During the next session of the Legislature, which is likely to meet some time early next year, the Government will introduce three Bills prepared for it by the Calcutta Metropolitan Planning Organisation. The Bills in question seek to establish a Metropolitan Water Supply, Sewerage and Drainage Authority, control the future use of land in the metropolitan district and improve and clear the slums. It may be recalled that some World Bank experts were associated with the preparation of these Bills, and the World Bank's regional representative, Mr. Peter Wright, who is due to come to Calcutta early next month, will almost certainly raise questions about the State Government's failure to do anything about what it had clearly undertaken to do.

★ ★
The West Bengal Planning Board which last week considered the Government's fourth Plan proposals for industrial and agricultural development and the development of social overheads and capital, broadly agreed that the outlay in the next five-year period should be nearly double (Rs. 600 crores) that of the third Plan of the State, but it had differences with the

Has Sugar Turned the Corner?

From Our Correspondent

MADRAS:

THE UNEXPECTED developments in the food situation in the past few months took away attention from sugar which was seriously in short supply in the closing months of the last season. Actually, it was feared for a time that the requirements of the festive season could not be met and in the absence of a short increase in output in October and November the situation could not be easily gone through. Somehow, with the virtual rationing of available stocks the most difficult period of the 1963-64 season has been got over and it is now expected that the output during the current season will increase significantly. The incentive announced by the Food Ministry a few weeks back will no doubt be helpful to the units in Uttar Pradesh and Bihar for raising production as the rebate in excise duty to the extent of 50 per cent would offset the loss sustained by the factories in the shape of a lower recovery of sugar. In the South, the various units will not start crushing until after the rains have ceased. The main season usually begins early in December. All the important producers are

Government over the order of priorities. It wants top priorities for agriculture and power, with industrial development coming closely after, but it would like the proposed expenditure on education and social services somewhat scaled down. Most members pointed out that one of the basic reasons for West Bengal falling behind Maharashtra and Madras was its difficult power problem. Power scarcity has been responsible for many a promising industrial project being postponed or even shelved. This cannot be allowed to hold up the State's industrial progress in face of growing urban unemployment with all its explosive consequences. Consequently, the Board has appointed a sub-committee to re-examine the question of priorities. It is understood that the sub-committee has already made some recommendations, and the Government is likely to avail itself of the opportunity of Mr. Asoka Mehta's presence in Calcutta in the first week of December, to discuss the fourth Plan proposals in detail to know his (and the Planning Commission's) reaction to the pattern of the outlay envisaged.

Power Problem

It is fairly certain that the State Government will stick to fourth Plan power target of a little over 2,000 MW at all costs. There is no other way of stimulating quicker industrial progress. What is particularly significant is that the business community in the State is anxious to expand its enterprise if adequate supply of power can be ensured. If the State Government encourages private enterprise as Maharashtra and Madras have done, there is no doubt that West Bengal will see many more industrial ventures during the fourth Plan than what the State Government with its limited resources can promote or accomplish. But this is only a matter of policy or emphasis. The State would require more power in any case. The State Electricity Board, which is the main instrument of power expansion in West Bengal, as similar bodies are in other States, is pursuing all projects for power expansion during the current Plan. It is also anxious to go ahead with the Santaldih project for a 1,000 MW super thermal power station, but certain matters including the phasing of the project are still to be cleared with the Central authorities with the result that not much preliminary work has been done. The Board however is taking up a number of smaller schemes to augment its generating capacity and to extend its grid and sub-stations. It has just successfully floated a loan of Rs. 1.25 crores — the loan was in fact over-subscribed — to spend on its expansion schemes.

confident of being able to maintain output at a high level as ample cane supplies will be available.

It is, however, felt that the units in the South will not benefit to a great extent by any scheme relating to a rebate in excise duty as new records have been established in some cases in 1963-64. All the same, it is pointed out that there should be a sort of bonus for boosting production consistently besides offering a straight rebate in respect of production in the summer months when there is a loss in recovery on account of drage and late crushing. Since the performance of the industry in this part of the country has been consistently satisfactory of working should be made more attractive and that licences for expansion of capacity should be freely issued wherever it was clear that adequate cane supplies were available or would be assured. The policy pursued so far in relation to the fixation of minimum prices of sugarcane has benefited only the cane growers leading to the anomalous position of sugar produced in this part of the country costing more than the product in Uttar Pradesh and Bihar even though the yield of cane

per acre is very much less in these States. This is due to the compulsion to fix prices on a basis which would be profitable for the cane growers in Uttar Pradesh and Bihar.

The anxiety to take advantage of the growing demand for sugar and utilise the existing facilities to better purpose have been responsible for the decision of a number of existing sugar factories to undertake expansion plans. Already, the Mysore Sugar Company is engaged in a modernisation and renovation programme of the existing unit. With the scheme to raise capacity the factory will be able to crush 3,000 tonnes of cane daily. The Party group, which is the largest single producer of sugar in Madras State, is also having ambitious plans of expansion.

The Chairman of Deccan Sugar and Abkhari Company Limited, Mr. H. V. R. Iengar, indicated, at the annual meeting of the company held recently, that it is proposed to raise the capacity of the Pugalur factory to 1,500 tonnes daily from 1,250 tonnes in order to participate in the development of the industry in the coming years. He also stated that the current thinking in the industry was in terms of an optimism unit of 2,000 tonnes daily as only then the high costs of construction of new factories can be easily absorbed and satisfactory profit margins earned. As the Pugalur factory is ideally situated in regard to cane availability, the ultimate objective is probably to raise the capacity of the unit to 2,000 tonnes daily. The first phase of expansion is limited to 1,500 tonnes daily because some time will be required for extending the area under cane. Also, it is necessary to find large financial resources immediately which would be difficult at a time when the capital market is depressed. The schemes for increasing the capacity of Pugalur to 1,250 tonnes from 800 tonnes have just been completed. It to 1,000 tonnes from 800 tonnes have just been completed. It is expected that the newly installed plant and machinery will be in operation at Pugalur right from the beginning of the main season this year and at Samalkot from January next. Besides, an expenditure for about Rs. 40 lakhs has already been incurred on renovation and rehabilitation of worn-out machinery at Samalkot. As it will be necessary to undertake a continuous process of modernisation in both the centres, apart from the expansion of the Pugalur unit, it is estimated that a total expenditure of around Rs. 90 lakhs will have to be incurred in the next few years. Other sugar units in this region may be expected to follow suit.

It will have to be examined in this context how the co-operative sugar factories are functioning. Some of them are reported to have a capacity of around 800 tonnes and even reported to have a capacity of around 800 tonnes and even in the existing facilities are not being utilised properly. As in many cases output can be considerably raised with the installation of balancing equipment, a committee should go into the whole question and make the necessary suggestions.

★ ★
The plastics industry is developing in a big way in the South and it is expected that the progress in the coming years will be striking as a large petro-chemical complex is likely to develop around the two refineries at Cochin and in Madras. The first good beginning has been made by East Anglia Plastics, which is constructing its factory for manufacturing cellulose acetate flakes based on industrial alcohol and linters which are available in plenty in that region. The output of this factory will be used for making cellulose acetate flakes in the factory, which is already working in Calcutta. Another company will also be undertaking the manufacture of the same product in its new factory which is proposed to be located at Mandya with the help of the main promoters, Mysore Sugar Company Limited. As the acetic acid required by the newly formed unit, Mysore Acetate and Chemicals Company Limited, is to be produced and supplied by Mysore Sugars Limited out of the alcohol produced in its distillery, the new factory will be

located alongside the existing distillery. It is also proposed to manufacture cellulose acetate which is required in large quantities by Hindustan Photo Film Manufacturing Company Limited, functioning at Ooty, not far away. In order to increase the output of alcohol, Mysore Sugars is undertaking a programme of expansion. The new unit will have the advantage of collaboration with well-known American and Swedish interests who, besides providing technical know-how, will also be participating in the paid-up capital. The company has approached the market for raising the required funds. Out of the issued capital of Rs. 2.25 crores, the Government of Mysore will take up equity shares for Rs. 50 lakhs, Mysore Sugars for Rs. 30 lakhs and the directors and their friends for Rs. 7 lakhs. The American collaborators will be allotted 58,500 equity shares for consideration other than cash in part payment of the cost of plant and machinery, know-how, designing etc. The Swedish interests will also be allotted 95,500 equity shares for consideration other than cash in payment of the cost of know-how, relevant blue prints, manuals etc. The balance of Rs. 70 lakhs has been offered for public subscription. This portion of the issue is underwritten by the Industrial Finance Corporation, Life Insurance Corporation and a number of banks.

Another company, Chemicals and Plastics India Limited, will also enter the market shortly for raising a part of the capital from the public. This company has been sponsored by the industrialists belonging to the India Cements Group. The factory will be located at Mettur, near Salem in Madras State, and the company has received a licence for manufacturing 6,000 tons of polyvinyl chloride annually and for fabricating 1,500 tons of finished products. The plant for this purpose will be located in Bombay as there is a large market for flexible and rigid polythene pipes and other finished goods. The cost

of the project is estimated at Rs. 3.38 crores and a technical collaboration agreement has been concluded with G.F. Goodrich Company of Akron, who are the world's largest producers of polyvinyl chloride. The factory is expected to be completed by the end of 1966. The site of the factory has been selected having regard to the easy availability of raw materials. Chlorine will be supplied by Mettur Chemicals whose new factory is now being constructed while industrial alcohol will be supplied by a refinery which is proposed to be constructed at Tiruchirappalli. Ample quantities of molasses are available in this region.

The foreign collaborators will be participating in the equity capital of the Indian company apart from agreeing to be allotted equity shares for the equivalent of \$350,000 which will be the initial payment for providing technical know-how and assistance for laying out and constructing the factories.

CHEMPLAST has been fortunate in concluding, with the help of the American collaborators, a loan agreement with the US Export-Import Bank for \$3.15 million which will be of great help in purchasing plant and machinery. A rupee loan out of the Cooley Funds for Rs. 32.61 lakhs will also be secured. These loans are usually given to those companies which are having collaboration agreements with American firms. The issued capital will be Rs. 1.5 crores consisting of Rs. 1.35 crores in equity shares and Rs. 15 lakhs in preference shares carrying interest at 9.5 per cent gross. The allotment of 34,425 equity shares will be made to G.F. Goodrich while the directors and their friends have agreed to take up shares to the value of Rs. 51.07 lakhs including Rs. 2.5 lakhs in preference shares. The balance of 49,500 equity shares and 12,500 preference shares have been offered for public subscription. The Madras Industrial Investment Corporation, Indian Overseas Bank and two leading broker firms of the City have agreed to underwrite this portion of the issue.

Kerala's Dilemma: Food or Cash Crops?

From Our Correspondent

TRIVANDRUM:

KERALA is said to be turning the corner in the food crisis, according to official spokesmen though scarcity conditions prevail throughout the State. The experience of the public is that rice is beyond reach, even at the black market prices, except for the handfuls that are doled out on the basis of informal ration cards, and through Fair Price Grain Shops to card holders. Formerly the toiler as well as the white collar worker could take his full meal of rice by approaching the small-scale blackmarketer in the town or village, but, now, he also cannot render any assistance.

People are thoroughly disgusted with the present system of rice distribution. The Co-operative Ration Stores have become the target of public criticism because of their inefficiency, irregularities and discourteous behaviour to the non-member consumers. Private ration shop owners are much better, it is stated. A widespread feeling exists that even during the all-round scarcity of war years, rationing system worked perfectly well, and there was equitable distribution of foodgrains. The present food scarcity has served as an eye opener to Keralites. The State is deficit in food to the extent of 50 per cent. For the rest, she has to depend on the goodwill and generosity of her surplus producing neighbours, especially Andhra Pradesh. Since the beginning of planning era, there has been a mad rush for introducing cash crops in place of paddy fields. In places where paddy was grown in plenty, the people have started cultivating rubber, coconuts, and other profitable cash crops. Thousands of acres where tapioca was grown have now become rubber estates. As the Land Reform Acts do not impose a strict ceiling on plantations, people have chosen to extend the area under rubber estates

and reduce the land under paddy fields. That brought down the output of rice in the State.

The peasants have, of late, become more disorderly, greedy, and non-co-operative, with the result that the owners of paddy fields are put to considerable losses. Strike threats and forceful removal of paddy by the peasants for their own needs have become common in many parts of Kerala under communist leadership. To teach the greedy peasants a lesson, many land-owners have converted their paddy fields into dry lands for the cultivation of cash crop. In the present circumstances, it is being increasingly felt that if Kerala went on producing more and more of cash crops so as to earn dollars for the Union Government, in the end the people in the State may have to starve. The largest dollar-earning area of India is not getting its rightful due from the Centre. The Centre has taken interest in Kerala's food problem only after maximum pressure was exerted at all levels. Kerala, it is now argued, should try to stand on its own legs by a large scale return to food crops because the foreign exchange earned for the country will not feed it.

Local leaders and newspapers have started thinking in terms of pressing for the Grow-More-Food-Campaign, as it was done in the days of World War II. Kerala cannot hope to attain self-sufficiency in food but she can produce enough to reduce her dependence on the goodwill of the neighbouring States. The cost of letting Kerala starve will have to be paid by losing heavily on India's foreign exchange earnings since the local opinion is now strongly in favour of going back to rice, tapioca, and other cereals, instead of rubber, cardamom, pepper etc. If this trend persists, many of the cash crops may disappear from Kerala.

Goodlass NEROLAC Paints

ONE STEP AHEAD OF PROGRESS

Paints and surface coatings must keep pace with the changing and unceasing demands of industry. We at Goodlass Nerolac welcome the challenge of remaining ahead in technology, quality and production... of meeting these ever widening demands. We accept the challenge in a characteristic way by adopting new methods of manufacture... by conducting constant research into new qualities... by giving you today the paints for tomorrow's needs.

The moving finger writes

I AM being frequently amused and entertained by my newspapers these days. I particularly enjoyed the unconscious humour in the opening sentence of a report in "The Hindustan Times" of November 26 by its Special Correspondent on the passage of the Food Corporations Bill. The sentence read: "The Food Minister's Bill to set up Food Corporations at the Centre and in the States today received the Lok Sabha's unanimous approval after Members had voiced misgivings about the nature and scope of their functions." In other words, even if the Lok Sabha had not been sold a pup it has at least been compelled to buy a pig in a poke. The Food and Agriculture Minister has certainly given no clear idea of the machinery through which the Central Food Corporation would function. It is, of course, reassuring that he has given the Chairmanship to a leading and spectacularly successful practical banker. But however talented Mr. T. A. Patel may be, he cannot manage to work the Corporation on business lines unless he can avoid being encumbered with a bureaucratic machinery.

I hear that the intention is to recruit personnel for the Corporation from the ranks of officials in certain existing departments of Central or State Governments (such as the Department of Supply at the Centre or Civil Supplies in the States), or from public sector undertakings, such as the STC. I am not at all sure that this would be the best way of managing the Corporation. It would certainly be more sensible to organize the buying or the selling on behalf of the Corporation through a network of private traders who could act as the licensed agents of the Corporation. The Corporation's own salaried staff should be as small as possible. I am happy to note that Mr. C. Subramaniam has disavowed ideological commitments in this matter. It should, therefore, be all the easier for him to honour and obey the commercial principle, at least as far as possible, in the working of the State trading body in question. This would be sensible too since the Food Corporation is bound to prove a costly failure unless its working expenses as well as the funds locked up in its capital are kept low. The Minister for Food and Agriculture asserted in the Lok Sabha that the only reasonable criticism which could be made of the Food Corporation project was that it should have been launched at least five years ago. I hope it will not fall to his lot to hear it said five years hence, (or sooner), in the Lok Sabha and elsewhere, that all that was wrong with the Food Corporation was that it had ever been set up. "The Hindustan Times" was merely being technical when it spoke of the "unanimous approval" of the Food Corporations Bill by the Lok Sabha.

★★

Then, there was the editorial in "The Statesman" in its issue of November 26, advising the people of Pakistan that since they should obviously be grateful for the bread of stability which the Army take-over of 1958 had given them, they might possibly be erring by clamouring now for the jam of democracy. In fairness to "The Statesman", however, it must be said that the editorial is protesting more on the ground that this demand for democracy is inopportune than on the plea that it is essentially unreasonable. "The Statesman" concedes that "there is little hope of gaining popular acceptance for the monolithic State after which F.M. Ayub hankers" and proceeds to reassure the people of Pakistan that the Field Marshal

"will no doubt try to absorb this change in temper by appropriate constitutional reforms after he is returned to power". It must indeed be a great morale-booster for leader-writers in newspapers to be thus taken into confidence by the high and the mighty, Presidents and Field Marshals. Those who are less endowed with opportunities of access to the minds of the great (which, incidentally, need not always be great minds) are however likely to be more impressed with the fact that, whatever the ultimate intentions of the President of Pakistan may be with regard to the sharing of his powers with the people of that country, his current election strategy betrays no thought but that of holding on to what he has. "The Statesman" seems to regret the fact that the Field Marshal is being compelled to work hard for his victory, thanks to the popular upsurge for Miss Jinnah. Surely the sympathy is misplaced. If it is true that the labourer is worthy of his hire, the converse too must be valid. In any case, "The Statesman" itself has recorded "a conspicuous example" of the Field Marshal's earnest electioneering — the publication by the ruling party of a full-page advertisement in "Dawn" quoting Indian editorial comment to prove that India would hate to see Pakistan strong under a martial Ayub. I enthusiastically endorse "The Statesman" opinion that this is "crude" tactics. It is open, after all, to the rival candidate to seek ammunition in "The Statesman" editorial columns for the counterblast that there is at least a section of the Indian Press which likes to see Ayub Khan President again because it believes that he is the best President of Pakistan that India can have.

★★

The Treasury Benches showed unusual wisdom last week when Mr. B. R. Bhagat refused to be drawn into a speculative discussion of the extent of unaccounted money, on being invited in Parliament to produce an estimate. Unfortunately, there has already been too much kite-flying in this matter and fantastic figures have been freely played with. Rather ironically, but quite appropriately, it was the Chairman of the Direct Taxes Board, however, who recently happened to expose the absurdity of some of the estimates. Mr. J. B. Singh disclosed that about 55 searches for unaccounted money had only yielded in all about Rs. 92 lakhs, of which a third was recovered from film stars. This would show that about 50 business men, suspected of having unaccounted money, were found to hold among themselves only about Rs. 60 lakhs of what is alleged to be unaccounted money. Surely this gives the lie direct to wild estimates of many thousand crores of rupees of unaccounted money being in the possession of a few flocks of black sheep within the fold of the business community. The truth, perhaps, is that either the unaccounted money is so widely distributed in relatively small amounts among a very large number of business men that to go after it in any serious way would be an impossible adventure or the various high estimates of unaccounted money to which we have been treated from time to time by persons of varying degrees of responsibility are greatly exaggerated. The Government has been trying to unearth hoarded food stocks and it has been attempting to unearth unaccounted money. In neither case has much been found. I wish an attempt would now be made to unearth some talent for governing in the ruling party.

Trade Winds

IMPROVED SEEDS FOR HIGHER YIELD

A LARGE 500-acre model seed centre, i.e., a farm for research, production, multiplication, processing and distribution of improved quality seeds, especially of wheat, will soon be established in Punjab by the Birla Institute of Scientific Research, Calcutta, with the co-operation and assistance from the U.S.A.I.D. and the Rockefeller Foundation. The broad aspects of the plan for the centre were discussed last month at Chandigarh at a high level meeting attended by the Punjab Chief Minister, Mr. Ram Kshan, Home and Agriculture Minister, Mr. Darbara Singh, the senior officials of the Department of Agriculture, Mr. V. N. Kohli of Messrs. Birla Brothers and Mr. Freeman of the Rockefeller Foundation. The State Government has agreed to allot the required piece of land on a long-term lease without any delay. The seed centre, which will be run on "no-profit, no-loss" basis, is expected to take shape by the next sowing season. This centre will be a pilot project to be followed by other similar centres in the States of Uttar Pradesh and Rajasthan.

The idea of setting up seed farms originated on the suggestion of the Union Minister for Food and Agriculture, Mr. C. Subramaniam, who had recently asked Mr. B. M. Birla to examine the possibilities of providing assistance in seed production and distribution with a view to helping the farmers in increasing per acre yield of foodgrains, particularly of wheat. Accordingly, Messrs. Birla Brothers agreed to actively pursue the development of improved seed production provided the State Governments afforded necessary co-operation and facilities such as the allotment of land on long lease. Besides the technical collaboration that may be obtained from some American seed companies, the seed production and distribution operation would need (a) strong extension programme by the Government supporting the utilisation of improved varieties of seeds, and (b) freedom to establish an economic, competitive price to enable the production and distribution of high quality seeds. It would also necessitate the planting of seeds supplied by the "model seed centre" by selected growers on contract basis. The certified seeds thus produced would be purchased by the model seed centre for sale to cultivators on a commercial basis.

The establishment of a seed industry by agencies other than the Government is a new venture which needs active support from the Government agencies. In order to be successful, such a system must operate economically and produce high quality seeds in large volumes. The supplying of high quality seeds to the cultivators is an obligation which is a continuing one and which will require substantial capital investment. The success of the model seed centre in Punjab will pave the way for the evolution of a sound system of seed production and distribution, ultimately leading to increased yield of foodgrains.

FORWARD TRADING IN GROUNDNUTS & OIL

Trading in the "January 1965 delivery of groundnut and groundnut oil hedge contract" at the Bombay Oilseeds and Oils Exchange Ltd., has remained suspended owing to a number of factors arising from the rise in prices witnessed recently. The Board of the BOOE held a number of meetings in this regard with a view to ending the deadlock in the market and recommended to the Forward Markets Commission that suitable ceilings may be fixed for the January 1965 delivery. After consultations with the President and representatives of the

Exchange, the Commission has come to the conclusion that the interest of the trade will be best served by (i) imposing a second marginal line at Rs. 103.00 per quintal in respect of groundnut and at Rs. 20.60 per 10 Kg. for groundnut oil above which margins will be payable at the rate of Rs. 40.00 per quintal in respect of groundnut and Rs. 8.60 per 10 Kg. in respect of groundnut oil and (ii) by withdrawing the facility of free limit altogether whenever the prices of the contracts exceed the second marginal lines mentioned above. Necessary orders have accordingly been issued.

TORT LEGISLATION

The legislatures in India and Parliament in particular should consider seriously the passing of legislation to regulate the claims of immunity of the State from damages for tortious acts of the public servants so that the citizens' legitimate rights may be protected adequately. This has been pointed out in a representation to the Ministry of Home Affairs by the Federation of Indian Chambers of Commerce and Industry. The need for the passing of legislation as suggested by FICCI arose as a result of the adverse judgment of the Supreme Court in the case of M/s. Kasturilal Raliaram Jain versus the State of Uttar Pradesh. The appeal to the Supreme Court was filed by a firm of bull on merchants of Amritsar in 1947 when the State of Uttar Pradesh pleaded that it was not liable for the loss of 103 "tolas" of gold of a partner of the firm who was arrested in Meerut and his belongings deposited in the police "Malkhana", because the head constable in charge of the "Malkhana" had misappropriated the gold and fled to Pakistan. The Supreme Court, while holding that the police was negligent in dealing with the property of the appellant, held that the State could not be liable for the loss because the act was committed in the course of an undertaking or employment which was referable to the exercise of sovereign power or to the exercise of delegated sovereign power. Before disposing of the appeal, the Supreme Court, however, recorded in the judgment that it was now the time when the legislatures in India should seriously consider whether legislative enactments should not be passed to regulate and control the State's claim for immunity in cases like this on the same lines as has been done in England by the Crown Processings Act, 1947. In dealing with the present appeal, the judges felt disturbed by the thought that a citizen whose property is seized by a process of law is told, when he seeks a remedy in the court of law on the ground that his property has not been returned to him, that he can make no claim against the State. The judges, therefore, suggested that as the remedy to cure this position lies in the hands of the legislature, it should consider to do the needful.

The Law Commission, which was set up to examine all the Indian statutes and make recommendations for their revision to bring them in line with the spirit and purpose of the Constitution, suggested, in its first report submitted in 1956, the passing of special legislation to provide for the liability of the State in tort. After a review of the legal position in the United Kingdom, the USA, France and other countries, the Commission came to the conclusion that the Indian law regarding liability of the State in tort should be more comprehensive and precise than the present legislations in other countries and that a distinction between sovereign and non-sovereign or governmental and non-governmental functions should no longer be invoked to determine the liability of the State. It is eight years since the Commission submitted its report on the subject but nothing has been done so far to

December 4, 1964

implement its recommendations. The representation, therefore, of the Federation of Indian Chambers of Commerce and Industry to the Ministry of Home Affairs, is a timely reminder to the Government for initiating the necessary legislation.

BUSINESS SCIENCE CONFERENCES

A series of "business science" conferences will be held at Poona during January 1 to 4, 1964. Dr. P. S. Lokanathan, Chairman of the National Productivity Council, will preside over the session of the Indian Committee for Management Development (the Indian affiliate of an international association of developing countries) on January 2, 1965. The discussion will centre round the recent developments in the field of management education in India and the future lines of growth, as also the vital problem of introducing modern management techniques in developing countries. The participants include Professor Warren Haynes of Harvard University, Professor Ted Alfred (M.I.T.), Dr. A. N. Agarwala of Allahabad University, Mr. N. K. Bhojwani, Director, National Productivity Council, Mr. R. L. Gupta, Principal, Administrative Staff College of India and other Indian and foreign experts.

The eighteenth conference of the Indian Commerce Association, which will be presided over by Dr. A. N. Agarwala, will examine such problems as transport development and coordination, marketing research techniques for developing countries and business education and research in India. At the second session of the All India Convention of Heads of Commerce Departments of Indian Universities, which will be presided over by Prof. K. C. Sarkar, foreign and Indian scholars will discuss the patterns of business education in western countries in the light of their relevance to India.

SUGAR CUT RESTORED

In expectation of a sizable increase in sugar output during the 1964-65 crushing season, the Union Government has decided to restore the 5 per cent cut on monthly State quotas imposed in March last. The monthly allotments due to the States on Nov-

ember 23 have been made on the basis of the full quotas fixed for them.

HIGHEST PRICE RISE

The general price level in the country during the twelve months ending September 5, 1964 was higher than that of any comparable period since World War II. This was revealed in the monthly bulletin for October of the Reserve Bank of India, issued on November 16, 1964. The average increase in prices during the period, compared to the immediately preceding twelve-month period, was 14 per cent. There was also a rise in money supply during the same period at the rate of 11 per cent and this had been largely due to the credit expansion by the banking system, not only to the Government but also to the private sector. The prices of food articles rose by 23.6 per cent over the year, industrial raw materials by 21.9 per cent and manufactures by 4.7 per cent. Commodity-wise, the increase was more noticeable in wheat (51.7 per cent), rice (11 per cent), Gram (108 per cent) and groundnut (37.8 per cent).

RICE IMPORTS FROM PAKISTAN

Pakistan has agreed to export another 50,000 tons of rice to India. Disclosing this in Lahore on November 15, Pakistan's Food Minister, Rana Abdul Hameed, stated that his country had so far (in 1964) exported 70,000 tons of rice to India and that this fresh quantity of 50,000 tons would be completed by the end of January, 1965.

INTEREST RATES

The raising of the bank rate last week by the U.K. from 5 per cent to 7 per cent was followed by similar revisions in bank rate by the USA (from 3.5 per cent to 4 per cent) and Canada (from 4 per cent to 4.25 per cent). In this context it will be of interest to make an international comparison of the latest bank rates along with the short-term rates of interest in some of the leading countries. It will be seen that Switzerland is the only leading country which continues to operate a cheap money policy with the bank rate at 2.5 per cent.

INTEREST RATES IN SELECTED COUNTRIES IN 1964

Country	Bank Rate	(Per cent)							
		Short-term Credit		Bank Term Loans		Commercial Paper		Deposit Rates of Commercial Banks

Notes: (i) 'Prime rate' is the rate which commercial banks charge for demand loans.
(ii) 'Term loans' are granted usually for a period not exceeding 6 months.
(iii) 'Commercial Paper' are short-term negotiable instruments maturing in 3 or 6 months.

Company Affairs

OBSTACLES TO PROGRESS

MR. BHARAT RAM, Chairman, Delhi Cloth and General Mills Company Limited, expressed deep concern over the increase in prices during the year, while addressing the annual general meeting of the company held recently. The spurt in the price level was occasioned, he added, on the one hand, by shortfalls in the agricultural production, and on the other, by excessive spending on the part of the Government on non-productive uses. There have been failures in the administration policy at village and block levels and incomplete co-ordination between different departments. He sounded a note of warning that the administrative structure and policy should be re-oriented without any delay towards self-sufficiency in food production. No system of distribution will be effective, he added, if production itself remains at a low level. There should be adequate incentives for the farmer to produce more and he should be provided with adequate facilities at the right time. The Chairman desired that the industrialists should take active interest in agriculture and it should be possible to impart to agriculture the techniques that make the successful running of industries.

Mr. Bharat Ram highlighted the contradiction in the present economic situation that the rapid increase in prices was accompanied by a continuous decline in the level of share prices. There has been certainly something wrong in the financial policy which had tended to divert larger parts of investible funds from the people to Government, he added. The major factor which led to freezing of the flow of finance from the public was taxation which depleted the investible funds in the hands of the private sector. "What is worse is that a large part of the resources mopped up by additional taxation was dissipated by Government over uses which did not increase productive capacity of the country". His advice was that the Government should secure finance for investment by borrowing on the capital market. This would not only promote better use of resources but indicate the urgency of the investment in different sectors of the economy.

The Chairman pointed out that to mark the happy occasion of the completion of 75 years by the company the directors recommended a special dividend of two per cent on ordinary shares. The gross profits of the company increased from Rs. 3.39 crores to Rs. 3.94 crores, but the net profit was lower, essentially because the company continued to invest large amounts of money in new industries which involved heavy initial depreciation and development rebate. All the units of the company did well except the sugar unit which, like all other sugar mills in the area, suffered due to shortage and low quantity of cane. The PVC plant has been in full production and the rayon tyre cord plant is expected to start very shortly. Unfortunately, he added, there was a danger of the PVC plant having to reduce its production due to a cut in electricity by the Rajasthan Government. The company, however, was making efforts to evolve an alternative solution.

INTERNATIONAL TRACTOR ISSUE

International Tractor Company of India Limited enters the capital market on December 7, with a public issue of about Rs. 61 lakhs made up of 610,050 equity shares of Rs. 10 each. The subscription list will close on December 17 or earlier at the discretion of the directors, but not before December 9. The entire public issue has been under-written by Life Insurance Corporation of India, the Industrial Credit and Investment

Corporation of India, the Industrial Development Bank, the Union Bank of India, the New India Assurance Company, the South British Insurance Co and the South India Insurance Company. The authorised capital of the company is Rs. four crores made up of 4,000,000 equity shares of Rs. 10 each out of which capital to the extent of Rs. 1.50 crores has been issued. The International Harvester Company, Chicago, USA has subscribed 255,000 shares, Mahindra and Mahindra has subscribed 255,000 shares and Voltas Limited, their directors and friends have also subscribed 255,000 shares. Shares to the extent of 124,940 have been agreed to be subscribed for cash at par by Mahindra and Mahindra Limited, their associates, directors and friends.

The company has been promoted jointly by Mahindra and Mahindra Limited, Voltas Limited and International Harvester Co. Limited, Chicago, with the object of manufacturing and marketing agricultural tractors, implements and allied attachments and spare parts thereof. It holds an industrial licence for the manufacture of 3,500 tractors and matching implements every year on single shift basis. It also holds an import licence for Rs. 92.70 lakhs for the import of machinery. Orders for machinery have already been placed with the suppliers abroad. The company has also received import licence for tractor components of the value of Rs. 30 lakhs. The factory building to be located at Akurli village near Bombay is nearing completion and production is expected to commence early in 1965.

PROGRESS OF INDIAN OIL

Thanks to the unique position that the Indian Oil Corporation, Ltd. (so called since the merger of the Indian Refineries with the Indian Oil Company on September 1, 1964) occupies, there is no gainsaying the claim of its Chairman, Mr. P. A. Gopalkrishnan, that the Corporation bids fair to become the biggest oil organisation in the country in the next 6 or 7 years. He expressed this view at a Press conference following the fifth annual general meeting of the Corporation, held recently, at which the Corporation's balance sheet and profit and loss accounts for the year were approved. Here are some interesting features about the Corporation. The paid-up capital of the Corporation is Rs. 4,97,25,000. It has so far received loans aggregating Rs. 4,75,00,000. Besides these, the IOC has a demand cash credit account of nearly Rs. 11 crores (as on March 31, 1964). This equity debt ratio provoked the question whether there was any proposal to convert the Government loan into equity shares. Mr. Gopalkrishnan ruled out this possibility as, he said, it would further bring down the percentage return on equity capital. Though satisfactory, the results for 1963-64 show a slight decline in the net return percentage from 18.5 per cent in the previous year to 16.8. Before taxation, however, the return on equity capital at 21.1 per cent compared with slightly less than 20 per cent in the previous year. But it should be noted here that the result would have been slightly less favourable had depreciation been charged on the same basis as before.

The notes on the accounts refer to certain losses due to negligence or misappropriation or theft which have added to the cost of sales. But the main items of expenditure that affected the profits for 1963-64 adversely were two, viz., under-recovery of railway freight (Rs. 55.77 lakhs) due to the location of the Gauhati Refinery (Government has fixed ceiling selling prices for all oil products on the basis of imported parity and many consumers refuse to pay the heavy freight charges from

Thermocole keeps your room so cool, so gay!

THERMOCOLE is foamed polystyrene: the lightest rigid insulation material. It is available in white slabs, as well as in gaily patterned tiles that make attractively gay false ceilings.

THERMOCOLE is efficient. Its closed cells provide an effective barrier against heat, noise and moisture. In fact, one inch of THERMOCOLE insulates better than four feet of concrete.

THERMOCOLE is versatile. It is ideal for insulating roofs, walls and floors in all kinds of buildings. It is also excellent for fabricating light-weight insulating partitions and doors.

THERMOCOLE is feather-light yet strong, durable and easy to work with. It cuts structure and labour costs. Efficiency with economy—that's the insulation THERMOCOLE provides.

distant Gauhati) and under-recovery of Central Sales Tax (Rs. 26.92 lakhs), thanks to the refusal of the Assam Government to exempt from Sales Tax inter-company transactions on oil products. The IOC's experience regarding the sales tax levy only underlines the difficulty of industrialists and business men, besides pointing to the imperative need for adopting a uniform basis all over India. It remains to be seen what the Government of India, to whom a reference has been made, will do.

The IOC's total sales of oil products in 1963-64 nearly doubled, being 1.17 million kilolitres, as against only 629,639 kilolitres in 1962-63. Its sales of petroleum coke also increased from 11,498 metric tons in 1962-63 to 26,488 metric tons in 1963-64. The increase in sales was made possible by the increase effected by the IOC in tankages at installations and depots, as also by the building of new depots, and because of these, obviously, Mr. Gopalkrishnan feels confident of handling a sale of more than two million kilolitres.

Organisationally, the IOC has two divisions now — the Refineries Division and the Marketing Division, but expects to increase the number to four to include a Pipelines Division and a Petro-chemicals Division. Future plans of the IOC include the setting up of aircraft refilling stations at 19 Indian airfields and the entry into the field of liquefied petroleum gas. The Corporation expects to serve not only the Indian Air Force, international airlines operating in India and aircraft manufacturers, but also all ships using mobil lubricants and calling at Indian ports. As a result of a new contract proposed to be entered with ENI, the IOC will also enter the industrial liquefied petroleum gas trade. The Directors' Report refers to the relevant project report which envisages the setting up of four plants for the purpose, those at Calcutta, Delhi and Baruani being already decided upon. The location of the fourth plant is said to be still under consideration.

PODAR MILLS

The Podar Mills Limited entered the capital market on November 23, with an issue of Rs. 95 lakhs made up of 550,000 equity shares of Rs. 10 each and 40,000 cumulative first preference shares (9.5 per cent) of Rs. 100 each (subject to deduction of tax) at par. The subscription list will close on December 7. The company has an authorised capital of Rs. 4 crores and issued, subscribed and paid up capital of Rs. 65 lakhs made up of 550,000 equity shares of Rs. 10 each and 10,000 cumulative preference shares (7 per cent) of Rs. 100 each. Equity shares of the face value of Rs. 15 lakhs have been subscribed by the managing agents, directors, shareholders and their associates and the remaining issue has been underwritten.

The company has a composite textile mill in Bombay with an installed capacity of 38,800 spindles and 930 looms. Now it holds licences from the Central Government for effecting a substantial expansion in the installation of a cotton spinning mill of 25,056 spindles in Jaipur, Rajasthan. Construction work has already commenced and orders have also been placed for necessary machinery. The new unit is expected to go into production in 1965 and is planned to be equipped with highly rationalised equipment. The company also proposes to instal a modern dyeing, bleaching, finishing and printing plant in the mill at Bombay.

SYNDICATE BANK: 200 BRANCHES

The directors of the Syndicate Bank Ltd. have indicated that two more branches of the bank will be opened at New Delhi and Alwai (Andhra State) on December 7, 1964. The New Delhi branch will be the first branch of the bank in the Capital.

With the opening of the Alwai branch, the Syndicate Bank will have one more branch in Andhra State raising the total number of branches in the State to 23. The bank is also opening one more branch in the Capital at Old Delhi shortly. The South Travancore Bank Ltd., Neyyoor (Kerala) will join the Syndicate Bank on December 9, 1964. This will bring the total number of branches to 200.

ALLIED INTERNATIONAL

Allied International Products Ltd., a new company formed in collaboration with Textron Industries Inc., USA for the manufacture of standard parts for automobiles and aircraft, is expected to enter the market towards the end of December 1964 to raise Rs. 35 lakhs from the public. The authorised capital of the company is Rs. two crores and the issued capital will be Rs. 75 lakhs. The promoters will take up Rs. 15 lakhs of the issued capital and the foreign collaborators Rs. 25 lakhs in consideration for the supply of plant and machinery and the balance will be offered to the public. The entire public issue has been underwritten.

The total capital outlay on the project is estimated at Rs. 110 lakhs, which will be met by the share capital of Rs. 75 lakhs, a loan of Rs. 30 lakhs from the Industrial Finance Corporation of India and a loan of Rs. 5 lakhs from bankers. The factory will be located near Moradabad in Uttar Pradesh. The collaborators will assist the company in designing the factory layout and supply technical know-how. They will also train Indian technical personnel in their factory in the USA.

STEWARTS AND LLOYDS

Stewarts and Lloyds India Limited, a subsidiary of Stewarts and Lloyds Ltd., of London, is entering the capital market early in January next year with a public issue of 220,000 equity shares of Rs. 10 each at a premium of Rs. 15 a share, with a view to financing the expansion of its steel tubes fabrication unit at Calcutta as well as setting up a new factory in Bombay. The authorized capital is Rs. one crore in equity shares of Rs. 10 each. The issued, subscribed and paid-up capital is Rs. 53.83 lakhs. Now the company will be issuing 261,710 equity shares of Rs. 10 each at a premium of Rs. 15 a share. Of this, the directors and their friends will take up 20,000 shares, while the TISCO has agreed to take up 21,710 shares and the balance of 220,000 equity shares is now being offered for public subscription. The company has already purchased the necessary land in Bombay for the new factory and has arranged with the Indian Tube Co. Ltd. for the supply of the steel tubes and other raw materials. The capital outlay on this project is estimated at Rs. 72.50 lakhs. The company has also purchased land at Madras for future expansion.

CENTRAL INDIA SPINNING

The total turnover of the Central India Spg., Wvg. & Mfg. Co. Ltd., for the year 1963-64 was Rs. 663 lakhs, as against Rs. 614 lakhs during the previous year. The net profit for the year, after providing Rs. 20,45,517 for depreciation, amounted to Rs. 24,81,824. At a meeting of the Board of Directors held on November 24, 1964, the Directors decided not to recommend any dividend on Preference shares of the Company in view of the accumulated losses carried forward from the previous years.

A.C.C. MAINTAINS DIVIDEND

The directors of the Associated Cement Companies Ltd., propose to maintain the dividend of Rs. 12 per share for the year ended July 31, 1964. The company has been paying this rate of dividend for the last five years.

CHAIRMAN'S SPEECH

LIFE INSURANCE CORPORATION OF INDIA

Statement by Shri B. K. Kaul I.C.S.,
Chairman, at the Hundred and
Second Meeting of the LIFE
INSURANCE CORPORATION OF INDIA
Held in Bombay on 30th November 1964

The draft of the Annual Report and the Statement of Accounts for the period 1st April, 1963 to 31st March, 1964 have been circulated and are now before us for consideration.

The country suffered an irreparable loss in the sad and sudden demise of Jawaharlal Nehru. At its meeting held on 29th June, 1964, the Corporation passed a resolution placing on record its deep sense of sorrow at the passing away of our beloved Prime Minister. The Corporation was proud to recall the privilege of having him on 26th December, 1963 in Bombay to declare open its new headquarters, 'Yogakshema', and his inspiring words on that occasion which would guide the Corporation in carrying on such activities from 'Yogakshema' as would contribute its humble share in the various tasks of national reconstruction so dear to him.

NEW BUSINESS

During the year under review, our new business amounted to Rs. 703 crores under 16.46 lakhs policies as against Rs. 746 crores under 17.68 lakhs policies in the previous accounting period. As that period comprised of 15 months while the period under review covered 12 months only, a direct comparison of the figures is not possible. However, the new business performance during the year under review may be evaluated by comparison of business completed in the period 1st April, 1962 to 31st March, 1963. During this period the Corporation completed a business of Rs. 708 crores. There has thus been a slight reduction in new business.

The rise in the cost of living during the year under review as also the introduction of the Compulsory Deposit Scheme, which affected the tax-payers, had their inevitable repercussions on our business. In addition to this, natural calamities like famine conditions in some parts of the country and excess rainfall in others also had their adverse effect on our business. The shortfall in business is only marginal and, in the context of the prevailing conditions, the achievements should be considered as fairly satisfactory.

FIRST INSURANCES

As many as 11.54 lakhs policies, forming 70.5 per cent of the total policies issued during the year, were taken by persons who were insuring for the first time. The corresponding figure for the previous accounting period of 15 months was 12.22 lakhs policies, being 69.5 per cent of the total policies issued. This confirms the trend of growing insurance consciousness and

gives satisfaction that the message of insurance is being taken to more people who have hitherto not availed of life insurance protection for their families.

RURAL BUSINESS

5.85 lakhs policies assuring Rs. 209.40 crores were issued to people in rural areas. The corresponding figures for the accounting period of 15 months ending 31st March, 1963 being 6.77 lakhs policies assuring Rs. 233.45 crores. The classification of urban and rural areas is the same as adopted in the 1961 Census.

The scheme for collection of premiums through selected Post Offices in rural areas, where banking facilities do not exist, which was operating in Jaipur District of Rajasthan, has since been extended to the whole State of Rajasthan. The Postal authorities have also agreed to extend the scheme to the States of Andhra Pradesh, Kerala, Madras and Mysore, and the details are being settled.

OFFICES

As on 31st March, 1964, we had offices in 251 out of the 316 districts and in 5 out of 10 Union Territories in India. We also had Development Centres in 32 of the remaining districts and in one of the Union Territories. The programme for 1964-65 is to open 2 Branch Offices, 3 Sub-Offices and 17 Development Centres.

NON-MEDICAL BUSINESS

During the year 7.21 lakhs policies assuring Rs. 164.87 crores were issued under the Non-Medical Schemes; 2.38 lakhs policies assuring Rs. 36.36 crores being under the Non-Medical General Scheme and 4.83 lakhs policies assuring Rs. 128.51 crores under the Non-Medical Special Scheme. It may be mentioned that under the Non-Medical Special Scheme, proposals are entertained for amounts up to Rs. 10,000 from special categories of persons in civil employment and also category A-1 of commissioned officers in the Armed forces.

SALARY SAVINGS SCHEME

Under the Salary Savings Scheme, we issued during the year under review 2.71 lakhs policies assuring Rs. 81.47 crores as against 1.93 lakhs policies assuring Rs. 61.03 crores during the previous accounting period of 15 months. I am glad that the scheme is proving popular with the employees and em-

ployers in general. More and more employees are coming forward to make the premium deduction a first charge on their salaries, thus ensuring insurance protection for their families with least inconvenience to themselves.

I am happy that in addition to the existing scheme for employees of Kerala State Government, satisfactory arrangements were made with the Governments of Rajasthan and Punjab for introducing the Salary Savings Scheme amongst their employees. In July 1964, similar arrangements have been made with the Government of Orissa.

GROUP INSURANCE AND GROUP SUPERANNUATION SCHEMES

New Business amounting to Rs. 12.30 crores was written during the year under the Group Insurance Schemes and under the Group Superannuation Schemes Life Annuities of Rs. 2.86 lakhs per annum were granted. The comparative figures for the previous 15 month period were Rs. 10.49 crores and Rs. 5.05 lakhs respectively.

BUSINESS IN GOA

The policies issued by the erstwhile Portuguese Companies to Indian citizens resident in Goa, Daman and Diu vested in the Corporation as from 8th June, 1962, which has been fixed as the Appointed Day while applying the Life Insurance Corporation Act to these territories vide notification issued on 29th February, 1964 by the Government of Goa, Daman and Diu. How to meet the deficit in respect of this business is being discussed with the Central Government.

FOREIGN BUSINESS

During the year the Corporation issued 8,532 policies assuring Rs. 10.21 crores in the foreign countries where it is operating, as against 9,498 policies assuring Rs. 11.24 crores during the previous accounting period of 15 months. For the sake of comparison, it may be mentioned that during the period April 1, 1962 to March 31, 1963 the Corporation issued 8,885 policies assuring Rs. 10.58 crores. The slight set-back in the business is due to a shortfall in business in Mauritius and East Africa. At other places there was satisfactory progress.

BUSINESS IN FORCE

The total business in force as at 31st March, 1964 was Rs. 3,571 crores under 103.28 lakhs policies as against Rs. 3,165 crores under 95 lakhs policies as at March 31, 1963, thus recording 12.8 per cent increase during the year under review. I may mention that the business in force as at 31st March, 1964 is almost three times the business in force of all the Insurers taken together as at 31st December, 1955.

LAPSE RATIO

The ratio of lapses to mean business in force was 8.2 per cent during the year as against 8.1 per cent during the period 1st January, 1962 to 31st March 1963. The impact of the general economic conditions and of the Compulsory Deposit Scheme on the saving capacity of the insuring public would be expected to have an adverse effect on the lapse ratio. From the very slight increase in the lapse ratio, it appears that the various steps which the Corporation took to control lapses are bearing fruit and the rising trend has been arrested.

VALUATION

During the year the Fourth Valuation of the Corporation's business as at 31st March, 1963 was completed. Usually the Corporation's business is valued biennially but consequent upon the change in the accounting year of the Corporation, it was decided that the Fourth Valuation should cover the 15 month period ending 31st March, 1963. As a result of this Valuation, Rs. 25.03 crores were allocated to the participating policies.

The rates of reversionary bonus allowed to the policies issued by the Corporation were increased from Rs. 16 per thousand sum assured per annum to Rs. 17.50 per thousand sum assured per annum in the case of Whole Life Policies and from Rs. 12.80 per thousand sum assured per annum to Rs. 14 per thousand sum assured per annum in the case of Endowment Policies. In the case of policies issued by the erstwhile insurers corresponding increased bonuses were allowed in accordance with the scheme of differential bonuses.

UNDERWRITING OF FEMALE LIVES

As a result of the review of the conditions for grant of assurances to female lives, a new categorisation for grant of such assurances has been adopted and Joint Life Assurances on the lives of husband and wife have been re-introduced, subject to the condition that both should be earning and the amount of insurance should be commensurate with their separate incomes.

PREMIUM AND OTHER INCOME

The premium income for the year under review amounted to Rs. 146.32 crores against Rs. 150.38 crores in the previous accounting period of 15 months.

The total income for the year under review was Rs. 179 crores as against Rs. 185 crores during the previous accounting period of 15 months.

LIFE FUND, INVESTMENTS AND TOTAL ASSETS

The Corporation's Life Fund as at 31st March, 1964, was Rs. 808.36 crores, registering a handsome rise of Rs. 88.80 crores over the adjusted Life Fund at the beginning of the year.

Of the total investments in India of Rs. 707.60 crores, the Public Sector accounted for 75.5 per cent, Co-operative Sector 4.3 per cent, the Joint Sector 1.0 per cent and the Private Sector 19.2 per cent. During the year, 70 new issues were agreed to be underwritten to the extent of an aggregate sum of Rs. 13 crores.

The total assets of the Corporation as at 31st March, 1964, amounted to Rs. 880.57 crores as against Rs. 785.94 crores as at 31st March, 1963. The net increase in the assets of the Corporation, since its inception, amounted to Rs. 466 crores.

RATE OF INTEREST

The income from interest, dividends and rents before deduction of income-tax was Rs. 38.25 crores as against Rs. 39.38 crores during the 15 months ended 31st March, 1963. The gross rate of interest realised on the mean Life Fund was 5.11 per cent per annum as against 4.76 per cent per annum during the previous accounting period.

The net rate realised was 4.07 per cent per annum against 4.08 per cent per annum during the previous accounting period. The net rate of interest has not increased commensurately with the increase in the gross rate due to the fact that a refund of tax of about Rs. 4.04 crores in respect of the previous accounting period has not been received in the year as the income-tax assessment of the Corporation had not yet been finalised. If this refund of tax of Rs. 4.04 crores had been received in the year, then the net rate of interest would have been 4.61 per cent.

EXPENSE RATIO

The overall expense ratio for the year has come down to 27.5 per cent from 29.3 per cent in the previous accounting period of 15 months. The Renewal Expense Ratio has also come down from 14.13 per cent to 12.46 per cent. This is gratifying because the reduction has been achieved in spite of the increase in salaries and allowances of employees in Classes II, III and IV.

CLAIMS

During the year the claims inclusive of bonus additions amounted to Rs. 33.86 crores under matured policies and Rs. 10.80 crores under policies becoming claims by death. The total claims for the year amounted to Rs. 44.66 crores as compared with Rs. 43.96 crores in the previous accounting period of 15 months. The outstanding claims as at 31st March, 1964, amounted to Rs. 14.91 crores as against Rs. 13.55 crores as at 31st March, 1963.

The percentage of outstanding claims as at the end of the accounting period to claims arising during the period has been gradually coming down. It was 49.9 per cent for the year 1959, 40.8 per cent for the year 1961 and 33.4 per cent for the year under review. We are constantly endeavouring to reduce delays in settlement of claims. During the year a "Service to Claimants Campaign" was initiated and our Branch Managers and Assistant Branch Managers called on a large number of claimants personally to render them assistance for early settlement of claims. This form of service to the claimants will be rendered as a part of the normal settlement procedure hereafter. I hope that our efforts will bear fruit and with the co-operation of the public we shall be able to speed up claim settlement.

BUILDING ACTIVITIES

During the year, apart from the Divisional Office at Varanasi and buildings at other places, our Central Office building "Yogakshema" was completed and was opened at the hands of the late Prime Minister, Jawaharlal Nehru.

MORTGAGES

As I mentioned in the last report, the "Own Your Home" Scheme came into operation from the 1st of January, 1964 at 26 centres. It has since been extended to further 49 centres and it is proposed to extend it to two more centres from the 1st January, 1965. The earlier scheme for grant of loans on immovable properties which was in operation in 26 centres was extended to 10 more centres.

In addition to the schemes mentioned above, we are advancing loans to State Governments for financing the Middle Income Group Housing Schemes, the Rental Housing Schemes, the Village Housing Project Scheme, the Low Income Group Housing Scheme, Plantation Labour Housing Scheme and Land Acquisition & Development Scheme. Loans are also granted to Co-operative Societies formed by employees of the Corporation and a scheme has been introduced for grant of loan to individual employees of the Corporation for purchase or construction of houses. The total assistance given by the Corporation to housing development under these various schemes up to 31st March, 1964 amounted to Rs. 62.78 crores.

PUBLICITY

The Corporation continues to do vigorous publicity work both in the urban and rural areas, using a wide variety of media. Emphasis is being placed on outdoor publicity and use of audio-visual media in the shape of films, slides, and slide-ons exhibited in 2,500 theatres throughout the country and through the Corporation's publicity vans and projection units in the outlying rural areas. I am proud to mention that the total publicity efforts has won for the Corporation the I.S.A.-Khatau Gold Medal awarded by the Indian Society of Advertisers. The presentation is being made today at the hands of Smt. Indira Gandhi, Union Minister for Information and Broadcasting. I am also happy to mention that the Corporation's House Magazine, 'Yogakshema' was awarded the first prize in the category of English periodicals (other than Annuals) at the Ninth State Awards instituted by the Ministry of Information and Broadcasting.

GENERAL INSURANCE

Implementing the decision taken during the year under review, with the approval of the Central Government, the Corporation has started transacting all kinds of General Insurance business from 1st April, 1964. We can now look forward to giving complete and comprehensive insurance service to the public to suit their varying needs. I may mention that although the Corporation is not a member of the Tariff Committee of the Insurance Association of India, we have adopted the tariff rates for the present. It is, however, open to us to revise the rates in due course in the light of our own experience.

ELECTRONIC DATA PROCESSING

The Corporation has decided to install two Computer Systems, one at Bombay and the other at Calcutta. These machines will ultimately replace the existing Adrema and Punch Card machines and are expected to do the job more efficiently yielding more information to the management to bring about an improvement in the servicing to policyholders and agents. I may reiterate that this decision will not lead to any retrenchment in the existing staff.

ORGANISATIONAL SET-UP

A reorganisation scheme was prepared during the year and it was to be implemented in stages. Since representations were received from members of the public, from institutions and other bodies, further steps in the implementation of the scheme have been deferred. In the meantime, a review of the scheme, in the light of the points raised in the representations is being made.

I have always received sincere co-operation and valuable advice from my colleagues on the Board and on the Investment Committee. I offer my grateful thanks to them. I take this opportunity to record my appreciation of the services rendered by the officers and staff at all levels. It is their services which have solely contributed to the fine results achieved by the Corporation. Finally, I thank all the agents who have done such excellent work in spreading the message of insurance to the people.

Public Appointment

MAKERERE UNIVERSITY COLLEGE-UGANDA

APPLICATIONS are invited for Lecturership in Agricultural Economics, with special reference to either Agricultural Marketing or Statistical Analysis (including computer programming). Appointment on contract terms for one tour of 21-24 months initially, with possibility of renewal and with terminal gratuity of 25% (or if in F.S.S.U., 15%). Secondment arrangements welcomed. Salary scale £1,550 — £2,350 p.a. including expatriate allowance of £350 p.a. Entry point according to qualifications and experience. Part-furnish quarters at rent not exceeding £114 p.a. Expatriate appointees receive: education allowances; up to five adult economy class air passages on appointment and leave (3 months every 21 months); sea passages on termination; additional children's air passages for children educated overseas. Detailed applications (6 copies) naming three referees by 20 January, 1965 to Secretary, Inter-University Council for Higher Education Overseas, 35, Bedford Place, London, W.C.1., from whom further particulars may be obtained.

December 4, 1964

ANNOUNCEMENT REGARDING THE PROPOSED ISSUE OF CAPITAL

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS AND PERSONS INTERESTED ARE REQUESTED TO APPLY FOR A COPY OF THE PROSPECTUS FOR FULL DETAILS

INTERNATIONAL TRACTOR COMPANY OF INDIA LIMITED

Registered Office: Gateway Building, Apollo Bunder, Bombay-1.

EXISTING AND PROPOSED ACTIVITIES

The Company has been promoted jointly by Mahindra & Mahindra Limited, Voltas Limited and International Harvester Company, Chicago, U.S.A. with the immediate object of manufacturing and marketing agricultural tractors, implements and allied attachments and spare parts, thereof. The Company holds industrial Licences Nos. (i) L/10-1/N-6/59 dated 2-9-1959 and (ii) L/10(1)/4/60-A.E.I. dated 15-6-1960, for manufacture of 3,500 tractors and matching implements per annum on single shift basis.

The Company holds Import Licence for Rs. 92,70,000 CIF, for import of machinery. Orders for machinery have been placed with suppliers abroad.

The Company has received import licences for Tractor components valued at Rs. 30,00,000. Production will commence early in 1965.

LOCATION

Factory buildings are nearing completion on approximately 38 acre site at Akurli Village, Kandivli, near Bombay.

BOARD OF DIRECTORS

- MR. KESHUB MAHINDRA (CHAIRMAN) (Indian), 45, Nepean Sea Road, Bombay-6. (Industrialist).

BOOKS BRIEFLY

Worker Participation in Management

Experiments in Industrial Democracy: By Nabagopal Das; Published by Asia Publishing House, Bombay; Pp. 175; Price Rs. 16.

THE AUTHOR has attempted an analysis of the causes which have been responsible for the slow progress of the scheme of worker participation in management in India. The socio-economic circumstances in this country, according to Mr. Das, are not yet conducive to the introduction of this refined technique in management. The credit for the success of the experiments in industrial democracy in Western countries goes to the traditions of political democracy which are more firmly rooted there than they are in India. Moreover, the developed economies have provided higher standards of living and various social security benefits for the workers, thus creating a more congenial climate. The basic essentials of a good life having been assured, the workers there could look forward to something concrete and substantial in a participation scheme. It also needs to be conceded that employers in those countries are progressive and are always keen to adopt new ideas. These prerequisites for worker participation in management are sadly lacking in India.

The book under review has no less than twelve chapters out of which six are devoted to an examination of the joint consultation arrangements in the UK, the USA, France, Germany, Sweden and Yugoslavia. One full chapter is devoted to an evaluation of the practices prevalent in Europe and America while the beginnings of joint consultation are also discussed in a separate chapter.

Joint Consultation

In the United Kingdom, worker participation in management has generally been in the form of joint consultation. According to Mr. B. C. Roberts, consultative committees have generally turned out to be an extension of collective bargaining. It is almost a universal experience to find management complaining that the union members do not understand the purpose of joint consultation.

Instead of a single, specific pattern emerging, in the USA worker participation has burst forth into several forms. The main pillars of the worker participation movement in the United States are voluntarism and economic liberalism, accepted by both labour and industry. Precisely for these reasons, there is no set or rigid pattern.

In France, the degree of participation by workers in management has varied considerably from undertaking to undertaking. Several independent studies have underlined the fact that the agencies of participation, i.e. the works committees, did not work effectively in discharging the functions assigned to them by law. A recent ILO study stated that the functions of works committees were often confined simply to managing the firm's welfare schemes.

German workers do not have any effective say in the decisions of the management. Says Abraham Shuchman: "Despite the enactment of the Co-determination and Plant Organisation Laws, the ultimate decision and responsibility in German enterprise remain in the hands of the management. The laws have established an elaborate mechanism for worker

participation in the making of enterprise policies, but when one looks beyond the mechanism to the essential rights labour has secured, one must conclude that these are almost entirely rights of co-operation, not rights of co-determination, and certainly not a right of co-decision."

Worker participation developed in Sweden essentially through the voluntary efforts of workers and employers. Behind these voluntary efforts lay the traditional liberalism of the people and their deep-rooted love for self-government. Consequently, despite occasional spurts of Syndicalism and revolutionary trade unionism, the radical doctrine of workers' control never took firm root in Sweden.

No simple solution has been suggested in the book; only action that could be initiated along certain lines by the Government and the employers has been indicated. Although three parties are involved, viz., Government, employers and workers, the author however is of the opinion that the suspicion and hesitancy of workers stem largely from the acts of omission and commission by the first two parties. He, therefore, suggests that the Government must view the situation as a whole and not in the limited context of worker participation in management. Instead of pinning its faith on joint management councils as the only, or event the main, panacea for labour troubles, the Government should encourage management to hold such other types of consultation with workers as are considered appropriate to the conditions prevalent in an undertaking. In a recent report to the Government of India, an expert of the Ministry of Labour from the UK, sent out by the ILO to advise on the development of management policy with regard to personnel and industrial relations, observed that consultation arrangements work best where they are tailor-made to the needs of the organisation or are allowed to grow gradually as and when they are recognised. With a view to creating a better atmosphere, Mr. Das recommends that "both Government and employers must take steps to (a) reduce the present abnormal disparity in earnings between those at the top and those at the bottom, (b) help the growth of a strong and responsible trade union movement and (c) encourage collective bargaining on a much larger scale than at present. A special responsibility rests on the more enlightened managements of our country. To prove the bona fides of employers as a class, they must give a lead to the more hesitant and persuade the latter to come out of the shell in which they have imprisoned themselves. Finally, the programme of workers' education and the training of managers in modern management should be extended and developed with vigour, so that, in course of time, conditions become more favourable for the injection of a further dose of industrial democracy."

Mr. Das has, without doubt, handled a delicate subject in a skilful manner; the employers, the employees and the Government will all benefit from a reading of this book.

RECORDS AND STATISTICS

The Profit Motive—II

This is the second instalment of passages from the pamphlet "The Profit Motive", published by E. I. Du Pont De Nemours & Company, the well-known American firm and a world leader in the chemical and allied industries:

COMPETITION : *The persistence of rivals assures social control of the profit system. Here, Government performs its greatest service by keeping the channels of competition open.*

In the economic arena, as in political life, there is a need for checks and balances. There must be some way to assure that the profit system operates for public as well as private gain. That assurance is provided by the lively force of competition.

As long as profit seekers are free to contend with one another, the interests of society are well protected. The urge for profit may suggest a high scale of prices, but the presence of competition suggests a low one, and each vendor must be guided accordingly. Should one merchant set a scale his customers find unconscionable, his rivals would quickly spirit his business away. The more valuable and desirable the product he offers, the greater the chances to sell it at a handsome profit — and the more attractive that segment of the market will be to other producers or distributors. Thus, competition, both real and prospective, constantly adjusts the market to society's needs.

There is a large body of regulation pertaining to commerce. However, with few exceptions, the principal contributions of

THE PROFIT GOES : *The way the pie is cut has a lot to do with the future prospects of the economy, as well as the immediate return to the investor.*

The distribution of profits involves much more than slicing up the net gain at the end of the year. Profits are an important agent of economic improvement and growth as well as an immediate reward to the investor. They are divided accordingly, with some of the profits paid to the owners and the remainder reinvested in the hopes of gaining a greater return in the future.

By earlier traditions of commerce, the division of profit was simple and prompt. Most ventures were temporary in nature, and were financed on a project-by-project basis. When a voyage ended and the goods had been sold in the town market, any outstanding loans were repaid. Whatever was left constituted the owners' profit, and was usually subdivided on the spot.

Today, the owners' rights are no less manifest. However, the perspective has changed, and so has the scale of capital needs. It is no longer possible or prudent to finance all growth through borrowing or through the sale of new shares of ownership. Vast as the U.S. money market is, it could not indefinitely fill all requirements of a business system now investing more than \$35 billion a year in new plant and equipment.

PATTERNS OF PROFIT : *Profits have slumped while other indices of prosperity have soared.*

In a period of rapid advance on many economic fronts, corporate profits have proved to be listless. Their refusal to climb in parallel with the nation has serious implications. This not only affects the corporate stock-holder, but also could

regulatory agencies are indirect rather than direct. They help keep the channels of competition open, prohibiting business practices and combinations which would restrain trade, and offering a guarantee that all men have the right to enter a field of commerce if they wish to try.

The major exceptions are "regulated" industries such as railroads and bus lines, gas and electric companies, and the telephone system. Here, unbridled competition could bring less rather than more service to the consumer. Imagine, for example, the consequences of having rival electric companies supplying power at different volages. (Such a condition actually existed at one time in England, with chaotic results). Where competition is deliberately curtailed, though, the opportunities to profit also are held in check. Rates and schedules are controlled by public regulatory bodies.

In the much larger segment of the market that is free from such regulation, competition is the relentless and unorgiving master of all businesses. Neither size nor age exempts any company from its dictates.

Moreover, today's business units operate not as transients, but on the assumption of permanence. In incorporated businesses, shares of ownership are transferable, surviving the original holder. Two-thirds of the nation's commerce is conducted by this form of organization. The remaining one-third is carried out in proprietorships and partnerships. These are less enduring in legal structure, but their owners nonetheless regard them in enduring terms. Commonly, they reinvest part of their profits just as corporations do.

Two factors place special emphasis on the need for reinvested profits. In companies such as Du Pont, comparatively inexpensive machinery has given way to installations controlled by panel boards. Per pound of output, they are marvels of efficiency, but their cost is calculated in millions of dollars. The increase in the cost of tools brought about by advancing technology, coupled with inflation, makes it impossible to finance replacements through depreciation allowances alone. Funds on hand will not cover the needs. Businesses are permitted to set aside each year, tax free, a portion of the money they have spent for plant and equipment. However, that depreciation allowance is not adequate to meet the bill. Money has to be taken from profits to make up the difference.

limit the nation's future growth and cut the number of new jobs available.

The economic pattern of the past 15 years shows that the total output of goods and services of USA has advanced steadily

December 4, 1964

EASTERN ECONOMIST

ly with minor interruptions. Corporations have demonstrably increased in value. Pay and fringe benefits of employees have more than doubled. Yet corporate profits have shown no sustained uptrend in absolute measure, and have actually declined when measured in relative terms.

Were the problem of concern only to stockholders, it would be wide enough in consequence. The corporations of the US are owned by an estimated 17 million people. With their families, they represent an important segment of the population, and in a period of such remarkable prosperity one may well ask whether their investment has been adequately rewarded. Yet, the problem extends beyond them to encompass all citizens.

An economic climate which discourages the investor, or leaves his company with too little growth money, inevitably curtails employment and expansion opportunities. It has become increasingly more expensive to equip workers with the tools of production. That expense can be met, and new

PROFIT'S BLURRED IMAGE : *Few deny the need for profit, but we are all made to suffer through misunderstanding and vague misgivings about profit seeking.*

Because the profit system contributes so broadly to man's freedom and range of choices, society might reasonably be expected to approve and encourage it. In point of fact, profit making has as often been condemned as applauded, and the profit maker has frequently been relegated to the lowest position in the moral order. To assess the role of profit in society, it is therefore necessary to consider its ethical as well as its economic rationale, and ask how profit seeking gained such a dubious reputation. On analysis, it seems to stem more from confusion than from questions of principle.

Profit of itself has no moral connotation, of course. It is inanimate, and incapable of good or evil. What has been called to question is the motives of those who pursue it. Almost from the beginning of the Judaeo-Christian epoch, money making has been regarded with some suspicion and distrust. At particular points in history, the strictures of religion and the restraints of law have been focussed against the accumulation of profit, with the attack defended on Biblical grounds.

It is essential to note, though, that what was really subject to attack was not profit seeking, but abuses committed in its name. For example, Christ was not protesting the function of the money changers when he drove them from the temple.

WHAT PROFIT BRINGS : *The profit system is fruitful indeed, stimulating gains in research, expansion of production, and creation of jobs.*

In any reasoned judgment of the profit system, the accomplishments of the United States must weigh heavily. More than any other major nation, the U.S. has built its economy around an open market chiefly governed by the search for profit. The success of that effort is measured in tens of millions of jobs, hundreds of billions of dollars of national income, and the creation of a vast and productive technology.

The role of profit in the promotion of science and engineering is everywhere in evidence but frequently overlooked. The synthesis of new materials, the creation of new drugs to cure and prevent disease, and the astonishing production feats of industry gain quick attention, but few observers pause to

jobs created, only if there is an expectation of reasonable profit. Producers can invest only to the extent that there is reasonable hope of a fair return and recent profit records, if extended into the future, will hardly encourage the creation of new plants and employment opportunities.

Obviously, if there is to be economic growth the necessary money must be on hand, along with the inclination to invest it. That too is a problem. Retained earnings have supplied a declining portion of the total corporate funds. More and more corporate funds have come from external sources and from the depreciation allowance. Borrowed money, of course, has to be repaid, and the depreciation allowance merely represents recovery of money invested in previous years. Strictly speaking, then, neither of these two sources represents a potential for future growth. Only retained profit can be considered as a growth fund, and a persistent rise in costs has prevented this source from serving its full role in stimulating expansion. The downward drift in retained earnings thus is a particularly sobering and ominous trend.

Many currencies were in use at the time, and an exchange system was needed. What offended Christ was the despoilment of the temple by rapacious men who sought quick fortunes by preying on their fellow citizens. So it was when St. Paul protested the lust for "filthy lucre", when the organised church unleashed its wrath against the usurers of the Middle Ages, and when society voiced its many other protests against greed and avarice. At stake were issues of personal morality and civic injustice, and the failings of men who sought private gain to the exclusion of social or spiritual good. Under attack, as well, was an economic system that is now long dead and in no danger of resurrection. Wealth was centred in the hands of a few individuals and organisations, some of whom simply hoarded it. However, the economic systems of earlier centuries bear little resemblance to the present structure, with its focus on useful investment, its wide dispersal of savings, and its checks and balances.

As for the profit motive itself, it deserves no disfavour from those concerned with spiritual issues. It has, in fact, been specifically defended in such memorable writings as The Parable of the Talents and St. Paul's correspondence with his fellow Christians. As Paul said in his first letter to the Corinthians, "The ploughman ought to plough in hope, and the thresher ought to thresh in expectation of partaking of the harvest."

credit the important function of profit in this panorama of technical progress. Yet the fact is that profit is both a direct and indirect contributor to America's technical proficiency and future prospects. The profit system pays the bills for research, and provides the stimulus for expansion.

The U.S. now spends more than \$15 billion a year on research and development, and supports a technical staff of nearly 1.5 million people. About three-fourths of the work is performed by private industrial firms, working to their own account or as contract agents undertaking research for the government. By its nature, research is often too abstract and basic to suggest immediate prospects for profit. In Du Pont, for example, \$59 million was spent in 1961 for pioneer-

ing studies, much of it for projects of no immediate commercial utility. Nonetheless, in the long range if not at the moment, such projects hold promise of producing profitable products. It is this promise of profit that justifies the investment of the stockholders' money in technology.

The other one-fourth of U.S. research and development

FOR FREEDOM'S SAKE

Any political or economic system can establish some link to the profit motive, but none has established as close a kinship as the free society, and none stands to gain as much from the liaison. For the free society, as the most spirited and venturesome economic organisation yet devised by man, can make maximum use of the creative function of profit, and derive proportionate benefit.

Static or tightly controlled economies often have been directed away from the idea of the competitive, open market. The record of many peoples, from ancient Egypt to modern Russia, gives evidence that such alternative approaches are not total failures. It is possible to allocate resources from a central command post. Where society changes little from one generation to another, trial and error combine to produce a workable if not particularly efficient assignment of men and materials to the tasks of survival. It is also possible, where individual profit is not available as an incentive, to gain greater output through coercion and punishment. In the long experience of mankind, the whip and shackle have been more in evidence than freedom and opportunity.

In a nation such as the United States, however, only the profit motive is an acceptable and adequate basis for the production and distribution system. Prosperous, volatile, and expanding, the U.S. economy requires a sensitive instrument to measure needs and allocate resources. Only the profit motive provides the needed sensitivity and it does it bril-

ly, automatically adjusting and retuning the economic mechanism in accordance with consumer demand. Of all man's automated tools and precision instruments, none is more dazzling in versatility and performance than this one.

Because the American society constantly increases its ambitions, its hopes, and its membership, the American economy faces a constantly growing demand for new products and services, facilities and talents. Only the profit motive provides a degree and variety of incentives equal to the task. It has served this function remarkably well, filling a vital role and making possible the transformation of a handful of colonies into one of the most impressive nations in history.

liantly, automatically adjusting and retuning the economic mechanism in accordance with consumer demand. Of all man's automated tools and precision instruments, none is more dazzling in versatility and performance than this one.

Accorded the same respect it has had in the past, kept free from arbitrary restraints, and permitted to offer rewards that are commensurate with the challenges, the profit motive can doubtless meet the larger needs of the future.

Above all, only the profit motive is consistent with the doctrine of individual freedom. Force and fear are not merely poor substitutes for liberty; they are its negation. Just as the franchise and the right of free speech are the manifestations of freedom in the political sphere, the profit motive is its economic manifestation. Kept vital and active by competition, the search for profit is a central element in the future prosperity of both the individual and the nation, and an inseparable part of our freedom.

We Are Not Impressed

MR. MASANI'S sharp attack on the Government's economic policies during the general debate in the Lok Sabha on the Bill to amend the Wealth Tax Act provoked the Finance Minister to a significant confession. Mr. Krishnamachari admitted that the Government's purpose at the present time was not the promotion of affluence but the prevention of acquisitiveness. This clearly is a negative attitude. The constructive purpose of any government which seeks to assume a large responsibility for the economic well-being of the community should surely be much more positive. Politicians, in any case, are not the best qualified to do battle against human weaknesses, such as greed, and it has been pointed out often enough that the worst form of acquisitiveness may well be the pursuit of power rather than the pursuit of wealth. It may be argued, of course, that wealth could be employed to pull the strings of power. That, however, is a thesis which the ruling party itself should rather find unacceptable since it is its publicly stated view that the financing of political parties by private sources of wealth, such as corporate funds, does not pollute the springs of governmental authority or integrity. The truth is that moralizing is an unprofitable game. This country has had enough of prophets, priests or preachers. What it needs now is some good government.

Good government means these days certainly more than the maintenance of law and order, although it must be admitted that many of us would be thankful even if only that first responsibility of the State is properly discharged. Especially in the case of a government which has taken it upon itself to plan and administer the economic life of the country, the people are unlikely to accept the proposition that its economic policies would have done their job by making life difficult for those whom the Finance Minister might consider to be guilty of "acquisitiveness". A community may perhaps afford witch-hunting as a passing pastime, but it surely cannot indulge in that luxury as its prime occupation. We must bluntly state that we, for one, are sick of being told that the Government's economic policies, which would otherwise have created a new heaven and a new earth, are being sabotaged by anti-social elements alleged to be active in this or that area of national life.

The plain fact is that the Government does not have a constructive and positive policy for securing the economic well-being of the people. If it were otherwise, its policies would certainly have secured the live support of the people and their active co-operation — in which case the allegedly acquisitive minority would surely have been rendered powerless for mischief. It is clear that the Government's policies do not have the advantage of a national consensus. It is at least equally clear that what are claimed to be the Government's policies do not even seem to enjoy general, not to speak of complete, support among the members of the Government itself or in the ruling party. The other day, for instance, Mr. S. K. Patil found it necessary to examine in public the alleged virtues of one of those sacred cows of Congress socialism — the Industrial Policy Resolution. Purists and pedants might question, if they like, the propriety of a Cabinet Minister challenging what is claimed to be a fundamental policy of the Government, but a more realistic reaction would surely be to attempt to realize the implications of a situation in which the Government's major policies are proving so demonstrably restrictive or sterile

that even a member of the Government is compelled to protest against them in public.

The Finance Minister declared in the Lok Sabha that the economic situation was extremely grim. How are the people expected to take it? Are they to stand up and cheer because a leader of the Government has had the honesty and courage to state the obvious. We must confess that we are not impressed. On the contrary, we must ask whether the Government is prepared to accept any responsibility for the economic situation having become extremely grim, and if so, what they intend doing about it. It was all very well for Britain's present Prime Minister to describe that country's economic situation as grim and expect his people to sympathize with him — because he has the advantage of having, as predecessor, a different set of people, a different government and a different party on whom the legacy could be blamed. But here in this country we have had one political party uninterruptedly in power for all the 17 years since independence. The personnel of government may, indeed, have slightly changed from time to time, but most of the present members of the Cabinet have been there for a great part of the time in high positions of seniority, responsibility and influence. Therefore we feel that we have both the right and the responsibility to ask the Finance Minister whether the economic situation could at all have become extremely grim had the official economic policies been even reasonably right. During all these 17 years the Government has been taking more and more authority to itself and the people have been called upon to bear more and more burdens. If then the economic situation has now become extremely grim, does not the Government owe an explanation to the people why it has so dismally failed in its management of the economic affairs of the nation?

We are not denying, of course, that some, or even considerable, progress has been made in the last 17 years. We do not intend either to enter into a fruitless debate over whether the result has matched the effort. We are content to take our stand on the Finance Minister's own responsible and expert assessment of the country's current economic situation which he has described as "extremely grim". That he has not exaggerated the economic outlook will certainly be readily granted. The Government's farm policies have largely failed to engineer an agricultural expansion with the result that our need of imported grain is increasing while our capacity for exporting even traditional surpluses of commercial crops is dwindling. These twin pressures on the balance of payments are becoming acute precisely at a time when the nation's maturing repayment obligations will also be straining its foreign exchange resources. As a result maintenance imports may have to be cut down below the levels of essentiality and that is not going to make things easier in industry where already the growth of production is slowing down. The pros-

pects for new industries could hardly be called bright in the circumstances. The capital market has been sick and ailing for some time now and two disastrous budgets have almost knocked it out. Steel development has been put back by at least two years by delays over Bokaro, while since 1958 very little additional cement capacity has come into existence. So there is a cement shortage. There is also a sugar shortage. If there is not yet a cloth shortage, it may be because shorter crops last year might have depressed rural purchasing power, while the sharp increase in the cost of living has certainly crippled the consumption standards of urban middle-class families. The slums, of course, are still there; only they are slummier than ever, whether in Calcutta, Bombay, Delhi or Madras. Over-crowding and rack-renting are as rife as ever even in the favoured cities where there is some concessional government housing for government employees. Power — not political power which is being abundantly deployed, but electric power — is short. Transport too would have been short were it not for the fact that the curve of economic growth is looking down. Schooling is becoming costlier, while jobs are becoming scarcer.

All this is part of how grim the "extremely grim" situation, of which the Finance Minister spoke, is. The question is how this situation could be dealt with. May not a part of the answer be that the economic policies which have been pursued so far should at least be examined anew, not indeed with the negative purpose of pursuing the allegedly acquisitive few, but with the positive aim of promoting the reasonable affluence within a reasonable period of the admittedly deserving many whose welfare after all is the excuse pleaded for all the self-aggrandisement of the State in this nation all the 17 years?

This issue (dated December 11, 1964) is the last one for this year. The next issue, which will be dated December 25, 1964 will be "Eastern Economist" Annual Number, 1965; its theme will be "The Nehru India: 1947-64". Jawaharlal Nehru had described our national endeavour in the social, economic and political fields as the mighty adventure of building a new India. "Eastern Economist" proposes to draw extensively, both on Jawaharlal Nehru's own speeches and writings and on Government papers and other documents to analyse critically the processes and progress of this mighty adventure. This account will not be merely eulogistic but will be a thoughtful assessment of the economic ideas, attitudes, policies and programmes of Jawaharlal Nehru. The Annual Number will be richly illustrated with statistics, charts and colour graphs and will adopt the latest techniques in the presentation of economic data.

Indian Rare Earths

THE INDIAN Rare Earths Limited — one of the leading foreign exchange earners of the public sector companies — is located in Kerala; it processes monazite and produces Rare Earths Chloride, Trisodium Phosphate and Thorium Hydroxide. It is of interest to examine the working of this enterprise during the last four years ending March 31, 1964 on the basis of the data published by the company.

The production and sales of the two main products of the company during the last four years are given in Table I below.

TABLE I.
PRODUCTION & SALES

Year	(In metric tonnes)			
	Rare Earths Chloride		Trisodium Phosphate	
	Production	Sale	Production	Sale
1960-61	1834	1858	1773	965
1961-62	2019	1992	2312	1957
1962-63	3274	2944	3049	3681
1963-64	3019	3161	3374	3788

It would be seen that production of the company has recorded a continuous growth. Along with the increase in output, the sales have also increased, showing that the company does not have to finance accumulated finished goods over any length of time. Notwithstanding this advantage, the company has been using its paid-up capital and reserves to finance its current assets. This fact is brought out in the summarised balance sheets of the company as at 31st March of 1961, 1962, 1963 and 1964 in Table II.

TABLE II.
SUMMARISED BALANCE SHEET

	(In lakhs of rupees)			
	1961	1962	1963	1964
Liabilities				
Paid-up capital	100	100	100	100
Reserves	(—)8	(—)3	5	15
Tax Provision	—	—	—	4
Current Liabilities	15	17	35	25
	107	114	140	145
Assets				
Net fixed assets	45	44	43	44
Inventory	12	18	20	18
Sundry Debtors	5	9	12	12
Loans and Advances	7	5	5	5
Short-term Deposits with Banks	35	35	53	61
Other cash and bank balances	3	3	7	6
	107	114	140	145

Not only has the company financed a considerable part of its current assets from paid-up capital during all the four years, but it has also invested a part of its funds in short-term bank deposits which stood at Rs. 35 lakhs in 1961 and progressively increased to Rs. 61 lakhs in 1964. Since during all the four years the company had paid-up capital much in excess of the net fixed assets, there is doubt that a considerable part of these short-term bank deposits came from paid-up capital, which is a long-term fund. Since the net fixed assets of the company have not recorded any growth during the four years under review, but have stabilised around Rs. 44 lakhs as against the paid-up capital of the company at Rs. 100 lakhs, there is reason to believe that while planning the financial needs of the company at the time of its formation, its requirement of fixed assets was overestimated and so was the paid-up capital. Be that as it may, the company could have either reduced its share capital later or at least invested the excess of paid-up capital in long-term fixed deposits with banks rather than in short-term deposits which carry a relatively lower rate of interest. Moreover, such misuse of long-term funds for short-term purposes results in misallocation of the meagre financial resources of the country.

The importance of exports to the company may be seen from the fact that its entire production of Rare Earths Chloride has been exported during the last two years. The total sales of the company in 1962-63 and 1963-64 amounted to Rs. 60 lakhs and Rs. 69 lakhs respectively, of which Rs. 45 lakhs and Rs. 52 lakhs were from exports. Against this the company's foreign exchange bill (imports) is hardly Rs. 1.5 lakhs a year for the purchase of spare parts. Since about three quarters of the sales income of the company is derived from abroad, it would be interesting to see whether the sales are profitable. The rate of net profit (that is profit after depreciation but before tax) on the sales of the company during the last four years is summarised in Table III.

TABLE III.
RATE OF NET PROFIT ON SALES

	1960-61	1961-62	1962-63	1963-64
Net profit (Rs. lakhs)	3.54	1.91	10.73	14.57
Sales (Rs. lakhs)	28.47	35.77	60.17	69.41
Rate of profit (net profit as a percentage of sales)	12.4	5.3	17.8	20.9

In computing net profit, credit has not been given for interest receipts and other miscellaneous receipts, since they have not been earned by the sales of the company. It would be seen from Table III that the

company is making a fairly high rate of profit on its sales. In 1961-62 the rate of profit was lower and this was due to (a) the fixation by the Government of India of an annual ceiling of Rs. 9.79 lakhs for Thorium Hydroxide, produced at Alwaye. This was the amount paid by Government when the plant treated about 1361 metric tonnes of monazite during 1960-61. The company treated 1797 metric tonnes of monazite during 1961-62 and therefore the sum of Rs. 9.79 lakhs was spread over 1797 metric tonnes as against 1361 metric tonnes in 1960-61. While this assisted in reducing the *pro rata* cost of Thorium Hydroxide, it did not reduce the unit cost of production of rare earths to the extent it did during 1960-61 and (b) imposition of excise duty on caustic soda and hydrochloric acid.

The rate of return earned by the company after tax on the total capital employed and the rate of dividend paid by the company on the paid-up capital subscribed by Government are given in Table IV.

It will be seen that although the rate of return on capital employed was low in the first two years, it rose to as high as 15.5 per cent in 1963-64 in spite of the fact

that the company was over-capitalised. It speaks well of the management of the company. The rate of dividend could have been higher but for the high capital base.

TABLE IV.
DIVIDENDS AND RATE OF RETURN

	(Rs. lakhs)			
	1960-61	1961-62	1962-63	1963-64
Dividends	—	—	4.50	7.00
Profit before tax and after depreciation	5.12	4.17	12.48	22.52
Paid-up capital	100.00	100.00	100.00	100.00
Total capital employed ..	115.44	118.24	140.06	145.07
Rate of dividend (dividend as a percentage of capital employed)	—	—	4.5	7.0
Rate of return (net profit as a percentage of capital employed)	4.4	3.5	8.9	15.5

Associate these numbers with Pure Protection. Why? Because "point-two", "point-two-three-four" and "point-two-five-four" millimetre represent the gauge thicknesses of aluminium foil from which Pilfer-proof Closures and Vial Caps are made. Extensively used by Pharmaceutical Manufacturers and other Industries which market products in which purity is not merely desirable but absolutely vital. An Alfoil closure virtually guarantees the contents. Further, it protects the consumer from the spurious re-use of a pharmaceutical container.

there are such projects as Hindustan Cables Ltd., which do not compete with the private sector and whose output is altogether consumed by the Government. In such cases the question of profitability does not arise because it will amount to taking out money from one pocket of the Government and putting it in the other. Most of the industrial projects in the public sector, it is stated, have still to overcome "teething troubles" and are not in a position to show high profitability because they still have to attain maturity.

There is, however, a small number of public sector undertakings which have shown encouraging results. To this category belong Hindustan Machine Tools Ltd., Hindustan Cables Ltd., National Instruments Ltd., Nepa Mills Ltd., and Hindustan Salts Ltd. As the table below shows, most of these public sector companies showed substantial improvement in their working in 1962-63, compared to 1961-62. Three out of these five companies declared net profit as a percentage of net worth at more than 10 per cent in 1962-63 which is the private sector's level of profitability as indicated in a recent Reserve Bank study relating to 1,333 large public limited companies. In the case of the remaining two, this percentage has been between 7 and 8, with prospects of improvement in the coming years. The net profit of National Instruments Ltd., in 1962-63 for example, worked out to 8.4 per cent of the net worth. The 1963-64 results of this enterprise are expected to show a significant improvement over 1962-63 because some of the grievances of the employees have been removed which, it was felt, was the basic cause of the relatively poor performance in 1961-62 and 1962-63. Similarly, in the case of Hindustan Salt Limited, conversion of the rock salt mines from a losing proposition to a profit-making one will alter the level of profitability significantly.

It must be conceded that many of the Public sector units have got entangled in bureaucratic administration. Their intrinsic faults remain rigidity, red-tape and lack of interest at all levels. If some of the public sector units are able to show good working results, it is because of the privileges enjoyed by them, with the exception of Hindustan Machine Tools Ltd., and one or two others. The hope of a continuous rise in the profitability of public sector companies is a misplaced one. The memorandum of the fourth five-year Plan has stipulated that at least 12 per cent rate of return would be available from these companies. As things stand today, there is very little possibility of these undertakings coming up to that level.

	Gross profit as a percentage of capital employed		Net profit as a percentage of net worth	
	1961-62	1962-63	1961-62	1962-63
Hindustan Machine Tools Ltd	14.0	21.4	17.7	17.9
Hindustan Cables Ltd.	8.9	12.9	6.9	10.6
National Instruments Ltd.	2.0	11.1	5.0	8.4
Nepa Mills Ltd.	9.1	10.0	10.1	10.6
Hindustan Salt Ltd.	9.9	9.9	7.3	7.3
Private Sector*	10.0	10.0	9.0	10.0

*Reserve Bank study relating to 1333 selected large public limited companies.

EXIT PRIZE BONDS

ONE OF the pet schemes of the Union Ministry of Finance will meet its end next month. Mr. B. R. Bhagat, Minister for Planning and Minister of State for Finance, revealed at the two-day session of the National Savings Central Advisory Board in New Delhi this week that the Government had decided to discontinue the Prize Bonds Scheme after the sales for the current calendar year came to an end at the close of this month. The experience of the scheme, he said, had not been happy. The Five-Year Interest Free Prize Bonds, which were sold between April 1960 and June 1962, would mature for payment in April next year. A sum of Rs. 20 crores would be needed for this purpose. The rules regarding the savings certificates are proposed to be amended to allow for conversion of the maturing prize bonds into savings certificates.

The dismal end of the Prize Bonds Scheme should act as an eye-opener for the Ministry of Finance. New schemes for raising funds are started with great enthusiasm but not enough attention is paid to details so as to keep up the interest of the people in the schemes. Another scheme which may, for the same reason, soon face heavy weather is the UTI which started its operations about five months ago. The fixation of the re-purchase price of the units at Rs. 10 (as against the sale price of Rs. 10.50) has caused resentment among the unit-holders. It is true that the rules and regulations of the Unit Trust of India permit a difference of 5 per cent between the issue price and the re-purchase price of the units. But the trustees of the UTI have not cared a bit about the unit-holders in distress who would receive no return on their investment in case they liquidated them. If the unit-holders had deposited their savings with the banks on short-term basis instead of investing them in the units, they would have been able to get at least some return, say three per cent.

The Minister stated at the National Savings Central Advisory Board's meeting that the small savings schemes had made rapid progress and the net collections under them in 1963-64 had attained an all-time peak at Rs. 127 crores. The trend in the collections during 1964-65 was also upward. The collections till the end of October, for example, at Rs. 62 crores were an improvement by Rs. 10 crores over the corresponding period in the preceding year. He expressed the hope that the target of small savings at Rs. 600 crores for the third Plan period would be achieved. The State Bank of India has agreed to lend its assistance for the sale of savings certificates. It has undertaken the sale of savings certificates at as many branches as possible. The certificates, which will be sold through the State Bank of India, would be identical with those sold through post offices, though they would belong to a different series.

The Minister revealed that according to the findings of a recent study, a large number of persons in the higher income brackets were making investments in small savings schemes as they wanted to take advantage of tax concessions. Even after so many years of publicity, the small savings movement had not taken roots amongst the people of small means. The movement, he said, must be built up from below "where people in thousands contributed to small savings even if these came in dribbles." In fact, this was the precise objective of starting the small savings schemes which, unfortunately, has not been realised. Out of Rs. 120 crores collected by way of small savings in 1963-64, as much as Rs. 51 crores came from provident fund investments and Rs. 16 crores from interest on post office savings bank deposits. It means that the savings schemes made less than half of the total contribution. Unless some fresh thinking is done to popularise the basic ideas of small savings, the movement is likely to lose whatever momentum it has gained in the recent past.

By Our Parliamentary Correspondent

NEW DELHI:

ADOPTION OF the Finance Minister's two Bills — the Wealth Tax (Amendment) Bill and the Foreign Exchange Regulation (Amendment) Bill — by the Lok Sabha and the successful passage of the Food Corporation Bill in the Rajya Sabha provided the highlights of last week's proceedings in Parliament.

The Wealth Tax (Amendment) Bill was primarily intended to mould the Wealth Tax Act to fit into the general scheme of direct taxes. The Wealth Tax Act, 1957, followed the pattern of the Income Tax Act, 1922. Since the law relating to income-tax had been modified by the Income Tax Act, 1961, and several changes of form and substance had been made in this Act to check evasion more effectively and to ensure prompt collection, it was considered necessary that the provisions of the Income Tax Act pertaining to collection and recovery, grant of refunds etc., should be adopted for the Wealth Tax Act as well. A few other amendments had also been incorporated in the Wealth Tax (Amendment) Bill in the light of the experience gained in the operation of the Wealth Tax Act.

The Foreign Exchange Regulation (Amendment) Bill proposed: (a) to empower the Reserve Bank of India to control the transfer of shares of a foreign company from a register outside India to a register in India and to regulate the giving of guarantees by persons resident in India in respect of debts or liabilities of persons resident outside India; (b) to control and regulate payments or remittances in favour of a non-resident in pursuance of any settlement of property by will as well as by gifts; (c) to control and regulate the appointment of foreign companies, firms or branches thereof as the agents or advisers of companies and firms in India; (d) to require airlines, shipping companies and travel agents to obtain the general or special permission of the Reserve Bank of India in respect of international travel bookings; (e) to include provisions on the lines of Rule 132A of the Defence of India Rules, 1962, prohibiting unauthorised dealings in foreign exchange brought in by tourists and tightening the control over such dealings; (f) to confer additional powers on officers of the Enforcement Directorate similar to those conferred by the Customs Act, 1962, on officers of the Customs Department, in regard to search and arrest of persons, search of conveyances and premises and summoning of persons to give evidence and produce documents, etc.; (g) to increase the strength of the Appellate Board from two to three members; and (h) to confer a right of appeal to the High Court on questions of law from decisions or orders of the Appellate Board.

Frontal Attack

In a fairly interesting debate, the Wealth Tax (Amendment) Bill came in for a frontal attack from the Swatantra Party spokesmen, Mr. M. R. Masani and Mr. N. Dandekar. They opined that the Bill violated the principles of jurisprudence and would adversely affect capital formation. Mr. Masani characterised the Bill as a "primitive idea of socialism." While the Government had adopted Prof. N. Kaldor's idea of taxing the idle wealth, it had failed to give incentives proposed by him for stimulating economic growth, he added. Mr. Masani particularly objected to the provisions in the Bill which would have the effect of meting out to persons who make mistakes in evaluating their assets, treatment reserved for criminals. The onus of proving concealment of wealth, he stressed, should be on the authorities. Mr. Masani also vehemently opposed the enormous powers sought to be given by the Bill to the authorities to raid the houses of persons suspected of possessing assets disproportionate to

their incomes. Mr. Dandekar expressed the view that under the guise of socialism, a good deal of Communistic legislation was being enacted by the Government. He was opposed to the Bill for practical reasons. Under Clause 7 of the Bill, he said, a good principle of valuation of assets was sought to be destroyed. Mr. Dandekar wanted that in the interest of fostering economic growth, investments in new industries should be exempted from wealth tax. The Bill, however, received strong support from the leader of the official Communist group, Prof. Hiren Mukerjee. The income-tax and wealth tax laws, Prof. Mukerjee said, must be made more stringent because persons with big incomes did not disclose their assets correctly. Prof. Mukerjee also suggested strict enforcement of taxation laws in the interest of reducing economic disparities. The Jan Sangh spokesman, Mr. U. M. Trivedi, wanted that in view of the importance of the Bill, it should be referred to a Select Committee. While he was all for unearthing the hoarded wealth, he did not want innocent persons to be harassed by taxation authorities. The Bill received general welcome from the Congress members.

Acquisitive Instinct

Winding up the discussion, the Union Finance Minister, Mr. T. T. Krishnamachari, condemned the acquisitive instinct of certain sections of the people. This, he said, was responsible for the increase in prices, unwarranted by any economic laws or forces of demand and supply. Mr. Krishnamachari stressed that the Bill sought to curb the acquisitive nature of the people who were in a position to disturb the economic life of the country. He indicated that the Government would get very near to mastering the problem of black money in a year or two. The Minister of State for Finance, Mr. B. R. Bhagat, pointed out that the Bill provided sufficient safeguards against arbitrary raids of assessee's houses. Referring to Mr. Dandekar's plea that investments in new industries should be exempted from the wealth tax, Mr. Bhagat pointed out that income-tax rather than wealth tax exemptions were the proper way of encouraging and stimulating investments in new industries. The Bill was passed after the House had accepted a few official amendments, including the one which sought to exclude assets transferred after payment of gift tax from the net wealth of an individual for the purposes of computing wealth tax.

The Foreign Exchange Regulation (Amendment) Bill received good reception; almost all the members participating in the debate expressed concern at the tight foreign exchange situation of the country and the necessity to improve it. Mr. Dandekar, who opened the debate for the Opposition, drew the attention of the House to the abuse of export incentive schemes. He alleged that foreign exchange made available under this scheme was being hawked around. He also criticised State trading in exports; the activities of the STC, he said, sometimes resulted in loss of foreign exchange to the country as the goods sold by it to some countries were passed on by them to other countries. Prof. Hiren Mukerjee attacked the policy of foreign private investments, which, according to him, were growing dangerously. He wanted a close scrutiny of the collaboration terms to prevent payment of fantastic rates of royalty. Mr. R. R. Morarka (Congress) preferred restrictions on remittances to restrictions on appointment of agents. Mr. Sachin Chaudhuri (Congress) suggested that in order to remove any fear of the misuse of powers by officers dealing with foreign exchange regulations, procedure should be laid down to be followed by these officers. Prof. D. C. Sharma (Congress) demanded summary trials of people violating foreign exchange regulations.

Moving the Bill for consideration earlier, Mr. T. T.

What's the loss from a blown out fuse?

Install high quality LT-LK switch, fuse, and switch fuse units—available in ratings of 100A, 200A, 400A, 600A & 1000A at 500v. A.C.

Much more than you imagine—due to loss of production. The cost of the fuse itself being comparatively insignificant, use only very reliable fuse units which can be replaced in a minute. Then you will keep down fuse replacement time and minimise production loss.

The HRC fuse of an LT-LK unit is simply pushed in against spring pressure. The fuse units have spring loaded contacts, eliminating clumsy bolting. These springs are of stainless steel to ensure long life and resistance to corrosion.

Where the switch fuse unit is not absolutely necessary, a fuse unit alone will serve your purpose. The insertion and removal of the fuse can be done even when the circuit is live, using the insulated fuse handle.

Insulated fuse removing handle.

Highlights of the Week

P.M.'S PILGRIMAGE

AFTER A four-day visit to the United Kingdom, the Prime Minister, Mr. Lal Bahadur, returned to New Delhi on December 6, 1964. In a statement made in Parliament three days later he said that he was "much impressed and touched by the warmth of friendship" for this country amongst the Government and other leaders of public opinion in the United Kingdom. With Mr. Harold Wilson, the UK Prime Minister, and his other Cabinet colleagues, he had an opportunity to discuss fully and frankly a number of problems which included the international situation, problem of peace, disarmament, United Nations, the proposal regarding multilateral force, programmes of assistance to developing countries, balance of payments problem of the United Kingdom and India's problems of development and defence needs. The Prime Minister further stated that the British leaders were of the opinion that in the complex and difficult world situation, personal discussions would assist the larger interest of world peace and disarmament and would also help in the promotion of economic and social progress.

The most important topic on which discussions were held related to the explosion of "a nuclear device" by the Chinese and its possible impact on the nuclear policy of the Government of India. Mr. Lal Bahadur reiterated the decision of this country not to go in for the manufacture of the atomic bomb. "India is determined", he said, "to pursue the path of peace and to work for the elimination of the nuclear menace which faces mankind today." A suggestion that it was the responsibility of the great nuclear powers, particularly the USA and the USSR, to evolve concrete steps for the elimination of the threat that overhangs mankind, is under consideration. Mr. Wilson who flew to Washington immediately after his meeting with Mr. Lal Bahadur is expected to discuss this aspect with President Johnson. Should this move catch the imagination of the USA and the USSR, it will be a great victory for the policy pursued vigorously by the Prime Minister ever since the explosion of the Chinese Bomb.

COMMON MAN AND THE PLAN

THE MEMORANDUM on the fourth five-year Plan, placed on the tables of both the Houses of Parliament on December 2, has in its last chapter some concluding observations which highlight the broad strategy to be adopted for the formulation of the fourth Plan. The emphasis, it is indicated, will be on diminishing the gap between planning and implementation. The priorities fixed in the memorandum show that "a substantial improvement in agricultural production" will receive the maximum attention. To the second order of importance will be along the basic consumer goods the supply of which at stable prices will be ensured. The heavy industries will be in the third order of priority. And in the final analysis, measures and policies subserving the interests of the common man would take precedence over other considerations. For the first time the common man has become the centre of attention of the planners. "The Plan", states the memorandum, "must have a positive content for the common man. He has suffered for long and time has come for him to be assured of his minimum requirements in respect of food, clothing, shelter, medical aid and education. He must get adequate return for his labour and full value for his money. The measure in which these essential objectives are achieved will be an important test of the success of the Plan."

How far will it be possible to attain these laudable objective? While emphasis has repeatedly been put in the memorandum on stabilisation of prices, the size of the fourth

Plan in terms of financial outlay shows that it may not be possible to keep prices under control. If the outlay of the Plan, ranging between Rs. 21,500 crores to Rs. 22,500 crores, is not matched with the anticipated growth in agriculture and other consumer goods, the history of the third Plan may be repeated. The size of the Plan, in fact, should be linked up with the performance in the primary sector of the economy. The rate of investment should be slowed down if it is noticed during the implementation of the Plan that the output of food and other consumer goods is not rising according to expectations.

Discussing the financial resources for the Plan, the memorandum has made no mention of deficit financing. The Union Finance Minister, Mr. T. T. Krishnamachari, has also made pronouncements recently that deficit financing would be eschewed during the fourth Plan period. The elimination of deficit financing altogether implies a greater tax mobilisation on the part of both the Centre and the States which, in turn, will mean evolution of "broad national policies for administration of complex measures like urban land and property taxation, taxation on agricultural incomes, pricing policies of public undertakings and so forth". Both the tax and non-tax revenues are expected to increase at an average rate of 8 per cent per annum. While urban land and property taxation and agricultural income taxation will, no doubt, yield additional revenue, the expectation of realising funds for expansion from the public undertakings may not be fulfilled.

On the trade account, it is estimated that the gap between imports and exports in the five-year period of the fourth Plan will be of the order of Rs. 2,100 crores. Imports are estimated at Rs. 7,200 crores as against Rs. 5,100 crores worth exports. During this period, a sum of Rs. 1,100 crores will have to be reimbursed to the countries extending us development loans — Rs. 500 crores by way of repayment of debt and Rs. 600 crores by way of interest. Thus the overall gap between payments and receipts of foreign exchange may be of the order of Rs. 3200 crores. If exports do not rise, for any reason, to Rs. 5,100 crores, the gap may be widened further. In line with the policy pursued in the preceding Plans, the fourth Plan strategy will be to reduce dependence on imports of commodities which can be produced within the country. An assurance is held out that domestic consumption would be restrained and the quality of Indian products would be improved so as to boost exports. What about providing high quality goods to the common man? The memorandum has maintained a discreet silence in this regard.

RATE OF RETURN IN PUBLIC SECTOR

THE PUBLIC sector projects have come in for severe criticism in recent months because of their disappointing performance. In many cases, the rate of return on capital employed has not been equal to even the Bank rate. Many a time, members of Parliament have raised this issue on the floor of the House demanding from the Government explanation for the inadequate performance of these public sector projects. Some sort of a defence has been put up by citing the cases of a few units which seem to have done better than the rest. While it is acknowledged that public enterprises should make substantial profits so as to provide resources for future expansion, it is explained that in certain cases, the Government had to embark upon some projects which had relatively "long gestation periods". In this category are put such projects as Heavy Electricals Limited, Heavy Engineering Limited, etc. There are certain other undertakings such as the National Industrial Development Corporation Ltd., and the National Small Industries Corporation, which were set up more to satisfy some of the social objectives than to earn profits. Again,

Krishnamachari referred to the decline in invisible earnings, in recent years, particularly from Malaya. These earnings, in the form of remittances from Indians in Malaya to their relations, he said, had declined from Rs. 18.9 crores in 1956-57 to a bare Rs. 3.1 crores in 1962-63. In his reply to the debate, Mr. Krishnamachari made three important observations. He ruled out concessions for attracting remittances from Indians abroad and declared that the Government would strictly adhere to its obligations to the International Monetary Fund. He had been informed, he said, that private remittances to the extent of £100,000 a week could come in if concessions were given. He knew that Pakistan was permitting pound-sterling to be brought at the rate of Rs. 18 to Rs. 20. But if India followed this practice, she would have to face the charge that her rupee was over-valued and should be devalued. The Minister conceded the need for greater flexibility in the matter of spending of foreign exchange allocation to an individual. An individual, he said, should be allowed to spend up to 25 per cent of his allocation on purchases without accounting for it. Mr. Krishnamachari favoured private foreign capital investments in India. Private capital investments, he said, did not carry with them any political pulls. While foreign loans were dated, the only regular remittances that were required to be made in the case of foreign private investments were on account of dividends. Even these remittances were not heavy as the private foreign investors could re-invest their profit within the country. No repatriation of capital was involved till an enterprise in which it was invested was nationalised or liquidated. Quoting the Indo-German Investment Guarantee Agreement, the Finance Minister added that even in the case of nationalisation, foreign investments could be repaid over a period of three years. In the case of liquidation, repatriation of capital could be spread over a period of six years. Absolute restrictions on remittances from India to foreign countries, Mr. Krishnamachari said, could not be enforced under the IMF code; they could only be regulated. Speaking in personal capacity, the Finance Minister warmly responded to a proposal that all administrative decisions should be scrutinised by the Supreme Court.

Among the other Bills passed by the Lok Sabha last week were the Mineral Oils (Additional Duties of Excise and Wages) Amendment Bill, the Payment of Wages (Amendment) Bill, and the Standards of Weights and Measures (Amendment) Bill.

Abrogating Art. 370

The other highlights of the last week's proceedings of the Lok Sabha were the debates on Mr. Prakash Vir Shastri's resolution seeking to abrogate Article 370 of the Constitution, which confers a special status on Jammu & Kashmir State, and the discussion of "manufacture, consumption and price of cars" raised by Mr. Mani Ram Bagri (SSP). Although Mr. Prakash Vir Shastri's resolution was lost despite the fact that during the debate on it, spread over three non-official legislative business sessions, members belonging both to the Treasury and the Opposition benches had spoken in its favour, it served the useful purpose of eliciting from the Union Home Minister, Mr. G. L. Nanda, an announcement that a Presidential order extending Articles 356 and 357 of the Constitution, entries 43 and 75 of the Union List and entries 33 and 34 of the Concurrent List to Jammu & Kashmir would be issued soon. Article 356 provides for the proclamation of President's rule in case of failure of the constitutional machinery in a State. Article 357 empowers Parliament to confer on the President the power of the State Legislature to make laws and also to delegate powers to specified authorities. Entry 43 of the Union List relates to incorporation, regulation and winding up of trading corporations, including banking, insurance and financial corporations but excluding co-operative societies.

Entry 78 refers to the constitution and organisation of High Courts. Entries 33 and 34 of the Concurrent List relate to trade and commerce in, and production, supply and distribution of, various industrial products, foodstuffs and other commodities as well as price control. Application of these Articles and the entries of the Constitution should strengthen the bonds of integration of the Jammu & Kashmir State with the Indian Union.

During the discussion on "manufacture, consumption and price of cars" a demand was made by both the Congress and Opposition benches that the Government should enter the automobile manufacturing field to produce a low-priced car. The Government was accused of yielding to the pressure of vested interests in shelving the small car project. Both the poor quality and high prices of the Indian cars were criticised by the members generally. But Mr. P. D. Himatsingka (Congress) pointed out that there was a misconception about the position of car manufacturers. The three manufacturers had a capacity to produce about 50,000 cars per annum, but the Government had not been able to give them necessary foreign exchange for the import of components and raw materials. Mr. Himatsingka expressed the view that it was better to expand an existing unit rather than set up a new one as the foreign exchange needed for the latter would be much higher. The discussion was not concluded and had to be postponed to a later day.

Welcome Measure

The Rajya Sabha debate on the Food Corporation Bill was more or less on the same lines as in the Lok Sabha. The Bill was generally welcomed by all the sections of the House. Most of the members who participated in the debate asked the Government to ensure that the producers got the major share of the price paid by the consumers and the traders were not allowed to corner stocks. The Swatantra spokesman, Mr. Anand Chand, hoped that the Corporation would not be turned into a monopoly with too many officers. He wanted the Corporation to supplement and not supplant the foodgrains trade. Winding up the debate, the Minister for Food and Agriculture, Mr. C. Subramaniam, expressed the hope that the Corporation would help the Government in implementing the policy of greater production, equitable distribution and reasonable prices. He reiterated that the Government might clothe the Corporation with powers under the Essential Commodities Act and the Defence of India Rules to enable it to requisition stocks should the necessity arise, and asserted that the proposal to set up the Food Corporation had no political ideology behind it; the decision was based purely on practical and technical considerations, taking into account the food situation in the country and also future trends. The Corporation, the Minister said, would build up a buffer stock of foodgrains and would make purchases both within the country and abroad. For purchasing foodgrains abroad, the Corporation might have to establish offices there. Mr. Subramaniam added that it was his intention to have as many non-officials as possible on the Board of Directors of the Corporation. Producers would also be represented on the Board. The Corporation would utilise the services of wholesalers and co-operatives in its purchasing operations.

Intervening in the debate later on a non-official resolution asking for the appointment of a 25-member Parliamentary Committee to recommend measures to tackle the food situation, the Food and Agriculture Minister told the Rajya Sabha that he proposed to re-orient the agricultural set-up by reorganising the administrative machinery and effecting better co-operation between the Centre and the States; as soon as the Government's new agricultural policy was evolved, a White Paper would be presented to Parliament during this session or early in the next session. Mr. Subramaniam rejected the

BIRD'S CENTENARY YEAR

OUT-GOING JUTE AND IN-COMING DOLLARS

A boost in exports means increased foreign exchange—today's prime need. Among exports jute is of top priority. The Bird-Heilgers Group's export of jute goods in the last year increased to nearly Rs.10 crores—a significant part of the country's foreign exchange earnings.

Deploying the skills acquired over a hundred years, the Bird-Heilgers Group is making important contributions to the economy.

SUGAR FOR EXPORT—

E.I.D.-PARRY HELPS

India is now a regular exporter of sugar. The country exported in 1962/63 4.18 lakh tonnes valued at over Rs. 16 crores. The Middle East, Malaysia, Japan, Canada & the U.S.A. are her best customers. The production capacity is to be expanded by 5 lakh tonnes. This means more sugar for domestic consumption and export.

The E.I.D.-Parry Group with its five sugar factories at Nellikuppam, Pugalur, Samalkot, Pettaivaythalai and Tiruvalla is contributing to export expansion from its own output which is expected to improve in 1964 significantly to a lakh of tonnes. Export obligations have been met regularly and planned extensions are in progress. Sugar exports are now supplemented by confectionery in which E.I.D.-Parry has been firmly established as manufacturer for fifty years and exporter for twenty-five years.

The E.I.D.-Parry Group helps the South Indian cane-grower with fertilisers, (especially superphosphate) to raise the yield per acre and get the benefit of higher prices. In 1963 the Group supplied 25,000 tonnes of fertilisers to the sugarcane industry alone.

Other manufactures of the Group include sanitary-ware, acids, chemicals, carbonic acid gas and industrial and potable alcohol

Started as a small trading concern in 1788, the Group today comprises nine companies of substance, offering employment to more than 10,000 people, and continues expanding its activities in pace with the nation's march to economic independence.

THE E.I.D.—PARRY GROUP, MADRAS

PLAY YOUR PART IN THE NATIONAL DEFENCE EFFORT

demand for making agriculture a Central subject. If this was done, it would only create more difficulties between the Centre and the States, he said. The Minister also opposed the resolution for setting up the Parliamentary Committee on the ground that the constitution of this Committee would sidetrack the food problem. He was, however, considering the suggestion of Dr. B. R. Sen, Director-General of FAO, for setting up an agricultural commission, he said.

Question Hour

Rupee's Value : The Minister of State for Finance, Mr. B. R. Bhagat, refuted in the Lok Sabha on December 3 the suggestion that the internal value of the rupee had gone down to 17 paise. He also denied that the value of the rupee in foreign countries had slumped and that the rupee needed rejuvenation. The Union Minister for Finance, Mr. T. T. Krishnamachari, added that the fall in the value of the rupee in unofficial exchange transactions abroad was not a matter on the basis of which the strength of the economy of the country or the stability of the rupee could be judged. The Government and trade channels dealt in foreign exchange only at the official rates. Explaining the reasons for the difference between the official and the non-official rates of rupee in terms of dollars, Mr. Krishnamachari said it might be that a lot of people were going outside India and perhaps they were prepared to give more rupees for the dollar or the pound-sterling. Mr. Bhagat further said that the present rise in prices could not be attributed to the change in the currency value.

Public Sector Returns : Mr. Bhagat told the Rajya Sabha on December 2 that the public sector industrial and commercial enterprises, other than the departmental enterprises and Hindustan Steel, had shown a net return of 7.8 per cent (on the capital invested) during 1962-63 as compared to the net return of 5.2 per cent during 1961-62. The three public sector steel plants, he said, reached their capacity production only towards the end of 1962-63. Provisional figures for 1963-64 indicated that Hindustan Steel was able to show a profit of about Rs. 14 crores in that year, after providing for depreciation but without providing for payment of interest, as against a loss of Rs. 6 crores in 1962-63. Besides, like the private steel companies, Hindustan Steel also paid Government excise duties and surcharge on iron and steel. The railways, Mr. Bhagat added, gave a net return of 7.4 per cent during 1962-63, as against 6.6 per cent during 1961-62. The electricity undertakings in 1962-63 showed a net return of 7.6 per cent, as against 7.2 per cent in the previous year. As for the fourth Plan, it had been suggested that most public sector enterprises should aim at obtaining a net return of 12 per cent.

New Gold Reefs : Mr. Krishnamachari told the Rajya Sabha on December 2 that a new gold reef had been recently discovered in the southern extension of the Kolar goldfields in Mysore. This reef had been developed so far only to a shallow depth of 63 feet, but deeper development had now been taken up. An extension of the Champion Lode, the major reef of the Kolar goldfields had also been traced in the southern part of the mine in an area hitherto considered barren. No definite figure for tonnage or grade of ore could be quoted at this early exploratory stage. Mr. Krishnamachari added that there was also a report from the Hutti goldfields that four new reefs had been discovered there.

Industrial Policy : The Deputy Minister in the Ministry of Industry and Supply, Mr. B. Misra, told the Lok Sabha on December 4 that no shift was contemplated in the Industrial Policy Resolution in respect of the allocation of industries between the public and private sectors.

Scoter Manufacture : Mr. Misra told the Rajya Sabha

on December 3 that in view of the shortage of scooters in the country, the Government was considering grant of new licences for manufacturing scooters.

U.K. Surcharge on Imports : The Minister for Commerce, Mr. Manubhai Shah, told the Lok Sabha on December 4 that India would lose about Rs. 10 crores a year owing to the surcharge levied by Britain on imports. While the Union Government sympathised with Britain in her balance of payments difficulties, the British surcharge would hit India's exports very hard. "We are very much concerned about this and have made suitable representations to the British Government", added Mr. Shah. The Minister, however, expressed the hope that Britain would agree to remove the surcharge at least on handloom products which provided a large amount of employment in India. Following the GATT Conference, a number of countries Mr. Shah said, had relaxed duties on commodities exported by the developing countries. These duty concessions had come into force recently, but the benefit to India was already apparent.

Cloth Availability : Mr. Manubhai Shah also told the Lok Sabha on December 4 that there was no scarcity of cloth anywhere in the country; State Chief Ministers had told him not to bother about the cloth position as there was no shortage. The price index, Mr. Shah added, showed that there was no increase in the prices of cloth during the last three months. The total cotton crop this year, Mr. Shah further stated, was a record one around 60.5 lakh bales. Imports during the current cotton year were expected to be about 9.5 lakh bales, including PL 480 imports from the USA. The large crop of indigenous cotton alongwith imports and the usual carry-forward from the last year would be adequate for increasing cloth production.

Fertilizer Manufacture : The Minister of State for Petroleum and Chemicals, Mr. O. V. Alagesan, told the Lok Sabha on December 4 that the Government had made it clear to the American Consortium which had come forward to assist in the setting up of fertilizer plants in India, that "we would like to have the controlling interest in the plants." The Consortium, Mr. Alagesan added, had undertaken a feasibility study for the establishment of an additional capacity of one million tonnes of nitrogen. The cost of this study would be between Rs. 12 lakhs and Rs. 19 lakhs. Fifty per cent of this would be borne by the Union Government in rupees. No payment had so far been made to the Consortium. Its report was expected in the beginning of the next year. Regular negotiations and the pattern of financing the plants would be discussed then.

Pig Iron Manufacture : The Deputy Minister for Steel and Mines, Mr. P. C. Sethi, informed the Lok Sabha on December 4 that apart from liberal licensing of capacity for the manufacture of pig iron in the private sector, the Union Government was setting up an additional blast furnace each at the steel plants at Bhilai and Durgapur by way of advance action for the expansion of these plants under the fourth Plan. The Government, Mr. Sethi added, was also considering the possibility of setting up of a low shaft furnace at Bhilai with a capacity of 150/200 tonnes of pig iron a day. The Deputy Minister further stated that feasibility studies had been commissioned at eight locations in the country with a view to setting up of a few blast furnace complexes for the production of pig iron. A technical committee had also been appointed to suggest measures for increasing the blast furnace efficiency at the existing steel plants by effecting technological improvements so as to increase pig iron production at these units. The Deputy Minister, however, did not expect self-sufficiency in pig iron to be achieved by 1967. After that year it might be possible to meet the domestic demand from indigenous production.

Financing Limits to International Trade

C. SURIYAKUMARAN *

INTERNATIONAL TRADE has now moved on to a stage when a number of financing problems seem to assail it with increasing force. True, finance has always been at the core of international commerce. The struggle for command over a universal means of exchange has been more at the root of the trading practices of nations than the exchange of goods itself — whether they were the practices of the mercantilist period, or of the heyday of laissez-faire, or even of current twentieth century liberalism. The past contradictions arising out of a mutual struggle for possession of 'gold', which led to what may be termed Keynesian and post-Keynesian thinking, and the attempts of recent years to reconcile national employment and development objectives with stable international commerce, are of course well known and do not call for recounting here.

The starting point for a discussion of solutions to current problems may conveniently be said to lie in two phenomena that exist today in the field of international trade and trade expansion. One of these is the alleged state of inadequate international reserves for the satisfactory finance of international trade. Although often described in a generalised way, it is essentially a feature that is of relevance among advanced countries. The gradual supplementing of gold with strong currency media, primarily dollars and sterling, has led to a situation where the stability of international finance is now dependent on the internal stability of the economies whose currencies are being used as international money. The recent pressures on Sterling and the Dollar have led to intricate swapping arrangements among central banks of advanced countries, aimed at sustaining the strength of the economies concerned and the stability of the international media used. Since the swapping arrangements do not constitute an addition to international reserves, but are really a reserve creation mixed with a reserve transfer, they do not bring a lasting increase in owned reserve. In the process, a new manifestation has emerged as to the meaning and content of reserves. In the meantime, those advanced countries which now are using Euro-dollars in massive proportions, have themselves very large owned reserves of international exchange media. These countries, and particularly those of the Common Market, have still not developed an international currency of their own. Perhaps if this occurs the apparent shortage of international currency reserves now felt would ease. It is still an open question, however, whether this is the proper basis for future financing arrangements as well.

Absence of Reserves

The second current phenomenon referred to earlier belongs to the developing countries. To these countries the problem of finance in the international sphere is not one of an inadequacy of reserves but one of its total absence. Their requirements do not get met by a mere accretion of 'gold', for the reason that any such increase will be fully spent. The inadequacy of the present nature and levels of international assistance, from the point of view of developing countries' need, is therefore not even an open question; it is well nigh self-evident. And so we have the insistent pressure from under-developed countries for primary product prices to be determined by considerations outside pulls of supply and demand, and for preferential zero tariffs on their raw materials and manufactured goods. The same situation has led to the increasing use of foreign grant and soft loan arrangements to

The subject of international liquidity has a long bibliography which has in fact intensified recently (Triffin, Bernstein, Kaldor, the 'Paris Club', to mention some active recent participants). No attempt is made therefore to list such references, even though in the discussion of current patterns in this article, certain points clearly derive from already published contributions, and some others are too widely known to be referred to sources.

The concentration in the agreement is in leading to the idea of 'local currency' settlements (wherein the globally deficit countries' currencies made out to the surplus countries in trade balance settlement, constitute the resources for the 'international fund') and the corollary arrangements relevant to such a scheme. This idea, implying automatic creation and adjustment of the required foreign exchange media for settling the net dues of international trade, is of course different from policies for quota contributions based on gold or for commodities as a currency base or for revaluation of gold etc. (whether with or without a world currency). It has links, however, with the multi-lateral clearing or pool clearing idea advanced in the past — e.g. by Schumacher as long ago as 1943 ('Economica', May issue), as also in some ways with the Bancor scheme. It is an interesting commentary that after all these years, the directions for resolving the problem of international liquidity should still lead substantially that way, though with adjustments in the light of years and new experience.

meet developing countries' import requirements. It is also worth noting, on the side of certain 'surplus' countries, and presumably many more in the future, that these countries have problems of surplus production in certain sectors for which it is in their own employment interests to seek export markets. Normally, in the absence of international reserves among potential importing countries, such export of surplus output should be rendered impossible. And so they still are in respect of some of the surplus output in many sectors, but need not be, if only the methods of international financing did permit it. While developing countries have been driven to ask for better primary product prices, yet one cannot escape the feeling that such approaches are no more than asking for free income transfer from advanced countries to under-developed countries, since the total requested incomes obviously exceed the economic value of their products. The fact that the terms of trade for raw materials vis-a-vis manufactured goods have been against the former is, after all, no more than an economic manifestation. As for the charge that there have been absolute falls in the terms of trade, there is hardly uniform opinion on this². In fact, rising prices on a long term trend for primary produce have been argued out as a historical fact.

We have, therefore, within the limits of these two phenomena in world trade, what is essentially an unnatural limitation on the scope of such trade imposed by the volume of monetary reserves available in the case of strong countries, and by the volume of international income transfer decided upon in the case of weak countries. In either case, the im-

IMMORTAL MESSAGE OF TRUTH AND LOVE

After he had attained 'enlightenment', the Buddha, centuries ago, gave a stirring message of truth and love that inspired millions of people all over the world. Poets and writers, artists and craftsmen, down the ages, have faithfully recorded the teachings of the Buddha on tree-leaves, on stones and temple walls.

And now it is through the powerful medium-paper that the Buddha's immortal message is conveyed to mankind.

ORIENT's writing and printing papers are there to meet the country's needs.

port potential or export possibility is not determined by the internal economic capacity of the countries concerned, as would evidently be the case in the matter of trade between areas with one country. Clearly, the important missing factor at international level is the absence of a single currency. To achieve this or more correctly to re-outline financing methods in a way that would approximate to this, would be the ultimate problem for solution. Vigorous thinking has undoubtedly gone on, on this, for years — particularly since Bretton Woods and even, as some would claim, since the time of fixed exchange rate systems. What follows is an attempt, in the light of the doctrinal bases in current international financing, and in the light of what countries are in effect practising or working towards, to isolate the realities of trade finance.

In the interest of achieving our objective, let us try to go over some of the basic elements in international financing, which in a way are known well enough. As in most other spheres, however, the simpler elements in a process tend to be overshadowed by the complex operational features of a system, and as such tend also to be lost sight of after a time. Under present systems, there are, despite claims made for fixed exchanges as approximating to unified currency, important distinctions between national economic and international transactions. In the one case, the media of exchange are always the currency (or quasi-currency) and not reserves whether they be real or fiduciary. Reserves within a national system may, of course, be adjusted in an intra-bank sense, but the total structure of 'money' remains the same and is influenced by other factors and by conscious government policy. The limit to transactions by income holders' is, therefore, their income itself (or producing capacity) and not the position of gold or 'near gold'. In the other case, i.e. at international level, 'not' against 'note', or more properly book entries, will function as the media of exchange under a situation of equilibrating transactions. This is also the same as saying that the transactions take on the form of goods against goods. As soon as the trade flow ceases to be equilibrating, the foregoing does not hold good and settlements will then need to be made in gold or internationally accepted media, whose availability within national economies is determined not by national income (or money in circulation) but by the goods tradeable for such gold or allied media; not goods that could yet be produced internally but only such lines as could be exchanged for gold, dollars or sterling. In other words, the limit to international trade is set not by national income or producing capacity, but by the proportion of international media directly or indirectly available in total income. Viewed from the surplus country side, the size of the market in international trade is determined by the volume of goods available in exchange and not by total income and spending capacity of the physical market area concerned (i.e. the importing country).

Trading in Goods

Now, essentially international trade is not trade in gold or other similar media but in goods. And so, if one may elaborate in terms of an example, it is financed, say by the U.S. importer from Ceylon lodging his local currency (i.e. dollars) to the Ceylon exporter's credit in New York, and the Ceylon importer lodging his Rupees to the U.S. exporters' credit in Colombo. Since this implies a U.S. exporter and Ceylon exporter in the scene to equivalent value, the two holdings are extinguished by using the funds created in the transactions. If this were followed now by a transaction, where there was only a Ceylon importer (without a U.S. importer), Rupees to the U.S. exporter's credit will emerge in Colombo, which conceptually the U.S. exporter has to hold on to (because, of course, no Rupees will be sent to the U.S.), or more realistically the exporter's bank will hold on to, after paying the former a dollar equi-

valent. Under present international arrangements what obligations now emerge for Ceylon? Either there must be an exporter who could send an item of equivalent value to the U.S., or the country must stop its import obtained in the earlier equilibrating trade mentioned and settle the outstanding debt. If the U.S. bank is, however, prepared to hold on to the Rupees created in the second one-way transaction, (incidentally, the basic process of an international currency) there is no further debt and Ceylon's import limit is determined by the global demand for goods of its internal money income. Whether Rupees are so held or whether they are required by Ceylon exporting goods or gold, the U.S. exporter himself receives dollars from his bank and there the transaction for him is complete. When the U.S. finances an export beyond the equilibrating point, the financing system within the U.S. economy remains the same; it is only that the U.S. does not receive goods or gold or equivalent, but holds Ceylon Rupees. The position, therefore, is that internally exports are dollar financed (as always they are under any system) and externally in this case, are Rupee financed.

Cutting Down Exports

Now, it is worth noting that if the U.S. does not wish to adopt a system such as this in the case of an under-developed country (or even an advanced country placed in a similar position), the only course open to it is to cut down its own export and thereby depress its own employment and income levels; or, in the case of countries helplessly dependent on U.S. commodities, to maintain exports at the high disequilibrating level and create dollar re-payment obligations by deficit countries sometime in the future. From the point of view of financing, this is the same as the U.S. holding Rupees, except that, unlike under a unified currency, interest costs have to be met by the deficit country till such time as the latter exports adequate goods to wipe off the debt. Internally, within the U.S. economy, the position is the same whether the export surplus is paid for and received in Ceylon Rupees or is made out as a dollar loan to Ceylon. Dollar payments are made out to the private American exporter by his government in either case. Under either system, an imbalance is created within the U.S. economy between goods and money, with a consequent price pressure on national product which is larger by the amount of the exports unrequited by corresponding commodity imports. How far the U.S. as a surplus country would keep exporting beyond the equilibrating point would, of course, be determined by the capacity of the economy or more properly the U.S. budget, to husband surpluses or run deficits for exchanging dollars for the Rupee holdings of its banks. The parameters to trade are thus the economy's financing capacity on the surplus country side and the government and private income holders buying capacity on the deficit country side. Even under the present context, therefore, the availabilities of international reserves are not the limiting factor in trade for most deficit countries. The question is whether this should be pursued to its logical conclusion and a system accepted where 'local currency' holdings constitute payment in settlement, with the possessor of the currency using it as part of its international financing reserves. For the under-developed countries, the question is whether they should go on asking for higher prices for their primary product as what is essentially charity, in the face of natural economic determinants, and the alternative possibility of a payments system which gives all countries the chance of being in the same position as those that now have large gold and allied reserves.

In a situation where trade is between the U.S. (assumed for the present to be a surplus country) and another industrial country (assumed to be in deficit with the U.S.), the trade disequilibrium has to be settled ultimately either by an increase in imports by the U.S. or by suffering a cut-back in its

exports. The alleged fact of international reserves coming in to sustain a continuing flow of disequilibrating trade has over and over again proved illusory. As Keynes pointed out long ago, gold or allied media held as reserves are either sterile and, therefore, meaningless in that form, or they have to be used and, therefore, soon reach the limit of their capacity. The next stage, i.e. when there is no gold left, provides a more realistic limit, where the surplus country has to decide how much to import from the deficit country, and how much of its surplus exports it should itself finance. Where the deficit industrial country is in a strong position economically it would in fact seek to recover its lost gold by cutting down U.S. exports. And so this seesaw can go on, with no substantial strengthening of trading power by either country but only a generally restrictive and, as some have observed, inherently anti-growth bias. Where the industrial country is in a weak position, as was Europe during the Marshall Aid days, the U.S. will, if it wants to maintain its level of export trade, soon have to hold 'local currencies', and euphemistically rename the whole or part of it as capital credits. The interest paid by the deficit countries does not seem to be so much a charge for not paying in money for the imports made, as the price for being helplessly dependent on the imports. Among the western countries today, it may be possible to assume with reason that countries are no longer helplessly dependent in this manner. One may assume that they could cut back potential surplus countries' exports. It could thus be advantageous to all advanced countries to talk less in terms of transferring reserves or granting loans, and more in terms of settling disequilibria while extending exports and holding each other's local currencies. This in fact is really what has been happening in the North Atlantic Area in the last few years. The totem attached to the Reserves Idea has carried the fixation that the objective of national policies in trade has been to strengthen reserves positions. In fact, the sole objective of recent trade trends has been to achieve balance on an upward trend of commodity trade, with no one gaining substantial gold resources, but rather moving towards a system of governmental credit more in the nature of overdraft financing.

See-Saw Game

And so the position is that, except where local currency is being held, the international reserves accumulated by one country or another are constantly seesawing in a process of won, lost and won. Since this is more often achieved by contracting trade than by expanding it (that is by surplus countries increasing imports) the only consequences are stepping down of GDP in the export sector of the surplus country and of Gross National Expenditure in the import sector of the deficit country. Total world output goes down³, for the transitory gain (or recoupment) of international reserves. Under the alternative 'local currency' holding system, world income tends to remain high, with exports continuing at their own levels and imports by surplus countries very likely increasing. Among industrial countries the chances of equilibrating at a high level of total trade are much greater; while among developing countries the chances of others absorbing their exports are equally increased. Trade will thus be related not fortuitously to the holdings of world exchange media but to country's capacities in export and import.

In this situation deficit countries can find that imports are welcome so long as surplus countries care to hold outside currencies in exchange. Surplus countries need not face the same demands from deficit countries for importing goods such as primary produce, that they need not use, whether for reasons of cost or quality. The case for reducing unfair tariffs on primary produce would, of course, remain. As for the actual

prices of this produce, they could afford to be determined, as they are, by market conditions which include the essentially rational substitution of natural for synthetic raw materials by advanced countries. Such deficit countries' payment obligations over and above what their primary and other exports earn for them, would be met by payment in local currency. The surplus countries could now readily do away with their duties on primary goods and simple manufactures and enjoy a welfare increase by the import of these in the knowledge that overall economic activity will be more than compensated by increased exports. This expansionist process would also render much easier the rationalization of such internal sectors of an advanced country (of which 'Lancashire' has been typical) as may be affected by the exports of developing countries.

The control function of international reserves was primarily to show that a country was importing more than it was exporting — and vice versa. The corrective action it prescribed worked against maximising world production and even world trade; it worked against efforts at development assistance to developing countries; and against maintaining high and steady GDP levels in advanced countries. The function of indicators will now be performed by the size of 'local holdings'. The corrective action called for will be action prescribed by national development policy and not by the unequal possession of gold, dollars or sterling. In the same way as a developing country would not internally encourage luxury goods production, it would not, for fiscal and developmental reasons, encourage luxury imports. Yet the point is that curbs on import will be imposed not for 'balance of payments' reasons but for national income reasons. The test of this would be in the fact that the country could and would import capital and intermediate goods, as well as essential consumer goods, to the measure required by national development needs —

Eastern Economist 20 Years Ago

DECEMBER 15, 1944

The chief bottleneck in the way of rapid development even after the war is feared to be the paucity of trained technical personnel and capital goods. It will be a mistake, however, not to distinguish (1) between imports of capital goods which are paid for out of our own resources and those which accompany foreign financial assistance; (2) between capital equipment which is available only on condition of our acceptance of foreign loan and that which is not so hedged in with conditions; and (3) between different kinds of offers of assistance which would make for varying degrees of dependence on foreign technical personnel. In the earlier stages of our economic evolution, say, particularly in the nineteenth century, these distinctions perhaps were not material and we perhaps needed foreign financial and technical aid and for a continuously long period, though it by no means follows that the influx of foreign capital did actually result in positive benefit. For, foreign capital exploited without imparting expertise, and Dadabhai denounced the drain. But today India is dependent only on foreign technical help, and not on financial assistance. Barring a heroic rate of development which would compress the progress of generations within the fraction of a life-time, our accumulated external assets and domestic resources must be adequate for any high rate of expansion that might be visualized by a Government even of our own choice.

something it could not have often done under the current system of trade financing. Developing countries may also, for reasons of building their national economies, grant protection to industries which in the long run will be economic. Subject to such saving clauses, however, the request to curb imports would really come from the exporting countries which have to carry the internal financing burden of effecting surplus exports. These surplus countries would also desire certain limits to their 'local currency holdings' and would, therefore, urge the countries concerned to develop exports, and would welcome such exports.

As also mentioned earlier, where countries run export surpluses, there is more money than goods within the economy with some price pressure involved assuming unchanged fiscal policies. This is so, however, whatever the international financing system. The only point for gold or equivalent as a reserve holding is that the internal money - goods balance can be restored by financing imports from a third country. But this balance can be effected under the local holding system itself if the third countries too operate their foreign trade under the local currency reserve system. If, for instance, a deficit country (B) has settled its payment obligations in its own currency to the surplus country (A), but has 'local currency' holdings of a third country (C), this would be set off against A's holdings of its own currency, assuming that country C is in surplus with country A. All this will be much in the manner of international transactions as now known. A residual global deficit, if it exists, will, however, be held not in gold or equivalent, but in a collection of local currency holdings. So long, however, as any country can import goods by paying in its own currency, the need for other media of exchange will not arise.

Best and Realistic

This process is, of course, international income transfer at its best and most realistic. Theoretically an under-developed country can meet huge portions of its consumer needs in this way. In practice, however, working arrangements are bound to emerge wherein local currency holdings by foreign countries will, if not limited by, be at least related to potential export capacities — a point which will now be more closely studied by exporting countries themselves than before, when export by almost anything would be sought so long as the receiving countries had gold or equivalent to pay in exchange. But, as suggested earlier too, these export capacities will not be confronted by co-existing import curbs of one type or other by advanced countries. There is, on the contrary, likely to be a great endeavour among advanced countries to absorb various types of consumer goods, and especially to help in their future development. As for advanced countries, there is bound to be unrestricted flow of goods among themselves at an increasing pace, with trade either balancing at much higher levels or deficit/surpluses accruing again at much higher levels of trade than hitherto.

The discarding of the international reserve idea in its present form will afford unrivalled opportunity to under-developed countries to overcome today's critical obstacles to their development. The situation where masses of food, raw materials and other intermediate goods are available in the rich countries but cannot be sent to the poor for want of international reserves, will cease to exist in these paradoxical forms. The current special arrangement under PL 480 export, as well as the several soft loan arrangements being mooted and tried, are indeed a recognition of the inevitable logic of the foregoing argument. These are indeed only marginal attempts towards this new approach, yet they are sufficient recognition of the rationale of a local currency holding system. Given the surpluses emerging now in Europe and elsewhere, and the

great capacity increases in world GDP that may be expected in the coming years, a solution to international trade finance is obviously being awaited. As seen before, the lip service paid to the solidity of the international reserve idea has not prevented the governments and central banks of advanced countries from innovating a number of 'heretical' measures.

Mention was made of the approximation of the local currency system to a unified currency. It is, of course, clear that the approximation is not complete unless surplus countries' local currency holdings are themselves as freely utilizable within the deficit country as the currency of other income earners of that country. In practice, therefore, institutional arrangements would emerge which partly make this possible and partly render the deficit country liable to limits of sorts in the use of local currency systems. For instance, while payment in local currency would constitute settlement of obligations up to certain determined levels, beyond a point the deficit country may be required to pay a charge on the local currencies held by others (in other words the conventional foreign loan); for a further segment of local currency holdings the surplus country may be permitted to spend within the country on agreed investments and purchases; and so on. The idea here is not so much to relate import capacity to international exchange media, but to relate total investment and consumption to current and potential GDP levels. It means also, therefore, that the relation is meant to avoid a country undertaking a level of Gross National Expenditure by means of uncontrolled inflation.

International Reserve

As also mentioned earlier the local currency holding system would mean that a set of currencies of the world would now constitute the international reserves of world trade and play the same role as gold, dollars and sterling jointly do now. Theoretically, the fact that under local currency holdings, international financing reserves would be composed of weak currencies as well as some strong, could mean that an unacceptable basis exists in place of current exchange media. Theoretically also, however, this should not be so if every country concerned does partake in trade on the basis of local currency holdings. The fact that Germany for example may hold considerable Rupees would not hinder it from importing from the U.S., under a system where payments for the U.S. imports are to be made in marks and where, in fact, the U.S. could take over Ceylon Rupees to the extent that there is a residual balance. This is easy to see if one could only remember that the whole objective of reserves accumulation by modern countries is to be able to import — and this they are able to do under the alternative system with the added advantage that they are not forced when already in surplus to restrict their exports.

There is no doubt, however, that in history, the passage from one mental horizon to another has rarely rested on logical demonstration. In this sense, the role that a World Central Bank can play in transforming the system could be both impressive and convincing. In the same way as governments have given respectability to paper money, the World Central Bank could 'transform' net local currency holdings into World Central Bank notes giving similar quality to international money as Governments do to theirs. Perhaps something like a guarantee by strong surplus countries, in addition to pledges by all others, could be available to the World Central Bank, to provide the desired 'goods equivalent' (not 'gold') to claimant countries in the event of currency collapse in any of the country or countries whose currencies form part of the 'local currency holding' international reserves. These 'holdings', although of a deficit country currency, belong not to that country, but to the outside surplus country. What

the latter is doing is essentially to put out this holding, instead of its gold, to finance international trade. If the currency of the holding in question gets debased, such local currency would revert as a charge on the country concerned. There would be no call for 'gold', but the country will re-accept formal responsibility to repay 'in goods' or in a later stable currency. Meanwhile the claimant countries would receive 'goods-equivalents' on the basis of the guarantees and pledges available to the W.C.B., with the 'local holdings' frozen out of international financing flow. Subsequent immediate trade by that country will be only on a 'barter' basis, relieved to the extent that foreign and international loans are bilaterally available. This is much in the way of what would occur under present financing systems as well. Once restored to financial stability and equilibrium, however, not only would the rehabilitated local currency take its place in international finance, but the earlier local currency holding held by the countries will be put back by the W.C.B. in settlement of used guarantee obligations and pledges⁵. In practice, institutional arrangements, to which reference was made earlier, would, as in present-day trade financing, limit the unrestricted accumulation of local holdings even before a currency comes to a stage of collapse. If each local holding were dominated to a world standard of measure (and thus isolated in value terms from local inflationary collapses); and if the W.C.B. maintained certain 'liquidity ratios' (between weak and strong currencies) the world of international finance would skip the history of 'bank-runs' that national monetary experience went through more than a hundred years ago before it came to its present, fiduciary-based, unassailable stage.

Purposeless Attachment

The trends and emerging practices as between industrial countries, as illustrated chiefly in the North Atlantic Area, make it clear that attachment to gold or equivalent is purposeless and unnecessary. No one country would suffer the other to carry on long with a process which brings gold or allied benefits to the other countries — and vice versa. Similarly, parallel trends and emerging practices for advanced countries vis-a-vis developing countries leave no doubt as to the fiction that is the international reserves idea. If one were to choose a limited adoption of the local currency financing system, it would appear safer to countries to begin in the industrial west; but to begin elsewhere in the backward areas of the world would be the more necessary step. The greatest

need, however, is to overcome the mental subordination to past ideas. It would then be possible to cease interpreting the present world with a past theoretical instrument. As to the inevitability of change, there is no doubt. What is in doubt is whether the realities will be comprehended sooner, or later.

- 1 The preliminaries to the World Trade Conference had apparently some interesting postures taken up by countries. The advanced countries each suggested generous measures of income transfer of various types, in each case calculated to be more at the expense of its industrial neighbours than of the proposer. On the side of the developing countries a string of requests emerged adding up to an impressive demand for larger markets for raw materials and manufactures at prices specially advantageous to these countries, along with demands for more credits at lower interest and for longer periods. The fact is that under present systems of trade finance, such scales of income transfer become impossible. For example, the Common Market made timid concessions to trade liberalism last year and found its global commercial deficit double to the figure of \$2,800 million. So long as international reserves are the determinant of trading ability such policies will continue to be impracticable.
- 2 Note for example Haberler 'Integration and Growth of the World Economy in Historic Perspective'. "American Economic Review," March 1964.
- 3 The volume of world output, as Nurkse reminded once, is a truer criterion of world prosperity than the volume of world trade.
- 4 All useful trade promotion measures familiar today would, of course, fit into the new scheme. For instance, the system of foreign investment on the basis of purchase of the outputs of those investments; or the 'division of labour' argument brought out in one of the resolutions of the World Trade Conference, where the simpler stages of an industrial process are desired to be undertaken by advanced countries in the backward countries — these are types of useful action which can certainly be developed, and will probably find a more welcome atmosphere under 'local currency holdings'.
- 5 An alternative procedure would be for a special set of W.C.B. notes to replace this set of holdings, to be withdrawn from circulation later, when the currency in question has been rehabilitated.

THIS BOTTLENECK MUST BE BROKEN

Hindustan Motors . . . partners in India's industrial transformation

Today the whole country is astir with economic and industrial development. All our Five Year Plans aim at raising the standard of living of the masses. Very often, however, the development programmes in the country are obstructed by a bottleneck in transportation. *This bottleneck must be broken.*

Not all the rail wagons and all the railway tracks we plan to build can put us on the road to economic growth at the desired pace without the adjunct of an efficient system of motorized transport.

Countries in the West have economically forged ahead largely through the development of road transport. In the USA, for instance, some 2.8 million trucks are used in the agricultural sector alone, and the truck transportation industry provides employment to one out of every nine persons.

We are still far behind in road mileage as compared to the country's territorial area. While England has 230 miles of road for every 100 square miles of area, India has only 12 miles of road per 100 square miles. The rate of production of motor vehicles must be stepped up. In order to bring about reduction in the price and in the cost of operation, some relief must be provided in the heavy incidence of taxation on motor vehicles. At present, direct and indirect taxes come to over 45% of the "on-the-road" price of trucks and buses produced in India. Again, the licensing policy on motor trucks and buses should be rationalised and the vexatious curbs imposed on inter-state road transport should be removed.

Only in circumstances congenial to its growth can the motor vehicle industry effectively contribute to India's economic development.

WINDOW ON THE WORLD

In That Other Germany

BY THE EDITOR

LAST WEEK I attempted to present some aspects of the West Germany I saw in October this year. After staying in that country for about 15 days, I went to East Germany where I spent about a week. The Federal Republic of Germany, as I had said, was more or less familiar ground to me. The German Democratic Republic was a new experience. Not that I had never been in the eastern part of Germany before. As a matter of fact, on my previous visits to West Germany, when I happened to be in West Berlin, I had managed to spend a tourist's afternoon in East Berlin. Like most others who had to make this comparison, I was also struck on those occasions by the drabness of the eastern city which the glitter and the gaiety of that other opulent metropolis across the way served to emphasize all the more. I was also aware during my earlier visits to West Germany of the moan and murmur of the economic dislocations and difficulties which were then being experienced in the eastern region.

But it was only this year that I had an opportunity of spending some time not only in East Berlin but also in other parts of the German Democratic Republic and getting to know by direct personal observation something of the social and economic processes there. My stay in East Germany and my schedule of travels and discussions in that country were taken care of by the Press Department of the Foreign Ministry of the German Democratic Republic, which looked after me with characteristic German hospitality and competence. All the same, whereas my trip to West Germany as a member of the group of journalists had the advantage of the months of meticulous preparation which the Press Departments of some of West Germany's top business houses and corporations had jointly put in, my programme in East Germany was largely improvised after I had actually arrived in East Berlin.

Finding My Way

This scheme of things certainly had its inadequacies. I could not, for instance, meet Members of the Government or top political leaders; nor was it possible for me to visit some of the industrial centres or industrial plants which I would have greatly liked to study. The hurdle mainly was lack of time and the fact that some of the interviews or appointments I had in mind could not have been arranged at short notice. I was, however, not altogether sorry that my programme was largely unplanned because this had its compensations. For one thing, I could move about in a relaxed manner, see things and talk to people in an informal way, go where I wanted and when I wanted and above all so order my movements that I was left to myself for at least some part of each day. If in the process I did manage to visit some very interesting places, meet well-informed officials and plant managers, talk to articulate party loyalists and local party bosses and meet a few kindred spirits in my own profession, it is surely reasonable that I should consider the time I was in the German Democratic Republic as time well and usefully spent.

A question I have been frequently asked lately is whether I did not find East Germany economically very much behind West Germany. This question may have a point, but I feel that by now it has become an exercise in rhetorically labouring the obvious. The German Democratic Republic is certainly considerably less well off than the Federal Republic of Germany and is unlikely to draw even in a hurry. But it would surely have been a miracle had it been otherwise. Leav-

ing aside differences in political and economic systems, the basic fact remains that the economy of the eastern part is far less richly endowed with resources than the economy of the western part. Added to this have been other disparities notably the great advantage in foreign capital and commerce which the latter enjoys by being linked to the economies of some of the most industrially advanced countries of the world. The differences in basic resources, however, could alone explain why East Germany must be inferior in economic development to West Germany, now as well as over a period. I found that the people in East Germany with whom I came into contact were acutely aware of this deficiency in their heritage. They were, in fact, never tired of underlining the fact that, before the War, only two per cent of the hard coal, six per cent of the iron ore, one per cent of the pig iron, or seven per cent of the raw steel produced in Germany as a whole was produced in the eastern part. This had meant that, after the division of the country, many of the major industries in East Germany, particularly the machine building and chemical industries, found themselves abruptly cut off from a national metallurgical base.

Serious Handicap

The inadequacy of natural resources, moreover, is only the most serious of the handicaps. There are certainly others and the existence of some of them is conceded, although guardedly, in East Germany itself. For instance, there was the reluctant admission that most industries in East Germany lagged behind their counterparts in West Germany by about 25 per cent in the matter of productivity, while in the case of some the gap was even higher at 40 per cent or more. But, at the same time my informants were generally inclined to believe that it was only a matter of time before this deficit was largely made up. According to them the last 15 years had been spent in laying the political and social foundations of a new order with the result that the economic tasks were only now to be attempted with full regard to efficiency in organisation and methods. I myself am inclined to favour a somewhat different interpretation. I believe that economic progress generally and sound industrial development particularly, had suffered partly because of doctrinaire and dogmatic approaches and partly because of the sheer immaturity and inefficiency that are necessarily attendant upon adventurism, whether in politics or in economics. I also believe that those who are in charge of the destinies of the German Democratic Republic are becoming wiser with experience and are learning from their mistakes.

I am supported in this assumption by a significant remark which a senior official in East Berlin made in the course of explaining to me the philosophy and the machinery of planning in East Germany. He said that whereas in the past the approach was to rely on physical means of direction, viz., executive fiat or bureaucratic decrees for achieving targets of production in individual industrial establishments, the tendency now is to switch over to economic means of influencing output and performance in factories and plants. He elucidated this point further by informing me that whereas in the past a specific volume of output was fixed for a piece of machinery or for a plant, present practice is to levy a capital tax on the value of machinery supplied to an industrial establishment. Under the former arrangement there was the temptation for plant managements to fulfil production quotas by sacrificing quality or ignoring production economies. But since the tax

The progress of economic integration under the Comecon,

I heard it argued with great passion that the German Democratic Republic simply could not afford to let the Government and industry on the other side poach at their pleasure on the precious resources of educational or craft skills which the East German people are creating in their younger generation through great expenditure of public treasure and effort. Indeed, I was asked how it became a crime on the part of the East German Government to prevent the out-flow of its most productive asset — the educated and skilled young manpower of the country — when the capitalist countries take measures as a matter of course for preventing, for instance, exports of capital where such out-flows threaten to compromise their currencies or damage their economies. My reply naturally was that human beings could not be treated as if they were bank notes or packets of share-holding. But I must confess that I was uncomfortably aware all the time that even outside the Communist world the freedom of men to move was a freedom severely restricted in practice not only by passports and visas but by the emigration policies or immigration laws. In any case, however much one might lament the Wall that divides the mind and heart of Berlin — and lament we all must this very human tragedy — the fact remains that the

11

Rostock is about 180 kilometres to the north of Berlin, while Jena is about 200 kilometres to the south. But in terms of motoring, Jena is appreciably nearer Berlin than is Rostock. This is because the way in the north is through a relatively less developed agricultural country where the traffic on the road is often held up at railway crossings. The communications between Berlin and Jena are however more highly

of such projects which are in progress in many areas and centres of the German Democratic Republic whether in the old cities, such as East Berlin or Dresden, or the new industrial centres, such as Rostock.

I spent the best part of a day going around the new housing development in Hoyerswerda, and this gave me a fine opportunity of studying an impressive example of "pre-fab" housing in action. I saw that a gang of six construction workers, including a crane operator and the team's foreman, were all that were needed by way of labour force to assemble a block of flats on site. I was told that a group of this size, working two shifts a day, took some six weeks to build a block of some 40 or 50 three- or four-roomed dwelling units. But another 12 weeks or so are taken up in finishing up, inclusive of the installation of electrical fittings. Experiments are now being made in exploring economical means of cutting short the time taken up in the finishing process. One technique which I saw being tried out at Hoyerswerda is the pre-fabrication of entire rooms complete with electrical fittings at the pre-fabrication plant itself. These units are then transported to the building site and assembled with the help of a crane in the usual manner. It is believed that once the economics of this development is successfully established it would be possible to cut down the building time from the present rate of about four and a half months for a four-storeyed block of 40 or 50 flats to about three months.

'P' Is for Pre-Fab

The various construction periods mentioned here are timed from the completion of the driving down of the foundation piles. The great advantage of pre-fabrication, of course, is the saving in time and it is only the large-scale adoption of this technique which has made it possible for the German Democratic Republic to put through a large-scale housing programme within a reasonably short period. But in addition to saving time, pre-fabrication seems also capable of reducing building costs. In East Germany pre-fabricated housing has been found to be about 25 per cent cheaper than conventional construction. The system followed seems to be to locate central pre-fabrication plants in various areas in such a way that each plant serves a number of housing schemes in its region. It is interesting to note that, even in 1962, roughly half the building construction, including housing, agricultural and industrial construction, was carried out with pre-fab techniques and that the share of pre-fabrication in housing construction was over 70 per cent. Pre-fab construction has made further headway since then and along with its progress as well as independently of it the mechanization of building processes has also been advancing steadily. The unloading and assembly of pre-fabricated parts has been mechanized to over 90 per cent. Other building processes, such as excavation work and rough cast outside or inside, have been mechanized from over 60 to 80 per cent.

The housing scheme I saw at Hoyerswerda consists of five "complexes", with more to be added in due course and each complex comprises about 1,300 dwelling units divided into about 30 or 40 blocks. Housing construction of this order, it is easy to see, can be attempted economically and quickly only where the building processes are modernised and mechanized to a considerable degree. Here, again, I could not but be impressed with the contrast in performance as between East Germany and our country. Here we have been talking of the large place given in our five-year Plans for housing, but actually precious little has been done even in the limited sphere of slum clearance in a dozen or so of our big cities or towns. As the Visakhapatnam shipyard is to the Rostock shipyard, the notorious Hindustan Housing Factory in Delhi is to the grand and earnest effort which is being made in East Germany in the direction of evolving modern

methods of economical house building on a large scale.

Finally, I should like to make a few general observations on the standard of living in East Germany. From my remarks on housing it would have been evident that I was impressed with the progress made in East Germany in the area of housing the people. Housing construction in the year 1962 is stated to have been of the value of 1,300 million East Marks and over 90 per cent of this construction was in the socialist sector. Private housing, in other words, was a marginal element. The public funds expended for housing purposes had increased from 286 million East Marks during 1950 to over 2,000 million East Marks during 1962. In the latter year 87,200 dwelling units were either newly constructed or repaired and out of them over 50 per cent were in the co-operative sector. Incidentally, while the pre-fab method accounted for 5,700 flats in 1958, the number of flats built by that technique was some 49,400 in 1962. It is estimated that about 11 per cent of the total housing in East Germany is new construction dating from 1945.

In assessing this housing effort two facts have to be borne in mind. In the first place, the total population of the German Democratic Republic is about 17 million. Secondly, families in East Germany, as in the industrial countries of Europe generally, tend to be small. One-child families are frequent, while two-children families are common. Considered along with those circumstances, the fact that there are about two million dwelling houses, or over five million flats in dwelling houses, shows that a reasonable standard of housing is being achieved. It must, however, be said that the quality of housing, especially in the matter of amenities, varies widely as between the old buildings and the new constructions. Even in the case of the latter, the very modern flats, for instance in the neighbourhood of Alexander Platz — East Berlin's new social and shopping centre — provide an ideal, rather than an average, for housing amenities. At the same time, it must be said that housing developments in the various cities and industrial townships seem to have attempted to provide reasonably comfortable accommodation which often include amenities, such as, central heating, and even central hot water supply. A fact which needs to be prominently stated is the extreme reasonableness of the rents charged in the new housing developments. The standard rent seems to be one East Mark (which is equal to one rupee) per square metre of housing space, and this works out in the case of a three-room flat to about Rs. 65 per month. Add to this the fact that the rent often covers central heating as well as central hot water supply, the Government and the people of East Germany have every reason to be proud of their performance in an area of basic human welfare. Before leaving this subject of housing I would like to add that parks, playgrounds, schools and shopping centres are regular features of the various housing developments.

Food and Farming

In the matter of food, East Germany seems to be certainly much better off now than it was in the earlier years of its 15-year history. This is at least partly due to the fact that a very flexible gradualism has been adopted in the socialisation of agriculture. A certain degree of peasant cultivation is still being permitted, although steady pressure is being exercised in the direction of co-operative farming. East German agriculture has been mechanized only to a limited extent so far. In fact, manual labour is still being used to an appreciable extent for the harvesting of potato, sugar beet and a few other crops. Motoring through the countryside I often came across cows being used on small peasant lots for ploughing, while tractors rumbled across the surrounding co-operative or State farms. Ideology apart, given the scarcity of labour, relative to the growing demand for manpower from

the industrial sector, the further mechanization of East German agriculture seems to be inevitable and this process, given the political and economic structure of the country, is bound to lead to the dwindling of the element of peasant ownership or cultivation in East German farming.

The German Democratic Republic heavily supplements domestic production of foodstuffs with imports, chiefly from some of the other member-countries of the Comecon. Pig-gery products constitute the chief items of meat, while mutton is also consumed in large quantities. Fair amounts of fish — especially sea fish — and poultry are being eaten and venison is available when in season. Beef, however, is expensive. Butter, tea, coffee and tobacco are luxuries, but there are large imports of wine from Bulgaria and Yugoslavia. Fruit, again, is less plentiful and more expensive than in West Germany which has the advantage of access to the horticultural abundance of its Common Market colleagues, particularly Italy. I found, for instance, that Yugoslavian grapes were selling at a Rostock at a price twice as high as that which I had paid a few days earlier in Munich for Italian grapes far superior in quality. More generally speaking, however, I found food supplies to be available in variety as well as in adequate quantities in the various places I visited in East Germany.

The position with regard to clothing and other consumer goods of industrial origin is, however, less satisfactory. Wool-len and other textile fabrics or clothes wherever they were of more than average quality, struck me as being priced rather high. This was also the case with footwear and household effects, such as furniture. Variety is also lacking in the case of industrial manufactures. I found, for instance, that only one make of toothpaste was for sale in the department stores of the Alexander Platz. Electrical goods, toys, articles of stationery and the like seemed to be in liberal supply, but in many cases the finish was poor in comparison with the far more sophisticated displays seen in the shopping areas of Western Europe. This is a feeling or opinion which I am sure many East Germans would share with me. I am saying this partly because of an amazing incident of my first afternoon in East Berlin.

What the Boy Said

A young boy whom I met, while out on a stroll, decided to walk some distance with me since that, as he said, would give him an opportunity of practising on me his knowledge of English. Hardly had we gone a little distance when he noticed the ball point pen I was having with me and the next moment I found him offering to buy it. It was quite an ordinary pen and I naturally said that I would not sell it to him but would like to present it to him. The transaction thus concluded to our mutual satisfaction, the young man said rather ruefully that the pens available in his country were poor stuff and were nothing as good in quality as the one I gave him. Later on, after I had seen something of East Germany, I found that the boy had been complaining unduly, for I did find that East Germany was not incapable of offering to its people ball point pens or other similar articles of a quality which could not fairly be described as "poor stuff". Perhaps there is a large amount of consumer prejudice in East Germany towards domestic products, which is a state of mind which must be familiar to us in our own country — and the explanation, I believe, is that when a country is severely limited in its access to imports, it does fall into the habit of cultivating an exaggerated preference for the scarce foreign product.

In any case, I do not believe that East German industry is incapable of producing consumer goods of good quality. But it is possible that quality production of consumer goods for the domestic market is being deliberately given a very

low place in the scheme of things. East Germany is in great need of foreign exchange — as I had mentioned at an early place. A very great and concerted effort is therefore being made in that country to concentrate resources on production for export, with the result that the domestic market has to make do largely with the leavings. For instance, nobody could criticize the quality of the products of the Carl Zeiss works but most of the output of this plant is earmarked and sequestered for sale abroad so that the domestic consumer has only a very restricted access to those products.

Cars for Few

Even more striking is the case of automobiles. I certainly believe that East Germany has all the technical resources for manufacturing high quality automobiles for its people. But a deliberate decision seems to have been taken to impose austerity on the domestic car-user. As a result, few people in East Germany are able to buy a Wartburg, a sturdy family car which has lately been greatly improved in appearance and performance, since much of the production of this car is being exported particularly to the Scandinavian countries where this automobile is stated to have been favourably received. I was told that the domestic queue for the Wartburg is over two years long but a small baby car, the Trabant, with a plastic body, is more freely available in the home market. It will readily be seen that the East German automobile situation and automobile policy have lessons for this country. But one moral which I would particularly like to underline is the clear-headedness with which this problem is being dealt with in East Germany.

The domestic market for private automobiles is severely discouraged partly because of the urgency of exports and partly because it is realised that East Germany cannot just now afford the diversion of resources from high priority to low priority purposes which a large domestic use of private automobiles would involve. Consequently, a decision seems to have been deliberately taken to the effect that it is necessary for a large number of people to wait for a long time for private automobiles. At the same time, from what I could find from personal experience, cities and towns in East Germany seem to be very well served indeed in the matter of public transport. In East Berlin itself the public has the choice of four modes of public transport: buses, trams, and underground as well as overground local trains. All these services are frequent, tidy and very reasonably priced. Incidentally, the discouragement of private car ownership has made for a relatively small incidence of traffic on the autobahns in East Germany which has involved some under-utilization of what must be an expensive facility to maintain. As an item of topical interest in this country, I might mention that the East German baby car, the Trabant, despite its plastic body, is priced about 8,000 East Marks (about Rs. 10,000) which, taken together with the relatively high cost of gasoline in East Germany, makes private car-owning on expensive pleasure indeed in the German Democratic Republic.

From what I have said here, it would seem to follow that one of the major explanations for consumption standards in East Germany not being as high as they might otherwise be is the high priority given to exports. Another equally important reason is that the foreign exchange stringency has the effect naturally of imposing on East Germany an austerity programme with regard to imports. The price of coffee, for instance, is very high because the import of coffee is severely restricted. Similar is the case of tobacco. This also explains why many people in East Germany must regret that they cannot treat themselves to imported luxuries, such as cheap Japanese transistors or good quality Swiss watches as liberally as, for instance, the people in West Germany could. I believe that, only over a period, after East Germany has succeeded in developing its industrial production for export con-

siderably further, it will be in a position to build up consumption standards at home both in depth and in breadth with the assistance as much of imported consumer goods as of domestically produced consumer goods.

Meanwhile, appreciation is certainly due to the tremendous foreign trade effort which East Germany is making. It is worth remembering in this context that East Germany is as keen on selling to as it is keen on buying from countries such as ours. Indeed, a complaint I often heard in East Berlin and elsewhere in the German Democratic Republic was that this country does not seem to be sufficiently interested in pushing its wares into the East German Market. It is pointed out that the inter-governmental trade agreements between the two countries could yield greater fruit if we on our part put in as much effort as the East Germans make on their part to promote mutual trade. The absence of any kind of an Indian trade office or other trade representation in East Germany is being adversely commented upon. My own impression is that in the area of trade with East Germany, meaning both buying and selling, the Indian Government and the Indian business community could certainly show more initiative and enterprise than either has displayed so far. Perhaps the spring fair at Leipzig in the new year could be a suitable occasion for initiating a larger exchange of commerce between the two countries.

The Balance-Sheet

To conclude, the German Democratic Republic, which has a population less than a third of that of the Federal Republic of Germany and is vastly inferior in natural, particularly mineral, resources, seems, after a number of false and fumbling starts, to have succeeded reasonably well in building its industrial and general economic base. East Germany, in fact, claims to be the tenth in industrial production among the countries of the world. Whether its social, economic and political system has been an advantage to it or a handicap in its quest for progress and welfare is a point on which there is bound to be disagreement. My view, for what it is worth, is that if East Germany has done moderately well in the economic sphere, it is in spite of rather than because of its economic ideology or political order. What seems to have mattered is the basic German character of realism, resourcefulness, hard work and discipline. Added to this is the fact that science and technology have placed effective means of economic progress in the hands of organised communities with a background of industrialization.

There is, again, a basic undercurrent of social will and popular pressure in most communities today which make it virtually impossible for the fruits of economic progress not to be widely shared sooner or later. In East Germany certainly there is clear evidence that both public and private consumption are improving. Wherever I went I found individuals as well as groups, grown up people as well as children, going to work or spending their leisure hours more or less normally, more or less freely. This is not to deny either the totalitarian character of the East German polity or the authoritarianism of its economic system. All that I am suggesting is that the police States of today do seem to have achieved a very large degree of sophistication. Even at Check Point Charly, where I crossed over from East Berlin into West Berlin on my departure from the German Democratic Republic, and where the State was represented by the passport and the customs officials — who are always and everywhere among the crudest representatives of governmental authority — I must confess that such rigour as there was seemed to be dictated more by the German Democratic Re-

public's dire need to protect its foreign exchange than by its anxiety to protect its political existence. It is sad but true that only those governments can afford to be reasonably relaxed at their frontiers as have comfortable trade and balance of payments surpluses; and it is necessary to add that I experienced no more discomfort at Check Point Charly than at Santa Cruz Airport, which is to say that it was all very much in the day's business and East Germany — Check Point Charly and all — was by and large a rewarding experience.

Standard of Living Comparison

The following tables, taken from a West German source, claim to relate to mid-1963. Table I is based on hourly wages of DM 2.85 in East Germany and DM 3.75 in West Germany.

1) PURCHASING POWER OF WORKING TIME

Working time necessary to buy:	West (hours/minutes)	East (hours/m.minutes)
Milk, 1 litre	-/ 7	-/14
White bread, 1 kg	-/21	-/21
Eggs, 10	-/37	1/18
Pork chop, 1 kg	1/58	2/48
Butter, 1 kg	1/56	3/30
Margarine, 1 kg.	-/36	1/22
Oranges, 1 kg.	-/29	1/45
Chocolate, 100 gr.	-/10	1/21
Coffee, 1 kg.	4/26	28/ 4
Ladies stockings, 1 pair	-/44	4/ 4
Men's shirt	5/29	11/56
Men's shoes (leather)	8/27	18/31
Refrigerator (115-120 litres)	91/44	543/52
Vacuum cleaner	57/ 4	82/27
Television set*	242/24	578-57
Motor car**	1,328/00	5.157/54

*GDR: 53-cm-screen; Federal Republic: 59-cm-screen.

**GDR: Wartburg 99 ccm; Federal Republic: VW Export 1,200 ccm

2) OWNERSHIP OF DURABLE CONSUMER GOODS

Of 100 households own a:	West	East
(end of 1963)		
Refrigerator	54	16
Washing machine	36	18
Television set	49	38
Radio set	98	91
Sewing machine	57	44
Motor car	27	6

3) PRODUCTION OF CONSUMER GOODS

Production per 1,000 inhabitants (1963):	West	East
Motor cars	39.5	4.9
Mopeds	1.7	7.9
Electric stoves	14.9	3.3
Vacuum cleaners	21.1	20.7
Washing machines	18.7	14.9
Television sets	34.7	33.8
Leather shoes (pairs)	1,742	1,612

Sterling Crisis

PAUL BAREAU

LONDON:

THE FIRST hundred days of the Labour Government are going badly. In part this may be because the Labour Ministers themselves have been caught up in the meshes of a hundred days of dynamic action. It was one of the gimmicks copied by Mr. Harold Wilson from the Kennedy aura. He should have recalled that the expression was born with the final fling of Napoleon I and in this Napoleonic contest the hundred days ended with the defeat at Waterloo.

The Government admittedly inherited an unenviable situation. The preceding Government had allowed the economic position to drift into deficit and in the last three months of Conservative Administration nothing was done to check the drift. Electoral considerations were allowed to take precedence over good economic policy. Having said this one must immediately add that never has a poor inheritance been so bungled and aggravated as by the new Labour Government.

The direct attempt to tackle the deficit by the 15 per cent surcharge on import duties may have been inevitable and it should at least have been done with a modicum of forewarning and consideration for international treaty obligations. In justifying this abrupt initiative to our friends in the European Free Trade Association, British Ministers had to paint the economic position in Britain in dark, perhaps over-dark, colours, and this loosed a boomerang which very quickly came back to hit sterling. The autumn budget was in large measure irrelevant to the balance of payments situation. It was more than irrelevant. It created uncertainties in the domestic capital market by foreshadowing but not defining new taxes that would take effect next April. This had the effect of unsettling the stock market, a phenomenon which may not have brought many tears to Labour politicians' eyes, though it helped to set loose a considerable selling of sterling securities by foreign investors and both directly and indirectly must have contributed to the pressure on sterling. What was more important was the effect it had on issues of new capital and therefore on investment decisions by industrial firms. These could rapidly affect industrial production.

Steel Nationalisation

Steel Nationalisation

Add to these psychological and other mistakes the decision of the Labour Government to go ahead with steel renationalisation despite its lack of relevance to the immediate problems with which the country is faced, and one can understand the growing lack of confidence in sterling which had already been in evidence before the election but which steadily gathered strength after Labour took office.

In the face of this run on sterling the advice of the Bank of England was to increase interest rates and use other traditional methods to deal with the disequilibrium in Britain's international payments. For at least two consecutive weeks this advice was disregarded. The move towards dearer money was only made when the pressure on sterling had assumed the proportions of a crisis. The jump that then had to be made was from 5 to 7 per cent and, furthermore, it was made on a Monday. Both the amount of the increase and its timing indicated crisis conditions and were interpreted as such by foreign opinion. In past crises a 7 per cent bank rate had been sufficient, taken with other measures, to deal with the situation. On this occasion it had a negative effect. The run on sterling barely halted on the day of the higher bank rate. On the following two days it broke into a seemingly uncontrollable gallop and the spectre of devaluation began to appear on the horizon.

It was at this point that the Bank of England took charge of the rescue operation. Using its close and friendly contacts with other central banks it succeeded by a series of telephone conversations, in mobilising an international credit of \$3,000 million. The participants were eleven central banks together with the Export-Import Bank in Washington and the Bank for International Settlements in Basle. The precise size of this credit is irrelevant. What mattered was that it should be so large as not to be needed. The credit was given for three months but is renewable at maturity. It was given without strings of any kind. In the circumstances there was no time for discussing strings or anything other than the bare provision of these standby facilities. The strings will, however, become apparent if when the credit comes to be renewed, inadequate evidence is available or progress made towards the elimination of the balance of payments deficit.

The credit is a tourniquet which should stop the haemorrhage in Britain's reserves. It cures nothing. All it does is to provide a little more time during which the longer term measures of the Labour Government can begin to take effect. Foreign opinion has interpreted the move in this way. There does not appear to have been any substantial reflow of foreign funds to London. Some speculative positions against sterling have no doubt been covered; but before full confidence is restored opinion both at home and abroad will wait for deeds to follow the words that have been uttered from the new Government in declaring their determination to defend sterling.

It would be unfair to say that no deeds have been forthcoming. The autumn budget had in the short run at least, some decidedly deflationary effects, since revenue will be provided by the new indirect taxes well before the additional expenditure is incurred. In addition a 7 per cent bank rate holds no expansionist joy. The cost of overdrafts and of industrial credits have now risen to a point at which a number of marginal projects are being eliminated.

Whether this is enough is a question about which serious doubts still prevail. It may well be that a real credit squeeze

will have to be put into effect, reinforcing dear money with further restriction of the basis of bank credit. The purists will also argue that the best export incentive that can be provided for industry is to take some of the buoyancy out of the domestic market. This could be done by using the so-called "regulator" which allows the Chancellor of the Exchequer to increase a wide range of indirect taxes by up to 10 per cent without waiting for a budget.

The Labour Government, like its predecessor, has pledged

its belief in an Incomes Policy, that is in securing from employers and workers a voluntary restraint in the search for higher profits, dividends and wages. If they can secure this while at the same time maintaining the economy at fairly full stretch they will indeed have achieved the "British economic miracle". Since they have moved some way on the road to disinflation, there is greater hope that an incomes policy will succeed and the export incentive will begin to operate. If they do not, these "hundred days" could all too easily end in another Waterloo.

Private Investment Helps Meet Economic Needs

GUY SIMS FITCH

WASHINGTON:

IT IS affirming the obvious to say that private business men see private capital as an especially effective instrument for speeding economic diversification and progress around the world. That this subject should have received more than passing attention at last week's National Foreign Trade Convention in New York was to have been expected. The Convention, after all, is sponsored each year by the National Foreign Trade Council, the leading association in the United States of private traders, investors, bankers and others interested in international business and financial affairs.

Yet there were enough new ideas and approaches behind the speeches and other expressions of opinion, and enough intriguing questions raised, to warrant a closer look at this theme as it emerged during the convention proceedings. What many of the delegates were intaining, in effect, was that the whole world today can properly be viewed as one gigantic market, with trade and investment to all intents and purposes two sides of the same process.

Increasingly, these business men are finding it difficult to make sharp distinctions between their foreign and their domestic markets and operations, and are coming to regard both foreign and domestic demand as integral elements in their over-all sales efforts. This raises the interesting question, posed by a number of delegates, as to whether we may not be seeing the emergence of a new type of enterprise — what some of the participants termed the International Corporation. Such an enterprise is seen as having a total commitment to economic expansion everywhere, with its capital and its operations oriented to world resources and needs, and

with its personnel, including its managerial and professional staffs, increasingly drawn from the lands in which it functions.

There obviously are differences among business men and companies as to how far to go with this concept. But it is clear that almost without exception they see American exports and capital doing much more than merely creating local markets for American products — although candour requires that this element be taken into account. From the international point of view, they see trade and investment bringing many benefits to other lands — for instance, in creating larger markets for local products; stimulating local production, jobs, know-how and economic activity generally; broadening the local tax base and increasing local tax revenues; creating opportunities for useful employment of local capital; helping to conserve or increase local foreign exchange reserves. These benefits are augmented when American investors are joined by local citizens who wish to participate in the risks and rewards of a productive enterprise that contributes to the economic growth and development process.

Underlying it all is the growing awareness among American business men, as was amply evident at the Trade Convention, that they too should be good citizens of the lands in which they operate, ready and willing to take into account the special problems and aspirations of those lands and to co-operate in finding meaningful solutions. American business men are firmly convinced that foreign governments and businesses have nothing to fear from American investment, but should welcome it as Americans have always welcomed investment from abroad. The Convention delegates saw all this as particularly relevant to the less-developed countries, which have many unmet needs and huge capital requirements that can be supplied only in part by government assistance.

Cashed in a Minute!

And that is precisely what we mean. It takes no longer than a minute to cash your cheque at any PNB office with the Teller System.

The streamlined Teller System eliminates tokens, queues, all tedious and unnecessary waiting and delay.

PNB was the first bank to have introduced the Teller System as far back as 1954. Today, PNB has 90 branches operating this system and plans to introduce this on-the-spot service in 60 more branches throughout the country.

A GREAT GET-TOGETHER IN HANOVER

In a single place, at the same time — in one journey — you reach the meeting ground of the industrial world — THE HANOVER FAIR. Here you learn the latest production methods and techniques... exchange ideas with leading international industrialists... see over 5,800 exhibits from all over the world... gauge the driving force of modern industry.

Groups exhibited include:
Mechanical & Electrical Engineering, Iron & Steel, Non-Ferrous Metals, Chemicals and Plastics, Rubber, Building Materials, Precision Mechanics and Tools, Optics, Office Equipment, China, Ceramics, Glassware, Clocks and Watches, Jewellery, Hardware and Cutlery, Handicrafts, Gift Articles—and many others.

HANOVER INDUSTRIES FAIR Hanover, West Germany.

India's Plea for Untied Aid Justified

By Our Special Correspondent

NEW DELHI:

IN AN illuminating study of public international development financing in India, the Colombia University School of Law has endorsed Government of India's plea that a major portion of the economic assistance being provided by the friendly countries should not only be not tied to purchases in the donor countries but should also not be earmarked for specific projects. From the point of view of the recipient countries, the School says, there are obvious disadvantages in such tying-up of aid.

The tying of aid to purchases in the donor countries, the School says, restricts the area of purchases and thus limits the composition which results in undesirable influences on the prices as well as the quality of goods to be obtained. Further, if the donor country has not been a traditional supplier of goods to the donee nation, delays may occur in utilisation of assistance because of the difficulties of locating proper suppliers and also because of the unfamiliarity of the users with capital equipment of new specifications. The School cites the example of USAID loans to India for the purchase of capital equipment; considerable amounts of assistance offered by USAID, it notes, have remained unused for substantial periods because of these difficulties.

The School, however, justifies tying up of aid to purchases in the donor countries on the ground that if the untieing of aid were to result in a lower volume of assistance because of the balance of payments difficulties of the donor country, the result might be still more undesirable. Tied aid, the School opines, is obviously better than no aid at all. As a general rule, the School suggests that in the absence of basic compelling reasons, such as persistent balance of payments problem, capital aid should be extended by the donor countries on an untied basis. Exceptions should be made by general agreement for countries having deficit balance of payments position. This general rule should not, however, be applied so as to interfere with the maximising of the volume of aid.

Serious Difficulties

This type of assistance programme, the School, however, notes will encounter some serious difficulties as the reversal of the present policy of most of the aid giving countries will not be easy to achieve, considering the various national legislative processes involved. Nor could it be effected for India alone. The most obvious way for achieving international agreement in this regard is the setting up of the Development Assistance Committee of the Organisation of Economic Co-operation and Development.

In regard to the project vs. non-project aid controversy, the School has expressed the opinion that there are obvious advantages for extension of non-project aid to developing countries like India where foreign assistance is being judiciously utilised for economic development and not squandered away on imports of commodities having low priority in the development programmes.

The tying of assistance to specific projects and programmes, aside from extraneous considerations such as commercial or prestige motivations, the School observes, is essentially a matter of confidence in the economic programme and policies of the recipient country. While it is recognised that the granting of aid for specific projects releases resources in the recipient country for other, perhaps less desirable, uses and

that the tying of aid to projects cannot assure development unless there is control over all investment and economic policies, there is a feeling that at least the desirable specific projects are being carried out when aid is tied to projects. This is perhaps less compelling a consideration in the case of India than in the case of other countries, in view of its respected public administration, developing planning techniques and general economic policies. There is no feeling, for example, in the case of India that foreign exchange will be squandered on unnecessary imports or that it will be used to shore up a negative balance of payments position caused by internal inflationary policies. Although there may be differences in view between the donor countries and India on specific elements of her five-year Plans, there is satisfaction with the general nature of its development effort and confidence that general foreign exchange provided will be used to promote development. The very definition of aid requirements in relation to comprehensive national economic plans contributes to that confidence.

With a view to accelerating the utilization of external aid in India, the School has stressed the need for organising a public service trained in the manifold problems of management, accounting and other aspects of business. It suggests extension of foreign aid for this purpose.

Numerous Problems

"Despite the sophisticated level of economic planning and public administration in India," the School observes, "there are numerous problems remaining to be solved in the more effective and more rapid utilization of the amounts of aid committed to the country. The sheer size and complexity of the programme make it a difficult one to administer. The difficulties are most pronounced in the portion of aid which is tied to specific investment projects. It is obviously much easier to administer commodity aid programmes which are simply a matter of organizing distribution mechanisms. Lags in the utilization of specific project commitments aggravate the scarcity of foreign exchange and delay the favourable effects hoped for on the balance of international payments. There are inadequacies in pre-investment studies, in the budgeting of foreign exchange requirements, in maintaining targets during the execution of projects, and in the co-ordination of the activities of all the official agencies and dependencies that may be involved.

"There are, of course, no easy answers to such problems which are not unique to the administration and utilization of foreign aid, but are a reflection of shortcomings in public administration in general, from which foreign aid administration cannot be divorced. What is needed perhaps is more concentration on the practical aspects of carrying plans out more efficiently relative to the attention that is paid to the formulation of the plans themselves. With all due credit to the impressive accomplishments of Indian planning, it may now be appropriate to focus massive attention on the correction of deficiencies in administration and execution. India, like other developing countries, needs a public service trained in, or at least aware of, the manifold problems of management, accounting and other aspects of business. This is important not only for the conduct of public enterprises such as India's publicly-owned steel mills, but also for the many complex and vital planning decisions. They often involve co-operation with foreign and international public institutions, as well as private investors. Precisely because so many vital economic decisions

must, in a country like India, be a matter of public rather than private decision, foreign assistance in the training of a public service that has a practical as well as a theoretical understanding of the conduct of business is likely to pay dividends out of all proportion to the financial investment involved."

★★
The Union Ministry of Industry and Supply is understood to be currently negotiating with Czechoslovakia the setting up with Czech financial and technical collaboration, of two more large-scale machine tools manufacturing units in the public sector. Czechoslovakia is already assisting India in the establishment of a Heavy Machine Tools Plant at Ranchi as part of the heavy engineering complex being established there.

The fourth Plan requirements of machine tools are estimated around Rs. 450 crores. It is envisaged to manufacture indigenously by 1970-71 machine tools worth Rs. 131 crores per annum. Currently, annual production of machine tools in the country is around Rs. 20 crores — approximately Rs. 8 crores in the private sector and the rest in the public sector. The combined output of the two sectors is expected to go up to Rs. 25 crores by the end of the current Plan, as against a target of Rs. 30 crores.

Slightly more than 50 per cent of the Rs. 131 crores worth production of machine tools to be achieved in 1970-71 will be in the public sector where apart from setting up the Heavy Machines Tools Plant at Ranchi and establishment of two more Czech-aided machine tools projects, expansion of Hindustan Machine Tools, Bangalore, to Rs. 50 crores worth output is proposed. The remaining production is expected from the expansion of the private sector. Including the present installed capacity, the private sector has already been licensed for the manufacture of Rs. 50 crores worth of machine tools. Not all this capacity may materialise by 1970-71. So stress is being laid on expansion of the existing units. Some new units may also be licensed.

With a view to expediting the implementation of the machine tools manufacture schemes already licensed in the private sector, the Industry and Supply Ministry is urging the recently-set up Industrial Development Bank to devise a suitable programme for providing long-term rupee finances to the units needing such funds. Apart from foreign exchange shortage and the difficulties of securing technical know-how, paucity of rupee resources, it is felt, is hindering the growth of the private sector machine tools industry in the country. To enable private entrepreneurs to import technical know-how, the Union Government is also not averse to giving special concessions in the case of the complicated and sophisticated machine tools production schemes. In such cases, it is also prepared to relax the general rule that the indigenous content, to begin with, should be at least 80 per cent, to be raised to 100 per cent in about three years' time after start of production. The Government is already according in allocation of foreign exchange a very high priority to the requirements of machine tools manufacturers. Steps are also being taken to augment supplies of essential raw materials for this industry, such as pig iron and alloy steel, from indigenous sources.

★★
The public sector, it is understood, may shortly enter the field of paper and paper board production. It is already manufacturing newsprint at the Nepa Mills.

As against the third Plan target of 0.82 million tonnes, the paper and paper board manufacturing capacity likely to be installed in the country by 1965-66 will be approximately 0.74 million tonnes. This capacity is proposed to be raised to 1.5 million tonnes by 1970-71. On the basis of the licences

issued so far, capacity to the tune of 0.99 million tonnes may materialise by the middle of the fourth Plan, leaving a gap of about 0.51 million tonnes to be filled by additional licences. In order to bridge this gap, the Union Ministry of Industry and Supply has proposed to have one or two pulp projects in the public sector. The National Industrial Development Corporation has been entrusted with the task of collecting the requisite data from Assam, Madhya Pradesh, Mysore, Uttar Pradesh and Bihar and preparation of project reports. This assignment is expected to be fulfilled by NIDC by the end of this month. These pulp manufacturing units will have some capacity to manufacture paper.

The national Industrial Development Corporation has also been asked to prepare a project report for setting up a second newsprint manufacturing unit in the public sector. This plant may have a capacity to produce about 60,000 tonnes of newsprint annually — the likely gap between the fourth Plan newsprint requirements and the capacity expected to be installed by 1970-71 through expansion in the Nepa Mills' production from 30,000 tonnes per annum at present to 75,000 tonnes and the setting up of four newsprint manufacturing plants in the private sector for which letters of intent or licences have already been issued. Requirements of newsprint in 1970-71 are estimated around 300,000 tonnes.

★★
In a statement made in the Lok Sabha last week, the Union Minister for Industry and Supply, Mr. T. N. Singh, disclosed that the Government of India had licensed expansion of the existing cement manufacturing units and setting up of new cement factories to an additional capacity of 4.47 million tonnes. Advance approval, he added, had also been given for augmenting the cement producing capacity in the country by another 8.9 million tonnes. On the basis of the progress made so far by the schemes already licensed, he expected that by the end of the current financial year, the cement manufacturing capacity in the country will go up to 11.25 million tonnes. During the next financial year, another 1.75 million tonnes capacity would be added, making a total of 13 million tonnes. The Minister further revealed that the incentive scheme, under which a premium on the controlled price is paid for production this year in excess of the best annual output for the three years ending 1962, had helped in raising cement production by 0.5 million tonnes.

The Minister further disclosed that proposals for the import of balancing equipment by the existing factories for maximising the utilization of the already installed capacity were being examined. The output of cement in the country was also being attempted to be raised by utilization of blast furnace slag and pozzalanic materials. A slag cement factory with an annual capacity of 290,000 tonnes had already gone into production.

In order to promote the steady growth of the cement industry, the Minister stated that the Government hoped to set up shortly the Cement Corporation of India, a private limited company fully owned by the Government. The Corporation will have three functions — (1) surveying, prospecting and proving of limestone deposits in the country; (2) establishment of capacity to manufacture cement; (3) development of ancillary and supporting activities for the building up of the cement industry, including the development of expertise.

The production of cement in the country currently, the Minister said, was of the order of 9.5 million tonnes per annum. The annual demand was estimated at about 12.5 million tonnes.

The West German Investment Delegation visiting India on January 16, 1965, on an invitation from the Indian Investment Centre, New Delhi, will not only include leading German

"DRAMATIC NEW TYRE"

with the record
mileage
SUP-R-TUF
Miracle Rubber
the most advanced tyre
ever built to give you
EXTRA mileage

Firestone research and development engineers have done it again! They have formulated a new miracle rubber — 'SUP-R-TUF' — which gives extra mileage...at no extra cost! And at the same time, comes the NEW DeLuxe Champion tyre, with its perfected tread design for safer motoring. Now, every Firestone passenger tyre is built with SUP-R-TUF rubber to give you extra mileage on any road at any speed. And you get greater safety, because SUP-R-TUF is tougher and has more resistance to punctures, bruises and breaks.

Firestone NEW DELUXE CHAMPION TYRE

ANNOUNCEMENT REGARDING THE PROPOSED ISSUE OF SHARES

This is NOT a Prospectus. Persons interested in full details may obtain copies of the Prospectus from the Registered Office of the Company or from the Bankers and Brokers named hereinafter

HINDUSTAN FERODO LTD.

A member of the TURNER & NEWALL Group

EXISTING AND PROPOSED ACTIVITIES OF THE COMPANY

The Company was formed to take over the manufacturing and associated selling activities of Asbestos, Magnesia and Friction Materials, Ltd., Ghatkopar, Bombay 77 AS. Its main activities consist of the manufacture of "Ferrodo" woven metallic and moulded brake and clutch linings, "Firefly" brand asbestos yarns, dry and lubricated asbestos plaited packings, asbestos cloth, proofed asbestos sheetings, asbestos tape, asbestos rope lagging and compressed asbestos fibre jointings, and "Limpet" asbestos sheets. The Company has now been licensed by Government to manufacture asbestos millboard and "Ferrobestos" flooring sheets in addition to the above listed items.

LOCATION OF FACTORY

The Company's factory is located at Ghatkopar, Bombay 77 AS.

BOARD OF DIRECTORS

Norton Arthur Morling (Chairman)	Director of: Turner & Newall Ltd., Manchester, England.
Son of N. E. Morling	Director of Asbestos, Magnesia & Friction Materials Ltd., Manchester England and other Companies within the T. & N. Group
Henry David Stewart Hardie (Managing Director)	Merchant. Managing Director of Asbestos Cement Ltd., Mulund, Bombay 80-NB.
Son of J. S. Hardie	Director of Asbestos, Magnesia & Friction Materials Ltd., Manchester England
Cecil William Hannan Son of W. Hannan	Committee Member of 1) General Committee, Bombay Chamber of Commerce & Industry, Bombay.
Phillip Anthony King Son of C. King	2) Executive Committee, Association of Indian Automobile Manufacturers. Engineer.
Percy Charles Barr Son of H. Barr	Merchant. Director of Asbestos, Magnesia & Friction Materials Ltd., Manchester England

(INCORPORATED ON 1ST. JULY 1964 UNDER THE COMPANIES ACT 1956)
REGISTERED OFFICE: AGRA ROAD, GHATKOPAR, BOMBAY 77 AS.

SHARE CAPITAL

Authorised:	
40,00,000 Equity Shares of Rs. 10/- each	Rs. 4,00,00,000

APPLICATIONS: Copies of Application Forms and Prospectus can be obtained from the Company's Brokers or Bankers to the issue or from the Company at their respective Registered Offices. Applications for shares must be for 10 shares or multiples of 10 shares.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 17TH DECEMBER 1964 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON 30TH DECEMBER 1964 OR EARLIER AT THE DISCRETION OF THE DIRECTORS, BUT NOT BEFORE THE CLOSE OF BANKING HOURS ON 21ST DECEMBER 1964.

Unit Trust of India

Over 1,25,000 Applications for 'Units' have been received during the initial sale period, July 1 to August 14, 1964 alone, when the units were sold at par.

Applications continue to flow in for 'Units' at Premium

The premium on 'units' includes an element of income accrued to the Trust, which will be returned to unitholders as part of the Trust's income distribution as dividend.

Units are a safe investment, bring in steady income and are liquid enough to realise when you need money. Further, income on unit up to Rs. 1,000/- is exempted from Income-tax.

Repurchase operations by the Unit Trust have commenced from November 16, 1964.

Units certificates are being despatched every day. Those who have not yet received their certificates will receive them shortly.

UNITS ARE ON SALE AT ALL BRANCHES OF LEADING SCHEDULED BANKS THROUGHOUT THE COUNTRY

BUY UNITS

*They are good investments
for your savings*

UNIT TRUST OF INDIA
Amar Building, Pheroze Shah Mehta Road

DA 64/481

industrialists but also bankers. It will be led by Dr. Hans Kuntze of Klein Schanzlin & Racker AG, and will consist of 35 members representing the leading German banks and a wide range of industries such as electrical engineering goods, insulation pipes and tubes, ball and roller bearings, plants and equipment for chemical, pharmaceutical and food industries, machine tools, radio and tele-communication engineering, automobiles, ship-building, mining and metallurgy, oil refineries coal products, photographic equipment, textile machinery, steam boilers, submersible pumps, industrial furnaces agricultural machinery including tractors and harvestors, handicrafts and several domestic goods industries.

The Delegation will stay in India for three weeks and explore the possibilities of German private investments in this country. It will begin its engagements with discussions with the Government of India and then visit Bombay, Ahmedabad, Baroda, Poona, Bangalore, Madras, Coimbatore, Calcutta and Jamshedpur. At all these places, the members of the Delegation will see a cross-section of India's development projects as well as the projects and industries which have come up with German collaboration. They will return to New Delhi on February 2 to resume their discussions with the Union Government. Part of the Delegation will leave for Germany on February 6. Some members of the Delegation will stay on for attending the 20th Congress of the International Chambers of Commerce.

German private investments in India currently amount to approximately Rs. 10 crores. It is hoped that as a result of the German Investment Delegation's visit, the flow of private

capital from Germany to India will gather momentum.

★★
The sixth 50 MW unit of the Neyveli lignite power station is expected to be commissioned into operation by March 31, 1965. The seventh unit of 100 MW is likely to go on stream by June 30, 1966. The installation of these two units, under the first phase of the expansion programme of the power station, will raise the power generation capacity from Neyveli lignite to 400 MW. The capacity is proposed to be augmented further to 600 MW under the second phase of the expansion programme to be undertaken during the fourth Plan period. Up to October 31, 1964, the Neyveli lignite power station had generated 2,090 units of energy. Of this, about 1,650 units were fed into the Madras State Electricity Grid.

The target of producing 3.56 million tonnes of lignite annually is expected to be reached by February, 1966, when the last of the three lignite consuming plants of the Neyveli Project — the fertilizer manufacturing unit — will start production on commercial scale. The second lignite consuming plant — briquetting and carbonisation unit — is expected to go into production early next year. The lignite mining capacity will be raised from 3.56 million tonnes to 6.3 million tonnes during the fourth Plan period to meet the requirements of the 600 MW power station. The clay washing plant of the project, which went into operation in 1961-62, had produced up to October 31, 1964, 7,700 tonnes of washed clay.

The expansion of the Neyveli lignite power station from 400 MW to 600 MW will be undertaken with assistance from the USSR which has helped in setting up the present 250 MW capacity and is also assisting in its expansion to 400 MW.

Textile Industry : A Case for Concessions

R. V. MURTHY

BOMBAY :

AS WAS decided at a meeting on November 21, 1964, of its Committee, the Indian Cotton Mills' Federation (ICMF) has addressed a representation to the Union Ministry of Finance to press its plea for including the cotton mill industry in the list of industries of national importance, so as to become entitled to rebate in income-tax and super-tax and also for a more liberal scale of development rebate as has been granted to coal and shipping. If it is conceded, as it must be, that the Indian cotton mill industry supplies one of the basic needs of the people, is a major foreign exchange earner and has a predominant role to play in the national economy, the country cannot afford to postpone any further a comprehensive programme to modernise and expand the cotton mill industry.

It is not only in India, but practically all over the world, that it has become necessary to make structural adjustments to new requirements. Previously, the industry was mainly labour-intensive and it was, therefore, easy enough for the developing countries to engage themselves in it. But, today, thanks to several changes and improvements, it has become exceedingly capital-intensive. Moreover, prices of machinery have been going up steadily from year to year. Thus, between the year 1960, when the Working Group of the Cotton Textile Industry was appointed by the National Industrial Developmental Corporation (NIDC) and 1963, according to an index to measure the cost of rehabilitating the textile industry compiled by the ICMF taking only the minimum imperative need for imported machinery, the Index Number has gone up by 17 points. This estimate more or less corresponds with the estimate prepared by the Planning Sub-group on Cotton Textiles for expansion of the spinning and weaving capacities of the industry during the rest of the third Plan period.

On the basis of the estimate prepared by the Planning Sub-group on Cotton Textiles, the industry's financial requirements for expansion during the remaining years of the third Plan amount to Rs. 92 crores and those for expansion in the fourth five-year Plan will aggregate Rs. 225 crores, while, for mere rehabilitation alone, the total bill, at Rs. 40 crores per year, works out to Rs. 280 crores. Breaking the overall total of all these of nearly Rs. 600 crores into two divisions, one for new units and another for the existing units, taking into account the expansion already allowed as also that which may be allowed in future, the ICMF estimates the requirement of the existing industry alone at more than Rs. 400 crores.

The question facing the industry now is whether, with its present low profitability, it can raise this amount. In other words, do the internal resources and borrowings of the industry permit of an investment of this magnitude? An answer has been provided by two recent studies made by the Federation of the financial position of nearly 300 textile factories for two different periods, viz., 1955-59 and 1961-62. Some interesting conclusions emerge from these studies. For one thing they reveal the magnitude of the industry's effort towards investment and gross block, mainly consisting of plant and machinery. Thus, between 1955 - 1962 (ignoring the difference of 10 per cent in the installed capacity that formed the subject-matter for the two studies), the gross block has gone up from Rs. 244 crores to Rs. 415 crores. Secondly, the studies bring out the strain on the industry's capital resources for working capital and the staggering increase in borrowings. The internal resources have steadily declined from Rs. 76 crores at the end of 1955 to Rs. 27 crores at the end of 1962. Over the same period, borrowings and trade dues have mounted up from Rs. 82 crores and Rs. 52 crores at the end of 1955

to Rs. 184 crores and Rs. 86 crores respectively, at the end of 1962.

The need for adequate resources for any industry arises not only because of the growing requirements of working capital but also because, unless the internal resources position is satisfactory, it is not possible to raise either fresh loans or fresh capital. Against the background of the finances of the Indian Cotton Mill Industry referred to earlier, the concessions sought by the Federation, which are estimated to increase the resources of the industry by no more than about Rs. 4 crores per year, pales into insignificance. But even small mercies count these days, and the Finance Minister may rest assured that the industry will feel grateful to him if he should accept the Federation's suggestions and gives effect to them in the forthcoming budget.

★★

"A very definite pointer to the good work that has been done during the brief span of 7½ years during which the Corporation has been operating", according to Mr. B. K. Kaul, Chairman of the Life Insurance Corporation, is the almost three-fold increase in its business compared to that in force of all insurers as on December 31, 1955. The business in force as at March 31, 1964 was Rs. 3,571 crores under 103.28 lakh policies, as per the Chairman's statement at the 102nd meeting of the L.I.C. on November 30. There is no gainsaying that the volume of life insurance business since nationalisation has gone up remarkably, but it is still worth speculating whether, under the existing conditions, the private insurers, had they been functioning today, would not have achieved similar if not better, results. This is, of course, on the assumption that private insurers also would have had the same privileges and facilities as the L.I.C.

This academical exercise apart, it must be said that the L.I.C. has registered several satisfactory features in its working during 1963-64. In addition to the continued increase in the business in force, there has been a further reduction in the expense ratio and strengthening of the financial position. The L.I.C.'s investments had a higher yield and notable steps were taken to expedite the settlement of claims. The only fly in the ointment, however, was the further, albeit slight, increase in lapse ratio. Judged absolutely, an increase from 8.1 per cent for the period ended March, 1963, to 8.2 per cent for the 12-month period under review may not appear very much, especially in the context of the general economic conditions leading to impairment in the saving capacity of the insuring public. However, the persistent rise from 5.1 per cent in 1958 to six per cent in 1959, 6.6 per cent in 1960, seven per cent in 1961, 8.1 per cent in 1962-63 and 8.2 per

cent for the latest year is something that requires to be taken serious note of. 8.2 per cent of the main business in 1963-64, if expressed in the actual number of policies, would perhaps provide a more realistic picture to the lay public. The need for thorough appraisal in this case also arises from the fact that, according to Mr. Kaul himself, "the impact of general economic conditions and of the compulsory deposit scheme on the saving capacity of the insuring public would be expected to have an adverse effect on the lapse ratio". While his assurance, at the same time, that the various steps being taken by the Corporation to control lapses are bearing fruit, is comforting enough, his statement that the rising trend in lapse ratio has been arrested suggests a measure of complacency, which may have the unfortunate effect of slackening the efforts at arresting the rising trend in lapse ratio.

Insurance Conscious

A notable feature in 1963-64 was that 70.5 per cent of the total policies were taken by persons insuring for the first time. This is at once an indication of the growing insurance consciousness of the people and an indicator that the message of insurance is being taken to more and more people, as claimed by the L.I.C. Chairman. That more and more people are taking to insurance is also evident from the satisfactory progress of business written in the rural areas (5.85 lakh policies assuring Rs. 209 crores, as against 6.67 lakh assuring Rs. 233.45 crores for the 15-month period ended March, 1963). The increase in the L.I.C.'s network of offices and the headway being made in respect of non-medical business, salary saving schemes, and group insurance are also indicative of the expansion of life insurance business in the country.

A word about the L.I.C.'s foreign business is necessary here. There was a decline in business (from 8,865 policies assuring Rs. 10.58 crores for the 12-month ended March, 1963, to 8,332 policies assuring Rs. 10.21 crores), which was not unexpected in view of the political and economic changes in some of the countries in which the L.I.C. has been operating. In fact, it seems creditable that, save in only two countries, namely Mauritius and East Africa where there were short-falls in business, there was satisfactory progress in the other places. But we should be prepared for disappointing results from the newly independent countries which may naturally want to encourage their own newly set-up national concerns. From our point of view, this is not a very encouraging prospect though, particularly by reason of the imperative need of the country to augment its export earnings, both visible and invisible. The L.I.C. has to gear itself to meet this challenge, and it seems the installation of the new computer systems and the implementation of the re-organisation scheme in hand are but a reflection of its preparation in this behalf.

Coal Price is Key to Expansion

From Our Correspondent

CALCUTTA:

LORD ROBENS, Chairman of the UK National Coal Board, who has come to India to discuss the possibilities of Indo-British collaboration in some new public sector coal ventures, told the Press in Calcutta last week that if the two Governments decided on starting such ventures in India, work could well start some time next year. It may be recalled that the British Coal Board first offered to the Indian Government early in 1960, to collaborate in the development of the coal industry in this country. Since then negotiations have gone on. Subsequently, it was broadly agreed that a project with an annual output of 2.5 million tons could be taken up, but nothing concrete has materialised so far. From Lord Robens's statement

it appears that his Board would be interested in collaborating for the three mines east of Bokaro which would yield the coking coal that the Bokaro steel plant will require. The UK Coal Board has had long technical discussions on these mines with the National Coal Development Corporation of India and the officials of the Union Ministry of Steel, Mines and Fuel. Details of the necessary geological survey and administrative arrangements have also been discussed. Lord Robens gave an idea of how the mines would be worked. These would be fully mechanised, most up-to-date machinery would be provided and the most efficient and cheapest method of extracting coal would be adopted. They would be able to compete with most mines in England and would constitute a project which they "in England would not be ashamed to operate in their

country." The mines would be deep, and the estimated reserves would justify operations for 30 to 40 or even 50 years. In terms of outlay, the project would require £7 to 8 million as foreign exchange expenditure, besides the rupee capital which would be needed for creating all other facilities. The UK Coal Board Chairman was fairly confident that on the basis of the present plan which has been drawn up taking the present wage and price levels into account, the project would yield a reasonable profit.

The first mine, it has already been decided, will be opened at Asnapani, and the location of the second and the third will be decided soon. If an Indo-British agreement is reached soon, and negotiations are said to have started already, it will give the National Coal Development Corporation a really good start in the fourth five-year Plan. The public sector has fared not particularly well in the third Plan; it will probably not reach a production level higher than 15 million tons by the time the current Plan ends. But in the tentative targets fixed for both the sectors, in the next Plan, the public sector is required to raise its production to 60 million tons in an overall coal output target of 136 million tons. That leaves some 76 million tons for the private sector, which will produce about 54 million tons by the end of the third Plan. The question, however, remains whether the public sector of the coal industry, or the National Coal Development Corporation which is the chosen instrument, will be able to move that fast in its production drive. After all, it takes time to open up new mines and output cannot be increased from existing mines overnight. But the National Coal Development Corporation has already taken considerable preliminary measures for new projects which must bear fruit in the next five-year period. Even so, the target looks a bit too high, especially if the capability of India's public sector enterprises is taken into consideration. There is another reason why the NCDC should not be asked to overstrain its capacity. This is the demand aspects. As is common knowledge, India's coal industry will produce not more than 65 million tonnes, or 70 million tonnes at the most, by the end of the third Plan. How does this compare with the original target of 97 million tonnes, which has had to be revised one time upward and three times downwards? Not that revision of plan targets is a sin, but this just shows how unreliable India's demand estimates have been.

Over-Production

It may be argued that coal production must remain somewhat ahead of demand and not lag behind it. In that case, the major part of the job should be entrusted to those who already have the necessary machinery, skill and administrative apparatus, rather than start brand new ventures in the public sector which may not mature just when they are required the most. However, at the moment the industry as a whole is in a state of over-production. There are 5 or 6 million tonnes of low grade coal which the collieries concerned do not know how to dispose of. This in turn reflects a lower industrial demand among other things. It is possible that production in industry will pick up soon, but this needs to be watched. Unless demand conditions in the country justify a target as high as 136 million tonnes, it would be sheer waste to plan for it and make the necessary investments. The World Bank which has a sort of vested interest in India's coal industry, having already advanced a fairly large sum of money, does not recommend a figure higher than 126 million tonnes. It remains to be seen whether the sub-committee which has been appointed by the National Development Council to look into the various proposals for increasing coal production in the country before deciding on a specific figure, will allow itself to be influenced by over-zealous officials of the Central Ministry for Steel, Mines and Fuel, or whether it will prefer the hard-headed calculations of World Bank experts.

Whatever be the target that is finally fixed, there is one question which has to be tackled objectively and realistically. That is the question of coal prices. It concerns as much the public sector as it does the private. The earnings of the NCDC mines are considered pretty low and if the net profit is to be about 10 per cent of the capital at charge, which the Union Finance Minister wants and which it should be if the Government's coal enterprises are to run on sound commercial lines, the coal prices would clearly need to be raised. There is a greater reason why the private collieries need a higher price than they are allowed to get. The NCDC can fall back on the immense resources of the Government; the private collieries have no such aid available to them. They can at best borrow from banks or go to investors in the capital market. But in either case, they must have sufficient financial strength to service loans or pay reasonable dividends to investors. These the collieries are at present not able to do. They are not making good profits and have, therefore, been unable to pay good dividends. This is the main reason why investors in the stock markets are at present so apathetic to the shares of coal companies.

★ ★
The president of the Indian Chamber of Commerce, Mr. Sookamal Ghosh, did well, in the course of his address at the last week's quarterly general meeting of the Chamber, to sound a note of warning against excessive reliance on controls just when the Government is bent on imposing more and more of them. With prices continuing to take the upward course, controls look attractive as a solution as they provide the Government just an easy way out. The Government takes responsibility for fixing the prices and introducing rationing for various essentials of life including food-grains, but it is apparently assuming no obligation for maintaining the supply pipeline. It has a positive responsibility to see that the basic causes of shortages and bottlenecks to

Yet another herb?

industrial production are removed, but how far has it been successful in acting up to that responsibility? Moreover, most of the fundamental causes of the present inflation and the consequent shortages and evils of hoarding and profiteering can be ascribed to the so-called measures of planning such as deficit financing, lop-sided investment and administrative inadequacies. All these have arisen due to the rigid style of planning chosen for a democratic country. Mr. Ghosh, therefore, criticised not only the various control measures, but also the causes which lie behind them. The Government he pointed out, thought more in terms of regimented and detailed planning on the lines of certain totalitarian countries, but because of the democratic functioning of the Government, "we have very often lost our way in the labyrinth of controls, restrictions and regulations which this form of detailed planning involves." Controls after all are no solution to shortages; they only aggravate and even perpetuate shortages.

★ ★
In his address at the third annual general meeting of India Carbon Ltd., the Chairman, Mr. P. D. Himantsingka, provided some useful information about the present political and economic conditions in Assam. (India Carbon's plant is located near Gauhati and it depends for its raw materials on the two oil refineries at Digboi and Noonmati which it produces calcined petroleum coke.) According to Mr. Himantsingka, a sense of stability has been steadily growing in Assam; so is the sense of security. The State Government is doing its best to create a favourable atmosphere for industrial development. But there is a great shortage of power, which the State Government is trying to remedy through setting up new power plants. However, the environment of expansion and growth which has been created through the active assistance of the Assam Government is helping industries to develop. India Carbon, for instance, has been doing well, largely because of the co-operation it has received from that Government. The company is paying a 6 per cent dividend free of tax, this year. It is also looking into fresh avenues of expansion. It has already requested the Government for permission

to make calcined anthracite coal and more proposals are likely to follow when the Managing Director's new ideas on expansion have been scrutinised and given effect to. However, the management has not been able to work the plant to its full capacity as the size of the market is still not adequate. Yet the Government has been allowing some imports. What is worse, it is even proposing to licence a second calcined petroleum coke plant in Barauni, in the public sector. This is of course in keeping with the Government's policy of balanced industrial development, matching a private sector plant with one in the public sector.

★ ★

The work concerning the Paradip port project, it is claimed, has made considerable progress. The lagoon harbour from which ore will be shipped to Japan is nearing completion, and it will be possible to start shipments from here some time in the second half of 1965. Paradip port, as is well known, will have sufficient facilities for large-scale iron ore shipments. The ore will come from what is known as the Daitari iron ore project, the mechanisation of which will be done in collaboration with Hungary. The mining experts of the firm of Nikex of that country are already in Orissa, discussing with the officials of the Orissa Mining Corporation the project report for the mine and the details of the mechanisation to be introduced. The reserves in Daitari (in northern Orissa) are said to be large, and the ore of excellent quality with a ferrous content of 60 to 62 per cent. The mine will be completely mechanised, the project cost running into nearly Rs. 6 crores. Like the Bailadila project, the Daitari iron ore project is designed to produce sufficient iron ore to enable an annual shipment of 2 million tons to Japan. It is confidently expected by the officials of the Orissa Mining Corporation that the project will start producing ore by the end of 1965, or early in 1966. From Daitari, the ore will be conveyed to Paradip through a mechanised loading system, after being treated by a washery which it is claimed is the biggest of its kind in India, and which has been manufactured in the United States.

Andhra's Ambitious Plan

From Our Correspondent

MADRAS :

AFTER THE recent meeting of the National Development Council, the State Governments have been busy preparing their estimates for the fourth Plan. Since it has been finally decided that the total outlay for the whole country in 1966-71 should be around Rs. 21,500 crores, the State Governments also have taken it for granted that there would be a doubling of their outlays as well and in some cases by a greater proportion in order to overcome serious disparities in the levels of income. The Andhra Pradesh Government has been the first among the Southern States to publish the draft of the fourth Plan. It is encouraging to note that the serious deficiencies of the earlier Plans are being sought to be removed and that there will be great emphasis on the generation of electricity. But it is difficult to anticipate at this stage how an overall outlay of Rs. 1,500-1,600 crores, for the State, Central and Private sectors put together, can be achieved.

It has been explained that this volume of investment is necessary in order to bring about an increase in the income of the region by 40 per cent in a five-year period. Only then it is contended that the gap between the 'per capita' income for the whole country and the 'per capita' for the State can be narrowed. On the basis of these estimates, it is expected that the 'per capita' income in the State will increase from Rs. 319 at the end of the third Plan to Rs. 413 by 1971. In the same period, the All-India figure will increase to Rs. 426 from Rs.

352. Thus, there will be a narrowing in the gap to Rs. 13 from Rs. 33 in 1966.

There cannot be any dispute over this approach to the whole problem. But the outlay of Rs. 1,600 crores in the fourth Plan will be possible only if there is an investment on Central projects in the State to the extent of about Rs. 800 crores. How exactly this huge outlay will be brought about is the major conundrum. The State has, of course, assumed that the expenditure on the Nagarjunasagar Project and Srisailem Project will be borne wholly by the Centre. A number of Central projects will necessarily come into being though capital expenditure of the order proposed would be feasible only if the steel plant at Visakhapatnam, having a capacity of 1.5 million tonnes, can be erected. It is too early to speculate now whether a definite decision in this regard can be reached before the estimates for the fourth Plan are finalised. The State Government, however, has emphasised that the target will have to be reached in any event by its undertaking additional projects.

The size of the State Plan has tentatively been fixed at Rs. 700 crores, roughly double the size of the third Plan. Against the original estimate of Rs. 312.50 crores it is now anticipated that the total outlay will be around Rs. 350 crores because the work of construction on the Nagarjunasagar and Srisailem projects has been expedited. The larger plan is proposed to be implemented with Central assistance to the extent

of about 80 per cent which would mean that even if there was a shortfall in Central investment in the State directly, an increase in the State's expenditure to off-set this shortfall will willy-nilly have to be financed to the extent of 80 per cent by the Centre. When there is a shortage of resources all round, both the Planning Commission and the Centre will of necessity bargain for a reduction in outlay because it will mean so much of reduction in Central assistance.

The proposed outlay under different heads in the fourth Plan, as compared to the revised estimates for the third Plan, will be as indicated below :

FOURTH PLAN OUTLAY			(Rs. crores)
Sector of Development	Revised outlay in the third Plan	Allocation in the fourth Plan	
1. Agricultural programmes, Animal Husbandry, Fisheries, Co-operation including Community Development ..	49.50	78.00	
2. Irrigation :		45.00	
(i) Minor Irrigation	28.26	12.00	
(ii) Ayacut Development	2.08	75.00*	
(iii) Major and Medium Irrigation ..	75.33	200.00**	
3. Power	78.81	60.00	
4. Mining and Industries	16.72	60.00	
5. Transport	13.24	64.50	
6. Education	18.08		
7. Medical, Public Health, Housing, Miscellaneous welfare schemes	30.64	75.50	
Block allotment for the development of chronic drought affected areas ..	—	25.00	
Reserve for additional allotment when necessary	—	5.00	
TOTAL	312.66	700.00	

*Excluding the provision for Nagarjunasagar Project.

**Excluding the provision for Srisailem Project.

Whatever might be the ultimate shape of the Plan, power development will receive the pride of place with agriculture and irrigation also getting greater prominence. Between these two heads nearly 60 per cent of the outlay will be accounted for. The actual expenditure on power schemes will be Rs. 77 crores while Rs. 16 crores are proposed as advance expenditure on fifth Plan schemes. The addition to installed capacity is, however, expected to be as much as 1,390 mW, 490 mW on account of spill-over schemes and 900 mW in respect of new projects. As it will be necessary to retire old sets having a capacity of 51.90 mW, the net installed capacity at the end of the fourth Plan is expected to be 1,749.10 mW against 411 mW in the third Plan. This great achievement will be made possible by the fructifying of the huge expenditure incurred already on many schemes and the new capacity created will be as much as 1,390 mW against only 198 mW in 1961-66. Whether these estimates will be realised with the proposed capital expenditure remains to be seen. The expenditure on transmission schemes, rural electrification and railway electrification has been placed at Rs. 238 crores. If power availability improves on the scale envisaged there might even be a surplus available for consumption in the neighbouring areas for a short period.

Of the spillover schemes, thermal power from Kothagudem and Ramagundam first stages will be for 120 mW while the Ramagundam second stage, which apparently re-

lates to the package deal proposed by Dr. Teja, will yield 200 mW. The Nellore Thermal set and gas turbo sets at Hyderabad will have a capacity of 50 mW in the third Plan with the result that, out of the total capacity of 688 mW on account of the existing schemes, the thermal content will be as much as 430 mW which is a noteworthy feature contributing greatly to the firming up of power supply. Of the new schemes the biggest contribution will again be made by the Kothagudem Thermal scheme — station - B with a capacity of 480 mW and Station - A Stage - 2 scheme with a capacity of 120 mW. The Upper Sileru project will yield 300 mW. There will thus be a predominance of thermal power which augurs well for the future, for the State as well as the region. Only, as stated earlier, the estimates of expenditure would appear to be very low.

There will, of course, be a big increase in agricultural production though the detailed and physical targets consistent in the allocations have yet to be worked out. It is hoped that the targets envisaged by the Working Group will not be substantially reduced. This group had proposed an increase in the output of foodgrains by 30 per cent, sugarcane by 10 per cent and oilseeds by 17 per cent, among the more important crops. The estimates of agricultural production are probably easier of achievement because a large potential exists.

The State proposes to find Rs. 140.26 crores out of its own resources in order to finance the various schemes. The balance will presumably have to be found by the Centre. Fresh taxation for Rs. 45 crores only is envisaged. Even here the collection of arrears of taxes is expected to make a contribution. Net open market borrowings are expected to secure Rs. 68.90 crores and small savings Rs. 10 crores. Whatever might be the criticism levelled against the tentative estimates of the State Government, it cannot be denied that a stepping up of outlay in Andhra Pradesh will yield the maximum results.

★ ★

The problem of augmenting water supply for Madras City has been baffling solution. It had been hoped that the UN team of experts, which visited the City recently, would be able to offer new suggestions. But it has been found on a close examination of the various schemes that the proposal for desalination of sea water will have to be accorded the lowest priority on account of its prohibitive cost. It had been hoped that this scheme would be feasible as all available water sources had been effectively tapped. For a time, the idea of utilising the surplus water at Neyveli was vigorously pursued. But the Neyveli authorities were not willing to commit themselves on a long-term basis as it had not been possible to assess precisely the availability of under-water resources in the region. It is also felt that the Corporation itself would be requiring much larger quantities over a period, and that the agriculturists in the area would be disappointed if large quantities of water were diverted to Madras for drinking purposes. At the present moment, the surplus is made available for use by agriculturists on the definite understanding that the Corporation could absorb the supplies in other directions if the need arose. The scheme for drawing water from Cauvery has not also been taken up as there are no large surpluses available. It has, therefore, been emphasised that, the implementation of the project for bringing water from the Krishna River to Madras with the co-operation of the Andhra Pradesh Government should be expedited. For this year, there may not be any serious problem as the main reservoirs feeding the City are full, on account of the recent heavy rains. However, the problem of augmenting supplies cannot be postponed for long as, after three or four years, a serious situation would arise. It should, therefore, be examined how the Krishna water scheme can be implemented in the shortest period.

The moving finger writes

LAST WEEK this country played host, with fulness of heart, to a leader of a great religion and the Head of a great Church. Pope Paul VI came, as he described it, "as a pilgrim of peace, of joy, of serenity and love" and the Prime Minister bade him welcome in the name of "a country that stands for peace and the essential unity of all religions". A few days earlier, another Man of God, Sri Sankaracharya of Kanchi Kamakoti Peetam, in a voice more authentic than that of President or Prime Minister, had called for the stilling of religious feuds and controversies and firmly laid down that "the co-operation of all religious heads was badly needed today to guide humanity away from dry, materialistic ideals towards moral or spiritual path". The Sankaracharya had also appealed to the intolerant few in our midst that they should show no disrespect to the Pope. Whether the intolerant heard his words or not, they themselves went completely unheard in the surge and swell of the great reception which India gave in Bombay to the exalted visitor from Rome. I have no doubt in my mind at all that the Pope's visit and the Indian response to it have shed lustre on India's image and India's name as one of the civilised communities of the world. Incidentally, I wonder whether there are at least a few honest red faces now among the editorial visages on the Board of the "Time" magazine which, true to its bad habit of being mean-minded and prickly phrased while commenting on this country, had done an uncharitable preview of the preparations in Bombay for the Eucharistic Congress and the Pope's visit.

★★
The post-mortem lament which the Council of Scientific and Industrial Research ritually set up for the late J. B. S. Haldane was the conscience money which the pharisees paid to a prophet. It is but natural that the pedlars, parvenus, and the panjandrums who prey on the scientific world should feel easier with a Haldane dead than with a Haldane living. Haldane hated richly and he hated nothing more fiercely than he hated career "scientists" unblest with the spirit of inquiry. Haldane was also a man of great loves. He loved fun and adventure and he loved science and, unlike the girl in Oscar Wilde who did not love music but loved musicians, he loved genuine scientists more than he loved even science. Above all he loved life, living it generously and heroically, and there was one thing he loved more than life itself and that was his fellow men.

Among the great loves of Haldane I should not omit to mention India. Through the centuries India has been loved and lost over and over again; and in this year of 1964 India herself lost two of her greatest lovers ever. Each of them had chosen his own special way of showing his yearning to be identified with the country he loved. Jawaharlal Nehru directed that the ashes of his body should be scattered over the good earth of the land of his birth. There was perhaps a certain childishness in that gesture and possibly some vanity. In Haldane, resigning his body to medical research in some obscure institute somewhere in India, I see, however, only the most complete self-effacement and the uttermost dedication to the country of his choice.

★★
It is possible that the Press in this country is not over-keen on championing lost causes but it does seem to have a weakness for lost personalities and their problems which more often than not are of their own making. Stray suggestions in Parliament that Sheikh Abdullah or Mr. Jayaprakash Narayan should be prevented from preaching the gospel of disinteg-

ration have been avidly seized upon, for instance, by more than one national daily to sound the alarm that the liberty of the individual is in danger of being destroyed by the intolerance of obscurantists and chauvinists. I find this agitation strangely unconvincing since it ought to have been obvious to the most innocent that there never really was a possibility that Mr. Jayaprakash Narayan, or, for that matter, Sheikh Abdullah, was about to be placed under preventive detention.

But surely the point of the disquiet shown in the country over the utterances and activities of Mr. Jayaprakash Narayan, the Rev. Michael Scott or, in a different context, Sheikh Abdullah, is that these people should not have the advantage of functioning the way they do from favoured positions. I agree these gentlemen need not be gagged simply because they say things which are disagreeable or unacceptable to many of us. But I do not see why Mr. Jayaprakash Narayan or the Rev. Michael Scott should be allowed to continue as members of a Peace Mission in Naga Land sponsored by the Government of India, even after it has become clear that their views are uncompromisingly at variance with the basic assumptions and objectives of the Government of India's policies with regard to Naga Land.

In the same way, is it so unreasonable to suggest that the Government of India would be acting without prudence or dignity if its leaders were to conduct themselves before Sheikh Abdullah as if he were some sovereign authority with whom the status of Kashmir should be negotiated? It is simply because the Government of India has been showing unwarranted indulgence to these individuals that there is a degree of unhealthy reaction among certain sections in Parliament or the country against the latitude allowed.

★★
Another intriguing instance of the partiality of the Indian Press for individuals is provided in the thundering editorials published by two of our national dailies demanding that Messrs. Dastur and Company should not be done out of the Bokaro steel plant. "The Times of India", writing on December 1, presents the case for Messrs. Dastur as the case simply for the nation's technological self-reliance. This surely is an over-simplification of the issues involved. In the first place, I would very much like to know how self-sufficient Dastur and Company is in technical skills and competence — whether it employs or it plans to employ foreign consultants and if so how much the country is or would be spending on those consultants in the form of foreign exchange. Secondly, if Dastur also have to seek foreign personnel or technical assistance would it not be more economical for the Government of India itself to do so directly or to have the service performed by the foreign supplier or builder of the plant as part of a turn-key job? In any case, there is no point in complaining that the Russians are trying to sabotage Dastur since it was by no means certain that Dastur and Company would have fared better under an American dispensation for Bokaro. The fact is that no foreign collaborator, accepting a very considerable responsibility for finance, supply, construction and commissioning of an integrated steel mill, is likely to surrender substantial authority in designing to a firm of consultants which has yet to build its first steel mill and on behalf of which the utmost that its enthusiasts could plead is that its "technical competence has not been questioned".

Then there is "The Statesman" writing on December 5 of the high importance of the Government of India properly dis-

December 11, 1964

tinguishing between "associating" Indian engineers with the construction of steel plants and investing them with responsibility. The paper goes on to advise rather irresponsibly that it is for the Cabinet to take a political decision on assuming responsibility within India. This is easier said than done. The Cabinet took a political decision to build the Bokaro Steel Plant in the public sector and the result was that the U.S. Congress concluded that there were better ways in which the U.S. taxpayers' money could be utilized. Is it now being seriously suggested that the Government of India should insist on keeping the issue of consultancy responsibility out of the negotiations with the Soviet Government and thus run the risk of those talks too breaking down? It seems to me most unwise that we should at all seek responsibility in designing, when other large responsibilities in the matter of the supply, erection and commissioning of the plant must necessarily lie with the collaborator.

★★
I am sorry to have to say that Mr. Chagla's reputation for objectivity and even veracity seems to have suffered a great deal as a result of the statement he made in Parliament on the resignation of Prof. Kichlu as Director of the National Physical Laboratory. Quite a few people who seem to be personally acquainted with the background and details of this episode tell me that the most favourable construction that could be placed on the Education Minister's representation is that he had been wrongly briefed if not deliberately misguided by interested parties. Mr. Chagla's declaration that in future he would have all proposals for "merit" promotions considered by a panel has been sarcastically commented upon. It is pointed out that this was precisely the procedure that Prof. P. K. Kichlu had pressed for in the case of Dr. S. C. Jain whom the Director-General of the Council for Scientific and Industrial Research successfully insisted on promoting on the basis of the Director-General's own personal assessment.

Prof. Kichlu's objection, in other words, seems to have been neither to "merit" promotions in general nor even to Dr. Jain being promoted on grounds of "merit". All that he urged was that the claims of other candidates for "merit" promotions should be considered along with Dr. Jain's by a panel. I believe that he was right and, consequently, I suspect that an argument so eminently reasonable could only have been so summarily ignored either, because the Director-General of the C.S.I.R., Dr. Hussain Zaheer, wanted to do a special favour to a particular member on the staff of the National Physical Laboratory or because he deliberately sought to create a situation from the embarrassments of which Prof. Kichlu could save himself only by resigning, as he did, the Directorship of the National Physical Laboratory.

★★
When the Governor of Kerala recently complained that his administration found itself in the soup as a result of the Central Government not fulfilling its food commitments to the State, I wonder whether he anticipated so prompt a salvage operation. Mr. V. V. Giri is now being relieved of the Governorship of Kerala and is being taken out of the soup. Whatever his own reactions may be to being "rescued" in this particular manner, the public is bound to suspect that he is being punished for the indiscretion of his statement to the press on the food muddle in Kerala. I am not maintaining, however, that the suspicion must necessarily be well-grounded. It is possible that New Delhi was merely on the look-out for opportunities for creating a suitable berth for Mr. M. J. Desai who has "retired" or is in the process of "retiring" — I confess I do not know what is the precise situation — from the Indian Civil Service as well as from the post of the Secretary-General of the External Affairs Ministry. Old soldiers, they say, never die. In this country, old civilians, I may suggest, never really retire even though they go through the motions of retirement which their "service" rules specify. Mr. R. K. Nehru, so far as I know,

EASTERN ECONOMIST

1141

has not retired except in the strictly formal sense; neither has Mr. S. S. Khera, nor Mr. S. Dutt.

The subject is a delicate one; critical comment is apt to be misunderstood or taken "personally". But an issue of public significance is clearly involved and the responsibility of discussion cannot, therefore, be evaded by the press. I am therefore glad that "The Times of India" has written what, in the circumstances, is a courageous editorial of protest. In its issue of December 4, it makes the pertinent point that indefinite retention of superannuated officials in government employment of one kind or the other is bound to affect the quality and efficiency of the public services in the long run as such a practice must necessarily defer unduly just expectations and aspirations at the younger levels of the hierarchy. To this I may perhaps add another argument which I have pressed on earlier occasions in this column. I sincerely believe that distinguished public servants should really retire at the proper time and devote themselves to the larger cultural and public life of the nation. Only then could the quality of our society or social life improve. At the present time there is far too little of intellectual activity through those voluntary associations of individuals which are the essential organs by which alone a free society could, in the long run, progress in freedom.

★★
I have no patience with those among us who seem to have suddenly discovered that Mr. Swaran Singh is unlikely to make a great Foreign Minister and have started complaining about it. Surely Mr. Swaran Singh himself had never done anything to warrant extravagant expectations. I have never concealed my view that, while Mr. Swaran Singh has certainly held a variety of ministerial assignments, he has never handled any of them in any specially distinguished manner. If I were to name two Central Ministers who have held long periods of office for little public purpose, I would mention Mr. Swaran Singh and Mr. K. C. Reddy. The fact that both of them are very agreeable and pleasant-mannered individuals would, no doubt, make this judgment sound harsh, but unfortunately it does not invalidate it.

★★
On second thoughts we should perhaps be glad that Mr. Swaran Singh is being so predictably pedestrian in his latest job, considering what a craze for notoriety could do for some of us, such as, for instance, Mr. Shriman Narayan. Our Ambassador at Kathmandu, it appears, will report to Headquarters only in Hindi. Since it is possible, however, that the reports are unlikely to be read in any case, Mr. Shriman Narayan's language fanaticism may not do much harm. But his threat to serve "tulsi" water at Embassy receptions cannot be dismissed as a mere fad. Our Embassies abroad are not the private establishments of our Ambassadors. They have to organize their social functions in conformity with certain standards of hospitality and in my view treating guests to a dose of Ayurvedic medicine on the sweeping assumption that such of them as are not suffering from asthma must at least be affected with a chronic cold in the head does not seem to me to be a very diplomatic thing to do; on the contrary, this "tulsi" water-business might suggest a mild case of water-on-the-brain.

★★
This column has run to two pages of the Journal. This I may hasten to assure my readers is an aberration, and I have no intention of making it a habit. My excuse on the present occasion is that this is the last issue of the Journal for the old year. Good old 1964, I bear you no grudge, though you have not been a particularly good year for my country. Things, however, could have been worse and because they were not, I thank thee and, while bidding you farewell, I prepare, with true human fickleness, to let thy memories fade as I turn my face towards the bright gleam of your emerging successor.

V. B.

Trade Winds

I.M.F. — RECENT ACTIVITY

DURING THE first half of 1964, the developing countries continued to make greater use of the Fund's resources, in proportion to their quotas, than advanced industrial countries — Deutsche marks and French francs playing a leading role in these drawings and repayments. The volume of the Fund's operations was also greater during this period than in any January-June period since 1957, and the drawings of \$581.4 million as against repayments of \$215.6 million i.e. an excess of drawings of \$365.8 million raised the total to \$1,835 million of drawings outstanding at the middle of the year. At the beginning of November 1964, the developing countries were using as much as 80 per cent of the \$1736 million in currencies outstanding from the International Monetary Fund. The equivalent of \$1.4 billion was outstanding as a result of drawings by developing countries in Africa, Asia, Latin America and the Middle East, and there were net drawings amounting to \$320 million on the part of the United States. The USA has drawn \$400 million in Western European currencies under stand-by arrangements which have been in effect since July, 1963, but the net US drawings have been reduced by Fund transactions in dollars with other countries.

The bulk of the \$1820 million available under the Fund's stand-by arrangements, as on October 31, 1964, represented potential claim of three industrial members — Japan, the United Kingdom and the United States. The undrawn balance of the existing US stand-by arrangement which extends to July 21, 1965, is equivalent to \$350 million, while Japan and the United Kingdom maintain stand-by arrangements for \$305 million and \$1,000 million respectively, neither of which has been drawn upon.

The largest drawings during the first half of this year were made by the United States (equivalent to \$250 million) and Italy (equivalent to \$225 million). Both countries were using the Fund's resources for the first time, and neither drew beyond its gold subscription. Most of Italy's drawing, in fact, had the effect of restoring the Fund's holdings of lire, which had been reduced in the course of drawing by other members. In drawing European currencies, the United States indicated that it would sell these currencies for dollars to countries wishing to make repayments to the Fund.

Total drawings since the 1947 beginning of Fund operations stood, on October 31, 1964, at \$7890 million. During October, 1964, members drew the equivalent of \$38.65 million and repayments were equivalent to \$77.40 million. The latter included a \$57.15 million payment in Deutsche marks by the Government of Canada which fully restored Canada's financial position in the Fund, which was upset following its \$300 million drawing in June 1962. The Fund's holdings of some Western European currencies have been reduced in the course of its operations over the past two years, despite repayments in these units over the period. Deutsche marks, for example, were at 20 per cent of the member's quota in the Fund at the beginning of November, 1964, and French francs at 34 per cent. Members customarily pay 75 per cent of their quotas in their own currency and 25 per cent in gold.

On June 11, 1964, Mr. Schweitzer, the Fund's Managing Director, and His Excellency Alfred Zehnder, Ambassador of Switzerland to the United States, exchanged letters which constitute an association of Switzerland with the Fund's "General Arrangements to Borrow," in which the ten industrial countries viz., Belgium, Canada, the Federal Republic of Germany, France, Italy, Japan, the Netherlands, Sweden, the United Kingdom and the United States, already participate. Switzerland would make financial agreements, which may be

reciprocal, directly with participants in the borrowing arrangement, and will make available resources in amounts up to 865 million Swiss francs. The Fund will thus be able to call upon Switzerland to extend credits, in accordance with its agreements with individual countries, if the general borrowing arrangements are invoked.

NEW GATT CHAPTER

The details of a new chapter on trade and development, which will form Part IV of the General Agreement on Tariffs and Trade, have been finalised for submission to the member countries for their approval. The text, that was adopted at the GATT special session towards the end of November, 1964, represents a compromise whose key elements were negotiated at the eleventh hour between the Indian and the US delegations representing the developing and the developed contracting parties. The new chapter will make GATT the first contractual agreement to embody some of the principles defended by the developing countries at the last UN trade conference. The three main points in the new chapter are: (1) The contracting parties agree on the necessity to ensure for the developing countries a rapid and sustained increase of income from export products. (2) Since the undeveloped countries' exports still depend on limited range of raw materials, it is necessary to assure these products the most favourable and acceptable conditions of access to world markets, and to draw up measures to stabilise and improve the position of these products in the world market. This especially concerns measures to stabilise prices at such equitable and remunerative levels as will permit an expansion of world trade and demand — a "dynamic and constant increase" of these being necessary for their economic development. (3) Developed countries belonging to GATT do not expect reciprocity for their commitments in trade negotiations to reduce or eliminate customs duties and other obstacles to the trade with non-developed contracting countries.

An article of the new chapter also lists the commitments which developed countries should undertake, unless prevented by imperative reasons. Among these commitments is a pledge to abstain from revision of fiscal policy aimed at reducing or eliminating the fiscal measures in force.

Mr. K. B. Lal, leader of the Indian delegation to the GATT conferences, is reported to have said that this chapter was a starting point and provided the legal and institutional framework within which measures to expand the trade of developing contracting parties could be pursued. The European Common Market commission is also reported to have accepted the new chapter with reluctance. The ECM countries feel that the organisation of markets is more important than the removal of tariff and non-tariff barriers to exports of developing countries.

AIR-CONDITIONING & REFRIGERATION

As the Council of Scientific and Industrial Research cannot look after everything, the refrigeration and air conditioning industry should have a scientific organisation of its own for the technical development of the industry. This view was expressed by Mr. T. N. Singh, Union Minister for Industry and Supply while speaking at the opening ceremony of an exhibition of the refrigeration and air-conditioning products, in New Delhi, on December 4, 1964. The Minister emphasised the need for larger exports of the products of this industry so that the import of components required by the industry could be financed without any difficulty. Industrial refrigeration, he emphasised, was essential in an agrarian economy like ours for the preservation of foodstuffs.

Earlier, in his welcome address, the President of the

Northern India Refrigeration and Air Conditioning Trades' Association, referred to the popular misconception of considering air conditioning and refrigeration as luxuries. Besides its utility in the preservation of foodstuffs, these days, in the and air conditioning industry was essential, these days, in the running of such important industries as textiles, synthetic fibres such as rayon and nylon, drugs and pharmaceuticals, chemicals and dyes, fertilisers, aviation engines, tools and dies, and precision instruments. But in spite of this, Mr. Seth pointed out, the industry suffered a serious set-back because of high incidence of excise duties, sales tax and the phenomenally high prices of indigenous raw materials. The imposition of excise duties was wrongly based on Government considering this industry as a luxury industry, he added. Reviewing the development of the industry, Mr. Seth said that during the last ten years the total industrial refrigeration load had exceeded 1,50,000 h.p. The imported component had also fallen from an average of 50 per cent in 1956 to less than 10 per cent at present. The only components that the industry had still to import were thermostatic controls and special valves and fittings.

FOOD HANDLING AT PORTS

The handling of food ships at the various Indian ports has come in for severe criticism in a special report submitted to the Prime Minister, Mr. Lal Bahadur, by the US experts team which has been looking into this problem at the instance of the Government of India. The team, consisting of four investigators from the US Maritime Administration, is understood to have found inadequate port facilities and red-tape hampering the unloading of wheat, coming in from the US under PL 480 at the rate of 600,000 tonnes every month. The experts have observed that some ports are clogged while others hardly have any business. According to them, the "bureaucratic machine" is unable to co-ordinate the unloading of ships simultaneously at ports thousands of miles apart.

The experts have also found the unloading process cumbersome — stevedores going abroad and filling bags with wheat, stitching them, swinging them over the side and carting them to the nearest railway station. This technique, according to them, handles only a couple of hundred thousand tonnes of wheat monthly. In some ports the experts have detected bags of such poor quality that they burst easily and spill the grain over the docks or in warehouses.

"BLEEDING MADRAS" EXPORTS

With a view to clarifying its position regarding certain newspaper reports about the difficulties experienced by the trade in the export of the handloom fabric "Bleeding Madras" to the U.S.A. and other countries, the Union Ministry of Commerce has issued a press note explaining that the Government's policy has been a long-term one and has been in operation for the last few years and that the exports of this fabrics are under compulsory pre-shipment inspection and quality control. In order to avoid speculative fluctuations in prices the Government regulates exports by prescribing floor and ceiling prices for exports. Exporters have also been told that as it is not possible to increase the production of this item in a spurt and it is unwise to over-sell in the interests of production, price-stability and quality, the regulatory measures adopted by the Government are designed to ensure that the quotas allocated to established exporters match with the increasing production capacity and also the market potential in the USA and other importing countries. Exporters have, therefore, been cautioned not to enter into firm commitments without ensuring production and securing adequate supplies of the right quality. Government has also registered the established shippers of known competence so as to avoid

scramble-buying by a large number of casual new-comers with no long-term interests at stake in the export trade. Already the number of established exporters is quite large as compared to the limited production and demand for this fabric. All quotas for shipment in the current financial year have already been allocated and established shippers informed about it. The shippers have also been requested by the Government to register all their legally valid contracts against these quotas with the Joint Chief Controller of Imports and Exports, Madras.

The exports of this fabric have increased rapidly, from Rs. 1.3 crores in 1959 to the expected Rs. 4 crores in the current year. The production has been going up by 25 per cent each year and now about 17,000 handlooms are producing this fabric in Madras and Andhra Pradesh. Due to wide fluctuations in prices and indiscriminate sale by exporters without proper regulations, the USA and other markets were lost to this fabric in the years 1960 and 1961. It was only after the regulatory measures were enforced in 1962, that, in the last three years, exports of this fabric began catching up at a fast rate.

IN-FLIGHT PICTURES

Trans World Airlines have characterized the transatlantic in-flight motion pictures as the greatest contribution to passenger relaxation since the advent of pressurized cabins and have accused certain other international carriers of seeking to deprive passengers of movie benefits for their own narrow, selfish purposes. It was more than three years ago when the TWA took the initiative for the development of this service. According to the TWA Vice-President, Mr. Thomas B. McFadden, anything that attracts more persons to air travel and that eases the tension of "first-time riders" and relieves the long flight boredom of experienced travellers has great psychological and therapeutic value for the customers of airline services. It is noteworthy that TWA has been able to provide motion picture diversion aloft at a time when basic transatlantic fares have been on the decrease. The arguments that in-flight entertainment will eventually result in higher fares or prevent lowering of present fares at some future date, according to Mr. McFadden, are highly exaggerated. The cost of TWA's type of in-flight entertainment is quite reasonable and anyone with a knowledge of airline arithmetic can realise that if movies contribute to higher load factors they do not present a significant cost increase. The higher the load factor, the more are the persons who ride a given airplane and consequently the lower are the unit costs.

EXPORT PROSPECTS FOR CARPETS

As brought out in the report of the Indian Government Trade Representative, a larger quantity of carpets, both cotton and woollen, are imported into the Aden market. The concentration of British armed forces personnel has further increased the market potential for this item. Aden's climate being extremely hot and humid for the best part of the year, cotton carpets are generally preferred. In the last few years the British Royal Air Force has purchased a larger number of such carpets for use by its armed forces in Aden. The three years' import figures given below illustrate the marketing possibilities of different types of carpets in Aden.

	1960 (£)	1961 (£)	1962 (£)
(a) Carpets, floor rugs, etc. other than wool and fine hair	81,583	131,340	50,315
(b) Carpet etc. of vegetable plaiting materials (including coconut matting)	6,852	8,743	17,859
(c) Carpets etc. of wool and fine hair	31,717	15,456	15,654

Company Affairs

L.I.C. : PURPOSEFUL PERFORMANCE

MR. B. K. KAUL, Chairman, Life Insurance Corporation reviewed the progress of the Corporation for the year ended March 31, 1964, while addressing the annual general meeting held recently in Bombay. New business during the year, he stated, amounted to Rs. 703 crores involving 1,646,000 policies as against Rs. 746 crores involving 1,768,000 policies in the previous accounting period of 15 months. Although the two figures are not comparable, it is evident that the year under review has experienced a slight reduction in new business. The Chairman was of the opinion that the rise in the cost of living as well as the introduction of the Compulsory Deposit Scheme, which affected the tax-payer, had their inevitable repercussions on insurance business. Other factors, like famine conditions and shortages of food supply, further affected the business adversely, but the short-falls were only temporary. Mr. Kaul indicated that the ratio of lapses to new business in force was 8.2 per cent during the year, as against 8.1 per cent during the previous accounting period. This, again, is a reflection of the impact on insurance of the adverse economic conditions. He added, however, that the very slight increase in the lapse-ratio was a proof of the steps taken by the Corporation to control the lapses and he hoped that the business during the current year will be much better. The total business in force as on March 31, 1964 was Rs. 3,571 crores, covering 10,328,000 policies, as against Rs. 3,165 crores covering 9,500,000 policies a year before. The Chairman added that the business in force on March 31, 1964 was nearly three times when the insurance was taken over as on December 31, 1955.

The premium income of the Corporation during the year amounted to Rs. 146.32 crores, as against Rs. 150.38 crores during the previous 15 months, which shows a positive improvement. The total income was Rs. 179 crores, as against Rs. 185 crores during the last 15 months. Of the total investment in India, of Rs. 707.60 crores, the public sector claimed nearly 75.5 per cent, co-operative sector 4.3 per cent, the joint sector 1 per cent and the private sector 19.2 per cent during the year under review. As many as 70 new issues were agreed to be underwritten to the extent of an aggregate amount of Rs. 13 crores. The Chairman revealed the encouraging fact that the overall expense ratio for the year came down to 27.5 per cent from 29.30 per cent in the previous accounting period and the renewal expense ratio has also come down from 14.13 per cent to 12.46 per cent. This, indeed, has been a performance of remarkable nature because, as the Chairman indicated, it had been achieved in spite of the increase in salaries and allowances of all employees except those of the Class I.

Mr. Kaul indicated that the 'Own Your House Scheme' which came into operation on January 1, 1964, at 26 centres has been extended to further 49 centres and it is proposed to be extended further to two more centres from January 1, 1965. The Corporation can also boast of a number of other housing schemes and a scheme has been introduced for grant of loan to individual employees of the Corporation for purchase and construction of houses. The total assistance given by the Corporation to housing development under these schemes upto March 31, 1964 amounted to Rs. 62.78 crores. This important function of the Corporation has positively relieved various cities of the housing shortage to some extent and it is

hoped that the Corporation will continue to go ahead with these schemes.

PARRYS CONFECTIONERY'S PROGRESS

Mr. H. V. R. Iengar, Chairman, Parrys Confectionery Ltd., indicated recently that the sales turnover of the Company increased substantially during the 18-month period of April 1, 1963 to September 30, 1964. The increase over the previous 18 months was about 22 per cent in value and in actual figure it came to Rs. 2.77 crores. This upward trend was a proof of the growing popularity of the Parrys products throughout the country. The Company achieved this imposing result in spite of the fact that the supply position of the main raw materials presented considerable difficulty and the shortage continued to persist. Consequent on the imposition of control in April, 1963, release of sugar for confectionery manufacturers has been strictly controlled. Even other essential raw materials, like milk powder and condensed milk, have not been available in the required quantities due to diversion of the bulk of these products for defence requirements. The Chairman added that the recent increase in the price of sugar was another factor that enhanced the cost and the Company had to increase the selling price which meant some additional efforts in maintaining the sales.

Mr. Iengar pointed out that during the period under review, the Company successfully negotiated the purchase of machinery for replacement of some of its old units, which had reached the end of useful life, from Manjula Confectionery Ltd. This machinery had been very little used and had been well maintained and was available because the Manjula Confectionery Ltd. had discontinued the manufacture of sweets. This act will positively help in the modernisation of its plant but the Chairman was of the opinion that it will have to modernise its plant if the Company wanted to improve the quality of its products to be able to sell in foreign markets. The Company, he added, exported during the period under review sweets valued at Rs. 1.31 lakhs and hoped to export more in the Far East, Middle East and East African markets. He urged the Government to view the problems of the industry more sympathetically so that it could compete in the foreign markets.

CHEMICALS AND PLASTICS ISSUE

Chemicals and Plastics India Limited, will enter the capital market with a public issue of Rs. 62 lakhs. It has an authorised capital of Rs. two crores and an issued capital of Rs. 1.50 crores made up of Rs. 1.35 crores in equity capital and Rs. 15 lakhs in cumulative redeemable preference shares (9.5 per cent) of Rs. 100 each. The public issue consists of 49,500 equity shares of Rs. 100 each and 12,500 preference shares of Rs. 100 each for cash at par.

The subscription list will open on December 16 to close on December 24 or earlier at the discretion of the directors, but not before December 18. Out of the present issue of Rs. 1.50 crores, B. F. Goodrich Company of Akron, Ohio, USA and their nominees have agreed to subscribe 17,212 equity shares of Rs. 100 each for consideration other than cash, and 17,213 equity shares of Rs. 100 each at par for cash. The founders, directors, managing agents and their relatives and friends and their associated companies have subscribed 51,068

a Pleasure to Give

POYSHA CONTAINERS MAKE IT POSSIBLE

Think of any colour, almost any brand of paint, for any painting job. Chances are that the paint you want comes in a Poysha container in just the size you need. It's amazing how much care goes into the manufacture of Poysha tin containers. And they're also tested to rigid quality control standards to protect the high quality of today's paints.

Already one of the two largest tin container manufacturers in the country, Poysha is expanding rapidly... with new factories coming up at Dighe (Bombay), Ghaziabad (Delhi) and Cochin. By producing more top-quality containers, Poysha will help the paint industry bring you more paints—brighter living.

POYSHA INDUSTRIAL COMPANY LIMITED

FOR PERFECT PROTECTIVE PACKAGING

CASPI-12

equity shares of Rs. 100 each at par. (Indplast Private Ltd. — 17,000 shares, The India Cements Ltd. — 13,500 shares, Kumari Investment Corporation Private Ltd. — 3,750 shares, Narayan Investment Trust Private Ltd. — 3,750 shares, The Mettur Chemical and Industrial Corporation Ltd. — 5,000 shares and directors, friends and associates — 8,068 shares). As many as 2,500 cumulative redeemable preference shares of Rs. 100 each are to be subscribed by Kumari Investment Corporation Private Limited (1,250 shares) and Narayan Investment Trust Private Ltd. (1,250 shares). The remaining shares worth Rs. 62 lakhs are being issued for public subscription. The entire public issue has been underwritten by the Madras Industrial Investment Corporation Ltd. (25,000 equity shares and 10,000 preference shares), The Indian Overseas Bank Limited (15,000 equity shares), Chitra & Co. (4,750 equity shares and 1,250 preference shares) and Paterson & Co. (4,750 equity shares and 1,250 preference shares).

The company has been licensed for an initial capacity of 6,000 tons per year of PVC resins and compounds and also process 1,500 tons of resins to fabricate PVC products. The factory to produce PVC resins will be located in Mettur Dam, Salem District and the fabrication plant will be located near Bombay. The project is sponsored by The India Cements Limited, and B. F. Goodrich Company of Akron, Ohio, U.S.A., a leading manufacturer of PVC. The foreign collaborators will provide all technical information, know-how and data for the manufacture of PVC and related materials and will also make an investment in the equity capital. The company has been sanctioned a Dollar loan of \$3.15 million from the Export-Import Bank which will be adequate to finance the cost of imported plant and machinery. In addition, an AID loan in rupees from PL 480 funds has been sanctioned to the tune of \$685,000.

The main indigenous raw materials will be chlorine and alcohol. Chlorine will be delivered by pipeline from the adjacent plant of Mettur Chemicals Ltd. Alcohol will be delivered from a central distillery which is being located in Tiruchirapalli. The company has been able to secure 120 acres of land which will be adequate to take care of future expansion also.

The fabrication plant in Bombay will process 1,500 tons PVC resins annually and produce PVC pipes and fittings, both rigid and flexible of exceptional quality. Other PVC compounds and compositions to meet various special requirements of the belting, electrical cable, building, paint and other industries will also be made. The business will be managed by Indplast Private Ltd., which has entered into an agreement with Chemicals and Plastics India Limited.

UNITED COMMERCIAL BANK: A NEW BRANCH

With the opening of a new branch at Kirti Nagar, New Delhi, last week, the United Commercial Bank Ltd. has now a network of more than 200 branches in India and abroad. Already it has about a dozen branches in Delhi and New Delhi and in view of the increasing population in the Capital, the Bank considered it advisable to open this new branch. Deposits and bills payable of the Bank have already gone beyond Rs. 122 crores and with the increasing number of branches, the deposits are likely to be higher by the end of the current year.

BLUNDELL EOMITE PAINTS

Mr. E. B. Calvert, Chairman, Blundell Eomite Paints Limited, laid the foundation stone of its modern paint factory under construction on a 27-acre site at Kolshet, near Thana, on November 29. Blundell Eomite Paints Limited is the

Indian subsidiary of Blundell-Permoglaze Group, a leading paint manufacturing group in England. Blundell Eomite Paints was formerly known as the Elephant Oil Mills. When complete, the Kolshet factory will be one of the most modern factories in India equipped with the latest plant and equipment and up-to-date research and quality control laboratories and also staff welfare facilities. The factory's oil, resin and varnish units will commence production shortly.

ESCORTS: A YEAR OF GROWTH

The Escorts achieved substantial progress and recorded a net profit of Rs. 24.99 lakhs during the year ended December 31, 1963. Sales during the year amounted to around Rs. 4.51 crores as against Rs. 3.45 crores last year. Its unit at Faridabad made significant strides to produce X-ray equipment, railway shock absorbers, heating elements and trailers in large quantities. The sales of pistons, piston rings and cylinder liners manufactured at Patiala also increased substantially. The company obtained a licence for the import of plant and machinery to manufacture piston pins in collaboration with a leading German firm and during the current year expects to reach an overall level of sales to the extent of Rs. 6 crores.

The main building to house the manufacture of motor cycles and scooters, magnetos and wheel rims has been completed and the assembly of Rajdhoot motor cycle will be taken up early in 1965 there. A fact of remarkable achievement has been that the company has already been able to bring down the value of the imported content to below Rs. 350 as against ex-factory sale price of a motor cycle at Rs. 2,390. The company continues to progress in its after-sales service organisation and has been able to manufacture tractors and allied equipment, a part of which is being exported now. The company proposes to manufacture additional items like automatic couplers, brakes and trailers for the Indian Railways.

SESHASAYEE ROPE FACTORY

The steel wire rope plant of Seshasayee Wire Ropes Limited will be inaugurated on December 18, by Mrs. Yumiko Iwasaki, wife of the President of Kokoku Iron & Steel Wire Manufacturing Company Limited, well-known Japanese manufacturers of steel wire and wire products. Spread over thirty six acres of land at Edathala, about five miles from Alwaye, this new plant will have an annual production capacity of 3,000 tons of steel wire ropes, worth about Rs. 100 lakhs.

The authorised capital of the project is Rs. one crore of which Rs. 50 lakhs is subscribed, including the participation of the Japanese collaborators — Kokoku Iron & Steel Manufacturing Company — who have besides helped in the design, layout, purchase of equipment, construction and starting up of the factory. The foreign exchange requirements of the project were obtained under the "Yen Credit" assistance made available to the Government of India by the Government of Japan. Indian engineers who have been trained in Japanese wire rope factories will be in charge of production.

Steel wire ropes are today extensively used in the mining industry for haulage and winding, for aerial ropeways, in ships as hawser ropes and mooring ropes, and by the general engineering industry in cranes and winches.

BRADY ENGINEERING

The Brady Engineering Co. Ltd. has entered into a collaboration agreement with Herbert Morris Ltd., UK, for the manu-

facture of lifting and carrying machinery, electric hoist blocks, electric overhead travelling cranes and hand and load chains of the standard and type manufactured by the latter in the UK.

The collaboration agreement provides for the issue of 10,724 equity shares of Rs. 100 each of Brady Engineering to Herbert Morris Ltd., in consideration for the supply of plant and machinery for the expansion scheme of Brady Engineering. A further 2,000 equity shares will be allotted to Herbert Morris for supply of know-how. Under the scheme of amalgamation, Brady Engineering will issue 13 equity shares of Rs. 100 each for every 10.5 shares of Morris and Brady Ltd., held by the shareholders of Morris and Brady as on December 31, 1964. The present issued and paid-up capital of Morris and Brady Ltd., is Rs. 6 lakhs, divided into 6,000 equity shares of Rs. 100 each. The issued and subscribed capital of the Brady Engineering is Rs. 25 lakhs, divided into 25,000 equity shares of Rs. 100 each.

DANDEKAR MACHINE

The directors of the Dandekar Machine Works Ltd., have decided to issue next month bonus shares in proportion of one share for every nine shares held, by capitalising Rs. one lakh held in capital redemption reserve, after redeeming the preference shares. Bonus shares are in celebration of the silver jubilee of the company. The directors have also recommended a silver jubilee bonus dividend at 2½ per cent and the usual dividend of 12½ per cent, thus making in all 15 per cent, on equity shares for the year ended June 30, 1964. After providing for depreciation and development rebate reserve, the company has shown a profit of Rs. 3.55 lakhs for the year ended June 30, 1964. Taxation gets Rs. 2.16 lakhs and general reserve Rs. 25,000. The directors in their report point out that due to changing and frequent pronouncements by the Government in respect of rice milling machinery industry and the distribution of foodgrains, buyers are hesitant to accept the delivery of rice mills manufactured by the company with the result that as many as 12 plants are lying in stock undelivered.

SANDOZ (INDIA)

The subscription list of the public issue of Rs. 30 lakhs in equity shares of Rs. 10 each by Sandoz (Ind a) Ltd., will open on December 14 and close on December 24 or earlier but not before December 16. The new issue is made to finance the expansion of the agro-chemical plants and a part of capital expenditure of the dyestuff scheme. The company has an authorised capital of Rs. 2 crores and a paid-up capital of Rs. 75 lakhs. The present issue is for Rs. 75 lakhs, of which shares worth Rs. 45 lakhs will be taken up by Sandoz Ltd., Switzerland and associates of the company in India. The capital outlay is estimated at Rs. 1.70 crores — Rs. 80 lakhs for the expansion of the dyestuff plant, Rs. 70 lakhs for other expansion schemes and Rs. 20 lakhs for working capital. The dyestuff plant will go into production early next year. The company's factory is situated at Kooshet, near Thana.

CHOWGULE STEAMSHIPS

Chowgule Steamships Limited proposes to raise its tonnage to 200,000 dwt. during the fourth Plan period. Presently, the company owns 3 ships of about 10,000 tons capacity each operating on the Indian coast as well as overseas for transportation of bulk cargoes. Their first bulk carrier of 35,100 tons which was launched in Germany in September last is due to be delivered on December 15. The second bulk carrier of 35,000 tons for which an order has been placed with a Japanese yard will be delivered to the company in the month of January-February 1966 and will be employed for transport of pellets to be produced from their pulp palletization plant for

the entire life of the ship. Of the three passenger ships which are now being built in Yugoslavia, the first one will be delivered to the company between December 10 and December 15, while the second ship will be put into service by April, 1965. With these two ships the company will operate a daily passenger service between Bombay and Goa. The third ship will be delivered to the company by June 1965, which will also be added to the service on the Konkan coast.

HINDUSTAN FERODO ISSUE

Hindustan Ferodo Ltd. enters the capital market with a public issue of Rs. 54.68 lakhs on December 17. The subscription list will close on December 30 or earlier at the discretion of the directors but not before December 21. The authorised capital of the company is Rs. four crores made up of 4,000,000 equity shares of Rs. 10 each and issued, subscribed and fully-paid up capital, including the present issue, is Rs. 2.68 crores. Out of the present issue of Rs. 69.68 lakhs, as many as 150,000 equity shares of Rs. 10 each have been agreed to be subscribed by the directors, their associates, and friends at a premium of Rs. 17 per share. The public issue is of 546,800 equity shares of Rs. 10 each, which is also at a premium of Rs. 17 per share i.e. at a price of Rs. 27 per share for cash.

The Company was incorporated in July 1964 as a public limited company with the main object of taking over and expanding and manufacturing and related selling business of Asbestos, Magnesite and Friction Materials Ltd., in the manufacture and sale of brake and clutch linings, asbestos yarns and textiles, asbestos packings, and jointings and insulating materials; asbestos flooring sheets and asbestos millboard. The Company has been jointly promoted by Turner & Newall Ltd. and Asbestos, Magnesite and Friction Materials Ltd. of the UK. The promoters amongst themselves will hold 74 per cent of the issued capital of the company.

The company has entered into technical assistance agreements with four of the operating subsidiaries of Turner & Newall Ltd. viz. (i) Ferodo Limited for the manufacture of "Ferodo" friction materials, (ii) Turner Brothers Asbestos Co. Ltd. for the manufacture of "Firefly" asbestos textiles and "Permanite" and "CAF" compressed asbestos fibre joining, (iii) J. W. Roberts Ltd. for the manufacture of "Ferobestos" asbestos flooring sheets, and (iv) Turners Asbestos Cement Co. Ltd. for the manufacture of Asbestos millboard. The use by the company of the registered trade marks will be secured by registered user agreements with Turner & Newall Group.

The proceeds of this issue will be utilised for effecting a major expansion programme which is expected to be completed by October 1966. The Company has secured licences to raise the installed capacity of brake linings from 1,084 tonnes to 2,160 tonnes, clutch facings from 499,992 to 1,000,000, asbestos textiles from 600 tonnes to 775 tonnes, other miscellaneous textiles from 148 tonnes to 312 tonnes, jointing limpel sheet from 1,400 tonnes to 2,100 tonnes and also to manufacture new items. The company has also secured licences for the import of plant and machinery and, in this regard, Turner & Newall have deposited foreign currency amounting to £400,000 (Rs. 53.33 lakhs) in an account in the name of the company with a bank in London to cover the purchase of plant, machinery and equipment to be imported. The capital outlay required for the proposed expansion is estimated at Rs. 291.46 lakhs of which Rs. 241.17 lakhs will be provided by share capital including the premium amount of Rs. 50 lakhs from internal resources and to the extent necessary from bank borrowings. The company has purchased from Asbestos, Magnesite & Friction Materials Ltd. that company's estate and factory at Ghatkopar, Bombay, approximately 18 acres in surface area. The construction of additional factory buildings has already commenced and is expected to be completed by July 1965.

COMPANY MEETINGS

TUBE INVESTMENTS OF INDIA LIMITED

ADDRESS BY SIR A. RAMASWAMI MUDALIAR, K.C.S.I., D.C.L. (OXON), CHAIRMAN, TUBE INVESTMENTS OF INDIA LIMITED, AT THE FIFTEENTH ANNUAL GENERAL MEETING ON 7TH DECEMBER, 1964.

Gentlemen,

Let me extend to you a cordial welcome to the Fifteenth Annual General Meeting of the Shareholders of Tube Investments of India Limited. The Directors' Report, the Audited Balance Sheet and the Profit and Loss Account for the year ended 31st July, 1964 have been in your hands for some time and with your permission, I shall take them as read.

During the year, the Company had to face a serious power cut which considerably affected all sections. Nevertheless, I am happy to state that owing to special efforts made by the Management in the Factories, the results have been better than were anticipated.

T. I. CYCLES

I am glad to report that from the point of view of final output of cycles, this has been a particularly satisfactory year. The target figure was exceeded by a slight margin and, it is hoped, during the current year we shall be able to exceed even this. This forecast is subject, of course, to conditions being satisfactory regarding power supply and adequate raw-materials, sufficient in quantity, and the quality up to requisite standard. Several improvements have taken place in the Cycle Factory to overcome the defects in indigenous raw-materials.

The Debrassing Plant was completed early in the year and its operation has been successful. In addition to increased production of cycles, the components section has produced a fair amount of spares which is in excess of what was produced in the previous year. Both freewheels and hubs are available to the market which has received supplies to fulfil a reasonable portion of the requirements. It is hoped, subject to availability of raw-materials, this supply could be increased.

TUBE PRODUCTS

The Directors' Report refers to the increase in the production of tubes of various kinds in the Factory. There are still difficulties due to the power cut and more especially to the nature of a skelp that is supplied. I referred to various handicaps which the Tube Mill suffered from, in my speech last year, particularly the cut in the import licence for essential consumable stores. There has been no great improvement in this respect during the year under review.

The question of the quality of raw materials supplied has been taken up again with the suppliers and I am glad to say that, after prolonged consultations, there is now a better understanding about our requirements by the indigenous suppliers and efforts are being made to meet our requirements. The deficiency in quality has not been completely made up and this naturally affects the quantity available for processing. Further improvements in output of tubes are mainly dependent on the quality of steel supplied to us and on the quantity. As we are one of the main suppliers in the

Country of high quality cold drawn tubes, it is extremely important that suitable raw materials should be available.

COLD ROLLING MILL

The production from this Mill showed some increase over the previous year's output. The demand, however, far out-steps the supply. It is proposed to expand the production and the approval of the Government having been received for doubling the existing capacity, your Board have taken steps to implement this sanction.

METAL SECTIONS

In my speech last year, I referred to the fact that while all preliminary steps had been taken by us including selection of personnel for the special training required for this section and the erection of buildings to instal the plant and machinery of the unit, Government orders for the capital goods licence had not been received. I am glad to inform you that this licence for the Metal Section has since been received and orders have been placed for plant and machinery both abroad and in India. The building is ready and the imported plant and machinery from abroad is expected to be received early in 1965 and will be installed in the buildings already erected.

SUBSIDIARY COMPANIES

T. I. Diamond Chain Limited

Further progress has been made in the manufacture of cycle chains. The number of bicycle chains produced in the Factory has shown a satisfactory increase and we hope we will be able to export a fair quantity of chains—indicating that the quality of the product has been such that it has been possible to export the chains to Great Britain.

The Factory was also constructed to produce industrial chains and I am glad to state that the chains produced have been well received in the market. Single, Duplex and Triplex industrial chains have been produced and our collaborators in the United States have approved these chains as being of good quality and the reception in the market has been enthusiastic.

T. I. Miller Limited

I stated last year that the production of dynamo lamps was expected to commence early in the New Year. During the year under review, a reasonable quantity of lamps was produced and I consider this a satisfactory performance, when it is borne in mind that this is a completely new unit with raw labour and a limited senior staff. Certain components are in short supply, particularly magnets. The product has been put on the market and very favourably commented upon.

ACKNOWLEDGEMENT TO COLLABORATORS

I should like to record our sincere thanks for the ready help and advice that your Company has continued to receive from our associates, Messrs. Tube Investments of the United

Kingdom and other Companies in their group. We have had the benefit of the advice given by the technicians and planners coming to India and examining the working of the Factory. Our collaborators for the Subsidiary Companies have also helped us with their best advice and have placed at our disposal the latest know-how.

BOARD OF DIRECTORS

In my speech at the Thirteenth Annual General Meeting, I referred to certain changes that had been made in the Board of Directors and in particular to the appointment as Director of your Company, of the Rt. Hon'ble Lord Plowden, K.C.B., K.B.E., Chairman of Tube Investments of Birmingham. As was anticipated, he has been taking a keen interest in the Indian Company and his experience as an administrator and industrialist has been of great value.

I also stated then that Sir Ivan Arthur Rice Stedeford, G.B.E., had expressed a desire to retire from your Board, as he would cease to be Chairman of Tube Investments of Birmingham, although he would hold the Presidentship of the parent Company. On the request of the Indian Directors, however, he acceded to their desire to continue as Director of your Company. I have now had his approval personally to his being re-elected Director as his term of office as Director ceased during the year and I have genuine pleasure in requesting you as Shareholders to elect him at this Meeting as a Director.

Mr. R. D. Young who has been associated with the T.I. Cycles project in India for a long time will cease to be a Director of your Company in the course of the current year, as he has ceased to be connected with the Tube Investments of Birmingham. I cannot overestimate the interest that he took and the help that he gave to this Company during all these years.

I would like, with your approval, that our deep appreciation and thanks for his contribution to the progress and success of Tube Investments of India, should be recorded. I wish Mr. Young all success in the new field in which he will be working hereafter.

Mr. B. A. Forsyth, Works Director, will be returning shortly to the United Kingdom to take up a position with the Tube Investments of Birmingham. Mr. Forsyth came to Madras in 1955 and joined the Tube Investments of India, at that time the T.I. Cycles of India, at an interesting stage of development. He has been associated with development of the Cycle Factory and Components Unit, and has latterly been supervising the Chain and Lamp Factories. First as Works Manager and then as Works Director, he has been closely associated with the progress of the Company and has played his part in helping the standardisation of cycle parts manufactured in the Country by the Indian Standards Institution. I wish to express the appreciation of the Board for the service he has rendered to the cycle industry.

ACKNOWLEDGEMENTS

We are grateful to the Government of India and to the State Government of Madras for the interest that they have shown in all the activities of the Company, for the facilities that they have extended to us and the advice they have given to us in the expansion programme.

Our relations with our employees, both officers and workers in the administrative offices and in the Factory, have been cordial and I have pleasure in acknowledging with thanks, the co-operation that has been extended to us in the difficult circumstances that prevailed during the year.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

CHAIRMAN'S STATEMENT

PARRYS CONFECTIONERY LIMITED

Statement by the Chairman, Mr. H. V. R. Iengar

The following statement has been circulated to Shareholders of Parrys Confectionery Limited by the Chairman, Mr. H. V. R. Iengar.

Since we last met, the country has suffered an irreparable loss in the death of Jawaharlal Nehru. Millions of words have been written about him — his courage and sacrifice, his intense patriotism, his humanism, and his contribution to world peace. I am sure shareholders would wish to have recorded, in this statement, their grief at his passing away and their determination, in so far as they are concerned, to see that they make such contribution as they can to the carrying on of the great work which he launched as the first Prime Minister of India.

ACCOUNTS

Shareholders are aware that the year-end of the Company has been changed from 31st March to 30th September and the Report and Accounts which have been in your hands for the statutory period, relate to the eighteen-month period 1st April, 1963 to 30th September, 1964, whereas the comparative figures of the previous year reflect the results of the twelve months to 31st March, 1963. As indicated in the Directors' Report, the sales for the period under review were higher by Rs. 50 lakhs over the corresponding 18 months ended 31st March, 1963.

PROFIT

The net profit before taxation for the period under review is Rs. 21,82,374. Provision for taxation including the Surtax of Rs. 2,81,000 amounts to Rs. 14,71,180 leaving available for appropriations, together with a small balance of Rs. 2,705 brought forward from the previous year, a sum of Rs. 7,13,899. Out of this sum, the statutory transfer to Development Rebate Reserve, and the two interim dividends totalling 18 per cent have absorbed Rs. 3,70,000 leaving available Rs. 3,43,899 for the final dividend. The Directors have recommended payment of a final dividend at the rate of 9 per cent amounting to Rs. 1,80,000 and transfer of a sum of Rs. 1,60,000 to General Reserve, leaving a small surplus of Rs. 3,899 to be carried forward. The total of dividends paid and proposed for the eighteen-month period under review amount to 27 per cent or 18 per cent per annum i.e. an increase of 2 per cent over the previous year. In the context of the need to conserve resources for rehabilitation of plant and machinery and strengthen the Reserves in order to reduce the high incidence of Surtax, the total dividend for the period should be considered satisfactory.

SALES TURNOVER

Shareholders will have noted from the Report of the Directors that the sales turnover of Rs. 2.77 crores was the highest achieved so far, the increase over the 18 months ended 31st March, 1963, being 22 per cent in value and 25 per cent by volume. The upward trend of sales was maintained everywhere which is proof of the growing popularity of your products throughout the country.

RAW MATERIALS AND RISING COSTS

Although, during the period under review, trading conditions were on the whole favourable, the supply position of the main raw materials presented considerable difficulties and I am sorry to say that these continue to persist. Consequent on the imposition of control in April 1963, releases of sugar for confectionery manufacture have been strictly controlled by Government. Other essential raw materials like Milk

Powder and Condensed Milk are not available in the quantities we require owing to the diversion of the bulk of the indigenous production for Defence needs. Apart from the short supply of these raw materials, their prices are continually rising with no prospect of a fall in the near future. The recent increase in the price of sugar is another factor that has enhanced the cost. Our selling prices have had to be increased from time to time in an endeavour to absorb some of these increases, but for a commodity like sweets it is clearly undesirable to go beyond the limit at which consumer resistance is likely to affect the offtake.

REHABILITATION

In my statement circulated with the last year's Accounts, I referred to the difficulty your Company was facing in obtaining machinery for replacement and rehabilitation. I am glad to inform you that during the period under review your Company successfully negotiated the purchase of Manjula Confectionery Limited's machinery for replacement of some of our old units which have reached the end of their useful life. This machinery had been very little used, had been well maintained and was in very good condition at the time of purchase. It was available for purchase as Manjula Confectionery Limited discontinued the manufacture of sweets. Whilst these and other additions to machinery will help replacement and modernisation of our plant, there is still a considerable imbalance between the sweet making and wrapping capacity. If your Company is to maintain its present rate of growth in the home market and play an effective role in developing exports, further additions, particularly of wrapping machines, are essential. The long term prospect, therefore, depends largely on your Company's ability to overcome the twin problems of raw material shortage and procurement of machinery to sustain a satisfactory rate of sales growth.

EXPORTS

Your Company exported during the period under review sweets valued at Rs. 1.31 lakhs. Surveys made by the Company's Executives in the Far East, Middle East and East African markets, reveal that a considerable export potential exists, but it is difficult to achieve a satisfactory volume of exports in competition with other exporting countries, because of our high production costs. The reasons for the wide disparity in prices between the foreign and Indian manufacturer have been brought to the attention of Government from time to time but until substantial assistance such as supply of sugar and glucose at international prices and liberalisation of imports of other essential raw materials is forthcoming, it is impossible to build up a large volume of exports. I would, therefore, urge Government to view these problems of the industry more sympathetically and extend the necessary help for the development of exports.

STAFF AND LABOUR

During the year under review our relations with the staff and labour have been most cordial and I take this opportunity to record our sincere appreciation of the good work done by them.

Note: The above statement is not a report of the proceedings of the Annual General Meeting, which will be held on the 31st December, 1964.

COMPANY NOTICES

UPPER GANGES SUGAR MILLS LIMITED NOTICE

NOTICE is hereby given that the Thirty-second Annual General Meeting of Upper Ganges Sugar Mills Limited will be held on Wednesday, the 30th December, 1964 at 2-15 P.M. at 15, India Exchange Place, Calcutta for the following purposes:-

1. To receive and consider the Report of the Directors and to adopt the Audited Accounts of the Company for the year ended 30th June, 1964.
2. To declare dividends.
3. To elect a Director in place of Shri B. T. Thakur, who retires by rotation as well as under Section 280 of the Companies Act, 1956. In this connection the Company has received a special notice pursuant to Section 281 of the Companies Act, 1956, from a Shareholder of the Company and Special Notice is hereby given that the following resolution will be moved at the meeting:-

"RESOLVED that Shri B. T. Thakur who retires by rotation and who has attained the age of 72 years be and is hereby re-elected as a Director of the Company and that the age limit prescribed under Section 280 of the Companies Act, 1956 shall not apply to him".

Shri B. T. Thakur has vast experience in finance and it is considered advisable in the interest of the Company to re-elect him on the Board to continue to avail of his valuable advice.

4. To appoint Auditors and fix their remuneration.

AS SPECIAL BUSINESS:

To consider and, if thought fit, to pass with or without modification the following resolutions as ordinary resolutions:-

5. "RESOLVED that subject to the approval of the Central Government, The Cotton Agents Private Limited be and are hereby re-appointed Managing Agents of the Company for a further period of five years with effect from the 15th August, 1965 upon terms as to remuneration and otherwise contained in the draft agreement placed before the meeting and initialled by the Chairman for the purpose of identification subject to such modifications as may be required by the Central Government for granting the approval as aforesaid and agreed to by the Directors of the Company and The Cotton Agents Private Limited."

6. "RESOLVED that the mortgage dated the 22nd day of May, 1961 and made between Upper Ganges Sugar Mills Limited of the one part and the State Bank of India of the other part registered at Calcutta Registry in Book No. 1, Volume No. 101, Pages 43 to 69, Being No. 3,400 for the year 1961 should be taken as having been made with the consent and under the authority of the Shareholders of the Company".

By Order of the Board,
14, Radha Bazar Lane,
Calcutta, the 3rd December, 1964. **S. N. GUPTA,**
Secretary.

- Notes: 1. A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member.
2. Shareholders are requested to notify any change of address failing which the dividend warrants will be posted to their addresses as registered with the Company.
3. The Register of Members of the Company will remain closed from the 22nd December 1964, to

the 30th December, 1964 both days inclusive.

4. The dividends when declared will be payable to the registered Shareholders as on the 30th December, 1964 or to their mandatees on or after the 20th January, 1965.

Explanatory Statement as required under Section 173 of the Companies Act, 1956 has been sent to the Shareholders along with the notice.

BHARAT SUGAR MILLS LIMITED NOTICE

NOTICE is hereby given that the Thirty-third Annual General Meeting of Bharat Sugar Mills Limited will be held on Wednesday, the 30th December, 1964 at 2.30 p.m. at 15, India Exchange Place, Calcutta for the following purposes:-

1. To receive and consider the Report of the Directors and to adopt the Audited Accounts of the Company for the year ended 30th June, 1964.
2. To declare dividends.

3. To elect a Director in place of Shri R. K. Bhuwarka, who retires by rotation as well as under Section 280 of the Companies Act 1956. In this connection the Company has received a special notice pursuant to Section 281 of the Companies Act 1956 from a shareholder of the Company and special notice is hereby given that the following resolution will be moved at the meeting.

"RESOLVED that Shri R. K. Bhuwarka who retires by rotation and who has attained the age of 67 years be and is hereby re-elected as a Director of the Company and that the age limit prescribed under Section 280 of the Companies Act 1956 shall not apply to him".

Shri R. K. Bhuwarka has vast experience and it is considered advisable in the interest of the Company to re-elect him on the Board to continue to avail of his valuable advice.

4. To appoint Auditors and fix their remuneration.

AS SPECIAL BUSINESS:

To consider and, if thought fit, to pass, with or without modification the following resolution as ordinary resolution:

"RESOLVED that subject to the approval of the Central Government, The Cotton Agents Private Limited be and are hereby re-appointed as Managing Agents of the Company for a further period of 5 years with effect from the 15th August, 1965, upon terms as to remuneration and otherwise contained in the draft agreement placed before the meeting and initialled by the Chairman for the purpose of identification subject to such modifications as may be required by the Central Government in granting the approval as aforesaid and agreed to by the Directors of the Company and The Cotton Agents Private Limited".

By Order of the Board,
14, Radha Bazar Lane,
Calcutta, the 3rd December, 1964. **S. N. GUPTA,**
Secretary.

2. Shareholders are requested to notify any change of address failing which the dividend warrants will be posted to their addresses as registered with the Company.
3. The Register of Members of the Company will remain closed from the 22nd December 1964, to the 30th December, 1964 both days inclusive.
4. The dividends when declared will be payable to

Keep Production rolling with Caltex "STOP LOSS" programme

When a machine bearing fails, it's not the cost of replacement that's expensive, it's the lost production. A Caltex "Stop Loss" Programme can virtually eliminate the most common cause of bearing failure—improper lubrication.

HOW "STOP LOSS" WORKS: Caltex Lubrication Engineers help you set up a fool-proof system of lubrication control. From woodyard to shipping platform, they see to it that every piece of equipment gets the right amount of the right lubricant at the right time. The results: maintenance costs down as much as 15%, number of major lubricants required reduced to as few as six, purchasing simplified.

Production is worth a lot of money—keep it rolling with Caltex "Stop Loss" Programme.

E.R.W. BOILER TUBES

For trouble-free steam raising in all applications calling for rigid specifications, Electric Resistance Weld tubes are in every respect equal to corresponding seamless tubes. High frequency current ensures efficient welding, and normalising is carried out in controlled atmosphere furnaces to produce a ductile tube with a smooth, blue finish.

LOCO

We supply E.R.W. loco boiler and superheater tubes from our Jamshedpur Works to meet the bulk of the Indian Railway's demand. These tubes meet all the technical requirements of Indian Railways.

MARINE

Our E.R.W. tubes meet all the tests specified by Lloyd's Register of Shipping. Indian Tube is on Lloyd's Register of Shipping's list of approved manufacturers

LAND

Our E.R.W. tubes for land boilers are accepted by the D.G.S. & D. and comply with the Indian Boiler Regulations. We also carry ready stocks of this category at our Warehouses.

McKee-WKE engineers can bring practical experience from fifty countries to India's Steel Industry

Successful execution by McKee-WKE engineers of some 4,000 contracts in fifty countries, including India, has created for our organization a fund of specialized knowledge and experience unequalled by any other company.

McKee-WKE men know local laws, customs and conditions in the mining, steel and non-ferrous metals-producing and petroleum refining areas of the world. They know how to get a construction rig into remote locations—how to get men and materials on the job at the right time—anywhere. But above all, *they know how to do the job*—efficiently, rapidly and economically. That's why about 80% of our contracts are repeat contracts from satisfied customers—a good indication of the quality of McKee engineering and construction services. We will be glad to show you how these services can work effectively in India for the nation's basic industries.

NEW INDIA SUGAR MILLS LIMITED

NOTICE

NOTICE is hereby given that the Thirtieth Annual General Meeting of New India Sugar Mills Limited will be held on Wednesday, the 30th December, 1964 at 2-45 P.M. at 15, India Exchange Place, Calcutta for the following purposes:-

1. To receive and consider the Report of the Directors and to adopt the Audited Accounts of the Company for the year ended 30th June, 1964.
2. To declare dividends.
3. To elect a Director in place of Shri T. D. Kanoria, who retires by rotation and being eligible offers himself for re-election.
4. To appoint Auditors and fix their remuneration.

AS SPECIAL BUSINESS:-

To consider and, if thought fit, to pass, with or without modification the following resolution as ordinary resolution:-

"RESOLVED that subject to the approval of the Central Government, The Cotton Agents Private Limited be and are hereby re-appointed as Managing Agents of the Company for a further period of 5 years with effect from the 15th August, 1965 upon terms as to remuneration and otherwise contained in the draft agreement placed before the meeting and initialled by the Chairman for the purpose of identification subject to such modifications as may be required by the Central Government in granting the approval as aforesaid and agreed to by the Directors of the Company and The Cotton Agents Private Limited."

By Order of the Board,

S. N. GUPTA,

Secretary,

14, Radha Bazar Lane,

Calcutta, the 3rd December, 1964.

- Notes:**
1. A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member.
 2. Shareholders are requested to notify any change of address failing which the dividend warrants will be posted to their addresses as registered with the Company.
 3. The Register of Members of the Company will remain closed from the 22nd December, 1964 to 30th December, 1964, both days inclusive.
 4. The Dividends when declared, will be payable to the registered shareholders as on the 30th December, 1964 or to their mandatees on or after the 20th January, 1965.

Explanatory statement as required under Section 173 of the Companies Act, 1956 has been sent to the Shareholders along with the notice.

GOBIND SUGAR MILLS LIMITED

NOTICE

Notice is hereby given that the Twelfth Annual General Meeting of Gobind Sugar Mills Limited will be held on Wednesday, the 30th December 1964 at 3.00 P.M. at 15, India Exchange Place, Calcutta for the following purposes:-

1. To receive and consider the Report of the Directors and

to adopt the Audited Accounts of the Company for the year ended 30th June, 1964.

2. To declare dividends.
3. (a) To elect a Director in place of Shri K. P. Khaitan, who retires by rotation and being eligible offers himself for re-election.
- (b) To elect a Director in place of Shri S. G. Nevatia, who retires by rotation and being eligible offers himself for re-election.

Shri S. G. Nevatia is a Director and an associate of The Cotton Agents Private Limited, the Managing Agents of the Company. He has vast experience in the management of sugar mills and it will be in the interest of the company to re-elect him on the Board to continue to avail of his valuable advice. The Company has received the requisite special notice from a Shareholder and accordingly the special notice is hereby given to shareholders for passing the following special resolution under section 261 of the Companies Act, 1956 for re-appointment of Shri S. G. Nevatia, as a Director of the Company.

"RESOLVED that Shri S. G. Nevatia, who is a Director and an associate of The Cotton Agents Private Limited, the Managing Agents of the Company, be and is hereby re-elected as a Director of the Company".

4. To appoint Auditors and fix their remuneration.

AS SPECIAL BUSINESS:

To consider and, if thought fit, to pass, with or without modification the following resolutions:-

5. AS ORDINARY RESOLUTION:

"RESOLVED that subject to approval of the Central Government The Cotton Agents Private Limited be and are hereby re-appointed as Managing Agents of the Company for a further period of 5 years with effect from the 15th August, 1965 upon terms as to remuneration and otherwise contained in the draft agreement placed before the meeting and initialled by the Chairman for the purpose of identification subject to such modification as may be required by the Central Government in granting the approval as aforesaid and agreed to by the Directors of the Company and The Cotton Agents Private Limited."

6. AS SPECIAL RESOLUTION:

"RESOLVED that the payment of a commission @ 1% of the net profits of the company to be computed in accordance with the provisions of the Companies Act, 1956 to all the Directors for a further period of five years with effect from 1st July, 1965 be and is hereby sanctioned".

OBJECTS AND PROPOSED ACTIVITIES

The main object for which the Company has been established is, 'inter alia', to carry on the business as manufacturers of and dealers in "Forgings" of various types. The Industrial Licence from the Central Government authorises the manufacture of 5,000 tons annually of mild and alloy steel forgings. The indigenous production of forgings is inadequate to meet the present, as also the growing demands from the expanding industries and for the Defence requirements in all its phases from Ordnance to aircraft and missiles. The tariff policy of the Government of India gives encouragement to the forging industry and the Company hopes to establish itself in a short period as one of the premier manufacturers of quality forgings on mass scale.

FOREIGN COLLABORATION :

The Promoters viz., Messrs. B. K. Khanna & Co. Private Ltd., entered into an agreement dated 1st August, 1963, with Messrs. Kropp Forge Company of Chicago, U.S.A. who, having 66 years experience in forging industry are among the largest manufacturers in U.S.A. of forging from various ferrous and non-ferrous metals. The said collaborators have agreed to make available their extensive experience in the manufacture of mild and alloy steel and other metal forgings, to assist in the layout of the plant and erection of factory, to train Indian personnel at their Works and to provide men with technical experience. This agreement has been assigned in favour of the Company by the promoters. The duration of the Agreement is ten years.

LOCATION

The plant will be located at Bhopal in Madhya Pradesh where land has been acquired.

FINANCIAL ARRANGEMENTS

The Company has arranged loans from Industrial Finance Corporation of India for Rs. 26,40,000 (foreign exchange loan of Rs. 23,34,000 and rupee loan of Rs. 3,06,000) and United States Agency for International Development ("A.I.D.") for Rs. 47,50,000.

APPLICATION FOR SHARES

Application for shares must be for a minimum of 25 equity shares or multiples thereof and/or for a minimum of 5 preference shares or multiples thereof, and must be on the prescribed forms accompanying the prospectus, which can be had from the Company's Registered Office, Underwriters, the Bankers and Brokers to the Issue.

All application forms duly completed must be lodged together with the amount payable on application with the UNION BANK OF INDIA LIMITED, Connaught Place, New Delhi or THE NATIONAL AND GRINDLAYS BANK LIMITED, H-Block, Connaught Circus, New Delhi, or THE CENTRAL BANK OF INDIA LIMITED, National Insurance Building, Parliament Street, New Delhi, or at principal branches of any of the said Banks at Agra, Ahmedabad, Ajmer, Allahabad, Ambala, Amritsar, Bangalore, Baroda, Bhopal, Bombay, Calcutta, Chandigarh, Coimbatore, Cuttack, Dehra Dun, Delhi, Ernakulam, Gauhati, Hyderabad, Indore, Jaipur, Jammu, Jamshedpur, Jullundur, Kanpur, Kotah, Lucknow, Ludhiana, Madras, Madurai, Meerut, Mysore, Nagpur, New Delhi, Patiala, Patna, Poona, Ranchi, Shillong and Surat.

DATE OF OPENING AND CLOSING OF SUBSCRIPTION LIST

The Subscription List will open both in respect of Equity and Preference Shares, at the commencement of banking hours on 28th December, 1964, and will remain open until the close of 12th January, 1965, unless closed earlier or later at the discretion of the Directors but not before the close of the banking hours on 2nd January 1965.

December 11, 1964

THIS IS AN ANNOUNCEMENT AND NOT A PROSPECTUS. PERSONS INTERESTED IN FULL DETAILS ARE REQUESTED TO APPLY FOR A COPY OF THE PROSPECTUS FROM THE COMPANY'S REGISTERED OFFICE. BANKERS, BROKERS, AND UNDERWRITERS NAMED BELOW :

S. & L. AND CHEMICAL PLANTS

Even more than in other industries, the modern chemical plant relies on complex piping systems—a breakdown in a simple pipeline could bring the whole plant to a standstill.

S. & L.'s experience in this field all over the country—at Durgapur, Rishra, Gomia, Bombay, Sindri, Varanasi etc.—places them in a unique position to render an important service to the Chemical Industry.

Recognised as the leading manufacturers in India of fabricated pipework, S. & L. offer a complete service from design to commissioning, with all materials and workmanship of the traditional high standards associated with S. & L.

OBJECTS, PROPOSED ACTIVITIES AND LOCATION OF INDUSTRY:

The main objects of the Company are as set out in the Memorandum of Association and include inter alia the following: to carry on business as manufacturers of and dealers in polyvinyl chloride, polyvinyl dichloride and other chemicals and products of a like nature or otherwise; and also to carry on business as manufacturers and dealers in all other chemicals, plastics/petro-chemicals, oils, paints, pigments and varnishes and in any similar or allied business and either in connection with the said business or as a distinct or separate business; to carry on business as distillers, gas makers, smelters, metallurgists and chemical engineers, manufacturers and dealers in rubber and rubber products, textiles, nylon, rayon and materials of all descriptions connected with the foregoing; to manufacture, deal in and manipulate PVC bases into electrical wires, leather cloths, lining material and as films, sheets and pipes for general use and for construction material; to construct, maintain and alter any chemical and industrial plants, buildings or works.

The Company has been formed with the object of setting up a factory at Mettur, Madras State, for the manufacture of polyvinyl chloride (P.V.C.) and other chemicals and pro-

ducts which may be usefully or conveniently combined with or derived from the same and another factory near Bombay in Maharashtra State for fabricating P.V.C. pipes, fittings, other extrusions and mouldings (both rigid and flexible). The Company has entered into a Technical Service Agreement for a period of ten years in the first instance with the B. F. Goodrich Company of Akron, Ohio, United States of America (Goodrich), the largest producer of polyvinyl chloride in the world. Goodrich will provide the Company all technical information, know-how, and data and the Company will be licensed to use in India the relevant patents of Goodrich. Goodrich will assist the Company in planning the layout of the factories and provide drawings, designs, blue prints and specifications for the plant, machinery and equipment for the setting up of the factories, besides procuring for the Company trained and competent engineers and technicians and providing in its plants in the U.S.A. training facilities for the Company's technical personnel. It is expected that the factory will go into production before the end of 1966.

APPLICATIONS:

Copies of Application Forms and Prospectus can be obtained from the Company's Registered Office, from any of the above mentioned Underwriters, Brokers and Bankers to the issue named in the Prospectus or any of their main branches at the addresses given in the Prospectus.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 16-12-1964 AND WILL REMAIN OPEN UNTIL THE CLOSING OF BANKING HOURS ON 24-12-1964 UNLESS CLOSED EARLIER OR LATER AT THE DISCRETION OF THE DIRECTORS BUT NOT BEFORE 18-12-1964.

I.O.B. is big enough to serve you...

...and small enough to know you

THE INDIAN OVERSEAS BANK LIMITED

Central Office : Madras 2 • Over 100 Branches in all important places in India
M. Ct. Muthiah, Chairman K. M. Nanjappa, General Manager

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased." They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

RECORDS AND STATISTICS

The Profit Motive—III

"PROFITS, IN the great majority of cases, are earned in the marketplace through the working of manifold and shifting forces of supply and demand. Profits are a residual — a residual subject to the discipline of competition", says the Monthly Economic Letter of the First National City Bank of New York in its October issue in an article entitled "Guidance for Profits?". It adds that "profits are rewards for successful enterprise and inducements for further enterprise" and "it is the most important single incentive for increased productivity and efficiency". "After all not all investments earn profits; many result in losses. Imposing uniform limits on profits and dividends would penalize growing and enterprising businesses and industries and impair the ability to get the capital needed for expansion, while it would leave inefficient and stagnating firms unharmed...." "The objective of reasonable stability of costs and prices is best served by sensible and determined economic and monetary policies of a general nature" rather than juggling with control over profits which cannot but lead to "regimentation of the economy". "Profits earned by efficiency", it concludes, "are the mainspring of economic growth". The following is an extensive reproduction of the article entitled "Guidance for Profits?":

Nearly all industrial countries in Western Europe are caught up in the toils of inflationary strains. In the United States, the generosity of settlements negotiated recently in the automobile industry, has been interpreted by some as portending another bout of wage-price spiraling. Almost everywhere economies are unusually liquid. Excess demand, sustained by enlarged money and credit supplies, is a common and pervasive factor in pulling up prices. There is, however, almost universal recognition that the push of rising wage costs is yet another basic cause of inflation. For whenever wage increases outstrip gains in productivity, the higher wage costs exert upward pressures on prices unless competitive conditions deny opportunities for passing on cost increases in the form of higher prices. The result then is profit squeeze and reduction of employment opportunities.

Guidance for Profits?

It is essential that, in any ordered society, the rate of wage increases be moderate. For sharply rising wage scales — validated in an environment of expanding demand by increases in prices — come to represent irreversible cuts in the buying power of money.

To grapple with wage-cost pressures, country after country is trying to work out what it is now fashionable to call "incomes policies". In the United States, "incomes policy" takes the form of the Council of Economic Advisers' "guideposts" for non-inflationary wage and price behaviour, first presented in 1962 and re-stated in 1963 and again this year. The hope is to "guide" wage negotiations so that wage increases are kept within the bounds of the increment in productivity for the economy as a whole.

The practical difficulty lies in implementing the "guidance". In the United Kingdom, the official target for wage increases "consistent with price stability" is 3 to 3½ per cent; increases in wage rates during the year ended last April were about 4½ per cent. In the European Common Market nations, as the European Economic Commission's Vice-President, Mr. Robert Marjolin, reported last month, little progress has been made to implement "incomes policies".

Governments acknowledge frankly that there is a problem of educating public opinion and getting the "guidance" follow-

ed. They place the main hope on general co-operation by labour and industry. It is at this point that there arises the idea of developing policies not only for wages but also for "non-wage incomes" — incomes from self-employment, personal incomes from property such as rents, interest and dividends and undistributed corporate profits. In this mixed bag, most attention is focussed on one vital area — profits — and on the alleged tendencies for mark-ups in "administered prices".

Case for a Policy for Profits

A report prepared by a group of government economists for the 21-nation Organisation for Economic Co-operation and Development, reviews what it calls "the case for a policy for profits and other non-wage incomes". It gives two main reasons why governments may consider "a policy for profits" a necessity. The first is that "the behaviour of profits and other non-wage incomes is an important cause of rising prices, either in isolation or in supporting and reinforcing a rise in wages." The second is that wherever governments endeavour to counter wage-cost inflation labour asks "for some 'quid pro quo' in return for any agreement to accept a more moderate increase in wages".

The second of these reasons — a promise of wage restraint on the part of labour obtained in return for limitations on profits — is one of political expediency, but the first raises questions of deep significance. The report supplies little evidence that increases in profits have significant causal effect on costs. Its 'piece de resistance' is a quotation from the 1962 Annual Report of the Council of Economic Advisers dealing with the period 1955-58 in the United States and mentioning, among developments of major importance at that time, "the use of market power by management to maintain profit margins despite rising costs". Other countries are "uncertain" that "market power to maintain or increase profit margins" has been an important element of cost inflation in recent years. The OECD report concludes that:

Though a degree of competition is undoubtedly a common feature of our economies there are many sectors where prices are in some sense "administered". The existence of administered prices is at least a potential cause of cost inflation.

This is not the first time that the theory of "administered prices" has been resurrected. However, apart from utilities where prices are regulated, profits must be earned under competitive conditions. In the American marketplace, competition is intense. In steel, an occasional whipping boy for the price-cost problems, the growing availability of new materials and rising imports have increased competition not only in prices but also in quality, delivery terms and marketing services.

The views expressed in the new OECD report on profits as an independent cause of inflation stand up in sharp contrast to those of one of its predecessors, which found in 1961 that business pricing policies are not a serious inflationary problem:

.... the danger of aggressive pricing to raise profit margins is a limited one. It can add fuel to the fire in an inflationary situation. But it is not likely to be the starting cause, nor can it be a cause of continuously rising prices. In this respect, an increase in profit margins differs from an increase in wages; there can be a wage-price spiral but there cannot be a profit-price spiral for the simple reason that the dampening effect of higher

prices on output and sales would be immediate when consumers' incomes were not rising. Moreover, a deliberate raising of profit margins is necessarily limited at any time to a few industries. There is no "profits round."

The OECD report recognises that the problem is not "purely economic" and that both the economic problem and its social and political background differ greatly from country to country.

Comparing the efforts of different countries to evolve "policies for profits", the report distinguishes three lines of approach, which are not mutually exclusive. The first consists of general monetary and fiscal policies. It concentrates on influencing the context within which wage and price decisions are taken, rather than "directly" influencing the decisions themselves. The OECD report regards "proper management of the general level of demand" as an essential pre-requisite for success in stabilising prices. To supplement these general policies, it offers a number of suggestions, including selective measures to curb excess demand in particular sectors, steps to improve mobility of labour and — to enhance competition — legislative control of restrictive business practices and freer imports.

Second Line of Approach

The second line of approach rests on government control of prices. The OECD experts reject a comprehensive and detailed system of direct price control; as a permanent instrument of policy, they agree such control is neither desirable nor effective. But this does not mean that "governments must appear indifferent or helpless" about prices. A number of countries have been moving toward what has been described as an "active price policy, including the use of various techniques of price supervision."

Some countries have instituted procedures for prior notification and consultation in cases involving important price increases. Others have set up special bodies, with power to obtain detailed information about price increases. Still others feel that price supervision cannot be effective unless "the government is known to possess reserve powers to intervene in the last resort." The two countries that, according to the report, place most emphasis on general price supervision and control as an integral part of their overall policy are Norway and the Netherlands. Over the past twelve months, France has used such controls on a temporary basis.

The third line is what the report calls "direct policy for non-wage incomes." It may comprise: "first, watching the development of the major categories of non-wage incomes; second, obtaining general agreement as to what should be regarded as the appropriate behaviour of these incomes; and, third, correcting any disproportionate movement by tax changes or other means."

In many countries, the report notes, tax rates on income from property are higher than those on income from employment. Some countries also differentiate between distributed and undistributed profits. Statutory control of dividend payments, used in the immediate post-war years in a number of countries, was revived last year in Denmark.

The OECD report also reviews British and French thinking on profits. In the United Kingdom, the government pledged in 1962 that it would "by fiscal or any other appropriate means, restrain any undue growth in aggregate profits which might follow from restraint in wages and salaries". In France, where development of an "incomes policy" is still at an early stage, particular weight is being given to social considerations in the execution of economic planning.

The evolution of policies along these lines, the report adds, is still in an exploratory phase. It concludes: "In so far as it

leads governments to examine in a more coherent way the influence of existing measures on wages, profits and other types of income, the results can hardly be other than beneficial."

Much more remains to be done to clear the ground and pinpoint the difficulties. The need of the moment is to deepen our understanding of the essential inter-relationships between costs, prices, profits, capital formation and employment.

Realistically, recognition should be given to the fact that profits and wages are different animals. Profits, in the great majority of cases, are earned in the marketplace through the workings of manifold and shifting forces of supply and demand. In contrast, wages are often settled by contractual agreement through processes of collective bargaining in a labour market where competition is to say the least, limited. Unlike wages, profits cannot generate spiralling price advances. Wages are costs of production; profits are a residual — a residual subject to the discipline of competition.

Profits are reaching record highs here as well as in many other industrial countries. But this is not a good indicator since the rise in aggregate profits merely reflects rising volumes of production and sales; these go up with higher employment, incomes and diffused general prosperity. The ratio of profits to sales and the return on the capital employed to earn the profits are better indicators. In the light of Internal Revenue data, the after-tax return on net worth of all US corporations amounted in 1961 to less than 6 per cent. Estimates made show that the figure has since remained basically unchanged. This conclusion is sobering.

A Crude Picture

The actual trend in the United States thus bears scant resemblance to a crude picture of swollen profits that would call for a crash programme to curb them. Indeed, it is to enhance the profitability of enterprise that the Administration has, of late, provided such incentives as new depreciation guidelines, investment tax credits and general corporate income tax-rate cuts.

So long as profits are under the discipline of competition — including increased international competition under liberal trading policies — they cannot be a cause of continuously rising prices.

Juggling with control over profits is to follow a will-o'-the-wisp. A sense of uneasiness lingers on when one considers whether a government can venture on the path of interference with prices and profits — and, for that matter, wages too — without getting into extensive regimentation of the economy. The objective of reasonable stability of costs and prices is best served by sensible and determined economic and monetary policies of a general nature.

Opportunity to earn profits is the most important single incentive for increased productivity and efficiency. Increased output and productivity are not due entirely to increased efforts by workers; they are also the fruits of improved techniques of management or of new plant and equipment. Russia itself is re-examining its ideas and attitudes about profits, judging from debates among planners. Profits are rewards for successful enterprise and inducements for further enterprise. After all, not all investments earn profits; many result in losses. Imposing uniform limits on profits and dividends would penalize their ability to get the capital needed for expansion, while it would leave inefficient and stagnating firms unaffected.

Increasing the profitability of new investment is the most effective way to make today's marginal ventures tomorrow's foundation for new products and new jobs. Profits earned by efficiency are the mainspring of economic growth.

From India's first Carbon Black Plant at Durgapur

PHILBLACK*

another step towards national self-sufficiency

PHILBLACK*, famous all over the world for its outstanding performance in many different applications and especially for the unique quality it imparts to rubber compounds, is now for the first time made in India by Phillips Carbon Black Ltd. at their Durgapur Plant. With an annual production capacity of 30,000,000 lbs., the plant will ensure a saving in vital foreign exchange to the value of more than two crores of rupees per annum.

All four types of PHILBLACK are available to you from Durgapur. Write for complete information and find out which PHILBLACK will be the best and most economical for your operation.

Let any or all the types of PHILBLACK work for you.

PHILBLACK G, General Purpose Furnace Black

PHILBLACK A, Fast Extrusion Furnace Black

PHILBLACK O, High Abrasion Furnace Black

PHILBLACK I, Intermediate Super Abrasion Furnace Black

PHILLIPS CARBON BLACK LTD.

The Battle of Industrial Production

THIS IS a confession accompanied by an apology. When *Eastern Economist*, some time in the latter part of this year, chose "The Battle of Industrial Production" as the main theme of this Annual Number it was planned that this should be a straight indictment of the Government and the Planning Commission for their various sins of commission and omission resulting in the pace of industrial expansion slowing down at a time when the demands of defence and development had made it all the more imperative that this country should build up its industrial base as fast as possible. It was felt then that the Government was not only failing in vital areas of its responsibility for the economic well-being and progress of this country but also that it was being complacent over its failure.

Many things have happened since. There has been, for instance, the Mid-Term Appraisal of the Third Plan by the Planning Commission. There has also been a discussion of that Report in Parliament. The Mid-Term Appraisal has given some evidence that the Planning Commission and the Council of Ministers at the Centre are at least embarrassed by the failure of many important development programmes to make sufficient headway. Although the Mid-Term Appraisal has certainly not gone as far as it should have done in assessing the seriousness of the many failures, particularly in the industrial field, analysing the causes or apportioning responsibility, it at least has the decency, uncommon in such documents, not to pretend that everything is going on as well as it could be expected in the matter of the economic development of this country, particularly its industrialisation. The debate in Parliament has also been useful. Besides putting the Government on the defensive, it has given significant expression to a national mood of impatience with poor performance in the highly important field of promoting production, employment and a strong industrial base.

Nor has this been all. With the assumption of the office of Finance Minister by Mr. T. T. Krishnamachari, it is becoming increasingly clear that the Government's economic policies are acquiring a sense of urgency as well as positive direction. The Finance Minister, in a series of pronouncements intended for national consumption, has made it clear that the Government is interested not in the stagnation of the national economy, but in its forward movement. It is true, of course, that not everything Mr. Krishnamachari has been doing lately is wholly relevant or clearly helpful to the main national purpose of economic, particularly industrial, expansion. It is possible to say that a good deal of his recent legislative activity is beside the point. But in a democracy where popular prejudices and sectional pressures are at least as important as public opinion, it becomes sometimes necessary for the Government to strive to reach its destination through byways rather than by the highway.

What is important in the main is for the nation to be assured that the Government's basic strategy, as distinct from its tactical manoeuvres, will be firmly geared to the purpose of rapid industrialisation. In this regard, the Finance Minister's broadcast to the nation as well as his statement in Parliament on the broad lines of policy which the Government is expected to follow in ensuring economic and social progress have been quite promising as declarations of intentions. They suggest that the Government has at last been stirred into disquiet by the slow progress of the economy. This is a good sign in a democracy and we should be prepared to wait for this governmental discontent to spark off a period

WELDING ELECTRODES & EQUIPMENT

when only the best is good enough!

of positive and constructive activity, provided, of course, we do not have to wait long.

In these changing circumstances, while the theme of this Annual Number is still pertinent, its statement could be in terms more hopeful than what seemed possible earlier. Consequently, in the following pages, we have studied the fortunes of the development programmes in a number of important industries, not so much for the purpose of blaming the Government for lack of progress or for want of sufficient progress as with the object of underlining blunders in policy which the Government in its present mood of what may perhaps be described without undue optimism as "penitent heart-searching" may be expected to be keen on not repeating in the coming years.

Thus, in the case of steel, it is our finding that if sufficient progress has not been made towards targets it is because there is just not enough capacity for planning or execution within the public sector alone to accomplish a really large steel expansion programme. It follows that we regard it as highly important that if steel development is to be considerably more rapid in the future, the Government should not hesitate to have its efforts in the setting up of new plants supplemented by the resources of the private sector at home or abroad. Our study of the cotton textile industry has brought into prominence the need for a realistic policy of expansion with regard to the basic consumer goods industries. It is a contradiction in terms to talk of higher standards of living for the people as well as of restraining the production of organised consumer goods industries which alone can supply the necessities of life at reasonable prices. Oil is a case where ideology, neither pure nor simple, has played havoc with national interests. Thanks to a negative policy of bullying the international oil companies, this country has lost many valuable years in the building up of a petro-chemicals industry which could do so much to strengthen our industrial base.

Idling, rather than ideology, has been at fault in the case of the fertilizer and aluminium industries. Having drawn up large development programmes for those two industries and invited the private sector to participate in them to a substantial extent, the Government has not taken sufficient care to avoid lapses due to indiscreet licensing of projects. In the case of fertilizers there have also been other complications. As in the case of steel, the public sector in the fertilizer industry seems to have bitten off more than it can chew. Secondly, the Government's policies affecting the profitability of this industry have not been such as to encourage foreign collaboration. Pricing and marketing policies for fertilizers seem to have been a deterrent. Uneconomic price levels seem also to be the reason for the lag in the expansion of the paper, cement and, possibly, the coal industries. Our study of the paper industry in particular, shows how unrealistic price

policies could knock the bottom out of development intentions. In the case of cement, apart from the price factor, the tying up of expansion with the availability of domestic cement machinery has also contributed to the non-fulfilment of targets. Here policy has lately become more flexible, but it is nevertheless important to underline the fact that a proper scheme of priorities should always be followed between the capital goods industries and other industries. Otherwise, neither would develop satisfactorily.

Sugar and automobiles are rather strange cases. Both seem to be suffering from over-regulation. Actually, there is no sense in the Government's excessive pre-occupation with these two industries. Neither of them produces articles of mass consumption and to the extent that road transport has to depend upon the automobile industry for its vehicles, the Government could certainly have protected all reasonable public interest without having to concern itself excessively with the details of the automobile industry. We are convinced that, provided the minimum conditions necessary for orderly expansion are secured to these industries, their progress as well as the public interest will

EASTERN ECONOMIST

Wishes its Readers

A HAPPY NEW YEAR

be best served by leaving them alone. The jute industry is in a class by itself. Here the difficulty is less excessive governmental interference than plain indifference on its part. For no reason that we could appreciate, the Government seems to have assumed that the jute industry needs no particular attention and that it will continue to earn a large amount of foreign exchange irrespective of whether the Government does anything or not to assist it in meeting the dangerous aggravation of the competition from Pakistan which is gathering strength from year to year. For an allegedly export-minded Government it is no credit that the only interest it takes in the jute industry is to ask the State Trading Corporation to undertake obviously uneconomic trading in raw jute.

There are certainly many other industries besides those studied here, the experiences of which are relevant to the theme of this Annual Number. We would submit, however, that the ground covered here is not inadequate and that the industries discussed seem to provide among themselves a sufficiently illustrative bunch of case studies of wrong development policies and practices. We hope that the points we have tried to make in this analysis will be studied dispassionately in the light of the universally admitted need for avoiding serious lapses in planning or policy-making as India enters the next critical phase in its industrialization.

ANNUAL NUMBER 1964

MARTIN BURN LOOK BACK TO OVER 180 YEARS OF SERVICE TO INDIA

...to be able to compute this service by decades, not by years alone...to recall that our creed has consistently been the development of our country's resources through engineering and allied enterprises...to take pride in planning that makes the many units in our organization fall into a rational and complementary group and each one a leader in its particular field, a position which some of them, early pioneers in India, held even in the last century. For us looking back is a worthwhile proposition —an incentive to move forward.

AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

THE INDIAN IRON & STEEL CO. LTD.: With a million ton integrated steel plant at Burnpur, the largest foundry in the Commonwealth at Kulti and HISCO has an enviable record in production efficiency.

BURN & CO. LTD., HOWRAH: Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP: Apart from the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories—in fact, any industry requiring refractory material for the maintenance of furnaces.

THE INDIAN STANDARD WAGON CO. LTD., SANTA: The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive components.

THE HOOGHLY DOCKING & ENGINEERING CO. LTD.: Established in 1819, the Company has a shipbuilding yard, a dry dock and extensive workshops at Salkia.

ROBERT HUDSON (INDIA) LTD.: A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

LIGHT RAILWAY COMPANIES: Some of the first feeder light railways in India, with six systems in five states.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India—Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD.: A collaboration with The Vaughan Crane Company Ltd. of Manchester—manufactures hand operated and electric overhead travelling cranes and chain pulley blocks.

INDUSTRIAL PRODUCTION : 1950-51-1965-66

** Stationary.

†† Includes cotton textile, sugar, paper and cement machinery.

Steel: Needed a Strategy Without Sentiment

STEEL IS often claimed to be of the hard core of our five-year Plans. It would perhaps be more accurate to say that steel is of the hard emotional core of our politico-economic planning. This has not been entirely to the bad. For any great effort certain specific enthusiasms are necessary and the rapid development of steel capacity could be a logical purpose of any programme of rapid industrialisation for a developing country and has undoubtedly got the virtue of being able to capture the popular imagination.

Earlier this month when Lok Sabha debated the Mid-term Appraisal of the third Plan, presented to it by the Planning Commission, the Finance Minister rose in his seat to argue that it was obviously wrong to blame the Government for wanting to do too much about steel, as some critics had done. A more reasonable charge, Mr. Krishnamachari said, would be that the Government had been doing too little too late in the matter of steel development. There is clearly force in this contention and, in discussing here the drag on the economy which might be attributable to the failure of planning in the steel sector, it is proposed to take Mr. Krishnamachari at his word.

It is perhaps useful to start this discussion by pointing out that the idea of substantial development of steel capacity is not really something which the country owes wholly to the present Government. It may be recalled that, as far back as in January, 1945, an Iron and Steel (Major) Panel was set up by the then Government to recommend measures for the expansion of the steel industry. This Panel was headed by Sir Padamji Ginwala, a man who had behind him a life-time of service in the employ of the (then virtually wholly private) iron and steel industry of this country. But this did not come in the way of the Panel recommending either that two new major integrated steel plants should be set up, or even in the way of its suggesting that, if no private entrepreneur came forward to set up those plants, the Government should not hesitate to undertake their erection on its own. The proposal of the Ginwala Panel was that the two new plants should each have an initial capacity of 500,000 tons steel ingots a year, which should be capable of being doubled in due course. The Panel also contemplated the simultaneous expansion of the two existing units in the private sector. This ought to make it clear that none of the major elements of the steel development programme, as it was evolved subsequently, was in the nature of an original contribution of the Government of the day. The idea that steel capacity should be expanded and that it should be expanded both through extensions of the existing units and through the setting up of new units, had been authoritatively recognised early in 1946 when the Panel made the report. It was also acknowledged at that time that, if private capital and enterprise was, for any reason, unwilling or unable to accept responsibility for the setting up of new units, the Government should come forward to do so.

Political Adventurism

It is possible that, if this essentially rational attitude had been allowed to continue, this country today would have been producing more steel, more efficiently and at lower cost. Unfortunately, very soon after Independence, planning for steel started becoming less of an economic exercise and more of a political adventure. The signal was given in April, 1948, when Parliament entered the steel picture with a Resolution on Industrial Policy which declared, among other things, that in the case of basic industries, such as iron and steel, the State would be responsible for all new undertakings, while

the existing units would be allowed to continue for a period of ten years at the end of which the position would be reviewed and the units might be taken over on payment of fair compensation. This statement of intentions was variously interpreted at that time. Some argued that the Government's declaration was actually in the nature of an assurance to the steel industry in the sense that it had been informed that the Government had no intention of nationalizing it for the next ten years. This argument proceeded to maintain that, having been assured that the industry would continue to remain in the private sector at least for the next ten years, it should be possible for the steel companies to undertake the urgent task of post-war rehabilitation of plant and, if possible, the installation of additional capacity.

Pessimistic Appraisal

But there was also another interpretation which maintained that all that had been allowed the steel industry was a reprieve, the Government having committed itself to ultimate nationalization which perhaps might not be postponed for long after the initial ten-year period was completed. Subsequent events have shown that the pessimists or the panic-mongers had been exaggerating although even now it is too early to say that the idea of ultimate nationalization has really been given up. All that has happened is that the review which was promised at the end of the ten-year period was never made in that form. The revised Industrial Policy Statement, which was issued in April, 1956, eight years after the original declaration, restricted itself to placing iron and steel in Schedule A, which included all those industries in the case of which all new units, save where their establishment in the private sector had already been approved, would be set up only by the Government. It was further provided that in the case of industries in Schedule A, the existing privately-owned units would not be debarred from expanding their capacities and it was also envisaged that the State might seek the co-operation of private enterprise in the establishment of new units when the national interest so required. This still remains by and large the official position with regard to the status of the iron and steel industry in our mixed economy. In the implementation of this policy the Government has been liberal to the extent that it has not only allowed but has encouraged and assisted the steel companies in the private sector in expanding their capacities substantially, but at the same time, it has also been illiberal to the extent that it has altogether been allergic to the enlisting of the co-operation of private enterprise in any form in the establishment of new units.

To go back to April, 1948, when the first Industrial Policy Resolution was promulgated, the immediate consequence was the clash of the two widely differing interpretations which had been described earlier and which naturally created a certain amount of confusion and uncertainty. Looking back, some observers have been inclined to attribute to this state of affairs the subsequent slowness in the long-term planning for steel as well as the tardy emergence of essential post-war activity in the private sector steel industry. This perhaps is not a right reading. At the end of the War, the steel plants which had been in operation for more than 30 years and, in part for more than 40 years, had been worn out by continuous operation and required rehabilitation badly. But even this maintenance job could not be undertaken promptly and adequately, first because the industry lacked finance and secondly, in the conditions of the early years of the post-war world, the plant and equipment and the engineering facilities needed for any major job on the steel works was not readily

forthcoming. For the same or similar reasons, it would not be correct to blame either the industry or the Government for the absence of a vigorous pursuit of additional steel capacity through the expansion of existing units or the setting up of new units.

It has been shown retrospectively that India could create substantial additional capacity in the steel industry only with the technical, physical and financial assistance provided by advanced industrial countries with large steel and machine-building industries of their own. The conditions for the emergence of that assistance were not fulfilled for some years after the War. The countries which later came to co-operate with us in this area were themselves confronted with enormous problems of post-war rehabilitation and recovery until the early Fifties. The signing of an agreement with the Krupp-Demag combine for the designing and erection of a 500,000-ton integrated steel plant to be established at Rourkela was the first positive development which made it possible to plan for India's long-term steel development with any degree of pragmatism. The second great impulse in India's steel development came in November, 1954, when a team of Soviet technicians arrived in India and within three months, a preliminary agreement was signed between the Government of India and the Government of the USSR for assistance by the latter in the building up of a second steel plant at Bhilai. This agreement was extremely significant for the effect it had in widening the horizon of our steel planners. The Soviet experts did a great service in discounting timid planning in steel and by pointing out that a half-a-million-ton plant would be pointless and uneconomic in the context of India's long-term steel planning. They thus paved the way for big thinking on steel.

Pioneering Effort

The Bhilai contract itself was for a plant of a million-ton ingot capacity and in the light of this larger notion, the Rourkela scheme had also to be revised and the projected capacity raised to a million tons in the final project report which was accepted in 1956. This project report again had its own original contribution to make to India's widening steel horizon because it was on this occasion that the Minister then responsible, Mr. T. T. Krishnamachari, decided in favour of the adoption at Rourkela of the then novel L-D process for the manufacture of 75 per cent of the steel output of the plant in preference to the conventional stationary open-hearth furnaces which were to produce the remaining 25 per cent. It must be noted here that although the availability of excellent qualities of low-phosphorus pig iron had suggested the suitability of the L-D process, at the time the decision was made in favour of this process, it was being tried only in two steel plants abroad. In retrospect, India seems to have participated in pioneering this major development in steel technology because now the L-D process is becoming the standard technique for new steel making facilities all over the world.

It is curious to note that once West Germany decided to enter India's steel expansion programme, international interests, which till then had been largely academic, quickened very perceptibly. We have already seen how the Soviet Union followed in a big way. It did not take Britain long to realize that with its extensive and established political and economic connections with this country it could not afford to remain an idle spectator. The agreement with the British Consortium in 1956 for a third steel plant, which has since been set up at Durgapur, completed the pattern of foreign collaboration in India's steel development which obtains today.

It may perhaps be said that the four years between 1953 and 1956 were the most important formative period in India's long-term planning for steel, because it was during these years that concrete steps were taken for the setting up of

three entirely new, integrated iron and steel works each with a capacity of one million tons of ingots per year. This would have been a considerable effort for any country anywhere in the world, but for India, with its narrow industrial base and limited resources of capital and know-how, it was a truly tremendous undertaking. The dimensions of the planning effort for steel were further augmented by the modernization and expansion programmes which were being carried out in the existing steel works under the first five-year Plan. At Jamshedpur, the Tata Iron and Steel Company had incurred a capital outlay of over Rs. 34 crores in the five years ended March, 1956 on an expansion and modernization scheme for raising the production capacity to 931,000 tons of saleable steel. During the same period the Indian Iron and Steel Company had incurred a capital outlay of over Rs. 15 crores on an expansion scheme for raising the production of saleable steel and pig iron to 620,000 tons and 500,000 tons by the end of 1957. The third existing producer, the Mysore Iron and Steel Works, a government-owned facility, had also invested in the five years about Rs. 1.4 crores for raising its capacity to 100,000 tons of finished steel.

Considering all the facts of the case — the first obligation of the existing producers to rehabilitate their war-worn equipment and the inability of the steel and machine-building industries in other countries to undertake foreign contracts in the immediate post-war years when their energies were fully engaged in the reconstruction and building of the domestic steel industry —, it must be allowed that, up till the year 1956, the development effort in steel had not been unduly dilatory. The trouble arose later, in the course of the practical implementation of the projects for the three new steel plants in the public sector. In the case of the Bhilai plant, which

was a package deal, the Soviet side had taken command of the situation from the beginning. The Soviet engineers on the spot could talk to their Embassy in New Delhi or even to the Kremlin and when the need arose, Mr. Khrushchev could and would talk to Mr. Nehru. This greatly simplified matters and the Indian side of the administration was in a sense compelled to function to the rigorous schedules which the Soviet side was bent on observing. Advantages of this kind were not to be had at Durgapur or Rourkela.

In Durgapur, however, the situation was largely saved by the fact that the Project Agreement provided for a turn-key job by a British Consortium which co-ordinated both the designing and fabrication of equipment at the workshops of the supplier firms in the U.K. and the construction of the factory and the erection of the plant at the site in India. It is true, however, that in spite of these arrangements, Durgapur had its share of the discomforts and disappointments of its birth and infancy and, on the Indian side, there was a feeling that the faulty designing of the soaking pits suggested that, compared with the high quality of the Soviet collaboration at Bhilai, the British performance at Durgapur could perhaps have been better than it was. The circumstances of the construction at Rourkela, unfortunately, were far less satisfactory. To some extent this was due to the fact that it was the first of the three projects to be initiated and negotiated. Neither side seemed to know exactly what it wanted. The Germans were at a disadvantage that they had no substantial experience of industrial construction in this country. Before the last War, German experience here was confined to the trading field. On the Indian side, the agreement was negotiated by a Secretary of the Ministry concerned who did not possess at that time either the knowledge or the experience which he subsequently seemed to have gained as the Comptroller and Auditor-General and is now freely displaying as a critic of the Government's economic policies. Mr. A. K. Chanda was an administrator with an agile mind and this would have been wholly a virtue had there been over him a Minister who could have exercised some salutary discipline. Unfortunately, Mr. K. C. Reddi is one of the most uninspiring and uninspired persons to have been associated with the various industrial programmes in this country as a Member of the Central Cabinet. The Minister and the Secretary, between themselves, managed to make the Government of India a party to a project agreement under which different sections of the Rourkela plant were to be supplied or erected by different German companies with no one being responsible either on the German side or on ours for the co-ordination and integration of either procurement or construction.

Foor Planning

The disaster inherent in such an arrangement was aggravated by poor auxiliary planning for the linked facilities for the steel plant, such as water, power and raw materials. And the situation was not improved by a certain technical inability of the German personnel in the earlier years to adjust themselves to the social and other aspects of an environment which in many ways they found as puzzling, if not disturbing. It is possible that if Mr. T. T. Krishnamachari, who assumed responsibility for the steel portfolio in June, 1955, had not given up the Steel Ministership in April, 1957 and subsequently in February, 1958 left the Government, there might have been somebody in the Government of India who, in the critical early years of the Rourkela project could have managed to retrieve the difficult situation. Unfortunately, things turned out differently and Mr. Swaran Singh, who was the Minister responsible for steel development in the important years between 1957-62, was certainly not the man who could have been expected to bring to his task that degree of knowledge or drive which were clearly necessary for sustaining the momentum of long-term steel planning which was initiated in the period 1953-56. It is not unfair to say that most of the

prolonged agony of Rourkela and much of the errors in steel development which the country has to reckon with now must be attributed to Mr. Swaran Singh's listless stewardship of the steel portfolio in the period 1957-62.

DEMAND, PRODUCTION, CONSUMPTION AND TARGETS FOR FINISHED STEEL: 1955-56 — 1965-66

gramme in the critical years over 1957-62, he was fortunately able, at the idealistic level, to incorporate into this country's long-term steel planning a grand vision of a programme of steel-based industrialisation of the country. As Mr. Krishnamachari himself reminded us earlier this month, it was he who unreservedly affirmed that this country should fix a target of six million tons of steel ingots for its second five-year Plan. Again, it was he who recognised and acted vigorously on the recommendation that the attainment of a steel target of six million tons of ingots by the year 1960-61, could not be achieved without a further substantial expansion on the part of the two major producers in the private sector. Following this appreciation, a total investment of Rs. 115 crores was envisaged in the second Plan for steel development in the private sector with the object of taking up the combined capacity of the Tata Iron and Steel Company and the Indian Iron and Steel Company from about 1.25 million tons of finished steel at the beginning of the second Plan to about 2.3 million tons at its end.

Liberal Interpretation

It would be seen that the Government has been quite liberal in interpreting the revised Industrial Policy Resolution which contemplated expansion of the existing units in the private sector as a part of the development of the steel industry. But, as was pointed out earlier, the Government has not been equally liberal in acting upon another part of the same Resolution which allowed for the possibility of the State securing the co-operation of private enterprise even for the setting up of new steel plants in the public sector. While the Government has no doubt been willing enough to invite and even urge private enterprise in West Germany, U.K., U.S.A. or Japan to share in setting up steel plants in the public sector in this country, it has fought shy of letting private enterprise in our own country also share the burden and responsibilities of constructing new plants. This is surprising seeing that the origins of the Durgapur plant which has blossomed into a fully Government-owned facility, were to be found in the preliminary negotiations undertaken by Indian private enterprise with its counter-part in Britain. It is possible that, along with the errors of implementation of the public sector steel projects in 1957-62, the unwillingness of the Government before, during and since that period to explore constructively the possibilities of co-operation with private Indian enterprise in the setting up of new steel plants has been responsible for steel development proceeding at a slower and lower rate than might otherwise have been possible. As we have noted at the beginning, Mr. Krishnamachari conceded that the Government's critics might have a good case if they were to blame the Government for having proceeded slowly rather than fast with steel development. This precisely is the criticism which we are now making here.

Despite the announcement made by the Government in the later stages of the second Plan that steel entered into the hard core of that Plan, and therefore, qualified for top priority for its development, the expansion of the steel industry — its capacity as well as production — was well below the second Plan targets when the third Plan came to be formulated. Whereas the production target fixed in the second Plan for finished steel was 4.3 million tons (6 million ingots) in 1960-61, the actual production in that year was only 2.4 million tons. We are now in the third year of the third Plan and the annual output of finished steel is only now running at a level of four million tons (or about 5.7 million tons in terms of ingots). In the fixing of the third Plan targets of capacity for steel development at 10.2 million tons of ingots per year, the Government seems, therefore, to have been inspired more by the continuing idealism of Mr. Krishnamachari's declaration eight years ago when he desired that the second Plan should aim at a target of six million tons of ingots in 1960-61 than by the background of actual experience in the second

Plan period. While idealism is undoubtedly a virtue, it is clear that it should not be unduly diluted by a high degree of unrealism. The official estimates themselves do not anticipate actual production in 1965-66 to exceed a level of eight

million tons in terms of ingots (or six million tons in terms of finished steel). In other words, the third Plan has not made up at all for the drag in the second Plan. On the contrary, it is adding to it.

From this point of view, it would largely be an academic exercise to debate the wisdom of the proposed fourth Plan target for steel capacity of 20-21 million tonnes of ingot (18 million tonnes of actual output) in terms of whether so much steel would really be required or whether it is sensible to earmark for the steel sector alone so large an amount of domestic finance or foreign exchange implied in the target. The more pertinent question is whether the Government can, in the context of the accumulating shortfalls in performance in the steel sector in the second and third Plans, truly expect to approach anywhere near the target now being proposed. We would hasten to make it clear here that to pose the issue in this manner is not to fall into the trap set by Mr. Krishnamachari when he twitted the Government's critics with blaming the Government for wanting to produce too much steel instead of blaming it for failing to produce enough steel, particularly flat products as opposed to merchant steel. Our precise criticism here is that, whatever the targets might have been, the Government had failed during the second Plan and is failing in the third Plan to bring sufficiently satisfactory planning and sufficiently vigorous effort to bear on the task of developing steel capacity as fast as possible. It is precisely in terms of this failure that we question the Government's assumption that it will be able to raise the output of steel to 18 million tonnes of ingots by the end of 1970-71. It is wholly and solely in these terms that we would criticize the proposed target for the fourth Plan as unrealistic and misleading.

Question of Financing

It is tentatively proposed to achieve an output of 18 million tonnes of ingots (which would mean an installed capacity of 20-21 million tonnes) by the end of the fourth Plan, partly by the expansion of the capacities of Bhilai, Rourkela and Durgapur plants and those of the Tata Iron and Steel Company and Indian Iron and Steel Company to 3.25 million tonnes, 2.50 million tonnes, three million tonnes, three million tonnes, and two million tonnes, respectively, and partly by setting up three new integrated steel manufacturing units, that is, a plant at Bokaro with an ultimate capacity of four million tonnes and two more units with a capacity of 1.5 million tonnes each to be set up in the Vishakhapatnam-Bailadilla and the Goa-Hospet regions. It is probably true that so far as the expansion projects relating to the three State steel plants are concerned, further collaboration from the respective foreign partners concerned would be forthcoming in sufficient measure. As regard the two private sector plants, again, the concerned companies already seem to have expressed their willingness to undertake the expansion indicated. Whether they will actually be able to carry out these programmes would depend on a satisfactory answer being found to the question of financing.

Internal financing has so far played a considerable part in the expansion of the steel industry in the private sector, but because of the fact that the prices of their products have been strictly controlled throughout with the primary purpose of keeping the costs of various development programmes which use large quantities of steel as low as possible, the steel companies have had to draw heavily on additional capital sources. Here again, since the investment climate has been conditioned by certain Government policies relating to the controlled industries in particular and the economy in general, the steel companies have had to go to the Government rather than to the capital market for finance for expansion. As a result, the Tata Iron and Steel Company and the Indian Iron

and Steel Company have, besides borrowing from the World Bank to the extent of \$107.5 million and \$51.5 million respectively, had also taken loans from the Central Government to the extent of Rs. 10 crores and Rs. 18.7 crores (including a special advance of Rs. 10.8 crores) respectively. While it is true that assistance on these lines might be forthcoming also for further expansion, the recent decision of the Government to take powers to convert its loans to the corporate sector into equity capital if it is considered necessary in the public interest to do so, might possibly be a discouragement to the steel companies to seek loans from the Government. It is not suggested here that such possible difficulties might be found to be too stubborn to be dealt with, but it certainly seems to be the case that prospects for the further expansion of steel capacity in the private sector do not seem to have been improved by recent developments.

INVESTMENTS IN STEEL PROJECTS

(In crores of rupees)

Indian Iron & Steel	85.2	23.2*

*Post-war expansion.

The tentative expansion targets for the five established units would take the aggregate capacity to 13.75 million tonnes of ingots in 1970-71. If the current official estimates are borne out, the combined capacity of these five units at the end of the third Plan i.e., in 1965-66, would be 9.2 million tonnes of ingots. It follows that the additional total capacity to be created in the existing steel units during the fourth Plan would be 4.55 million tons. In terms of the actual growth of the steel industry in this country in recent years, this expansion would appear to be all that might be established on a firm basis in the period of the fourth Plan. The Government, however, has decided otherwise and is planning to proceed immediately with work on the Bokaro project besides planning also for two other new steel plants.

The question whether the Government would be able to implement the steel development programme in the fourth Plan in the manner it intends to would consequently seem to boil down to the more specific question whether the Government will be able to undertake and complete the Bokaro project within the period proposed. Here the only encouraging feature is the Government's own optimism. The failure at least for the time being of the effort to enlist the technical and financial participation of a US steel consortium in the project is only part of the problem. Even if it is to be conceded that other sources such as Japan or France, or even Britain, might carry some of the burden of the external

ESTIMATES OF DEMAND AND OUTPUT OF FINISHED STEEL : 1965-66 TO 1970-71

It has been said that Bokaro could be built with substantial reliance on equipment fabricated in this country, at Ranchi or elsewhere. If there is this kind of fabricating capacity, it could be used as much in the expansion of the existing plants as in the building of a new one. Therefore, the argu-

Meanwhile, there is a great deal to be done as well in other areas closely allied to the main programme of basic steel development. Mr. T. T. Krishnamachari recently pointed out that the Government had erred in not anticipating fully the sharp and fast rise in the demand for flat products, such as plates, sheets, tin-plates and skelp. At the present time, the

ratio of flat products to other categories of steel in the Indian production picture is about 30 per cent and this ratio may be increased to 40 per cent when the proposed Bokaro plant is built and commissioned. In the interval, the relative shortage of flat products is bound to persist, a fact which any scheme for streamlining the distribution of steels cannot but take into account. It is possible that there could be marginal additions to the proportion of flat products in the total steel output through the more exhaustive exploration of possibilities at Tatas, Indian Iron and particularly, Rourkela, which are the three plants now turning out flat products. For the rest a rationing of consumption of flat products to the benefit of more essential users along the scheme of priorities recommended by the Raj Committee is obviously unavoidable.

Another area of steel demand, where requirements have outgrown official expectations, is in the case of special, alloy and tool steels. The Government had assumed in the second Plan that the demand for those categories would not exceed 50,000 tonnes by 1955-56. It is now being recognized that probably twice that quantity could have been profitably utilized in the expanding engineering sector even in that period. As the domestic output of these varieties is negligible at present, imports allowed on an extremely austere basis have been serving so far only a very limited area of actual or potential demand. Thus, during 1962-63, 68,335 tons of alloy, tools and special steels were imported. The Planning Commission had estimated the demand for special, alloy and tool steels at 389,000 tons by the end of the fourth Plan, but it is now recognized that it will be safer to leave such conservative ideas behind and plan for capacity of the order of about a million tons by the end of the fourth Plan.

Special Steels Project

Mr. C. Subramaniam, Minister for Steel, Mines and Metals and Heavy Engineering, has been quick to realise the importance of speeding up major schemes for meeting this fast-growing demand for special alloy and tool steels. He has shown commendable vigour in processing the project for an alloy steel plant to be built at Durgapur with Japanese collaboration. This plant is expected to yield 48,000 tons a year and it is possible that it may be commissioned towards the close of the third Plan. Another — and quite daring — step taken by the Minister is his important decision to convert the plant at the Mysore Iron and Steel Works from the production of mild steel to the production of special, alloy and tool steels. The collaboration of the well-known West German firm, Demag, has been secured for this scheme and the Mysore plant is expected to produce about 80,000 tons of special steels. It is estimated that the capacities in the Ordnance Factories could provide another 50,000 tons a year. A very recent development was the move made at the Bhilai and the Rourkela steelworks, to produce certain categories of special steels. These sources, it is expected, might yield 200,000 tons a year, rising in due course to 400,000 tons.

The Government's planning in this area provides for the large-scale participation of the private sector and it appears that so far a capacity of 773,000 tons has been licensed in the public and private sectors. Unfortunately, in the private sector many of the parties to whom licences have been issued have not been able, for one reason or the other, to proceed with the schemes. Some of the licensees have found it difficult to secure foreign collaboration, but, at the same time, it seems to be the case that foreign interest is not by any means wholly absent. On the contrary, there seem to be bright possibilities of attracting foreign collaboration from countries such as France. It follows that, apart from revoking licences which are unlikely to be utilised in time, the Government should follow a positive policy of encouraging schemes which are

promising of early fruition. But the issuing of licences is not enough as has been shown in the case of the fertilizer and aluminium industries. It is important to ensure that the licences are, in fact, utilised promptly so that the targets are hit in time. We have no doubt that the Government is aware of the importance of these considerations and that, besides pursuing vigorously with projects in the public sector, it will also pay equally positive attention to the prompt and proper licensing of capacity in the private sector so that special steels, which the national economy urgently needs, are in fact turned out in adequate quantities.

The shortage of pig iron experienced by the foundry industry, again, is a clear indication that the planning of the iron and steel industry has not been matching in the harmony of its details the ambitions of its grand strategy. There has been a consistent disposition on the official side to underestimate the demand for pig iron which is bound to grow fast with the expansion of such industries as plant and machinery, machine tools, automobiles and other heavy engineering products, which are based on cast iron castings. The availability of pig iron for the foundry industry at the present time is of the order of 1.1 million tons, while the demand, officially estimated at 1.5 million tons, is probably actually well over two million tons. In the engineering industry, it is held that provision will have to be made for requirements of the order of four million tons by the end of the fourth Plan period and while this must necessarily involve the planning of further expansion of the various integrated steel works in such a man-

NIBS ARE ALSO SUPPLIED TO THE MANUFACTURERS OF FOUNTAINPEN, IN THEIR TRADE MARKS.

ner that they are able to spare substantial quantities of pig iron for the foundry industry, there is also need for the Government encouraging the setting up of pig iron capacity in the private sector.

The policy here has been halting. Although in the third Plan it has been proposed that the private sector should produce about 300,000 tons of pig iron by setting up low-shaft blast furnaces, electric smelting of iron ores and/or the more recent processes developed in the United States, for example the Strategic Udey Materials process and the R.N. process, it is now being realised that the limit of 100,000 tons imposed on the capacities of individual pig iron plants has to some extent been responsible for the failure of licensees to go on with their schemes. The Government therefore decided recently to raise the limit on capacity to the less uneconomic level of 300,000 tons. Considering the critical shortage of this basic material for development of the engineering industries, it is desirable to examine further whether, merely for the ideological purpose of ensuring to the State an overwhelming position in the ownership of the iron and steel industry, it is wise to place on the capacities or processes of pig iron plants restrictions which are liable to prejudice their economic operations and are, therefore, likely to act as discouragement to the private sector in the expansion of pig iron capacity. We do not know whether it is the Government's fear that once large pig iron plants are allowed to be set up, their promoters in due course might come forward with proposals for converting and expanding them into integrated iron and steel works. Assuming, however, that this could happen, we do not see why the Government should be frightened of such possibilities. On

the contrary, they should rather welcome them since progress on those lines could possibly help in the expansion of the nation's iron and steel industry over a period of time, perhaps without making unduly excessive or concentrated demands on scarce resources of capital and steel know-how.

To conclude, while we certainly do not quarrel with the idealism of the Government's steel programme, we do plead that it will be all the better for a sufficient degree of pragmatism as well. This is a proposition which the present Minister responsible for steel should be able to appreciate more readily than most. It has taken Mr. C. Subramaniam the best part of his first two years as Cabinet Minister at the Centre to bring some order into the steel programmes of the second and the third Plans and consolidate the working of the three units set up in the State sector. He should surely be in a position to recognise the risks and the ultimate wastefulness of ambitious planning unrelated to the practical circumstances under which that planning has to be put into effect. We are one with the Government in desiring the earliest and the fastest development of the basic iron and steel industry, but we are convinced that there are no short-cuts to this goal. What would really help the Government most is a proper scheme of priorities, a scheme which would give to the expansion of the existing five units in the steel industry, the raising of the proportion of flat products to the total output, the development of capacity for special, alloy and tool steels in the public and private sectors and the setting up of pig iron plants an importance which is adequate in relation to the establishment of new integrated iron and steel plants in Bokaro or elsewhere.

IN INDIA'S SERVICE

With a heritage of over a century we lay claim to a creditable record of service in promoting India's economic development. The watchword is one of endeavour in the service of the Nation.

Cloth: The Cinderella of Planning

IN THE MID-TERM Appraisal of the third Plan, the Planning Commission concedes that an important reason why the pace of industrial expansion has been slow is that the growth of consumer goods industries has been rather poor. This, of course, is not an accident. A certain negative attitude in the minds of our planners which has made them assume that the sufficient capital and other resources could be secured to the development of basic industries only by putting a limit on the growth of the organised consumer goods industries is clearly to be blamed. The mischief was done in the notorious "Tentative Framework" prepared for the second Plan in March, 1955 under the inspiration of Prof. Mahalanobis. It is no doubt true that his thesis that new investment in the organised consumer goods industries in the private sector should be virtually banned was never accepted wholly in theory and has been extensively repudiated in practice. Even so, his advocacy of this freeze, coupled with another negative attitude that the production of consumer goods in the centralized sector could be built up only by discouraging its production in large-scale industries, has certainly had a most undesirable influence on industrial growth generally.

Artificial Restrictions

The prime victim of these restricted ideas has been the cotton textile industry. Under any sound scheme of industrial planning in the circumstances of this country, the expansion of the cotton textile industry would have been assigned a large and important place. The organised cotton textile industry is one of our oldest and most firmly established major industries. It is significant in our economy for the market it offers to the nation's leading cash crop, its employment capacity and potential and its possibilities as a major export industry. Had there been less ideology and more ideas in our industrial planning, the cotton textile industry would have been encouraged and even brought under pressure to raise production, lower costs, increase the range of its products and improve their quality. As it is, through a series of dog-in-the-manger policies, the cotton textile industry has been prevented from growing naturally with the result that, while its production has remained artificially restricted and controlled, its costs have gone up and its efficiency has fallen. Thanks to the various restrictions put from time to time on the number of spindles and looms and the installation of modern equipment, such as automatic looms, in addition to the elaborate system of controls at every point in the industry and a scheme of labour legislation which has put a premium on trade union resistance to modernization and rationalisation, the cotton textile industry today is far less of an asset to the economy than its potentialities warrant.

Fortunately, it is being realized now that a restrictive attitude to the expansion and modernization of this industry would directly conflict with the requirements of economic expansion as well as the demands of social justice in the sense that high-cost cloth must cut into the people's welfare. As a result of this change in attitude, several steps have recently been taken for relaxing restrictions relating to spindles or looms and it is now widely believed that the Government is disposed to look at the problems of the industry in a liberal spirit so that its delayed modernization may at last be carried out and its productivity (and competitive efficiency in the export trade) could be improved. The occasion is, therefore, appropriate for an appraisal of the problems of the cotton textile industry in the historical background and in the perspective of the future demands of planning.

The first and primary problem for the industry is that of building up a regular supply, in adequate quantities, of its raw material, cotton. The latter constitutes the largest single element in the cost of yarn and cloth production. Unfortunately,

despite the importance of the industry and the long period of its growth, the raw material position has been allowed to remain unstable. With the Partition of the country in 1947, fertile lands which gave about a million bales of medium and long staple cotton annually, were lost to Pakistan. This placed the industry in the post-Independence period at an initial disadvantage and created an alarming situation of crucial short supply of raw cotton for the Indian textile industry. The grow-more-food campaigns, finally integrated in the first five-year Plan in 1951-52, intensified the cotton development work. In the 16 years since, there have been creditable achievements, the cotton acreage moving up from 10.66 million acres in 1947-48 to the peak of 20 million acres in 1957-58, and since then the area has been fluctuating between 18 and 20 million acres. The production of raw cotton has also improved from 2.91 million bales in 1950-51 to 5.39 million bales in the year 1960-61; according to the trade estimates, the production in 1962-63 is likely to be even higher than the above figure. This would show that cotton production has been increased by about 87 per cent over the decade of planning, and this normally should be taken to indicate that the raw material position is satisfactory. But, a disconcerting fact is the wide fluctuations in the quantity of raw cotton produced in different areas, as nearly nine-tenth of the crop is being raised under rain-fed conditions and is subject to all the vagaries of the season. We have not yet been able to make any planned approach to the problem of cotton cultivation from the point of view of maintaining stable production levels. However, the emphasis is now being placed on the introduction of cotton in the new irrigation project areas and to provide irrigation facilities for the crop from minor irrigation schemes on as wide a scale as possible. It is hoped that, by this step, the cotton supply would stabilise itself at higher and higher levels and provide the base for further stepping up of production in a systematic manner by harnessing all the known intensive cultivation measures.

Unsatisfactory Yield

The achievement in the improvement in the per acre yields is also not as satisfactory as it should be, when compared to the levels reached in other cotton growing countries. The average yield has increased from 78 lbs. of lint per acre in 1950-51 to 112 lbs. in 1960-61. The yields in the USA, the UAR and the USSR range between 500 to 600 lbs. of lint per acre. Though India has the largest acreage under cotton in the world, it has one of the lowest per acre yields. There is still much leeway to be made up in reaching the levels attained in other advanced countries.

What is more important from the point of view of the development of the textile industry is the cultivation of cotton of the quality that is required by the mills. In this respect, there has undoubtedly been some improvement. India has nearly reached self-sufficiency in the requirements of cotton stapling below 1-1/16th inches; the production of superior cotton with staple 7/8 inches and above which stood at 20 per cent in the period 1947-51 has increased to 41 per cent in 1961-62. Against this, the production of short staple cotton, below 11 and 16 inches has been reduced from 30 per cent to 19 per cent within the same period. This improvement in quality has contributed to the replacement of a good portion of foreign cotton which was hitherto being imported at considerable cost. This has also made it possible to meet the increasing demand for locally produced superior cotton from the textile mills which has grown from 2.52 million bales in 1950-51 to 4.71 million bales in 1961-62. In spite of this improvement we are still deficit in cotton with a spinning value of 50 to 70 counts.

The position has become acute on account of the rise in

the standards of living of the people and the preference for extra long staple cotton for the manufacture of superior varieties. According to the present level of consumption of this cotton in the cotton mills, about 400,000 bales of staple manufacture of 1-3/16th inches and above are required annually for the production of superior fabrics. This cotton is being imported from foreign countries involving an expenditure varying from Rs. 54 to Rs. 81 crores. In the context of the present national emergency can India afford to provide for this large foreign exchange for the import of superior cotton when technological methods are open to it to meet this deficit by increasing internal production? On the raw material side, there is thus this very important problem that is posed, of intensifying the efforts in a determination to achieve self-sufficiency, in the production of such extra long staple cotton. It should also be the endeavour to provide a surplus of this quality for export purposes to other countries. This should not be considered as a long-term problem but one which should be managed by the end of the fourth Plan, at the outside.

Modest Target

The Planning Commission has fixed a target of seven million bales to be achieved by the end of the third Plan period namely, 1.9 million bales or 37 per cent over the production of the base year 1960-61, taking into account the requirements of textile mills, extra factory consumption and exports of raw cotton and cloth. But, apart from achievements, even this target would fall short of the requirements. The present per capita con-

sumption of cloth in India is just 16.04 yards per annum which is lower than that reached in developed countries. There is every need to step up the targets in cotton and achieve them through a higher yield per acre.

The vicissitudes in the expansion of cotton textile industry reveal the impact of Government policy. There was a remarkable rate of growth until 1940, the spindles and looms installed standing at 1,00,06,000 and 2,00,100 respectively in that year. Since then, the growth has been almost stunted, the spindles and looms remaining at 1,08,49,000 and 1,99,800 respectively in 1950, the pre-Plan year. In the Plan period (from 1951), under the policy of reserving about one third of the quantum and certain varieties of textiles for production, exclusively by the handloom and the small power-loom, Government have not been allowing the balancing of new spindles with looms. In 1962, the spindles and looms installed were only 1,31,33,484 and 1,99,427 respectively. The mill industry is thus pegged to an arbitrary level of development.

The third Plan has envisaged expansion in the mill sector by installation of 25,000 automatic looms and increasing of active spindlage to about 16.5 million compared to 12.7 million at the end of the second Plan. The shortfalls are clear according to the Mid-term Appraisal of the third Plan and even the limited expansion permitted for the mill sector may not be fulfilled. The procurement of necessary machinery, indigenous or foreign, has become increasingly difficult and involves considerable delay. Indigenous machinery is not available within

the period of delivery considered necessary; the prospect for import of machinery under the present restrictions, is not bright and if possible, implies additional foreign exchange and even if this is made available actual arrivals take a considerable time. Further, the problems in respect of additional space, availability of financial resources etc., have emerged in the most recent period. For all these reasons the expansion in the mill sector cannot conform to the time schedule of the Plan as laid down. These impediments will have to be fully examined and provided for, before Government and industry could agree and set targets for expansion, over the next Plan period. The prospect for expansion appears bleak, if the present policy is not replaced by a positive approach to readjust the organised mill industry to the pressing needs of a technological change and modernisation.

The production of cotton mill piecegoods has varied within small margins in the second Plan period. Production rose from 4,080 million yards in 1951 to 5,304 million yards in 1958. Since then, it has remained at about the same level or has declined, the estimate for 1962 being 4,975 million yards. The production of cotton yarn by mills has also suffered a setback in the period, being 1898 million lbs. against the

peak of 1901 million lbs. in 1961. The third Plan has set a target of 9,300 million yards for cotton textiles, of which the share of the decentralised sector (handloom, powerloom and Khadi) is 3,500 million yards. The mill sector will thus have to increase production by 800 million yards from the present level of output and the effective capacity of about 5,000 million yards. The Mid-term Appraisal shows that the production of textiles would be only 4,921 million yards in 1962-63 and the achievement for the third Plan period is not expected to exceed 5,550 million yards. The pressure of demand on the low production levels would obviously exert its influence on the prices of the materials.

The pattern of production in the industry, in yarn and in cloth, has changed significantly in the Plan period. The production of coarse and medium varieties has declined and that of fine and super-fine counts has registered a rise. This is attributed mainly to three factors: (1) the production of short staple cotton and therefore, yarn-spun of 1 to 20 counts has gone down; (2) the use in a larger quantity by mills of US cotton suitable mostly for fine counts and higher medium counts and (3) the shift in consumer preference to cloth made from higher counts, and for bleached and dyed, mercerized

and printed cloth. Naturally, the mill production had to respond to the influence of these factors.

The trends in production pose two major problems: How to increase production within the capacity permitted? And, how to meet the changes in the pattern of production? In answering these questions, the position regarding stock accumulation and per capita availability should also be taken into account. Many factors, particularly the operation of the controls on prices and distribution of cloth and yarn, the fluctuations on production trends, the restrictions in the varieties of cloth produced, the increases in excise duties etc. have a bearing on the accumulation of cloth and yarn from year to year. Such a changing situation is directly responsible for the fluctuations in prices of the textile goods. The per capita availability of cotton textiles has increased very tardily from 14.3 yards in 1952 to 15.9 yards in 1956 and has significantly gone down in 1960 to 15.2 yards. The per capita availability thus depends on the lifting of cloth from mills and in turn on the accumulation of supply. This position should be examined in detail so that an advance method of adjusting supply to existing demand and the expected increase in demand could be devised in a more realistic manner. Only such an integration in the method of distribution could enforce the maintenance of prices at levels considered reasonable and necessary from the point of view of the producer and the consumer. The scope for manipulation in this process should be avoided through the building up of buffer stocks of Indian cotton and yarn.

On the basis of the per capita availability of cloth, it becomes essential to achieve a level of production in the mill sector that would meet the requirement of increasing the per capita availability to over 17 yards by the end of the third

Plan. In fact, the calculation of the per capita consumption of cloth is not quite real in the face of the actual production levels obtaining in the mill sector. If, as already indicated, there cannot be a substantial expansion in the installing of looms, the only alternative is to utilise the existing capacity in a fuller measure. In this connection, the suggestion made is to enforce three shift working by textile mills; the average number of spindles worked in the first shift is about 88 per cent and in the second shift is also of the order of about 85 to 86 per cent, but in the third shift, the percentage has increased in the Plan period only from about 24 to 45. It is estimated that even on a liberal estimate, the under-utilisation of capacity in the third shift exceeds 13 per cent. The difficulties of starting or extending of three shift working are that it adds only 6½ hours to the working time with the payment of the wages as for 8 hours. The wage cost appears to go up by 23 per cent and since the wages constitute 25 to 33 per cent of the cost of cloth and 21 to 23 per cent of the cost of yarn, the net increase in cost would amount to from six to eight per cent for cloth and about five per cent for yarn.

Technical Problems

Besides, on experience, it is found that efficiency in the third shift is lower. There is deterioration in the quality and waste, greater breakage of machinery parts and less attention to machines, all these having repercussions on the production of day shifts also. There are thus cost and technical problems which should be fully examined before this suggestion is implemented. However, on an appraisal of the position, if it is considered that the third shift could be worked to a higher extent even with less efficiency, this would yield at least six

seven per cent extra spindles with the resultant increase in the output of yarn and thus meet the immediate objective of stepping up production of cloth. It may not be quite feasible to exhort the looms to step up cloth output without an increase in yarn spindlage. If cloth production has to be increased without a corresponding increase in yarn output, it can be only at the expense of choking the yarn supply to the handloom and powerloom units. This may not be practicable under the existing policy. It is, therefore, necessary to place emphasis on the increase in yarn output which alone could ensure a large consumption of indigenous cotton, at the same time imparting stability of cotton prices eliminating the policy of rigid price support. The balanced growth of the mill and the decentralised sector would also call for such a realistic approach in utilising the existing capacity to the fullest measure possible, consistent with efficiency and stepping up production of yarn. In the long run, the problem of expansion in the textile industry should be viewed from the point of view of increasing the per capita availability of cloth and the effective steps necessary to expand the loomage capacity. The industry cannot grow under a deliberate policy of restraining its expansion.

Regarding the second problem of adjustment to the change in the pattern of production, it should be considered an advantage if staple fibre and other man-made fibres could be substituted for imported cotton to diversify the production according to the shifts in consumer preference. There is a trend of an increase in consumption of mixed fabrics and processed goods and the textile industry will have necessarily to cater to the changing pattern of demand by re-adjusting its production varieties. So long as the industry has to depend on the import of foreign cotton for the manufacture of

superior varieties, it would be difficult to bring about a re-adjustment; the method of substitution as indicated needs therefore to be seriously considered.

Indian textiles have always had a prominent share in our exports. However, it is common knowledge that, due to external factors and the uncertainties pertaining to the development of the industry within, India is being gradually priced out of international markets; exports are fast going down. The annual shipments in 1962, against the third Plan target of 800 million yards, totalled not more than 500 million yards compared to 574 million yards in 1961, 695 million yards in 1960 and 815 million yards in 1959. The export of yarn also was shorter than in the preceding year by nearly 10,000 bales. Indian textiles have lost ground in quite a number of traditional markets, especially the UK, Saudi Arabia, Sudan, British East Africa, Ethiopia, Aden, Burma and Malaya. In all these and several other markets, Japan has continued to steal a march over India. The decline in exports is accounted for in all the varieties. This has naturally affected the contribution of the textile industry to the building up of our external resources. The factors which have accounted for this decline in exports are, the continued increase in cost of production, largely due to the steep rise in cotton prices, labour cost, cost of stores and fuel etc. These have seriously impaired the competitive capacity of India abroad. Besides, external factors such as credit squeezes, import restrictions and foreign exchange curbs in a number of markets have operated to restrict our exports. Since the application of the UK to join the ECM in 1962, the prospect for Indian textile exports has further receded.

The attempts now made to restore the lost position and

1301

also to expand our export capacity have yielded only modest results. The cotton mill industry has, no doubt, taken upon itself voluntarily a scheme of obligatory export, in terms of which every mill is required to earn by export foreign exchange equal to 12½ per cent of its turn-over in cloth and three per cent of its turn-over in yarn. Failure to fulfil this obligation would entail payment of penalty to the Export Promotion Fund of the industry. The utility of this scheme is being disputed both within the industry and outside. While it is necessary for the industry to make every effort to earn foreign exchange, even at considerable sacrifice, the mills, particularly the new-comers, in the field of export, are at a distinct disadvantage and would need some time to build up their organisation and export connections. For instance, in the Eastern zone, the units have neither automatic looms nor equipment to produce specialities which alone have a market outside. In the alternative, it would be a considerable loss for them to pay the penalty prescribed under the obligatory export scheme. Besides, other internal problems of the industry such as the burden of increasing costs and taxation should be examined before anticipating a higher target of export performance from the mill sector. This does not however minimise the important need for concentrated effort to boost textile exports. The decision of the industry to establish a consortium of mills for stimulating exports of textiles to West Europe is a step in the right direction and may result in favourable results. However, if the industry is to rise to the occasion and achieve the export target of Rs. 65 crores set for it in the third Plan, the financial operations of the industry should also be placed on a profit-yielding basis.

An analysis by the Reserve Bank of India of the financial results of the major industries shows that the profitability in the cotton mill industry was comparatively lower. The gross

profit, as percentages of gross sales at 9.2 in 1960, was much less than for several other industries, 22.4 for silk and woollen textiles, 34 for rubber plantations, 28.4 for coffee plantations, 18 for mineral oils, 12.5 for paper, 19.8 for basic industrial chemicals and 22.7 for electricity. Similarly, the gross profit as percentage of total capital employed was 11.8 for textiles, as against 18.8, 17.2, 13.0, 14.0, 9.5, 11.3, and 7.4 respectively for the aforesaid industries. The industry has not been able to make profits at a level which would enable it to build up the funds for even a modest programme of modernisation. It was estimated that an amount of Rs. 180 crores, at 1958-59 prices, will be required in the period ending 31-3-1966 for the programme of modernisation and it is assessed that the industry may be in a position to mobilise about Rs. 60 crores only against this; the balance will have to be found by external loans from institutional agencies. In fact, the Working Group for the cotton textile industry has recommended that 'all authorities who deal with questions relating to mill finance, profit margins, etc. should adopt a liberal and realistic attitude in regard to the performance of the industry and the service it renders to the national economy at large'. There is no doubt, that, if there should be a speedy modernisation in the industry, the high cost structure should be lowered; the industry should be allowed a return which will attract capital and will enable the average unit to distribute a reasonable dividend after paying interest on loans taken for modernisation. Provision will also have to be made for enabling the mills to repay the loans. All these would involve an examination of the sources of funds available to the industry such as the Industrial Finance Corporation, the State Finance Corporations etc.

It is not easy to come to a conclusion on the fair prices for cotton textiles without a detailed probe into the elements

SYMBOLS OF PROGRESS

Progress takes different shapes at different times. These shapes constantly keep on changing in the minds of planners who design and build the symbols by which progress can be perceived.

For around fifty years engineers at Gammon India Limited have actively engaged themselves in building large numbers of these symbols — Bridges, Water Storage Tanks, Reservoirs, Industrial Cooling Towers, Factory Sites, Power Transmission Tower Foundations, Materials Storage Facilities, Silos, Aircraft Hangars etc. — which serve as massive milestones in concrete along India's road to progress, contributing in a large measure to the country's industrial advance and economic well-being.

of cost and the present rate of return which is found inadequate. The Tariff Commission, which is engaged in an inquiry into this problem, will have a very onerous task in getting at the true facts of the case. It must, however, take note that the unit labour costs in the industry have been pushed up following the implementation of the Wage Board Award, in spite of the fact that there has not been much progress in the direction of rationalisation of work loads. The import policy relating to the industry is also frequently changed resulting in dislocation of production. The import duties are rather high and the prices of indigenous products used in industry compare unfavourably with those of imported ones and this affects the quality of the materials. In considering the production costs that should be allowed for the industry, it would be also necessary to examine the normal practice of the Tariff Commission in allowing depreciation at income tax rates. The suggestion of the industry that the grant of depreciation should not be on the original cost, but on the replacement basis spread over the residual useful life of the machinery, if the machinery still has economic life left, should be considered on merits, and if that would help the industry, it should be accepted. There is a basic difference in fixing the prices for commodities like steel and cement and that of cotton textiles. The fortunes of the latter fluctuate very widely with periods of depression alternating with the periods of prosperity, depending upon a number of factors. This apart, the consumer preference plays a large part in the demand for cotton textiles and even in the best of times, some varieties have to be sold at loss, or at nominal profits. A range of prices, instead of a single price as for any other commodity, or an upper and lower limit with permissible deviation from the fair price line, may have to be examined in the case of textiles.

The decision on fair prices must naturally take into account the impact of taxation on the industry. If production, even within the present capacity, should increase and the per-

formance under exports should be satisfactory, the taxation limits should be such as not to disturb and distort the cost structure and therefore the price level. On the other hand, in the case of this industry, every encouragement should be given to implement the scheme of utilising fully the capacity and target for exports. The excise duties, basic and addition-

PHILIPS RESEARCH SPELLS TECHNICAL EXCELLENCE

A great deal of thought and research goes into the design of every Philips product used every minute of every day to satisfy countless human needs.

Yet research work, conducted in the Philips laboratories, is only one of the responsible factors. To complete the picture, add to it the invisible plus of international experience and know-how. You will not wonder Philips products are of the highest technical standard, the last word in reliability.

PHILIPS

contributing today to India's future

PHILIPS INDIA LIMITED

A PLEDGE RENEWED

We pledge
that we shall work hard and produce more. That is not enough!
With nearly half-a-century of engineering experience covering
such a wide and varied field as tea machinery, jute mill machinery, railway
signalling equipment, wagons, road rollers, printing machines etc, we
renew our pledge that we shall produce goods par excellence - second to
none that Indian engineering industry can offer.

Where Orient Leads - Others follow

The very ancient form of counting, known as 'Arabic' numerals, was in fact Indian in origin. The first traces of these are found in some of the rock-cut inscriptions in central India dating back to 300 B. C. The invention of '0' is considered one of the greatest in the world. This has made it possible to work on numbers like 1,030 or 3,042,050. The zero is of oriental origin—adopted by other countries.

Harbinger of a new industrial era

Ambattur, a tiny village twelve miles away from Madras, lay sleepily, neglected by history, by-passed by the industrial revolution. Then, on a cool morning in November 1949, the village woke suddenly to life. Bulldozers and excavators arrived on the scene to be followed by a mass of steel and weird-looking machines. The T.I. Cycles factory had come into being. ■ T.I. Cycles was only the first venture of Tube Investments of India, a joint enterprise of Murugappa & Sons of Madras, and Tube Investments of England. The scope of the TI group had been widening year by year and today it embraces steel strip rolling, tube making, the manufacture of cycles and cycle accessories and industrial chains. ■ T.I. Cycles was the harbinger of a new industrial era for Ambattur, and its environs are today among the busiest industrial townships in our country.

TUBE INVESTMENTS OF INDIA LIMITED

307/11-2183 a

hoc basis representing the element of tax in the price of goods, entering into the export market. The super-profits tax is expected to result in the payment of tax at 70 to 80 per cent of the profits for some of the textile companies. It is feared that the measure will put a premium on inefficiency and malpractices. It may also dry up the resources of the companies leaving no other alternative except to effect drastic cuts in dividends, with the result that the corporate sector would find it very difficult to raise the risk capital. When the dividend rate of as much as nine to 10 per cent is offered to attract preference capital, it would be obviously impossible to induce risk capital for textile industry on the basis of a return of 6 per cent. The effect of taxation on textile industry should be viewed in the light of the present organisation and problems of the industry.

Other Problems

The other major problem faced by the textile industry in our country is the want of adequate and unfailing supply of power. The periodic power cuts and failures have prevented the textile units from performing to the level of their maximum efficiency. Similarly, the inadequacy of coal supplies has also affected the progress of the industry, particularly in Western India and the South where there is a greater concentration of the units. The question of use of oil as a substitute for coal has not been sufficiently examined for its feasibility on account of the price factor. The difficulties of the industry in respect of overhead facilities in the process of development are not often given the attention that they deserve.

The survey of the problems of the textile industry in perspective would not be complete without examining the policy governing the decentralised sector. The powerloom sector is a source of competition for the mills because the latter operates under distinct advantages of lower wage costs, substantially lower excise duties and also not being governed by the

STEPPING
OUT
TO TOMORROW

Day by day, month by month, the face of India changes fast. Mighty steel penstocks guide the rushing river waters to turn the turbines to produce electric power. Massive generators, dotted across the country, send this power vibrating along wires to turn the wheels of industry. Electric lamps are switched on in village homes. Long lines of steel pipes girdle vast stretches of land, carrying water to thirsty villages and liquid gold to refineries. Automatic guide rolling wheels along a criss-cross of steel tracks. Radio waves race across the skies to help mighty jet planes land on our soil with their precious cargo. And thus a nation steps out to tomorrow.

As electrical and mechanical contractors and maintenance specialists on behalf of leading West German manufacturers, we too are contributing our bit towards building a new India.

factory legislation and other restrictions applicable to the mill industry. While the policy objective of Government should be to encourage the powerloom sector, it should be the endeavour to ensure that in implementation of this policy, the organised sector is not placed in a serious disadvantage. Only a special study of the extent of the nature of competition and the factors that give rise to it can throw more light on this problem. However, in principle, every step should be taken by Government to remove unfair competition arising from differential treatment in respect of taxation or other legislation consistent with the structure and organisation of the powerloom sector. The handloom sector is having its own distinct place in the economy and apart from the high employment potential which it offers, it is of great economic value in earning foreign exchange and meeting approximately one-third of the clothing requirements of India's population.

INDIA'S SHARE IN WORLD EXPORTS OF COTTON TEXTILES

(In million sq. yds.)

Year	World Exports	Export from India	Percentage of (2) to (1)
1953	4,821	654	13.6
1954	5,463	863	15.8
1955	5,157	751	14.6
1956	5,434	747	13.7
1957	5,972	881	14.8
1958	5,338	622	11.7
1959	5,991	850	14.2
1960	6,759*	723	10.7
1961	5,610*	603	10.7
1962	5,300*	530*	10.0

* Estimated.

The co-ordination of the mill sector with the decentralised sector and particularly the handlooms should also be viewed in the wider perspective of increasing production of cloth and expanding the mill sector, without prejudice to the maintenance of the handlooms at the level at which their capacity can sustain them.

It is needless to review the number of controls under which the textile industry is operating. It is the most extensively controlled sector right from the control of the raw material to that of production, distribution and prices of the textiles. While all these controls may be necessary in the interests of the consumer and also for a healthy development of the industry, there should be no rigidity in adhering to these controls. They should be kept flexible and modified according to the changing trends of the industry and conditions which affect their operation.

In conclusion, the cotton mill industry comprising over 500 mills spread throughout the country, has the proud privilege of being the biggest producer in the organised sector, the value of its production being over Rs. 500 crores per year. Its contribution directly to the national and State exchequers is over Rs. 100 crores a year. It distributes to a labour force of about 800,000 over Rs. 125 crores per annum. By consuming the bulk of India's cotton, the mills provide a secure means of livelihood to a large section of our farming population and thus are a direct stimulant to agricultural growth in the economy. Apart from the vast number of people employed in producing cotton in the fields and its processing at the ginning and pressing factories, there are over 25 lakh workers in the handloom and powerloom sectors. Besides, by providing a demand, increasing and continuous, the industry also opens up avenues of livelihood to a large number of men engaged in cotton, yarn

and cloth trades and in the transport services and is the mainstay of many big and small enterprises manufacturing and selling textile machinery, mill stores, chemicals and other supplies whose annual consumption runs to nearly Rs. 80 crores. In earning foreign exchange of over Rs. 60 crores annually, the industry is next only to tea and jute.

LEADING EXPORTERS OF COTTON TEXTILES

Country	Unit	1962 (Estimated)	1961
Japan	Mil. sq. yds.	1,420	1,412
India	Mil. yds.	520	603
U.S.A.	Mil. sq. yds.	400	472
France	'000 quintals	450	484
Hong Kong	Mil. sq. yds.	290	376
Holland	'000 quintals	288	307
W. Germany	'000 quintals	243	288
U.K.	Mil. sq. yds.	217	287
Belgium	'000 quintals	280	267

Note: 1,000 quintals is approximately equal to one million square yards.

Thus, from all points of view, the cotton textile industry occupies a dominant position. The maintenance of the continued progress and prosperity of cotton textiles are of determining importance for national growth. The crying need of the cotton textile industry is modernization of plant and diversification of production. This has to be achieved by assuring adequate finances for the industry through the maintenance of conditions that would enable them to build up internal resources and also by adopting a liberal policy for providing finances through the existing institutional agencies established for the purpose.

Cement: Achievement Lags Behind Ambition

WHEN, IN the second Plan, the target for the cement industry was set at six million tons in terms of capacity and 13 million tons in terms of production, it was probably more a gesture than a programme. At the beginning of the first Plan, the capacity of the cement industry was only 3.28 million tons while its output was 2.69 million tons. By the end of the first Plan, there were 27 units in the industry with an aggregate capacity of 4.94 million tons. Consequently, what the second Plan professed to aim at was something like the trebling of the dimensions of this industry.

In retrospect, the second Plan programme for cement could be seen to have been both unrealistic and unnecessarily expansive. The demand for cement is a derived demand—derived, that is, from a number of other demands over a wide area of industrial and constructional activities. A target of 16 million tons of cement in the second Plan period implied an enormous expansion in constructional projects of all kinds — dams, roads, public buildings, factory buildings, housing. That kind of expansion just did not happen in that period. In addition the delay in the implementation of the steel expansion programmes naturally reacted on the demand for cement since steel and cement are complementary requirements in construction. As a result of all these factors, cement development in the second Plan was modest and uninspiring. By the end of that period the number of units had risen to 34 with a total installed capacity of about 9.16 million tons. The seven new units contributed part of the expansion in capacity. The rest came from the extension of facilities at 16 of the existing plants. The level of output rose from 4.59 million tons to 7.8 million tons in the course of the second Plan. It is interesting to note that the Planning Commission had realized in the course of the second Plan that the target had been fixed too high. Resulting from this knowledge was the revision of the target downward to what was called a "working" level of 11 million tons of installed capacity, which also turned out to be more than what could actually be secured.

The targets for the third Plan have been more cautiously conceived. The capacity aimed at is fixed at 15 million tons from which an annual production of 13 million tons is expected by the end of the Plan. Unfortunately, while the targets have been modest, the effort made for their achievement has proved to be even more modest. In the Mid-Term Appraisal of the third Plan, the Planning Commission states that a shortfall of about one million tons in the output target is likely, which means that instead of 15 million tons of installed capacity, there may be

only 14 million tons. There will be a corresponding shortfall in the production aimed at, the expectation now being that the annual output available at the end of third Plan will be only some 12 million tons instead of 13 million tons. Superficially, it might seem that this is not a serious failure. Actually the case is different. Whereas in the second Plan period the demand potential was over-estimated, in the third Plan it seems to have been under-estimated.

During the years from 1961-62 to 1965-66 the output of cement had been rising at a rate of 14 per cent (simple) per annum. Although demand was not keeping pace with this increase for the greater part of that period, there were certainly indications towards the end of the second Plan that the long-awaited increase in demand for cement was at last around the corner. In fact, early in the third Plan there was clear evidence that demand was fast out-running supply. In 1959-60 indents for cement had amounted to 7.9 million tons as against production at that time of 7.2 million tons, but in the following years demand grew rapidly. This was due to a variety of circumstances, such as increased availability of steel, some quickening of the pace of construction, particularly factory and housing and the various relaxations effected in respect of controls on distribution and consumption. With the proclamation of the emergency in 1962, the demand for cement increased further. At the present time there seems to be some aggregate shortage of supply which is accompanied by more acute local deficiencies. To some extent the difficulties experienced by the public generally in obtaining supplies of cement for purposes such as housebuilding seem to be due to the fact that more cement than is currently used is being reserved for Government departments or other high priority users. Thus we see a situation where, while there are reports that Government or other public agencies are not lifting the cement quota sanctioned to them, there are also complaints from ordinary consumers all over the country that cement has to be bought in the blackmarket for housebuilding or even for the construction of factories.

A study of the licensing of new capacity discloses an interesting situation. It appears that 18 schemes with a total installed capacity of around three million tons are likely to go into production before the expiry of the third Plan. But there are, however, 37 other schemes which have been approved but many of which may be completed only in the early years of the fourth Plan or later. Given the shortage of cement in the country and the fact that essential industrial and social schemes may be held up for want of this material, it is obviously desirable that the Government should speed up the implementation of all the

schemes which have been licensed for the purpose of the target of the third Plan. One of the principal difficulties in the setting up of new cement capacity seems to be the problem of procuring cement machinery. In view of the foreign exchange shortage, the Government is understandably keen on imports of machinery being kept as low as possible. There is also another equally valid reason for this approach. It is part of our planning to encourage development of capital goods industries in this country. It is therefore the general policy of the Government to tie up expansion schemes in the various industries with the installation of domestically manufactured machinery.

In accordance with this policy, the Government has been insisting on new cement facilities being put up with machinery fabricated by Indian manufacturers. There are at present six firms in this field, but only two of them have started production of machinery (see appendix). Apart from the fact that they are in a position to meet only a part of the demand for cement machinery, there is a general complaint that the cement machinery manufacturers, partly for reasons beyond their control, are generally unable to guarantee delivery schedules or performance of plants supplied by them. Whatever may be the substance in this complaint, it is certainly true that many prospective

cement manufacturers have to deal with special problems regarding quality of limestone which can be solved only by installing special cement machinery the manufacture of which has not yet been undertaken in this country. Finally, as happens with every infant industry, the cost of the domestic cement machinery seems to be higher than the prices of imported machinery. As a result, the cement industry has been agitating for greater freedom in the procurement of machinery since cement plant could be imported from some East European countries on rupee payment basis. It has been frequently represented to the Government that import of cement machinery could be liberalized.

There is, however, no denying the fact that it is not easy for the Government to take a decision in this matter. It has to be conceded that, if the cement machinery manufacturing industry is to be established in this country, the initial concession of a guaranteed home market has to be extended to it. At the same time, the Government has to make up its mind what relative priorities it is prepared to extend to the manufacture of cement and the manufacture of cement machinery. If the demand for more cement is urgent, as it seems to be the case, it follows that the country will have to reconcile itself to a somewhat slower pace of development of the cement machinery industry. The

issue is the reconciliation of two interests which clash with each other in the short period, both of which are important but one of which seems to be rather more urgent than the other. It must be said to the credit of the Minister concerned, Mr. C. Subramaniam, that he seems to have adopted a pragmatic approach to this difficult problem. As a result, the Government is now following the principle of allowing persons who hold licences for cement schemes to import some parts of machinery from abroad on the basis of a scrutiny of individual applications. The procedure is to ensure that such parts of the plant as could be fabricated by the licensee himself or by those with whom he could make arrangements to that end are procured within the country and that only the balance is imported. Where imports of portions of cement plants are allowed, foreign exchange is sanctioned on the basis of a limit of Rs. 45 lakhs for a plant with a capacity of 600 tons per day. As a result of this policy, about half a dozen licensees have so far been able to proceed with their

schemes for the setting up of cement plants. It is also to be assumed that the Government will watch the situation, and if necessary, liberalize further the foreign exchange allocations for cement plants consistent with the developing capacity of domestic manufacturers for fabricating cement machinery of acceptable quality and guaranteeing timely deliveries.

At the beginning of this year (1963-64), there were 35 units in the cement industry with a combined installed capacity of about 9.7 million tons and an annual production of 8.8 million tons. The capacity and output are expected to increase to 10.4 million tons and 9.3 million tons respectively in the course of the year. Incidentally, most of the cement industry is in the private sector. At present there are two in the public sector, the Uttar Pradesh Government's cement factory at Churk with a capacity of 234,670 tons and the cement factory at the Mysore Iron and Steel Works, which has a capacity of 99,560 tons. Five new factories are pro-

NO BOLTS • NO RIVETS • NO WELDING
A revolutionary new concept in body building...
**PREFABRICATED
 TVS ALL-METAL BODY**
 (PUSH-FIT) inserted type

TVS, the largest body builders in India, have invented (and patented) a prefabricated inserted type bus body that makes body building simple. Every part is interlocked into its proper place.

Advantages of TVS 'Prefabs':

ECONOMICAL—Need no expensive tools or skilled labour.

LIGHTER comparatively to reduce fuel consumption and tyre wear.

STRONGER because there's no drilling or welding, but only special effective joints.

RATTLE-FREE—Rubber beadings between successive panels eliminate rattling.

EASY TO REPAIR—You just remove the damaged parts and insert new, easily available panels

147-51-00-2109a

IN KIT FORM—Once mass production gets into its stride, the TVS 'Prefab' will be made available in kits. This will be the greatest advance in the history of body building in India.

posed to be set up in the public sector and with their installation the total capacity of all the public sector plants will be of the order of 1.6 million tons.

We had suggested that the problem of availability of cement machinery is highly relevant to the rapid expansion of the industry. The price factor also seems to have a bearing on cement expansion. At the present time, the distribution of cement is being handled by the State Trading Corporation, but the marketing of cement is done by cement producers acting as agents of the S.T.C. for a commission. Whether the State Trading Corporation should at all have been brought into the picture is a question on which there can certainly be two opinions. If the object is to avoid a grey or blackmarket in cement, it is evident that this purpose has not been achieved. Perhaps the question of cement distribution needs to be examined anew even as the problem of steel distribution is currently under scrutiny. In the case of cement as in the case of steel, the best course would certainly be to secure supplies to certain clearly warranted priority users and allow the balance of output to be sold freely in the market. To the extent that this leads to a higher level of cement prices during the period when the industry is expanding to catch up with demand, the increasing prices will serve as a useful purpose in restraining consumption while stimulating the industry's expansion. So far the Government has chosen to be rather unduly circumspect in responding to the industry's demand for more remunerative prices.

The increase in the selling price of unpacked cement by Rs. 3.75 per ton and manufacturers' retention prices by Rs. 2.25 per ton under the incentive scheme in November 1961 did not meet with the demands of the industry. The manufacturers represented to the Government early in June, 1963, that the cost of production had increased by 66 nP. to Rs. 4.73 per tonne in the case of different units, without including the extra burden caused by the Emergency Risks Insurance Premium. The new increase compensated the industry only partially and did considerable additional injustice to the industry since it was not given retrospective effect. For the 19 months preceding the sanction of the increase in selling prices, the industry suffered losses for which it was not at all compensated. In the case of high-cost marginal producers, even the sanctioned increase is not likely to cover manufacturing costs.

Lower Profits

A Reserve Bank study has confirmed that profitability in this industry is lower than the average for the corporate sector. In 1961 15 cement factories the balance sheets of which were analysed by the Reserve Bank showed the average gross profits at 8.7 per cent of the capital employed as against the average of 10 per cent for 1,333 companies belonging to all the major industries. Dividend as a percentage of the paid-up capital averaged 9.8 per cent as against the average of 10.9 per cent for the corporate sector. Even after distributing 88 per cent of the profits after tax, the dividends as a percentage of net worth were no more than 6.9 per cent. Because the funds ploughed back are not even one-eighth of the profits after tax,

the internal resources of the industry are clearly inadequate for rapid, large-scale expansion. The responsibility for this state of affairs falls squarely on the Government's price policy. The cement industry has been recognized as a strategic industry and its expansion has got to be accelerated in view of the needs of defence and development. It is clearly desirable that the Government should deal with the problems of this industry in such a manner that a favourable climate is created for the speedy implementation of all the licensed schemes.

APPENDIX

Manufacture of Machinery

There are six approved cement machinery manufacturers in India. Three other concerns which have either been manufacturing heavy engineering machinery or sugar machinery or coal washeries, have shown interest in the manufacture of cement machinery. Messrs. A.V.B. have an integrated shop for the production of boilers and "cement and mining machinery" at Durgapur. The Government has approved the proposal of this firm to collaborate with Messrs. Fullers of the U.S.A. Negotiations for collaboration have also been going on between Messrs. A. V. B. and Messrs. Hamboldt of West Germany; on completion of these negotiations, this firm will also be in a position to fabricate cement plants for dry process.

Messrs. A.C.C. have their machine and fabrication shops at Shahabad in Mysore. The new foundry and the shops went into production in the third quarter of 1963. The grey iron foundry will be completed, according to present indications, in the first quarter of 1964. Technical collaboration with Messrs. Hitachi Limited of Japan is being sought to enlarge the scope of the engineering activity at Shahabad by including new lines of manufacture. The shop capacities of A.V.B. and A.C.C. are complementary to one another. The plants which have already been taken up for execution are the Jamul Main plant, the Dwarka Works expansion, the Kymore White Cement plant and the Panyam Cement expansion; the combined capacity of all these four projects is deemed equivalent to three standard plants of 600 tons a day capacity. A.C.C. has its own schemes; included in them are the New Porbandar Works, the Jamul duplication project, the Madhukarai expansion project and the expansion of Jamul plant. The total capacity of these four is equivalent to three plants of 600 tons a day capacity. A.C.C., over and above these projects, has capacity to accept orders for three to four standard plants (of 600 tons a day

capacity).

Messrs. K.C.P. Limited have their workshop at Thiruvottiyor near Madras. Capacity exists for the manufacture of both sugar and cement machinery. The firm has collaboration agreement with Messrs. Fives Lille Cail of France. Two complete 600 tons a day capacity cement plants will be fabricated in the workshop. The Government have already released the necessary foreign exchange in respect of both these plants. The firm has shown willingness to accept orders for two more plants for delivery before the end of the third Plan. There is a proposal to set up a steel foundry and forge in collaboration with Messrs. Fives Lille Cail. If and when this proposal materialises, this firm will have capacity to fabricate steel castings for the cement plants which are currently being imported. The firm also possesses capacity to manufacture large gears. The Government have granted the necessary foreign exchange to raise their capacity for gear cutting.

In collaboration with Messrs. F. L. Smidth of Denmark, Messrs. Sahu Jain Limited have a proposal to establish a workshop for fabricating cement machinery. Government have already approved the necessary foreign exchange for that purpose. Since there are slender chances of the workshop being established before the end of the third Plan, there is a move to arrange collaboration with Messrs. Walchandnagar Industries, who have also been permitted to manufacture cement machinery.

At Walchandnagar near Poona, Messrs. Walchandnagar Industries possess machinery worth nearly Rs. 1.5 crores for manufacturing sugar machinery and boilers. The firm has capacity to manufacture heavy gears. Collaboration agreement is being finalised with Messrs. F. L. Smidth for their gear putting project. Messrs. Larsen and Toubro have an engineering shop at Bombay. They also have facilities in their engineering shops in Orissa for the manufacture of cement machinery. The firm is reported to have capacity to deliver four plants before the end of the third Plan.

Three other firms are interested in the manufacture of cement machinery. They are finalising arrangements with their collaborators. Their names are: Messrs. Indian Sugar and General Engineering Corporation Ltd., Messrs. Buckau Wolf New India Engineers Works and Messrs. McNally Bird and Company Ltd. The licence which has been granted to Messrs. Tendulkar Industries Ltd. for the manufacture of cement machinery has been revoked.

Targets for Paper Are 'Paper Targets'

THE PAPER INDUSTRY, one of the nation's major consumer goods industries, is located predominantly in the private sector. Expansion programmes for the industry were accorded high priority in the third Plan which fixed the target for capacity at 820,000 tons as against an installed capacity of 410,000 tons existing in 1961-62. But progress has been inadequate. According to current estimates by the Planning Commission, not more than 680,000 tons in all can be produced over the remaining two years of the Plan. Even this expectation is probably optimistic. The Government's pricing policy, more than any other factor, has hampered expansion. Although it has endorsed the need for early expansion, it will not allow the economic level of prices necessary for that expansion. Price has been a crucial factor in the failure of the industry to achieve the desired rates of progress, and this has added to the series of shortfalls in the third Plan targets for Industry.

The total output of paper in this country in 1962 was 387,680 tonnes as against 196,509 tonnes in 1956. Production has thus doubled over six years, rising at the (simple) rate of about 16 per cent per annum. The production figures for all varieties of paper and board relating to the first seven months of 1963 are set out in Table I. The seven-month total of 256,320 tonnes yields an increment rate of 15.9 per cent over the previous year. Production of writing and printing paper increased by 19.5 per cent and paper board by 12.9 per cent, while that of wrapping paper rose only by 8.1 per cent; production of special varieties actually fell by 9.1 per cent. Assuming that these rates will hold, the production of paper for 1963 is likely to be about 450,000 tonnes.

Lagging Production

The capacity and output of 33 mills which commenced production in 1962 were 474,900 tonnes and 387,680 tonnes respectively; the proportion of production to installed capacity was thus 82 per cent on an average, although production exceeded capacity in individual cases. The contribution of other new units which came into being only in the latter part of 1962 was naturally negligible. Three more units started production in 1963 increasing the installed capacity to 483,000 tonnes. Details of the licensed expansion by the 15 units already in existence is set out in Table III; precise details are actually available about only 10 of them. Of these, Delhi Pulp Industries has already gone into production, while seven others are likely to begin in 1964. The expansion of Titaghur Mills will be completed in December, 1965 and that of West Coast Mills in March, 1966. Rohtas expansion project, designed to increase production by 37,500 tonnes, may not fructify during the third Plan. The Sirpur Paper Mills is to have a new tissue mill which will start manufacturing "speciality" and other light-weight papers by 1965. The expansion programme of the Mandya National Paper Mills should be fulfilled by the third quarter of 1965, while that of Rohit Pulp and Paper Mills may not materialize before the third quarter of 1964. As against the increase in production of 158,560 tonnes sought to be achieved through the expansion of the existing units, the actual figures might not exceed 100,000 metric tonnes.

The Licensing Committee of the Ministry of Commerce and Industry has already approved proposal for 15 new large paper mills with a combined capacity of 364,200 metric tonnes. (Table IV). Only two projects, at Amlai and at Dharbhanga, have started going up and they hope to start production in 1964. The remaining 13 have not progressed beyond the stage of preliminary enquiries. Two licences have lapsed. All of them are likely to spill over into the fourth Plan at this rate.

Of the 39 licences issued for small-scale paper mills, for a

combined capacity of 97,480 tonnes, 11 are expected to be taken up toward the end of 1963, seven of them in 1964 and the remaining only in 1965. By the end of the third Plan, installed capacity will very likely have increased to 683,900 tonnes, made of the following: (a) the capacity existing in 1962, 436,900 tonnes; (b) addition in 1963, 46,100 tonnes; (c) subsequent expansion, 95,260 tonnes; (d) fresh large-scale units, 63,000 tonnes; and (e) fresh small-scale units, 42,640 tonnes. Assuming that production will reach 82 per cent of installed capacity, it will be of the order of 560,000 tonnes at the end of the third Plan. The latest official estimates, however, put the figure at 580,000 tonnes.

The Joint Committee of the Paper Industry submitted a memorandum on paper prices to the Government in June 1963, spelling out details in regard to the fresh burdens imposed on the industry. The incidence of State and Central levies was set out item by item. Here are the details:

Central Levies

(a) **Railway Freight:** A 5 per cent surcharge on railway freight was imposed with effect from 1st April, 1960; again in November, 1960, there was a further increase in railway freight as a result of alterations in the minimum weight-conditions for transport of bamboo and other raw materials. From 1st July, 1962, the basic rate charged for goods traffic was further enhanced by 50 nP. per tonne carried up to 50 kilometres and by Re. 1 per tonne in the case of traffic carried beyond 80 kilometres. There was a further increase of 5 per cent in the surcharge on freight from 1st April, 1963.

(b) **Coal Price:** The pit-head prices of Grade I steam coal (non-coking) was revised upwards six times between June, 1962 and June, 1963. The increase was by Rs. 2.25 per tonne or by 11 per cent.

(c) **Excise Duties:** The industry's costs were pushed up either by the levy of fresh excise duties or increase in the existing rate of levy on different raw materials and chemicals used in the manufacture of paper. Fresh levies at the rates of Rs. 20 and Rs. 40 per tonne were imposed on soda ash and caustic soda respectively from 1st March, 1961. So also chlorine, an important chemical used in the production of bleached varieties of paper and board, which was subjected to a fresh levy of excise duty of 10 per cent 'ad valorem' from the 1st March, 1962. Jute goods which are used for packing paper manufactures were similarly subjected to excise duty from the 1st of March, 1962 at the rate of Rs. 250 per tonne for hessian and Rs. 125 per tonne for other jute manufactures. The levy of excise duty on tyres, petrol, diesel and other motor accessories with effect from 1st March, 1963 increased the road transport costs, particularly on transportation of bamboo and other raw materials.

(d) **Import Duties:** Government also increased duties on imports of various items of spares, from 35 per cent to 50 per cent and on machineries from 5 per cent to 15 per cent ad valorem from 1st April, 1960 and levied a surcharge of 10 per cent from 1st April, 1962. A further surcharge of 10 per cent was levied on all import duties with effect from 1st March, 1963.

(e) **Central Sales Tax:** The rate of Central Sales Tax was raised to 2 per cent from 1 per cent from the 1st of April, 1963.

(f) **Emergency Risks Insurance:** With effect from 1st March, 1963, Government introduced Emergency Risks Insurance scheme under which mills were required to pay premium at the rate of 25 nP, 15 nP. and 11.25 nP. per Rs. 100

Planning TOWARDS
A BETTER PORT

As the life-line of Eastern India's trade and commerce, the Calcutta Port faces recurring problems every year. The emphasis on industrial progress in the Second Five-Year Plan period has considerably changed the type of cargo to be handled. Steel and mechanical equipment, heavy machinery and huge plant form a considerable bulk of the import. On the export front it is coal or ore.

To-day's well-equipped Port needs be made into a better Port to-morrow. But this is possible not by more equipments alone. The Calcutta Port needs most the whole-hearted co-operation from all fronts,—from those who use and also from those who serve it.

**MEN & MACHINES MAKE
A BETTER PORT**

CALCUTTA PORT COMMISSIONERS
Issued by the Commissioners for the Port of Calcutta

on the value of their production during the first, second and third quarters of 1963 respectively.

State Levies

Apart from the Central Levies, a number of States have either increased or imposed fresh taxes which went to push up production costs. An examination of the budget proposals of the various State Governments for the last 3 years shows that almost all the States have increased the rates on electricity, the rate of sales-tax and have also imposed new duties on transport of goods by road.

(a) **Electricity Duty:** The Government of Mysore increased electricity duty from 1 nP. to 2 nP. per unit from 1st April, 1961 on own generation and from .07 nP. to 1.5 nP. on purchased electricity. The State Government of Maharashtra increased the rate of electricity duty from .8 nP. to 1 nP. per unit with effect from 1st March, 1963 while the Government of Punjab increased the duty from previous slabs to uniform rate of 40 per cent on consumption from 1-3-63. The Government of West Bengal also increased the rates of duty on industrial consumption of electricity from 1st March, 1963. The Government of Madras introduced tax on consumption of electricity with effect from 1st March, 1962. The Government of Rajasthan imposed electricity duty at 3 nP. per unit on power with effect from 1st March, 1962.

(b) **Sales Tax:** In the matter of sales tax also, State Governments have not lagged behind. For instance, the Government of Punjab enhanced the rate of general sales tax from 4 per cent to 5 per cent from 1st March, 1961. Again the rate of tax was revised to 6 per cent from 1st March, 1963. Similarly, the Government of Rajasthan increased the general sales tax on goods from 4 per cent to 5 per cent from 1st August, 1961.

The rates were further raised to 6 per cent from 1st March, 1963. The Governments of Gujarat, Kerala and Andhra Pradesh made upward revision in the rates of sales tax from 1st March, 1963.

(c) **Road Tax:** In respect of transport of goods by road, there has been a regular increase in tax by the State Governments. The Government of Orissa introduced a new tax on freight on transportation of goods by public carrier from 1st March, 1961, while the Government of Rajasthan increased rates of tax on goods carried by motor vehicles from 8-1/3 per cent to 10 per cent with effect from 1st March, 1961. In the following year, the Government of Maharashtra introduced a tax on carriage of goods by road at 3 per cent of the freight actually charged while the Government of Madras doubled the tax on goods freight from 3 nP. with effect from 1st March, 1962. Similarly, Governments of Punjab and Gujarat levied a tax on goods carried by motor vehicles at the rate of 3 per cent on gross freight with effect from 1st March, 1962. In addition, the Governments of Maharashtra, Rajasthan, Gujarat and Assam either levied or enhanced tax on petrol, which went to increase the transport costs.

While forecasting demand for paper and paper-board, it is usually assumed that the major factor making for rapid increase of demand is the growth of literacy. This has, however, not been true of India during the last twelve years. Admittedly, the demand for printing and writing paper has been rising fairly rapidly, but the greatest acceleration has been in wrapping paper which has scored over all other varieties. Table II shows that, while the total production of paper rose by 266.9 per cent between 1950 and 1962-63, that of wrapping paper rose by 700.0 per cent and printing and writing paper only by 246.7 per cent. It is not as if the 1950 base for wrapping paper was a small one; in fact, it constituted 13.4 per cent of the total output of paper and

JYOTIRGAMAYA**
(Lead me from darkness unto light—Upanishad)

From the very infancy of civilisation the human soul has always yearned for liberation from the darkness of ignorance to the light of knowledge. From articulate words, man slowly graduated to visual lettering on leaves, barks and stones.

Then came Paper, the greatest boon in his search for knowledge. Nothing has helped the spread of learning as effectively as Paper.

We at Seshasayees are proud to contribute our mite in this great human task by producing uniformly high quality printing and writing papers, and distributing them in all parts of India, to meet the ever-increasing needs of our great country.

paper-boards in 1950. By 1962-63, its share had more than doubled to 29.3 per cent of the total production. This pointed unmistakably to a greater industrial use of paper, and it can be safely asserted that, during the next decade also, the consumption of wrapping paper will rise faster than that of printing and writing papers. Exhaustive market surveys of the probable demand of wrapping paper during 1970-71 appear to be necessary.

TABLE II

THE CHANGING PATTERN OF PAPER AND PAPERBOARD PRODUCTION

Variety of Paper	(In tonnes)		
	1950	1962-63	Percentage change of (2) over (1)
	(1)	(2)	(3)
Printing and Writing			
Paper	71,274 (64.4)	247,125 (60.9)	+246.7
Wrapping	14,850 (13.4)	118,801 (29.3)	+700.0
Special Varieties	5,279 (4.8)	8,044 (1.9)	+ 52.4
Boards	19,251 (17.4)	32,074 (7.9)	+ 66.6
Total	110,654 (100.0)	406,044 (100.0)	+266.9

Note: Figures in brackets are percentages to total.

Apparent consumption of paper in India in 1962 was estimated at 406,000 tonnes of which 388,000 tonnes were produced in this country and 19,554 tonnes were imported; of Indian paper, 1,624 tonnes, mostly cigarette paper and white tissue paper, were exported. (Table V). Packing paper especially kraft paper, followed by printing, writing and other miscellaneous varieties of paper, accounted for the bulk of the imports. Printing paper (135,000 tonnes) accounts for the bulk of indigenous production. The internal demand for

printing as well as writing paper will continue to exceed 15 per cent per annum as against a provision in the third Plan of 12.5 per cent, of all kinds of paper. For, despite a steady increase in annual production of over 15 per cent, supply lags significantly behind demand.

A paper prepared for the fifteenth meeting of the Central Advisory Council of Industries held in New Delhi on September 24, 1962, computed per capita consumption in India, of paper including newsprint at a little over 3.5 lb. as against the 440 lb. in the USA and 210 lb. in the UK. Per capita consumption has nearly doubled since 1955-56, when it was 2 lb. That the production of paper had not kept pace with the rise in demand was acknowledged by Mr. Nityanand Kanungo, the Minister of Industry. In reply to a question in the Lok Sabha on September 20, 1963, he, however, denied that there was an acute shortage of some varieties of paper in the country. Among the measures taken to improve the situation, he men-

1 Quintal = 100 Kgs.

tioned the rationalization scheme for distribution, based on the 1961 level of supplies and an 'ad hoc' committee associating manufacturers, traders, consumers and government departments, which periodically reviewed demand and supply. The Government continued to license new units as well as the expansion of existing ones. He estimated the shortfall in supply in 1966 at about 120,000 tonnes. The Government, he revealed, was drawing up a scheme to increase production in the existing plants by 60,000 tonnes through suitable adjustments in equipment.

Why are entrepreneurs so slow in implementing the licensing schemes? The official paper ascribed this to Chinese aggression and the shyness of the capital market. There are other reasons besides which the paper did not discuss. The return on capital in the paper industry, since 1958, compared unfavourably with returns in other industries, thanks to the Government's unrealistic pricing policies. Following repeated representations made to the Government, a meagre rise of 6 nP. per kg. was allowed in June last year, but this did not even remotely cover increased costs. Unless the Government can be persuaded to take a more realistic view, it will be futile to expect a speedy attainment of third Plan targets. Further representations made by the industry in regard to the price aspect are under examination by the Government. These protracted examinations militate against the industry's interest and considerably retard its growth.

The costs of production have risen substantially since the Tariff Commission fixed prices for paper in 1958. According to the industry's own estimates, current costs exceed the Tariff Commission prices of 1958 by about 26 nP. per kilo. This is what Mr. D. C. B. Pilkington, Chairman of Titagur Paper Mills Ltd., had to say in his last address to the share-

holders: "Sir Walter Michelmore mentioned last year that, between 1958 and March, 1962, the estimated total increase in costs in the paper industry was Rs. 160 per metric tonne or 16 nP. per kilo. Since March 1962, prices have shown a further increase, and with the 1963 Budget, an estimated further increase of Rs. 100 per tonne or 10 nP. per kilo has been added to the industry's costs. Therefore, since 1958, against a total increase in costs of Rs. 260 per tonne or 26 nP. per kilo, the industry has been granted 6 nP. per kilo. Between June, 1962 and June, 1963, the cost of coal was increased on no fewer than five occasions resulting in a total increase of Rs. 2.26 nP. per tonne of coal. . . . Further, increase in freights as well as increase in the Central Excise Duty have affected the delivered mill prices of sodium sulphate, rosin, lime, etc., and added to this was the Compulsory Insurance against Emergency Risks. . . ."

Lower Dividends

An analysis made by the Reserve Bank of the affairs of 21 paper companies for 1960-61 and published in its June, 1963 Bulletin shows that their dividends, computed as a percentage of net worth, were lower than in 19 industries out of the 25 under study. Table VI below shows that the dividends distributed by the 1,333 companies studied by the Reserve Bank of India fetched 6.3 as against 5.5 per cent in the paper industry. It is thus low return on capital that has stood in the way of its further expansion, and capital is bound to be shy.

The "per capita" consumption of newsprint in India at 0.2 kg. is, perhaps, the lowest in the world after Pakistan which consumes only 0.1 kg. of paper per head. Burma's 0.5 kg. is nearly two-and-a-half times the figure for India. The

The cooker that lasts a lifetime!

- Precision-made weight valve
- Three automatic safety devices:
 - (1) Weight valve releases extra pressure
 - (2) Safety plug with pintel
 - (3) Cooker opens only when pressure inside is reduced safely
- Lid offers steam space above food, saving cooking time and fuel
- Special trivet affords space for water between body and separators
- Heavy gauge aluminium body

TWO MODELS: With Model '77' you get a set of three triangular separators. With the HI-DOME you get these plus an extra flat, round separator, for more cooking space!

average Russian consumption is eight times and the American—USA's 36.6 kg. per head is incidentally the highest in the world — nearly 183 times the corresponding Indian figure. Japan does better than Italy, the USSR, UAR (Egypt) and Yugoslavia by a wide margin. Even though the official estimates in India assume a 10 per cent increase in consumption, the demand is bound to be explosive if the literacy targets of the third and the fourth Plans are fulfilled.

PER CAPITA NEWSPRINT CONSUMPTION: 1960
(In kilograms)

India	0.2 (1959)	Japan	7.7 (1960)
Burma	0.5 (1959)	Pakistan	1.1 (1959)
Canada	27.9 (1960)	Thailand	0.7 (1960)
Ceylon	1.0 (1959)	USSR	1.6 (1959)
France	10.4 (1960)	UAR (Egypt)	1.3 (1960)
W Germany	9.6 (1960)	UK	24.9 (1960)
Indonesia	0.2 (1960)	USA	36.6 (1960)
Italy	5.3 (1960)	Yugoslavia	2.3 (1960)

The third Plan assumes a newsprint demand of about 150,000 tonnes for 1965-66. The maximum supplies of newsprint were planned for so as to keep imports to the minimum. The Plan envisaged the establishment of three newsprint mills and the extension of capacity at the National Newsprint and Paper Mills Ltd., (Nepa) a public sector project, by 30,000 tonnes. While the Nepanagar project is coming along, three other projects which have been proposed in the third Plan are nowhere within sight. One of the licensees is still surveying the suitability and sustained availability of raw materials as well as extraction methods. Another has proposed a revised scheme for doubling the licensed capacity among other things. Present indications suggest that the third is unlikely to go ahead with his project. The first will go into production, if at all, only during the fourth Plan period. In the circumstances, the Government is considering the further extension of Nepa's capacity by 75,000 tonnes of newsprint.

Discussions are now being held with a view to setting up a newsprint mill in Maharashtra with the co-operation of the sugar mills from four districts in the State. Newspapers are also being persuaded to set up a newsprint mill on a co-operative basis. These plans cannot, however, fructify unless the pulping process for producing quality newsprint from bagasse is demonstrably feasible. Soft coniferous woods are known to be the ideal raw materials for newsprint and the Government is contemplating the use of Himalayan soft woods for the purpose. The Governing Council of the U.N. Special Fund is reported to have approved a grant of Rs. 42 lakhs for an Indian project which seeks to survey coniferous and hard-

India reaching the goal of Self Sufficiency in SUGAR MACHINERY

We manufacture, erect and commission the complete Sugar Plant of any capacity upto 4,000 TCD. THE FIRST 1,000 TCD SUGAR FACTORY MADE IN INDIA WAS MANUFACTURED, ERECTED AND COMMISSIONED BY OUR TECHNICIANS IN THE YEAR, 1961. By now, we have installed FIVE such complete sugar plants. In addition we are regularly supplying the machinery for replacement and expansion programme to most of the sugar factories in India. We are also now venturing on the export of Sugar Machinery.

To serve our esteemed customers with the QUALITY PRODUCTION and efficient after sales service, we have a well equipped heavy engineering workshop, supported by a team of qualified and experienced technicians.

All your enquiries in Sugar Machinery will be cordially attended to.

wood forests. India's matching contributions will be about Rs. 95 lakhs.

The import of 1,13,678 tonnes of newsprint cost India Rs. 8.5 crores of foreign exchange in 1962. The demand for newsprint — constrained by controls — increased at 7.5 per cent per annum, during the first Plan and at 10 per cent during the second.

Composite Plants

Some paper mills in the country do not have pulping sections, and imports of pulp cost Rs. 7 crores each year. In recent times, the Government has encouraged the erection of composite plants which make their own pulp as well as others which produce only the pulp. The present output of pulp is estimated at 300,000 tons as against the 375,000 tons required; but it is expected to rise to 450,000 tons by 1965-66.

Bamboo and grass — the supplies of which are limited have so far provided the raw materials for paper. The Government is devising a long-term programme for the development of plantations of fast-growing species which are required for industries based on forest produce. Also, the Forest Research Institute at Dehra Dun has been experimenting on substitute raw materials, such as bagasse.

In 1962, 13 units were manufacturing paper machinery valued at Rs. 47.30 lakhs, but their output constituted only a very small fraction of the total demand for paper machinery. The Government has therefore issued licences to 23 firms (including the 13 above) to produce about Rs. 30 crores worth of machinery. The target for 1965-66 has been fixed at Rs. 6.5 crores. At the present rate of progress, production will not exceed Rs. 20-22 crores at the end of the fourth Plan and can at best increase to Rs. 30 crores some time during the fifth. If paper targets for the third and the fourth Plan are to be achieved, considerable amounts of paper-making machinery will have to be imported.

Looking Ahead

Capacity for the production of 970,000 tons of paper including newsprint by 1965-66 has been planned for. This entails an increase of 120.5 per cent over five years, that is, a simple growth rate of 20 per cent per annum. The actual production target of 820,000 tons entails an increase of 123 per cent over five years. The foregoing arguments have been designed to show that there will be substantial shortfalls in output. The fourth Plan target of 1.74 million tons of capacity and 1.5 million tons of production will mean a much greater rise in percentage terms than the 79.4 per cent for capacity and 82.9 per cent for production mentioned in recent papers of the Perspective Planning Division of the Planning Commission. Assuming that the 1.5 million-ton target would be achieved by 1970-71, per capita consumption of all paper would still not rise beyond three kgs. A substantial gap between demand and supply would remain unless timely measures are taken to attract capital into this vital industry. At the existing rate, the indigenous fabrication of paper machinery will also be inadequate. Incentives must also be provided for foreign participation by making the industry more remunerative. An immediate revision of prices is clearly called for, but that will only be the first step.

To conclude the story, the supply of paper and paper products over the last several years has been trailing demand. Official sources acknowledge reluctance among entrepreneurs to invest in the paper industry because of poor prices but the Government has done precious little to encourage investment. The case of newsprint is even worse. The new mills already licensed show no signs even of sprouting. At the

end of the fifth Plan, India will still not be self-sufficient either in paper or in newsprint. Meanwhile, the growth of both population and literacy adds to demand each year while the expansion plans of the industry are defeated through indecision or concessions grudgingly given at the best.

TARGETS OF PRODUCTION: 1970-71

Paper and Paper - Board (Including Newsprint)

(In thousands of tons)

Year	Capacity	Percent- age change	Produc- tion	Percent- age change
1960-61	.. 440	..	368	
1965-66	.. 970	120.5	820	123.0
1970-71	.. 1740	79.4	1500	82.9

Perhaps the year 1963 is ending for the paper industry more hopefully than it began. The Finance Minister, who announced the abolition of price controls on 16 industrial goods in the Lok Sabha on December 16, 1963, however, restricted the concession to paper-board only. It is to be hoped that this liberalization will be eventually extended to a wider field of industrial manufactures to the advantage not only of the paper industry but of others as well.

AMBASSADOR

faces the future with a broader outlook !

The re-styled radiator grille gives the new Ambassador a face-lift matching her numerous other attractive features. For, mark you, her face is not her only good fortune. With new front and rear bumper over-riders, the "Mark II" flash on each front wing, side-lights placed at the base of the grille, improved front-seat design, addition of two-tone trim, ash trays for the front and rear seats and at the centre of the fascia panel, new designs for the roof lining and door trim pads and provision of the **HM** emblem at the bottom centre of the rear glass, the new Ambassador presents a definite new look. With graceful modern styling, spacious comfort, a powerful 1489 c.c. O.H.V. engine and modest fuel consumption, the Mark II boasts of beauty as enchanting as her performance.

the old favourite with the new look

GOVERNMENT OF INDIA NEW PREMIUM PRIZE BONDS SCHEME

BONDS AVAILABLE FOR SALE IN DENOMINATIONS OF RS. 100/- AND RS. 5/- FROM 1ST JANUARY 1964.

ISSUE: THE PREMIUM PRIZE BONDS, 1964 WILL BE ON SALE WITH EFFECT FROM
1ST JANUARY 1964 AT

(i) Offices of the Reserve Bank of India at Bombay (Fort and Byculla), Calcutta, New Delhi, Madras, Bangalore and Nagpur;

(ii) All Branches, within India, of the State Bank of India and its subsidiary Banks;

(iii) Treasuries and sub-Treasuries other than those in the State of Jammu and Kashmir, the cash business of which is not conducted by the Reserve Bank of India, the State Bank of India or its subsidiary Banks; and

(iv) Head Post Offices and Departmental sub-Post Offices.

FORM AND DENOMINATION: The Bonds will be issued in two denominations of Rs. 100/- and Rs. 5/- and will be in the form of bearer bonds. No application will be required for their purchase.

REDEMPTION VALUE AND PRIZES: The Bonds will be repaid with premium of 50 nP. and Rs. 10 for every bond of Rs. 5/- and Rs. 100/- respectively five years after the date of their sale. In addition to the premium, every bond sold will be eligible for participation in two draws for prizes to be held in 1965 on such dates as may be announced by the Government of India.

For every one crore of rupees of Bonds sold of each denomination, prizes as under, will be awarded in each of the two draws:

Rs. 100/- denomination		
1 Prize of Rs. 50,000	Rs. 50,000	
2 Prizes of Rs. 25,000 each	Rs. 50,000	
5 Prizes of Rs. 10,000 each	Rs. 50,000	
10 Prizes of Rs. 5,000 each	Rs. 50,000	
75 Prizes of Rs. 2,000 each	Rs. 1,50,000	
150 Prizes of Rs. 1,000 each	Rs. 1,50,000	
Total	243	Rs. 5,00,000
Rs. 5/- denomination		
1 Prize of Rs. 15,000/-	Rs. 15,000	
2 Prizes of Rs. 10,000 each	Rs. 20,000	
10 Prizes of Rs. 5,000 each	Rs. 50,000	
25 Prizes of Rs. 2,000 each	Rs. 50,000	
200 Prizes of Rs. 1,000 each	Rs. 2,00,000	
330 Prizes of Rs. 500 each	Rs. 1,65,000	
Total	568	Rs. 5,00,000

In respect of the sale proceeds in excess of round crores of Rupees, the Prize-money will be increased proportionately and distributed in suitable number of additional prizes. Thus, the amount and number of prizes are not limited but will increase with every increase in the sale of Bonds.

The draws for prizes will be held under the supervision of the Government of India and only sold bonds will be eligible for prizes. No bond will, however, be eligible for more than one prize in each draw. If an unsold Bond draws a prize, a fresh number will be drawn for that prize and if that number also pertains to an unsold Bond, the process will be continued till a sold Bond draws that prize.

PUBLICATION OF WINNING-NUMBERS: The particulars of the prize-winning Bonds will be published in the Gazette of India and the press as soon as possible after the date of the relative draw.

TAX FREE CONCESSION: The prize-money and the premium on the Bonds will not be liable to tax under the Income-tax Act, 1961.

SUPPLEMENTARY PROVISIONS: The Bonds will be on sale upto 31st December 1964 but the sale may, at the option of Government, be discontinued earlier.

For further details including the procedure for the payment of prizes, a reference may be made to the Government of India Notification No. 34(1) NS/63 dated 16th December, 1963 copies of which are being exhibited at the Selling Offices.

Oil Plus Ideology

AT SOME POINT in the course of the Indo-American dialogue over Bokaro, Mr. C. Subramaniam happened to say that the Government of India would execute the project with U.S. assistance, if possible, without it if necessary. That was a perfectly respectable proposition. But the attitude of Mr. K. D. Malaviya, the former Minister for Oil, to the development of the oil industry in this country was rather different and less sensible. He appeared to proceed on the basis that he would develop this industry without the assistance of the international oil companies if possible and with their assistance only if necessary. In consequence, his tenure, remarkable as it was for his personal brilliance, was patchy in terms of achievement. Undoubtedly, he showed much perseverance and firmness in wringing valuable concessions from unwilling international oil companies. But even more notable was his success in enlisting Soviet and Rumanian support for the development of India's oil, especially that of the former in the exploration and exploitation of the country's oil deposits.

When allowance has been made for these gains, the reproach still seems merited that Mr. Malaviya's tactics were clever but his strategy was short-sighted. Had he been more objective and farseeing, he should have been able to secure the active co-operation of the international oil companies at least to the extent promised by those who have evinced an interest since. However, by sticking to a dogmatic refusal to consider any reasonable basis for the expansion of the existing refineries, Mr. Malaviya lost for this country valuable time and resources not only in oil but in the ancillary field of petro-chemicals. The pace of progress in these vital sectors would, therefore, seem to depend on the capacity of Mr. Malaviya's successor to the Oil portfolio to develop new and flexible attitudes which would yield constructive and useful results for the speedy development of a comprehensive oil industry in this country including not only exploration and refining but a full-fledged petro-chemical industry as well. Whether Mr. Humayun Kabir is going to be the architect of this policy remains to be seen, but he at least starts off with the advantage of having an able Secretary who has had considerable experience of the nation's oil industry during troubled but exciting years.

Elephantine Effort

Contrary to the impression possibly engendered by propaganda of a certain kind, the oil wealth of India was not Mr. K. D. Malaviya's discovery. The credit should properly go to an elephant in the employ of the Assam Railways and Trading Company Limited in the remote year of 1889. The Assam Railways and Trading Company Limited was engaged in the exploitation of coal in the vicinity of Marghirata and in its transportation south-west. The elephant — so the legend goes — returned to camp one memorable evening with traces of oil on its feet. In the excitement that followed, the company's engineers recalled earlier stories about oil in this region. Then were told tales of crude oil noticed near the Dihang, the Nampong, the Namchuck rivers in 1828, 1837 and 1865. (We must here remind ourselves that the world's first well for production of oil from sale to the public was drilled in Pennsylvania, U.S.A., by Colonel Drake, in 1859, and that not many years later — between 1866 and 1868 — several wells were bored in Upper Assam. A tea-pot refinery was, in fact, set up at Marghirata in 1883. But these pioneering attempts seem to have had a short run and were not pursued in right earnest until that celebrated elephant of the Assam Railways and Trading Company took a hand — or rather a large foot — at things some years later). Thanks to these elephantine efforts,

a small oilfield was discovered, and the Assam Oil Company, formed in 1898, built a refinery at Digboi in 1900.

Thus India had the rudiments of an oil industry when it entered the 20th century. But, further development during the fifty years that ensued was negligible and the country was all but waiting for Mr. K. D. Malaviya. Meanwhile, the capacity of the Digboi refinery had increased to 400,000 tons, while the sporadic search for oil which was undertaken during the 'twenties in Upper Assam through using geophysical methods at deeper levels, resulted in the location of a possible horizon near Nahorkatiya. There were other minor successes too, such as the discovery of a shallow oil-depth at Badarpur, near Silchar, but it dried up after yielding 300,000 tons of oil of poor quality. Indications of oil were also found in the Jorhat area. The Assam Oil Company had carried out seismic work in these regions during the late 'thirties, but the War intervened, changing much else besides the course of Indian oil history. At the conclusion of the War and during the early years of Independence, the Government of India rightly decided to concentrate on the setting up of refining capacity based on imported crude in order to meet the rapidly expanding demand for petroleum products. In those less controversial days, it was possible to act quickly on State intention with the help of the international oil companies which were already distributing imported petroleum in the Indian market. Thus, three new oil-refining units were set up between 1954 and 1957: Burmah Shell and then Standard Vacuum set up refineries at Trombay with capacities of 2 million and 1.2 million tons respectively, while Caltex built the third at Visakhapatnam with an annual output of 680,000 tons. This raised the total refining capacity in the country to 4.3 million tons. Earlier, in 1953, following up the pre-War exploration of the Nahorkatiya area, the Assam Oil Company had succeeded in striking oil in the region and this was soon followed by success in the adjacent Moran area.

Industrial Policy Resolution

These oil reserves, however, could not be developed and exploited expeditiously due to changes in the Government's Industrial Policy in 1956. Under the revised policy, mineral oils were included in Schedule A to the Industrial Policy Resolution (1956) which made the State responsible for further growth of the oil industry. The existing privately-owned units, of course, could expand. The State also could secure the co-operation of private enterprise in the establishment of new units when national interest so required. In 1959 Oil-India Limited was established as a joint venture between the Burmah Oil Company, the Assam Oil Company and the Government of India which contributed a third of the equity capital. Subsequently, however, Oil-India was converted into a 50:50 partnership between the Burmah Oil Company and the Union Government. It is now engaged in developing the Nahorkatiya and Moran oilfields, having established oil reserves of the order of 45 million tonnes in that region.

The last six years have witnessed a good deal of intensified activity in the oil industry. The four private sector refineries have progressively stepped up their throughput to 7.75 million tonnes — Burmah Shell to 3.75 million tonnes, Standard Vacuum (now ESSO Standard Eastern) to 2.5 million tonnes, Caltex to 1.05 million tonnes and Assam Oil Company to 0.45 million tonnes. Two Government-owned refineries have been based on the Nahorkatiya-Moran reserves of crude — one at Noonmati with a capacity of 0.75 million tonnes and the other at Barauni with a throughput of two million tonnes. The Noonmati Refinery went on stream on January 1, 1962. The Barauni Refinery is to be commissioned

Burmah-Shell are People

People with families and budgets and worries and joys. Thousands of men and women from all walks of life doing responsible jobs—big and small—and doing them well.

Today, as ever, they are hard at work...working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

Burmah-Shell are People in the Service of the People

POWER TO THE PEOPLE

Power to turn the wheels of industry. Power to grow more food. And light for the home.

More power to more people in more places. More out-of-the-way places. That about sums up the work of the Madras State Electricity Board. A rural electrification record, far and away the best!

And in the efforts of the State to take the benefits of electric power to more people in more places—and more out-of-the-way places—Alind has played a modest, if significant, role.

ALIND

THE ALUMINIUM INDUSTRIES LIMITED
India's largest manufacturers of aluminium conductors and accessories.

in two stages: the first million tonnes capacity by June next and the second a few months later. These two refineries are to be further expanded during the current Plan: Noonmati to 1.25 million tonnes and Barauni to three million tonnes. Two more refineries have also been planned. The first of these will be wholly in the public sector and is to be located at Koyali with an initial capacity of two million tonnes, which will later be expanded to three million tonnes according to the following schedule: the first one million-tonne capacity by October, 1964; the second million-tonne capacity by January, 1965; and final expansion to three million tonnes by January, 1964. The second is a joint venture with the Government contributing 51 per cent of the share capital, Phillips Petroleum of the USA 25 per cent and their Indian associates, Duncan Brothers of Calcutta, two per cent; the rest is to be subscribed by the Indian public and other parties of the Government's choice. It is to be set up at Ambalamukal near Cochin and will have an initial capacity of 2.35 million tonnes to be raised to about 3.5 million tonnes after two to three years of continuous operation. Expectations are that it will go on stream by October, 1965. The Koyali Refinery will process crude from Ankleshwar and Kalol and that at Cochin will import supplies; these are later to be supplemented or wholly replaced if oil is forthcoming from the Cavary Basin.

Exploration and prospecting too has been stepped up in various parts of the country. Oil-India has been granted another concession for this purpose over an area of 1,291 sq. miles in the neighbourhood of its Nahorkatiya and Moran oil

fields. The survey over, deep exploration wells are being drilled here at Tinali and Bogapani.

The Oil and Natural Gas Commission, a public sector undertaking, is engaged in oil exploration at a number of places in the country, besides developing the Cambay-Ankleshwar-Kalol oil and gas fields in Gujarat where its efforts were crowned with notable success some years ago. Extensive geological and geophysical explorations are being carried out by it presently in the Ganges and Cavary Basins, in the foot-hills of the Himalayas and in the Rajasthan desert. Exploration in the Himalayan foot-hills has not yet yielded any positive results apart from some shows of gas at Jawalamukhi. Drilling in the extensive Ganges Basin has been in progress for some time; a deep well is being bored fairly rapidly at Raxaul. In the Cavary Basin, drilling was undertaken a few months ago at Pattukottai in order to obtain structural information. Exploration here is to be intensified after an exploratory well has been drilled at Karaikal. Exploratory drilling will commence in Jaiselmer area of Rajasthan when the results of the geophysical survey now being conducted are known. Drilling is being continued in Sibsagar area in Assam, an ONGC concession where some initial success has been achieved.

Standard Vacuum abandoned its search for crude oil in West Bengal and Orissa in 1959. The ONGC is, however, considering a further geophysical survey of this region. Although oil in the Cambay structure in Gujarat is believed to be limited in quantity, it can yield 25 million cu. ft.

INDIANOIL'S PETROLEUM PRODUCTS KEEP INDUSTRIES MOVING

INDIANOIL Signifies Progress and is indispensable to India's growing economy. The INDIAN OIL COMPANY LIMITED markets and distributes all over the country petroleum products that accelerate the industrial development. Indianoil is the sole distributor in India of the world famous Mobil lubricants known for their premium quality.

of gas per day. The oil reserves of Ankleshwar have been established at about 45 million tonnes. Also the Kalol area in this region holds promise of becoming commercially exploitable.

India, thus, has made good progress indeed on the oil front. Refining capacity has been increased from a bare 0.4 million tonnes to as much as 8.50 million tonnes. A further capacity of 8.85 million tonnes is being built up and is due to be commissioned by 1965-66 or so. The total will further increase by a million tonnes or so when the Cochin Refinery is able to increase its throughput to 3.5 million tonnes. Two more refineries are to be set up at Madras and Haldia, each with a capacity of two million tonnes, but the proposals are still under consideration. Oil deposits, estimated at 90 million tonnes, have also been located in Upper Assam and Gujarat areas. In 1951, India had only one small oilfield at Digboi which too was nearing exhaustion. In the new oilfields, efforts are being made to develop an annual production potential of 6 million tonnes of crude by 1965-66. A potential of about 2.75 million tonnes per annum is already available in the Nahorkatiya and Moran areas and about 0.7 million tonnes in Ankleshwar-Kalol area. Noonmati and Digboi Refineries draw their supplies from the former (Digboi has its own oilfield in addition) while the Burmah-Shell and ESSO refineries at Trombay utilize the latter, making up the deficit in crude from the Middle-East. The Caltex Refinery at Visakhapatnam gets its supplies from Indonesia.

Apart from the pioneering work done by the British and American oil interests, the rapid growth of the Indian oil industry during the second Plan has been in no small measure due to valuable Soviet and Rumanian assistance. They have helped

to lay the foundations of the public-sector in Indian oil, for which a dominant role was envisaged by the Industrial Policy Resolution of 1956. The Russian and Rumanian collaboration has been available both for oil exploration and refining. While the Rumanians have assisted with exploration equipment and in the setting up of the Noonmati Refinery, the plant for which they also supplied, the Russians have actively helped the ONGC in exploration and prospecting. The USSR is also helping in the erection of refineries at Barauni and Koyali, the equipment for both of which they are supplying. Furthermore, the ENI, an Italian oil combine, is assisting in oil exploration at Raxaul and the French Institute of Petroleum in the Jaiselmer area. ENI is also constructing five oil/gas pipelines in the Cambay-Ankleshwar-Kalol area for the ONGC and a product-pipeline from Gauhati to Siliguri for the Indian Refineries.

The Indian oil industry, in spite of its rapid growth over the last 12 years, has been unable to catch up with the needs of the economy (Tables I and II). The country not only imports crude to augment indigenous supplies but large quantities of refined petroleum products as well (Table III). Much of the foreign exchange spent on the import of petroleum products after 1958, could have been saved if changes in the Industrial Policy had not hindered the expeditious exploitation of the Nahorkatiya oil reserves. The Government entered into negotiations with the Burmah and Assam Oil Companies about the setting up of refineries to exploit this crude. The decision to locate the new refineries at Noonmati and Barauni was in disregard of the Vashist Committee's recommendation, and it entailed much unprofitable expenditure. What was worse, the construction schemes for the two refineries could not be fulfilled either. The Noonmati Refinery, started pro-

TODAY, AS EVERY DAY
OF THE PAST SEVENTY YEARS,
BATLIBOI MEET THE DEMANDS
OF GROWING INDUSTRIES IN INDIA
Batliboi manufacture a wide range of products including industrial air-conditioning plant, wood working machinery and engineers' steel files. Also, Batliboi supply specialised heavy machinery, and other essential equipment, to such diverse industries as textile mills, foundries, workshops, agricultural and power projects. Their offices in many important cities in India make certain that these supplies are punctually and efficiently delivered and serviced

AND NOW, ANSWERING
THE VITAL NEED
OF THE HOUR, BATLIBOI
BECOME EXPORTERS

Among the products they have exported so far are air-conditioners, sewing machines, water heaters and diesel engines. Besides, Batliboi's office, associates and agencies—spread over the world—are making a tremendous effort to develop a sound market for Indian products abroad. As industrial demand increases, Batliboi develop their resources and know-how...so that seven decades from now they will still play a dynamic role in the country's economy.

duction in December, 1961, instead of in April that year as planned, and soon ran into acute teething troubles which were not overcome until recently. Work on the Barauni Refinery (originally due to be ready by the end of 1962) is 20 months behind schedule, it may now go on stream in June next. Although the kerosene unit at Barauni has been modified in the light of Noonmati experience, it is too soon to assert that the sorry tale will not be repeated. Full utilization of the Nahorkatiya-Moran crude can only be expected in the latter half of 1965 at the earliest. Not all the delays in the commissioning of the Noonmati and Barauni refineries were avoidable, but the decision to locate the Barauni refineries at its present site, ignoring the recommendations of Russian experts, did upset the construction schedule. Similarly, exasperating delays in finalising the agreement with ESSO Standard on the lubricants plant and the unjustified obstruction to the extension of capacity of private sector refineries have resulted in a wasteful use of foreign exchange resources. Although the broad heads of arrangement between ESSO and the Union Government, such as the 50:50 partnership of the lubricants plant, had emerged over three years ago, the working out of details is taking inordinately long.

The persistent refusal by the Government to allow the private sector refineries to expand their capacities, not by what is technically known as "debottlenecking" but through the installation of new units at existing sites, will entail large-scale imports of petroleum products up to 1966-67 at any rate. If expansion had been allowed to these refineries early last year, the cost of these imports between the latter half of 1964, when the new units could be in production, and 1967, when adequate supplies from indigenous sources would be available, could have been reduced by at least 40 per cent, even after allowing for increased cost of crude imports and remittances of refining and marketing profits. Some stubbornness in the face of expansion pleas was perhaps necessary and justified as the international oil market had meanwhile turned in the buyer's favour. But wresting concessions through procrastination was carried too far and at the expense of the interests of the economy as a whole.

The sum of Rs. 65 crores thus wrung out of the oil companies — a good part of it, would have come in any way, as the oil companies had started renouncing some of their privileges voluntarily even before pressure had been brought to bear upon them — is bound to be more than offset by larger imports, and possible loss on exports, of petroleum products over the next three or four years. Imports of these products from the Soviet Union on the rupee account and at lower cost might have reduced the drain on foreign exchange. But if the report is true that the USSR has asked to be allowed to charge freight on oil exports to India from Black Sea ports instead of Persian Gulf ports as hitherto, it should rob these imports of much of their charm.

Various Estimates

Since the demand for petroleum products will grow at a rapid rate during the fourth Plan period, there is a good case for allowing the private sector refineries to expand. Table IV gives the industry's estimates of the demand for various oil products in India up to 1971. These, of course, are widely at variance with the Government's latest estimates as reported, which put the total demand for petroleum products by 1970-71 at about 26 million tonnes. But these estimates are based on artificially depressed consumption figures for the current year, resulting from this year's highly enhanced taxation. Furthermore, sluggishness in the Indian economy has also led to reduction in demand for petroleum products during the past two years. To project future demand on such conservative basis, while attempts are simultaneously being made to step up the rate of economic activity through advance action on the fourth Plan projects, is nothing short of foolhardy.

Even if the industry's estimate of a demand of 31.4 million tonnes is considered high, there can be little doubt a figure of 28 million tonnes per annum at the end of the fourth Plan period should be beyond controversy. If the country is to be made nearly self-sufficient in essential petroleum products, a demand of 28 million tonnes will call for 30 million tonnes refining capacity. But then aiming at mere near-self-sufficiency in industries such as petroleum is

TABLE II

not prudent. If planning is to have any meaning in such vital spheres, it should be undertaken for marginal surpluses, not for deficits. The Western countries always plan for 20 per cent excess capacity in the oil industry at the least, the surplus being exported during normal times. When the proposed refineries at Barauni, Koyali, Cochin, Madras and Haldia are in full commission, this country will have an aggregate refining capacity of 23 million tonnes. If the refining capacity is raised to 30 million tonnes by 1970-71, the really problematic surplus will be of gasoline. In a developing country such as ours, however, this should not pose a problem at all. Surplus naphtha can be profitably utilized for the manufacture of petro-chemicals and of fertilisers, for which there exists an insatiable demand for decades to come. Research work is also being done at present with a view to utilizing gasoline by mixing it with kerosene.

An early decision on the expansion of the private sector refineries should serve us well even by the last year of the current Plan and early during the next. Even if the Barauni, Koyali and Cochin refineries go on stream more or less according to current schedules, they cannot be expected successfully to function to capacity before 1966-67. This should be particularly true of their expansion plans; these are to be accomplished by widening of bottlenecks in operation -- a slow and gradual process which takes years. The combined output, in the case of the four major production groups, of the existing refineries as well as of those now being set up will be of the order of: light distillates, 2.9 million tonnes; kerosene, 3 million tonnes; middle distillates, 4.3 million tonnes and furnace oil, 4.3 million tonnes. If this is to be the supply position from indigen-

ous sources in 1967, it is apparent that fairly large quantities of kerosene and middle distillates in 1965-66 at least will have to be imported in order to meet the estimated demand of 4 million tonnes and 4.3 million tonnes, respectively. The demand should grow further by 1966-67 and 1967-68 necessitating imports in those years too. The expansion of the private refineries should serve to fill these gaps. There will, of course, exist surpluses of gasoline. But increased resort to fuel injection in the fertilizer and steel industries and the proposed development of petro-chemicals during the next few years should easily wipe out the surplus.

It is high time that goodwill was restored between the Government and the private oil companies. The recent offer of the latter to abrogate their 1951 refinery agreements voluntarily and to replace them by licences under the Industries Act, without this being conditional on expansion of their existing refineries, is a step that calls for a counter-gesture. The companies have asked for the safeguard that: (i) they will be allowed to import crude from their own sources at prices that will be competitive in the world market; (ii) the Government of India will not reduce their competitiveness by levying import duties on crude; (iii) they will not be discriminated against, particularly in respect of taxation and marketing "vis-a-vis" the public sector refineries, and (iv) they will be permitted to repatriate their profits. ESSO has also offered to merge its refining and marketing organizations in a single unit. Trouble, if any, is likely to arise over the first two assurances sought by the companies. But as long as the companies are prepared to import crude from their own sources at competitive world prices, there should be no objection. For their part, the companies should have no objection to processing

Iranian or Kuwait crude if the Government can obtain supplies at concessional rates. If they will not do that, they should consent to reduce the price of their own crude to the level at which the Government can ensure regular supplies from the Middle East. The resilience shown by the companies in adapting themselves to changed circumstances should ensure their future in this country. The latest evidence of this spirit is the willingness they have expressed to collaborate with the Union Government in the proposed refinery at Madras on terms more or less similar to those agreed to by Philips Petroleum in respect of the Cochin Refinery. Indeed, the Cochin Refinery Agreement is a landmark in the history of the Indian oil industry.

Lubricants Output

The Government must at the same time expedite plans for stepping up output of lubricants, oil exploration and prospecting and for the establishment of petro-chemical industries. Assuming conditions of peace, our demand for lubricants at the end of the current Plan period will be around 500,000 tonnes per annum. At present, only small quantities are produced locally. The ESSO plant and another at Barauni should raise lubricants capacity to about 330,000 tons a year. Surely more is necessary.

Our demand for crude should increase to about 30 million tonnes per annum by 1970-71. About seven million tonnes should be available from the Assam and Gujarat oilfields. The rest will have to be imported at heavy foreign exchange cost unless, of course, fresh sources of indigenous supply are found meanwhile. The ONGC and Oil-India are doing a commendable job in this regard, but their efforts need to be supplemented. Since prospecting for oil is a highly speculative business, the country can only gain if the experienced international companies can be pressed into service not merely to work as contractors for the ONGC but to operate on their own account. The Oil-India pattern of collaboration, though desirable, may, in this case be modified somewhat in order

to evoke the interest of the other oil companies: the foreigner who invests in oil exploration should be allowed a share in the refining capacity which will be based on the crude thus discovered. Incidentally, the attempt being made to secure supplies of crude from Iran through a collaboration between the ONGC and the agency of the Iranian Government in prospecting for oil is a step in the right direction.

Now to petro-chemicals. Dr. Henny of the French Institute of Petroleum has estimated that, if concerted action is not taken to develop petro-chemical industries in India, we will have to foot an import bill on this score to the tune of Rs. 51 crores in 1965-66 and Rs. 140 crores five years later. Based on the estimated availability of naphtha between 1966 and 1971, he has recommended a phased programme for building up five major petro-chemical complexes at a total cost of Rs. 262.9 crores; one each at Bombay (Rs. 64.3 crores), Gujarat (Rs. 74.9 crores), South India (Rs. 66.4 crores), Barauni (Rs. 53 crores) and at Calcutta (Rs. 52 crores). He has further suggested that the Bombay and Gujarat complexes should receive Government sanction in 1963 so that they may start production by 1968. He has recommended that the Government should sanction the initial phases of the South India and Barauni complexes by 1964, so that they can start by 1967-68. For the Calcutta complex, 1967 has been suggested as the year of sanction and 1970 as the year of commissioning.

Work on the Bombay and Gujarat complexes has already begun. Two schemes — one of Union Carbide (India) to establish a naphtha cracker of 60,000 tonnes capacity per annum for the manufacture of polyethylene and solvents and the other of Herdillia Chemicals for producing phenol and acetone from petro-chemical propylene — were sanctioned for Bombay early in 1961. A letter of intent has also been issued to Mr. A. Mafatla for setting up a 200,000-tonne naphtha cracker in Bombay for producing, among other things, ethylene. The plan for the Gujarat complex was approved about

TEN MINUTES TO LOAD 22 TON WAGONS MICHIGAN

Sets

NEW TIME RECORD

Loads 80 to 90 "Twenty two-ton"
Railway wagons in three shifts.

The National Coal Development Corporation Ltd., Ranchi, who have acquired three MICHIGAN tractor Shovels, are loading 22-ton railway wagons in 10 minutes.

The Michigan 175-A tractor shovel with 2½ cubic yards standard bucket, working at Kathara colliery is loading 80 to 90 wagons in three 8-hour shifts working round the clock. Before the shovel took over at Kathara, one of the methods employed for loading wagons was by labour, involving more time and expense. The colliery also using two bunkers was loading 60 wagons a day. But when the 175-A was put on the job it alone heaped 60 wagons in two shifts apart from doing odd jobs like stock-piling, clean-up work, removing over burden etc.

MICHIGAN Tractor Shovel

ELECTRIC MOTORS

STURDY - SAFE - DEPENDABLE

RANGE INCLUDES:

INDUCTION
MOTOR

INDUCTION MOTORS

- Squirrel Cage both Screen Protected and Totally Enclosed Types for use on 400/440 V. Capacities up to 20 B.H.P.
Manufacturing programme will also include up to 50 H.P. in Slip-Ring Type.

LOOM
MOTOR

LOOM MOTORS

- Totally Enclosed, Self-Cooled, 3 phase for Outputs from 0.50 H.P. to 1 H.P.

CARD MOTORS

- Totally Enclosed, Surface Cooled Type, High Torque 400/440 V. 3 Phase, 50 Cycles A.C., 1.5 H.P. to 2 H.P.

RING-FRAME DRIVE MOTORS

- Squirrel Cage, Totally Enclosed, Fan Cooled Type, 10 H.P. & 12.5 H.P.

Manufactured by: **ELECTRIC CONSTRUCTION & EQUIPMENT CO., LTD.**
9, KALIPRASANNA SINGHEE ROAD, CALCUTTA-2. Also at: BOMBAY - DELHI - MADRAS - HYDERABAD

three weeks ago. It will be implemented in four stages: in the first phase, benzene (32,700 tons) and toluene (15,000 tons) will be produced; in the second phase, methanol (4,500 tons) and isoprene (41,000 tons); in the third stage, O xylene (10,350 tons), P. xylene (8,050 tons) and ethyl-benzene (14,000 tons); and in the fourth phase, ethylene (45,800 tons), propylene (24,800 tons), butadiene (24,900 tons) and benzene (30,000 tons). While the authorisation schedules of these two petrochemical complexes, as suggested by Dr. Henny, have been, thus, adhered to, it remains to be seen whether energetic action will be taken so that these complexes can be commissioned by 1966. Fortunately, some ENI credit is available for the Gujarat complex, but care must be taken to avoid procedural delays.

Phillips Petroleum is stated to have evinced interest in a synthetic rubber plant which it has offered to set up as part of the complex in South India. According to Dr. Henny, the other petrochemical intermediates which may be produced here are polyethylene, polyvinyl, acetate polyvinyl chloride, chlorinated C2 derivatives, phenol, acetone, isopropyl alcohol,

propylene glycol and polyisoprene.

The production-patterns recommended for the Barauni and Calcutta complexes are: Barauni — benzene, O. xylene and polystyrene; Calcutta — polyethylene, ethylene oxide, dodecyl, benzene, polypropylene, acrylonitrile, polybutadiene and methanol.

Mention may also be made here of the PJB Industries' scheme for manufacturing carbon black from Nahorkatiya natural gas. A licence for this purpose was issued in December, 1960. Duncan Brothers had also taken out a licence for a synthetic rubber plant based on Nahorkatiya natural gas but the scheme has fallen through as it was considered that the supplies of gas, after the requirements of the PJB Industries carbon black unit and those of the Namrup fertilizer plant had been met, would be inadequate. Oil-India is now planning to utilise this surplus gas for the manufacture of channel black.

The offer of the Kuwait Government to participate on a minority basis with the Government of India in the petrochemical industries needs to be availed of.

TABLE IV

INDUSTRY'S ESTIMATES OF DEMAND FOR PETROLEUM PRODUCTS IN INDIA: 1962-1971

(Thousand metric tons)

Aluminium: Good in Parts

AMONG THE highlights of our recent industrial expansion is the growth of the aluminium industry. It goes to the credit of our planners that they have been prompt in recognizing the large potential demand that there is for this versatile metal in any modern (or modernizing) economy and providing for the substantial development of this industry in order to meet our burgeoning requirements. That their effort has been only partially successful is, of course, the point of this story.

The aluminium industry in this country is only 25 years old. Even as late as in 1947, the total installed capacity of the two producers then functioning in this field was only 4,000 tons of ingots, yielding an output of 3,215 tons of ingots. There was some progress in the first Plan period when the capacity of existing plants was stepped up to a total of 7,500 tons. As a result, the actual output at the end of the first Plan was near 7,000 tons. In the second Plan, the Government decided that, in addition to further expansion of existing units, new units should be set up. The target which was originally fixed at 30,000 tons was later revised to 25,000 tons. Unfortunately, the project for a new 10,000-ton smelter to be located at Salem in South India in the public sector by the National Development Corporation did not fructify and it was subsequently arranged that this scheme was to be undertaken in the private sector by Madras Aluminium, a company formed for the purpose. As a result of this default, the second Plan target could not be achieved. The expansion in that period was confined to the additional capacity installed by one of the two established producers. Thanks to the new smelter with a capacity of 10,000 tons, which had been set up at Hirakud by Indian Aluminium, the installed capacity was increased to 18,100 tons of ingots by the end of 1960-61 and the actual output in that year was slightly more at 18,200 tons of ingots. The Aluminium Corporation of India, which was to have raised the capacity of its smelter at Asansol from 2,500 to 7,500 tons went to work on the project in the second Plan period, but the completion of the scheme has spilled over into the third Plan.

Lagging Production

By the time aluminium targets for the third Plan came to be considered, the consumption of this metal was running at a level well over 50,000 tons, as against a domestic production of slightly more than a third of that amount. It was clear moreover that the demand would go up within the next five years by three to four times and the planners were, therefore, disposed to set their sights high when drawing up the development programme for this industry. It was proposed initially that the industry should aim at an increased capacity of 87,500 tons, but it was subsequently realised that a much more ambitious goal would be justified in the context of the need for employing aluminium to replace steel as well as scarce non-ferrous metals such as copper and zinc, in a number of industrial and constructional uses. The target, therefore, was revised upward to 150,000 tons and the development programme designed to meet these goals rightly placed reliance both on the expansion of capacities in existing units and the setting up of large, new units.

Apart from the additional capacity of 5,000 tons which had been sanctioned in the case of the Aluminium Corporation under the second Plan, provision was made in the third Plan for Indian Aluminium to step up the capacity of its Alwaye smelter from 5,600 to 10,600 tons and the capacity of its Hirakud smelter from 10,000 tons to 20,000 tons. Both these expansion programmes have been pursued successfully

and the increased production expected from them is now becoming available and is expected to be fully established by next year.

In addition to the expansion of production of established units, new plants with a total initial capacity of 80,000 tons, with a provision for further expansion up to 140,000 tons, were also to be set up during the third Plan. Here, however, most of the planning has gone awry and so far only one of the new projects has come to fruition. The successful new plant is that of Hindustan Aluminium, which has been able to set up within a remarkably short period a smelter with a capacity of 20,000 tons of ingots at Renukoot in Uttar Pradesh. This plant has been commissioned within 18 months of the start of construction and is now giving regular production at an annual rate of 22,000 tons of ingots. In the case of this plant, further expansion up to 50,000 tons had been originally provided for, but now the company has been allowed to raise its installed capacity to 60,000 tons, partly because of the need for more aluminium which is being felt in the country and partly because other new plants contemplated in the third Plan are not coming up to schedule.

Behind Schedule

Among the projects which have fallen behind schedule is that of Madras Aluminium, but in this case the initial hurdles which had to do with procedural delays in arranging for institutional finance have been cleared and the plant, which will have a capacity of 10,000 tonnes, may begin producing alloys and ingots by the latter half of 1964; the electrolytic pot has been installed this month at the plant site at Mettur. Three other new projects included in the Plan, however, are in the doldrums. The two parties to whom licences had been issued for setting up plants at Koyna in Maharashtra and near the Sharawati power project in Mysore respectively were unable to secure foreign collaboration, raise internal finance or otherwise proceed with the processing of the projects. As a result, neither the Koyna plant for which an initial capacity of 20,000 tons with scope for further expansion up to 50,000 tons has been fixed, nor the Sharawati plant for which a capacity of 30,000 tons has been indicated, is likely to make substantial progress in the period of the third Plan. As regards the Koyna project, the licence has been transferred to another party, while in the case of the Sharawati project, the Mysore Government recently indicated that it was thinking in terms of taking up this scheme in association with private enterprise. The remaining proposal in the third Plan for a new aluminium plant relates to a public sector scheme which is to be sited in Madhya Pradesh and although the Central Ministry concerned has been negotiating with the Hungarian Government for collaboration, the talks have not so far led to any specific results. The Government's ambition, however, appears to be to organise a plant with a capacity of about 50,000 tons. This is no doubt quite consistent with the target of 150,000 tons set for the industry in the third Plan and even more relevant to the rapid development of the industry visualized for the fourth Plan for which it is now being considered that a target of up to 250,000 tons may not, by any means, be excessive.

Meanwhile, it must be pointed out that substantial though the expansion in the third Plan has been, the failure of so many new projects to make headway has underlined the need for more vigilant planning of development in the coming years. Thanks to the expansion schemes undertaken by the two existing producers and the emergence of the new plant of Hindustan Aluminium, the installed capacity of the industry has gone up from 18,100 tons of ingots in 1960-61 to 27,500 tons in 1961-62 and 53,350 tons in 1962-63. During the same

HOW THE LABEL 'SANFORIZED' CAN HELP TO STEP UP TEXTILE EXPORTS

Indian textiles are a major earner of foreign exchange; the export of cotton cloth in 1961-'62 added Rs. 48.39 crores to the nation's coffers. Exports will expand still further as new foreign markets are being tapped. Only textiles that are competitive in quality as well as price can hold

their own in tough world markets. Indian mills are producing increasingly better quality cloth and the label 'Sanforized' is helping them to do so. The trademark is an international word denoting a uniform standard of shrinkage control. Millions of consumers in 49 countries look for the

label 'Sanforized'. It is known and trusted on every continent. Such a label, recognised the world over as synonymous with quality, can help to increase exports of India's cotton fabrics, and enable them to earn more and more foreign exchange.

Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark 'SANFORIZED', or permit its use by authorised registered users, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay 2.

THE DAY BREAKS BRIGHTER TOMORROW

 WITH SOAPS, FOODS, TOILET PREPARATIONS

MB. 10-23A

period production has successfully risen from 18,200 to 19,400 and 42,000 tons of ingots. In the Mid-Term Appraisal of the third Plan it is indicated that the capacity of the industry may reach a level of 68,850 tons with production at 68,000 tons by the year 1965-66. Apart from the fact that this would mean a substantial failure to achieve the third Plan target of 110,000 tons, there is also the fact that the supply of aluminium is failing to catch up with demand, thereby frustrating the country's effort to effect economies in the use of scarce metals, such as stainless steel, copper and zinc.

Hindal's Capacity

It is no doubt true that, with Hindustan Aluminium well set to expand its capacity three-fold within the next few years, the total output of aluminium could possibly exceed the third Plan target by the end of the first year or early in the second year of the fourth Plan. But even so, domestic production would still fall short of requirements to the extent of perhaps 40 or even 50 per cent. In the circumstances, it is clearly necessary that the delay resulting from the lack of progress on all but one of the new schemes included in the third Plan will now have to be made up by bold and energetic planning. With the transfer of the licence to a new party, the Koyana scheme may be expected to come to life. It is also to be hoped that the Central Government would soon have a clear picture of the extent to which Hungarian or other collaboration might be forthcoming for the proposed public sector plant in the Amarkantak region of Madhya Pradesh. Meanwhile, there is need for positive decisions to be taken both with regard to the vigorous pursuit of the Sharawati scheme and the exploration of the possibilities of encouraging some more new plants in the private sector. The Mysore Government has taken the right step in showing keenness for association with private enterprise. It is important that negotiations should be pursued with the purpose of securing efficient entrepreneurship and management for this project. Similarly, applications from private enterprise for new licences for plants in Madhya Pradesh or elsewhere should also be promptly and favourably considered. Finally, as the economies of scale are extremely important to this capital-intensive industry, the Government will do well to encourage or accept readily proposals for further expansion of existing units. The guiding consideration in all this should be to secure the participation of such entrepreneurs as are demonstrably able to

ensure quick and efficient completion of new schemes in this important growth industry.

It is interesting here to recall that it is the demand for ACSR conductors, arising from the large-scale power development programmes in the five-year Plans, which has sparked the substantial development of the aluminium industry in this country. Electrical industries are the major users of aluminium accounting for about a third of the total demand, with the manufacture of domestic utensils and the manufacture of transportation equipment following in that order. In fixing the third Plan targets at 150,000 tons, the Planning Commission has been guided by the following projections of the demand pattern for the year 1965-66:

Industry	Demand Pattern (Tons)
Building and Construction	6,000
Transportation	20,000
Domestic Utensils	30,000
Electrical Industries	50,000
Food, Farming and Sugar Industries	5,000
Canning and Packing	10,000
Miscellaneous	9,000
Exports	20,000
TOTAL	150,000

It is likely that increased use of aluminium in the coming years will mainly be in the electrical industries. For the second place in the list of users, it is not improbable that the manufacture of transportation equipment might compete even more keenly than at present with the manufacture of domestic utensils. Over a longer period the demand for aluminium for canning and packing and for building and construction are likely to grow apace.

According to non-official estimates the demand for aluminium is growing much faster than what has been assumed in the Planning Commission's projections. This view places the potential demand for the use of aluminium in building and construction and for canning and packaging at much higher levels than are indicated in the Planning Commission's estimates, as may be seen from the table given below.

In estimating the potential demand for aluminium an im-

ESTIMATED DEMAND FOR ALUMINIUM IN 1965-66

(Quantities in Tonnes)

Industrial end-use	Estimated product-wise demand						
	Total	Sheets	E.C. Rods & Bars	Extrusions	Castings	Foils	Others

(6) Other Industrial & Engineering uses	7,000	2,500	..	1,000	3,500	..	..
(7) Miscellaneous	7,000	2,000	..	..	4,000	..	1,000
(8) Exports	15,000	9,000	1,000	2,500	..	1,500	1,000
TOTAL	200,000	87,500	60,000	19,000	18,500	12,000	3,000

portant factor which has to be taken into consideration is the enormous scope that there is for the substitution of aluminium for scarce or more expensive metals in a variety of uses. This aspect is particularly relevant to this country because not only has its steel industry not yet been geared to the production of special steels, but its basic non-ferrous metal resources (other than bauxite for aluminium) are limited. In the case of copper, for instance, there was only one plant with a production, wholly of the fire-refined variety, of 7500 to 8500 tons per annum. Subsequently, the company concerned, Indian Copper Corporation, has set up another smelter with a capacity of 8,400 tons for producing electrolytic copper from imported blisters. The limiting factor in the case of copper, of course, is the absence of large-scale copper ore deposits. In recent years, however, surveys conducted in West Bengal, Rajasthan and Andhra Pradesh have been moderately promising. The existing plant is based on an 80-mile long belt in the Singbhum District of Bihar. If, as is believed, the Khetri belt in Rajasthan contains nearly 20 million tons of this ore, the position with regard to copper would certainly improve considerably. But further exploration is needed to confirm such assumptions and meanwhile, copper does remain a scarce metal, the use of which needs to be economised by the employment of substitutes such as aluminium.

Pending the expansion of the domestic aluminium industry, this country has been importing substantial quantities of aluminium ingots as well as fabrications. It is interesting that the tonnage of aluminium imports in 1960 exceeded substantially the tonnage of domestic production. This situation has now changed, although imports are bound to be of the order of some 50 per cent of domestic production for some time to come. The country is also spending foreign exchange on the import of non-ferrous metals such as copper, lead and

zinc. But in spite of domestic production being supplemented by imports, there is a general scarcity of non-ferrous metals which has resulted in considerable idle capacity, particularly in the various small-scale industries which are utilising non-ferrous metals as raw materials. A recent survey conducted by the Central Government disclosed the following percentage deficits in supply relative to demand in the cases of the more

FIRE BRICKS, FIRE CEMENTS, FIRE CLAYS, ACID RESISTING BRICKS & CEMENTS
in the service of the INDIAN INDUSTRY

With half a century's experience at our back we serve our customers' individual requirements. REFRACTORIES OF HIGH QUALITY. We serve the industry with Fire Bricks of all types, sizes and grades, with Alumina ranging from 30% to 70%. Insulating bricks & mortars, Fire Clays, High Temperature Fire Cements, 85% Magnesia Composition etc., etc. We also manufacture complete requirements of Refractories for the Iron & Steel Industry, Railways, and Ordnance Factories.

important categories of non-ferrous metal fabrications: aluminium rods for ACSR conductors — 57; zinc sheets and strips — 44; aluminium rods and sections — 42; lead sheets — 22; lead pipes and tubes — 11; copper rods and sections — 42; copper pipes and tubes — 10; and arsenical copper rods — 2.

Progress in Copper

We have reviewed the steps which have been taken for expanding the aluminium industry. In the case of copper, apart from the existing smelters of Indian Copper Corporation in Bihar, two new plants have been sanctioned, one to be located in Khetri and the other in Sikkim. The Khetri project was to go into production by the middle of next year but has been delayed and is now expected to go on stream only towards the close of 1966. Meanwhile, the original capacity of the proposed plant has been revised upward from 10,000 tons to 22,000 tons. This project is to be in the public sector.

A feature of the Indian aluminium industry is the integration of smelting and fabrication. The Indian Aluminium Company and the Aluminium Corporation of India, manufacturers of primary metal, have installed rolling mills. Indian Aluminium, in addition, has an extrusion press at Alwaye for the manufacture of various structurals and other items

such as beams, channel, angles, bars, tubes, hand rails and window frames. This company operates ball mills in its plant in Thana district in Maharashtra for manufacturing aluminium powder and paste. Hindustan Aluminium, after completing and commissioning its smelter, is now engaged in putting up

CANARA PROVIDES YOU CRADLE LIKE Comfort

The choice of Canara Springs by fleet operators and car owners is borne out by experience. The quality of a spring rests on its performance reflected in the comfort in travel. That is why owners of every type of motor vehicle rely on Canara for the built-in strength and consistent quality, eloquently proved by the cradle-like comfort provided by the Canara Springs in actual performance. Fitted with Canara Springs you enjoy the drive on any kind of road

a rolling mill, an extrusion press and other facilities for fabrication.

The rolling mills of the manufacturers of the primary metal are equipped for the production of industrial sheets and strips not only from pure aluminium but also from aluminium alloys of both heat treatable and non-heat treatable types. There are other rolling mill units in the country which are engaged mainly in manufacturing commercial sheets and circles for use in the production of household utensils and hollow-ware. Again, a large number of small rollers spread all over the country are employed in rolling aluminium scrap into small circles for use in the manufacture of household utensils and hollow-ware. A plant located at Kamarhati in West Bengal is manufacturing aluminium foil, while the rapidly increasing use of aluminium conductors (steel reinforced) and all-aluminium cables in electric transmission and distribution systems has led to a rapid increase in the demand for aluminium wire rods for the manufacture of these cables. Among the leading manufacturers of aluminium wire rods and cables are the Aluminium Industries Limited at Kundara in Kerala State, the Hindustan Electric Company Limited and the Indian Cable Company. The manufacture of aluminium wire rods and cables is a growing industry and it is expected that it will have a surplus of production for export when new plants which are now in the process of installation are completed.

The Sikkim copper deposits are proposed to be exploited by the Sikkim Mining Corporation, a joint venture of the Sikkim Durbar and the Government of India. The ore here will be concentrated at the mine and will be railed to be refined at one of the smelters in India. Expectations are that copper to the tune of 2,000 tons (approximately) per annum

ESTIMATED DEMAND FOR COPPER, BRASS, ZINC AND LEAD IN INDIA: 1965-66 (Product-Wise)

	1961	1965-66
Copper		
Copper (Commercial) sheets and hot rolled circles ..	3,500	4,000

will be available from this source. The indigenous capacity for producing copper, therefore, is expected to go up to nearly 35,000 tons per annum in the next few years; the capacity at the end of the third Plan period is estimated around 17,400 tons. Suggestions have been made for the setting up of another refinery with a capacity of 10,000 tons of electrolytic copper; this is to be based on scrap available in the country.

The progress achieved in regard to zinc and lead has been even more inadequate. At present, there is no refining capacity for zinc in this country. There is only one firm, the Metal Corporation of India, which is engaged in the mining

1960	62.24	21.65	24.61	2.56	67.17	8.81
1961-62	70.1	23.5	28.4	2.6	66.8	7.4
1962-63	74.1	25.2	33.6	2.7	87.4	9.0

of lead and zinc ores and in processing them. It currently mines nearly 500 tons of these ores daily from the Zawar mines in Rajasthan and beneficiates them there. Lead concentrates are then sent to Tundoo in Bihar for smelting to produce 99.99 per cent pure metal. The zinc concentrates are shipped to Japan for treatment on toll basis, the recovered material being brought back to India. Lead output from the Tundoo smelter is nearly 4,000 tons per annum from an installed capacity of 6,000 tons.

For augmenting supplies of lead and zinc from indigenous sources, the Metal Corporation has been granted a licence to expand its Tundoo lead smelter to 10,000 tons per year and for putting up an 18,000 tons electrolytic zinc refinery at Udaipur. For meeting its increased raw material requirements, the Corporation has undertaken a large expansion programme envisaging the raising of its mining capacity from the present 500 tons per day to 2,000 tons per day.

Efforts are also being made to augment the supply of zinc by setting up a smelter based on imported concentrates. A new company has been formed for this purpose under the name Cominco Binani Zinc Limited. It proposes to establish near Cochin a refinery capable of producing 20,000 tonnes of electrolytic zinc per annum. The refinery is expected to be commissioned by the end of the current Plan period. The capacity likely to be installed for the manufacture of zinc and lead by 1965-66 is of the order of 18,000 tonnes and 9,000 tonnes respectively.

With the implementation of projects licensed or proposed to be licensed in the third Plan period, the indigenous supplies of the various non-ferrous metals should improve. But, in the context of the rapidly expanding demand for them, there are bound to be serious shortages, especially in the case of copper, zinc and lead.

The shortfalls expected at the end of the current Plan period are as follows:

('000 tons)

Metal	Likely production in 1965-66		Estimated demand in 1965-66		Shortfall
	1965-66	1965-66	1965-66	1965-66	
Aluminium	68.0	150.0*	82.0		
Copper	17.4	170.0	152.6		
Zinc	18.0	187.5	169.5		
Lead	9.0	65.0	56.0		

* Includes a provision of 20,000 tons for exports.

It follows that there is a man-sized job to be done in the further development of the aluminium and other non-ferrous metal industries in the coming years.

FOR 99 YEARS IN INDIA,

the Bird-Heilgers Group has been harnessing the vast resources of the land; developing products and processes; giving employment to thousands. Today, the activities of the Bird-Heilgers Group spread far and wide—in coal, minerals, paper, jute, engineering, refractories, shipping, oil, water treatment plant, pneumatic equipment, springs, research, labour, agencies, household goods and travel. This is the Bird-Heilgers Group in the Nation's life and service...an idea, a vision, a continuing reality.

Man-made Fibres : Government as Step-mother

THE GOVERNMENT'S dealings with the synthetic textile fibre industry is an interesting illustration of its inability to anticipate production-consumption urges and trends in a modern economy. It ought to have been obvious in recent years that this industry is bound to assume an increasingly important place in the world textile picture. But the attitude of the Government in this country towards this important new industry has always been one of exaggerated circumspection. The Government has tended to regard as a luxury industry a line of manufacture which is so eminently qualified to satisfy the developing desire of people at all levels of income for variety in clothing at economic prices. This apart, in a country such as ours where the cotton textile industry has to depend on imported cotton for finer varieties of its manufactures, the man-made fibre and fabric industry has a very useful supplementary role to play. In spite of all such strong arguments for the adoption of a farsighted policy with regard to this industry, the Government for the most part has been hopelessly divided in its mind on the question of the extent to which this industry should be encouraged, or rather permitted, to develop. As a result, the evolution of this industry, which could make a useful contribution to the satisfaction of consumer demand within the country as well as to export earnings, has been forced to be unnecessarily uncertain, lopsided and halting.

Immense Potential

An idea of the immense potential of this industry in this age of developing industrial technology may be gathered from its remarkably rapid emergence in the world textile picture. In 1962 man-made fibres accounted for one-fourth of the world production of all apparel fibres which totalled 35,867 million pounds. The balance was accounted for by cotton to the extent of 66.5 per cent and wool to the extent of 9 per cent. It is estimated that by 1964, there will be 638 man-made fibre-producing plants, consisting of 186 for Rayon, 46 for Acetate, 46 for Acrylic, 132 for Nylon, 60 for Olefin, 47 for Polyester, 52 for Textiles Glass Fibre and the rest for others. The production of cellulosic fibres has increased from 3,546 million lbs. in 1950 to 6,314 million lbs. in 1962; the non-cellulosic and glass fibre production has gone up from 153 million lbs. and 24 million lbs. respectively to 238 and 253 million lbs. in the same period. Another noticeable feature in the development of this industry is that, while the production of non-cellulosic fibres has continued to rise in the principal producing countries, the U.S., the U.K. and France, the production of cellulosic fibres has stabilised itself at the level reached a few years ago, indicating that the shift is in favour of the former. All this growth in man-made fibres and fabrics has not been without its effects on the cotton textile industry. Between 1950 and 1962, the proportion of cotton in the total world fibre production has gone down from 71 per cent to about 65 per cent, although in terms of actual quantity there may have been a rise. The percentage share of wool has also declined from 11 to nine per cent.

The largest producer of man-made fibres in the world today is the U.S.A., which accounts for one-fourth of the total output, followed by Japan with 17 per cent. The Rayon and Acetate Industry in the U.S.A. is experiencing vigorous growth, with the total demand for cellulosic fibres (rayon filament and with the total demand for cellulosic fibres (rayon filament and staples, acetate filament and staples) having risen to about 1.6 billion lbs. This great surge in demand has led to acute shortage of rayon in the country; and even though operating on full capacity, rayon is distributed on the basis of specific allotments to meet the demand. As a consequence, Japan has forged ahead in developing this industry and capturing the

external markets including the U.S. and European markets. The demand for rayon has been increasing in the U.K., Germany and the E.C.M. areas.

In this background of the position and growth of man-made fibre industries, the indigenous rayon industry in India has stepped up its capacity from five million lbs. in 1951 to nearly 60 million lbs. at present. The staple fibre output is now of the order of 65 to 66 million lbs. against five million lbs. in 1954 (the first year of production). As a result of this expansion of output of rayon filament yarn and staple fibre, the quantity of rayon (art silk fabrics) produced has risen from 175 million yards in 1951 to 420 million yards in 1962. The increased production in rayon has saved the country foreign exchange to the value of Rs. 30 crores. The increasing importance of rayon in the textile economy for conserving and earning foreign exchange need not be overemphasised. With the establishment of the first rayon factory in Kerala, the demand for rayon has steadily increased. The estimated demand for rayon yarn was in the neighbourhood of 50 million lbs. at the beginning of the first Plan; the current trends indicate that the rayon yarn consumption is of the order of 140 million lbs. and staple fibre yarn of 75 million lbs. on the conservative side. The Development Council for Art Silk Industry has estimated the demand at 184 million lbs. of rayon yarn and 100 million lbs. of staple fibre yarn. The Indian rayon yarn has also earned the reputation of its high standards, as laid down by world rayon industry. The local and export demand for the products has been increasing at a rapid pace. The export surveys reveal that one person in every four hundred in urban areas has a preference for rayon fabrics, and the major demand is from the low income groups for whom it has the advantage of economy and durability.

Growth Problems

The essential problems of this industry in the growth period are the provision of adequate raw materials within the country of the quality required, the effective organisation of the industry to reach the targets of capacity and production set and also to meet the local consumer demand and the export potential ascertained on a firm basis. Allied to these there are various problems, internal to the operation of the industry and external arising from the State policy governing the industry. The third Plan envisages an expansion of capacity from about 100 million lbs. (52 million lbs. of rayon filament and 48 million lbs. of staple fibre) at the end of the second Plan to 215 million lbs. (140 million lbs. of rayon filament and 75 million lbs. of staple fibre). This would provide for an increase in per capita consumption of rayon fabrics from 1.3 yards in 1960-61 to 1.8 yards in 1965-66. The overall target for rayon filament comprises 20 million lbs. of tyre cord yarn required for the automobile tyre industry, 76 million lbs. of viscose filament, 24 million lbs. of acetate yarn, 10 million lbs. of cuprammonium and 10 million lbs. of synthetics. The third Plan has also aimed at phasing investment in this

TABLE I.
WORLD PRODUCTION OF MAN-MADE FIBRES
(In million lbs.)

	1950	1956	1960	1962
U.S.A.	1,404	1,644	1,882	2,431
Japan	254	984	1,235	1,354

India	—	37	94	134
Total World	3,723	6,048	7,544	8,947

industry in such a manner that there would be no burden on the pressure of foreign exchange on current account, by the import of these fibres. It was also expected that the staple fibre would be a substitute for long staple cotton in the production of textiles.

PRODUCTION OF MAN-MADE FIBRES

(Yarn in thousand lbs. and fabrics in thousand yards)

	1951	1956	1960	1962
A. Rayon filament yarn	5,426	19,849	45,684	60,908
i. Rayon yarn	5,426	16,682	41,441	57,843
ii. Acetate yarn	—	3,167	4,243	3,065
B. Staple fibre	—	17,423	48,013	71,240
C. Total of (A) and (B)	5,426	37,272	93,697	132,148
D. Rayon fabrics	176,000	296,000	413,666	420,278

cess of development of the textile industry. In this connection, it may be noted that the cotton textile industry in India has not anticipated any adverse effect from the art silk weaving side, in view of the very small margin of increase provided in the per capita consumption for art silk in the third Plan period. However, one has to examine this aspect of the possible impact of expansion in the man-made fibre industry on the cotton textiles over a longer period, particularly in relation to the shifts in the consumer preferences that are being witnessed and also the impact of internal and external factors which affect production in cotton textile industry. A balanced growth within the textile economy would require a more studied appraisal of the position of both than has so far been made available.

Recent Trends

Against the estimates in the third Plan, the latest mid-term appraisal shows that there has been a shortfall in production in rayon filament in the years 1960-61, 1961-62 and 1962-63. The capacity and production in rayon filament are expected to fall short of the targets as laid down for the third Plan. Table III would give the position as at present assessed. The largest short-fall will be in rayon grade pulp. It may also be noted that against production targets of 76 million lbs. of viscose rayon yarn by 1965-66, the existing capacity is only around 60.60 million lbs. A further capacity of about 9 million lbs. has been licensed and covered by release of foreign exchange, while licences for another 8 million lbs. are reported to be not so covered. In regard to nylon filament yarn, the existing capacity is only 2.10 million lbs. against the target of 10 million lbs. A further capacity of 3.10 million lbs. only has been covered by release of foreign exchange, while licences for additional 6.6 million lbs. are awaiting the release of foreign exchange.

An important point to note is that even in the various licensed schemes, the progress is slow and the targets may remain unfulfilled. The biggest short-fall is in respect of cuprammonium and acetate yarn. Against the target of 10 million lbs. of this variety by 1965-66, no capacity has been established so far. While, licences for manufacture of about 8 million lbs. of such yarn have been issued, the necessary foreign exchange does not appear to have been made available. In acetate filament yarn, the present capacity is about 9 million lbs. against the target of 24 million lbs. An additional capacity of 11 million lbs. has been sanctioned, but the progress under these schemes is said to be very slow. For acetate staple fibre, the existing capacity is 1.0 million lbs. only against the third Plan target of 8 million lbs. In regard to viscose staple fibre also the existing capacity is only 56 million lbs. against the third Plan target of 64 million lbs. and no further licences have been issued to fill the gap between the present capacity and the third Plan target.

The present policy of Government appears to be that the projects already licensed should be implemented before further licences are issued. The Development Council for Art

Silk Industry has always held the view that for all types of man-made fibres, the targets should be substantially stepped up so that the country could be self-sufficient in rayon at least by the end of the third Plan and overcome the chronic crisis caused by the cotton shortage and avoid the drain on foreign exchange on account of imports both of cotton and rayon. The foreign exchange deficits on current account and the long time taken by the industry to represent the true facts of the case have contributed to the slackening trend in production. The problem is one of lack of understanding on the part of the industry and Government of the urgent necessity for implementing the targets fixed and reaching the production levels to avoid waste of investment. The shortfalls in production can only further accentuate the problem by slowing down not only the progress of a new industry but also exerting higher pressure on the foreign exchange position.

The production pattern in this country has undergone a change with a shift towards increased nylon and polyester fibre fabrics. Separate data on production in different categories are not available, but this position will have to be sufficiently examined before the targets are laid down for cellulose and non-cellulosic fibres in the fourth Plan period. The technical advantages claimed for the synthetic fibre sector in providing the light materials that may be needed for defence should also be considered on merits.

At a time when the national economy is faced with the challenge of mobilising financial resources for defence and development, the man-made fibre industry, which has made a mark in the export market, should not fail to focus attention on increasing export potential. There is no doubt that a satisfactory beginning has been made in the export effort. What is required is consolidation of the achievements and maintaining the growing markets. The exports of rayon and synthetic fibres in 1962-63 improved by 10.7 per cent over the previous

year. The total exports were 77.8 million metres valued at Rs. 8.46 crores compared to 81.2 million metres valued at Rs. 7.64 crores in 1961-62. This performance has exceeded the export target of Rs. 6 crores. Unfortunately, there has been a sluggish trend in the exports in the current year and this should not result in a sense of complacency that the same would be rectified in the future. Developing trends in the market in which Indian exports find a place should always be kept in mind. It is well known that the restrictive import policies of some of these governments, particularly of Ceylon, Iran, in the Middle East and British East Africa have all

a restraining effect on exports which are largely directed to these areas. Morocco and Iran have practically closed their doors to Indian art silk fabrics. The attainment of the target of Rs. 8 crores for the current year is uncertain. Similarly, if the present trends continue, the targets for 1964-65 and for 1965-66 at Rs. 12 crores and Rs. 15 crores respectively may not materialise.

While the factors contributing to the decline in the export position may not lie with the manufacturers, it is in their interests that a more co-ordinated analysis of the position is made with Government and adequate steps are taken to see that the markets that are built up are not lost. It must be remembered that within the short period of its rapid rate of growth, the man-made fibre industry has been able not only to enlarge the export potential but also diversify the export list to

as many as 50 items. The share of filament rayon fabric in exports is as high as 51.3 per cent. Other categories like spun rayon, synthetic and mixed were 27.9 per cent., 19.6 per cent., and 1.2 per cent., respectively. The bulk of the export trade is directed to the Asian zone with an intake of 69.3 per cent., the biggest market being Singapore with an offtake of 16.14 million metres. The other important markets are Aden, Afghanistan, Ceylon, Iraq and Malaya and in the African zone it has a share of 24.23 per cent., in Morocco, Rhodesia, Nyasaland, Mauritius, Kenya and Sudan. Among the European markets, Belgium has a very promising place. Nearly 73 markets are covered by India in 1962-63. There is sizable trade with Canada, New Zealand, West Germany, Netherlands and Italy. It is high time that no effort is spared in not only keeping these trade contacts but also enlarging the prospects for further exports.

The two important determining conditions for this are the quality and the price at which the Indian product is offered. While it is understood that the average price realised during the year 1962-63 was Rs. 1.07 as compared to 93 nP. in 1961-62, it must be remembered high prices obtained should not be at the cost of losing the confidence of the buyer. It should be a price competitive with similar products offered on a standard of better quality and satisfying pattern. It is of the utmost importance that in order to strengthen our export performance, quantities and piece lengths should be standardised, packing should conform to uniform specifications and efficient and correct business methods should be practised. At present there is too pronounced a tendency to link export activities with the availability of incentives.

Government Policy

It is through improving the internal organisation of the industry and achieving high productivity, and also on maintaining the quality and price that India can stand the foreign competition. Government policy should aid this process. This would require all the machinery and equipment with trained personnel to keep the industry at higher levels of performance. There are at present various impediments which stand in the way of attaining this objective. It is reported that the permissible percentage of entitlement of import machinery is inadequate and that the machinery employed in the industry continues to be old, worn-out and without adequate facilities to impart finishes to the fabrics which are in demand. These problems of the industry should be inquired into. Arrangements should be made for spinning of staple fibre yarn so that the units can produce different qualities of pure staple fibre fabrics as well as blended fabrics. Staple fibre fabrics should also find an increasing place in export. Man-made fibres are finding an increasing scope in the cotton and other textile groups, for blending or mixing and this should be fully utilised. The increasing demand for man-made fibres and fabrics is consistent with world trends and the industry in India should play a determined and dynamic part in fulfilling its targets to increase production and expand our exports.

several trunk calls on one line

Do you know that ninety per cent of long distance calls are carried by "carrier" channels. These are derived from the basic bearer wires by special carrier equipments which make it possible for several simultaneous conversations to be carried over a single pair of wires.

The special 'Carrier' equipment that provides these broad superhighways for telephone conversations, are manufactured in ITI, and are supplied to Indian Posts and Telegraphs Department for multiplexing the capacity of the long distance lines whether they be open wire, paired cable or coaxial.

Carrier equipment manufactured by ITI include 3 Channel, 6 Channel and 12 Channel Systems as well as Voice Frequency Telegraph Systems which allow as many as 24 telegraph circuits to work on one speech channel.

Sugar Industry Needs to be Saved From Controls

THE SUGAR industry has often been called "a problem industry". This is a case of the bad, old habit of giving a dog a bad name in order to hang it. If there is at all anything wrong with the sugar industry it is that it seems to have a fatal fascination for planners and controllers in the Government. There is something rather odd in this. The sugar industry is not by any means one which caters to mass consumption. Sugar, relatively speaking, is necessarily an article of luxury for most households in a country as poor as ours. The demand is highly elastic and is directly related to income.

It is true that the sugar habit is spreading and that more and more people in middle and low income brackets are taking to its use. Nevertheless, it still remains true that the consumption of sugar is largely confined to households enjoying income beyond a certain level. In the poorer households even if a little sugar may be consumed, the offtake is marginal. Actually, most of the sugar consumed among the poor sections of the people is taken in the form of a few pinches used to sweeten tea or coffee. In these circumstances there is absolutely no reason in equity for the Government to be excessively concerned with making supplies of sugar available at what it or others may consider to be fair prices. Here certainly is a case where the market forces of demand and supply could certainly be allowed to bring about a reasonable level of prices in due course. Since the demand for sugar is elastic, it follows its price cannot remain too high too long as the producers are under a constant temptation to increase production and take advantage of potential demand at lower levels of prices. If the sugar industry could be left to itself for some reasonable time, both production and prices are bound to get adjusted to the interests of consumers.

Helpless Apparatus

Not less important is the fact that, in the circumstances of a highly elastic demand, the Government's apparatus of regulation is inherently helpless in spreading supplies evenly over a large number of people. Sugar is not rice or wheat in respect of which a certain minimum quantity could be reasonably regarded as a "must" for all or most people. The moment, under the conditions of controlled distribution, an effort is made to fix the amount of sugar that could be sold to each individual, people with lower incomes, and whose demand for sugar is less keen relative to that of others with higher incomes, are bound to turn over or resell their rations. Similarly, people with higher incomes are constantly tempted to pay higher prices in order to secure additional quantities of sugar. These circumstances clearly show the limitations and the difficulties which any system of controlled distribution of sugar must reckon with.

Unfortunately, the Government has always lacked the political courage needed to shape its sugar policy in the light of those facts. We do not know whether even today, after all the recurrent sugar muddles of past years, the Government is any the wiser, or bolder. It is relevant here to mention that the Government is supposed to be keen on promoting exports, if necessary by restricting consumption. Sugar which is by no means a basic necessity of the common people is an ideal commodity for this exercise. If there is a case at all for some discouragement of domestic consumption for the sake of export promotion, it can certainly be argued with great force that the principle could well be applied to sugar. Today the world price of sugar is about double what it costs this country to produce it. The world demand again is such that this country can enter into long-term export commitments on an attractive price basis, provided it has the supplies. Over a period the Indian sugar industry could be expanded and organised to yield exports of the order of from Rs. 75 to 100

crores a year. It is strange that the Government, despite its professed eagerness for exports and its being committed in principle to restraining consumption wherever possible in order to increase exports wherever essential, has allowed this country's export trade in sugar to lapse by default. Not very long ago substantial amounts of public funds were being used to subsidise the export of sugar from this country when world prices used to be lower than ours. Today when world prices are above our prices, the Government is unable to find sugar for export. Thus this country's is a double loss in that the Indian taxpayer has been made to find money for subsidising exports without securing any return in the form of enduring trade gains.

It is often claimed that the sugar industry has to be controlled in the public interest. No argument can be more false. It is on record that sugar control for the reasons we have mentioned earlier has never been operated successfully. It has always led to hoarding and black-marketing and resale among the public. Sugar control, moreover, has always led to an increase in the prices of gur and khandasari which would mean that the poorer households in the countryside, which do not care for sugar but which do use some gur or khandasari, are adversely affected every time the distribution of sugar is controlled in the alleged interest of the public.

Controls Hamper Production

Controls on sugar, moreover, have always led to discouragement of production. A review of the sugar industry in recent years would show that production has tended to decline when controls are brought on and to revive once controls are withdrawn. If it is granted that the real interest of the consumers as well as the needs of the export trade could be met only by the expansion of sugar production on a stable and efficient basis, the desirability of the Government adopting a "hands off" policy towards the sugar industry becomes irresistible. If any reinforcement of this argument is needed, it may be found in the fact that the Government has repeatedly shown itself incapable of operating a managed sugar policy sensibly. This is because the moment the Government assumes any large responsibility in the matter of sugar, it promptly falls a victim to political pressures. There are the rival regional claims of the established sugar industry in the North, particularly, U.P., and Bihar, and the relatively recent sugar industry in the Deccan and the South where the higher productivity of cane is a constant attraction for the industry to grow. There are, too, the various pressure groups interested in hiking up the price of sugarcane for the political gains such a course might attract from the rural electorate. There is also the conflict of interests within the factory sector and the decentralized sector engaged in the manufacture of gur and khandasari. The Government has been traditionally incapable of dealing with these problems efficiently. Its record has always been to yield to this pressure group or that, with the result that one muddle has been succeeding another. A recent example of the Government's utter inability to monitor or guide the industry properly was its short-sighted decision to cut the production of sugar in the 1960-61 season. It is now recognised that much of the subsequent difficulties in the form of a continuing decline in production, which has given rise to the shortage of sugar for domestic consumption as well as for exports, was due to that unfortunate step. But the point is that there is no guarantee that faulty decisions will not be made again and again.

Lately the Government has been forced into giving one grudging concession after another either to the industry in the form of fiscal relief or to the cane-growers by raising the price of cane. The fact is that such concessions have been

either too little or too late or both. As a consequence, the actual benefits have been and are bound to be less than those expected. In the matter of the cane price the situation is now further complicated by the extensive, if unmeasured, diversion of gur into the distillation of illicit liquor. It must be clear to the meanest intelligence that no statutory fixing of cane price could effectively deal with this diversion. The sugar industry just cannot compete with the illicit liquor trade for its cane unless, of course, the industry is permitted far greater latitude than it now enjoys in the procurement of cane and the planning of its manufacturing programmes. It follows that an entirely new attitude is needed on the part of the Government and that this attitude should be one of minimal intervention in the affairs of the industry. We are aware that this goes against the current state of thinking which seems to favour a progressive accentuation of regulation, but this policy is, demonstrably, a blind alley. The Government has already conceded that the goal of 3.3 million tons of sugar set for the current 1963-64 season is unlikely to be achieved. Since increasing production could be the only rational guiding factor in the management of this industry, the abandonment of a policy which does not lead to that result must be regarded as an obvious course to follow.

In our view the withdrawal of all controls on sugar and the retention of a minimum price for sugarcane in the form of a uniform floor price of Rs. 1.75 per maund are the only sensible ways of ensuring that the various interests in the sugar economy arrive at a reasonable adjustment of their interests, thereby leading to the healthy expansion of the industry in the coming years. We have no doubt that this policy will not harm the interests of consumers. On the contrary, it is the present policies which have singularly failed to protect the consumer. A thoroughly deplorable situation has been created resulting in an unnecessary decline in production, an artificial shortage of supplies, absurdly elaborate Government regulation of such petty details as the movement of sweet-

meats and confectionery from place to place, queuing at retail shops, scramble among consumers, famine prices in smaller towns and disgust and demoralisation all round. There can be no more decisive indictment of the Government's economic policy than this picture of the sugar muddle. Considering the importance of the sugar industry in the nation's economy, the Government, surely, ought to be able to bring to bear on the problems of this industry a more mature attitude and outlook.

Tariff Protection

We had mentioned earlier that the sugar industry is extremely sensitive to Government policies. This it has been since its beginning. In 1931-32, for instance, there were only 31 factories in this country producing in all 158,000 tons of sugar. But with the grant of tariff protection in 1932, the industry raced ahead to reach a production of 1.8 million tons over the next five years. The number of factories also increased to 137. At the present time the sugar industry occupies the third place among organised industries in India, in terms of its contribution to the net value added by manufacture. Its 190 factories have an aggregate installed capacity which, in favourable circumstances, could produce as much as from three to 3.5 million tons of sugar. The productive capital invested in this industry represents about 5.8 per cent of the total for all industries. Apart from the extensive indirect employment offered by it to cultivators of sugarcane, the various agencies of the distributive trade and through subsidiary industries such as confectionery, the sugar industry gives direct employment to as many as 120,000 workers. The excise duty on sugar is a substantial source of revenue for the Central Government, the estimated yield being Rs. 81.3 crores in the budget for 1963-64.

For an industry of such economic significance it has unfortunately been plagued by much instability in the level of production. For this, as is argued earlier, the Government policy of regulation and control has been largely responsible.

THE SUGAR INDUSTRY: 1950-51 — 1963-64

(a) Target. (b) First estimate. (c) Estimated.

@ Related to calendar year.

The price and distributive restrictions imposed on the industry during World War II continued up to 1947. In the last three years of the period production declined to 950,000 tons as against a peak of 1.18 million tons in the pre-war period. The restrictive effect of regulation had also been felt on consumption which had declined from 1.32 million tons in 1942-43 to 972,000 tons in 1946-47. With the decontrol of the industry in December, 1947, both production and consumption promptly improved. But with the reimposition of controls in September, 1947, this improvement was lost. The production in 1949-50 dropped to 978,000 tons as against 1.01 million tons produced in the previous year. There were some modifications in the policy of controls in the years 1950-51 and 1951-52 and incentives were provided for higher production. As a result, the output rose to 1.51 million tons in 1951-52 but the various official restrictions still afflicting the sugar economy led to consumption remaining stagnant at 1.2 million tons.

Consumer Interest

It is often argued that controls on the sugar industry have been imposed from time to time to protect the interest of consumers. But if we study in some detail the actual results of the policy of controls, especially as it has been operated in the last 10 years, the conclusion is forced on us that whoever has been benefited it certainly is not a consumer. In the case of a commodity such as sugar, the demand for which is highly elastic, the true interest of the consumer is served only when steady production is maintained over a period. By applying controls, the Government has contrived to prevent such a trend in production. Apart from its unsettling effect on production, the policy of control-decontrol-recontrol has also prevented an orderly development of consumption. When the industry was decontrolled in 1952-53, there was a sharp rise in consumption to a level of 1.66 million

tons. Subsequently and up to 1957-58, both consumption and production kept growing until they stood at two million tons each. Back came controls in 1957-58 and production promptly reacted by retreating to 1.95 million tons in 1958-59. The Government responded by providing incentives for higher production and the sugar industry celebrated this gesture by stepping up output progressively to 2.5 million tons in 1959-60 and 3.03 million tons in 1960-61. Following this, sugar was decontrolled in September, 1961 and consumption rose to 2.6 million tons in 1961-62 showing an increase of more than 20 per cent over the previous year. Nevertheless, upset by a temporary increase in carryover, the Government, with some support from a section of the industry, decided to impose a cut in production as a result of which output dropped to 2.73 million tons in 1961-62 and even more sharply to 2.16 million tons in 1962-63. With consumption running at a level between 2.6 and 2.7 million tons over those two years, there has naturally been some shortage of supplies which has led to higher domestic price as well as decreased availability of sugar for export. This situation has led the Government into taking the familiar step of imposing or reimposing various controls on the industry.

In the current year, the cane crop, which has suffered to some extent from adverse weather conditions in the previous year, is reportedly in good shape. This should help maintain sugar production at a higher level. The main difficulty is the return of elaborate controls which, as the history of the industry shows, is inimical to higher levels of production and consumption. Within the limits set by the policy of controls, the Government, however, has endeavoured to secure adequate supplies of cane to the industry and encourage a higher level of crushing. It is now generally expected that production in

RIPPLE

The LIC is at the centre of a ripple whose widening impact is felt throughout the land. On the one hand, LIC's operations are far-reaching. They cover about 729 centres, a number which is steadily increasing. So is the number of new individuals in India being covered with Life Insurance.

On the other hand, the LIC invests over 2 million rupees a day in industry, agriculture, railways, transport, electricity and many other projects. The radiating effect of these investments creates more jobs, more incomes, more food—in fact, a higher standard of living—for everybody.

LIC—YOUR COMPANION IN PROGRESS

AMPUC-1-74

the 1963-64 season would be over 2.8 million tons; more optimistic estimates, official as well as non-official, even indicate a possible output of three million tons. Among steps taken by the Government to stimulate the crushing of cane by the industry is the raising of the price of sugarcane to Rs. two per maund. A higher price for sugarcane, however, is a double-edged instrument. Unless provision is made in the sugar price for the increase in the cost of the raw material, the industry will not be encouraged to crush larger quantities of cane. Rebates have been given in the Central excise duty for such additional quantities of sugar as may be produced by the industry this year as compared to the last. In order to encourage a longer crushing season, the rates of the rebate have been fixed higher for the initial as well as the closing months of the season. Recognising the fact that the competition for cane from gur and khandsari manufacturers should be regulated in view of the fiscal and other advantages enjoyed by the decentralised sector, the Government has raised the compounded levy of excise duty on khandsari manufacture with or without the aid of sulphitation plants. In order to discourage speculative increases in the price of gur, inter-State movements of this commodity have been controlled.

Long-Term Needs

While these measures may certainly be of some short-term use, it is clear that a lasting formula for an efficient and expanding sugar industry cannot be hammered out of such improvisations. This country and its Government have been playing with sugar control off and on for some 25 years now. But, except during the extraordinary circumstances of the last war, it has never been very clear that the industry should have been given all this excessive attention. On balance, it would have certainly done better for itself and for the country had it been given the privilege of normal development in response to changing market conditions. Apart from other inherent defects in the policy of controls to which references have been made earlier, there is also the fact that so long as the price of sugar is controlled, the temptation for the Government to fix the price at less than the economic level is great. This is because of prejudice, both popular and official, against this industry. Although sugar prices have been referred to the

Tariff Commission from time to time, they have never been fixed in reasonable relation to costs or other considerations. The three principal elements in the cost of sugar are the cost of cane, State and Central taxation and manufacturing charges. Cane absorbs 45 per cent of the price of sugar, taxes about 35 per cent and manufacturing charges about 20 per cent. The price of cane has to be maintained for political reasons at certain levels, irrespective of its sucrose content. Actually, there is constant pressure on the Government for an increase in the price of cane. As regards taxation, the Central and State Governments have found sugar a commodity easy to fleece. Given the need for more and more public revenues, the Central Government has been understandably reluctant to surrender any substantial gain from the sugar excise. As for the State Governments, although they collect large revenues through the cane cess, they do not spend adequately on schemes for the improvement of the yield of the crop or its quality. Uttar Pradesh and Bihar particularly have been blamed justifiably for their practices in this matter. The following table contrasts the revenue collected by State Governments from its sugar levies and the amounts spent by them on cane development:

State	Sugarcane cess/ purchase tax collected (in Rs. lakhs)	Amount spent for develop- ment (in Rs. lakhs)
Uttar Pradesh	660.83	126.29
Bihar	124.48	30.87
Maharashtra	12.00	8.59
Punjab	160.76	30.56
Madhya Pradesh	0.59	3.07
Andhra Pradesh	130.18	40.27
Madras	20.92	14.36

Since the Central Government is not in a position to do much about the price of cane or the burden of sugar taxation, it has been disposed to take an easy way out of squeezing manufacturers' margins. Hence its growing unwillingness to consider a reasonable price for sugar in the light of the need for

STATE-WISE SUGAR PRODUCTION

Name of the State	No. of Factories		Cane Crushed ('000 tonnes)		Sugar Production (Nov.-Oct.) ('000 tonnes)		Recovery

TOTAL:	180	186	27,937	20,808	27,30	21,40	9.77	10.24

the long-term expansion of this industry to serve the expanding domestic market and the requirements of the export trade. A study published in the monthly bulletin of the Reserve Bank in June, 1963 shows that in 1961-62 the profits of the all-India sugar industry amounted to 7.4 per cent on capital employed against the return of 12 per cent considered reasonable by the Tariff Commission. There is no clear or near possibility that sugar prices will be fixed on a rational basis in a system of controls. This is another reason why the Government should think in terms of decontrol, for a proper price structure is necessary for creating a sound economic basis for the long-term expansion of the industry on efficient lines. As we have mentioned earlier, the standards of cultivation of sugarcane in this country leave much to be desired. Although India has more acreage under this crop than any other sugarcane producing country, it has to put up with the lowest yield per acre. The yield, in fact, has remained stagnant around 15 tons per acre over the last 30 years. Along with the low yield goes also a low sucrose content where again the Indian crop compares ill with cane in other countries.

Structural Disadvantages

But it is not only the raw material basis of the industry which is unsound. Due to a historical accident, much of the manufacturing capacity is located in regions where the standards of cane cultivation are much lower than those in certain other parts of the country. Another structural disadvantage for the industry is the relatively small size of its units. Whereas the approximate sugar output per factory is 40,000 tons in Cuba, 50,000 tons in Australia, 60,000 tons in South Africa and 80,000 tons in Egypt, it is only some 15,000 tons in this country. All these maladjustments are unlikely to be corrected so long as Government controls leave little room for manoeuvre. It is only through decontrol and the restoration of competition in the industry that substantial progress can be achieved in such directions as the improvement of the cane crop or an efficient re-organization of manufacturing facilities. It has been shown that the State Governments in the main producing areas have little desire or capacity to improve cane production. It follows that progress in this direction has to be sought mainly through the commercialization of cane-growing with the assistance and under the guidance of the manufacturing section of the sugar economy. In Deccan, especially, the standards of cane cultivation have gained through such a development and although agrarian legislation in Maharashtra and elsewhere threatens to disrupt this achievement, there is little doubt that large improvement in cane cultivation cannot be secured except through a proper integration of farming and manufacturing activities.

To some extent the encouragement given by the Government to co-operative societies for the growing of cane as well as for operating sugar factories should help in this matter. But the co-operative pattern cannot be the complete answer. Side by side with co-operative cane farms or co-operative sugar factories, there should also be a competing sector of individual, commercial farming and manufacturing. In view of the fact that there is large scope for the expansion of this industry so that it may take full advantage of the export demand besides catering to the growing home market, it has to be considered carefully whether this industry cannot be freed from the Government's licensing restrictions. Here, it is relevant that expenditure of foreign exchange involved in the expansion of the sugar industry cannot be considerable. Already there is a respectable domestic industry for manufacturing sugar machinery. Imports of plant and equipment could therefore be very considerably reduced. It follows that wherever no foreign exchange is asked for, an existing unit should be allowed to expand or an industrialist permitted to put up a new factory. It may be that the regulations of manufacturing facilities are needed to ensure that there is no excessive expansion of manufacturing capacity in areas where

supplies of cane are not sufficient. In our view, this is not a matter which should concern the Government unduly. It is unlikely that, under the conditions prevailing today, such un-economic expansion of the industry is likely to take place. On the whole, it is good to let the industry judge for itself where and how it should expand. Actually, by leaving the industry to itself, the Government could bring about a better pattern of manufacturing facilities than is seen today or could be brought about by official regulation.

Finally, we would like to stress once again the desirability of a "hands off" policy for the sugar industry by emphasizing the export aspect. A rigorously controlled industry seldom makes much headway in the home market, far less in competitive world trade. If the sugar industry is to realise its large potentialities as a major exporting industry, it must be allowed to develop without being knocked about by political pressures or prejudices. A high and increasing level of production is absolutely essential to an export trade of the range of from half a million to one million tons of sugar a year. The industry should plan to export from a fourth to a third of its production. It cannot plan this with confidence if it cannot operate in the home market with reasonable freedom. It has been seen in the United Kingdom that the development of export capacities is not possible when restrictions are placed on the home market. In our own country, the sorry record of the cotton textile industry, which has been continuously retreating in its export markets, shows that rigid regulation, especially where it harms the planning of modernization and expansion, is bound to erode the foundations of any industry both at home and abroad. Recent developments have indicated, that there is a good and growing market for Indian sugar in many parts of the world. Apart from the U.S. and Canada, Britain, Japan, Western Europe and countries of West and South-East Asia, including Malaya, are showing interest in Indian sugar. The world export requirements are now about 5.6 million tons or some 30 per cent of world production. As world consumption has been increasing at the rate of 2.5 million tons per annum, countries such as ours, which are already large producers of sugar and have many natural advantages for the cultivation of sugarcane, could reasonably look forward to increasing export possibilities.

Fertilizers: Who Failed? Why?

THE SOVIET Prime Minister, looking around for means to correct the poor performance of Soviet agriculture, recently emphasized the importance of his country stepping up its use of chemical fertilizers. Mr. Khrushchev pointed out that, although the United States had only half as much land under cultivation as the Soviet Union, it was using twice as much fertilizers. In this country, the Government, it must be said to its credit, has been converted early enough to the idea that increased production of fertilizers within the country is essential to the expansion of agricultural production generally and food production in particular. The Government has also been fixing big production goals for the industry. It is, therefore, only natural that there should be much official concern at the slow rate of growth of the fertilizer industry in this country.

In the second Plan, the nitrogenous fertilizer industry was proposed to be expanded from a capacity of 85,000 tons of nitrogen in 1955-56 to 382,000 tons in 1960-61, the production during this period being estimated to go up from 76,000 tons of Nitrogen to 290,000 tons. This expansion programme was to be carried, virtually wholly in the public sector, partly through increased capacity and production at the Sindri and Alway factories, and partly by the establishment of new units at Nangal, Rourkela, and Neyveli. The actual progress achieved in the second Plan was, however, quite behind schedule, the total installed capacity in 1960-61 being only 158,300 tons in terms of Nitrogen, yielding a production of 97,150 tons. In other words, the actuals fell behind targets by about 60 per cent in the case of capacity and about 70 per cent in terms of output. For this deficiency most of the projects in the second Plan had contributed. Although the expansion of the Sindri fertilizer factory was completed in 1959, no additional production could be got from this factory within the second Plan period for such reasons as "the low performance of the lean gas plant, shortages of coal of suitable quality, lack of spare parts as well as the caking characteristics and acidic nature of the double salt produced." In implementing the expansion scheme of Fertilizers and Chemicals (Travancore), there was a delay of two years, the first stage of the expansion being completed only in 1962. The Nangal Fertilizer Factory was brought into partial production to the extent of one-third of capacity in February, 1961. The unit at Rourkela was also commissioned within the second Plan period, but its output was negligible. As for the Neyveli fertilizer project, it was not only not completed or even substantially implemented within the second Plan period, but it has not gone into production even up to this time.

Forward Planning

It is clear that the programme of developing the fertilizer industry substantially and rapidly in the public sector was not any too successful in the second Plan. Meanwhile, it was becoming more and more clear that the production of nitrogenous fertilizers should be stepped up rapidly if the vital programmes for increased agricultural and food production were to succeed at all. Hence when the time came for fixing the targets for the third Plan, the Government was driven to propose an installed capacity of one million tons of Nitrogen giving an output of 800,000 tons. The Government, in fact, had done some forward planning for the third Plan in the closing years of the second Plan when certain measures were taken with a view to achieving a capacity of 750,000 tons of Nitrogen by the middle of the third Plan. The development programme for nitrogenous fertilizers was given high priority and placed on a par with steel and electricity as being of the core of the second Plan. Accordingly, clearance was given in the last year of the second Plan for fertilizer projects at

Vishakhapatnam and Kothagudum in Andhra Pradesh, Durgapur in West Bengal, Nahorkatiya in Assam, Hanumangarh in Rajasthan, Gorakhpur in Uttar Pradesh and "at some suitable site" in Madhya Pradesh. A significant feature of this urgent thinking on fertilizers was that the Government revised its policy of relying almost wholly on the public sector and decided to permit substantial development of this industry in the private sector as well. When the third Plan came to be finalized, the position was that the following projects were taken into the public sector to be implemented by the Central or State Governments:

Trombay Fertiliser Project: The factory is planned for utilising refinery gases and naphtha and would have a capacity of about 90,000 tons of Nitrogen. The pattern of production would be that half of the available ammonia would be converted into urea by a partial recycle process and the balance of ammonia would be utilised for the manufacture of nitrophosphate by nitric acid treatment of rock phosphate. The phosphate content of the complex fertiliser would be rendered partially water soluble by the use of sulphuric acid.

Assam Fertiliser Project: The factory would be set up at Namrup in Assam based on "associated gas" available from the Nahorkatiya oil fields. The overall capacity of the plant as scheduled at present is for 32,500 tons of Nitrogen based on the production of 50,000 tons of urea and 50,000 tons of ammonium sulphate by the acid neutralisation process, the acid being produced from imported sulphur. A special feature of this factory is that it will include a gas-fired steam power plant.

Recycle Process

Gorakhpur Fertiliser Project: The capacity of the factory would be 80,000 tons of Nitrogen per annum and the end-product would be urea produced by the total recycle process. The raw material for this factory would be petroleum naphtha from the refinery at Barauni which is at a distance of 200 miles from the fertiliser plant.

Expansion of FACT and other schemes: Apart from the central public sector projects mentioned above, there is the scheme for further expansion of M/s. Fertilisers and Chemicals (Travancore) by 30,000 tons of Nitrogen, to produce ammonium sulphate/ammonium phosphate and ammonium chloride. Additional production of by-product ammonium sulphate may also be expected in connection with the expansion schemes of the steel plants. It is also envisaged that one more public sector nitrogenous fertiliser factory with a capacity of about 80,000 tons of Nitrogen will be implemented during the third Plan period.

In the private sector, apart from the E.I.D.-Parry project at Ennore for the manufacture of ammonium phosphate equivalent to 250,000 tons of Nitrogen, which was in progress at the beginning of the third Plan and has since been completed, and the doubling of the ammonium chloride-cum-soda ash plant of Messrs. Sahu Chemicals at Varanasi from a capacity of 10,000 tons of Nitrogen to 20,000 tons, the following major projects were license:

Kothagudum Fertiliser Project: A nitrogenous fertiliser factory based on coal from Singareni collieries was originally intended to be taken up by the Andhra Pradesh State Government. This has subsequently been transferred to the private sector and is to have a capacity equivalent to 80,000 tons of Nitrogen in the form of urea. This project is to be executed

by Messrs. Andhra Sugars Ltd. jointly with Messrs. Sheshasayee Bros.

Vishakhapatnam Fertiliser Project: Messrs. Parry and Co., have been licensed to set up the factory in financial and technical collaboration with Messrs. California Chemical Co. and Messrs. International Minerals and Chemicals Corporation Co. of the USA. It is proposed to produce under this project about 80,000 tons of fixed Nitrogen per year in the form of 365,000 tons of ammonium phosphates of various grades in terms of 20-22-0 and 16,500 tons of prilled urea. The raw material for this factory would be naphtha.

Madhya Pradesh Fertiliser Project: This factory is to be set up by Messrs. Khandelwal Bros. at Itarsi or any other location in Madhya Pradesh to be settled in consultation with Government and would have a capacity to manufacture 101,300 tons of urea per year (equivalent to 50,000 tons of Nitrogen), by the total recycle process. Coal from Madhya Pradesh or Naphtha from petroleum refineries would be the feed-stock depending on further examination of the relevant economic factors. This project has since been transferred to the public sector.

Rajasthan Fertiliser Project: Mr. B. L. Jalan has been licensed to set up a factory with an annual capacity of 80,000 tons of Nitrogen with ammonium sulphate as the end product. Gypsum supplies of the State would be utilised for the sulphate manufacture. Alternative feedstock for ammonia synthesis including lignite from Palana are under consideration.

In addition to these proposals in the public and private sectors, the possibilities of the West Bengal Government setting up a fertilizer factory in partnership with private enter-

prise at Durgapur with a capacity of 58,000 tons of Nitrogen were also indicated. It was also envisaged that the Government of Gujarat might set up a factory with a capacity of 96,000 tons of Nitrogen, again in collaboration with the private sector.

The latest (available) data on the capacities of the various fertilizer projects, as modified subsequent to the publication of the third Plan, is given in Table I.

Unsuccessful Scheme

In the actual course of events, most of the schemes, whether in the public sector or the private, have failed to progress according to schedule. The Mid-Term Appraisal of the third Plan has indicated that, as against the original capacity target of one million tons of Nitrogen in 1965-66, the capacity likely to be attained is around 640,000 tons. It was mentioned earlier that, towards the latter part of the second Plan, it was considered a matter of great importance that nitrogenous fertilizer capacity should be stepped up to 750,000 tons in terms of Nitrogen by the middle of the third Plan. In relation to this, it is sad to find that the capacity now is only 387,000 tons, with the prospect that, even at the end of the third Plan, the installed capacity will be well below 750,000 tons of Nitrogen.

The requirements of the nation's agriculture for nitrogenous fertilizers is estimated at 650,000 tons for the current year, whereas production could only be around 240,000 tons. There are no early chances of this gap being narrowed. This unsatisfactory state of affairs has naturally been discussed in Parliament and outside. On behalf of the Government it has been argued that the failure of the fertilizer plan is mainly to be blamed on the private sector. This charge perhaps is

VISIT GUJARAT

PALITANA

PALITANA, a picturesque city of over 600 temples, open to everybody and a place of pilgrimage mainly for the Jains, is situated at a distance of 33 miles by road and 31 miles by rail (via Sihor) from Bhavnagar, in Gujarat State. Over and above their sculptural beauty the temples of Palitana, also attract the tourist from the scenic point of view.

A mile to the south of Palitana, is the hill of SHETRUNJAYA, the most sacred of the five hills of the Jains.

1. Also for expansion
2. Expansion.

not quiet true. In the first place, the greater part of the expansion of this industry has been made the responsibility of the public sector and almost every major project in this sector has been dragging its feet. The only exception perhaps is the expansion of the Alwaye plant. The Gorakhpur project, for instance, will not be completed during the third Plan and may start operating late in 1966. The Namrup project may start producing on a commercial scale only towards the end of the third Plan. The Trombay project was scheduled to be commissioned in 1964, but it too may not go into production before 1965. The Neyveli project also may be delayed similarly. The Korba project, which was originally licensed in the private sector and has now been shifted to the public sector, will clearly spill out into the fourth Plan. All these five projects will command on completion an installed capacity of 341,390 tons and the delays in their implementation must be held to have contributed substantially to the failure of the fertilizer plan to hit the target. In addition, the proposal of the West Bengal Government to set up a nitrogenous fertilizer plant at Dugapur seems to have encountered heavy weather due to the inability of the Government to find the necessary finance.

Current Difficulties

Incidentally, apart from its not too good record in the initiation of new projects, the public sector in the fertilizer industry has also been plagued by difficulties in running existing plants properly. Sindri has had its quota of technical distempers and labour troubles. Supplies of gypsum and coal of required quality still continue to present problems for this plant. In the case of Rourkela, faults in the designing of the plant have led to a situation where twice as much capacity

has been created as can be kept employed with the quantity of coke-oven gas available from the integrated iron and steel plant at the place. It may be conceded, of course, that while the blame for the slow growth of the fertilizer industry has to be assumed in part by the public sector, the private sector too has not been able to implement its proposals. As a matter of fact, not even one of the major private sector schemes, apart from the Ennore factory of E.I.D.-Parry, has so far made substantial progress. On the contrary, one of the licences issued to the private sector has been surrendered and, as was mentioned earlier, this project which is to be located in Madhya Pradesh will now be implemented in the public sector by the Fertilizer Corporation of India which has chosen Korba as the site. The processing of other projects has also been far from substantial, although there is a fair chance that two of them might make some progress before the end of the third Plan. One of them is the Vishakhapatnam project in respect of which foreign collaboration and external finance were arranged recently after years of negotiations. Similarly, the Kothagudem project, after many vicissitudes, has at last succeeded in securing the necessary foreign collaboration.

In these circumstances it must be admitted that the private sector too must share the blame with the public sector for the absence of sufficient progress in the fertilizer industry, but before the discussion could be regarded as complete, attention must be drawn to certain relevant factors an understanding of which is necessary for the further planning of this important industry on realistic lines. In the first place, the fertilizer industry is a capital-intensive industry. It, moreover, not only calls for a great deal of finance, but must also have a good part of it in the form of foreign exchange, since there is need to import both equipment and know-how. It

TABLE II
PRODUCTION, IMPORTS AND DISTRIBUTION OF FERTILIZERS: 1952-53 TO 1962-63

	Nitrogen ¹			Phosphoric acid ² (P ₂ O ₅)			Potash (K ₂ O)	
	Produced	Imported ⁴	Distributed ⁵	Produced	Imported	Distributed ⁶	Imported	Distributed ³

- Note: 1. Includes complex fertilisers which contain both N and P₂O₅.
 2. Excludes bonemeal and ground rock phosphate for which data are not available.
 3. Figures from 1952-53 to 1957-58 are on financial year (April-March) basis.
 4. Figures from 1952-53 to 1956-57 relate to calendar years ending in the first half of the period stated while other figures are on financial year (April-March) basis and refer to allotments of fertilizers under the "Fertiliser Pool".
 5. Figures from 1952-53 to 1957-58 relate to calendar years ending in the first half of the period stated while other figures are on financial year (April-March) basis and refer to allotments of fertilizers under the "Fertiliser Pool".

REGIONAL AGRICULTURAL PRODUCTIVITY : 1960-61

Source: National Council of Applied Economic Research

follows that if the private sector is at all to develop substantially in this field a proper economic climate should be provided with that object in view. This is particularly important as foreign finance and technical collaboration have to be enlisted. Negotiations which were undertaken in the past some years in regard to various projects within the public sector or the private have abundantly proved that it is difficult to persuade foreign capital or enterprise to come into this industry. In the case of the West Bengal project, for instance, the State Government's talks with a US consortium failed partly because the consortium did not find the circumstances of the industry sufficiently attractive and partly because the West Bengal Government was not in a position to raise its part of the equity capital. In this context it is to be seriously considered whether State Governments should at all think in terms of participating in the capital of this industry.

The Vishakhapatnam project presented difficulties of another kind. The two U.S. firms which finally decided to come in were at first deterred by the Central Government's insistence on a debt-equity ratio of 2:1. It was only when the Government finally consented to a debt-equity ratio of 3:1 that the negotiations could be successfully completed. Another concession which had to be given by the Government in order to secure foreign collaboration in this case was an agreement that the proposed concern would handle most of the distribution of its product instead of handing it over to the Government. It is, therefore, pointless to blame the private sector in a vague or general way. If some schemes have not made progress it may be because licences were given to parties who are not resourceful enough to undertake the difficult negotiations involved in securing foreign collaboration or raising internal finance. To the extent that this is an explanation, the Government cannot altogether escape blame since its licensing policy in the matter of such an important industry should have been more discreet. Secondly, it is possible that progress has not been satisfactory in certain other cases where the conditions laid down by the Government for foreign collaboration were unhelpful, at least in the first instance, from the point of view of foreign enterprise or foreign capital.

Pricing Policy

Finally, there is also the important question of the Government's pricing policy with regard to fertilizers. Here the situation is complicated by the fact that the Government desires to make fertilizers available to the farmer at attractive rates in order to encourage their use. This policy, virtuous in itself, seems to act as a deterrent to the Government in contemplating a remunerative level of prices for this industry. Secondly, the scheme of Government-controlled distribution is far from a recommendation to potential entrepreneurs. As we have seen in the case of the Vishakhapatnam project, the Government has had to relax its attitude in this regard in order to attract foreign collaboration. It is not irrelevant in this context to point out that the Government's own thinking lately has been that industries in the public sector should be worked on a commercial basis so as to yield an adequate profit. The Government has taken upon itself a large direct responsibility for building the fertilizer industry and it will be an act of wisdom on its part to apply this principle to the pricing of products of this industry. If the consumption of fertilizers is to be subsidized it should be done not at the risk of discouraging the expansion of the industry but as a charge on public funds provided for agricultural development.

Viewed in this manner, the apportionment of blame between the two sectors is a matter of secondary importance. What is now necessary is to take various general and specific measures needed to create a favourable climate for the more rapid growth of this vital industry. The goal of one million tons of nitrogen fixed for the third Plan should at least be reached

by the middle of the fourth Plan. This is with regard to nitrogenous fertilizers. It must be noted that the development programme for phosphatic fertilizers is also much behind schedule. And it is now said that "we should be doing well if we succeeded in setting up a capacity of 500,000 tons." The consumption of fertilizers in this country has increased eight times over the last ten years. This increased consumption has been met partly by increased domestic production and partly by imports. Imports rose from 44,294 tons in 1952-53 to 229,462 tons in 1962-63. They are thus playing the major part in meeting the requirements of our agriculture. There is now talk of a fourth Plan target of two million tons of nitrogen which would involve the setting up of two new large factories every year. The Union Minister for Petroleum and Chemicals stated in the Lok Sabha recently that the Planning Group on the fertilizer industry had recommended this target tentatively. In the case of phosphatic fertilizers, the suggested target is one million tons. Corresponding to these goals of installed capacities, the targets of output are placed at 1.75 million tons in the case of Nitrogen and 800,000 tons for phosphatic fertilizers.

TABLE III
CONSUMPTION OF N, P2O5 AND K2O — STATE-WISE

IN STEP WITH TOMORROW

New processed foods, new pharmaceuticals, and many more new products are coming on the Indian market every day. They create new packaging problems. At Poysha, one of the leading tin container makers in the country, they are always geared to meet the requirements of their customers. In 1961 they pioneered the manufacture of 5½ oz juice cans. Soon these will be lithographed too. Next on the agenda is a much wider expansion of the range of packaging material. What is more, plans are ready for the setting up of subsidiary factories in the heart of the fruit and vegetable growing areas to help the canners with quick and economical canning facilities. Poysha are indeed always in step with tomorrow.

a clean,
bright,
spacious look
with

Glass

Office space seems to grow when cumbersome partitions are replaced with glass. Rooms look lighter, brighter and so much more elegant. It's not surprising glass is finding its way into more and more homes, stores, schools and restaurants—wherever light and space are important considerations.

Glass is so practical too. It keeps out noise and dust and lets in natural light. And keeping glass clean is the easiest thing in the world.

Available in a wide variety of sizes and thicknesses, and quality tested at every stage of manufacture, there's an HPG sheet glass to suit every purpose.

tious plans will not be possible without steps being taken promptly to enlist foreign collaboration of a very considerable order. Secondly, the development of technical and managerial skills in the country has also to be planned for vigorously. Such know-how is needed not merely for the running of established units but also for the fabrication of plant and equipment for new units. It is clearly desirable that the import content of fertilizer plants should be brought down as much as possible. Certain encouraging developments have already taken place in this direction. Sindri skills have helped in the setting up of the Rourkela plant. The Fertilizer Corporation of India, which is in charge of the public sector in the fertilizer industry, is now assuming responsibility for the engineering and erection of the factory at Korba in Madhya Pradesh. Fertilizers and Chemicals (Travancore) has developed a competent organisation for designs and construction and has been invested with the respon-

sibility of erecting three new plants during the fourth Plan. All the same it is necessary to realize that much more remains to be done in the area of finding and training suitable personnel for technical and managerial responsibilities at the higher levels. Here it is not out of place to remark that Government procedures seem to be coming in the way of not only the projects in the private sector but also those in the public sector. It is strange, for instance, that the post of a General Manager for the Trombay project has not yet been filled. The fertilizer industry has been given the status of a "high priority" industry. It is only reasonable that the Minister responsible for it should have reasonable freedom in taking and implementing important decisions relating to its development. Perhaps if there is this freedom, there will be less frustration in ministerial circles, and consequently, less inclination to shift blame to the private sector.

Heavy Electricals: Government as Monopolist

THIS COUNTRY has a large power development programme reaching into the years ahead. A substantial portion of the outlay on power installations—about 25 per cent in the case of hydro stations, over 50 per cent in the case of thermal stations and about 30 per cent in the case of transmission systems—constitutes expenditure on machinery. It necessarily follows that this country has to enter the heavy electricals industry field in a big way. This was realized at least as early as in 1948 when an "exploratory committee of experts" considered a scheme for the manufacture of heavy electrical equipments, but no action was taken until 1952, when the proposal was revived and included in the first five-year Plan. But difficulties came at the level of financial scrutiny and sanction. It was not until 1955 or later that the project could assume even a tentative shape.

Fortunately the plant eventually set up at Bhopal has had the advantage of technical collaboration on the part of Associated Electrical Industries of Great Britain which is a leader in this field. Even so it has had to pass through many vicissitudes in its initial stages due mainly to foreign exchange difficulties, delays in the receipt of machine tools and manufacturing equipment, dependence for almost all of its requirements of raw materials and components on imports, shortage of qualified technical personnel and labour troubles. Gradually this unit in the public sector has been dealing increasingly effectively with its problems and it seems to have succeeded reasonably well in organizing the production of heavy electrical equipment over an increasing range of descriptions. The Bhopal plant is run by the Heavy Electricals (India) Ltd., a public sector organization, which is now planning to set up two more heavy electrical units, one at Ramchandrapuram near Hyderabad and the other at Ranipur near Hardwar. While the former is being set up with Czech collaboration, Soviet financial and technical assistance are being made available for the Ranipur unit. The Heavy Electricals (India) Ltd. is also in charge of the high pressure boilers unit which is being set up at Tiruchirappalli with Czech collaboration, for the manufacture of boilers for steam turbines.

Shortsighted Policy

The Government certainly deserves to be congratulated on going into the heavy electricals business on this scale, but it may still be asked whether it will not be profitable to have its efforts in this direction supplemented by the private sector as well. As it is the Government seems to be chary of entertaining proposals from the private sector for schemes for manufacture of electricity generation equipment. This is shortsightedness. The field here is vast and it is possible that emerging needs are not being anticipated adequately. Again, there is a significant gap in the Government's planning in that no place has been found in it so far for any participation by the highly developed heavy electricals industries in countries such as the United States. If U.S. collaboration can be secured for more projects, there is no reason why the Government should not permit the private sector of this country to explore such opportunities. Talking of big industrialisation is not enough. It is only big action in vital development areas such as this one which can translate planning ambitions into reality.

The Bhopal Heavy Electricals Plant, which was commissioned into service in July, 1960, about three years after the project report was approved, has since established regular production and has supplied transformers to the States of Madhya Pradesh, Punjab, Madras, Andhra Pradesh and Assam. It undertook to supply 15,000 KVA capacity transformers for Delhi Electric Supply Undertaking, 37,500 KVA capacity transformers for Obra project of Uttar Pradesh, 40,000 KVA capacity transformers for the Dhuvaran project of Gujarat, 50,000 KVA trans-

formers for the Damodar Valley Corporation and Calcutta Electric Supply Company, and 75,000 KVA capacity transformers for Talcher Thermal Scheme of Orissa and power development schemes in Maharashtra. It has also negotiated for orders for 175,000 KVA capacity transformers for the Damodar Valley Corporation. Capacitors manufactured in factory have been supplied to a number of private industries and circuit breakers also have been supplied to various consumers both in public and private sectors. The value of the output of this plant is expected to amount to Rs 8 crores by 1963-64, Rs 20 crores by 1965-66 and Rs. 30 crores when in full production only in the fourth Plan. The investment on the five blocks of this plant stands at about Rs. 40 crores. A sixth block, involving an outlay of Rs 10 crores, is proposed to be added for the manufacture of steam turbines.

Dovetailed Projects

The two new heavy electricals projects which are being set up at Ramchandrapuram, near Hyderabad and Ranipur, near Hardwar are expected to be commissioned towards the close of the current Plan. The Ranipur Unit will have an ultimate capacity to produce equipment worth about Rs. 40 crores per annum, while the capacity of the Ramchandrapuram unit will be of the order of Rs. 14 crores. Their production programmes have been dovetailed into that of the plant at Bhopal. The Ramchandrapuram plant will produce steam turbines and turbo-alternators of 12, 25, 55 and 100 MW, besides pumps. The Ranipur unit will manufacture hydraulic turbines and generators of the capacity from 10,000 to 1,00,000 KW., steam turbines and turbo-generators from 50,000 to 2,00,000 KW capacity, heavy and medium sized A.C./D.C. machines for steel mills and other industrial units and starting, controlling and completing apparatus. This plant will be capable of making steam turbines of 3,00,000 KW also.

While the public sector has sought to monopolise the heavy electricals field, the private sector has been able to build up an extensive position elsewhere in the industry, particularly in respect of electrical appliances of consumer interest and also with regard to electrical transformers, electric motors, cables and wires. Several producers have been engaged in the manufacture of electric motors for the last 20 years, but real progress was witnessed only after 1951. The number of such units was 12 with a capacity of 263,000 H.P. and an actual output of 250,000 H.P. towards the end of the first five-year Plan. These units increased to 27 with an aggregate annual capacity of 1.3 million H.P. by 1960-61. Considerable progress has been recorded in the small scale sector too where the number of manufacturing units increased from 6 in 1955 to 74 in 1959 with an annual capacity of 266,000 H.P. The small-scale sector, it may be added, produced mainly fractional H.P. motors and motors up to 20 H.P. There were 39 units engaged in the manufacture of components only.

There has been considerable diversification in the manufacture of electric motors and special types such as geared motors, flame-proof and explosion proof motors have been taken up by the producers. It was estimated that during the third five-year Plan, the demand for electric motors upto 300 H.P. will increase to 2.5 million H.P. per annum. It was considered reasonable, on the whole, to expect that a capacity of 3.0 million H.P. on double shift basis would be able to achieve the proposed production level. A number of firms have been licensed to manufacture electric motors of varying H.P., apart from the 18 firms with a capacity of 218,400 nos., licensed to manufacture fractional H.P. motors in the large scale sector. The two Heavy Electrical Projects to be established at Hyderabad and Hardwar will also produce industrial motors of 200 H.P. and above.

The manufacture of power and distribution transformers of

a wide range has made considerable progress during the last few years with the result that a large part of the country's requirements are being met from indigenous production. The majority of the units confine themselves, by and large, to the production of transformers upto 1,500 K.V.A. and 33 K.V. on the H.T. side. A few units have taken up the manufacture of higher voltage and higher capacity transformers too. The demand has continued to increase so rapidly that the targets of production had to be revised from time to time. For instance, at the beginning of the second five-year Plan, there were 13 units engaged in the industry with an annual capacity of 657,000 K.V.A. During the following five years five new units went into production so that at the end of 1960-61 there were 18 units with an installed capacity of 1,404,000 K.V.A. Earlier, it was estimated that the annual demand would be nearly 1.36 million K.V.A. which was later on revised to 1.5 million K.V.A. corresponding to 2.2 million K.V.A. capacity.

Production Targets

The Development Council for Heavy Electrical Industries has estimated that the demand for power and distribution transformers of 33 K.V. and below will rise to 3.5 million K.V.A. per annum by the end of the third Plan and that was fixed as the production target with a proposed capacity of 4.0 million K.V.A. on double shift basis. Consequently, a number of schemes have been licensed which when implemented will raise the rated capacity of the industry to 2.19 K.V.A. on single shift basis. It is argued that by working this capacity on multiple shift, a production level of 3.5 million K.V.A. can be achieved, which is the proposed target of the third Plan. Consequently, no new licences are to be issued during the third Plan period.

Prior to 1953 there was hardly any production of switch gears and control gears in this country and in fact it was only during the early years of the second Plan that the industry progressed rapidly so that by 1960 there were 26 units in operation. Many of these manufacturers had entered into technical collaboration agreements with foreign entrepreneurs to produce items such as contact starters, star delta starters, stator-rotor starters and other special types of starters. The installed capacity at the end of the second Plan was 300 H.T. switch gears, 1,000 L.T. switch gears, 81,700 motor control gears and 1,36,000 iron clad switches and switch fuses. It was estimated that the demand for switch gears upto 11 K.V. by the end of the third five-year Plan will be 2,250 circuit breakers and switch boards, 18,000 L.T. circuit breakers and switch boards, 3.6 million iron clad switches and 225,000 motor starters. Several proposals made by the private entrepreneurs were approved and including the proposed output by the Government Electric Factory, Bangalore, and the Heavy Electrical Plant at Bhopal, the demand of these articles is likely to be met adequately.

Cables and Wires

Several types of cables and wires such as bare copper conductors, aluminium conductors steel reinforced (A.C.S.R.) and aluminium conductors, V.I.R. and PVC cables paper insulated power cables, telephone cables and winding wires, are being manufactured in India. The current value of the annual output is estimated at about Rs. 40 crores and it is expected to reach a figure of Rs. 78 crores by 1965-66. Due to the non-availability of foreign exchange for the import of copper, the production of bare copper conductors has continued to decline. In 1960-61, its output was 10,144 tons which declined to 4,237 tons in 1962-63. At the same time, ACSR and aluminium conductors have tended to replace it and consequently their output increased considerably which in 1962-63 was 33,055 tons. With the various aluminium plants coming into production, the industry will be largely self-sufficient in raw materials and will be able to meet the indigenous demand.

The demand for ACSR and aluminium conductors is likely to rise to 44,000 tons by 1965-66 for which a capacity of 55,000 tons on double shift basis is proposed to be established. The demand for paper insulated power cables is expected to be around 4,000 miles by 1965-66 for which a capacity of 4,500 miles has been proposed to be established on double shift basis. Similarly, the demand for dry core cables for the expansion programme of the Posts and Telegraphs Department is estimated at 2,000 miles in 1965-66 for which a capacity target of 2,000 to 2,500 miles is to be established. In the case of winding wires used for transformers, electric motors, fans, etc., it is estimated that the demand would rise to 24,000 tons per annum by 1965-66 for which a capacity of 32,000 tons is proposed to be established on double shift basis. A number of schemes have been licensed for establishing the required additional capacity of these cables and wires. Moreover, the Hindustan Cables, which is in the public sector will also expand its capacity to produce 2,000 miles of dry core cables and 500 miles of plastic insulated city cables on double shift basis. With the implementation of these schemes, the capacity for the manufacture of various types of cables and wires is estimated to be as given in Table I.

This is perhaps the only item of electrical equipment, the demand for which is independent of the progress in power generating capacity. Used for torches, defence operations and various types of automobiles, the production of batteries started in the country quite some years ago, but like many other industries, its output gained momentum only recently. The current rated capacity of dry batteries is nearly 300 million cells and the target for the third Plan is placed at a capacity of about 400 million cells. Similarly, the installed capacity of storage batteries increased from 290,100 in 1955-56 to 379,300 in 1960-61. During the years of the second Plan, there has been considerable diversification of production so

Largest Manufacturers of Heavy Electrical Equipment in the Country

RANGE OF MANUFACTURE

- Hydraulic & Steam Turbines.
- Alternators & Diesel generators.
- Power Transformers upto 400 MVA at 220 KV.
- Switchgear upto 220 KV & 7500 MVA.
- Electric Traction Equipment.
- Capacitors & Synchronous condensers.
- Welding transformers.
- Industrial motors & controlgear upto 5500 H.P.

HEAVY ELECTRICALS (INDIA) LTD BHOVAL

(A GOVERNMENT OF INDIA UNDERTAKING)

December 27, 1963

ANNUAL NUMBER 1964

that much larger variety of batteries is being produced now. Storage batteries are also being produced in the small scale sector. The third Plan target of production is 800,000 batteries in the organised sector and 200,000 batteries in the small scale sector per year. In order to achieve an output of 800,000, a rated capacity of 535,000 on single shift basis is considered enough, for which licences have been issued.

TABLE I
CAPACITY FOR MANUFACTURE OF VARIOUS TYPES OF CABLES AND WIRES

A.C.S.R. conductors	..	41,900 tons
Bare copper conductors	..	18,700 tons
Rubber insulated cables	..	965.86 million core yds.
Paper insulated cables	..	4,876 miles
Winding Wires:		
(a) Enamel covered wires	..	7,102 tons
(b) Paper and cotton covered wires and strips	..	5,059 tons

teries in the organised sector and 200,000 batteries in the small scale sector per year. In order to achieve an output of 800,000, a rated capacity of 535,000 on single shift basis is considered enough, for which licences have been issued.

Consumer Electricals

Apart from these items of electrical equipment utilised for generation or transmission of power, various articles of consumer interest such as fans, lamps, radio receivers, refrigerators, air-conditioners and several electric accessories have also witnessed an increase in output during the last few years. Along with the expansion in quantity, there has been a marked improvement in the finish of all these articles. Moreover the indigenous content in each of these final products has increased substantially. It may be pointed out that all these items were being produced for the last several years but varying contents of imported components were being utilised, which in some cases were very large.

Electrical fans were being produced at 24 units at the end of 1960-61 with an installed capacity of 871,750 per annum on single shift basis. Indigenous demand for electric fans has increased rapidly with the spread of electricity as well as the rise in the level of living of the people so that the overall requirements by 1965-66 were placed at 2.5 million (including an export of 250,000) for which a capacity of 2.8 million on double shift basis or 1.4 million on single shift basis was proposed to be achieved.

The number of units manufacturing incandescent lamps were 12 at the end of 1960-61 with an installed capacity of 35.95 million bulbs. With increased electrification of villages the internal demand for GLS and other similar lamps by 1965-66 is expected to increase to 62 million, and taking into account the possibility of an export of 6 million bulbs, the total demand is estimated at 68 million bulbs by 1965-66. During the last few years the production of fluorescent tubes, miniature bulbs, torch bulbs, mercury vapour lamps and photo flash lamps has been taken up by some entrepreneurs. The demand for fluorescent tubes by 1965-66 was estimated to be nearly 6.5 million, including 0.5 million for exports. Similarly, the demand for miniature bulbs including 5 million for exports, was expected to be 50 million. With the implementation of the schemes already licensed the proposed installed capacity was likely to be achieved.

The electric house service meters industry has made considerable progress during the last decade. Starting early in the first Plan, the output increased to 505,000 by the end of the second Plan. The target for 1965-66 has been fixed at 2

million for single phase meters and 100,000 for poly phase meters. A number of firms have been given licences, the implementation of which will achieve the proposed output. The industry is likely to be self-sufficient to the extent of 90 to 95 per cent for its raw material requirements.

The Refrigeration and Air-conditioning industry has also made considerable headway and production of sealed units for domestic refrigerators has been undertaken. A number of schemes for the manufacture of refrigeration compressors, controls and other raw materials particularly for industrial and commercial refrigerators and air-conditioners were being implemented. The production of domestic refrigerators has also improved considerably.

Radio manufacturing, which began in a small way as an assembly industry, has grown considerably so that towards the end of the second Plan the output was nearly 280,000 radios. An effort to produce cheap sets at a cost of Rs. 125 has considerably increased the demand. The industry has made significant progress in the manufacture of various components which till recently were being imported. Now it manufactures all the hardware and metallic parts and fittings, transformers, coils, cabinets, dials, knobs as also many essential components such as paper capacitors, carbon resistors, wave band switches, ceramic capacitors, loud speakers, potentiometers and gang condensers. The manufacture of valves has also been established. In the context of the growing popularity of transistorised radios, production of these has also increased during the recent years. It is estimated that the existing capacity along with the additional licensed capacity worked out to about 340,000 radios on single shift basis. To achieve the third five-year Plan target of 900,000 radio receivers, the gap is 150,000 on single shift basis which is expected to be covered by the small-scale sector.

Automobiles: Government as Back-seat Driver

IF THE automobile industry in this country is still rather diffident in its development, it is essentially because government policy for the industry continues to regard it as a necessary evil rather than as a desirable good. The impression that this industry produces a luxury product dies hard, although it is now coming to be increasingly realized that at least to the extent that it has to manufacture vehicles for road transport and power-driven implements for agriculture and construction, it has a dynamic contribution to make to economic growth and industrial expansion. But it is strange that even in the area of commercial vehicle production, the Government's planning for this industry is hopelessly timid. Although the Government has licensed a total capacity of 78,500 numbers in respect of commercial vehicles, trucks and buses, the Minister for Steel, Mines and Heavy Engineering recently told Rajya Sabha that the output might only amount to 45,000 by the end of the third Plan.

It has to be noted that this aggregate output has to be shared among three manufacturers, although the Government realized that the scale of production of 24,000 vehicles is the minimum necessary for economic production. At the present time, only one of the producers will perhaps be able to achieve this order of output by the end of the third Plan which means that the other two will have to be saddled with uneconomic scales of production for some time to come. This could hardly be regarded as good planning since output of commercial vehicles on less than the minimum economic scale per unit is bound to raise the basic cost of the road transport industry. Mr. C. Subramaniam suggested that if there had been no emergency, the third Plan target of 60,000 commercial vehicles, trucks and buses could perhaps have been practicable. But the emergency, surely, is one more reason for basic targets for road transport to be more energetically pursued. We realise that there has to be more intensive employment of capacity in the production of military vehicles, but commercial transport is certainly highly relevant to the provisioning and equipment of our Armed Forces in the strategic areas or elsewhere. We should have expected the Government to have appropriately upgraded the priority for road transport vehicles in the light of the demands of the emergency.

Apologetic Attitude

In the case of passenger cars, the Government's attitude is unduly apologetic. Mr C. Subramaniam informed the Rajya Sabha that cars were receiving the lowest priority in the automobile programme. Although the third Plan target is 30,000 vehicles, the Government has so far licensed only a capacity of 20,200, which is also the installed capacity at the present time. The Minister said that because of the emergency there would be no further licensing capacity in this line of production for some time. He seemed almost glad that this was so. Frankly, we do not comprehend this grudging attitude and while we do not suggest that the Government should divert foreign exchange to this section of the industry from the general pool from which so many other important demands have to be met, it seems to us that specially for this industry private foreign credits could be negotiated provided the Government's policy is positive and promotional.

It has been conceded that both cost and quality are dependent upon economic scales of output. It was mentioned in Rajya Sabha that the aim should at least be to secure to each unit manufacturing cars a scale of production of at least 50,000. Costs, it was pointed out, could go down by 30 per cent if output could be increased from 10,000 to 50,000. At the present time, three units among themselves make about 20,000 cars, and only one of them has a production which exceeds, but only slightly, 10,000. It may be that a total car production of 150,000 cannot be brought about within the third Plan

period, or even the fourth Plan period. But surely it ought to be possible to keep on pursuing the third Plan target of 30,000 instead of abandoning it altogether. The main limitation on expansion is the import of capital goods which must be added to the equipment of this industry. But, as we have suggested, it should not be impossible to secure liberal foreign credits for this purpose provided the Government could demonstrate an active interest in expansion. The industry is already in good repute with international institutional lenders and we would certainly urge that the possibilities of private consortia abroad taking a hand in financing this industry should be explored. Even if an output of 30,000 cars is not achieved by 1965-66, it should at least be achieved in the years immediately following so that it becomes possible to plan on a relatively long-term basis for an annual output of 60,000 cars by 1970-71. While it is true that even with that order of aggregate production, output per manufacturer would still be well below the desirable scale of 50,000, the technical and economic gains would still be considerable and it may not be impossible to bring down prices by 10 to 15 per cent even at these slightly increased levels of output.

Foreign Exchange

We have said that a positive promotional policy would be a condition of the availability of foreign finance. The chief element in that policy would be a liberal attitude towards consumers. Mr. C. Subramaniam, speaking in Rajya Sabha, did a necessary job in dispelling prejudices and misconceptions on this point. He had the courage to say that all the increase in car prices subsequent to 1958-59, had been in respect of elements such as excise and customs duties and prices of raw materials or components purchased from outside. He emphasized that no increase had been given to manufacturers on account of increases in their operating expenses. It should be pointed out here that the excise duty on the finished vehicle and the customs duty on imported components are only a part of the total incidence of taxation on this industry. Almost every item of raw materials, semi-finished parts or finished components, which the industry has to procure either within the country or from outside is being taxed often at multiple points and it is just not possible even to keep track of the progressive inflation of the tax incidence on the industry which is prompted by such additions. It is, of course, not possible in the general context of high direct and indirect taxation to plead for preferential fiscal treatment for cars, but in the case of commercial vehicles at any rate there must be room for relief. Even in the case of cars, even if there can be no deduction in taxes as such, there could at least be some rationalisation of fiscal imposts which in itself would give rise to a certain relief in the aggregate. An allied point is that although the prices of cars are fixed with the approval of the Government, the manufacturers who, as we saw, are under continuing pressure to buy more and more ancillary industries products, are not similarly protected in respect of most of the prices which they have to pay for components. From this point of view the Finance Minister's recent announcement de-controlling some of the price-fixed automobile accessories or components, while welcome in its limited context, would nevertheless complicate an already difficult situation so far as automobile manufacturers are concerned. In the circumstances it is to be considered whether a little more flexibility should not be introduced in the affairs of the automobile industry by the Government giving up the present system of voluntary prices. With the consequent elasticity in pricing, the automobile industry may be able to enlist adequate foreign financial investment or credits in its expansion.

Mr C. Subramaniam took justified pride in the fact that the Government's policy of insisting on a progressive increase in the indigenous content of automobiles has led to a subs-

tantial expansion of ancillary industries which, according to him, now contribute about 30 per cent in value to the content of an automobile. At the same time, the Minister was fair enough to admit that this encouragement of ancillary industries is being pursued at some cost to the manufacturer of the finished product—and the consumer—in terms of both quality and price. The problem is certainly a complicated one and no simple solution can be advertised. The policy of increasing the indigenous content is, of course, essentially a right one. It releases foreign exchange for the import of capital goods or essential raw materials needed by the industry and for which indigenous substitutes are in sight. It also promotes research, designing, technology and craftsmanship in the domestic industry. There is also the benefit in the form of increased decentralized industrialisation in the ancillary industries. The automobile manufacturers have, therefore, welcomed the policy of increasing the indigenous content and co-operated with it. It remains to ensure that this policy should be so operated that its disadvantages in terms of difficulties in cost or quality control should be minimized. This may be done, for instance, by reconsidering the policy of cutting down foreign exchange allotments to individual units in proportion to increases in the indigenous content. The contrary policy of rewarding manufacturers with higher indigenous content with larger allocations of foreign exchange would appear to be a more reasonable one. This would not only mean that a given amount of foreign exchange could be spread over a larger volume of output but also that the manufacturer, who has already succeeded in achieving a higher level of indigenous content by either stepping up the manufacture of components in his plant or by procurement from ancillary industries or through both means, is given the opportunity to add to his capital equipment. This will not only help him to complete the process of possible import substitution as early as that could be done, but also offset the cost disadvantage in respect of indigenous components by extending his scale of production. It is also desirable to permit a considerable degree of flexibility to manufacturers to decide which components they would procure from ancillary producers and which they would make themselves. Already ancillary production has been established firmly in a wide field of components and spare parts and there is no reason to suspect that manufacturers would unduly encroach on that territory. It should be appreciated also that automobile manufacturers would not ordi-

narily desire to divert scarce factory space or equipment to the production of components which they could get from ancillary producers at reasonable prices and in good quality and adequate and regular quantities. It is only where procurement from outside sources is seriously unsatisfactory in one or more of these respects that the automobile manufacturer would normally want to make the component himself. We, therefore, urge that there should be periodic examination of the position so that if, in the larger interests of the automobile industry, a component, an accessory or a spare part may be manufactured by the main producer himself, it should be the Government's policy to allow or even encourage him to do so. This may be one of the desirable ways of increasing the efficiency of automobile manufacture, improve its profitability and thereby enable it to render better service to the consumer.

Hire-Purchase

There is some discussion whether facilities, such as hire purchase, should be deliberately promoted for the benefit of the automobile industry. It must be realised that if the industrialisation of this country, especially in the engineering field, where the supply of raw materials is likely to improve in due course, is to be planned and pursued on a relatively long-term basis, people should be progressively encouraged to own and use durable or semi-durable consumer goods. Although it is true that, because of the short production of automobiles, the entire output is at present being absorbed without difficulty, it would still be beneficial to the economy, from a larger point of view, to encourage hire-purchase since thereby a car-buyer may not have his entire purchasing power mortgaged to one single item but may have some surplus which he could use to buy other articles such as, for instance, refrigerators. We are aware that this argument will not appeal to people for whom it is inconceivable that this country can cease to be poor or that an increasing section of its people could in due course come to afford in increasing number all the good things of life. But for others whose vision may be larger and brighter, it should not be difficult to appreciate that the nation's poverty could be eliminated only by planning deliberately for improving consumption among ever-widening communities of its citizens.

The genesis of the Indian automobile industry goes back

Usha is playing a vital role in actively assisting the country to earn valuable foreign exchange. The largest exporters in the light engineering field, Usha sewing machines and fans are warmly welcomed in about 50 countries around the world. Besides giving technical know-how to other countries, Usha have taken a major step forward in export promotion by setting up sewing machine assembly plants in Saigon and Colombo. We look to the future with confidence and in a spirit of dedication to serve the country well.

to the early years of the present century, when a couple of concerns were started in collaboration with foreign manufacturers for assembly and servicing of motor vehicles. It was, however, only during the 1940's that the industry started making rapid strides. By 1952, as many as 12 assembling units had come into existence; six of these — Hindustan Motors, Calcutta; Premier Automobiles, Bombay; Standard Motor Products of India, Madras; Automobile Products of India, Bombay; Ashok Motors, Madras; and Mahindra & Mahindra, Bombay—were major ones. Hindustan Motors was working in collaboration with Morris Motors of Britain and the Studebaker Corporation of the United States. Premier Automobiles had as its collaborators the Chrysler Corporation of the United States and Fiat Societa Per Azioni of Italy. Between themselves, the 12 units used to assemble, immediately after Independence, some 4,000 cars and commercial vehicles, the number going up to 6,587 in 1950. Five of the six major units had their manufacturing programmes also. But only two had taken effective steps to implement them, Hindustan Motors undertaking the production of engine gear boxes, axles (including differential) and front suspensions and Premier Automobiles starting the manufacture of the components such as propeller shafts and universal joint, exhaust pipes, radiator needle bearings and leaf and cushion springs

Tariff Enquiry

In 1952 the Government instituted a tariff inquiry to assess on what lines this industry should be developed. In view of the limited demand, the obvious course was to concentrate it on as few manufacturing units as possible so as to give them each an economic volume of production. On the basis of the manufacturing programmes submitted, five units were selected—three for undertaking the manufacture of cars as well commercial vehicles and one each for producing only commercial vehicles and jeeps. Hindustan Motors was to take up the production of light and big cars and medium trucks, Premier Automobiles and Automobile Products of light cars and medium trucks, Ashok Motors (under a new company, Ashok-Leyland) of heavy vehicles and Mahindra & Mahindra of jeeps. Subsequently, Automobile Products abandoned its programme of car and truck manufacture and switched over to production of scooters, clutches, brake equipment and medows diesel engines. It has now been taken over by Premier Automobiles. But two new manufacturers came on the scene; Standard Motors going in for the production of light cars and Telco, in collaboration with Daimler-Benz A.G. of West Germany, of 3-5 ton diesel vehicles. Simpson and Co., Madras, was also licensed to produce in collaboration with Perkin Ltd., Britain, Perkin diesel engines. All these manufacturers were required to step up the indigenous content in their products from 20 to 25 per cent to start with to 80 per cent in the course of three to five years of operation.

The capacity that came to be installed as a sequel to the above schemes going into operation during the second Plan period, on double-shift basis, stood as given in the table alongside.

Along with the production of commercial vehicles, cars and jeeps, manufacture was taken up towards the close of the first Plan, of motor cycles, scooters and mopeds. There was one unit — Enfield India Ltd., Madras — which had an installed capacity to produce, on single shift, motor cycles to the tune of 5,000 per annum. Automobile Products of India put up a capacity to produce annually scooters and mopeds to the extent of 6,000. In 1959, this capacity was raised to 12,000 a year. Another unit was set up by Bajaj Auto in 1960 with a capacity to turn out 6,000 scooters per annum. Manufacture of mopeds was also undertaken by Mopeds India. Tirupati

(Andhra Pradesh), in collaboration with M/s. Motobecane, Pantin, France, to an annual capacity of 5,000.

Besides the above lines of production, capacity was created in the Indian automobile industry, early in the first Plan period, for the manufacture of trailers and three-wheelers, including auto-rickshaws. Six units were engaged in this line with a total capacity of 5,232 units per annum up to 1955. Seven more came up during the second Plan period and the premier unit among these—Mahindra & Mahindra—expanded its capacity from 2,040 to 3,780, bringing the total installed capacity at the end of 1960 to about 8,500. Some small firms also started manufacturing trailers. Their capacity was besides the 8,500 units of the 13 major producers.

As is the case elsewhere in the world, the establishment of the Indian automobile industry has given rise to ancillaries which started manufacture of various components, such as leaf springs, brake linings, pistons, fuel injection equipment etc., to supplement the production in the main automobile units. Steps were also taken to set up ancillaries producing motor starters, dynamos, wheels and rims and brake systems.

Rising Production

With this fairly rapid expansion in the installed capacity, the production of various automobiles registered a steady rise after 1955. As against a total of 23,083 cars, jeeps and commercial vehicles produced in 1955, their combined output went up to 57,815 in 1962. During the first six months of the current year, the production amounted to 24,951, the decline being in the manufacture of cars and passenger buses, necessitated by changed priorities for allocation of foreign exchange after the proclamation of emergency. The output of motor cycles went up from a bare 420 in 1955 to as much as 8201 in 1962 and that of scooters from 528 to 14,569. During the first six months of 1963, their production was of the order of 3,893 and 6,979 respectively. The manufacture of 3-wheelers, similarly recorded a steady increase.

Under the third five-year Plan, the manufacture of cars, commercial vehicles and jeeps was contemplated to be raised to 30,000, 60,000 and 10,000 respectively, and that of motor cycles and scooters including mopeds and auto-rickshaws to 50,000. This involved installation of the following additional capacities: cars 800 (approximately); commercial vehicles 32,000; jeeps 4,500; motor-cycles, scooters and mopeds 37,000. As a result of the permission granted for the expansion of the existing units and issue of five licences for setting up new units, the projected third Plan capacity of 60,000 of motor cycles, scooters and mopeds has been fully covered. Five

Cars		
Hindustan Motors (Ambassador)	12,000

Perkins	6,000	

* Studebaker trucks were produced before 1958 when switch-over took place to Bedford trucks due to change in demand from petrol to diesel trucks.

units are already in production. Two more are expected to be commissioned shortly.

Commercial Vehicles

Additional capacity has also been licensed for the manufacture of commercial vehicles. Foreign exchange too has been released for setting it up. TELCO has been allowed to raise its Tata-Mercados-Benz vehicles production from 12,000 to 24,000, Premier Automobiles of its Dodge vehicles from 7,000 to 15,000, Hindustan Motors of its Bedford trucks from 7,000 to 15,000 and Ashok-Leyland of its "Comets" and Royal Tigers from 3,000 to 5,400. Bajaj Auto has been allowed to raise its Tempo "Hanseat" (3-wheeler) production from 1,000 to 4,000. Mahindra and Mahindra's jeep manufacturing capacity has been raised to 10,000. This company has also been permitted to manufacture within its overall capacity one-ton jeep trucks up to 2,000. Besides these expansions, two new licences have been granted — one to Simpson and Co., Madras, for undertaking the manufacture of 3-5 ton trucks and bus chassis to an annual capacity of 12,000 and the other to Standard Motors to produce yearly 1,500 one-ton truck chassis. The former scheme is proposed to be implemented by forming a new company, while manufacture in the latter case is to be taken up in the existing works. No further capacity, however, has been sanctioned as yet for the manufacture of cars. This is because of the limited foreign exchange available for the automobile industry and the lowest priority accorded to car manufacture. The first priority, after proclamation of emergency, has been accorded to the production of trucks and second to that of motor-cycles and scooters, the automobile products required to meet the defence needs. From the existing and the proposed capacity, production of cars, commercial vehicles, jeeps and station wagons and motor cycles and scooters by 1965-66, according to the mid-Plan appraisal, is estimated to go up to 25,000, 54,000, 10,000 and

45,000 respectively.

There have been complaints that the industry in the earlier years had not been exerting itself vigorously to raise the indigenous contents of its vehicles. This charge certainly does not apply to all units and some remarkably steady progress by individual manufacturers had been recorded almost from the beginning of their manufacturing programmes. Nevertheless, it is true enough that the advance in this direction has been particularly marked in more recent years. This has been assisted lately by USAID loans to the tune of \$15.8 million for Hindustan Motors, \$13.7 million for Telco and \$3 million for Premier Automobiles, which have helped finance the import of the necessary capital equipment. In October this year, Mr. C. Subramaniam stated in the Rajya Sabha that Hindustan Motors had raised the indigenous content of their Ambassador car to 76.9 per cent in value, while Premier Automobiles had stepped up the indigenous content of their Fiat-1100 to 64.1 per cent and Standard Motors, the indigenous content of their Standard-10 to 61.81 per cent. Similar progress has also been made with regard to trucks where the indigenous content of Dodge, Tata-Mercados-Benz, Bedford and Leyland Comet trucks have been taken up to 79.85 per cent, 74 per cent, 60.4 per cent and 71 per cent respectively. In the case of jeeps, the indigenous content is now around 71.3 per cent. This trend is likely to be strengthened further with the release of about Rs. 25 crores of foreign exchange by the Government in October this year, thanks to the World Bank agreeing to the utilisation of a part of its loans for truck manufacture. Hindustan Motors has secured additional external finance through a loan of £450,000 from the Commonwealth Development Finance Company. There are indications that the limitation of foreign exchange could be exaggerated. Provided the Government could adopt a truly dynamic policy for this industry, finance, internal or external, is hardly likely to be a bottleneck.

Machine Tools: Mother Machines Need Mothering

THIS COUNTRY generally, and Hindustan Machine Tools in particular, have come a long way since a visiting expert from the United Kingdom, after inspecting the HMT at Bangalore, chose to describe it as a lady "all dressed up and nowhere to go". Hindustan Machine Tools is now rightly regarded as an outstanding performer not only in the public sector of industry in this country but also in the total industrial landscape. The spectacular success of one single unit, however, should not blind us to the fact that in the matter of machine tools, as in many other such matters, what has been done is a fraction of what needs certainly to be done and what perhaps could have been done. The industry today is credited with a capacity of about Rs. 11 crores of products in value and the actual output is also of the same order. But there are machine tools and machine tools and if we apply the rigid tests by which advanced industrial countries grade what they consider properly to be machine tools, it is possible that the size of the machine tool industry proper in this country may be considerably smaller than is imagined. This would imply that more effort is needed in this field than is perhaps assumed to be necessary. Secondly, this would also mean that the Government's policy of restricting the import of machine tools may not be the right policy. While it may be conceded that the domestic industry, in its development stage, needs some protection against imports, it is to be seriously considered whether this protection cannot be given by some other means than that of putting curbs on import of machine tools. It is often forgotten that machine tools are required even for the further production of machine tools. It follows that the curtailment of categories of machine tools which are not at present being produced in this country would in effect mean the curtailment of the growth of the domestic machine tool manufacturing industry itself. It seems to us that the Government's import policy with regard to machine tools needs to be re-examined and we would strongly suggest that if the Government is at all to have any prejudice in this matter it is well that the prejudice should be in favour of allowing the free import of all categories of machine tools which are not at present being manufactured here.

Rapid Progress

It is interesting to recall that in 1951 this country was producing barely some Rs. 34 lakhs worth of machine tools. Today not only has production increased but also the range of manufacture which covers high speed lathes, high precision central lathes, general purpose central lathes, turret lathes, lathe chucks, lathe cone-pulleys, milling, gear-cutting, shaping, slotting, grinding, special can making and planing machines, radial drills, power presses, tungsten carbide tipped tools and rock drills, gas welding and cutting equipments, portable electric and pneumatic tools, sheet metal machinery, boring machines, special purpose machines, hydraulic unit heads and

carbide grinders, besides other descriptions. Plans are now under way to start manufacture of machine tools on the turning principle, industrial furnaces, automatic lathes and various other complex types.

As the country's industrialisation proceeds, it is being found that the demand for machine tools is developing much ahead of its domestic production. The demand was originally expected to go up to Rs. 60 crores by the end of the third Plan, but even by the end of 1962, the nation's evident requirements of machine tools had grown to Rs. 41 crores. This amount is probably an under-estimate since, if more supplies are more easily available, a significant order of potential demand would probably come to surface. It is obvious that the Government's planning for this industry has no proposals for stepping up production to anywhere near prospective demand levels. It is estimated that the production might increase to Rs. 25 crores worth of machine tools by 1965-66. Here the main reliance is placed on the Hindustan Machine Tools which has a target of Rs. 10 crores for the third Plan, but is confident of exceeding it by another Rs. 6 crores. The HMT organisation has a programme of setting up one unit machine tool factory every year up to 1970. These units will each have a capacity of Rs. 5 crores in value of machine tools per annum. To its two existing units in Bangalore, the Hindustan Machine Tools recently added one at Pinjore in Punjab. Two more plants, one each at Kalamassery (Kerala State) and Sanatnagar (near Hyderabad), are expected to be commissioned in 1964 and 1965 respectively. These five units will have a combined output of Rs. 16 crores worth of machine tools by 1965-66: HMT I and II at Bangalore — Rs. 5 crores each; HMT III at Pinjore — Rs. 5 crores; HMT IV at Kalamassery — Rs. 1.5 crores and HMT V at Sanatnagar — Rs. 50 lakhs.

The third Plan target is Rs. 30 crores in value of machine tools. But despite the HMT's fine performance, this target is unlikely to be reached. One reason is that elsewhere in the public sector things have not by any means been going equally well. The expansion scheme of the Praga Tools Corporation, which is being carried out with Polish assistance, has fallen behind schedule. This programme aims at raising the output of that plant to Rs. 2.5 crores per annum in value. The Ambarnath Ordnance Factory, always a sick child, is having troubles with its scheme for turning out Rs. 1 crore worth of machine tools per annum for civilian use. The Heavy Machine Tools plant at Ranchi is now expected to go into production some time in 1966, but its output which could be of the order of Rs. 3 crores per year will not be available within the third Plan period.

In the third Plan a dramatic touch has been added to

ANDHRA PRADESH

the Government's already considerable presence in this industry by the Heavy Machine Tools plant which is being built at Ranchi with Czech collaboration. This project is expected to go into production early in the fourth Plan period. While its capacity may be subsequently increased to 20,000 tons a year, it is designed to produce, at the completion of its first phase, the types of machine tools as given in the table below to an aggregate weight of 10,000 tons per annum.

Private Sector Lags

Meanwhile in the private sector too, development has lagged behind the third Plan production target of Rs. 10 crores. This is due in part, to some of the licensees having difficulties in raising internal resources or securing foreign collaboration. This difficulty can only be solved by more positive co-operation between the Government and entrepreneurs in the industry. In view of the high priority which the machine tool industry should necessarily enjoy, the issues

of external know-how and finance and domestic funds should be more positively dealt with than has been the case so far. This apart, it is also necessary to examine whether the Government's licensing procedures have not also been coming in the way. Some 200 applications for new schemes were reportedly received up to August this year, but it appears that only about half that number had been cleared by that date. The industry has also complained of delays in the clearance of capital goods requirements even after manufacturing licences have been granted. It is evident that there is need for a co-ordinated promotional policy in the case of this industry. The World Bank recently agreed to allow a part of its loans to be used for meeting the foreign exchange requirements for the expansion of the machine tools industry. This solicitude will not bear full fruit unless the Government of India, for its part, is prepared to be equally accommodating in such matters as the prompt and unrestricted licensing of capital goods needed by this industry.

HEAVY MACHINE TOOLS PRODUCTION PATTERN

Description of Items	Range of sizes to be produced in H.M.T.P.	Peak Production per annum	
		Nos.	Weight (in tons)

PNB

A Bank for You — A Bank for the Nation

TOTAL ASSETS EXCEED Rs. 240 CRORES

* OLDEST IN EXPERIENCE — but young and progressive in outlook, The Punjab National Bank is very much a NATIONAL BANK — the first truly Indian Bank to be established in this country. It came into being in 1894 — at a time when the Indian National Movement was first stirring the country. Its founders were six pioneers from different parts of the country with different faiths and backgrounds — but single-minded in their aim “to provide their country with a truly National Bank and to safeguard the economic interests of the people”. Thus was established the P. N. B. — entirely owned, managed and operated by Indians.

** LARGEST NUMBER OF OFFICES — PNB today holds a proud place among the big five banks in India. It serves almost a million people through its 433 offices — a number unequalled by any other banking company in the country.

*** LEADER IN MODERN BANKING — TO give you more prompt and efficient service, PNB has constantly endeavoured to introduce the most modern methods. The PNB is proud to be the first bank in India to introduce the Teller System, install IBM Machines and establish a Staff Training College for the training of its personnel at all levels.

THE PUNJAB NATIONAL BANK LTD.

Industrial Machinery: A Problem in Planning

IT IS A favourite pastime of the Government to affirm on the slightest provocation, or without any provocation at all, that it is determined to develop heavy industries in this country and that nobody can stop it. Surely, there isn't anybody who is interested in obstructing the development of capital goods industries. Large-scale industrialisation would necessarily involve extensive installation of industrial machinery of all kinds. To some extent this equipment can be got from abroad. Indeed, imports up to a point are essential. This is because the fabrication of the equipment of modern industries demands a higher level of technology and a developing country by definition does not possess that order of technology. Nor does it have either the large industrial base or the considerable market which is necessary for the economic production of heavy or complex capital goods. Finally, if quality is important in all industrial products, it is particularly important in the case of capital goods where performance cannot fail to come up to specifications without giving rise to serious technical as well as economic problems in the running of the industries installing the equipment. For these reasons, the development of capital goods industries has got to be carefully planned and phased. If there is any criticism of the Government's attitudes in this matter, it is only that it frequently tends to place the cart before the horse. This kind of activity may indicate zeal but is unlikely to be rewarded by achievement.

Projects in Public Sector

At the present time four big projects in the heavy industrial machinery field are in progress in the public sector. The Government's Heavy Engineering Corporation aided by Soviet and Czech capital and know-how, is in charge of their implementation. The Heavy Machine Building Plant at Ranchi has the benefit of Soviet collaboration. It went into pilot production in November this year and is expected to be fully production in November the middle of the fourth Plan period. It is commissioned by the middle of the fourth Plan period. It is designed to produce diverse types of heavy machinery items such as equipment for iron and steel, mineral oil, coal mining, chemicals, fertilisers and cement industries, apart from some engineering items for general industrial use, such as heavy cranes, excavators, oil drilling rigs and crushing and grinding equipment. The stress, however, is to be on the production of machinery for the iron and steel industry, for the expansion schemes of existing steel plants as well as for the Bokaro and other new units. Originally planned to produce only 45,000 tons of machinery per annum, the capacity of this plant has now been raised to 80,000 tons, with provision to expand it further to 165,000 tons, if necessary. When in full production up to 80,000 tons capacity, this plant will be turning out annually the following quantities of various types of machinery, worth nearly Rs 42 crores:

Description	Output (In tons)
Coke Ovens and Bye-Product Equipment	.. 7,700
Blast Furnace equipment	.. 5,500
Steel Making equipment	.. 7,000
Crushing and Grinding equipment	.. 3,150
Crane equipment	.. 6,570
Rolling Mill equipment	.. 34,500
Spare parts of metallurgical equipment	.. 1,080
Heavy Mining equipment	.. 880
Excavators	.. 4,950
Press Forging equipment	.. 1,360
Heavy Oil Drilling Rigs	.. 5,500
Miscellaneous Heavy Machine parts & Assemblies	.. 1,810
Total	.. 80,000

Near the Heavy Machine Building Plant is being put up a Heavy Foundry and Forge Plant with Czechoslovak assistance. Castings and forgings of practically any type and composition, weighing from a few pounds to as much as 100 tons, are proposed to be manufactured here. When in full production by 1967-68 (pilot production may start in 1965), this plant will turn out castings and forgings to the following annual capacities: Grey iron foundry 46,600 tons; Steel foundry 88,382 tons; Non-ferrous foundry 700 tons; Forge shop 32,954 tons; Rough machine shop 64,015 tons. Machine and heat treatment shops for rolls 21,310 tons. Most of these products will be utilized by the Heavy Machine Building Plant. But some surpluses will be available for meeting the requirements of heavy castings and forgings of various other industrial units as well.

The third project in this series, which is being established at Durgapur with Soviet help, will be manufacturing, again by the middle of the fourth Plan (pilot production was started in November last), coal mining machinery to the tune of 45,000 tons per annum worth nearly Rs. 24 crores. Its product pattern will be as follows:

Description	Quantity	Weight in tons.
Coal Cutters	.. 600 pieces	1,704
Loaders	.. 250 pieces	1,371
Conveyors	.. 1,800 pieces	22,487
Trolley & Battery Type Electric Mine Locomotives	.. 150 pieces	1,300
Haulages	.. 400 pieces	3,804
Main Axial Fans	.. 100 pieces	1,154
Electric Winders	.. 25 pieces	1,167
Booster Fans	.. 250 pieces	50
Centrifugal Pumps	.. 500 pieces	998
Sand Pumps	.. 300 pieces	550
Automatic Cage Keps for use in vertical Shafts and Safety Detaching Hooks, Clips, etc.		2,000
Light Drill Rigs for exploration drilling	.. 25 pieces	28
Spare parts		8,323

Another giant project in the industrial machinery field is the Heavy Pressure Boilers Plant which is being set up at Tiruchirapalli in Madras State. This is also a public sector project, the collaboration in this case being provided by the Czech Government. This plant is an integral part of the plan for manufacturing heavy electrical equipment. It was originally planned to produce boilers upto 300 tons of steam corresponding to a 75 MW unit, with a pressure of 100 atmosphere and temperature of 530 degree C. In the light of the prospective demand, the range of its manufacture has now been extended to suit 100/120 MW and even larger steam turbines, including the "once through" types operating near critical pressures. Production is expected to start by 1966-67 and the annual capacity of the plant is designed for an output worth Rs. 20 crores in a year.

It is certainly true that these big projects in the industrial machinery field will in due course lend weight and substance to the industrial structure of the nation. Their orderly progress will therefore be watched with keen interest. As has been emphasized earlier, the important thing is to maintain a high level of productivity and high order of quality in the product. The standards of technical expertise and business management which these projects are able to command both during construction and after commissioning con-

sequently, are of material significance. So far as ambition goes, the Government certainly has not been lacking in it in the contemplation of these projects. It remains to be seen whether this ambition will be matched by ability in performance. Already a certain concern has been occasioned by the fact that the Ranchi Heavy Machinery Building Plant has been taking more time and money than was originally expected. This plant is now passing into the production stage and its performance will certainly be relevant to an informed judgement of the efficiency of the Government's plans and programmes in the heavy industries field.

Expansion in Private Sector

Apart from these spectacular projects, there has been some expansion of the production of industrial machinery of various types, chiefly in the private sector, in the last ten years. The manufacture of cotton textile machinery which was only of token value before 1951 has now widened into a range of manufacturing and processing equipment such as carding machines, ring frames, looms (plain) Augusta pneumatic suction and high draft conversion systems equipment, washing machines, water mangles, dyeing jiggers, cloth printing and stentering machines, drying cylinders, soapers, kiers and heaters. Similarly, the manufacture of jute mill machinery has also developed fairly rapidly, thanks to the modernisation programme put through by the jute industry. Items of jute mill machinery now being manufactured in this country include light and heavy yarn spinning frames, drawing frames, broad looms, cone winders, pre-beamers, dressing machines and automatic machines (one neck).

Of more recent development is the manufacture of complete plants for the sugar, cement and chemicals and pharmaceuticals industries. Sugar mills machinery manufacturers claim to be in a position to fabricate 14 new standard sugar plants every year, besides equipment equal to another nine such plants. The production of high speed centrifugal and heavy duty gears for milling plant for the sugar industry has also been started. Cement machinery manufacturers are now able to undertake the fabrication of complete plants of 600 tonnes of cement capacity per day. The installed capacity of the industry, it is claimed, will go up to nine such plants per annum in the near future. In the case of paper machinery, the capacity is mainly for the fabrication of plants upto 10 tons of paper capacity per day. But it is said that some capacity is also available for the manufacture of plants with capacities up to 50 tons of paper per day. The tea industry has put up capacity to produce practically all tea processing equipment. As regards coal mining machinery, capacities are available for the manufacture of haulage equipment, conveyors and coal-cutters. Three units have been licensed recently for the manufacture and installation of complete coal washery plants in collaboration with British or American firms. Another interesting recent development is the project for the manufacture of flatbed printing machines.

Table I on page 1409 shows the present position of the various industrial machinery industries with regard to capacity and production (the capacities expected in as well as planned for, 1965-66 are also shown for comparison).

It will be seen that, whereas the third Plan capacity targets for cotton textile, jute, sugar, cement and tea machinery

GOVERNMENT PRODUCTION UNITS

UNITS WHICH UNDERTAKE TO MANUFACTURE & SUPPLY QUALITY PRODUCTS.

TANNING AND FINISHING UNIT
Vinnamangalam (North Arcot Dist.)

Finished leather of all types like Suede, Zugrain, Sole Leather (Chrome Bark) etc.

GOVERNMENT FOOTWEAR UNIT
Perambur, Madras-12

All types of footwear (Shoes, Boots, Chappals Etc.) and any other leather goods of required specification.

GOVERNMENT CERAMIC CENTRE
Vridhachalam (South Arcot District)

Water Closets, Urinals, Wash Basins, Sinks in various sizes, Crockery, in attractive shapes and designs.

GOVERNMENT LOCK UNIT
Dindigul (Madurai District)

Door Locks and Latches of all types.

WOOD WORKING UNIT
Guindy, Madras-32

Wooden articles like Tent Pegs, Handles, Mallets etc. and Wooden furniture.

BOLTS AND NUTS UNIT
Erode (Coimbatore District)

Bolts, Nuts and Rivets of various sizes.

GENERAL PURPOSE ENGINEERING WORKSHOPS
Rajapalayam & Vellore

Hospital Furniture like Cots, Bedside Lockers, Diet and Medicine Trolleys etc., etc.

Apply to the Superintendents of the respective units

Issued by the **DIRECTOR OF INDUSTRIES AND COMMERCE, MADRAS-5**

are likely to be achieved, considerable shortfalls are to be expected in the case of paper and ceramics machinery and cranes. The lag in the manufacture of paper machinery, however, does not seem to be causing concern in view of lack of the orders for such machinery. The manufacture of cranes continues to be under the open licensing list and it is believed that some new schemes may come up in this line.

Perhaps a more serious problem than the lag in the expansion of capacity in some lines of machinery is the partial utilisation of installed capacities in several others. With the exception of the cotton textile machinery and jute machi-

nery industries, the underutilisation of capacity seems to be a serious problem in these industries and it is possible that this is perhaps part of the more general problem of under-utilisation of capacities in the engineering industries as a whole. Among the factors responsible for the situation are the insufficiency of raw materials, particularly certain categories of steel products and non-ferrous metal products, many of which have to be imported to a considerable extent. The shortage of power in many parts of the country has been another limitation. To the extent that the manufacture of industrial machinery is considered to be of urgent importance, this unhappy situation has to be corrected by assigning relatively high priority in their requirements of power and also raw materials, domestic or imported. It is also necessary for the Government to consider ways and means of liberalising the allotment of foreign exchange for the import of essential components and capital goods including machine tools.

It is necessary here to bear in mind that, in the case of industrial machinery mere production is not enough, the products have got to come up to certain standards. Otherwise the technical and economic foundations of the industrial development of the country would become vitiated. In the case of most items of industrial machinery manufactured in this country, there is still a lot to be done before international levels of performance can be claimed. In the case of many items of domestic industrial machinery, the user-industries are found complaining of manufacturers' reluctance to guarantee deliveries or performance. This is certainly not a very satisfactory situation and besides dramatically affirming in Parliament its anxiety to develop basic industries in this country, the Government should address itself to the more prosaic, but certainly more relevant, task of providing foreign exchange to the industrial machinery industries for import of capital goods, components and technical know-how, so that they may be organized on sound lines and function as a source of strength for and not as a cause of weakness in the national industrial structure.

UNITED NATIONS**WORLD ECONOMIC SURVEY 1962****I. The Developing Countries in World Trade**

Part I of the annual survey of the world economic situation focuses attention on the position of the developing countries in world trade, with emphasis on international trade, payments and production; international commodity problems; trade between developing countries; and the expansion of export markets from the developing countries.

Jute: Dangerous Corners Ahead

SUPERFICIALLY THERE does not appear to be much that is presently wrong with our jute industry. The industry is working to full capacity and production, in recent months, has touched an annual rate of 1.3 million tons which is the target fixed for the final year of the third Plan. And even more than the third Plan target, the export target of 900,000 tons for the end-year of the Plan has also been hit already. The industry, by exporting 891,000 tons of manufactures, earned Rs. 156 crores in the year ended March, 1963, which makes it the nation's leading earner of foreign exchange. Incidentally, the value of exports of jute goods in the last year of the third Plan is estimated in the Plan at only Rs. 140 crores. It is true that, lately, export trends have not been altogether bright, particularly with regard to the trade in sacking, but there is also a considerable improvement in the outlook for trade with the Soviet Union and some of the East European countries.

Nevertheless, there is a serious problem of production in the jute industry. Actually, this problem is a problem of production in the sense that every industry produces only in order to sell. The problem for the jute industry is whether it will continue to be able to sell well to the rest of the world in competition with the jute industry in Pakistan. It is undoubtedly odd that this critical issue was not discussed even casually in the report of the Jute Committee set up by the Ministry of Commerce and Industry in March, 1962, and which reported to the Ministry of International Trade in January, 1963. In the Introduction to its Report, this Committee courteously apologises for not having been able to consider the possible effects of the national emergency which arose when the Report was in the final stages of preparation. This meticulous attempt at underlining its sense of responsibility would have been more impressive had the Committee deigned to explain in its Report why it did not regard the issue of Pakistan competition as of sufficient importance to have found a place in its discussion of the problems and prospects of the jute industry. It should be interesting to know whether the Committee had received any informal or unwritten directive from the Government in this matter or whether its attitude to this question was influenced by the prejudices of preferences of one or more of its members.

Mischief Undone

Whatever might have been the motives for the curious conduct of the Committee in this matter, the mischief that might have been caused by its silence on the vital question of Pakistan competition has been undone to some extent by the Export Study Group on Jute manufactures presided over by the present Jute Commissioner. The Study Group concedes in its Report that the emergence and rapid expansion of the Pakistan industry presents a very serious challenge to Indian mills. With the growth of Pakistan's jute production, India's exports of sacking have been correspondingly declining. The following table will bring out this fact:

EXPORTS OF SACKING FROM INDIA AND PAKISTAN

Year	Total Tons	From India	From Pakistan
		%	%
1957	482,300	87.6	12.4
1958	417,500	81.5	18.5
1959	482,500	72.3	27.7
1960	429,600	71.6	28.4
1961	417,100	66.9	33.1
1962	449,500	64.0	36.0

It has been repeatedly represented to the Government by the industry that Pakistan has made substantial inroads into our traditional markets for sacking, such as Australia, Burma

and Cuba. As a result, a sad position has been reached in which India is only left with orders which the Pakistan industry cannot handle with its present production. Pakistan now has an installed capacity of about 10,000 looms and has recently announced plans for adding to this number another 5,000 to 6,000 looms over the next few years. As the loomage in Pakistan increases, that country will be able to offer more sacking for export and this would cut further into Indian exports of this material. The threat, however, is not confined to sacking, although Pakistan has so far been concentrating on this line of production. As Pakistan industry expands and becomes more sophisticated, it is bound to turn to increased production of hessian as well and offer more quantities of this type of manufacture to world markets.

Balance Sheet Struck

In a systematic study of the problem of Pakistan competition, the Export Study Group has listed the advantages enjoyed by the Indian jute industry over the industry in Pakistan and the advantages enjoyed by the Pakistan industry over the Indian and struck a balance sheet. This part of the report is reproduced here in view of its great importance for a proper understanding of the main problems which India's premier export industry now faces:

"Advantages of India over Pakistan:

- (a) Power charges in India are lower than in Pakistan.
- (a) Labour is more efficient in India than in Pakistan, resulting in better output per man per hour.
- (c) With better results of research and technique, it will be possible to lower the cost of jute batch in India.
- (d) Depreciation cost in India is lower because part of the machinery has already repaid its value (excluding modern preparing and spinning machinery installed) and because Pakistan's capital outlay is proportionately several times higher than that of the Indian industry.
- (e) The Indian industry gets almost all supplies of stores and accessories from indigenous sources at cheaper rates, whereas Pakistan industry has to pay import duties on many of its stores items.

"Advantages of Pakistan over India:

- (a) Pakistan possesses the most modern machinery, with higher productive capacity per man.
- (b) Pakistan has abundant good quality of raw jute. The industry gets jute of superior quality at lower prices. The use of good quality jute gives a better quality of product. Pakistan has fixed its minimum raw jute prices at rates which are about Rs. 6.00 per maund below that for the comparable Indian variety. Stock operations are at 10 per cent below even the minimum prices. The incidence of freight from the cultivator's fields to the mills is less than a third of that in India. The Pakistan industry is also protected by an export duty on raw jute. The overall advantage enjoyed by Pakistan in the price of jute and cuttings amounts to about Rs. 168.00 per ton.
- (c) Pakistan has got abundant supply of cheap labour which only needs to be trained. The efficiency of the Pakistan worker is gradually increasing with experience.
- (d) Pakistan's industry is not required to spend as much on modernisation as the Indian industry.
- (e) Pakistan's industry sells a part of its production at present in the internal market at high prices. The benefit so accruing is used to subsidise export prices.
- (f) Pakistan's industry enjoys the benefit of export bonus, the impact of which is about Rs. 180.00 per ton on hessian and Rs. 120.00 per ton on sacking.

"A careful study of the advantages in favour of India will reveal that most of them are of a temporary nature and will

ANNUAL NUMBER 1964

gradually disappear in years to come with progress of the Pakistan Industry. As for example, Indian power charges are gradually increasing and the labour productivity in Pakistan should also gradually improve through experience and training. With modernisation in weaving, the relative depreciation cost in India will also be on the higher side. On the other hand, if India's depreciation cost is based on the replacement prices for purposes of comparison with Pakistan's depreciation cost, the quantum of benefit will certainly be very much lower than what is seen by comparing figures as per books of accounts.

"The picture of Pakistan's cost advantages over Indian jute goods in the export markets makes the necessity of an all round productivity drive vitally important to meet the challenge although it is appreciated that only a part of the deficit can be met by cost reduction through higher productivity. It is necessary for the Indian Industry to diversify its production and take to more and more sophisticated manufactures. In this connection the role of Research and Market Development is of vital importance. The serious competition from Pakistan at present, applies to jute goods of sacking quality, but very soon it will start having serious repercussion in respect of hessian and speciality goods also.

Immediate Measures

"The Study Group recommends that immediate measures be taken to work out a suitable solution to the problem and an appropriate machinery set up for dealing with it."

It may be added here that according to one estimate the cost difference in favour of Pakistan works out to about Rs. 454 a ton for sacking as per the following details:

Cost of raw jute	= Rs. 224
Labour cost	= Rs. 60
Export bonus	= Rs. 165
Emergency Risks Insurance	= Rs. 5
TOTAL	= Rs. 454

It is clear that, if the Government of India is serious about protecting the large export earnings from the industry, it cannot afford to ignore the implications of this analysis indefinitely. The time has certainly come for the Ministry of International Trade to summon sufficient courage to look the facts in the face and impress upon the Government generally and the Finance Ministry in particular the need for taking bold and adequate steps for dealing with the dangerous potential of increasing Pakistani competition.

It is perhaps not irrelevant to return at this stage to the Report of the Jute Committee which, while fighting shy of dealing directly with the issue of Pakistan competition, nevertheless thought it proper to salve its guilty conscience by blaming the Working Time Agreement of the Indian Jute Mills Association for promoting the manufacture of jute to take shape in Pakistan. The Jute Committee has argued that by restricting production through the Working Time Agreement, the Association has been guilty of creating conditions for the emergence of a rival industry in Pakistan. This surely is a childish complaint. After all, once Pakistan had secured 80 per cent of the jute - growing area of undivided India, it was bound to develop a jute manufacturing industry in due course. India could never have prevented and cannot now prevent Pakistan from having a sizable jute industry. What can and ought to be done at the present time is that the Pakistan industry is not assisted by any of our acts of commission or omission in growing too big, too fast.

As it is, India's loomage of 72,960 represents 50 per cent of the world loomage as against Pakistan's loomage of 8,726 working out to 6.85 per cent of the world loomage. Since, however, the Pakistan industry is working at 2½ shifts, whereas

Indian loomage is based on the equivalent of single shift working, the proportion of Pakistan's effective loomage actually works out to about 30 per cent of India's capacity. The problem is to see that this proportion is not upset by a more

rapid growth of the industry in Pakistan than in India. From this point of view the Jute Committee was not only barking up the wrong tree when it condemned the Working Time Agreement, but it also chose to forget a much more relevant fact that if India's production of jute goods did not go up as much as it could have done during the decade 1950-1960, it was not because of the Working Time Agreement, but because of the crippling export duties of Rs. 1,500 a ton on hessian and Rs. 350 a ton on sacking which the Government of India insisted on maintaining long after the harm they were doing to our export capacities had become obvious. Apart from the fact that such high export duties were an invitation to Pakistan to go ahead with the development of its jute industry, the heavy export taxation necessarily cut into the resources of the Indian jute Mills in this country and thereby made it more difficult for them to modernise and rationalise their plant and machinery.

Amusing Assertion

This is not to say that the utility or propriety of the Working Time Agreement should not be examined from time to time. On the contrary, no such arrangement can be regarded as sacrosanct and the jute industry is certainly under an obligation to demonstrate whenever it is called upon to do so the continuing justification for such arrangements. The Jute Committee, however, was merely amusing itself by delivering 'obiter dicta' when it asserted that the Working Time Agreement was "essentially restrictive." It is no doubt true that the Indian jute industry was working around 10 per cent below capacity for most of the years between 1950-60, but that was not because there was any organised attempt on the part of the Indian Jute Mills Association to curtail production in order to benefit Pakistan or fleece the raw jute growers of this country or the consumers of Indian jute goods abroad. We have already referred to the high export duties which were bearing down heavily on exports. The devaluation of the Indian rupee in 1949 and the fact that Partition had left the Calcutta jute mills at the mercy of uncertain and irregular sources of raw jute supplies from Pakistan were other factors which came in the way of the orderly functioning of this industry in those years. It was not until 1955, when Pakistan had also devalued its currency and the cultivation of raw jute and mesta within India had reached respectable proportions, that there came into the functioning of the Indian jute industry some elements of relative stability. The Working Time Agreement, in its true substance, was in the nature of a device for spreading out evenly through the industry the impact of the extraordinary stresses and strains of this period. The Agreement was designed to adjust in a flexible manner the production of jute goods to the world demand for it. Every industry, indeed every unit of an industry, is not only entitled but is even obliged to carry out such adjustments in production. If it does not do so, it will only run into losses and ruin itself.

It may also be explained here that by adjusting production to demand, the Indian jute industry could also obtain for the country the maximum possible export earnings out of a given amount of exports. This consideration became all the more important when due to short jute crops during those years, the output of jute goods had in any case to drop to a lower level. It is no doubt true that high prices of jute goods had encouraged substitutes, but where fluctuations in prices are of a seasonal character relative to the vagaries in the harvesting of the agricultural raw material, consumers of the finished product do generally appreciate the fact that price increases in those circumstances are of a passing nature. The real mischief is done only when extraneous factors such as the unwise export taxation leads consumers abroad to assume that the Government of the exporting country is attempting to exploit for fiscal purposes foreign buyers of its products. It is therefore wrong to blame the Working Time Agreement either for the growth of the Pakistan industry or for the

development of substitutes for jute manufactures in the world at large.

Although the Jute Committee has dubbed the Working Time Agreement as essentially restrictive, the basic restrictive

factors in the jute industry are the vagaries in the availability of raw material or power. The Working Time Agreement is only a device for distributing evenly and fairly over all units of the industry the disadvantages of such bottlenecks. If the Working Time Agreement was "essentially restrictive," the industry could not have been operating at full capacity from the beginning of last year when comfortable supplies of raw jute and favourable trading conditions have made it possible for the industry to do so. More important still, if the Working Time Agreement was a restrictive instrument, the jute industry could not and would not have undertaken and carried out an extensive modernisation programme on which it has spent about Rs. 30 crores, including loans amounting to over Rs. 7 crores given to the industry by the Government through the agency of the National Industrial Development Corporation. Thanks to this modernisation programme, the Indian jute industry has been able to incorporate into the various stages of the processing of jute prior to the weaving operation, the latest technological developments which have taken place in that field.

Modernisation Plan

The industry is now planning to take up the modernisation of its post-spinning equipment. The old winding equipment is being replaced by new high-speed machines and additional pre-beaming equipment is also gradually being installed to increase the productive efficiency. Plans for the modernisation of the weaving process could go ahead once conditions such as the availability of foreign exchange, the expansion of the domestic jute mill machinery and a smooth solution of the probable impact of automation on employment have been satisfactorily negotiated. Meanwhile, there has been a remarkable readiness on the part of the Indian jute industry to take advantage of the phenomenal growth in the demand for carpet-backing cloth in the U.S. market in recent years. Since 1955, the mills in India have installed about 2,300 carpet-backing looms and it is estimated that another 500 of these looms will have been installed by the end of the third Plan and a further 1,000 looms by the end of the fourth Plan. Production is currently running at the rate of about 112,000 tons, representing about nine per cent of the industry's total production. The entire production is exported and the principal export market is at present the United States.

The Jute Committee has argued that the Working Time Agreement has afforded artificial protection to inefficient units in the industry. This particular contention needs to be seri-

ously examined. It is possible that there are some aspects of the Working Time Agreement or some particular applications of its principles which have given unnecessary or undesirable protection to less efficient mills. Specifically, it is necessary to find out whether the Working Time Agreement has resulted in situations in which some mills are enabled to transfer their loomage entitlements to other mills for a consideration. No arrangement is ever perfect and if there are aspects of the Working Time Agreement which could be dropped or modified with advantage, the matter should certainly be examined dispassionately by the industry and the Government. The Indian jute industry is fortunate in having one of the best organised trade associations in the country to speak for it and thanks to the development of the Jute Commissioner's organisation in Calcutta over the years, machinery for adequate and effective liaison between the Government and the Indian Jute Mills Association has been brought into being. This advantage should be enough to permit a full and frank discussion between the industry and the Government on matters which are relevant to the continued good health of this important export industry. In these circumstances, the Jute Committee certainly did not show sufficient sense of responsibility when it sweepingly and arbitrarily condemned the Working Time Agreement. This, however, should not prevent the Indian Jute Mills Association from taking the initiative in discussing with the Government such modifications in the Agreement as may be found to be desirable for the further growth of the jute industry in the critical years ahead when Pakistan will be making a strong bid for increasing its share of the world market in jute goods of all kinds.

Mutual understanding and cooperation between the Government and the industry are certainly vital requirements at the present time when the planning of the further development of the industry in terms of the fourth Plan has to be taken up. There is general agreement in the Government and the industry that the industry should aim at producing jute goods to the extent of 1.7 million tons and exporting its products to the extent of 1.1 million tons by the year 1970-71. These targets call for an additional annual output of 400,000 tons and additional annual exports of 200,000 tons. From the supply side, there should be no difficulty whatsoever in the industry achieving the increased output. The cultivation of raw jute seems to have been stabilized at a fairly high level and while there is certainly room for improvement in the yield per acre and the quality of the crop, it is not only fairly well

known what should be done in these directions but it is also well recognised in the industry and the Government that improvement in raw jute production should be pursued with vigour and on sufficient systematic basis.

As for manufacturing capacity, the Exports Study Group expressed the view that additional capacity could be easily created in the existing units by the installation of additional preparatory and spinning machinery as the extra loom capacity is already available with them in terms of multiple shift working. The Study Group had also pointed out that, as the expansion of existing units would be more economical and easy to implement, there was no need for new units at this stage. This argument is further strengthened by the fact that there are a certain number of units in the industry with capacities below 500 looms. It is desirable to encourage them to raise their capacity to that figure so that their scale of operation could be made more economic.

A bottleneck for the jute industry has been the shortage of power. Relief in this respect is tied up to the general development of power facilities in Eastern India, but it would be legitimate for the Central and State Governments to provide relatively high priority to the needs of this industry in view of its export importance.

Intriguing Picture

The demand side presents a more intriguing picture. Although the jute industry is an export industry, some part of its production is being consumed within the country. The internal consumption is now about 370,000 tons per year and it may go up to 400,000 tons by the end of the third Plan. It is considered prudent to provide for a further increase of 200,000 tons over the fourth Plan period. This would absorb half of the additional production proposed for the fourth Plan. It follows that in order to utilise the planned addition fully, this country should be able to step up its exports by 200,000 tons from 900,000 tons at the present time (or in 1965-66) to 1.1 million tons by the end of the fourth Plan. The question whether this country could expand its export of jute goods (or even maintain them at the present level) is related primarily to the problem of dealing effectively with the competition from Pakistan, actual and potential. Assuming that the Government would at some stage, but not at too late a stage, wake up to the need for dealing with the threat from Pakistan in an effective manner, the problem of additional exports would then have to be discussed in terms of the prospective growth in the world demand for jute goods.

The Food and Agriculture Organisation of the United Nations, after studying this subject in 1960, argued that the world consumption of jute goods was not likely to rise significantly in the following decade. This view was probably too

cautious even when it was recorded. Subsequent events have shown it to have been, in fact, unduly pessimistic. World consumption of jute goods had risen from an average of 1.5 million tons a year during the period 1946-50 to 2.65 million tons a year in 1960, a rise of about 77 per cent. The FAO was certainly justified in foreseeing some restriction of the demand for jute goods as a packaging material, particularly in the industrially advanced countries, as a result of the continuing competitive development of substitutes for jute cloth, such as multi-wall paper and polythene bags. But while the substitution would certainly prevent an increase in the consumption of jute cloth in the industrialised countries, there was—and there is—the likelihood, of which the FAO also was aware, of the industrially advanced countries increasing their consumption of sophisticated varieties of jute fabrics in new uses, such as floor coverings, furnishings, automobile upholstery and the like. The FAO could have allowed more liberally for the growth of this kind of demand than it did. It was also too conservative in providing for increased off-take of jute goods in the primary producing countries of Africa, West Asia, South-East Asia and Latin America where both population and agriculture are expanding. Here again, while the FAO noted the possibility, it failed to assess its significance.

Potential Demand

A third relevant factor to which the FAO study did not make due allowance is the potential demand in the centrally-planned economies of Eastern Europe as well as the Soviet Union. A delegation of the jute industry which toured the Soviet Union and the East European countries earlier this year has been considerably impressed by the possibilities of increased exports to those parts of the world. The Soviet Union, in fact, has already signed a long-term trade agreement providing for a fast and substantial increase in its off-take of jute manufactures. In these circumstances, it is now generally believed that there is no need to take too gloomy a view of the probable increase in the world demand which it is expected may well be of the order of about 3.8 million tons by 1970. On the basis that India's share of the world production of jute goods was around 45-50 per cent during 1958-61, it is considered reasonable to aim for the Indian jute industry a level of production of about 1.7 million tons by 1970. If out of this output about 600,000 tons are to be retained for domestic consumption, the Indian export effort in jute goods must be directed towards increasing the trade to 1.1 million tons, or 200,000 tons more than the present level. In the case of sacking, Pakistan already holds 32.5 per cent of the world market and it should be the endeavour of this country to see that the position does not change still further to its disadvantage. The sacking trade will be of special significance in the coming years since a great part of the total world demand for jute goods will be in the form of sacking required by the developing countries of Asia, Africa and South America. In the case of hessian, where the Indian jute industry today com-

THE NEW WET DOCK

Madras Port - Equipped with modern facilities for the vast and rapidly industrialising hinterland. The new Wet Dock for six vessels will be ready shortly. Vessels up to 35 ft. draft can be taken in at this Dock. A 120-ton Heavy Lift Crane is on order.

mands a leading position, the potential competition from Pakistan cannot with prudence be ignored. Pakistan has the two great advantages of good quality raw jute and modern machinery. Both advantages are bound to count heavily in favour of that country so far as the hessian trade is concerned. There is, therefore, no room for complacency. It is just because the production target of 1.7 million tons and export target of 1.1 million tons projected for the fourth Plan are eminently reasonable, it would be a tragedy if there is to be failure in terms of the framing and pursuing of proper industrial and trade policies needed for ensuring the fulfilment of those goals.

Mutual Agreement

It would, however, be wrong to leave this subject without making it clear that while India should certainly take measures promptly for countering and containing the competition from the jute industry in Pakistan in the export markets of the world, it will be extremely short-sighted on our part not to be thinking simultaneously of a mutually satisfactory long-term agreement with our neighbour on the development of the jute industry of the two countries. So long as Pakistan is committed to special fiscal and other measures for facilitating exports of jute goods, this country cannot avoid thinking in terms of compensatory relief for its own industry in the export trade. Nevertheless, competitions on these lines, if carried beyond a point, are bound to prove mutually frustrating. Secondly, a policy of hot-house development of the jute economy will do no good in the long run either to Pakistan's interests or ours. As the only two significant raw jute producing countries and as the principal jute goods manufacturing and exporting nations, India and Pakistan have to deal with certain common problems in relation to the world outside. The problem posed by the challenge of substitutes is one which concerns equally the jute industry of Pakistan and the jute industry of this country. Pakistan has so far been exporting some part of its raw jute production to other countries of the world. So long as the Pakistani industry itself could use only a part of its raw jute output, this might seem a profitable course to follow, but in the long run Pakistan is bound to suffer through a policy which assists the operation of highly protected jute manufacturing facilities abroad. This is a consideration which the Pakistan Government must sooner or later come to recognise in framing its raw jute policy.

There is also another aspect of this problem of raw jute. After partition, India has been forced to expand the cultivation of raw jute. With one of its most important export industries being based on this raw material, India must necessarily consolidate its raw jute production and put it on a firm and stable level. At the same time, an indiscriminate expansion of acreage, whether in India or Pakistan, is bound to weaken the competitive positions of the jute industries of the two countries in the world export markets. Such a trend will also

not be to the advantage of the jute growers either in India or Pakistan. The jute growers are already among the poorer sections of the population in either country. Their position in Pakistan is, if anything, worse than their position in India since the level of raw jute prices is considerably lower in Pakistan than here. It is true that the grower in East Bengal is compensated to some extent by a higher yield per acre, but it is surely not right to argue that the benefit of a higher yield per acre should not accrue as a positive net gain to the raw jute producer. Although in the short period it may be considered an advantage to the Pakistan industry that the Calcutta mills are having to pay a higher price for the jute, a gross disparity between the raw jute prices between the two countries is, in the long run, bound to prove detrimental to the cultivation of raw jute in Pakistan.

For all these reasons, it is very desirable that the representatives of the two countries should decide to come together and discuss the common problems of the jute economies in terms of a far-sighted joint-planning of the healthy growth of jute cultivation and jute manufacturing in both countries. All over the world the tendency is for primary producers to come together in some way or the other to safeguard their interests in world markets. It has been shown that where such commodity agreements are properly planned and pursued, they do not exercise any restrictive effect on production, trade or consumption. On the contrary, they result in an orderly development of production, trade and consumption. It is nothing less than a tragedy that Pakistan and India, which are neighbouring countries and which share the problems as well as the possibilities of one of the world's leading export trades, should not only not be co-operating even to a minimum extent, but should be actually indulging in mutually harmful bouts of short-sighted scoring of advantages over each other.

Despite the political difficulties that persist in keeping the two countries apart, there has also always been a modicum of sanity in both countries which has refused to stop believing that an effort cannot be made at least in the economic field to bring the two countries together in joint endeavours for at least obvious and important commercial gains. Jute offers an excellent field for constructive effort of this kind. It is very much to be hoped that the Government and the jute industry in this country will take the initiative in exploring the possibilities of initiating with Pakistan a discussion on the common problems confronting the jute economies of the two countries with a view to the achievement of at least basic agreement on the less controversial particulars. We have no doubt that, while each country would naturally be vigilant in safeguarding its own interests in this export industry and trade which are so vital to both, the path of wisdom for both would seem to lead in the long run towards intelligent and responsive co-operation in the joint planning of the common progress of the jute economies of Pakistan and India.

ANNUAL NUMBER 1964

A N N O U N C E M E N T

This is not a Prospectus but only an announcement of a proposed issue of Debentures. Interested persons may obtain copies of the Prospectus from the Company's Registered Office and the Bankers, Underwriters and Brokers of the issue.

KESORAM INDUSTRIES & COTTON MILLS LTD.

(Incorporated on the 18th day of October, 1919 under the Indian Companies Act, 1913)

Registered Office: 15, India Exchange Place, Calcutta-1.

A EXISTING AND PROPOSED ACTIVITIES:

The Company is engaged in the business of manufacturing various types of cotton textile goods. The Company has also established two Filament Viscose Rayon Yarn Plants (known as Kesoram Rayon Unit No. I and Kesoram Rayon Unit No. II) and a Transparent Paper Plant.

The Company has now decided to implement its Cast Iron Spun Pipe Project with an installed capacity (on double shift working) for the manufacture of 30,000 tons of Cast Iron Spun Pipes ranging from 3" to 12" nominal bore and fittings per annum. The construction work in respect of this Project has already commenced and it is expected that by the end of 1964 it will go into production.

The Company has entered into agreements with M/s GHW-Gesellschaft Fuer Huetttenwerksanlagen, M. B. H. of West Germany for the supply of plant and machinery, drawings, instructions, standards and specifications, etc. for installation of a complete plant of the said Cast Iron Spun Pipe Project and delegating skilled staff for supervision of erection, commencement of operation and fulfilment of guarantee, as well as for training the Company's basic staff for the purpose. Besides, a tripartite agreement between the Company, the said M/s GHW-Gesellschaft Fuer Huetttenwerksanlagen, M.H.B. and M/s Buderus' Sche Eisenwerke of West Germany under which the foreign collaborators have inter alia agreed to render all technical know-how for production and process control, technical consulting services and all research development to the Company.

B. LOCATION OF THE INDUSTRY:

The Textile Unit of the Company is situate at 42, Garden Reach Road, Calcutta-24 and its Filament Viscose Rayon Yarn Plants and Transparent Paper Plant are situate at Tribeni, District Hooghly.

The Company's Cast Iron Spun Pipe Project is located at Bansberia, District Hooghly.

C. BOARD OF DIRECTORS:

first in Assam

AIA now meets the need of consumers in Assam, saves time... reduces costs. Consumers in and around Assam can get high quality chemicals i.e. sulphuric acid and sulphur dioxide; high potency fertilisers like super phosphates; tea and agricultural mixtures and quality cotton yarn from AIA plant at Guwahati. AIA plant is the most modern and assures you of high quality products at reasonable prices.

INDIA AND THE WORLD

Industrial Growth and Social Justice

CHESTER BOWLES

IN PLANNING and promoting their industrial growth, developing countries face a dual problem, both aspects of which are perplexing.

The first half of the problem is how to encourage the most efficient use of the capital, raw materials, and skills which are immediately available. What are the needs? What are the priorities? Is steel more important than cement? Are rails more important than roads, freight cars more important than trucks? And what about the 'pace' of industrial development? How should it be balanced with that of other sectors of the economy?

The second perplexing aspect of industrial development involves its impact on people and institutions. While industry must be stimulated to grow as fast as possible, we must be sure that it does not generate more evils than it eliminates. In Gandhi's words, "Scientific truths and discoveries should cease to be mere instruments of greed. The supreme consideration is the man."

In mid-nineteenth century Europe, Karl Marx, impressed by the harsh process of early industrialization, produced a theory of economic development and revolutionary change which profoundly influenced the views of millions of people. Marx's thinking was powerful largely because it was based on shrewd observation of life around him; it was limited because he saw only those facts which time, place and inclination permitted him to see. What Marx saw were the grim realities of everyday life in the crudest years of the industrial revolution. He saw the London slum-dwellers, crowded into hovels, working themselves to exhaustion under the insensitive demands of an ever-expanding economy. He saw their helplessness as individuals before the power of the men who owned the factories in which they worked and who controlled the governments under which they lived. Marx did not overstate the social evils and the injustice of man to man during the earlier decades of the industrial revolution. What he did do was gravely to underestimate the resiliency and capacity of democratic societies to change these conditions and to establish a socially responsible framework in which rapid development could take place.

Striving for Balance

In my own country we have been striving to create and maintain this balance between economic and social justice on the one hand, and rapid economic growth on the other, since the earliest beginnings of our Republic. Inevitably this has resulted in continuing conflict between those who saw the accumulation of wealth as an 'end' in itself, and those who looked on the economic process as the 'means' by which the individual can be set free in an atmosphere of opportunity, dignity and justice. The American Presidents who have been most respected are the ones who effectively upheld the interests of the people against those whom Theodore Roosevelt once described as "malefactors of great wealth". The list of Presidents includes Jefferson, Jackson, Lincoln, Cleveland, Theodore Roosevelt, Wilson, Franklin Roosevelt, Truman and John F. Kennedy.

Not only in America but in Japan, Britain, Sweden, Germany and other economically advanced democratic countries, Marx's assumption that a ruthless class struggle was inevitable between "the exploiters and the masses" has proved to be mistaken. Experience has demonstrated that men can in fact become the masters of the machines which they have created, that they can prosper in material things and at the

This is the third of a series of four lectures, which was delivered at the Delhi School of Economics on December 12, 1963

same time live in freedom.

In the developing nations of Asia, Africa and Latin America the necessity for this balance is now widely accepted. The difficulties occur when the concepts of social justice and industrial growth are related to means and techniques. Often the result is a sterile confrontation of economic and political clichés which diverts the public dialogue into channels which are wholly irrelevant to the questions at hand. It is for this reason that I have been at considerable pains to define my own terms of reference.

I

Having accepted the premise that rapid industrialization, however essential, cannot be allowed to proceed at the expense of the public interest, let us turn our attention to a strictly pragmatic consideration of the means by which industrial production can be expanded most rapidly and effectively within this moral framework.

Development, in the end, means improving people, not feeding statistics. We want the things industry can give us. It is our task to figure out how to get them in a free and just society and in a manner that will further the entire process of nation-building in its broadest sense.

We may start with an obvious fact: In any developing nation, the government must play a central and critically important role. Only through government planning, government capital and government supervision can many of the basic tools be provided which are required to start things moving—and moving in the right direction. For instance, the so-called infra-structure—the roads, rail transport, schools, power, the communications network—are in large measure a governmental responsibility.

Even in the United States where private enterprise has played such a central role, the government has often been forced to carry a heavy share of the responsibility. Shortly after the formation of the American Republic in the late eighteenth century, federal subsidies were provided to build our privately-owned and operated Merchant Marine. In the 1830s, the Erie Canal, the first effective transportation link between the American East Coast and the fast-developing new West, was built with public funds—most of them borrowed in England. Thirty years later the privately-owned and managed railroads were given massive federal grants of public lands to finance the unprecedented programme of railroad construction which rapidly spanned the American continent. Following the outbreak of World War II, the United States Government, acting on an emergency basis, took over the planning and much of the control of the economy. Even in peacetime the U.S. Government continues to subsidize railroads, shipping, airlines, public housing, all levels of education, much scientific development, a large percentage of our agricultural output, many electric power plants, and other enterprises.

The people of Africa, Asia and Latin America at the dawn of a new age face a 'continuing' emergency. Their people, pressed by poverty and aroused by the promise of the new technology, are in a hurry, anxious to catch up. In such circumstances, government planning, investment and manage-

ment will inevitably have a bigger role to play than in the United States where the foundations for growth were largely created in the more leisurely atmosphere of the past. Yet the experience of the last fifteen years has demonstrated that in a developing nation there are practical limits to the share of the industrial load that the government can effectively carry. For instance, in the emerging nations of Africa, Latin America and Asia, administrative experience is rarely adequate even for such basic needs as education, electric power, and transportation. The amount of capital that can be raised by taxation or government borrowing from the underprivileged majority is limited, and the well-to-do minority is very small. In many cases the surviving traditions of the colonial civil services place more emphasis on regulating the people than on creating opportunities for them to prosper and grow.

In regard to the direct management of government enterprises, democratically oriented governments face an additional hurdle: In every industrial operation growth is dependent on thousands of day-to-day decisions, large and small, many of which require a trial-and-error approach. Any industrial manager who is unwilling to risk mistakes will almost certainly fail to create an efficient and expanding operation. Here we run into a paradox. In a thorough-going police State this essential risk-taking process can proceed unhampered by opposition attacks. The managers of private enterprises in a democratic nation are also politically free to seek answers through experimentation without regard for the second guessers. When the inevitable mistakes occur, they are marked off against more profitable operations elsewhere. But when mistakes are made in the 'public' sector plants of a 'democratic' society, the political opposition may be expected to fill the air with charges of incompetence, corruption and worse.

The Ford Example

A few years ago, the Ford Motor Company invested some \$300 million in building a car called the Edsel which, as it turned out, very few people wanted to buy. The company balanced its losses on the Edsel against more favourable investments elsewhere, and that was the end of the story. I shudder to think of the political uproar that would have occurred if the ill-starred Edsel had been built by a government agency under a Democratic or Republican administration. The party in power might have lost the next election.

Each mistake thrown up by a public sector enterprise in a developing nation will almost certainly be seized upon by the opposition as an instrument with which to belabour the party in power, and these attacks in turn undermine the administrative process on which further development depends. Civil servants, anxious to avoid further political chastisement for errors, actual or alleged, freeze into rigid attitudes. The already slow process of bureaucratic decision-making is further slowed and a damper placed on the vigorous experimentation which is essential to industrial expansion.

Since conditions vary widely among the developing nations of Asia, Africa and Latin America there can be no precise formula to govern the size and domain of the public sectors. But because of the awesome problems facing their governments, an increasing number now undertake in the public sector only those essential enterprises which cannot be financed through other means.

II

Once a developing nation has defined in general terms the scope and responsibilities of its public sector, it faces a second decision: how best to manage those enterprises financed by public funds. The first step is usually the obvious one: to assign the management responsibilities for publicly owned industries directly to the relevant ministries; thus steel mills are placed under a Heavy Industries Ministry, power plants become the responsibility of a Ministry of Power and so on. By and large this means that the already over-burdened,

understaffed ministries are asked to assume highly specialized, complex operating responsibilities in brand new fields where every move may be subject to opposition attacks. The second stage develops when the political and economic limitations on the direct Ministerial-Civil Service responsibility for the management of the public sector plants have become apparent. A search then begins for a system which will speed up decision-making, encourage experimentation and otherwise assure greater efficiency.

Although political opposition and press criticism is only a marginal factor in the communist nations, it is instructive to note that even they are now delegating greater responsibility and encouraging more managerial initiative.

Russian Experience

In an effort to speed up industrial production, the USSR, for instance, has created a system of integrated economic districts which have been given considerable authority by the central government in Moscow. Each factory in a given district can now order directly from or sell to any other enterprise in the same district. Each plant manager is given a considerable degree of autonomy in the operation of his plant, including substantial control over personnel. Soviet managers and their subordinates are judged increasingly by the overall results with less regard for the mistakes that may occur in the process. Of particular importance is the fact that they are also 'paid' accordingly. Indeed, some economists believe that the spread between the highest and lowest incomes after taxes is now greater in the USSR than in the United States.

Yugoslavia has gone even further in delegating operational responsibility for public sector industrial plants to professional managers. The central ministries in Belgrade now function largely as planning and regulatory agencies for the whole economy. The day-to-day and even year-to-year operation of the factories has been placed in the hands of the factory managers and workers' councils.

Western Europe

Yet paradoxically, the most effective techniques for the management of public sector enterprises have been developed in the basically capitalistic economies in Western Europe.

In France after World War II, government enterprises were defined as "public establishments of an industrial and commercial character provided with a civil personality and with financial autonomy". That is, public enterprises became legal corporations in which the government was the sole stockholder. Operating decisions are in the hands of professional managers who are wholly responsible for the operations of each plant and who now receive salaries and bonuses comparable to those of their counterparts in private business. The central government ministries are largely restricted to broad policy determinations.

In Germany many major enterprises are also government-owned and operated with the same delegation of responsibility. Indeed, the pragmatic Germans have gone one step further: Whenever private interests appear able and willing to manage a government-owned enterprise in the public interest, they may buy it at a fair price from the government. Thus the highly successful government-owned and managed Volkswagen Company was sold to private interests in 1961 at a handsome profit to the tax-payers.

In the United States the Tennessee Valley Authority is a public corporation which operates in much the same way the French public sector industries do, though on a larger scale. Its Presidentially-appointed three-man TVA governing board is responsible for a wide range of activities including flood-control and the production of electricity and fertilizer. Recently, the TVA was authorized to issue bonds to finance the expansion of its generating and transmission facilities.

In India, Mr. Subramaniam, Minister for Steel and Heavy

One of the fastest growing general insurance companies in India

MADRAS MOTOR & GENERAL INSURANCE COMPANY LIMITED

The stability of a general insurance company depends upon the continued patronage of its clients. The ability to expand the field of activities and serve new clients sets the pace of its growth.

The swift and steady growth of Madras Motor & General Insurance Company Limited indicates that it possesses both these qualities in ample measure.

This Age of Sillimanite

WITHOUT REFRACTORIES

the WATER we drink cannot be purified by lime and chlorine, both produced with the aid of Refractories. FOOD is obtained with the aid of potash, phosphates and nitrogenous fertilizers, none of which can be produced in adequate quantities without Refractories. CLOTHING cannot be produced in sufficient quantities if Refractories are not available for the power plant. Power plants using Refractories provide your home with heat for COOKING, LIGHT for comfort, and power for essential domestic appliances. It would be impossible to construct FURNACES to extract metal from ORES or to operate Rail Road LOCOMOTIVES. There will not be high octane AVIATION spirit nor LUBRICANTS as suitable furnaces cannot be constructed. STEEL plates cannot be produced for building SHIPS. It will be impossible to make LORRIES, TANKS, GUNS, SHELLS, Invasion BARGES, BATTLESHIPS even. ALUMINIUM and MAGNESIUM used in the manufacture of AEROPLANES cannot be produced. CHEMICALS used in explosives cannot be manufactured. The large POWERPLANTS supplying power, heat and light cannot operate

Machinery, recently announced the initiation of a notable experiment in managerial autonomy at the government-owned Durgapur Steel and Sindri Fertilizer plants. As in Germany, France, Italy, Sweden and other European countries, these two public sector plants are to take on some of the aspects of a private corporation, and shed some of the characteristics of government agencies. Henceforth, the managements of these plants are to have the power to hire and fire, and to make the day-to-day operating decisions. Their financial affairs will be audited by regular public auditors. In announcing this bold new approach, Mr. Subramaniam said, "The idea that public sector management can be so hedged about with checks and balances that mistakes cannot occur is mistaken. Effective management will always make interim mistakes. Mistakes are the price of progress. It is the end result that counts." This sophisticated step reflects the best world-wide experience.

III

The government in a developing nation, as we have seen, has the primary task of setting national, economic and social objectives, creating realistic plans and priorities in securing these objectives, providing the capital and direction for the basic infra-structure, and developing other essential production facilities for which private capital may be lacking.

In most of Asia, Africa, and Latin America this leaves a vast area of the economy open for a vigorous private sector operating within a clearly defined framework of national objectives and social and economic justice. With the right balance of profit incentives and respect for the public interest, experience demonstrates that this proven economic instrument can make a decisive contribution to national growth and well-being that cannot be duplicated by the government. Private enterprise, for instance, can enter every nook and cranny of economic life. It can draw out and thrive upon small pockets of indigenous capital and management skills which would otherwise remain untapped. By encouraging competition it can help generate initiative, research and the development of new products and methods which invigorate the whole economy. It can provide opportunities for individual advancement to people with intelligence, experience and energy. In particular it can sharply increase opportunities for employment not only in the great urban centres but in the rural towns. In Africa, Asia and Latin America, imaginative business leadership in the rural centres plus technical training and low interest capital loans can produce goods and services that the rural population will eagerly absorb. The recent surge of economic activity in the Indian Punjab is illustrative of the possibilities. Hundreds of small shops, factories, and services are being organized to meet growing consumer demands. Some 18,000 technicians are being trained annually to run them with thousands of additional non-skilled jobs also being created.

Profit Incentive

The prospect of reasonable profit incentives and political security can also attract substantial amounts of private 'foreign' capital which, in most developing nations, is sorely needed to supplement foreign exchange earnings and loans from foreign governments. To this may be added foreign 'experience' in complex industries that may lower prices and improve quality, plus modern marketing techniques that may sharply reduce the cost of distribution and help to open up export markets.

The self-regulating characteristics of the private sector are an additional factor which many developing countries are only beginning to appreciate. Privately owned and managed plants operating within the framework of the national plan more or less automatically shape production along the lines most acceptable to the consuming public. If enough people want bicycles, their willingness to pay for them provides a powerful inducement to their manufacture. Conversely, the public's dislike of a specific model is an automatic curb on additional production, at least of that particular bicycle at that particular price.

The fact of the matter is that no government is flexible enough to adjust itself effectively to consumer preferences which often vary from place to place and from year to year. The self-regulating market system, on the other hand, guides the allocation of capital and skills to those products and services which the public wants in the style and quality that it prefers. What appears on the surface to be a wasteful process of trial and error, as small entrepreneurs feel out the needs of the public, is in fact a vital process of experimentation and growth.

Regulation by Market

Although this system of "control by the market" is usually associated with the democratic nations of the West, it is interesting to note that here, as in other economic situations, the communist nations are being forced to adopt similar tools. As the USSR moves increasingly toward a consumer-oriented economy, its government faces a growing dilemma. How can a totalitarian economic system with arbitrary control from the top provide the wide and inviting consumer choices of colour, style, model, pattern and price which are necessary incentives to stimulate the public to greater efforts? In other words, what can the Soviet Government substitute for the relatively free-market system of the West? I believe that experience will demonstrate that there 'is no' effective substitute. If this is so, the communist nations, as in the case of worker and management incentives, will again be forced to abandon dogma and to adopt the marketing mechanism of free consumer choices as the ultimate guide at least to the production of consumer goods. Although this may cause Stalin to turn over in his grave, it will not be for the first time.

IV

In describing the potential role of private enterprise in a developing nation, I stressed that it must operate within a framework of established national objectives and economic and social justice. But how can such a framework be provided without creating a maze of controls that foster the very stagnation we are striving to avoid? The market mechanism is by no means a guarantee that private enterprise will always function even in its own best interest, much less in the public interest. Price-fixing monopolies can exploit the public, dishonest practices can lead to black markets and tax evasion; labour may be exploited.

The task of a developing nation, therefore, is not to forgo the creative aspects of private enterprise for fear of its excesses but rather to find the means to discourage those excesses without discouraging responsible initiative. This means that side by side with adequate profit incentives there must be realistic rules laid down by the government to ensure that private energies will be devoted primarily to creative enterprise rather than to speculation, that scarce resources are not used for frivolous or wasteful ends, and that the broader public interest will be given the highest priority.

Through the process of democratic debate and adjustment, we in the United States have gradually established a system of regulatory laws and agencies which police the activities of almost every segment of our private sector. In large measure we have succeeded in this delicate task of regulation without stifling the initiative of our entrepreneurs. As a result most American businessmen have come to see that what is good for the public is, in the long run, also good for them. This has been accomplished by the establishment of economic and social ground rules, administered by the Federal Government and the States, which have served to domesticate American capitalism and to help turn it into a socially responsible force for national growth and for increasing opportunity for the individual. For instance, the Sherman Anti-trust Act passed in 1890 and the Clayton Anti-trust Act of 1914 were designed

to assure competition in regard to quality and price so that the market can act effectively as the public's instrument for regulating the flow of goods. These are only two of several laws prohibiting price-fixing monopolies and combinations in restraint of trade. Other government regulatory agencies govern the actual performance of many of our major basic industries—such as transportation, communications and power. The Pure Food Act of 1906 and the Food, Drug and Cosmetics Act of 1938 prohibit mislabelling of products as well as deceptive packaging, adulteration and sale of unwholesome products. All the ingredients that go into every package of food, every box of pills, and every tin of cooking oil must be clearly stated on the label. These laws are rigorously enforced. In addition to such controls on business operations and behaviour, there are minimum wage laws, legislation guaranteeing the rights of labour unions and individual workers within those unions, social security tax laws, workmen's compensation for workers who suffer an injury on the job, and many more which serve to make private enterprise in the United States responsible to the public interest. In all but a few cases businessmen have willingly adapted their operations to these rules and even extended them voluntarily. Our tax system, also, has been a major factor not only in providing the revenue needed for governmental services, but in creating a mass market to help assure business expansion. Each United States corporation pays nearly half its gross profits to the Federal Government which spends the money for schools, roads, hospitals, defence and public services which in turn create millions of additional jobs at good wages.

Faulty Taxation

In my opinion, however, our tax system has failed adequately to distinguish between profits made through speculation or trading, where no additional value is created, and profits made from the creation of manufactured and agricultural products or services.

Indeed, I know of no nation, either developed or underdeveloped, which has dealt effectively with this challenging opportunity to lure private capital into the most socially productive uses. What is required is a tax system which offers extra profit incentives for the creation of goods and services and which strikes sharply at profits made by pure speculation in land and commodities. This is an area in which the developing nations of Asia, Africa and Latin America have a particular opportunity for initiative and imagination.

Another crucial factor in this process of industrial expansion within a framework of social justice is organized labour. Responsible unions, whose leaders respect the right of management to a fair profit and to the right to manage while insisting on favourable working conditions and a fair share for the worker, are an indispensable element in a free and expanding society.

IV

From this discussion certain basic principles emerge. First of all, private enterprise in a moral sense is neither more nor less to be preferred than public enterprise. With genuine encouragement on the one hand and the responsible regulation on the other, the private sector operating under a sound National Plan can provide a major share of the economic dynamism which is essential to national growth. This means that the overburdened governments of the developing nations can be freed for the primary task that they alone can accomplish—the spelling out of national priorities and the plans best calculated to serve them, plus the creation of the all important economic infra-structure of education, mass transportation and those basic industries for which private financing and management are unavailable and government subsidies impractical. Such a balance also allows these new governments to limit their political responsibilities for the day-to-day operation of

much of the country's economy. This relieves them in a major degree from the harassment of an opposition in search of political issues.

Questions in regard to degree and emphasis will arise in different ways in different countries. They can only be settled by trial and error and by enlightened public discussion. In most developing nations there are deep-seated differences about the proportions of public and private enterprise which are appropriate to a modern social welfare economy. On my return to India, for instance, I find that the priorities and financing of industrial development is a special subject of debate. Although the debate is often heated, India is steadily freeing herself from some of the more negative concepts which grew out of her long and frustrating experience under colonialism.

It was logical that the Gandhian Revolution should closely associate industrialization with colonialism and that in leading the fight against colonialism, Gandhi should oppose industrialization. While accepting some large-scale industries as "necessary evils" he felt that they should all be owned and run by the State so that they would disturb the moral fabric of society as little as possible.

However, events in the last ten years have made the old colonial-capitalist association largely irrelevant. In Africa as well as Asia colonialism has been smothered under the rush for freedom while new governmental techniques are being introduced which in large measure correct the abuses to which Gandhi referred. Thus the new India can move vigorously to develop her industries without contravening the moral values she inherited from Gandhi. With her traditional pragmatism, I believe that India will develop a realistic balance between government planning and government investment in the essential infra-structure, on the one hand, and a fast growing, socially responsible private sector on the other.

India's Assets

In its efforts to achieve this balance India has many advantages—dedicated leaders, a competent Civil Service, rapidly increasing experiences and skills. In addition, India unlike most developing nations has a substantial amount of domestic savings which now lie idle. These savings exist even in many villages. I once heard an old Punjabi grandmother express her concern over the tendency of the younger generation to put their savings into "iron" (meaning machinery) rather than into the traditional land and gold. Let us hope that in this case the initiative of the grandchildren will increasingly assert itself. The money that now flows into real estate speculation also represents major pools of savings that may be tapped for economic development by the combination of profit incentives and selective taxation that distinguishes between the creative enterprise and sterile and uncreative trading to which I referred. At present a vast reserve of human skills and energies, as well as savings, is going to waste for want of the profit incentives needed to create new enterprises and to provide consumer goods. I have in mind particularly the opportunities for building small factories and service establishments with from half a dozen employees to a few hundred that can play a major role in providing the products and jobs that India needs so urgently. With a little more encouragement these energies could provide a dynamic force for India's national development.

Other nations with a strong tradition of democratic socialism, such as Britain and Sweden, have long since struck a realistic balance between the public and private sectors. Having lost their doctrinal concern over private enterprise, they have learned to encourage it, to give it scope, while moulding it to the national objectives. In so doing I believe they have pointed the way for the developing nations of Asia, Africa and Latin America which are in a hurry for material progress but which insist that individual dignity and opportunity are the proper goal of a just society.

Nation's Life Lines... Today and Tomorrow...

Ocean transportation is the very foundation of international trade . . . and ships, in a sense, are a nation's Life Lines . . . in war and in peace . . .

It was so yesterday . . . It is so today . . .
It will be so tomorrow . . .

As the pace of India's economic progress increases . . . as she is both able to offer and receive more . . . she becomes part of ever-expanding world economy . . . an important member of world comity of nations . . . and for all her International Trade . . . for all her exports . . . for all her imports . . . India needs ships . . . her own ships . . .

State Should Partner Business in Development Aid

WALTER SCHEEL

THE SUBJECT "Co-operation of the State and private business in the development process" seems to me to call first of all for a brief look at the relationship between the state and private business in the so-called donor countries themselves. In these industrial countries, many important tasks are today in the hands of the government; these include nuclear engineering, rocket research, construction of satellites and, in Europe, in some cases also the aircraft industry, a large number of public utility works and services, and quite a series of other economic fields. In the light of this situation, would it not seem natural that in the developing countries, modern technical and economic entities of a magnitude and concentration of capital hitherto unprecedented there should be organized by the government; particularly in cases where the traditional commercial and industrial firms are not willing to take new risks because of their lack of either capital or experience; and certainly in cases where private business is virtually non-existent?

By stating this fact, nothing is implied yet as to the system of economic order connected with that situation. State operation or control of specific industries and the functioning of a free-market economy are by no means incompatible. As we all know, the essential features of a free-market economy include free choice of consumption, unhindered access to the market, the free interplay of supply and demand, and the unceasing stimulation of efficiency by free competition undistorted by direct or indirect subsidizing or by enforced regulations. If these elements are present, a free-market economy will not be impaired by the state holding shares of companies. Nor is the relationship between private business and the state a question of an ideological creed; it is rather a question of applying pragmatic solutions to definite and specific problems of economics and of development policy. A glance at history will confirm this. In the course of the developing process of nations, the co-operation between the state and private business has passed through changing patterns which always reflected the actual relation of strength of two partners and the needs of the specific tasks of the time.

State versus Private Sector

Today we are once again confronted with the question of the relationship between the state and private business in economic development.

In the developing countries, the struggle for independence made it a matter for the acting executive forces to assume leadership and conduct political, economic and social changes. It was simply impossible for the new tasks to be carried out by the traditional forces of society alone. The developing countries are faced with the hard necessity of having to work, to organize and intensify this work, to form capital and to pay interest on it, and most important of all, to enable all sections of the population to co-operate productively in the vast task by providing and instituting broad education programmes. It will hardly be possible to accomplish all this without a large measure of reasoned planning and of far-sightedness. The basis of any development — an educational system adapted to the needs of the developing country — cannot be created without the public authorities. Also the social reforms which are so urgently needed in many countries — especially land reforms accompanied by assistance to the new independent farmers through a modern advice and credit system, possibly in the reliable form of co-operatives — can, as experience has shown, be carried through if the state puts

Mr. Walter Scheel, Minister for Economic Co-operation of the Federal Republic of Germany, was in India in November - December 1963 in order to study the working of Indo-German co-operation. After visiting the Rourkela Steel Plant, he had discussions with the Government of India on such important issues as the utilisation of West German development credits and protection and fair treatment of West German investments. Mr. Scheel is a firm believer in the principle that private capital in industrialised countries should play its full role side by side with inter-Governmental assistance in promoting the economic progress in developing countries.

a certain pressure on the feudal landowners. As to the industrial sector there exist no basic objections either against the state taking the initiative in risky ventures, not even from the point of view of a liberal economic and developmental policy.

The problem then is how to achieve a balanced co-operation of public and private forces; the factual situation very definitely calls for such a fruitful complementary co-operation of the two sides. Paralyzing state control on the one side and excessive private profit-seeking on the other—the latter particularly strong and unpleasantly visible in certain forms of trade, in money-lending and in the construction of luxury apartments—mark the two extremes both of which must be avoided in the developing countries in favour of an efficient co-ordination of state initiative and private business activity.

The difficulties to be overcome in achieving this objective are obvious at once. The first obstacle that must be mentioned is the lack of entrepreneurs willing to, and capable of, assuming the risks of a new production, or fulfilling some other function, as long as safe profits can be had in the traditional fields of activities. Then there are the different difficulties caused by the lack of skilled labour, by the narrowness of markets, by the absence of market reviews and by an inadequate infra-structure, for example in power supply and transportation. Finally there is the uncertainty resulting from the latent threat of possible nationalization sooner or later.

I would like to stress very definitely the conviction of the Clay Committee that free enterprise is of considerable importance in any development programme because it is the private sector, operating with the co-operation of a vital and democratic labour movement and enlightened management which will make the greatest contribution to rapid economic development. At the same time, however, I am fully aware that, in quite a number of sectors, public action must come first and lay the ground for the subsequent entry and expansion of private business. There is no alternative of state or private business in the process of economic growth; we must recognize the dualism of the two. The initiative, strength and special qualities of both are required, and their relationship to one another can only reflect shifts of emphasis in the course of economic development.

As far as assistance to developing countries is concerned, the alternative of private business or state makes, in the donor country, just as little sense as it does in the recipient country. As a rule, both private business and the state have specific tasks to fulfil within the framework of development policy.

1. Development aid provided by the state in the form of

December 27, 1963

ANNUAL NUMBER 1964

public funds, technical assistance and educational and social assistance is aimed at creating or extending the infra-structure which includes power plants, transportation facilities, basic material industries, assistance in the training of experts, in the expansion of health services, of education etc.

2. Private business initiative seeks opportunities for profitable investments in the developing country, predominantly in the industrial sector. Private business furnishes capital, undertakes market research, trains the necessary personnel and provides middle and top-level management. Under the customary form of a "joint venture" the developing country receives not only industrial plant and equipment which benefits its income and employment situation, but in addition it has, through contacts with the foreign staff, access to invaluable experience in modern plant operation, in calculative and organisational planning, in regard to thinking in terms of cost and revenue, and in other matters.

In the ideal pattern, public development aid represents the pre-investment for the subsequent investments of private enterprise. An effective aid programme should have the objective of combining the efforts of public and of private enterprise. It should from the start be designed with that goal in mind.

I realize the difficulties on the side of private enterprise which time and again prevent the translation of the ideal pattern into actual practice even though the external prerequisites or the possibilities for this are given. Not every private foreign investment promotes development. Some may be without either positive or negative effect, and others may even have adverse repercussions. For example, the construction of a plant for mass production at low cost may force the promising, but not yet competitive local, small and medium-sized industries off the market.

Joint Ventures

Still more strongly felt are the reservations of many developing countries in regard to foreign private capital. They are by no means invariably caused by fears of a "neo-colonialist infiltration". One possible solution in such cases is the "joint venture", that is the combined participation of local and foreign enterprise in the project. Under that form of co-operation, the fear of too much foreign influence seems to be less strong because part of the control and of the profits rests in the hands of nationals of the developing country. The main in the hands of nationals of the developing country. The favourable evaluation of this kind of assistance on the part of the developing countries is visibly reflected in the legislation of many of these countries where provisions for financial co-operation and for the composition of the joint management are recommended or made mandatory. The drawback, however, is that foreign investors are not too interested in this sort of arrangement. It is just not possible to enforce partnership by law.

The greatest difficulties which even under liberal circumstances work against an unlimited entry of foreign capital naturally arise out of the effect of this inflow on the balance of payments situation of the country concerned. As they transfer their profits and require additional imports, the new foreign subsidiaries will cause losses of foreign exchange to the developing country, as long as they are unable to replace other imports with their own products or to export these products. Whether the external debt capacity of the developing countries will increase concurrently with their general economic growth depends on their import situation and, even more, on their ability to sell their raw materials and manufactured goods to foreign countries. The assistance of the industrial countries in industrializing the developing countries must in any event be supplemented with "aid by trade"

for a long time to come, if the adjustment process initiated by the assistance is to be made effective. "Aid by trade" means continued willingness to include certain industrial products in the imports from the developing countries. It also means willingness to transfer manufacturing facilities for certain products to these countries and to accelerate by long-term planning the process of a new division of labour in the world which is in any event inescapable.

The idea of private business investments following in the wake of the pre-investment activities of the state in developing countries cannot be carried out in actual practice unless the special risks awaiting the private investor in developing countries are in part offset by government incentives. The principles regarding the promotion of private foreign investments in developing countries as outlined by President Kennedy in his Message of Foreign Aid of April 1963, agree widely with the German considerations which have led to the establishment of the present system of support measures for private business activities in developing countries.

As early as 1959, the German Government began to guarantee direct investments of private German business in developing countries against special risks such as expropriation, war, moratoria and transfers, and conditions for these guarantees have continually been made more favourable. Apart from the capital invested profits up to a total of 25 per cent of the initial investment may be covered by the guarantees. In addition, special low-interest loans may be granted from a special fund. Agreements for the promotion of investments and for the avoidance of double taxation have been

THE VITAL LINK

Construction—be it bridge, building or dam—depends on cement, supreme among binding materials.

SANKAR BRAND Portland Cement, fully up to standard specification, produced in the two factories of The India Cements Limited, is the vital link in the chain of planned progress.

THE INDIA CEMENTS LIMITED
(Factories: Sankarapur and Sankar)
Regd. Office: Dharm Building,
175/1, Mount Road, Madras-2

concluded with a number of developing countries, thus creating the basis for the spreading of a favourable climate for investments.

Since 1961, German enterprises have been allowed to establish reserves which may be deducted from taxable profits. Moreover, export guarantees and sureties are granted. Private financing credits, too, may be covered by government guarantees and sureties. Additional measures of encouragement are in the preparatory stage. These measures concern in particular special depreciation allowances for German investments in developing countries, tax-exemption to developing countries of wholly or partly depreciable assets, and other measures. Every expert will realize that the special depreciation allowance (the German Government suggested a rate of 15 per cent) may be highly attractive.

German Development Co-operation

In September 1962, the German Company for Economic Cooperation was set up as a commercial company under private law. Its capital of DM 75 million is provided by the German Government. The purpose of the undertaking is to promote cooperation between German enterprises and enterprises in the developing countries on the basis of genuine partnership and of private business rules. In order to contribute to the growth of politically stable and economically solid middle classes in the developing countries, the establishment of small and medium-sized enterprises is to be supported by means of participations (which are to be sold to private buyers after the enterprise has started making profits), loans with equity features, guarantees, sureties and special funds, and also by advice in matters of investment.

These are the various means we employ to try and lay the foundation for economic systems where the vast potential of individual enterprise and initiative can unfold itself to great effect.

But even more important than the raising of capital is perhaps the imparting of technical, economic and organizational knowledge and know-how to developing countries, either by way of training nationals from these areas in our countries, or by way of sending experts and instructors to the countries in need. At the present time, 12,000 trainees from these countries are receiving training in West Germany.

Role of Executive

The strong position of the executive is in most developing countries the outcome of the struggle for political and economic independence. Apart from traditional trade and some processing industries for the single-crop farming produce, the necessary counterpoise in terms of efficient, manifold private business enterprises is seldom found. The crafts and small-scale trades have neither the technical know how and knowledge of organization nor enough capital to follow the Western development pattern—the transition from small beginnings to modern industrial enterprises which, when linked with the names of Siemens, Daimler or Krupp, is characteristic of Germany's industrial development. Today, the absence of these factors in the developing countries has meant the assumption, by the government, of promoting, co-ordinating and controlling functions and its growing influence in business life, leading to the concept of a mixed economy. In most of these cases revolutionary social movements provide the ideological background.

In the moderate form of a mixed economy the government takes over those sectors in which private business is not interested either because of lack of experience, the size of these sectors, their inherent economic and technical risks, or unsatisfactory yields; these sectors include social infrastructure, transport infra-structure, water engineering and

soil improvement as well as major industrial projects. Incidentally this kind of mixed economy—usually with the exception of the industrial plants—is found quite frequently in Europe.

When public business activity is more accentuated economic considerations are very often overlaid with concepts of social order in the developing countries. Priority is given to the necessity of reorganising a loose society after the disintegration of its traditional sociological structures. Nationalization programmes and movements to form co-operatives knowingly or unknowingly aim at establishing a new structure of society and regard the expanding public sector of economy as a primary instrument of social policy.

Experience seems to show, however, that a tendency to take to total state control is inherent in a mixed economy. Nationalization trends seem to evolve their own peculiar rules. Very often economic and political factors have the same effect: in most cases governments neglect to draw a clear line between the public and private field of activity. Nationalization beyond convincing and visible bounds gives rise to growing suspicion among private entrepreneurs and slows down private business activity which in turn induces the government to forge ahead more rapidly, intent on accelerating economic growth. In this manner the well-known process of apprehensions fulfilling themselves finds exemplary practical application; there ensues a vicious circle fostered by fear of nationalization on the part of private entrepreneurs. The result of such a development is total state control under a most incompetent administration which is by no means equal to these tasks—in fact, nationalization without a proper administrative apparatus. This process can be observed in a number of developing countries. In addition, there is the effect of every partial government intervention in private business which, if it is to be carried out consistently, almost necessarily entails supplementary controls.

Totally Planned Economy

The question is how to obviate this tendency towards totally planned economy. And reversely, is it possible to shift from a mixed economy to a free market economy? It is obvious that the conditions for such a development are growing private initiative and strongly promoted possibilities for private entrepreneurs to form capital, favourable conditions for investing and financially concrete opportunities for profit-making in those sectors of the economy which have hitherto been in the hands of the government due to the lack of private interest or for political, financial, strategic and other reasons. But even if a government is prepared to allow private entrepreneurs to enter branches which have, up to that time, been wholly state-controlled, the very existence of public enterprises will cause private entrepreneurs to show reluctance with regard to new investment in these branches. After all, the principle of enterprises maintaining their real assets holds true also for public business, and it is understandable that a nationalized banking system will grant them preferential treatment in the matter of loans, and that in case of foreign exchange controls, it will be easier for them to obtain import licences for vital materials, spare parts, etc. Also for other reasons private entrepreneurs fear competition with government-owned enterprises; genuine competition is doubtful from the outset because of possible direct or indirect governmental measures of support for state-owned enterprises. That which is considered a prerequisite for the functioning of a mixed economy as a whole applies also to the individual branches: The fields of activity of public and private enterprises must not overlap.

Programmes aimed at putting public enterprises into

private hands, in fact, require the government of a developing country to be prepared to withdraw completely from a particular branch, i.e., to sell the state-controlled pilot plants which were established in the first stage of economic development to private entrepreneurs after it has been demonstrated that these branches of economy, too, offer an interesting activity for private business.

Italy has successfully embarked on this venture for the purpose of new industrialization, and Pakistan is engaged in similar plans.

It is true that such endeavours often fail owing to the strained budgetary position and the low yields on the capital market. The achievement of a satisfactory rate of increase in the national income, as it is, presumes the corresponding rate of investment which often enough can be reached only with a certain measure of government pressure. When the possibility of tax increases and the prospects of more or less voluntary public loans on the capital market and of inflationary creation of money are completely exhausted, the government does not always feel inclined to abstain from financing new investments by re-investing the profits of state-owned enterprises, provided that such profits are made at all. To exaggerate somewhat, the situation could be outlined as follows: either state-owned enterprises make profits and the fiscal interest prevails, or they suffer losses and offer no incentive for private business.

This is to say that the shift from a mixed economy to a free market economy is by no means an automatic result

of the general development but requires a purposive and well-considered government policy of putting public enterprise into private hands. Since—as is well known—few developing countries pursue such a policy, a gradual strengthening of private business can hardly be expected from this side.

In general, therefore, we shall not move from the mixed economy at present prevailing in the developing countries to a free-market economy and thus to a dynamic growth out of indigenous forces unless we give private business direct and clear support.

Strengthening Private Business

The conclusion to be drawn from this is that in our development efforts we must conceive forms of aid which strengthen private business in the developing countries, without affecting the existing order. To give one example: we could adopt the procedure of granting credits and loans from development aid funds to construction or development banks which finance private projects. We are already studying, in different contexts, a number of such possibilities. In future, more attention should be devoted also to the importance of the consultancy firms for the strengthening of private business in the developing countries. It is true that independent consultancy firms are highly qualified teams of engineers which also accept, adapt and carry out government orders for planning, but still remain private enterprises. In carrying out infra-structure projects, for instance drinking-water supply, sewerage, power supply or the construction of roads, they introduce concepts and initiatives of

private business into the public sector.

But most valuable of all is their cooperation in planning long-term investments in agriculture and trade and industry. In doing so, they set the points for further action. Here a competent consultancy firm can translate the public impulses into private business activity. The danger is that consultancy firms become either agencies of the domestic export industry and lose their independence and impartiality which is so valuable to the developing countries, or become dependent on their public employers and lose initiative and mobility. Neither of these dangers exists if a sufficiently large number of consulting firms are engaged in keen yet fair and equal competition. Surely these methods could, if only indirectly, loosen up the economic system in the developing countries which shows a tendency towards a planned economy, without our intervening in the internal affairs of these countries.

History teaches us that the driving forces in the destiny of peoples spring from clear ideas. The idea of freedom, after the war, has demonstrated its regulative power also in the economic and social field. The astonishing reconstruction of the destroyed countries of Europe would never have been achieved without the dynamic activity of free private entrepreneurs and the responsible attitude of freedom-loving labour.

Let us jointly endeavour to refute through practical de-

monstration the wrong thesis according to which state control brings order whereas free market economy brings anarchy and exploitation, and at the same time help the developing countries to become independent partners in a community of free nations.

deteriorated steadily in spite of the multiple and substantial contributions of foreign aid.

Practically none of them has managed to pass the half-way mark to development. On the contrary: despite all their efforts, they seem to be sinking deeper into poverty with every year that passes.

This is hardly surprising when one reflects that the average economic expansion rate in these countries is between 2 and 3 per cent per annum, whereas the figure is 4 to 6 per cent in our own well-equipped countries.

This is as much to say that, at the present rhythm, the gap is growing wider instead of smaller.

When this unsatisfactory state of things is complemented by the demographic factor — which is distinctly to their disadvantage, since their population growth rate is 1.5 per cent per annum whereas ours is generally lower than 0.5 per cent — it is hardly astonishing that the aid provided up to now has given such little practical benefit.

This becomes particularly apparent from the relative share of the under-developed countries in world trade: their share, which stood at 32 per cent in 1950, fell to 25 per cent in 1962 and preliminary figures available for the current year show that this proportion will be smaller still for 1963.

This, of course, does not mean that the volume of the products sold by the under-developed countries on world markets has diminished. In actual fact, it has increased, but very little when compared to the total figure of trade among the industrialised nations themselves, which is constantly growing.

One reason for this phenomenon can be found in the fact that the bulk of exports coming from the developing countries consists of primary products or raw materials, the price of which is falling in proportion to that of the manufactured products and capital goods which those countries are obliged to purchase abroad — in most cases, from us.

Deteriorating Terms of Trade

The deterioration of what are known as the "terms of trade" helps to reduce still further the value of the only natural resources these countries are so far able to valorise for the purpose of earning their daily bread.

It is not surprising, therefore, that a situation which grows worse despite all the remedies that have already been attempted has caused great concern among those who are the victims of it, to such an extent that they have conceived a certain degree of animosity for other nations whose wealth increases day by day.

Their alarm and resentment, initially voiced in an isolated fashion by one government or another in Asia or Africa, has gradually become a unanimous outcry since the Bandung Conference took place.

At other meetings, such as those held in Belgrade, Cairo and, more recently, in Addis Ababa, the under-developed countries formed themselves into a concerted group and began to look for ways and means of collectively extricating themselves from their perilous position. Although economically weak, they discovered that they were politically strong.

By comparing their problems and collating their aims, they managed to coordinate their policies and gradually build up a common front.

But no front can stand if there are no enemies to fight.

So, little by little, they elaborated a doctrine of claims on all the industrialised nations — East and West alike.

Faced with these claims, the wealthy nations consulted with each other and sought for a fitting reply. A number of confrontations have already taken place. Under pressure from the under-developed countries, the World Trade and Development Conference is being organised by the United Nations, while G.A.T.T. has been approached in regard to a programme of action on behalf of the developing countries, to be implemented by a special committee known as the "Committee of Action".

In essence, this marks the end of multitude of bilateral arrangements. In future, whatever they think about it and whether they like it or not, the industrialised nations will have to join forces in order to provide a coherent response to the questions, claims and demands collectively submitted to them.

Decisions on aid to the under-developed countries must be made collectively, and the new foundations for co-operation between the two worlds—rich and poor—will have to be laid in G.A.T.T. this autumn and at the famous World Conference which is due to open in March next year, so that methods acceptable to all may be found for concerted and harmonious progress towards the greater welfare of all mankind.

Economic Independence

If I had to summarise the present hopes and desires of the under-developed countries in a single phrase, I would say that, after securing their independence, they have realized that the power to make a number of important economic decisions is denied to them. Consequently, what they are out to conquer today is their complete independence which, from the economic standpoint, is a bold target indeed.

In actual fact, it is not so much a principle as a worry that inflames the nationalist element in the young states of Asia, Africa and Latin America, for practical autonomy of this kind, carried to extremes, would only end in a progressive return to a hand-to-mouth economy.

Let us therefore assume that the economic independence so ardently desired by the under-developed countries is, in actual fact, merely the right to discuss economic matters with any nation on a footing of absolute equality.

And, in the final analysis, I would like to ask you whether the industrialised countries—such as Belgium, for instance — are indeed economically independent.

As Minister of Foreign Trade, I believe I am in a position to reply emphatically that such is not the case.

Quite the opposite, in fact: the prosperity of our own economy is bound up with that of other markets. It was not for nothing that we fought for free trade since we ourselves became independent, and that we are members of the Common Market today.

The state of interdependence in which we live has never prevented us from being a sovereign, respected nation.

But it does oblige us to weigh our external engagements carefully, and to display a great deal of political caution. Only by doing so were we able to derive the fullest advantages from technological progress, and on the strength of the wealth and experience we have thus acquired, we must do our utmost—today more than ever—to help the world at large to do the same.

Indeed, contemporary technological development is more than sufficient to ensure decent living standards for all the inhabitants of the globe.

Technological progress, moreover, creates growing soli-

parity and interdependence between nations. Without help and support from the industrialised countries, without the backing of their material means and know-how, the developing countries would be condemned to trudge along the hard and weary road which Europe has travelled from the sixteenth century down to the present day in order to develop its resources, techniques and manpower.

On the other hand, the industrialised countries need basic products and raw materials from all over the world in order to maintain their economic activity at a consistently high level.

In all countries, rich and poor alike, the principle is generally recognised that means must be found to eliminate trade barriers and develop extensive currents of exchanges of all kinds.

An increased volume of world trade would indeed be beneficial to everybody: to the developing countries in the first place, since it presupposes an increase in their share of international economic relations and, consequently, increased domestic production; and to the industrialized nations in the second place, since the creation of new outlets stimulates greater exports and leads to the improved structural adaptation of their industries.

Stabilizing Prices

If true exchanges are to be developed, it is necessary to begin by working out a system whereby the prices of raw materials can be stabilized. This problem is a very serious one, especially since it is very difficult to come up with definite solutions. And it is of equal concern to the rich countries and the poor.

It is, indeed, useless to attempt to co-operate financially and technically in a country's development if, in a slump on the world market for its basic products, that country runs the risk of losing far more than it received in five years under the heading of aid from abroad.

This is a case that really happened, and there are others. It becomes truly evident, therefore, that the stabilization of world market prices for raw materials is one of the major problems of under-development. A solution in this sphere would be as advantageous to the purchasing countries as it is to the producing countries.

Now, let us take the case of a highly developed economy such as ours. For generations past, our country has imported vast quantities of raw materials and primary products for conversion and processing in our factories by our skilled workmen into semi-finished or manufactured goods, which are then exported to foreign markets where they have to compete with similar products from other industrialized countries.

However difficult it may be to secure a foothold on a foreign market, it is equally difficult, if not more so, to maintain it once we have acquired it.

In former days, the quality of our products was sufficiently appreciated to minimize the importance of the price factor in so far as competitors were concerned. Today, on the basis of more or less equivalent quality, we are meeting strong competition from other producers and the price factor has become the determining one.

If the cost of raw materials does not remain stable — I am talking now in general terms — it will be difficult to preserve a stable price on foreign markets for finished products, to which we have contributed labour and little else. Consequently, with every increase in the price of raw materials, the pattern of trade threatens to become disorganized and these fluctuations are likely to weaken our own position on international markets.

Then, again, should prices suddenly fall, the producing countries are forced to place restrictions on the import of

manufactured goods in order to preserve their balance of payments, and their markets are therefore closed to exports from countries such as ours.

Finally, persistent deteriorations in the primary products market will, in the long run, discourage the producers. Even if there are occasional complaints at a certain amount of over-production of basic products, this phenomenon should normally be of short duration. We must have faith in the future; on a long-term basis, world production is inevitably bound to increase in proportion to expanding population and industrial development throughout the world. This will demonstrate how essential it is to safeguard and promote the production of raw materials in the interests of all.

So far, the methods put forward for the solution of this vast problem are only partial ones.

Price ceiling and floor systems, coupled with stockpiling, are already operating more or less successfully for certain products, such as tin and wheat. The United Nations, moreover, has been putting the final touches to a vast plan to control these markets by means of an international Stabilization Fund of 1,800 million dollars.

The European Economic Community has also devoted much thought to the problem. I myself, speaking in the name of Belgium, made a statement in Geneva to this effect. My personal belief is that isolated efforts are doomed to failure.

Bold measures must be taken on an international scale. Only on that condition will it be possible to find a final, acceptable solution.

There may, however, be another way of achieving the long-term development of the poorer countries.

These countries will no longer be the defenceless victims of fluctuation in the prices of raw materials when the latter are no longer the only products they have to offer.

Scattered and Unilateral

Now, if this is to be accomplished, the only radical way is to industrialise the non-industrial countries. Many projects aimed at this target have been drawn up already, but they were too scattered and their objectives were too unilateral for them to produce good results.

Without co-operation on a general scale, without being scientifically apportioned, reasoned and decided upon by mutual consent, the industrialisation of the under-developed countries has little prospect of showing returns in the immediate future.

If, on the other hand, all the parties concerned were to agree to join forces in creating industries capable of participating in world trade; if, at the same time, the wealthy nations were to agree to facilitate the disposal of these new products on their respective markets for a given length of time; finally, if the new industries were to take advantage of these initial facilities to develop outlets on their home markets as well, where consumption is bound to grow — then there would be some chance of success.

But such a vast undertaking requires a high degree of co-operation between the industrialized and the less developed countries. And such co-operation will not be possible unless and until there is a prior attitude of general willingness to take into consideration the minimum demands formulated on either side of the conference table.

Take the industrialized nations first. Generally speaking, the under-developed countries tend to over-estimate their cohesion and to attribute to their respective governments more freedom of action and authority than they actually possess.

But these countries — or at least those which belong to the Western hemisphere — are, in most cases, democracies

where power is anything but absolute and cannot be exercised without reference to public opinion, Parliament and other, often conflicting interests.

It is doubtless possible to influence such pressures on the government; it may even be possible to modify them; but it is certainly not possible to act counter to them or disregard them completely.

In so far as their public opinion is concerned, the industrialized states are in duty bound to maintain the expansion rate of their economies. To do so, they must watch over the soundness of their industries and the solidity of their economic structures.

This is why, although they are prepared to throw their markets wide open to competition as being the necessary spur to development, they must also be careful to prevent their markets from being disrupted or weakened by abnormal or destructive competition.

Moreover, their contribution to world development calls for increasing sacrifices on the part of their citizens and the appropriation of a growing portion of their resources in order to meet the requirements of foreign countries. If these sacrifices are to be acceptable to public opinion, they must at least serve some useful purpose.

By this, I mean that steps must be taken to avoid setting up huge industrial complexes in the young countries that would never find adequate outlets for their products, as also the creation of industries unable to withstand competition on world markets.

Let us now turn to the other side of this hypothetical conference table. However great their understandable and legitimate impatience to forge ahead may be, the developing countries must also obey certain imperatives if this gigantic attempt at world solidarity is to be brought to a successful conclusion.

Division of Labour

Their fundamental interest is to promote a division of labour, especially as between neighbouring countries. It would indeed be a sad and pointless business if their new industries were to duplicate each other, thus preventing any possibility of making a profit on account of the restricted markets available.

Take a steelworks, for instance. It is generally acknowledged that the output of an industry of this kind must reach 1,500,000 tons a year if it is to show a profit. And returns of this kind will never be forthcoming if all the under-developed countries on one continent or in one area are determined to have their own heavy industry despite the fact that their individual home markets could never absorb more than one-fifth or one-tenth of the minimum output.

Consequently, in creating a new industry, care must be taken to ensure that it is certain of having wide outlets in its home or regional market so that it may attain the degree of productivity necessary to compete successfully in world trade.

It is therefore absolutely necessary to disregard the seductive aspect of narrow economic nationalism which might incite to the simultaneous creation of the complete range of modern manufacturing industries in a single country. In the long run, the domestic market will nearly always be far too small even if this kind of industrial development were restricted to the production of consumer goods alone.

On the other hand, the under-developed countries must understand that Europe — and more particularly the Common Market — while in favour of the development of all the young countries, nevertheless acknowledges special responsibilities in regard to certain overseas countries that were united to it by special ties in former years.

There is one last principle I would like to mention which is that the young countries must be able to scale their ambitions down to size.

They must, of course, be daring but not reckless, and it would be reckless to try to create industries in the developing countries that are far too large for local needs and resources.

This is a matter of chronology. A century of delay can be made up in the space of a few years, but over-ambitious views and excessive impatience can definitely ruin future prospects.

In this connection, I shall revert to my former instance of the steelworks. This would be a justifiable project for a group of four or five countries whose present markets, taken together, could absorb the output of the mill. Given the general rise in living standards, consumption is bound to grow until, one day, it attains twice the present figure; then, and only then, will it become necessary to contemplate setting up a second steelworks in the same group of countries — and this time the mill could be built in another member state of that group. And so the process continues until, finally, each of the countries involved is able to achieve industrial development in the true sense of the term.

Lenin's Prediction

Lenin went further than the predictions of Marx when he said that Capitalism and its brand of civilisation would one day be strangled by the circle of under-developed countries who would refuse to allow their natural resources to be exploited any longer.

But it so happens that, since then, it has become evident that the link between cause and effect is a very tenuous one where the wealth of some nations and the poverty of others are concerned. More — the claims and demands of the developing countries are aimed today at all the industrialized countries, including the Soviet Union, the birth-place and home of Marxism.

Far from trying to strangle each other, both sides are seeking to establish contact with each other.

Tense though some of their discussions have been, they have never been strained to breaking-point, and almost certainly never will. Each side needs the other too badly not to strain every nerve and sinew to reach an understanding.

The coming months will require a special effort of comprehension on the part of all, in return for which a foundation could at last be laid for a common approach devoid of all political passions, which would make it possible to advance through rapid and practical stages towards a final solution to the problem of under-development.

The malady must be attacked at the root.

But the root is not a matter of politics, population figures or even finances.

Ideologies have their heyday and fade into oblivion; nations become more civilized; science forges ahead and capital investment goes all over the world.

But one thing which is non-transferable — or barely so — is the opportunity to work.

What we must give the developing countries, therefore, is the opportunity of remunerative work, and if the remuneration is to be adequate, the manufactured products must be sold, i.e. they must find outlets which are immediately available, stable as to volume, and showing good prospects for enlargement later on.

If this project succeeds; if it meets with the approval of all concerned — that of our own industrialized nations and that of governments in the three less favoured continents — then, I believe, we will have made another great step forward towards progress and international solidarity, which is the only real guarantee of world peace.

FROM BLUE PRINT TO INITIAL OPERATION

Kuljian's wide-range services in the field of consulting engineering range from preliminary surveys, site selection, feasibility reports, engineering studies, preliminary design through detailed plans and specifications, estimating and purchasing, management of construction and initial operation. ■ The Kuljian system of integrated engineering provides efficient and economical solution to all problems of an entrepreneur. Under one corporate roof Kuljian maintains not only an able team of project engineers—civil, mechanical and electrical—but also architects, designers, technicians, economists and administrators who, individually or collectively, are equal to any exacting assignment anywhere in India. ■ Whatever be your project—a steel plant or an apartment house, a fertilizer plant or a thermal station, subway systems or transmission lines, let Kuljian do the job for you. It has the experience and the resources.

THE ROLE OF PLASTICS IN INDUSTRY TODAY

Plastics, today, are extensively used as components in a host of manufacturing industries. Plastic's significant properties: lightness of weight, resistance to corrosion and wear, and controllable thermal and electrical resistance; have made it of immense value to the electrical, chemical and engineering industries as well as to textile, paper, aircraft, ship-building, automobile and locomotive industries.

Hyderabad Laminated Products Ltd. are specialists in the field of thermosetting plastics which they have been manufacturing for the past 10 years in association with the well-known firm

of Bakelite Limited of England. All of HLP material—HYLAM Phenolic Laminated Sheets, Rods and Tubes, DECOLAM Decorative Sheets, and HYLAK Polyester Resins, Phenolic Resins and Moulding Materials—are submitted to the same quality-control that has distinguished and made famous the name of Bakelite throughout the world.

The Changing Face of Europe

Our Correspondent in Western Europe

"PEOPLE ARE always talking of the mechanisation of life," said the novelist-minister Andre Malraux lately, "but they forget this fact: in Paris a century ago 3,000 people went to the theatre each day but nowadays it is three and a half the million Parisians that each evening go into the world of make-believe. Machines are less powerful over material things than the dream-machines are over our spirit". All over Europe each day at nightfall a hundred million people are transported by dream-machines to worlds their fathers never knew. In fact the dream-machine business—television, cinema, radio and the like—has been one of the fastest growing sectors of the European economy since the war, and yet its importance is still greater than could be reflected by its weightage in any industrial output index number. It is one of the things that has contributed to the qualitative transformation of European life. This transformation is not an incidental by-product of general economic progress for it often its motor and purpose. Once we discard the unfortunate "materialism" to which economists are inevitably prone, we can see that the soaring output of oil, steel and chemicals are the by-products of, or at most the mere means to spiritual or immaterial or non-economic changes that are hard to measure but are the real substance of a way of life.

At the risk of outraging the materialist prejudice of economists, let us take another example of this transformation of human life from a quite different quarter, and reflect on the rarefaction of the "commodity" grief. Without us being able to measure at all exactly the amount of grief in a society at various times, its decrease is sure, notably in countries like Italy and Rumania since the war. Taking less favoured parts of Europe so as to fit the process into a short span of time (but the same thing has happened everywhere in Europe in the last century and a half), one can find cases where a few generations ago a child lost its mother or father at the age 14 (supposing it lived to be 14), whereas in the same place today a man loses his first parent at 50. Yesterday, by the time he was 50, a man had mourned nine deaths in his immediate family; both parents, one grandparent (the other three were dead before he was born), three of his own children and as many brothers and sisters. Today, at 50, he has been to one funeral that deeply concerned him.

Toning Up Life

Again, I know a small town in the south of Europe that has lived for two millennia inside the stone walls that the Romans built to protect it, and it was still confined by those ramparts in 1945. Since then its population has not grown at all—but suddenly it has burst its walls and covers twice the area of before the war. And so one could continue collecting facts that are of the first importance to the life people actually live but which find no expression in economic indicators. This is without appealing to the obvious cases, such as the revolution of the tone of existence introduced by the motor car. Even in that familiar case, the effects strike deeper than is sometimes noticed. In a village 40 miles from Paris, I know a woman who has been twice to the metropolis since her marriage 20 years ago, and who regards herself and dresses as a provincial, whereas her daughter, newly married, goes to Paris every week, regards herself as a Parisian and dresses as one.

Of course, once one starts collecting such facts one runs the risk of losing oneself in trivial anecdote, and the economist can still prefer to stick to his abstract, anonymous figures as a safer guide to what is happening when nations progress economically. For example, if there is any signifi-

cance at all in my illustration of a daughter who lives and dresses differently to her mother, it will show up in the statistics for retail commerce, the textiles industry and transportation. That is correct, but unless one can read the trivial, anecdotal human facts behind the statistics one will encounter numerous paradoxes. The circumstance that in Europe now private persons' outlays on automobiles, petrol, garages and car insurance are about 40 times State outlays on roads only gets its full meaning when translated into terms of nervous strain and irritation in mounting traffic jams. The figure of seventy minutes for the time taken by an average worker to get from his house to one of Europe's biggest motor car factories has to be interpreted personally and emotionally as hours spent in crowded underground trains before one sees its connection with wildcat strikes and political indifference due to fatigue.

Consequences of Progress

Indeed it is in the conflicting psychological consequences of current industrial progress that one must look for the explanation of numerous economic and political facts of the first importance. There is no question, of course, of trying to decide whether, on balance, Europeans are "happier" or not since their economic expansion began on a spectacular scale 15 years ago. Happiness or contentment are altogether too vague and, besides, one soon notices that in so far as people can state clearly what they mean by them, it is evident that they do not seek them, or not them only; they want other things too, and often more urgently. Discontent can change radically in nature, as for example, from the massive protest against unemployment before the war in Europe to a feeling of satiety, "robotisation" and petulant envy which is the commonest form of "unhappiness" today. Without pretending to know how the totals compare, one can look at the various satisfactions and dissatisfactions that the new way of life has brought to Europeans.

The satisfactions are immense and countless, but in a way negative; that is, people not only take them for granted and soon get used to them, but they feel that such things are their due, as constituting the bare minimum for decent human existence. The complacency with which the European now accepts full employment and the possibility to feed and clothe a family without any anxiety must seem shocking to elders who recall pre-war conditions, and to visitors from Asia where such things are still unsecured. Before denouncing ingratitude (and it looks like very black ingratitude to regimes that made such things possible, such as the Fourth Republic in France, and then got thrown out of office), one should reflect that this attitude is based on a generous notion of human personality rather than on selfishness. If it is at all possible that an economy can be run without men worrying about losing their jobs, then this is the least of things to expect, in the view of people who have come to hold a higher opinion of the potentialities of civilisation. If the postwar chemicals industry can make fibre for socks that never have to be darned, housewives do not feel perpetually grateful for not spending their evenings with needle and thread as their mothers did, because they have a different, and frankly a superior, conception of a woman's role.

This effortless adjustment to the myriad creature comforts that have appeared in the past 15 years is not, however, the most striking thing in European homes today—for there are certain satisfactions that are relished and savoured with a childlike joy and gratitude. Talk about them provides the greater part of conversation in private circles and if you are unfamiliar with them, not interested in them or unprepared

Engrossment with this limited list of commodities and facilities is the social aspect of European integration, the cause of the increasing similarity of life in any part of the Continent. When you realise how large a part they play in setting the tone of existence, you will see too that they are a powerful factor making for differentiation between the West Europeans and the citizens of the Communist states. Looking only at the global figures, or at the techniques of production and work-organisation, one can advance the claim that the capitalist and communist societies are converging; much has been said in that sense in recent years, and Mr Nehru has cited the fact as reason for not opposing capitalism and communism as black and white. But looking at the human use that is made of the economy's products, one sees that ways of life are diverging as never before between the West European countries and the socialist societies. The role of the motor car is primordial here, for it would be no exaggeration to say that his car is the very meaning of life for many

If the communist planners adhere to their present view that the individual motor car is economic nonsense and that people's movements, daily transportation and holiday migrations can be managed much more rationally with socialised or community means (and "rationally", no doubt, this view is irrefutable), then two quite contrasting forms of personality will emerge in Europe. The differences between them that will be due to this one fact will be by far greater than those we are already familiar with and which are ascribed to racial, climatic, religious or other historical contrasts. The motor car, I am suggesting, is moulding attitudes so firmly that the Swedish Protestant bourgeois in his Volkswagen and the Italian Catholic peasant-turned-Communist-factory-hand in his Fiat have more in common with each other (and will show it in their political options at a pinch) than with people who have not their own car, no matter what standard of living is attained by the socialist states in the future. Mr Khrushchev's successor might be able to produce statistics proving that his country has "overtaken and surpassed" West Europe, and the USA into the bargain, but as long as Western social life is based as firmly as now on the individual motor car while socialist life is not, the two ways of life will not even be on the same path.

This fact would be more easily visible to the naked eye if West Europe had not been plunged so rapidly into galloping industrialisation in the last 15 years, because that abrupt break with the past has caught Europe materially unprepar-

ANNUAL NUMBER 1964

It will become apparent in architecture, urban planning, location of productive, commercial and cultural facilities, in regional development—in short, in the whole surface appearance of society. That task has already begun but the immensity of the changes it will entail is not clearly realised by most Europeans, who have not seen yet that it will involve the break-up of their old cities, a new distribution of populations and in general a revolution in daily life. "Paris", as you can hear any taxi-driver exclaim at five in the evening, "has become impossible!" He speaks truer than he knows; it has become literally impossible and cannot persist much longer, any more than Rome, Brussels or Frankfurt, because all those cities and the way of living built up in and around them are incompatible with the reign of the motor car. As Europeans are obliged to draw the necessary conclusions from this fact, their mode of life will have to change with a rapidity and thoroughness that will make the changes of the past 15 years seem superficial.

If the cause of this revolution is a mechanical contraption, it is obvious that the result is not going to be anything that could be called "mechanisation". On the contrary, it will entail a return to a semi-rural way of living that is already to be seen in the endless garden suburbs of some American cities. The discontent with mechanisation (which means being fatigued by 'other people's' machines, e.g. their TV sets heard through the wall of a flat or their cars in a city traffic jam) is apparent in every major European city today, but it expresses mainly the fact that in 15 years a plethora of commodities has been poured into a context that is not yet spacious enough to receive it.

Perhaps for readers abroad more emphasis is needful on the two other things I have mentioned as the juice of economic progress for contemporary Europeans. Pollsters who interrogate folk on their understanding of the Common Market, European integration, free trade and the like repeatedly report an amazing ignorance among the mass of the population about these affairs, which obviously are important for their present and future style and standard of living. I suspect that if they could psychoanalyse their subjects they would find that the sole concrete reality with which those things are

That impact, naturally, is most keenly felt by women, who do most of the shopping, but an interesting sidelight is that the supermarket has brought men back into direct contact with retail commerce. Whereas by far most of the family expenditure has always been made by the housewife (even most men's clothing was bought by women), men now consent to spend some of the family money because they will go into a supermarket when they would never set foot in a speciality shop and detested department stores. The fact is connected also with the motor car (which can carry a week's supply) and the refrigerator (which can keep it fresh), but the regular journey to the supermarket has become one of the new, and alas few, 'family' tasks which the isolated and purely functional European family undertakes in the same community spirit as peasant families undertake harvesting and gleaning.

The appearance of twelve-year-old song stars idolised by several million teen-age customers paying hard cash for records, and holding special sessions where groups share their devotion in the absence of grown-ups, is not just an anomaly of the current European scene. It is a symptom of much else in the same vein (and incidentally this is international, unifying force throughout Europe though at a low level) that is already with us, and very probably the sign of more to come. For example, the cinema is rapidly passing into the hands of childish and adolescent audiences, and is only surviving by

IBM WORLD TRADE CORPORATION

Vulcan Insurance Bldg., Veer Nariman Road, Bombay - 1
PARLIAMENT STREET • MADRAS NUNGUMBAKKAM

their customs, because TV has replaced it for adults. Then, too, the textile industry is fast adjusting to the fact that children buy their own clothing, or the casual part of it, and do not have it bought for them. And so on throughout the range of goods required by people under 18, and further on to new goods that they do not 'require' and that industry has never made because parents would not buy them but which free-spending youngsters will readily buy. In general, the warping of economic demand in the direction of a youth that enjoys a degree of financial independence is one of the most apparent features of Europe's recent expansion and could well become more important still.

In saying that the foregoing are the things that Europeans have noticed and valued in their accession to prosperity one is not denying that they will, on being asked or sometimes just in passing, refer to other ways in which life has become richer, easier and more secure. But in the ordinary way those are the things that are spontaneously appreciated and recognised as the fruits of Europe's second industrialisation. When it comes to the dissatisfactions that are directly ascribed to that same economic progress, the list is not much longer. All sorts of things are complained of and resented, of course, but there are half a dozen that are blamed, more or less correctly, on the nature and pace of current economic change.

The curious thing is that, for several of them, the complaint is ritual, stereotyped, almost a conversational formula but contains little real bitterness because it is understood that the nuisance in question is a price that has to be paid. For example, one of the things that makes life more difficult and much more expensive than before the war is the shortage of personal services, and their high price when available. The plumber's repair man is the case of a service that has virtually disappeared, though I did manage to get a leaking tap fixed this year after waiting nine weeks and paying Rs. 12 to the entrepreneur and Re. 1 in 'bakshish' to the repair man. The housemaid is a similar case, though recruits are available at a fancy price and for uncertain periods as the waves of Spanish and Portuguese migrants come north with their womenfolk. Barbers still exist, but the most cursory attention from them costs Rs. 4 and they make it clear that they prefer clients who pay Rs. 12 for a "real" haircut. Examples could be multiplied, but the main fact is that knowledge of the consequences of economic expansion is now (in sharp contrast to earlier periods) sufficiently widespread for most people to see that these very serious inconveniences are the reverse of the medal of full employment and technological progress.

Social Mobility

Something similar could be said for the necessity of increased social mobility in an expanding economy, but unfortunately acceptance of this fact is still limited to the official layers of the working class whereas the rank and file still frequently rebel. (At the bottom of that class, needless to say, it has never been questioned because dire need forces men to migrate from, for example, sunny south Italy to dreary German mining towns.) Mobility is still very much less in Europe than in nomadic America but the Europeans have the excuse of a grave housing shortage, and of a longer sedentary tradition abetted by excessive centralisation (though West Germany is still free of that last-named ill). The need of it is now recognised by the managerial class and by the trade union leaders, but one still sees blind revolts — as by the Belgians in the Borinage or by French miners in condemned coal and iron ore pits — which cause much embarrassment to union leadership which admits their irrationality.

The housing problem, which is disastrous in France, severe in Italy and by no means solved in West Germany, is beyond doubt the gravest cause of dissatisfaction, and worse, in contemporary Europe. It is not recognised (here there remains a gap in popular economic education) that the

basic reason is unwillingness to pay the cost of housing even if higher rents leave less to spend on cars, holidays and the other prized advantages of economic progress. The attachment to rent controls remains intense, even, be it noted, in "liberal" West Germany, and as long as this is so the housing shortage must persist, or only very slowly be overcome. Since however, as has been said, the motorisation of Europe will force a remodelling of its cities and a different mode of life, it is perhaps just as well that the Europeans did not go further and faster with post-war housing reconstruction; almost everything they did in that line is already unsuitable for a car-per-family population, not to mention the deplorable quality of this cheap, hurriedly built housing in West Germany as well as in France.

Price Rise

Having referred to the inadequacy of the road system (which in France means a lack of superhighways, but in West Germany means a lack of ordinary roads whereas the 'autobahns' are more or less sufficient), one may mention as the last serious cause of widespread discontent the constant rise in food prices. One must hasten to add that food is claiming a diminishing percentage of family budgets, so one should not attach too much weight to the bitter complaints that dearer food occasions throughout West Europe. The situation is not at all what it is in the Communist countries where food supplies are irregular and often impossibly expensive for the average worker; e.g. even milk and potatoes disappear from Moscow shops from time to time, while all the East European peoples are denied tropical foods. In contrast, in West Europe food is always available and one would have to search for a family that really cannot afford its fill. But there is universal resentment at having to pay prices that seem "unfair" in comparison with those of industrial manufactures.

This issue is at the root of the long dispute about the Common Market's agricultural policy and, to a large extent, about that region's trade relations with the USA (since a good part of America's exports to Europe is food). Thus to analyse it further would lead us into a large and complex subject. Since we are looking at the human angle rather than the properly economic, suffice to say that there would seem to be a perversion of values in a society that refuses to support its own peasantry by paying for food what it is worth, while being ready to pay any price for motor cars and holidays. By refusing to pay for housing what it really cost, West Europe virtually annihilated the landlord class. It can scarcely propose doing the same with its farming class, who constitute 20 per cent of the population in some parts of Europe.

One prefaced this list of satisfactions and dissatisfactions by warning that no balance could be struck, though of course most Europeans would confess that they are better off today than in 1948 — which has not weakened the Communist parties, with their myth of increasing exploitation. Perhaps the clearest indication of popular sentiment is the preference in politics for efficacy over ideology, which means the desire for a regime that will give more of what is already enjoyed rather than anything different. Excluding the Communist parties (and even then, there would be something to be said about them), the Left has gradually abandoned its programme of radical change and offers itself as the more efficient, steadier management group — a claim that so far has not carried conviction outside Italy, so that most Europeans continue to prefer proven managers of the style of Erhard and the Gaullist "technocrats". These are not, in the economic sense, conservative regimes for they are committed to the dogmas of full employment, increasing production and social justice even, if need be, at the expense of some details in property rights. Their "liberalism", like the socialists' "radicalism", covers the promise to go on giving Europe what it has been getting since 1948.

Development Planning in Under-Developed Countries

VINAY P. BHENDE

IN RECENT years, most of the under-developed countries have become aware of the need of improvement, and they have been formulating and implementing development plans. In most countries there is an attempt to make intervention by government conform to an overall plan, but many of the most important planning decisions are made on the 'ad-hoc' basis. Apart from the administrative weaknesses of the governments concerned, one main reason for the discrepancy between the objectives of the plan and actual procedures is the difficulty of translating the objectives into principles that will guide day-to-day government operations.

Despite differences in data, economic structure, and the political effectiveness of governments, development planning involves an analysis of production possibilities and a choice from among alternatives, which are essentially similar for most of the underdeveloped countries.

The traditional approach to development planning is to employ the Leontief Input-Output Model. Given the final bill-of-goods describing the planned-for final consumption for the various key-sectors of the economy, and technical co-efficients of the Input-Output Matrix, this matrix when inverted yields the total levels of activities, which should be planned for, in order to realize the desired bill-of-goods after the inter-industrial consumption.

However, there are many shortcomings in this model, inasmuch as (1) the problem of conflicting objectives is ignored. This model only tells how much should be produced, irrespective of their capital requirements. It does not consider import-export alternatives neither does it consider alternative methods of production; (2) the models are strictly macro-economic, working with crude average technical co-efficients and capital-to-output ratios. In reality, these constants vary with the particular projects selected in the programme; (3) the time-lag between investment and returns is not incorporated in the model; (4) the optimal solutions are too sensitive to data and do not permit modifications conveniently.

These shortcomings can be overcome by the Linear Programming approach.

This article is intended to show how the Linear Programming technique can be usefully applied for development planning in under-developed countries.

Structural Disequilibrium

A country, whose economy is not in the state of Structural Equilibrium is described as under-developed, and its economy as an under-developed economy.

One of the most significant characteristics of the economies that are loosely described as "under-developed", is the inefficient use that is made of the available resources. The causes of this situation are very complex, and will not be analysed in detail in this article, but, in short, they result in an economic structure for which some of the crucial assumptions of general equilibrium theory are not valid. The price system does not function so as to produce full employment of labour and natural resources even with a high level of demand. The tendency for marginal returns of factors to equalize in different uses becomes limited. This result can be attributed to small markets, ignorance of technical advances, lack of complementary public investment, an aversion to risk-taking by the rich classes, a low level of savings, shortage of efficient industrial entrepreneurs, and many other factors.

Mr. Bhende is studying at the Purdue University in Indiana, USA, for a Master's degree in Industrial Engineering. About his article he says:

"The paper is written to suggest a new approach to the development planning, particularly suited for the underdeveloped countries. As explained in the paper, government intervention is very important to bring about a balanced growth of economy in underdeveloped countries. In order to have the plans balanced and consistent, the planning body needs a systematic approach to analyse the prevailing conditions and to make the best possible decisions accordingly.

"The methods presently used are macro-economic in nature, and have many drawbacks. The technical figures used for planning are crude averages. In actual practice, the figures vary considerably with every individual project. The approach in the paper uses a 'Linear Programming Technique', for analysing all the data and figures of the individual projects, in the light of the objective and the prevailing limitations. The figures used in the paper are strictly hypothetical. The problem was solved by the IBM 1620 computer. The matrix and the computer solution are attached to the paper."

Although, all these factors may not be encountered together in a single instance, their features are sufficiently important to make the assumption of "Structural Disequilibrium", a better starting point for the analysis, than that of a full-employment equilibrium. Structural disequilibrium reflects an inequality between proportions in which they are utilised. The existing distribution of the capital and other complementary factors do not permit the best use to be made of the available and natural resources.

The fact, that the capital and foreign exchange are typically scarce in under-developed countries, makes their allocation the important feature of any development plan. The existence of under-employment of labour and scarce foreign exchange distorts the pricing system and often results in a wide divergence between the social and private benefits of investments. For this reason, among others, government intervention in economic activity tends to be more widespread in the undeveloped countries, than in more advanced countries.

In all countries in the stage of development, it is common to find the newly built facilities lying idle, because of non-availability of raw material, water, power, skilled labour or services. At the same time, there may be idle capacities of old and new facilities due to the insufficient market or unjustifying modernisation of competing facilities. Conversely, available capacities, especially for consumer goods, may not be sufficient to meet the market demand as determined by the disposable income. The result is inflationary pressure on currency. Danger of inflation is serious when large investments are made in overambitious plans without sufficient simultaneous investments in consumer goods industries. Hence in order to reach the objective in the fastest possible way, development plans must be balanced and consistent.

For any under-developed country, the main objective of development planning is to bring about sizable increase in national income so as to increase the standard of living.

With special reference to the economic policy of India, the

main objectives of planning are: (1) increase in national income; (2) rapid industrialisation with particular emphasis on the development of basic and heavy industries; (3) expansion of employment opportunities; (4) reduction in inequalities in income and a more balanced economic growth.

Obviously enough, it is assumed that the rate of development be as fast as possible, the main limiting factors being the available capital and natural resources.

Capital increases through investment, and more investment calls for more savings or foreign assistance. Foreign assistance, if not in the form of grants, means some burden for the future. The extent to which foreign loans can be repaid will depend, ultimately, upon what can be saved at home in the future. Domestic savings are, therefore, the more reliable source of capital accumulation. But domestic savings can be increased only by sacrifices in present consumption, comparable to the future increases in consumption it promises. Hence, it would be practical to estimate the amount of domestic savings and capital imports that could be expected assuming no changes in economic policies, and then calculate the rate of growth that this level of savings and investments would provide, and finally, compare it with the desired rate of growth. This is necessary to assure that the targets set are feasible.

Economic development implies structural changes due to the different rates of growth in different industries. Accordingly, it is extremely important to distinguish the broad sectors. For example, at the core of under-development usually lies a very slow expansion of demand for agricultural products, combined with the low man-year productivity in agriculture. Hence, the rapid rise in the national income implies a partial shift of resources from agriculture to industry, which tends to expand at a faster rate.

Tentative Goal

Instead of maximising the national income in one step, it is convenient to set a tentative goal, which is translated into targets for each category of final commodity and minimising the amount of capital required to achieve this target. The targets can be lowered or raised, depending upon the available supplies of investment funds. The amount of investment should be chosen as the function for minimisation, because neither the supplies of domestic savings nor the foreign exchange is fixed in amount. Both depend upon government policy and the results which will be achieved. The best way would be to find the capital requirements for different targets, as a guide to political decisions, before a programme is adopted.

The first step in development programming should be to determine the general rate of economic development, the country seeks to attain. As the most common and appropriate measures of economic development are expressed in terms of such aggregate quantities as national income, consumption, savings, investments, or employment, the general rate of development may be most usefully set out in terms of these quantities as a set of economic targets of the country, so that they provide a framework for the further stages in programming.

The second step should be to select the various key sectors, that is, the sectors which are of prime importance to the economy, and which need government intervention. Then the various departments should be asked to design projects for the expansion of these sectors. These projects should be technological alternatives for producing certain commodities. From preliminary survey, close estimate of the inputs and outputs in a specific project should be prepared.

All the project proposals should then be analysed in the light of the objective and various resource-limitations and other factors, such as social and political considerations.

The steps in this procedure can be outlined as follows:

- (1) to make the initial projections of the growth of national

income, supply of resources, and the balance of payments; (2) to determine the composition of final demand for consumer goods, investment goods, and exports on the basis of expected domestic demand and foreign demand; (3) to design, or invite project proposals in the key sectors. The projects should be designed after a detailed survey by the competent technical personnel; (4) to make a tentative selection of projects and their levels, which, as a group, are consistent with the expected demands and resource-limitations and which make the whole programme an optimum one in the utilization of resources.

It will be shown below how the Linear Programming technique can be used to analyse the various project proposals, and to select the projects to achieve the desired objective, within the imposed limitations.

Assumptions

- (1) Income distribution, and hence, social welfare can be made independent of the development programme. This depends primarily upon the government's ability to redistribute income to the unemployed.
- (2) Social welfare is unaffected, whether the commodities are domestically produced or imported.
- (3) Quantity imported will not affect the world price, since the local demand is a small part of the world market.
- (4) Export prices are known and will not change considerably with the amount exported, as long as the amount does not exceed a particular limit. (This limit

To
All Users

Dear Sirs,

'ENGLISH ELECTRIC' Steps up
Production Capacity

The rapid expansion of industry to meet the demands of Defence and the targets of the Third Five Year Plan calls for an increasing volume of high quality electrical equipment.

To meet this demand we at English Electric are currently expanding our production capacity and increasing the range of our products manufactured at Madras.

The present production includes a wide range of industrial distribution equipment using H.R.C. Fuses, Relays and Control Panels.

Our need to step up production has been a direct result of the confidence placed in us by the users of English Electric equipment. We trust that by substantially increasing our output we continue to be worthy of this support.

Yours faithfully,
THE ENGLISH ELECTRIC CO. OF INDIA LIMITED

'ENGLISH ELECTRIC' STEPS UP PRODUCTION

is taken care of in the export demand constraint.)

- (5) The difference between the projected demand and the domestic production will be imported, or exported.

FORMULATION OF THE PROBLEM

In the Linear Programming model that is formulated in this paper, the objective function is

"To Minimise the Total Capital Required For the Development Program"

Symbolically:

$$\text{Minimise } \sum_{j=1}^n C_j X_j$$

Subject to:

$$\sum_{j=1}^n a_{ij} X_j + M_i - E_i \geq b_i \quad i = 1, \dots, m \quad \dots (a)$$

$$\sum_{j=1}^n a_{lj} X_j \leq L \quad \dots (b)$$

$$\sum_{j=1}^n X_j + \sum_{i=1}^m M_i m_i - \sum_{i=1}^m E_i e_i \leq D \quad \dots (c)$$

$$X_j^p \leq 1 \quad \dots (d)$$

$$E_i \leq D_i \quad \dots (e)$$

$$X_j \geq 0 \quad \dots (f)$$

$$b_i \geq 0 \quad \dots (g)$$

$$M_i \geq 0 \quad \dots (h)$$

$$E_i \geq 0 \quad \dots (i)$$

Where

C_j = The capital investment for the j^{th} activity.

X_j = the j^{th} activity

a_{ij} = the amount of commodity i produced by the unit of j^{th} activity.

M_i = The amount of commodity i imported from the foreign market.

E_i = The amount of commodity i exported to the foreign market.

b_i = The projected future requirements, of commodity i .

a_{lj} = The amount of labor required for j^{th} activity.

L = Total labor supply.

X_j^p = The j^{th} project activity, which cannot exceed unit level.

D_i = Demand for commodity i in the foreign market.

t_j = Foreign exchange required for unit of j^{th} activity.

m_i = Cost in foreign exchange for importing one unit of commodity i .

e_i = Revenue in foreign exchange earned by exporting one unit of commodity i .

D = The exchange deficit permitted in the period considered

The variables, (or activities) in this model are the various proposed projects. A project can be defined as a definite investment pattern, which relates the various inputs to the outputs they are expected to produce. It may be a new steel mill, a hydro-electric power plant, an irrigation project, etc. Reliable estimates can be made by experienced personnel in the field.

A government explores various possibilities of development in terms of projects through its various departments. Improvement may be through social development or material development. Social development consists of health, housing, education, employment, recreational facilities, etc., while material development consists of increased consumption of various economic goods. If any of these is considered, its development can be brought about in a variety of ways. The best method will differ with different countries, their resources, economic situation and many other factors.

For example, let us consider production of agricultural goods, say, wheat. It can be produced in many ways. To list some of those: (1) by using manual labour, cattle, and depending upon the rain for water supply. This is a labour-intensive method; (2) by using tractors and other agricultural implements, and water sprinklers for water supply. This is a capital-intensive method; (3) various combinations lying between (1) and (2):

The Alternative

As an alternative to producing, wheat can be imported also, to some extent or in full; or more can be produced than the domestic demand and the rest exported to foreign countries.

Similar is the case with all other commodities. The government has to decide how the demand of the people for these various commodities should be met, with the minimum capital investment, and with the available resources.

The constraints can be divided into five main categories.

- (1) Minimum requirements of various economic goods. The present demand of various commodities and their income elasticities are estimated. Then from the forecast level of income, expected domestic demands are calculated. The minimum amount of consumption of goods is also decided by government policy, depending upon the rate of development sought and upon the social and ethical factors. Skilled labour is also considered one of the economic goods which is produced by an educational project and consumed in other sectoral projects. Constraint (a) in this problem is of this category.
- (2) Available natural resources. Limited availability of the natural resources sets up a limit. Constraint (b) is of this category, labour being the resource.
- (3) Maximum permissible deficit in foreign exchange. The total value of imports should not exceed the value of the exports by more than the maximum deficit permitted. Constraint (c) is of this category.
- (4) Activity level constraints.

Some of the activities considered in this model are various projects. It is obvious that a project activity cannot exceed 1, because all the estimates and the values associated with the projects are the largest possible values under that particular set of conditions. Generally, all the inputs are related to each other in nearly the same proportion at any level of activity less than one. Hence, these activities should be constrained to be less than or equal to one. Constraint (d) is of this category.

- (5) Export demand constraints.

Amount of goods exported cannot exceed the demand

for the goods in the foreign market, at the set price. Constraint (e) is of this category.

Constraints (f), (g), (h), (i) are added to ensure the economic feasibility of the programme. It is obvious that the activities, requirements, amount of goods imported, and amount of goods exported cannot be negative.

Totally, this problem consists of 25 constraints.

Regional constraints can also be added to the model, stating that the capital spent on each region (or state—this is a geographical classification) must be at least a certain amount, which is set by the government policy. If one state does not have enough development projects, there will not be sufficient development in the state. Hence, to assure a balanced growth, some capital should be spent for developing such states. However, these constraints are not included in this model. Instead it is suggested that, after getting optimal solution, capital spent on the projects in each state should be found out, and for the states in which enough capital is not spent, shortage amount should be spent, making the necessary correction to the total budget. This capital should be spent in the form of industrial estates, giving scope for minor industries, small-scale and village industries, and other programmes, which should be planned on the "state-level". In this way a balance can be struck by having major industrial activities situated in the most efficient locations and at the same time having a balanced development of all the geographical area of the nation. This consideration is also necessary to cultivate motivation in the people throughout the country and to account for the fact that labour force is not perfectly mobile. In the absence of this consideration, some states which are not comparatively productive may remain undeveloped, while the other may become congested in the long run.

Fourth objective, namely, a reduction in inequalities in income can be achieved separately by constructing a suitable tax-structure, and hence is not considered in this formulation.

To give an illustration, a project activity is described here in detail: (The matrix is given on page 1468).

ACTIVITY	—X ⁶	UNIT
CAPITAL	150	Million dollars
Constraint	Description	Amount
No.		Unit
4	Steel	800
5	Power	— 25
6	Coal	—300
7	Transportation	— 3
8	Cement	— .8
9	Petroleum products	— 1
13	Skilled labour	—2.5
14	Unskilled labour	30
15	Foreign exchange	3
17	Steel project	1
X ⁶		Activity level

X⁶ represents a steel project, which is expected to produce 800 kilo-tons of steel. (i.e. 800,000 tons/year). It will require an installed capacity of 25 megawatts of electrical power, 300 kilo-tons of coal, 3x10⁸ ton-miles of transportation facilities, .8 kilo-tons of cement, 1 kilo-ton of petroleum products, 2.5x1000 man-years of skilled labour, 30,000 man-years of unskilled labour, a foreign exchange of 3 million dollars, and the project can be conducted efficiently at or below activity-level of one.

This project requires a capital investment of 150 million

ANNUAL NUMBER 1964

It may be observed that the export prices are slightly less than the corresponding import prices. The ratio of the foreign exchange earned by exporting a unit and the foreign exchange required to import a unit is about 0.9. This takes into account the fact that, for importing, the shipping charges have also to be paid in the foreign currency, and overall shipping costs are nearly 10 per cent.

Activities 1 through 17, i.e. X_1 through X_{17} through X_{17} represent various projects, activities 18 through 22 are import alternatives for some of the commodities. Activities 23 through 28 represent the exports of some prospective commodities. From 29 through 41 are the artificial variables associated with zero costs. These variables denote the excess amount of goods over the demand, after the inter-industrial consumption and import-export activities are considered. Though these will be zero in almost all cases, these are included to add flexibility to the programme. Since the problem is to be solved by the computer, the inclusion of these variables is necessary to have the feasible solution. Also the shadow prices of these variables will show the required change in capital if the requirement of the commodity is slightly changed. This will help a great deal to check the programme and make revisions in it by eliminating the bottlenecks and making full use of other resources. Variables 42 through 66 are the basis variables, out of which, 42 through 54 are mainly used to facilitate the computer programming. Since all the basis variables and requirement elements must be positive, these positive variables were added to start with the feasible programme. Since all the inequalities associated with these, i.e., rows 1 through 12 are of the form equal to or greater than b₁, none of these basis variables should appear into solution. Hence, they are assigned very high capital costs 999,999 (highest available on IBM 1620 computer) $\times 55$ is a slack variable associated with the constraint 13—of direct labour. This represents the amount of labour unused in the programme. This is the unemployed labour. Cost of .12 million dollars per 1000 man-years is assigned to it with the view that no resource with zero capital cost should be left unused. In the thickly over-populated country, it is not possible to give full employment to the people before a certain growth has already been achieved. There is no point in using labour unproductively in any country, just to create full employment. The supply of labour is so much that the intersection of demand and supply curves occur at a very low price, even below the subsistence level and this price makes the labour almost impossible to live with. Hence, the government has to set a minimum wage level to assure that the labour is not employed at the wage level less than the subsistence level. In this case, there is bound to be some unemployment. It is suggested that the government should conduct an unemployment aid programme, through which the unemployed adults should be given some monetary help, which is necessary for bare survival. So, the cost of 0.12 million dollars is associated with this variable. This is an absolute minimum amount necessary for survival. However, some of this unemployed labour is employed in the small-scale industries and the industrial estates, which are considered separately from

x_{56} is a slack variable associated with the 14th constraint, that of foreign exchange. This represents the unused exchange from the allowed deficit. Its shadow price indicates the accounting price of foreign exchange, and it is equal to the incremental capital cost of earning foreign exchange through exports and to the incremental capital cost of saving foreign exchange through import substitution.

X65 and X66 are associated with constraints 24 and 25 respectively. They represent the difference between the export level and the maximum amount of export possible, which is an estimate of the foreign market.

The matrix is given herewith, with the units written besides the requirements matrix. The problem was programmed and solved by the IBM Fortran 1620 computer. The computer solution is given on page 1469.

The computer solution enlists the 23 iterations, the functional, the variables which enter the solution, and the variables which leave the solution.

The second part of the solution enlists the variables which appear in the final solution, with their activity levels. Also, the upper and lower limits of the cost of these variables, with the respective variables which set these limits are listed. In other words, the optimal solution does not change, if the cost of the variable lies within this range, the cost of the others being unchanged. If the capital cost of the variable goes beyond the upper limit, the variable will go out of the solution. If it goes below the lower limit, its activity level will increase. The problem was programmed for the computer as a maximisation problem, with the negative sign attached to the capital costs. Due to this sign, the upper limits associated with higher costs are defined as the lower limits in the computer solution, and vice versa.

It can be seen that 4915.3547 x 1000 man-years of unskilled labour are still unemployed. If the government decides to spend less than \$0856 million per 1000 man-years, the unemployment will increase. To create full employment, the government will have to spend at least .3204 per 1000 man-years. In the same way, all other variables can be analysed.

Third part of the solution enlists the variables which are not appearing in the optimal solution, with their shadow prices. Capital cost range for these variables is also given, within which, these shadow prices are valid.

Variable 56, slack for foreign exchange is of special interest. It indicates the accounting price of the foreign exchange, which is very important for making export-import decisions. Hence, one dollar of foreign exchange should be considered as equivalent to \$1.0421. This indicates the necessity of increasing exports, and restricting the additional imports. Shadow price of variable 35 is \$1.7717 million and indicates the saving made by reducing the target for transport by 1 ton-mile, or additional capital required to increase transport facilities by 1 ton-mile. Thus, the effect of varying the targets on the total capital required can be seen. By this sensitivity analysis, all the targets set should be reviewed, and the necessary revisions should be made. A few recommendations for guiding the policies are made below.

The optimal solution was reached on the Fortran 1620 computer after 23 iterations. The functional — the minimum

capital required to achieve the target is—6290.3908 million dollars.

With each iteration, the value of the functional, the variable which entered the solution, and the variable which went out of the solution, are given.

The main decisions, which the solution suggests, are:

- 1 Produce 11.8399 x 10⁶ tons of wheat by labour-intensive method, and import the rest of the amount.
- 2 Produce all the rice demanded, by labour-intensive method.
- 3 Produce the fertilizer domestically, by starting the proposed fertilizer project with full intensity, and import to meet the additional requirements.
- 4 Start the project 6 for producing steel, and export the extra production of about 147,311 tons. Do not take up project 7.
- 5 Start the irrigation project. This should be taken in 4 stages, and the first stage must be completed by the end of this planning period.
- 6 Start the power project 9 with full intensity.
- 7 Extract about 13,843 tons of coal from the coal mines.
- 8 Increase transportation facilities to handle about 12.1622 x 10⁸ ton-miles.
- 9 Start the cement project with full intensity and export the extra production of cement, which will be about 1374,589 tons.
- 10 Start the first stage of petroleum project, producing about 1260 tons at the end of first planning period.
- 11 Start the textile project with full intensity and export 80 million yards of cotton-textile.
- 12 Produce 1000 million yards of handloom-textile (12.5 x 80) exporting 500 million yards. If more can be sold, more should be produced. Special efforts should be made to increase the sales, in both domestic and foreign markets.
- 13 Produce 200 million units of hand-made articles, and export 180 million units. Special effort should be made to increase the sales, especially in the foreign market.
- 14 The accounting price of the foreign-exchange should be taken equivalent to \$1.0421, in making further import-export decisions.
- 15 In setting up industrial estates, and small-scale industries, special attention should be given to the employment of labour. Nearly 5 million people need to be employed in these activities. This amount should be allotted to the states, in which enough projects are not taken up.
- 16 The tax structure should be set so that it enables to collect the capital required for the programme.

Summary

The main lines of the discussion of this paper can be summed up as follows:

- 1 The main analytical problem in formulating a development programme is to find a solution which is consistent with the expected demands and the resource limitations and which is efficient in using the resources. Methods presently used do not ensure that the best use is made of the resources.
- 2 In setting up an investment programme, the choices have to be made among various alternatives. Of all the decisions, the choice between imports and domestic production is both the most difficult analytically, and the most important, since it determines the future

pattern of development. The linear programming formulation is particularly suited to analyse this problem. Though it cannot be empirically applied in great detail, it should at least clarify thinking on this subject. The principal application of this approach is to determine the shadow price of exchange rate at this level.

Since the structure of the economy is continuously changing and the information for analysis is continuously being improved, the revision of programmes and policies should be thought of, as a continuous process. "Sensitivity analysis" would be the best tool for deciding the policy instruments and to make the policy decisions, and revisions.

This approach will serve the purpose of guiding the policy decisions regarding the resources allocation, though it will not be a good forecast of the rate of growth. However, this difficulty can be partially overcome by constantly comparing the plans with the results. Even the error in forecasting is not very detrimental. An overestimate of the rate of growth may result in investments to be made too soon, with consequent under-utilisation of capacity till the estimated level is reached. But, this waste is certainly less severe than that caused by investment in a sector for which economy is not comparatively prospective. Incorrect analysis of the pattern of growth may result in high prices in some sectors and may call for government protection for another sector. But, the error in estimating the rate of growth can be wiped out over time. It is much harder to shift the resources from one sector to another, than to change the rate of production.

By sensitivity analysis, boundary conditions can be studied in details and the effect of changes in the target values on the whole economy can be visualised. Its use is particularly glorified by the fact that, in most of the cases, the availability of capital is not fully in the control of the government, particularly, when it is depending upon the foreign grants to a large extent. Hence, when the capital requirement, as shown by the functional in the optimal solution cannot be fully met, or is less than the available capital, targets can be lowered or raised to suit the disposable capital. Parametric linear programming available on IBM 7090 computer has greatly facilitated this use.

With Best Compliments of
TEXTILE MACHINERY CORPORATION LIMITED.
(TEXMACO)
 Belgharia, 24 Parganas
 WEST BENGAL

Manufacturers of :-

ALL TYPES OF COTTON & STAPLE FIBRE SPINNING MACHINERY
 SUCH AS RING FRAMES UP TO 8" SPINDLES WITH MOST MODERN
 DRAFTING SYSTEMS;

CARDING ENGINES, DRAWING FRAMES AND SIMPLEX FLY FRAMES
 IN COLLABORATION WITH HOWA OF JAPAN;

TEXMACO 3C WARD CAPSTAN LATHES IN COLLABORATION WITH
 WARD OF BRITAIN;

WATER TUBE BOILERS IN COLLABORATION WITH COMBUSTION
 ENGINEERING CORPORATION OF UNITED STATES;

LANCASHIRE BOILERS 30 Ft. x 8 Ft. upto 220 LBS. PRESSURE;

VERTICAL BOILERS OF NUMEROUS SIZES UPTO 13 Ft. x 5 Ft.
 FIRE BOXES AND SYPHONS OF ALL TYPES;

COMPLETE SUGAR PLANT IN COLLABORATION WITH STORKS OF
 HOLLAND;

RAILWAY WAGONS - BOX, CR, CMR, MBTPX & MBTPZ TYPES;
 HYDRAULIC DAM EQUIPMENTS, BRIDGES & CRANES IN COLLABO-
 RATION WITH VOEST OF AUSTRIA;

HEAVY STRUCTURAL WORK ETC. ETC.

STEEL CASTINGS OF VARIOUS SIZES & CAST IRON CASTINGS OF
 NUMEROUS VARIETIES.

EQUIPPED WITH MOST MODERN MACHINES AND HIGHLY MACHA-
 NISED CAST IRON & STEEL FOUNDRIES.

Managing Agents :

Birla Brothers (Private) Limited.,
 15, INDIA EXCHANGE PLACE,
 CALCUTTA-1.

Capital Market Conundrums

SAGITTARIUS

AFTER NEARLY a year, the problems relating to the capital market have come in for serious attention and efforts are being made to restore confidence in the outlook for the future of Indian industries. Until the middle of last year it was somehow taken for granted that the promotion of new industries and the implementation of the expansion plans of the established industrial units can come about at a rapid rate as long as the Central and State Governments incurred expenditure on development on a large scale. The boom in capital issues during 1957-62 also gave room for the impression that the inflow of foreign capital would continue to be satisfactory and there was growing faith in the ability of Indian entrepreneurs for new tasks which called for imagination and large capital outlay. The flotation of big companies in collaboration with foreign interests and the launching of expansion plans by nearly every important unit also confirmed this view. It was, however, not realized that a reasonable level of direct and indirect taxes, a stable administration and the enthusiastic co-operation of Indian industrialists with foreign interests were mainly responsible for the phenomenal progress recorded during the past few years. It will be no exaggeration to say that the like of a boom in new capital issues, as took place during 1957-62, has not been witnessed in this country's industrial history and that the benefits of the various collaboration arrangements with foreign interests are now being derived. The boom during World War II was no doubt impressive but there was no method about the promotion of new companies, and the development of new industries during the period was of a different kind and arose out of conditions then prevalent.

Gaps Closed

The years 1961, 1962 and 1963 will emerge as landmarks as the gaps in the industrial structure are closed, and there is now greater confidence necessary for bigger and difficult tasks. The magnitude of the effort made in the past few years will be evident from the fact that consents for capital issues for non-Government companies have been for large amounts. For the six years under reference the aggregate figure was Rs. 1,025 crores. Government companies also sought permission for issuing capital to the extent of Rs. 740 crores. These issues do not have any direct significance for the capital market as the funds are directly provided from government sources, but the fact that large resources were invested in government undertakings and there was an investment boom in the private sector evidences a new trend towards employment of individual savings in industrial securities which is due to a favourable climate in the capital market and the added scope for new industries following in the wake of high levels of development expenditure.

The figures relating to the issue of ordinary and preference shares and debentures show that the consents have been utilised fairly effectively, and the amount of fresh capital raised on behalf of non-government companies amounted on an average to Rs. 103 crores a year. It is noteworthy that bonus issues did not figure prominently during 1957-61 and that only in 1962 was there greater anxiety to capitalize reserves and issue bonus shares in order to bring the paid-up capital in line with the capital employed in fixed assets. Equity shares naturally accounted for a good proportion of the capital in the case of both initial and further issues. The amount raised in 1962 would have been much higher but for the fact that during last three months, many issues were postponed on account of depression in the capital market following the proclamation of Emergency. The actual investment in the different industries would, however, have been easily of the order of Rs. 1,500 crores,

if not more, as, in spite of the liberal participation by foreign interests in equity capital of many companies, it was thought advisable to raise large sums in foreign exchange and borrow from credit institutions so that the proportion of equity to total capital could be kept as low as possible. An average annual investment of Rs. 300 crores has not been achieved earlier. The details relating to consent given by the Controller of Capital Issues and the amounts raised in various forms are given in Table I.

No reliable study has been made so far of the extent of support for new issues from different quarters. But having regard to the response for many new issues and the method of allotment of shares, particularly of equity issues, it becomes clear that there has been an enlargement of investors and there was a greater disposition on the part of new investors to regard the deployment of their savings in industrial securities as a profitable source of income. The increase in the number of individual investors certainly augured well.

The recent boom in new capital issues has been diversified in character and the capital outlay is much more than the amount consented to by the Controller of Capital Issues or the amounts gathered from the public in various forms. It is also noteworthy that the capacity of the capital market has grown considerably and large sums have been gathered both by private and public limited companies. The large capital outlay in government undertakings has no doubt swelled the total but the performance of the private sector is more impressive. The largest amount gathered was Rs. 124.23 crores in

TABLE I

	96.02	69.40	61.17	122.49

1959. The proportion of consents utilized has been over 60 per cent. being as high as 77.4 per cent. and 75.1 per cent. in 1958 and 1959. There is always a carry-over of consents over a period of time. They were valid for 24 months until some time ago when the period was reduced to 12 months. In some cases, the promoters of new companies took time to finalize their arrangements. The sharp decline in the proportion to 40.2 per cent. in 1962 is, however, due to the uncertain conditions in the capital market in the last quarter of the year and an earlier feeling that the market had become saturated with new issues. The position will become clearer from the following figures:

TABLE II
CONSENTS TO CAPITAL ISSUE AND CAPITAL
SUBSCRIBED: ALL COMPANIES

TABLE IV.
CONSENTS TO CAPITAL ISSUE AND CAPITAL
SUBSCRIBED: NON-GOVERNMENT COMPANIES
(In crores of rupees)

Year	Consents		Capital	
	Public	Private	Public	Private
1951	41.78	15.71	23.46	9.47
1952	25.10	8.13	170.7	5.33
1953	66.07	6.70	53.41	4.64
1954	95.61	6.70	73.86	3.77
1955	97.34	24.11	58.93	12.11
1956	187.81	14.13	119.85	10.24
1957	109.05	33.38	77.64	23.82
1958	85.27	18.15	65.83	14.29
1959	124.72	40.71	92.96	31.36
1960	139.49	34.10	86.57	10.10
1961	164.39	31.71	83.55	23.19
1962	218.43	25.52	84.91	13.17

In regard to the consents issued to non-Government companies it is noteworthy that, alongside of the spectacular growth of public limited companies, there was also a sharp increase in the subscribed capital of private limited companies. While in the case of the former there was a more democratic ownership and units of a large size were formed, the emergence of medium and small-sized private limited companies meant the employment of a larger proportion of the savings of small groups of individuals who got together as shareholders and entrepreneurs to promote small-scale and ancillary industries. This is indeed a favourable development which has led to a greater utilization of talent for running industrial enterprises. The growth in the importance of this sector will be evident from the fact that, during 1957-62, subscribed capital was Rs. 124.93 crores as against Rs. 183.57 crores consented to. In 1951-56, the figures were much lower at Rs. 45.56 crores and Rs. 75.48 crores respectively. Public limited companies have also grown in stature as consents for Rs. 841.35 crores were issued during 1957-62 against Rs. 513.71 crores during 1951-56. The amount secured as subscribed capital was Rs. 491.46 crores against Rs. 346.58 crores. It is needless to say that the total for the last six years would have been very much higher but for the setback in the latter half of 1962.

Need for Greater Effort

A greater effort can probably be made under more congenial conditions and new facilities created with a view to mobilizing the resources of the lower middle-income groups. The formation of the Unit Trust will greatly spread the investment habit. It may also happen that the savings of the community would become more institutionalised and the Life Insurance Corporation and, for that matter, even the banking system might be able to lend substantial support to preference shares and debentures particularly. The objective should be to

C I B A where research is the tradition

The substance in these test tubes may be gold tomorrow, or it may be cast away. From research to riches is an unpredictable course with the only certainty being that progress in the chemical industry depends upon and demands the daring, the initiative, imagination and hard work that are associated with research investment.

The development of new products from research to reality, from the laboratory to the plant, and finally to the market, involves skills and co-operative endeavours that come only from long experience. A constant flow of original and valuable dyes, pharmaceuticals, plastics, and chemical specialties provide the character of the CIBA concern. These are the treasures that CIBA offers to the world.

In keeping with the CIBA tradition of research, a multi-million rupee centre has been established at Goregaon, Bombay, for fundamental chemical and biological research in answer to India's present Five-Year Plan. The CIBA Research Centre is the first of its kind sponsored by private industry in South Asia—an ambitious project devoted to the betterment of man.

CIBA of India Limited.

Macneills have been associated with India's commercial and industrial development for almost a century, and with the growth of the country's economy, Macneills' services to commerce and industry have grown.

Macneills today are owners and managers of an important group of companies engaged in the manufacture or sale of Mining and Industrial Machinery, Turbine Pumps, Starters and Switchgear, Ropes, Jute Products, Drums, Containers and Closures and other Light Industrial Products for the home market and for export.

They are important producers of Coal and Tea and also operate the largest system of inland water transport in Asia which maintains its own Shipbuilding and Repair Yard on the river Hooghly.

attract, as far as possible, new savings of individuals for investment in industrial securities as it would be undesirable, from the long-term point of view, to increase unduly the importance of the statutory corporations, other than the Life Insurance Corporation. These corporations can only provide capital in particular forms and that up to a specified limit. They can, of course, be made to come to the rescue of new companies and provide short-term relief when there is a slack in the capital market. The proposal to convert the Industrial Finance Corporation into a development bank and help the Refinance Corporation provide much larger sums through the discounting of medium-term loans is certainly to be welcomed. But it must be remembered that these corporations can be made to shoulder larger burdens only in an emergency. The development of the industrial economy in the private sector has to come about in large measure with the help of individual investors and those credit institutions which can gather medium or long-term deposits from the public and can be evolved into industrial banks.

Role of Statutory Corporations

Statutory corporations, such as Industrial Finance Corporation and other State Corporations have, between themselves, as Refinance Corporation for Industry, the Life Insurance Corporation and other State Corporations have, between themselves, as will be seen from the figures given below, latterly been providing over Rs. 50 crores annually, that is a sixth of the total investment to the industrial corporate sector (private) yearly.

The share of the statutory corporations in total investment has no doubt increased in 1962 on account of the depression in the capital market and the need for new as well as established companies to secure larger support from special sources for pushing through their schemes. In earlier years, the percentages were much lower. The proportion can be said to be even higher at about 25 per cent, if the additions to internal resources of the various industrial units were excluded. But it is important to remember that the catalytic effect of the funds provided by the Corporations has greater significance for the industrial economy than the actual quantum of financial assistance, when

I.F.C.—Industrial Finance Corporation of India.

I.C.I.C.I.—Industrial Credit and Investment Corporation of India Ltd.

R.F.C.—Refinance Corporation.

S.F.C.—State Financial Corporations.

Note: The increase in investment in shares and debentures by the Life Insurance Corporation during 1957-62 (inclusive) is estimated at about Rs. 48 crores, or an average of Rs. 8 crores annually, taking the total investment of all Statutory Corporations to be Rs. 180 crores or an average of Rs. 30 crores annually. The current rate, however, is over Rs. 53 crores.

the capital market was active. This is borne out by experience until 1961. Each corporation has assumed a special function and the co-ordinated manner in which funds were provided has led the industrial sector to expect that, in the absence of support for certain capital issues, the statutory corporations can be depended upon for specific kinds of assistance. Thus has it happened that, depending on conditions prevailing in the capital market, investors have shown preference for loan capital or preference shares or equity shares as the case may be. In the earlier years, preference shares were in greater vogue. Even debentures, too, were preferred—even by individual investors. But when it became clear that planned expenditure was having favourable effects on the economy, there arose a partiality for equity shares. This has been a feature of the last boom while latterly, with a decline in yields on equity shares and uncertainty about the outlook for the future, there has again been greater support for preference and debenture issues, and companies have had to think in terms of raising prior charged capital, thanks to the change in the preferences of investors. Naturally therefore, the recent issue of debentures by Madura Mills and preference shares by Jaya Shree Industries and Delhi Cloth and General Mills were successfully subscribed. There has also been a good absorption of preference shares and debentures of existing companies reflected in higher prices and even a drying up of floating supplies. If the issue of Oil India debentures of Rs. 30 crores did not prove a success, it was because the company's properties were located in an area which was considered unsafe and there was extreme nervousness in the stock markets following the proclamation of Emergency. The underwriters, mostly the statutory corporations including the State Bank of India, had, therefore, to take up a large portion of the issue on their own account.

Division of Function

The fairly clear division of function as between the statutory corporations, will be evident from the fact that the Industrial Finance Corporation usually advances loans against assets of the established companies in particular. Latterly, it has been engaged in joint underwriting operations which were, for a time, the main function of the Industrial Credit Corporation. These two institutions have also been lending in foreign currencies so that the companies which required only relatively small loans were not obliged to approach international lending institutions directly or utilize other foreign credits at the disposal of the Government.

The Refinance Corporation for its part has been discounting medium-term loans extended by member banks. These loans proved helpful to institutions which were sure of amortising their obligations out of internal resources or through the issue of additional capital at a later stage when fresh investment had started yielding results. Mr. T. T. Krishnamachari indicated in Parliament, soon after assuming office, that the statutory corporations should be enabled to play an even more important part in financing industrial growth. For this purpose, larger funds would be put at their disposal and the necessary amendments made in the law. Thus, it has been proposed that the Industrial Finance Corporation should be converted into a development bank so that loans can be extended over longer periods and the Corporation empowered to accept long-term deposits from the public. The Refinance Corporation, in its sphere, would make available to member banks much larger sums through the discounting of loans.

These changes will no doubt be helpful. But it has been overlooked that, for the provision of loans on a larger scale, there will have to be an enlarged capital base and loans by the Industrial Finance Corporation and those discounted by the Refinance Corporation should be backed by the requisite assets. If this is to be done by extending the capital base of the Statutory Corporations also, it would then mean that

the equity or preference capital would have to be provided in large part by the Corporations themselves. Even during the past few months, the I.F.C. and I.C.I.C.I. have been obliged to take up large parcels of equity and preference shares in pursuance of their underwriting commitments. The Life Insurance Corporation and the State Finance Corporations, such as the Madras Industrial Investment Corporation, have also been taking up shares on their own account with the result that the element of outside interest in some companies floated latterly has not been appreciable.

Stimulating Investment Habit

The I.C.I.C.I. has no doubt been successful in unloading some of its earlier investment at a profit and it may properly be argued that the public would be prepared to take up shares of companies which had reached the production stage and could pay dividends on equity shares. But apart from the public being obliged to buy shares at a premium, the funds required by the private sector cannot, in this manner, be found to any appreciable extent by the Corporations over a period. The investment habit has to be encouraged and a direct flow of savings into industrial securities has to be brought about. After all, Statutory Corporations provide only loan capital when necessary and the foreign exchange loans needed by medium-sized units for import of plant and machinery. Otherwise, with the pre-occupation of the Central and State Governments in developing their own projects, the desired progress by the private sector cannot be ensured. The catalytic effect of the assistance provided by the Finance Corporations in the past few years, when their role was not dominant, has been reflected in the expanding body of investors. This method of financing should be considered healthy as corporations serve to promote a measure of confidence in new enterprises, for the investment habit, among small investors in particular, has tended to grow.

It is difficult to make a precise estimate of additional production that can be ascribed to the new industrial units and that due to old units which have increased their capacity or the saving in foreign exchange through displacement of imports. But many of the earlier schemes for starting new industries are fructifying; hence — it was argued — that 1960, 1961, 1962 and 1963 were landmarks.

To cite only a few examples: The tyre industry has grown beyond recognition during this period. The new units of Goodyear India, the Madras Rubber Factory, Premier Tyres, Ceat Tyre, General Tyres and the expanded capacity of Firestone have been reflected in an increasing output of tyres and tubes of various kinds. The giant synthetic rubber factory of Synthetics and Chemicals has been in operation at Bareilly for some time now while the mammoth unit of

Gwalior Rayon for producing rayon-grade pulp, based on bamboo, was commissioned early this year. Likewise, the large factory, for producing compound fertilisers of East India Distilleries and Sugar Factories Limited at Ennore, near Madras, was completed towards the end of 1962; the additional ammonium phosphate will help greatly to increase agricultural production. The rayon units of Baroda Rayon and Indian Rayon have commenced working. The new entrants like Associated Vivkes Babco, Hindustan Aluminium, South India Viscose, Phillips Carbon Black, Usha Martin Black, United Wire Ropes, Seshasayee Paper, Seshasayee Industries, Mandya Paper, the new unit of Straw Products and the new paper mill of Star Paper and Isaac Holden are all outstanding examples of what the 1957-62 boom has achieved in the manufacture of carbon black, tyres, wire ropes, rayon-grade pulp, various kinds of industrial machinery, aluminium, increasing quantities of rayon yarn and cord, etc.

This process will continue for some time as a number of the new companies floated during the boom are yet to complete their projects. It will then be possible to have a much larger output of aluminium and aluminium products and cables of various kinds, apart from the processing of zinc and lead based on imported concentrates, larger quantities of fertilisers, sugar, carbide, plastics, larger quantities of industrial machinery, engineering items, etc. The expansion plans of existing producers, which have special significance in the present context, have also been and are being implemented.

Impact of Emergency

Until the middle of last year there was no looking back, and it had been presumed that the required capital for promoting different industries would be easily available. But the whole situation has undergone a sharp change since the declaration of Emergency in October last year. The serious situation on the border that continued for some months upset all calculations. However, even before the stock markets had emerged out of a critical period and fears of political uncertainties had subsided, the budget for 1963-64, presented by Mr. Morarji Desai to Parliament, came as a fresh shock. It had generally been expected that heavy taxes would be levied and that further sacrifices would be demanded of consumers as well as industries. But it had not been expected that fresh taxation would exceed Rs. 275 crores or that the corporate sector would be soaked so heavily. The Super-Profits Tax has resulted in the syphoning away of large funds to the Exchequer, and capital formation in the corporate sector has been seriously affected. The net incidence of heavy direct and indirect taxes has not been precisely assessed but it has been generally pointed out that the new taxes on intermediate

products and the upward revision of duties on end products, along with S.P.T., might easily result in a fresh diversion of funds from the corporate sector by over Rs. 75 crores in a year. Indeed, this constitutes a serious draft on the additions to internal resources.

But apart from the reduced rate of capital formation, the reduced profitability of new investments has had an adverse effect on the capital market and has led to the postponement or abandonment of many schemes. There are outstanding instances of many existing companies which in consequence are choosing to phase out their expansion plans in easy stages. Some have even kept these schemes pending while others have varied the mode of financing the new projects. Goodyear India Limited decided not to proceed with the issue of fresh capital after the budget proposals had been announced as the premium fixed on equity shares was regarded as high in the changed circumstances. It was not also clear whether fresh investments would be profitable from the shareholders' point of view. Likewise, Hindustan Lever had been permitted to issue additional capital at a premium of Rs. 25 per share, the Government having determined its procedure prior to the publication of the budget. The directors of Hindustan Lever, however, felt that the new shares could not be issued at such a high premium. It was, therefore, decided that the matter should not be proceeded with until conditions became more propitious. It was felt, however, that the new schemes should be implemented, though less expeditiously, as the plans for implementation had reached an advanced stage. The required additional foreign exchange was, therefore, secured on a loan basis from the parent company. East Anglia Plastics were permitted to raise over Rs. 3 crores by issuing new equity shares but the directors felt that it would be difficult to ask the shareholders to subscribe such large sums especially as the projects would take time to be completed and prices for existing securities had moreover been marked down sharply. The directors of this company, therefore, decided that new capital should be raised in two stages. Indian Iron and Steel Company Limited was, for a time, obliged to put off work on a new unit in Madhya Pradesh which sought to manufacture spun pipes in collaboration with British interests. Only after the concessions had been announced was it thought advisable to proceed with the scheme.

Projects Abandoned

There are, however, cases where it has been considered necessary to abandon projects. The directors of Botanium Limited actually felt that the various arrangements for manufacturing Titanium Oxide in collaboration with foreign interests should be cancelled as the new investment was no longer considered attractive. The shares allotted to the Belgian interests were taken back. While other shareholders were given the choice substantially to take back funds, alternatively to take up, in lieu of the amounts refunded, shares in a new company which had been promoted for manufacturing petrochemicals.

More than the delay in the implementation of schemes, their modification or abandonment and the hesitation shown by foreign interests to enter into fresh commitments has proved to be costly. Even some projects on which considerable preliminary work had been done are yet to be finalised while there would appear to be second thoughts about the expansion of capacity of new units in new industries.

The retarding effect in the rate of new floatations may not be felt until after a time because there is a time lag of two or three years before expansion schemes are completed or new industrial units reach the stage of production. Actually, the upward trend in industrial output in the past twelve months,

notwithstanding the difficulties involved in importing raw materials, may create a misleading impression and even lead to complacency. The new projects completed in recent months are really the result of the boom in the floatations of 1960-62.

Somehow, the activity in the capital market has been associated with the buoyancy of the stock markets. The development in the last quarter of 1962 came about suddenly and the declaration of Emergency upset all calculations. Defence expenditure had to be stepped up considerably and development expenditure maintained at high levels. The main problem of the Central and State Governments during the past year and earlier has related to mobilization of resources with which to maintain the Defence Services in a state of preparedness and simultaneously in implementing third Plan schemes. The increase in Defence Budget by over Rs. 400 crores during the current year and even a slightly large provision for the third Plan schemes obliged the Central Government in particular to levy heavy taxes. The budget estimate relating to expenditure came as a surprise as it was not generally expected that the total of the Central Budget alone would increase by over Rs. 500 crores and the Union Finance Minister would be obliged to present proposals to Parliament for new and higher taxes and a compulsory deposit scheme in order to increase the yield to the Exchequer by over Rs. 305 crores a year. The State Governments for their part proposed fresh taxation to the tune of another Rs. 100 crores.

Devastating Measures

Mr. Morarji Desai's devastating measures had a shocking effect on the stock markets in particular as, over and above the heavier customs and excise duties and a longer list of excisable commodities, the rates of income-tax were adjusted to make it impinge more heavily on the lower incomes while the compulsory deposit scheme soaked the middle-income groups. The Super Profits Tax in its original form had a throttling effect and was even more inequitable than the ubiquitous Business Profits Tax of Mr. Liaquat Ali Khan.

As a result of vigorous representations and heated discussions in Parliament, some changes were proposed in the Super Profits Tax and the Compulsory Deposit Scheme. But after the changes had been announced, it was found on a closer analysis that the proceeds of the Compulsory Deposit Scheme and the Super Profits Tax alone would exceed the estimates by over Rs. 60 crores while the indirect taxes were expected to secure another Rs. 90 crores in excess of estimates. That is to say, even the modified S.P.T. and the Compulsory Deposit Scheme along with the other fresh taxes would bring in a revenue of about Rs. 450 crores against the budget estimate of Rs. 275 crores.

This hectic drive for taxes and compulsory deposits, together with open market loans and an intensified small savings campaign, meant diversion of funds which was bound to lead to lower rates in the growth of deposits, a smaller volume of business for the Life Insurance Corporation and a vastly reduced capital formation in the corporate sector.

No useful purpose was really served by immobilizing funds which were not immediately required by the Central and State Governments especially because the Central Government in particular—so it was felt—would be unable to fully utilise its appropriations for defence and development, both at the same time. There may not be any serious difficulties in implementing third Plan projects if the required foreign exchange was forthcoming but a massive physical effort is involved in building up the defence forces and it may not be surprising if the actual expenditure on defence did not increase

to the desired extent. There will thus have been no meaning in gathering another Rs. 150 crores in the context of a complaint, in the private sector, about a shortage of rupee finance without comparable difficulties in securing foreign exchange for the importation of plant and machinery.

It has subsequently been realized that the impact of the Super Profits Tax and higher indirect taxes on intermediate and end-products have resulted in a sharp decline in disposable profits. Notwithstanding larger production, larger sales and higher gross earnings—even if the last of these has not increased in proportion to sales—the incidence of total taxation has been so heavy that in many cases it has been necessary to draw substantially from reserves even to distribute the reduced dividends.

The concessions made on the Super Profits Tax and the modification of the Compulsory Deposit Scheme have no doubt made the new levies less rigorous but as the months went on, it became clear that the incentive to save and invest had been sapped; thanks to a higher cost of living and rising costs of production, individuals and the corporate sector were unable to effect any significant savings from current earnings. Industrial units were greatly discouraged as the large expenditure on the expansion schemes had not yielded the desired net results from shareholders' point of view. Even otherwise, the controlled industries complained that the return on fresh capital was unattractive and the rate of growth in the cement, paper, sugar, steel and other industries had been retarded for these had to sell at "fair" prices.

Investment not Worthwhile

While there was already a feeling among those running the cement, chemical and other industries that fresh investment was not worth while, the levy of higher and new indirect taxes, the incidence of which could not be passed on fully to the consumer, and the heavy incidence of the Super Profits Tax upset all calculations. It is difficult to say what the net impact is of higher indirect taxes as the adjustments in selling prices have varied in respect of different commodities. For instance, the rayon industry has been adversely affected, being obliged to bear a part of the excise duty levied on yarn while the excise on sulphuric acid and the premium that has had to be paid for purchasing imported wood-pulp under the Export Incentive Scheme have cut seriously into the margin of profit. Similarly, in the case of the paper industry, the levy of an excise duty on caustic soda, higher freight charges and higher bamboo prices have been adjusted only in the shape of higher selling prices. In the case of the tyre industry, the increase in net selling prices by three per cent. has been considered inadequate while the cement producers have been complaining of the inequitable operation of the coal subsidy scheme and the inordinate delay in giving effect to the recommendations of the Tariff Commission when fixing retention prices for cement. The textile and sugar industries have been asking for higher selling prices. Under these circumstances, the incidence of the Super Profits Tax has had a cumulative and regressive effect and a large number of companies have been obliged to reduce their dividends in spite of reduced allocations to reserves.

On the basis of an analysis of the effects on select companies, it has become clear that the average tax (income-tax and Super Profits Tax combined) on corporate profits, after providing for depreciation and development rebate, worked out to 56 per cent. against 47 per cent. previously, or 20 per cent. more than the tax paid prior to the introduction of the Super Profits Tax. The incidence of direct taxation is uneven being as much as 70 per cent in particular cases. Even assuming that there would be anxiety to minimize the tax burden by transferring 10 per cent. of profits to reserves, before pro-

viding for taxation, the increase in tax burden by 20 per cent. must fetch for the Exchequer at least Rs. 40-45 crores which is more than twice the amount assumed in the budget estimates. This high level of taxation has not prevailed even in the U.K. and other countries during periods of stress and strain. Besides, there is no point in levying a tax which will have a much heavier incidence than intended and which will have a greatly discouraging effect on further development.

The cut in dividends by 20 to 30 per cent. in many cases should naturally make for a proportionate decline in prices for select scrips especially as interest rates tended to be higher. It is not surprising, therefore, that, until recently, extremely depressed conditions were noticeable in the stock markets. (Table VI). Even though the fears regarding a fresh invasion of the country by China in the North-East had receded and also there was increased confidence that the Defence Services were in a greater state of preparedness and the U.S.A. and U.K. would help if the need arose, the downward trend in prices for industrial securities persisted and even leading broker firms were unable to transact sufficient business to keep their establishments going. There was no disposition to enter into underwriting commitments and the response to new issues, except for a very few, was disappointing.

Buoyancy in Revenue

The buoyancy of Central revenues during first six months of 1963 clearly suggests that actual collections for the whole year will far exceed budget estimates and it may not even be necessary to resort to deficit financing on the anticipated scale. This is also confirmed by the fairly comfortable ways and means position of the Central Government in spite of the fact that the borrowing programme for 1963-64 has not been wholly completed and there is a shortfall of about Rs. 50 crores.

The authorities themselves would seem to be of the feeling that the stock and capital markets have been needlessly depressed and without a streamlining of indirect taxes and a sizable reduction in direct taxation, the stagnant phase of the economy cannot be overcome. With the assumption of

Why Aluminium

FOR TRANSPORTATION

- Extreme lightness and mobility, meaning lower fuel consumption and higher speed
- High durability and low maintenance cost

FOR ELECTRICAL USES

- High electrical conductivity
- High tensile strength/weight ratio
- Non-magnetic and nonsparking properties

FOR UTENSILS & HOUSEHOLD APPLIANCES

- High purity aluminium is extremely resistant to corrosion
- High thermal conductivity means quicker and more uniform heating in cooking vessels
- Lightness and durability

IN BUILDING & CONSTRUCTION

- Very high strength/weight factor
- Long economic life, low maintenance costs and high scrap value
- Highly reflective aluminium panels make buildings cool in summer and warm in winter

IN CANNING AND PACKAGING

Extremely attractive brightness and finish means high consumer appeal

- Excellent protection against moisture, heat, light and gases
- Light and handy to use

IN MACHINERY AND EQUIPMENT

- Ease of fabrication and shaping ensures tailor made satisfaction of specific jobs
- Combining a panoramic range of uses and properties, aluminium is the versatile wonder-metal for modern industry

HINDALCO

The Rs. 200 million Birla-Kaiser aluminium project at Rihand has, since December 1962, attained the present target capacity of 20,000 tonnes of high quality COMMERCIAL & E. C. GRADE ALUMINIUM INGOTS AND WIRE BARS per annum. Fabrication facilities to manufacture sheets, plates, circles, extrusions and wire rods, and expansion of the primary production capacity to 50,000 tonnes per annum are being undertaken, to keep the fast growing national industries on their march to progress and prosperity.

office by the new Finance Minister, it became, possible to take a more liberal view and adopt measures to improve the tone of the stock and money markets. Nothing tangible has been done so far to improve the morale of investors but with the indications of a significant change in the Government's attitude and an anxiety to buoy up sentiment, a sharp recovery in prices has been recorded in the past few weeks. The amendments to the Gold Control Order have not much significance to the stock markets but the freedom to convert old ornaments into new ornaments of the same purity with the help of individual goldsmiths has been appreciated while the Compulsory Deposit Scheme has been virtually abandoned. It is not now applicable either to non-income-tax paying group or those who own land and pay a land tax of over Rs. 5 annually. If the income-tax payers continue to bear the additional surcharge on residual income and make the compulsory deposit, it is because the Act has to be suitably amended. It is still hoped that this portion of the scheme also will be radically modified and the burden of direct taxes on middle-income groups will be made more bearable.

But the liberalization of credit restrictions have been taken as fresh evidence of Mr T. T. Krishnamachari's anxiety to enliven the stock and capital markets before he actually effects changes in taxes. The new credit policy cannot itself have any great significance for the industries or shareholders but the Reserve Bank has thought it necessary to oil the wheels of industry and trade by discounting export bills on a cheap basis and making credit available for productive purposes at lower rates. Even earlier, the Indian Banks Association had represented to the Reserve Bank that the quota for purposes of borrowing should be revised and the two-tier system of lending also abolished. It was at the same time proposed that banks should be allowed to borrow against investments in gilt-edged securities which were in excess of the liquidity ratio. After considering the various representations, it was eventually decided by the Reserve Bank that the quota of member banks for borrowing purposes should be increased by 50 per cent, and the two-tier system also substantially modified. Thus, member banks are now in a position to borrow up to 75 per cent. of the quota at the bank rate, that is 4.5 per cent., and another 75 per cent. at 6 per cent. The system of penal rates for borrowings in excess of the quota has been abolished and the Reserve Bank would be prepared to provide additional credit in deserving cases at 8 per cent. The restrictions relating to margins against advances of stock exchange securities have also been withdrawn.

From the stock-market angle, the liberalization of credit will have significance only if it leads to a lowering of interest rates generally and the halt to the dearer money policy is followed by a definitely cheaper money policy. But for the fact that banks have been obliged to meet heavy expenditure on the opening of new branches and on the implementation of wage award, there would be a significant reduction in lending rates especially as deposits have been growing at a fast rate. The difficulties of banks have been aggravated by the high level of taxation and the payment of larger bonuses. It is, therefore, expected that there can be only a marginal reduction in interest rates as a result of the liberalization of credit facilities. For an enterprising banker, it is, however, now possible to discount, on a profitable basis, export bills for large amounts and make good use also of the facilities for borrowing against usance bills on a cheaper basis. As interest rates had been stepped up on a number of occasions and fairly high rates were charged for particular types of loans, even by medium banks, it is perhaps reasonable to expect that there will be a slight downward adjustment in lending rates especially as the Reserve Bank would seem to have expressed a desire that larger and cheaper credit should be made available for productive purposes and to the small-scale industries in particular.

If there is a move in this direction and more credit is made available against industrial securities as collateral, consequent on the withdrawal of restrictions on this class of advances, there will be a lowering of the yield basis.

Tax Relief

The buoyant sentiment can thus be kept alive but the obstacles to larger investment support still remain. These relate to the heavy burden of indirect taxes on intermediate products and the severe incidence of corporate taxes and the Super Profits Tax. As a result, the disposable profits of all companies have declined sharply. Even if it were enjoined that higher dividends cannot be distributed without a proportionate increase in earnings and if a heavier tax on distributed profits and a lower tax on undistributed profits were levied, there would be a return of confidence in the stock markets. The earlier system of rebate on income-tax in respect of undistributed profits produced satisfactory results and there is no reason why that system should not be revived. However, as the Exchequer may be unwilling or unable to forgo its revenues, suitable adjustments in corporate taxes should be made in such a way that the revenue derived from

S.P.T. can be obtained otherwise. It is generally agreed that, with an increase in the total tax to 55 per cent., the revenue of Rs. 20 crores hoped for from the Super Profits Tax can be easily secured. Even the 55 per cent. tax can be split so that greater encouragement is provided for ploughing back profits. If the bonus tax also is reduced from 12.5 to 10 per cent., the shareholders will get a feeling that, with an effective utilization of internal resources and subsequent capitalization of reserves, the earning capacity of the companies concerned would improve and they would be afforded an opportunity to increase their interest with an issue of bonus shares. Also, if some of the indirect taxes, which have had an inflationary effect on costs and prices, were modified, the industrial economy would so grow that, in a few years, it should be possible to secure much larger tax receipts resulting from larger turnovers. The Union Finance Minister should make a generous gesture as he is in a position to afford concessions costing the Exchequer from Rs. 100 to Rs. 125 crores. If he can act imaginatively and abolish the Super Profits Tax as well as the Compulsory Deposit Scheme in so far as it relates to Income-tax payers, the boost to the economy, which is badly necessary, will have been given. In order to mobilize individual savings for investment in industrial securities, insurance policies or small saving certificates, the rebate in income-tax may be increased from a fifth to a fourth of the assessable income and there should also be tax remission in respect of investments in the initial issues of approved industrial undertakings. After abolishing the Compulsory Deposits Scheme, the gross income-tax rates can be raised slightly at different levels. Since it has been definitely proved on two occasions in the past six years, that the carrot can yield better results than the stick and the socialistic objectives can be achieved more speedily with a sharp increase in production, a reasonable long-term policy should be evolved by which it would be possible for the stock and capital markets to function on a rational basis and engender the feeling that investments in industrial securities are not any riskier than other investment and that industries would be allowed to go forward without major upsets.

Postscript

Since the announcement by the Reserve Bank regarding liberalization of credit and the removal of margin restrictions against advances on securities, it has been indicated that the Central Government would advance Rs. 10 crores each to the Industrial Finance Corporation and the Industrial Credit and Investment Corporation. The Unit Trust of India Bill has also been passed into law while the plans for converting the Industrial Finance Corporation into a development bank are being pursued. The Union Finance Minister has also indicated that the Refinance Corporation for industry would advance short-term loans to banks to help industries while the State Bank of India will adopt a positive policy of assisting small-scale industries. But the various measures will not have any lasting impact on the capital market, unless the Government is prepared to reduce indirect and direct taxes.

The Unit Trust of India, which will be constituted as a statutory corporation and which will enjoy special tax advantages, will be able to function successfully only if there is general confidence in the future of industries and the return on investments proves attractive. It has to be remembered that the provision for exemption from income-tax and super-tax of the income received by the Trust and the facility to receive dividend and interest without deduction of tax, will be advantageous only if the gross yields on the securities held by the trust are attractive. At the same time, the exemption from taxation is only an enabling measure because, if there were double taxation, the Unit Trust cannot function at all. In any case, the small investors, who are now receiving dividends directly from the companies concerned, will be

able to claim full relief from income-tax if they do not belong to the income-tax paying group. Only, they will not have the facility to diversify their investments as small amounts will be involved. The holders of units will presumably belong to the low-income groups. The tax relief will not, therefore, be appreciable in their case. The benefit derived from total tax exemption can therefore be attractive only if the gross yields are satisfactory.

It may be that individuals with incomes from agriculture will be attracted by this new facility though it is doubtful whether many in the low-income groups would be able to invest in the units. Thus, only those in the income groups between Rs. 5,000 and Rs. 25,000 would be able to think of purchasing units for fairly large amounts. If the exemption limit in respect of income from units can be raised, there may probably be greater response.

It would be, however, too much to hope that the Unit Trust itself could act as a prop to the stock markets as the issued capital of Rs. 5 crores could hardly make any impression if employed for the purchase of securities, particularly as Life Insurance Corporation is in a position to extend much larger support and its additions to assets annually are on an increasing scale. The scope of operations of the Unit Trust can be enlarged only through the sales of units which would depend on the attractiveness of the yield from these units.

Positive Steps Needed

While these measures will be helpful, more positive steps have to be taken to revive the capital market. The move to control the acceptance of deposits by industrial units might well have a retarding effect on the capital market. The anxiety of the Reserve Bank about deposits with industrial and non-banking institutions, which accept them from the public, is understandable. But it is difficult to believe that the quantum of deposits accepted by the corporate industrial sector, financing and trading companies, has upset the calculations of the banking system or minimized the effectiveness of the policies of the Reserve Bank. Unofficial estimates suggest that the volume of this class of deposits will vary between Rs. 75 and Rs. 100 crores which would only be under 5 per cent. of the deposits of banking system. The movement has gained momentum recently only because of the unattractiveness of equity shares and non-availability of first-class preference shares or debentures. The facility to keep deposits with industrial units at higher interest rates for short periods has, therefore, been helpful. It has even encouraged the savings habit to some extent and any move to restrict the acceptance of deposits by non-banking companies might cause hardship to regular savers. An investigation into the quantum of these deposits accepted would help in a clearer understanding of the magnitude of the problem. It would, however, defeat the Government's purpose if the genuine deposits cannot be accepted by reputed industrial units and other bodies. There will no doubt be need for safeguards in the interests of depositors. Thus, while there is general gratefulness for the small mercies shown by the Government, a definite revival in the capital market can come about only if there is a radical modification of the price and fiscal policies of the Government. The statutory corporations alone cannot go on making a success of new issues for any length of time. The expedients now adopted can afford only temporary relief. It has been repeatedly emphasized that the Union Finance Minister is keen to maintain buoyancy in the stock market and now that the latest indications are that the threat of a fresh invasion of this country by China has definitely receded, Mr T. T. Krishnamachari should logically follow up his earlier measures with more positive incentives in the form of tax reliefs. He should not fight shy of this approach on account of ill-informed criticism from party members or pressure from the leftists.

Foreign Participation in Indian Industry

DR. P. K. SRIVASTAVA

THE GOVERNMENT'S policy regarding foreign capital was briefly set out in the Industrial Policy Statement of April 6, 1948. It was further clarified in the Prime Minister's statement made exactly a year later in Parliament. This statement explicitly recognized that the country's resources needed to be augmented by foreign capital and clarified the modes of participation. On February 28, 1950, the then Finance Minister, Dr. John Mathai, reiterated the country's interest in the inflow of foreign capital. He considered foreign capital necessary not only to supplement our own resources, but to instil confidence in our investors. It was not only fixed-interest-bearing loans and bonds he favoured but equity capital advanced on strict business considerations without political strings.

The draft outline of the first five-year Plan, issued in July 1950, also stressed the need for foreign equity capital, if only in particular fields. In a Press statement on July 4, 1951, Mr Nehru summed up the matter in a single sentence: "We have always welcomed foreign capital in the past and we welcome it in future."

In the second Industrial Policy Statement of April, 1956, the Government adopted the socialistic pattern of society. With regard to foreign investments, however, the policy set forth in the first Industrial Policy Statement was to continue. Basically, the policy is to attract foreign investment and collaboration, on a selective basis, in those fields where there is need of, and scope for, development in pursuance of Plan targets. If imported plant and machinery are necessary for a project approved in the private sector, foreign investment will be welcome not only to finance the project but to pay for the imports.

Decision on Merits

While majority Indian shareholding is generally preferred, the ratio of foreign to Indian capital in joint enterprises and the extent of foreign shareholding are decided in each case on merits. It is made after evaluating the technical skills offered by the foreign collaborator, the requirements of foreign exchange for the import of equipment and the ability and desire of the Indian associates to play an effective part in the company's management. Thus in pharmaceuticals, where a heavy capital outlay is required on research—for which Indian firms do not have adequate resources in capital and personnel—ratios of 70-30 and 83-17 per cent in favour of the foreign company have been approved.* The foreign exchange situation being as stringent as it is, there have been indications that Government policy will be liberalized where the foreign firm contributes import-substituting or export-oriented production facilities. Much importance is attached to the arrangements proposed for the training of Indian technicians and executives in all aspects of production and management. Particular encouragement is given to schemes which involve expansion of exports on an economic basis with or without the assistance of the foreign collaborators for overseas marketing.

Another condition on which the Government is most insistent is that of progressive manufacture of goods in India which were formerly imported. Traders are not welcome. In the first five-year Plan, the Government carried this policy to such extremes that several foreign firms which contemplated modest manufacturing schemes and prefaced them with merchandising for the expansion of the market decided not to begin at all rather than give an undertaking which they considered they could not economically fulfil. The Government

is now unlikely to insist on a rigid commitment to the manufacture of an extra line of goods within a specified time. Where a phased programme of manufacture is proposed, emphasis is placed on the rapid development of indigenous production. Long-term plans based on assembly and the import of intermediate products are discouraged.

There is no restriction on the repatriation of profits on a scale that is consistent with the country's foreign exchange position. The record of the Government of India in this respect has been outstanding. Profits, which can be ascribed to foreign investment but are ploughed back, are treated as capital investment subject to repatriation. The Government, naturally, expects that the foreign collaborator will contribute import-saving equipment or export-earning facilities whose value exceeds the profits he expects to take out of India in the near future.

Royalty Issue

Royalty payments are allowed in lieu of technical assistance, patent rights and the latest techniques developed in the home plants of foreign concerns. In payments made to the foreign collaborator, a distinction is made between the element of royalty as such and that imputable to services rendered by him. The latter may be in respect of: (i) drawings; (ii) assistance rendered in laying out factories and the erection of machinery; (iii) goods purchased in foreign countries on behalf of the Indian companies; and (iv) products manufactured by the collaborator and paid for at cost price plus a nominal profit. All these payments are tax-free—unlike royalties which are subject to taxation. The effective super-tax on royalties received by a foreign company, in accordance with an agreement made on or after April 1, 1961, and approved by the Central Government, has been reduced from 43 to 30 per cent. in 1961-62 and further to 25 per cent. in 1962-63.

In the matter of royalty, which is a common feature of joint ventures, the Government is not committed to any particular rate, though five per cent. has so far been the maximum agreed on between Indian and foreign contracting parties. In specific cases, however, where there has been adequate justification, the Government has permitted royalties in excess of this percentage. There do not appear to have been many instances where negotiations between two parties broke down because of the Government objecting to a particular rate of royalty as being too high. Where the foreign firm, however, has a majority equity interest in an Indian company, the Government forces the foreign company to choose between the equity interest and the royalty arrangement. It does not permit both, on the ground that the foreign firm is not entitled both to greater profits anticipated from its equity investment and to the more certain royalty payments for the same services.

All industrial undertakings collaborating with foreign firms are required to take out a licence from Government of India in the Ministry of Commerce and Industry. The Government laid down broad principles governing the approval of such new industrial undertakings which propose foreign collaboration, in its Press Note of March 20, 1960. Draft agreements between foreign and Indian entrepreneurs, technical and financial, should be submitted to the Government so that they may be considered on their merits. Agreements involving recurring payments should be of limited duration not exceeding ten years, though extensions with the approval

Joint International Ventures in India: Columbia University Press, Pp. 80; Merck Sharp & Dohme of India 'P' Ltd.

of the Government are allowed. The agreements should not entail any restriction on exports from India; that is, the Indian company should be free to export to some if not all countries. Again, while it may be convenient to import capital goods from the home country of the foreign participant, the Government is disinclined to endorse any restrictions on the Indian firm. Another feature which concerns the payment of minimum royalty to the foreign collaborators states that, when the payments are related to turnover, no payment should be guaranteed regardless of the company's turnover.

The following enterprises have normally received the most favourable terms following initial admission: (i) Those considered vital for the country's development or welfare and involving large capital investments or complex technical processes; (ii) those which will serve further to train Indian entrepreneurs, technicians and labour in the operation of the industry; and (iii) those which will improve the country's foreign exchange position.

Enterprises which find it difficult to gain admission include: (i) Those regarded as luxury enterprises, which are not deemed to be essential for contemporary consumer needs. Enterprises, producing semi-luxury goods, such as soft drinks and cosmetics, have, however, been admitted; (ii) those which compete with Indian industries, particularly cottage industries which meet existing demands fairly adequately and which might be seriously disrupted by the admission of foreign enterprise; (iii) those which merely seek to package or assemble imported components rather than to begin active manufacturing; but approval may be given for assembly operations, if there exists, in the Government's view, a "bona fide" intention on the part of the foreign participant to move from assembly to manufacture in progressive stages; and (iv)

commercial and financial operations in which the Government believes that the country is well served by existing Indian talent.

In practice the Government appears to have granted more favourable terms of entry to particular foreign collaborators than its general policy statements would lead one to suppose. As screening requires a separate negotiation between each investor and the Government, different investors may obtain varying terms of admission depending on how anxious the Government is to bring about the particular investment at the time and how ably the investor presents his case.

The Government indicated in a Press Note dated May 8, 1961 the fields in which private investment by foreign nationals can play a part and it has also rationalized the procedure for processing projects involving such investment. A list of industries has been drawn up, where foreign capital would be welcome. The list takes into account shortfalls in planned targets. The following industries have been included in the list: Iron & steel structurals, iron & steel castings and forgings; iron and steel pipes; special steels; non-ferrous metals and alloys; boilers and steam-generating plants; equipment for the transmission and distribution of electricity; furnaces; marine diesel engines; industrial machinery including major items of specialized equipment used in specific industries; general items of machinery used in a large number of industries, such as those required for various unit processes; ball-, roller- and taper-bearings; speed-reduction units; machine tools; tractors; earth-moving and construction machinery; plastics; industrial and scientific instruments; fertilizers, organic chemicals, fine chemicals and intermediates; industrial explosives, industrial gases; agricultural chemicals, such as

TECHNOLOGISTS

mean more rapid progress, especially in an economy like India's.

Large projects must be carried out, industries must develop fast—for the speedy economic growth India needs.

This means there must be more qualified men. Men with training and experience in technology. Men who are experts in their field.

Since 1948 about 1,600 Indians have studied in German Colleges of Technology and thousands of Indians have received thorough practical training in many German industrial enterprises.

insecticides; dyestuffs; drugs including basic intermediates; newsprint and pulp.

The list is illustrative rather than exhaustive; schemes for collaboration falling outside the list will also be considered on merits. In fact the emphasis on flexibility has been amplified with reference to Schedule A of the Industrial Policy Resolution of April, 1956, which defines the fields earmarked for the public sector. Private participation in this area will, however, be permitted where public interest demands it.

The fields in which foreign capital is normally not required have also been listed. Most of the industries mentioned in the category are those from which foreign capital is already being repatriated, e.g., plantations; or others where foreign capital is consolidating rather than expanding e.g. banking, insurance, trading and commerce.

It is the policy of the Government to grant foreign exchange for equipment¹ in the following cases: (i) where the total value of the imported plant necessary to complete a project is less than Rs. 5 lakhs; (ii) where the value of equipment is less than 10 per cent. of the value of machinery already installed or is covered by an import licence. In the latter case it should be available from domestic sources and should be essential for the completion of the project; (iii) where the equipment is required for replacement for maintenance; (iv) where the total value of the equipment to be imported is less than the amount of fresh foreign capital coming in for the project; and (v) where the equipment is required for construction purposes, such as earth-moving equipment and excavators.

The Government has moreover adopted a deferred payment plan which the importer is obliged to conform to in order to qualify for foreign exchange: (i) total payments prior to shipments not to exceed 20 per cent. of the f.o.b. value of the plant and equipment, and the remaining 80 per cent. is to be paid in seven annual instalments thereafter; (ii) the initial payment to be limited to 10 per cent. and the balance to be paid after production has started and in instalments which may not exceed the net savings in or earnings of, foreign exchange which the project is expected to achieve

Note: The figures for joint ventures as between India on the one hand and West Germany, France and Switzerland on the other as reckoned in this table vary slightly from the figures set out in the table on pages 1505-06. This may be due to differences in the methods employed for counting in each case; where an Indian firm or joint-stock company enters into agreements with more than one party in the other country for the manufacture of a single product, they may be treated as one or, in the alternative, two joint ventures.

gives a breakdown of foreign collaboration in India according to year and country of origin.

It is seen that there has been a phenomenal increase in instances of foreign collaboration,—from 20 in 1956-57 to 428 in 1960-61 and 425 in 1961-62. The reasons for this may be: (i) The difficult foreign exchange situation which led not only to arrangements for long-term deferred payments for machinery but also to partnerships with foreign enterprises, sometimes in the form of participation in capital; (ii) the growing faith of foreign investors and their confidence in associating themselves with Indian entrepreneurs; and (iii) the Government's policy of encouraging industrialization in specific fields according to plan targets which provided a ready principle of selection.

In the year 1962-63, the number of joint ventures approved was 250, which is slightly more than half of those approved in 1960-61 and 1961-62. The total number of joint ventures at present is more than 1,500. Among the reasons which can be cited for the decline in the number of agreements are, undoubtedly, the depression in the Indian capital market due to fiscal and monetary factors; the Government's policy of narrowing down the field for joint industrial ventures; the decline in investors' interest due to the border conflict with China; continuance of strained relations with Pakistan; and the inadequacy of the country's infra-structure.

As in the case of foreign investments, the largest number of joint undertakings have been with partners from the U.K., 427; followed by the USA, 250; West Germany, 224; Japan, 113; Switzerland, 68; France, 48; and Italy, 45. A number of Indo-U.K. ventures had been set up in India before 1956, thus taking up the total to date to 610, which is more than a third of all the undertakings in the country which have foreign collaborators. The share of the USA and Germany together accounts for the other third. Japan, France, Switzerland and Italy are also playing a significant part in Indian industry, their combined share aggregating to a fifth of all the joint venture agreements. Canada, Australia, Sweden, Denmark, Holland, Belgium, Czechoslovakia, Poland, the German Democratic Republic and Austria are among the other countries which have shown some interest in entering into partnership with Indian firms.

Broadly speaking foreigners have participated in 15 types of industries tabulated below. Our Government's policy in this regard is amply reflected in the approval of agreements for collaboration in different industries. Similarly, the emphasis, in the Plan, on engineering, machinery-building (including electrical goods), chemical industries and transport is reflected in the number of collaboration agreements that have so far

Major Groups	Number of Joint Ventures
	(1956 to March 1963)
Mining and Quarrying	54

EASTERN ECONOMIST

December 27, 1963

Industry	No. of Joint Ventures
XVI. MISCELLANEOUS (NON-INDUSTRIAL)	
1. Re-insurance	1
2. Construction of dams, etc.	3
3. Development of fisheries	2
4. Taking-over by assignment land and buildings	1
5. Shipping	1
6. Petroleum	2
7. Tea export	4
8. Import of mechanized boats and bull trailers	1
9. Poultry-building farms	3
10. Production and distribution of educational films	1
11. Technical consultancy firms	4
Total	23

As is clear from the above table, there are 101 types of industries in which there are joint ventures associating foreigners. This excludes 11 types of the non-industrial category (No. XVI in Table above) in which 22 joint ventures have been established. The non-industrial sphere includes development of fisheries, technical consultancy firms, the construction of dams, import and export business, poultry-breeding farms, etc. It is seen from the above table that special emphasis has been placed on the development of engineering machinery of all kinds, chemicals, machine-tools, electrical goods, accessories and parts for motor vehicles and aircraft, etc. These industries together account for more than three-fourths of joint ventures approved during the period under review.

STATEWISE LOCATION OF JOINT VENTURES

Industry	No. of Joint Ventures
Maharashtra	613
West Bengal	289
Delhi	179
Madras	84
Gujarat	56
Mysore	31
Uttar Pradesh	29
Kerala	28
Andhra	16
Punjab	15
Bihar	6
Orissa	5
Madhya Pradesh	5
Rajasthan	4
Assam	2
	1362

As is clear from the above figures, the pattern of location of industries has not changed much even after 1,500 industrial enterprises have been established with foreign collaboration. On the contrary, it has increased the concentration of industries in the already developed areas. Before issuing licences for new ventures, the Government takes into account the need to encourage the growth of industries in backward States. The reason for this concentration is apparent since most of the joint ventures undertaken with foreign collaboration in engineering, machine-building, electrical goods, chemicals, etc. which require power, transport facilities, skilled labour, raw material and commercial facilities, have been started from the outset in chosen regions, the other parts of India which lack an adequate infra-structure have remained completely backward. Each individual concern cannot invest huge amounts of capital for these purposes. This is how about 50 per cent. of all these joint ventures with foreign collaboration have come to be set up in Maharashtra and a third in West Bengal, Delhi and

Madras, while backward States, such as Bihar, Orissa, Madhya Pradesh, Rajasthan and Assam, have only 6, 5, 5, 4 and 2 joint ventures respectively. Not a single venture of this nature has been located in Himachal Pradesh and other Union territories. An important feature in the new location pattern has been the emergence of Union territory of Delhi which has 179 joint ventures and comes only after Maharashtra and West Bengal. There has also been a significant improvement in Gujarat and Mysore which now have 56 and 31 joint ventures respectively.

As a result of this collaboration between Indian joint stock companies and foreign corporations, several altogether new avenues of manufacture have been opened up. Products, such as carbon black, bright steel, precision instruments, automobile and aircraft accessories and parts, chemicals and pharmaceuticals which were never before manufactured in India are going to be made for the first time with foreign technical collaboration. The increasing interest which foreign entrepreneurs have continued to evince is a measure of their growing confidence in the potentialities of the Indian economy. Notwithstanding the temporary setbacks often caused by political pronouncements or the misunderstanding among foreigners of India's commercial, financial and other policies, there exists today a suitable climate for fruitful collaboration between Indian and foreign entrepreneurs.

Between 1956 and 1963, about 1533 foreign collaboration agreements including the Indo-UK agreements signed before 1956 were approved by the Government of India. An analysis of the Indian parties to these agreements reveals certain interesting features. The following figures indicate the organizational pattern of the Indian partners to the foreign collaborations:

Type of Indian collaborator	No. of collaboration agreements	Percentage of total
Public Limited companies	612	39.9)
Private Limited companies	535	34.9) 74.8
Firms	267	17.4
Individuals	115	7.5
Institutional	4	0.3
Total no. of agreements	1533	100.0

Public limited companies account for the largest number of collaboration agreements, 612 or 39.9 per cent of the total, followed by private limited companies 535 (34.9 per cent), firms 267 (17.4 per cent), individuals 115 (7.5 per cent) and institutional 4 (0.3 per cent). The share of limited liability companies (public and private limited companies together) comes to 1147 or 74.8 per cent of the total Indian collaborating interests. In other words about three-fourths of the Indian collaborators are limited liability companies. The firms, individuals, and institutional collaborators combined, account for about one-fourth of the total Indian collaborating interests.

The following table compares the nature of the collaborating interests in India with those in the foreign country:

Types of collaborators	Indian	Percentage of total	Foreign	Percentage of total
Limited liability companies	1147	74.8	1192	77.8
Firms	267	17.4	248	17.0
Individuals	115	7.5	57	3.1
Institutions	4	0.3	36	2.1
TOTAL	1533	100.0	1533	100.0

The above figures make an interesting study. Limited liability companies account for the majority both among the

INDUSTRIAL FINANCE CORPORATION OF INDIA

(Incorporated under the Industrial Finance Corporation Act, 1948 (XV of 1948).)

ESTABLISHED IN 1948.

Head Office: Reserve Bank Building, Parliament Street, New Delhi.

Branches: Bombay, Calcutta, Madras.

Paid-up capital: Rs. 7,00,00,000/-

Reserves: Rs. 3,00,00,000/-

Assistance sanctioned up to 30.6.63 Rs. 1,64,30,00,000/-

Assistance disbursed: Rs. 1,02,60,00,000/-

Total assistance outstanding on 30.6.63. Rs. 78,90,00,000/-

IFC specialises in supplying Indian Industries with medium and long-term capital. Its activities include -

* Granting of loans or subscribing to debentures in rupee currency;

* Granting of loans in foreign currency;

* Underwriting of equity, preference or debenture issues;

* Subscribing to equity or preference capital;

* Guaranteeing deferred payments in respect of machinery imported from abroad or purchased in India;

* Guaranteeing loans raised from foreign Banks or Financial Institutions in foreign currency.

Detailed terms and conditions of IFC loans and other literature about its working are available on request from its Head Office at New Delhi and its Branch Offices.

ANNUAL NUMBER 1964

Indian interests and their foreign collaborators. The proportions, in the table, of Indian interests and foreign collaborators are comparable as far as limited liability companies and firms are concerned. About three-fourths of the Indian interests and foreign collaborators are joint-stock companies, and approximately 17 per cent. are firms in both cases. Individuals (115) constitute about 7.5 per cent. of the Indian interests (1533), and are twice the corresponding number in foreign countries (57). Institutional collaborators in India are insignificant, being only four in number, while those in foreign countries are 36. While the percentage is 2 in the case of the latter, it is still not very significant.

Let us now proceed to discuss in detail the role played by these different classes of Indian interests in Indian industries.

LIMITED LIABILITY COMPANIES

(1) Public Companies

Of the 1533 foreign collaboration agreements 612 Indian collaborating parties are joint-stock, public limited companies; they constitute about 40 per cent of the total Indian collaborating interests, and are besides the most numerous. About 28 Indian public limited companies have entered into more than one collaboration agreement. The details are as follows:

Name of Foreign Collaborator	Articles of manufacture
Larsen & Toubro Ltd., Bombay	
(a) Film-coating Towers (1925) Ltd., U.K.	Film flow-induced draught-cooling towers
(b) Weiger Maschinenbau, W. Germany	Portable belt-conveyors and hand scrapers
(c) Silkeberg Maskinfabrik, Denmark	HTST Plate Pastenrisecf & Can washers respectively
(ii) Wright Hargreaves Engineering Co., U.K.	
(d) Chamiban, (Dr. A. Zieren) G.m.b.H. Cologne, W. Germany	Sulphuric acid & superphosphate plants
(e) Niro Atomizer, Copenhagen, Denmark	Spray drying-plants complete for dairy industry
(f) Societe Des Soudures Castolin S. A. Switzerland	Welding electrodes & rods
(g) Interfonda Ltd., Switzerland	Feed milling plants, etc.
Asiatic Oxygen & Acetylene Co., Ltd., Calcutta	
(a) L' Air Liquide, Paris	Welding transformers & motor generator sets
(b) L' Air Liquide, Paris	Coated and uncoated electrodes

The first order is only half as important as the second order.

Therefore exporters must maintain a very high standard of business in order to make long term profits and uphold the country's prestige—particularly as new competitors with highly industrialised countries.

The export market can be a source of continuous earning power—if quality goods, prompt service, competitive prices and service facilities are provided.

Export is a Sacred Trust

ate limited companies, which constitute 34.9 per cent. of the total. The share of limited liability companies in the total comes to 74.8 per cent. In India the private limited company is a much favoured organisation, accounting as it does for as much as a third of all these joint ventures. The reason is obvious; as compared to firms and other forms of business organisations, it has the advantage of limited liability while its obligations are less legal and restrictive than those of the public limited company. Many individuals and firms often convert their business into private limited companies after entering into an agreement for collaboration with a foreign company. About 11 private limited companies have entered into more than one collaboration agreement with foreign parties. The details are as follows:

Indequip (P) Ltd., Bombay

- (a) Hobourn Easton Manufacturing Company Ltd., U.K. Diesel engine components
(b) Hobourn Easton Manufacturing Company Ltd., U.K. Motor pumps for lubricating oil systems in automobiles
(c) (i) Giacomo Jicker of Italy
(ii) H. W. Butterworth & Sons, U.S.A. Humidification plant, etc.

The Indian private limited companies produce the following in collaboration with foreigners: auto parts; light fittings; electric and welding generators; tyres and tubes; industrial machinery; infant milkfood; ovaltine; chemicals; time-pieces; mobile cranes; gas cylinders; 35 mm. projectors; furnaces; textile machinery; printing machinery; industrial instruments; transformers; combination optical frames; paints, etc.

FIRMS

There are 267 Indian firms which have entered into collaboration agreements with foreign parties. Firms constitute about 17.4 per cent. of all Indian collaborating interests, and come next only to limited liability companies. The three following firms have entered into more than one collaboration agreement. The names of the firms are as follows:

Gandhi Electric Industries, Bombay	
(a) Tuscan Engineering Co. Ltd., U.K.	Flame-proof motors and alternators
(b) Ferranti Ltd., U.K.	Transformers
(c) Hans Heidolph Electro, W. Germany	Fractional H.P. meters

Indian Rayon Corporation, Bombay	
(a) M/s Von Kohorn International Corporation, New York, U.S.A.	Rayon yarn
(b) Financial & Development Fund Inc., N. Y., U.S.A.	Viscose artificial silk

Rochren Fretigungs Austalt) of Luicheusten	

McLeod & Company, Calcutta	
(a) Parsons & Whittmore Inc., New York, U.S.A.	Paper, writing & printing
(b) Parsons & Whittmore Inc., New York, U.S.A.	Pulp & paper mill
(c) (i) Tokyo Seiko, Japan & (ii) Moritam Ltd., Japan	Wire ropes

Some of the articles which Indian firms are manufacturing in India in collaboration with foreign companies are: motor cycles; electric motors; cables and wires; sodium carbonyl; methyl; cellulose; photo-flash lamps; chemical machinery; auto parts; water meters; weighing machines, etc.

INDIVIDUALS

About 115 Indians have, as individuals, entered into collaboration agreements with foreigners for the manufacture of industrial products in India. Individual collaborators constitute 7.5 per cent. of all collaborating interests. The following

two individual collaborators have entered into more than one collaboration agreement:

Name of Foreign Collaborator	Articles of manufacture
Mr G. D. Binani, Calcutta	
(a) Revere Copper & Brass Inc., New York, U.S.A.	Copper & brass, alloys, tubes, rods sections, etc.
(b) M/s Consolidated Mining & Smelting Company of Canada Smelter	Setting up of a zinc
Mr A. K. Chowdhri, Calcutta	
(a) M/s Nitta Seikan Co. Ltd., Japan	Insulation material
(b) M/s. Miyaki Knitting Machine Works Limited, Osaka, Japan	Knitting-needles and other components

Some of the articles which individual collaborators are manufacturing in collaboration with foreign parties in India are: Insulation material; auto parts; sanitaryware and ceramics for the household; urea & formaldehyde resins; thermometers; glass tubes; paper machinery; polythelene & plastic-coated materials and packages, etc.

INSTITUTIONAL

Indian interests which cannot be subsumed in the above categories are treated as institutional collaborators for the purposes of this study. There are only three such institutions in India which have entered into collaboration agreements with foreign parties for the manufacture of industrial goods.

Indian collaborator	Foreign party	Article of manufacture
Chairman	M/s G.E.C., U.K.	House service meters
Assam State Electricity Board, Shillong, Assam		
Chittaranjan Locomotive Works, Chittaranjan, West Bengal	M/s F. M. Lloyd & Company Limited, U.K.	Steel castings
Development Department (Durgapur Industries) Government of West Bengal	(i) M/s Krebs & Cie S.A. France (ii) M/s Achenback Sohne G.m.b.H. Germany	Caustic soda-chlorine, phenol Durgapur coke oven doubling project

Of the 1,533 collaboration agreements approved by the Government of India, 1,192, or more than three-fourths of the foreign collaborators, have organized themselves into limited liability companies. The name, form and legal regulations governing this mode of organization differ from one country to another according to the law of each country*. The term "limited liability company" has here been used for any form, whatever the country of organisation in which the liability of the members is limited.

FOREIGNERS COLLABORATING IN INDIA: COUNTRY AND ORGANISATION

Name of country	No. of collaboration agreements	Limited liability companies	Firms	Individuals	Institutional
U.K.	610*	590	16	4	—
U.S.A.	250	222	20	8	—
West Germany	223	78	121	24	—

Switzerland	70	42	24	4	—
France	50	50	—	—	—
Italy	45	30	13	2	—

* According to the Company Law of Netherlands, for example, partnership firms having unlimited liability of partners are called private companies. There are two types of limited liability companies: (i) the open limited company whose shares are quoted on the stock exchange; and (ii) private limited companies whose shares are not quoted on the stock exchange. Limited liability companies indicate their status by the letters N.V. which must be attached to the name of the firm. West Germany has two types of limited liability companies: (1) G.m.b.H. (Gesellschaft mit beschränkter Haftung) company with limited liability; (2) A.G. (Aktiengesellschaft) the public limited company. In Switzerland, limited liability companies indicate their status by the letters S.A., S.P.A., A.G., Ltd., and in U.S.A., by Inc. (Incorporated) or Corporation; in the U.K., Japan, Australia, Canada, Sweden, etc., limited liability companies use the word "limited" after their names.

* This includes Indo-U.K. collaboration agreements entered into before 1956.

** Foreign collaborators other than the first three types.

This table clearly reflects the importance of and contribution made by limited liability companies in the economies of foreign countries. The foreign partners of all the major Indian industrial undertakings are limited liability companies and are especially associated with industries which require large amounts of capital; in which production is undertaken on a large scale; where patents or special manufacturing processes are employed; and finally, basic or capital goods industries.

In industrially advanced countries, such concerns are organized into joint-stock limited-liability companies for these alone have the necessary resources and ability to undertake major enterprises in under-developed countries in collaboration with local interests. The following are the examples of some of the articles they manufacture: aircraft & auto parts and accessories; tyres and tubes; engineering goods; machinery of all types; chemicals and pharmaceuticals; aluminium; iron and steel forgings, castings and other allied products; heavy and basic industries, etc.

Less than a fifth or 17 per cent. of all collaborating foreigners are firms. Foreign firms play an important role in joint ventures in India; some are big, others small establishments. Here are a few representative names: Messrs. Linn of West Germany; Messrs. Issac Holden & Sons, U.K.; Messrs. Citizen Watch Co., Tokyo, Japan; Messrs. James Bertram & Sons, U.K.; Messrs. Bengal Laboratories, U.K.; Messrs. Chemischa Works Huds, West Germany; Messrs. Arbor Acres Farm, Connecticut, U.S.A.; M/s. Mentor Asso-

ciates, San Francisco, U.S.A.; M/s. Hans Heidolph Electric, Nuremberg, W. Germany; M/s. Demco, Australia. They make: Industrial furnaces; paper & pulp; writing and printing paper; wrist watches; Dextran & Iron Dextran; ammonia and freon compressors; ball-point pens & refills; automobile electrical ancillaries; oil seals; electric motors; machine tools; ferrous & non-ferrous castings, among other things.

Only about three per cent. of the collaborating interests are individuals. Although individual foreign collaborators are fewer in number than companies and firms, their contribution to the industrialization of this country cannot be overlooked. They are usually individuals with specialized knowledge of some product or process of manufacture, who possess the patent right for some product and who collaborate in the manufacture of that article in India.

Some of the individuals collaborating in India are: Dr. Rudolf Krupicka (Vienna); Mr. George Heckel (W. Germany); Mr. C. G. Gorton, (U.K.); Mr. Aaran Permat (U.S.A.); Mr. T. Yamade (Japan); Mr. Aaren, Consulting Chemist (U.S.A.); Mr. H. Banstrain (W. Germany) etc.

They help to make: textile auxiliaries; steel wire and wire ropes; universal lathes; solid underground cables; pigment emulsions; thermometers; glass tubes; azo dyes and intermediates — loose optics and components for scientific instruments, etc.

All the 36 institutional collaborators are government departments or government companies of Communist countries, such as Poland, Czechoslovakia, Hungary, etc., who have collaborated with Indian firms to set up industrial

FERTILIZER CORPORATION OF INDIA KEY ROLE IN INDIA'S GROWING ECONOMY

The Fertilizer Corporation of India is the biggest producer of chemical fertilisers in the country. The total capacity of the Corporation's existing production units and the chain of new projects under implementation will be 6,32,000 tons of Nitrogen and 45,000 tons of Phosphate annually.

Over 4-1/2 million tons of nitrogenous fertilisers valued at over Rs. 141 crores, already produced in the Corporation's operating factories have made a very substantial contribution in enriching the soil and increasing crop yields.

The Corporation has built up adequate technical know-how and talent to design, engineer and build fertiliser plants. The first complete fertiliser plant in India to be designed, engineered and built by the Corporation will be at Korba in Madhya Pradesh with a capacity of 1,00,000 tons of Nitrogen annually.

Chemical fertilisers are the farmer's best investment.

More fertilisers mean more agricultural production.

BALANCE OF TRADE

In a rapidly developing country like ours, much is needed from the highly developed foreign countries - technical know-how machinery and equipment.

Against the above imports we have to make payment in foreign currencies. To earn this much needed foreign exchange, we must find more and more markets for the export of our traditional items such as tea, coffee, tobacco, spices: cashews, jute and jute manufactures, as well as for new commodities, such as cotton and woollen textiles, light machinery, shoes, handicrafts and handloom goods.

The State Trading Corporation of India Ltd., is dedicated to promote India's export trade and to import the essential items to achieve our development plan targets.

ventures in the private sector in India. They afford a fine example of co-existence and even good relations between Communist and non-Communist countries. Examples: M/s. Cekop of Poland; M/s. Strojexport, Strojimport; Techno-export & Motokov of Czechoslovakia and M/s. Komplen & Metrimex of Hungary.

They make: Styrofen capacitors; wired and figured glass; windshield glass for automobiles; milling machines; single-phase and poly-phase electric meters; abrasive grains; detonators; electronic testing equipment, etc.

Now a country-wise analysis of the structure and organization of foreign collaborating interests: Out of the 610 Indo-U.K. joint ventures, 590 U.K. collaborators are limited liability companies, 16 firms and four individuals. Most of the collaborating interests from the U.K. are limited liability companies and the share of other forms of organizations is insignificant.

Approximately 24 British companies have more than one joint venture agreement with Indian parties. The following have more than one collaboration agreement with Indian companies: M/s. Mond Nickel Co., Ltd. (7 agreements); M/s. Imperial Chemical Industries Ltd. (7 agreements); M/s. Joseph Lucas (Electrical) Ltd. (4 agreements); M/s. Tootal Broadhurst Lee Co., Ltd. (4 agreements); M/s. Pye Ltd., (5 agreements); M/s. Johnson & Phillips Ltd. (3 agreements); M/s. Associated Electrical Industries Ltd. (3 agreements); and M/s. Fellows Bros. Ltd.; M/s. Pressed Steel Ltd.; M/s. Crompton & Parkinson Ltd.; M/s. British Insulated Callenders Co., Ltd.; M/s. Murphy Richards Ltd.; M/s. General Electric Company Ltd.; M/s. Westinghouse Brake & Signals Ltd.; M/s. Joseph Sakey & Sons Ltd.; M/s. Cambridge Instruments Co., Ltd.; M/s. Hall & Nielsons Ltd.; M/s. Glaxo Laboratories Ltd.; M/s. Lever Brothers & Associates Ltd.; M/s. Sluzangers Ltd.; M/s. J. H. Fanner & Co., Ltd.; M/s. Chamberlain & Hooklan Ltd.; M/s. Hobourn Easton Manufacturing Co. Ltd. and M/s. Molins Machine Co., Ltd. (2 agreements each).

It may be noted from the above table that some companies like Mond Nickel Company Ltd., and Imperial

Chemical Industries Ltd. have as many as seven collaboration agreements with Indian parties. All British companies which formerly sold their products in India themselves or through the branches or subsidiary companies now help to manufacture them in India, often the same brand with the same name and standardization. The following are examples: Messrs Glaxo Laboratories Ltd.; Johnson & Nicholson; Lever Brothers; Murphy Radios; Bush Radio; General Electric; Pye Ltd.; Enfield Cycles; Raleigh Industries; Horlicks; Imperial Tobacco; Dunlop Rubber; Sluzangers, etc.

In partnership with Indian firms British concerns help manufacture all kinds of products from basic and heavy machinery to light consumption goods, such as biscuits and Ovaltine. Indo-U.K. collaborations are especially significant in the manufacture of: all types of machinery; chemicals and pharmaceuticals; refrigeration equipment; furnaces; radios; sewing machines; bicycles; cables; cars; aero engines; road rollers; railway wagons; machine tools.

U.S. Collaboration

The Government of India has approved about 250 Indo-U.S. collaboration agreements. The collaborating U.S. concerns comprise 222 limited liability companies; 20 firms and eight individuals; total 250.

Thus the majority of U.S. collaborators are incorporated limited liability corporations. In the U.S.A. joint-stock limited liability companies are called corporations. A minor part is also played by firms and individuals. About 14 U.S. corporations have more than one agreement with Indian partners. The names of these corporations are:

M/s. Parsons & Whittmore (9 agreements); M/s. R. C. A. (6 agreements); M/s. Cluett Peabody & Co., Inc. (6 agreements); M/s. Kaiser Industries Corporation (4 agreements); and M/s. International General Electric Co.; M/s. Union Carbide Corporation; M/s. Ex. Cello. Corporation; M/s. Merck & Company Inc.; M/s. Goodyear Tyre & Rubber Company; M/s. Gabriel Company; M/s. American Cynamid Company; M/s. Nepco Industries Limited and M/s. Caterpillar Tractor Company (2 agreements each).

Collaboration agreements with U.S. concerns have been

manufacture are industrial and printing machinery; tractors; chemicals and pharmaceutical preparations, etc.

About 13 Indo-Belgian collaboration agreements have been approved by the Government of India; five Belgian collaborators are limited liability companies, and the other 8 are firms. No individual Belgians has entered into any collaboration agreements with Indians. Only one firm has entered into more than one agreement with Indian collaborators, that is M/s. Extraction Coontinue Desmet, which has entered into agreements with (i) M/s. Desmet Extractions India (P) Ltd., and (ii) M/s. Oil Corporation of India (P) Ltd., Bombay, for the manufacture of Solvent Extraction plants. The articles of manufacture of Indo-Belgian collaborations are: Cast-iron spun pipes; sheet glass; wire ropes; coated paper; chemical products used as building aids; Antihistamine and tranquilizer group of drugs; extraction yarn and cloth-baling presses, etc.

In all 16 Indo-Danish collaboration agreements have been approved by the Government; six of the Danish partners are limited liability companies, seven firms and three individuals. No Danish collaborator has entered into more than one collaboration agreement. The articles of manufacture of the Indo-Danish collaborations are: refrigeration and air-conditioning equipment; Dextran and Iron Dextran; liquid petroleum gas cylinders; spray & drying plants for dairy industry; milling machines; gaskets; milk pumps, etc. One Danish firm, M/s. Larsen and Nelson Constructors of Copenhagen, has collaborated in the construction work of bridges and dams in India.

There are only six Indo-Norwegian collaboration agreements, and all the Norwegian collaborators are limited liability companies. Only one company, M/s. Munck International A/S Bergen, has entered into two agreements. The articles to be manufactured are prestressed concrete pipes; wire cloth for paper machines; electric hoist; different types of saws; P. V. C. Arch & E. O. T. cranes.

Eleven of the 12 Canadians collaborating with Indian concerns are limited liability companies and one an individual. Only Wireco Engineering Company Ltd. has entered into three agreements with Indian partners. The names of the Indian collaborators are: (i) Power Cables (P) Ltd., Kalyan, Bombay; (ii) Kothari & Sons, Madras; (iii) Traco Cables Ltd., Ernakulam.

All the three agreements are for the manufacture of different types of cables. Other articles of manufacture of the Indo-Canadian joint ventures are: tractors; a newsprint project; a zinc smelter; an aluminium smelter; chinaware etc. One agreement envisages the establishment of large-scale poultry-breeding farms in India.

Ten of the eleven Australian concerns collaborating in India are limited liability companies and there is only one firm among them. The following companies have two agreements each with Indian collaborators.

Australian Company	Indian Collaborators	Articles of manufacture
Mindrill Ltd., Preston, Australia	(i) Greaves Mindrill 'P' Ltd., Bombay	Diamond Drilling
	(ii) Greaves Cotton Co. Ltd., Bombay	Diamond Bits
Pepco Limited	(i) Indian Pistons Pepco 'P' Ltd., Madras	Thin wall bearings
	(ii) Indian Pistons Pepco 'P' Ltd., Madras	Fly wheel ring gears

The articles of manufacture of the Indo-Australian joint ventures are: furnaces; slip stream and rain spray irrigation equipment; cycle tyres and tubes; machine tools; plastic battery separators and taxi meters, etc.

Poland being a communist country, has only one Government firm, CEKOP, working in India; it has entered into 9 collaboration agreements with different Indian firms for the manufacture of electric motors; electric meters; C. I. Rolls; water meters; motor cycles; Styrolflex capacitors; and wired and figured glass, etc.

Seven of the 11 Austrians collaborating in this country are limited liability companies. There is one firm, and three individuals besides. No Austrian collaborator has entered into more than one collaboration agreement with Indians. Articles manufactured are: steel files; auto tyres and tubes—wood-working machines; high-pressure gas cylinders; universal lathes; tool bits; electric meters; aluminium powder and paste, etc.

All the collaborators of Hungary and Yugoslavia, who have entered into joint venture agreements with Indians, are institutional investors i.e. Government departments or companies. At present there are 6 Indo-Hungarian and 2 Indo-Yugoslav collaboration agreements. The articles of manufacture envisaged under Indo-Hungarian collaborations are: electronic testing equipment; electric hoists; enamelled acid and alkali-resistant mixers etc. Wind-shield glass for automobiles; poly-phase meters etc. Articles of manufacture under Indo-Yugoslav collaborations are: industrial flour-milling machinery and electric motors, etc.

Details regarding companies of other countries who have also entered into collaboration agreements with Indian interests are contained in the following table:

Name of the country/organizational pattern of foreign collaboration	Articles of manufacture
Firms	
Finland (4)	Chain pulley blocks; electric hoists; house service meters etc.
Liechtenstien (1)	Aluminium-coated paper.
Malmö (1)	Flint stoves for cigarette lighter
Limited Liability Companies	
Ireland (1)	Tea machinery and ventilating equipment.
Panama (1)	Welding electrodes.
Liberia (1)	Pumpless auto-safe stoves
Baden (1)	Train-lighting dynamos
Luxembourg (1)	Rolling mill for pulverising sulphur
Greece (1)	Basic dyes and other dyes
British West Indies (1)	Plastic collapsable container
Kenya (1)	Plastic coated products
Tanganyika (1)	Sanitary fittings
Individuals	
Brazil (1)	Absorption type refrigerator

Note:—The number of agreements entered into is given in brackets.

It may be concluded that all foreign interests collaborating in India, whatever their mode of organization, play an important role in the industrialization of this country. Each form of organization has its own importance and has its own contribution to make to the national economy.

contracted with a view to manufacturing a vast variety of industrial and commercial products in our country. The 250 joint-venture agreements cover almost every field of industrial activity i.e. machinery; chemicals and pharmaceuticals; machine tools; electrical engineering; other engineering goods; paper and pulp, etc.

Some of the articles of manufacture are: aluminium; ferro-manganese and other alloys; surgical adhesive tapes and medicated plaster, etc.; fork-lift trucks; auto-spring absorbers and other parts; refrigeration and air-conditioning; turbine and special pumps; machine tools; citric acid; auto tyres and tubes; cement; X-ray equipment; pipes; dyes and intermediaries; textile auxiliaries; earth-moving equipment; synthetic rubber; 16 mm and 35 mm motion picture projectors; transistors and semi-conductors; gramophone records; cement- and paper-making machinery; industrial gases; enamelled architectural and enamelled walled tiles; steel forgings; photographic equipment; explosives; aircraft parts; refractories; tractors and parts; carbon black.

American interests also play an important role in the development of fisheries; establishment of "de luxe" hotels; poultry-breeding farms; and publication of textbooks.

German collaborators include 32 public limited companies (A.G.), 46 private limited companies (G.m.b.H.), making up a total of 78 limited liability companies; 121 firms and 24 individuals and 223 interests in all.

More than half of West German collaborators are thus firms which clearly predominate in the West German industrial structure. About seven West German companies have entered into more than one collaboration agreement with Indian partners. The names of these companies are: Messrs VEB Electro Apprat Werke (3 agreements) and M/s. Linn, Merck A.G., Fabrik Chemacher, Linder, Electrica Kondensatorua-fabrik and Seimen's Engineering and Manufacturing Co. (two agreements each).

Indo-German Collaboration

A large number of Indo-West German collaboration agreements are for the manufacture of engineering goods, both machinery and components including electrical machinery, instruments and precision instruments. Not a single agreement envisages the production of light consumption material. The following are some of the articles manufactured in our country in collaboration with West Germany: industrial furnaces; industrial machinery; industrial gases; single-phase and three-phase electrical meters; refractories; tyre cord; acetic acid; industrial roller chains; rail equipment; capacitors; wire-drawing and wire-rope manufacturing plant; hydraulic press; submersible pumps; high-tension insulators; wire-ropes; oilers and equipment; sanitary-ware; malleable castings etc.

There are 113 Indo-Japan collaboration agreements out of which 93 are Japanese limited companies, 16 firms and four individuals. It clearly shows that more than four-fifths of the Japanese collaborators are big, well-established joint-stock companies, and the share of firms and individuals in Indo-Japanese collaboration is insignificant. The four following Japanese companies have entered into more than one collaboration agreement with Indian partners: Tokyo Shibaur Electric Co., Ltd. (five agreements); Mitsubishi Heavy Industries (Reorganised) Ltd. (three agreements); Nitie Seikan Co., Ltd. (two agreements); Farukawe Elec. Company Limited (two agreements).

About a third of the collaboration agreements are designed to manufacture electrical goods: cables; meters; anistorized radio-receivers and loudspeakers; signalling equipment; transformers etc. Other items of manufacture re: dye stuffs; chemicals; glass products; watches; machinery and precision instruments, etc.

About 70 Indo-Swiss collaboration agreements have been approved by the Government of India out of which 42 of the Swiss firms are limited liability companies, 24 firms and 4 individuals. Three Swiss companies have entered into more than one collaboration agreement with Indian partners, Dow Chemie A.G. (3 agreements), Swiss Locomotive Machine Werke and Interfonda Limited (two agreements each).

Generally Indo-Swiss joint ventures have been set up for the manufacture of precision instruments like time-pieces, micrometers and high-precision press, etc. Other items of manufacture are: Chemicals and pharmaceuticals; processes for bleaching, dyeing, printing and finishing cloth; electrical and diesel and refrigeration machinery; gramophone discs, etc.

All the 50 French collaborators approved by the Government of India are limited liability companies. The following two French companies have more than one agreement with Indian collaborators: L' Air Liquide, Paris (3) and L' Horlogerie De Savoie (2).

L' Air Liquide Company of Paris has all the three agreements with Asiatic Oxygen & Acetylene Company Ltd. and L' Horlogerie De Savoie Company has two agreements with Mr. J. S. Parekh of Bombay. Indo-French collaborations have been set up for the manufacture of engineering and electrical goods; wrist watches; paper; chemicals; perfumery; cranes; Diesel engines; cement and chemical machinery; sanitaryware; mopeds; fuel and vacuum pumps; castings and forgings, etc.

Italian Parties

Thirty of the 45 Italian collaborators are limited liability companies, 13 firms and two individuals. Only two Italian companies have two agreements each with Indian parties. They are: M/s. Centro Magneti Permananti and M/s. Braco Industries Chimica S.P.A.

The articles of manufacture are: automobiles; scooters; auto rickshaws and parts; tyres and tubes; pharmaceuticals; electrical goods; caustic soda and sulphuric acid plants; other chemicals and intermediates, etc.

The organizational pattern of the Swedish collaborators is as follows: limited liability companies 9; firms 14; individuals 1; institutions nil; total 24.

Indo-Swedish enterprises will manufacture the following articles in India: Primus brand burners and parts; pulp and paper-making plant; air control equipment; typewriters; calculators and adding machines; foam fire-fighting equipment; dairy machinery; self-lubricating bearings, etc.

Czechoslovakia being a communist country, all the Czech collaborators are government departments or companies. Only four companies have entered into more than one collaboration agreement, Techno-Export (3 agreements); Strojexport (4 agreements); Motokov (2 agreements); Kova (2 agreements).

The articles to be manufactured are: motor cycles; autolooms; electric and welding generators; horizontal and universal milling machines; textile processing machinery, etc.

The organizational pattern of the 25 Dutch collaborators are as follows: Limited liability companies 22; firms 2; individuals 1; total 25.

A special feature of the Indo-Dutch collaboration agreements is that one big company of Holland accounts for about half the Indo-Dutch joint venture agreements; M/s. N. V. Phillips of Holland has as many as 12 collaboration agreements with Indian collaborators out of the total of 25. Generally Indo-Dutch joint ventures have been formed to manufacture electrical goods and machinery. Other articles of

to be expanded only when new lines of products have emerged from the inventive processes of modern science.

To make this discussion as concrete as possible, the experience of the Centre at Okhla will be drawn upon. That will permit a discussion not only of the guiding principles common to all Centres but also some of the problems which confront them in practice.

Operation of the Centres

Four main stages may be distinguished in the operation of the Prototype Production and Training Centres.

(i) Selecting the item

Only those items are selected for prototype development which are suitable for manufacture by a small industrial unit with the tools and technical qualifications appropriate to it. Machines at present not manufactured in India naturally enjoy the highest priority, even if their production involves collaboration with a foreign firm. Apart from the overriding aim of replacing imported by indigenous products, the following factors, among others, enter into the selection of the products: (a) a rugged and fool-proof design; (b) accuracy in operation; (c) small power consumption; (d) satisfactory output; (e) interchangeability of parts; (f) ready availability of servicing facilities and spare parts; (g) low cost of maintenance; and (h) low purchase price.

(ii) Negotiating foreign collaboration

Once an item has been selected for prototype manufacture, negotiations start with a foreign manufacturer. The rights to be acquired must include the manufacture of the original design, with modifications, if any, in the design to adapt it to Indian production and marketing conditions. The contract

usually includes the import of a few complete sets of ready-to-assemble components with which to start off work in the assembly shops without delay. When necessary, the contract may specify a lump-sum payment for technical knowledge and royalty payments over a specific period. In these matters the Centre plays an essential intermediary role, since it is hardly possible for the small manufacturers either to enter into or successfully to conclude direct negotiations for a transaction of this type with the foreign manufacturer of the original piece of machinery.

(iii) Planning design and engineering and setting up the production line

Once an item has been selected for prototype manufacture, the Centre carries out some or all of the following functions: (a) design or redesign of the product; (b) preparation of process schedules; (c) manufacture of jigs, fixtures and tools for production; and (d) manufacture of a sufficient number of prototypes to ensure smooth production.

At this stage, the Centre may need to be in touch with some of the technological research institutions in India. It is expected that particularly close relationships will be established soon with the Machine Tool Design Institute now being set up by the Government of India in Bangalore.

(iv) Training and assistance to the small unit for commercial production

All the technological knowledge acquired during prototype manufacture and assembly is then handed as a "package" to selected small units for commercial production. As part of the training, the prototype is handed over to the unit together with all drawings, process schedules and instructions from the original manufacturer. Further advice is extended regarding

machinery and equipment, raw material supplies, etc.

Prototype production of any machine at a Production and Training Centre is usually confined to a small number, to what may be called a "Zero" series. In general, a small-scale enterprise is not expected to manufacture a whole complex machine by itself, since it seldom has the necessary facilities. The trend towards increased specialization within each unit and co-operation between units, the Government of India has encouraged through special incentive scheme. Accordingly, a prototype is broken down into several component parts, one or several of which are manufactured by different small units and then assembled in another small factory.

Increased specialization helps to overcome other major obstacles. Some of these arise from the basic discrepancies between the general levels of technology in India and those obtaining in highly industrialized countries. Others may arise from legal restrictions, for instance, proprietary rights, on the manufacture of certain machine parts. Specialization in a country like India allows production to proceed in progressive stages, from early manufacture of the less complex parts of a machine and their assembly along with imported parts, to the indigenous manufacture of an increasing number of parts, and finally to the production of the whole item within the country. In this way, specialization does not wait on industrial development but, on the contrary, makes it feasible.

An example may show how this development takes place in practice. At the Okhla Centre, three types of machines, manufactured in the Federal Republic of Germany, were taken up for initial development: a small bench lathe, a tool and cutter grinder and a milling machine. From 1960 to 1962, detailed drawings were prepared for undertaking, between 1962-66, the following production programme at the Centre:

Production	1962	1963	1964	1965	1966
Precision lathe (Weiler)	100	150	200	—	—
Tool and cutter grinder (Hahn and Kolb)	—	50	125	175	100
Horizontal milling machine (Steinel)	—	100	150	200	—
Total	100	300	475	375	100

A relatively large number of machines are to be produced at the Centre because it is desired to perfect prototype production and to implement a broad training programme built around a regular production line. The production of these machines by the Centre is to be discontinued in 1967.

The terms of collaboration between the Centre and the German manufacturers allow small units in India to produce and sell these machines in the country. In the beginning, some complete sets of components were imported, ready to assemble. This allowed the fitting and assembly sections of the Centre to begin working at the same time as the sections the manufacturing component parts, that is, the foundry, the forging shop and the machining shop, were starting their own operations. It is envisaged that the imports of component parts will be gradually reduced until they comprise finally only those items which carry proprietary rights or which are not manufactured anywhere in India.

A parallel method is followed for familiarizing small entrepreneurs with the products and processes developed at the Centre. At first, all the components and parts are provided to the unit for study and assembly, and, as the unit begins to manufacture its own parts and other units take up the manufacture of other parts, the Centre gradually fades out of the picture.

An effective form of organization would be to set up a

functional industrial estate as a counter part of a Prototype Production and Training Centre. Such an estate is devised for small enterprises producing parts of a given article, the assembly being done in one of the units of the estate. The Centre would provide training and guidance to the small units, and, if necessary, manufacture, in the beginning, certain parts and undertake the assembly of the product. Later on these functions would be taken up by some of the occupants of the estate. The Centre would continue to provide technological guidance and, if need be, common design and toolroom facilities.

It is to be expected that, because of differences in levels of technology and in available facilities, the collaboration between the Centre and the foreign manufacturer and between it and the small units will remain an active one for a long time. The fact that a few complete sets of components are originally imported does not usually mean that the product for which manufacturing rights have been obtained can be copied "in toto". Certain parts may be far too complex to be copied in India, at least for some time, or may be far too expensive to manufacture. Such parts would therefore continue to be imported from abroad.

Adaptation of Equipment

Modifications of the product are often needed to meet local conditions, and the Centre has an important role to play in devising adaptations of processes and equipment. Minor changes may be needed in the size of standard items such as screws, nuts and bolts, so that they conform to standards in common use in India. Major changes may affect, for instance, raw material specifications in order to bring them in line with resources available in the country. The case of steel is particularly serious in this respect. In a highly industrialized country, securing specified steel may be a matter of lifting the telephone and getting it "off the shelf". In a developing country such as India, however, where most of the steel alloys are imported, this presents a grave and very difficult problem.

Even though the requirements of small units for any particular type of steel alloy may be very small, and even when they are given an import licence meeting their individual requirements, actual supply to the required standard and in the proper time cannot always be guaranteed. Foreign manufacturers of steel are not much concerned with the small requirements of a single importer. Quite often, the types of steel required are not included in their current manufacturing programme, and they may be reluctant to accept special orders for small quantities. Moreover, small industrial units are not in a position to carry large stocks of every type of steel required. These difficulties compound others arising, for instance, from the shortage of foreign exchange, and constitute a serious obstacle to the development of small-scale industries.

For the Prototype Production and Training Centres, the problem resolves itself into two major parts. The first question is that of rationalizing the use of steel. In many cases, the wide variety of steels originally specified for the production of a machine can be reduced without affecting to any appreciable extent the quality of the product. Reducing the number of different types of steel to be imported makes it possible to increase the amount of orders for each individual type and so to induce foreign manufacturers to include such orders in their production programme. In the second place, the Centres will need to assure the small entrepreneurs that the substitute materials will be as good as those used thus far, instruct them in the use of heat-treatment processes appropriate to the new types of steel, and extend other advice and assistance. The Government is now considering the possibility of setting up, as part of the facilities of each

Training for Production of Prototype Machinery

A. D. BOHRA

THERE IS in India a very large number of small industrial establishments, employing some 3.5 million people and adding Rs. 4,550 million (approximately US \$1,000 million) to the value of the materials they process (excluding textiles). Thus far their main contribution to the economy has been to help in meeting the increased demand for consumer articles. Now, they are increasingly taking up the manufacture of simple producers' goods for industry and agriculture and of component parts of more complex capital goods produced by large industrial undertakings. Thus closer relationships are being established among small industries and between them and the rural economy on one side and large-scale industry on the other.

In India enterprises having a capital investment of Rs. 5 lakhs (about \$100,000) or less, in certain cases even Rs. 10 lakhs (about \$200,000) or less are designated small-scale industries. Units of the maximum size may have adequate access to capital and be modern in every respect. Most units are, of course, much smaller. Characteristically they lack bargaining strength in buying and selling and in securing capital. Their internal organization is little specialized, one to three persons carrying out all technical and managerial functions. These weaknesses become particularly evident when new lines of production are to be developed, especially producers' goods never before manufactured in the country, either by small enterprises or not infrequently, by large concerns. In view of the fact that the Government is deliberately promoting the indigenous manufacture of goods hitherto imported, it is common occurrence that industrial operations have to be undertaken which have a character of complete novelty for the country.

Socio-economic Problems

It is the view of the Government of India that small-scale industries help to ensure an equitable distribution of the national income, to mobilize resources of capital and skill which will otherwise remain idle, and to avoid some of the socio-economic problems created by industrialization. Consequently, the Government has taken many steps to promote this sector: the extension of advisory services on improved methods of production and management; assistance in the purchase of new machinery; provision of factory space in modern industrial estates and dissemination of modern knowledge through a nation-wide Industrial Extension Service and training institutions. The Government's policy is aimed at helping small-scale industry to become a more self-reliant and self-supporting sector of the national economy.

The fact, referred to above, that small-scale industries are increasingly undertaking the manufacture of new types of producers' goods has led the Government to provide them with a new form of assistance. A number of Prototype Production and Training Centres are being set up in different parts of the country, with a view to carrying out the following tasks:

(a) the development and production, with foreign collaboration if necessary, of prototypes of machines, implements, tools, accessories, component parts and the like which are at present being imported but are suitable for subsequent reproduction on commercial lines by small-scale units;

(b) the development and production of prototypes of im-

proved types of machines which are now manufactured in India but do not come up to the adequate standard and, at a later stage, of new types of machinery and equipment especially well suited to the needs of small industrial units in India; and

(c) the practical and theoretical training of the operating staff of small-scale units and of the technical staff of the Government Extension Services engaged in assisting small industrial units to carry out the above tasks.

(d) As a subsidiary task, the Prototype Production and Training Centres are also intended to undertake themselves the manufacture of such component parts or to carry out those phases of production for which facilities do not exist in the small units; however, this may be done only if it does not hamper the attainment of their three main tasks.

Model Centres

Thus, the Centres are intended to serve a number of small industrial units as a common development department providing them the necessary technical knowledge and training for their personnel, to enable them to undertake commercial production of new items which are of considerable importance for the further development of industry, especially in their own sector. At the same time, it is expected that each Centre would serve as a model for similar training centres to be set up by the Government or other agencies and that the organization and operation of each Centre would be a model both for individual small-scale units and for co-operative groups of small-scale units engaged in complementary industrial operations. Thus far, three Prototype Production and Training Centres have been established and are functioning. The first Centre, set up at Rajkot (Gujarat) in 1957 with the help of the United States Government, was originally intended to function as a central workshop providing a wide range of services for the establishment of model production units suitable for operation on a small scale, such as the manufacture of furniture or wire products. This purpose was, however, abandoned because it was felt that the demonstration value of setting up model production units could not outweigh the disadvantage of having these competing with existing small commercial units, and it was decided that the Rajkot Centre would specialize in training for production of machinery for foundry, wood-working and sheet-metal manufacture. In 1959, a second Centre was located at Okhla, a suburb of Delhi, with the help of the Federal Republic of Germany and it specializes in training people in the production of prototype machine tools. This Centre is described in some detail below. The most recent addition to the chain of Centres is at Howrah, a part of Calcutta. It receives help from the Japanese Government and concentrates on industrial machinery particularly suitable for small industry and on electrical instruments for switchboards.

Each Centre is an all-India institution in the sense that it services small units all over the country. Present plans envisage the establishment of twelve additional Centres, each specializing in a specific range of producers' goods. It is expected that a network of fifteen Centres will be sufficient to meet all current and prospective development and training requirements of the small-scale industry sector, and will need

Professor Bohra, Principal Director, Small Industry Extension Training Institute, Hyderabad, India, has participated in a number of seminars and working parties on industrialization organized by the United Nations and the Economic Commission for Asia and the Far East.

Centre, a raw materials depot with a view, in particular, to importing special steels and supplying them to the small units in the region. Another, perhaps less obvious example of the need for local modification, relates to the type of lubricants to be used for the prototype machine. The basic principle in the area of design or modification of the existing design is to simplify by maximizing the number of standard component parts and minimizing the number of types and sizes of raw materials.

Replanning the process schedules for the manufacture of various components and of the tools, jigs and fixtures required for manufacture is another important kind of modification carried out at the Centres. The technical information on this aspect supplied by the foreign manufacturer is at best a good guide. The schedules have to be modified to suit the scale of production and the type of machinery available not only at the Centre, but, more especially, at the units which will undertake commercial production. In the worst case, the original methods are practically irrelevant to the developing country; for instance, when the machine to be developed as a prototype is so standard in the country of origin that it is mass-produced on highly productive automated equipment.

Training

The third main function of the Centres, training, is closely integrated with their production function. It is, in fact, attempted through supervised production. The staff of the Centres is trained by foreign experts before it begins

* In addition, special courses are organized for qualified technical and other personnel of the nationwide extension organization in India, who provide technical assistance to small enterprises, and who are required to be informed of the latest developments in their fields of specialization.

providing instruction to the workers of the small enterprises. The experts train the staff of the Centres through their day-to-day work, exactly as, at a later stage, the staff will train the workers. To train the staff, the prototype production programme has been phased into three stages providing for progressively advanced instruction.* These are: (a) development of machinery and equipment through foreign technical collaboration with such modifications in design or manufacture as may be required to suit Indian conditions; (b) improvement in sub-standard products already manufactured in India by modifying design, processes, type of raw materials and so on; (c) design and development of new machines to cater for local needs or export markets.

As the staff and the foreign experts take these steps together, they also develop ancillary appliances and tools. Special work benches, cupboards and portable, hand-operated cranes are some of the many items developed in this way at Okhla. While they have been developed in the first place for the Centre's own use, they have attracted the interest of many small manufacturers, some of whom wished to procure the new appliances and tools for their own use, and others to procure the drawings in order to manufacture the items on a commercial scale. Such sideline contributions by the Centres may be important enough to affect the planning of their production programmes.

Training the workers of the small units is the key element in passing from prototype production to commercial manufacture. If training is to be fully effective, it must be preceded by a careful selection of small-scale industrial units

which hold out most promise of achieving commercial production of new items—a difficult task because many factors may make or mar this promise, such as the experience of the unit, its material resources, and the personality of the entrepreneur.

In spite of those difficulties, the selection of the units should be attempted well in advance of the commencement of prototype production. An early association would yield immediate practical benefits in addition to the obvious long-term ones, since some forms of training could be imparted to the operating personnel beginning from the stage of planning, and be continued and developed as production is undertaken by the Centre. Thus, even while the processes are being planned in the Centre, the supervisor of the small unit can be specially trained in the Centre during this phase of the work. When tools are being designed and then manufactured for prototype production, the tool-makers may be called in, and the moulders and machinists when the components are being cast or machined. Such a procedure would ensure the participation of the various categories of personnel at every stage of development of the product.

Proper training arrangements should greatly reduce or even eliminate disturbances and difficulties in the units resulting from the absence of staff away for training. The problem need not arise significantly — nor need it arise at all — in units newly set up for the very purpose of producing the prototype machine commercially, provided the units are selected early enough. Their staff can then work alongside of the staff of the Centre as the latter develops the prototype, and can begin work in their own units when a stage of training has been completed. The position need not be different if an existing unit has to enlarge its activities in order to enter this new line of manufacture, since it will need new staff in any event. Disturbances can affect units which wish to change over from an earlier line of production to the new one, or which request the Centre for modifications in their established designs for reintroduction in the same shops. In such cases, the changes in design may be as upsetting as the training of the staff.

Technical Personnel

There are in general three levels of technical personnel in a small enterprise in India; workers, technicians, foremen or supervisors, and superintendents or technical managers. In very small units, these levels are usually compressed into two and sometimes even one. Originally, the Prototype Production and Training Centres were to provide advanced training only to personnel having already acquired basic skills through formal training or experience. Now that some basic training courses have been organized for certain categories of technicians and foremen, the Centres have assumed responsibility for improving the technical skills of all the three categories of technical personnel.

Technical education is provided in India by the following institutions:

Institution	Nature of training
Technical high schools	General education with emphasis on technical instruction.
Trade schools, junior technical schools and industrial training institutes.	Practical and theoretical training in particular trades, such as turning, fitting, welding, and the like.
Specialized schools, such as those organized by ordnance factories & large enterprises of the public sector.	Practical and theoretical training in certain trades to meet specific requirements of the factories.

Institution	Nature of training
Schools of engineering & Polytechnics (diploma courses).	Practical training with theoretical background in a field of engineering — such as mechanical and electrical engineering, ceramics, etc.
Engineering colleges (degree courses).	Theoretical training with practical bias in one field of engineering.

To supplement such basic training, the Centres organize separate courses for skilled workmen, supervisors and engineers. Originally, the following qualifications were laid for selecting trainees in these categories:

- Skilled workmen: minimum experience of three years, excluding period of earlier training.
- Foremen: diploma holders with three years of practical experience; or skilled workers who after finishing course as under (i) above have further experience of about two years; or non-diploma holders with five years of practical experience, possessing prescribed qualifications.
- Superintendents and shop-masters: practising superintendents and shop-masters; and foremen with minimum experience of five years.

While these selection standards could not be applied rigidly, minimum standards providing for practical and theoretical tests for all candidates before admission have been prescribed and held for each course.

In all their courses, the Centres emphasize practical training. Theoretical subjects are left to be dealt with in vocational schools and colleges. At the Centres, teaching is centred on those aspects which allow the trainees to realize the causes and the advantages of each task. Such training has obvious limits: for instance, while the Centres can provide practical training to design and development engineers, they cannot go so far as to train them in machine construction; this is left to higher technological institutions in the country.

Since most of the trainees are already employed in small units, whether newly established or not, or in the Government's extension organization, both of which find it extremely difficult to spare their personnel for long, the training period must be as short as possible. Originally, none of the training courses lasted longer than six months. A few longer courses have now been organized for special purposes and for trainees who are to be employed in completely new vocations.

At the Okhla Prototype Production and Training Centre, the training courses cover the following subjects: turning, milling, gear-cutting, planing, grinding, fitting and assembly, heat treatment, electroplating, tool room, foundry, forge and sheet-metal work, welding, wood-working, pattern-making, materials testing, inspection and draughtsmanship, and maintenance.

In the middle of 1962, there were 150 trainees at Okhla divided into six categories:

- Skilled workers from small industrial enterprises in the age group of seventeen to thirty, employed in the engineering sections of their units. These workers have had one to three years' experience in the trade which they have chosen for training. They are able to read, write and understand English. Preliminary selection of the candidates was made by the Small Industries Service Institute, which is the Govern-

RAILWAY WAGONS AND STRUCTURALS

Wagons - and yet more wagons are urgently required to carry food grains and consumer goods to markets all over the country, not to speak of increasingly heavy movement of machinery, raw material and equipment to industrial centres. Equally important are the demands now made by the home and export markets for quicker and timely transport.

Today we are building CR, MBC and BOX wagons for the Indian Railways. Our partners in the enterprise are Metropolitan-Cammell Carriage & Wagon Co. Ltd., U.K.

We also undertake to design and fabricate general and special structurals, tanks, air vessels, pressed and welded work under strict quality control measures.

SOUTHERN STRUCTURALS LIMITED

GDC BUILDING, CATHEDRAL ROAD, MADRAS-6.

Factory: PATTABIRAM, SOUTHERN RLY.

ment's extension agency at the state level, and the final selection by the Okhla Centre. The duration of training is six or twelve months, depending on the experience of the trainee. Each trainee is paid a monthly stipend of Rs. 50 and provided with free furnished accommodation.

(b) Regular apprentices who are "freshmen" having passed matriculation, or an equivalent grade in science and drawing, and were recruited from all over India through advertisements in the leading newspapers. The course organized for them lasts three years. During the training, the trainees are paid a monthly stipend of Rs. 50 for the first year, Rs. 60 for the second year and Rs. 70 for the third year.

(c) Trainees from Industrial Training Institutes are at the Centre for advanced training for one year. These trainees have had at least one year's experience in the trade, and have been admitted after the nominees of small industrial enterprises have been accommodated. They are subject to the same rules and regulations, and receive the same stipend as the latter.

(d) Graduate apprentices are at the Centre for training on an 'ad hoc' basis. These trainees have competed for places with those from the Industrial Training Institutes, but do not receive any stipend or hostel accommodation.

(e) Assistant draughtsmen in training at the Centre are matriculates with at least twelve months' previous training in draughtsmanship.

(f) Junior trainees in draughtsmanship are matriculates in the age-group of seventeen to twenty years with at least some basic knowledge in this skill.

It is expected that the total number of trainees at Okhla will increase as follows in the next few years:

Type of course	Number of trainees			
	1962	1963	1964	Total
Three years' apprenticeship course	..	..	21	21
Six months' course	..	207	240	687
Twelve months' course	..	100	200	500
Courses for assistant instructors, technical assistants, assistant draughtsmen, junior draughtsmen, etc.	..	69	140	349
TOTAL	..	376	580	601

Not included in this compilation are the technical specialists of the Government's extension organization and technical training institutes who come on an 'ad hoc' basis for three to six months. They do not receive special stipend or accommodation.

A number of broad guide-lines are used in framing the syllabi for the three main categories of trainees, the duration of the courses varying with the nature of the trade and the grade of the trainees:

(a) **Skilled workmen** are given theoretical training covering the fundamental principles of different operations, types of machines and tools, blue-print reading, raw material supplies and manufacturing techniques relating to their trade; and practical training in the operations allied to their trade and in the manufacture of the component parts of machines and machine tools.

(b) **Foremen** are given practical and theoretical training covering machine tools, structure and composition of raw materials, and manufacturing processes; inspection and testing, blue-print reading, design and manufacture of simple tools and implements; and practical training in operations allied

to their trade and in the manufacture of parts of machines and machine tools.

(c) **Shop-masters and superintendents** are given, in addition to the training imparted to foremen, courses in time-and-motion study, cost accounting, design and manufacture of simple machines, jigs and fixtures, and workshop management including planning and production control.

In order to ensure that the setting for practical training approximates closely to normal production conditions, all production departments of the Centres are organized on regular production principles. After an initial period of a few weeks, trainees are attached to permanent staff members of the Centre who supervise their work. They receive preliminary instructions on the job and are then expected to execute their work according to established standards. Supervision is maintained until such standards are achieved.

Like other organizations, the Prototype Production and Training Centres have their share of day-to-day operational problems, the effective solution of which mainly depends upon the quality of their staff. In the following, some operational problems peculiar to this new type of organization are examined, and some indications given concerning the range of material resources required to set up new Centres.

Inherent Difficulties

The theoretical case for training personnel through actual production processes leading to finished products is tight but such integration has inherent difficulties. One problem is that production conditions for the manufacture of prototypes are not the same as for commercial manufacture. According to principle, when the two are proximate, the time has come for production to be transferred from a Centre to a commercial unit. However, if the principles were followed, it would be impossible to operate a Centre according to a regular schedule since production schedules would change far more frequently than is sound for purposes of training. To avoid this danger, fewer items have been taken up for prototype production at the Centres than would have been desirable and the production of at least some of them is being continued at the Centres well beyond the time needed to develop the prototype for commercial production.

The remedy to this danger gives rise to another one, namely, that the attention of the staff of the Centre may stray from the primary goal of manufacturing prototypes and training personnel to the subsidiary one of undertaking commercial production at the Centre itself. Encouragement has been officially given to the Centres to accept job orders on a non-commercial basis so as to put the equipment to maximum use, although it has been clearly stated that such orders could only be accepted, if they did not hinder the performance of the Centre's primary functions. The operative question is whether commercial production threatens exclusively to take up the attention of the Centre's staff. Whether this danger is avoided or not depends to a large extent on the criteria by which higher levels of the Government evaluate the operations of the Centres. It can be minimized if they assess the operations primarily in terms of the primary goals of the Centres and do not allow themselves to be sidetracked into assessing these institutions as if they were commercial units.

As in all training institutions, the number and quality of the staff of the Centres are the influential factors that affect the speed and quality of the work, both as regards prototype production and training. They determine the "atmosphere" of the Centre and the extent to which the staff can communicate to the trainees important matters beyond immediate technical training, such as, in the management field, record-keeping procedures, inventory control systems, costing and financial accounting, and still more generally, standards of

good order, cleanliness and punctuality; and, even beyond that, standards of personnel responsibility and co-operation.

Persons able to live by such standards and communicate them to others are rare anywhere, and especially in rapidly industrializing countries. One consequence of this shortage is that the best among the trainees tend to be retained by the Centres on their permanent staff, while at the same time, the Centres are losing experienced staff very frequently. There is no doubt that the quick turn-over of staff affects the Centres' regular programmes adversely. It seems that the only way of remedying this difficulty is to organize a continuing programme of staff training, once the limitations imposed by the Government machinery on recruitment of permanent staff can be relaxed.

In principle, all three parties to the benefits of training are to contribute towards its cost: the Centre, the trainee himself, and the small unit which has deputed him. The small unit may pay the trainee a part of his normal salary for the mediating family expenses during the training period. The trainee may cover some additional "out-of-pocket" expenses. In practice, it has been found difficult to enforce this principle rigidly without the small entrepreneurs losing their interest in the training of their staff at, and that of the staff itself in the training of the Centre. This touches on major questions relating to the appreciation, accorded in rapidly industrializing countries, to the learning of practical skills and to the traditional relations between people and their government. Meanwhile, the stipends paid to trainees are adequate for them to meet their expenses at the Centres.

Organisation of New Centres

The organization and working conditions — not to mention the buildings and the campus of each Centre—should be so planned that they would fit into the development programme; also that the trainees should have a lasting memory of their stay at the Centre and establish and develop ties between it and their own firms. Every facet of the Centre's organization and activity should serve to promote better human and professional communications.

The buildings and their lay-out can in themselves be prototypes. At Okhla, extensive use has been made of prefabricated components in putting up the structures. The roofs are of light foam-concrete slabs which are both nearer and considerably cheaper than other load-bearing materials. Since the Okhla Centre was built, these features of its construction have been adopted by many industrial units.

In view of the fact that no regular production programme is ever scheduled for a definite period ahead, all sheds at Okhla are so designed that the lay-out of machinery and the sequence of operations can be readily altered. There are no inside pillars. The roof spans and the overall length of individual sheds are great.

Similar considerations have determined the lay-out of the electric installations. An overhead wiring system has been installed. The distribution lines in the factory sheds branch off from the feeders along the larger walls and are carried on pillars standing on the floor with only light fastings. The arrangement can be easily adjusted to every change in the lay-out of machinery.

Another special feature of the Okhla Centre is the provision of a visitors' gallery running along the entire length of its main sheds. A production factory would not need this, but a Prototype Production and Training Centre is a place where visitors — officials, technicians, owners and managers of workshops and factories, students, people from all walks of life — come every day. Permitting free access to the Centres is an effective way of demonstrating development work in a stimulating and convincing manner. The gallery provides visitors with an unobstructed view of activities in the shed while preventing them from interfering with the regular flow of work.

Some less important features of the buildings include the following: the administrative buildings and classrooms are away from the workshops to avoid noise, dirt and gases. Stores are at one end of the workshops. Though in close proximity, they need to be separate in order to reduce fire risks. Workshops liable to accumulate or disperse dirt or dust are situated as far as possible from those requiring freedom from dust. Wide traffic lanes are provided in the workshops for floor-level transport of materials. Inter-shed transport is effected by suitable lift-type carriage and battery-type electric carriage. It will be desirable to have an overhead travelling crab system along the entire length of the two transport lanes.

General Purpose Machines

As a rule, small-scale enterprises employ principally general-purpose machines, and it may take a long time before they are able to acquire labour-saving machinery involving high investments. Accordingly, if a Prototype Production and Training Centre is to meet the needs of small enterprises, its equipment and machinery should not be of the very latest and most modern type. If they were, the training received would be of little use to the workmen upon return to their units. On the other hand, the Centre's equipment should be better than the sub-standard machinery usually available in small enterprises. The equipment should therefore be standard and well above the general level of small industry, but it should lie within its reach, even if it takes some effort. Some special equipment to provide common service facilities to small units must also find a place in a Centre. In India, examples of such equipment are gear-manufacturing and jig-boring machines.

The selection of machinery for a Centre poses major problems of a special nature inasmuch as the production programme, that is, the nature and quantum of the workload on different types of machinery, is not known in advance. The production programme will vary with changes in the prototype programme, and the latter should be projected in advance so as to ensure a balanced availability of machinery and equipment. The provision by the Centre of common service facilities (for instance, heat treatment and laboratory testing) and the use of machinery for job orders both help to ensure a balance in the utilization of equipment which might be difficult to achieve in the production of prototypes alone.

The equipment for individual workshops and the inventory of parts and supplies required for carrying out all phases of work and practical training cannot be planned in detail far in advance and will in part be contingent upon the development of the prototype programme. The Okhla Centre, which specializes in machine tools, has all the sections required in a modern engineering workshop: machine-shop, foundry, carpentry, smithy, metal finishing shops, design office, sheet-metal shop, and so on. Each section is well equipped to cater for the normal requirements of all phases of the Centre's activity. In the initial stages, some outside job orders were taken to utilize idle equipment and to organize proper training while the normal work of the Centre gained momentum. The equipment at Okhla cost nearly Rs. 6 million (\$1.2 million) for a training capacity of 250.

The lecture rooms are simple but furnished with teaching aids such as projectors for films, film-strips, and overhead projection. Extensive use of audio-visual aids helps in reducing the period of training.

Since the activities of the Centres are both very important and quite new to India, it is essential to get the best available persons in the country on their staffs.

In some cases not even the best is good enough, and assistance from foreign governments in the form of services of technical experts is needed to support indigenous talent. In India, specialized assistance from abroad has been obtain-

ed in many fields, particularly design, time-study, work-measurement and job-preparation.

While the foreign experts' knowledge in their fields of specialization can safely be assumed, more often than not their experience of India is limited or nil, and they may not therefore readily fit their knowledge to the actual working conditions. When a foreign expert teams up with an Indian, there can be a happy blending of the former's technical knowledge and the latter's local experience. In the Centres as in other institutions or factories, the foreign experts are placed in positions where they do not have to implement the programme directly, but are expected to provide advice and training. In the Centres, the local staff member is held fully responsible for the working of his section, and foreign experts assist him in doing the job. The key role of the foreign expert is clearly that of training his counterpart to do a job rather than to do the job himself. It is usually possible for the Indian counterpart to take over full responsibility within three years.

There are certain limitations in training Indian personnel at the Centre with the help of foreign experts, particularly as regards technical staff at the higher levels. There are programmes for sending personnel abroad for further training, whenever possible at the foreign firms who collaborate with the Centre in its manufacturing programme. Overseas training is preceded by six months to one year's work at the Centre, as it has been found that only then does the staff obtain full benefit of its stay abroad. Overseas training is granted subject to a guarantee from the trainee that he will serve with the Centre for a specific period upon his return to India.

The initial investment in each Centre thus far established in India has been of about Rs. 10 million (\$2 million). About half of this expenditure has been met by foreign countries—the United States at Rajkot, the Federal Republic of

Germany at Okhla and Japan at Howrah. Their contribution includes the foreign exchange costs of equipment, expenditure on foreign staff for an initial period of three years, and training costs of Indian instructors abroad. The rupee costs of the project for land and building, Indian staff and other working expenses are met by the Government of India.

Fostering Complementary Relationship

The Prototype Production and Training Centres are an important new link in the chain of institutions serving and assisting small-scale industries. By concentrating on producers' goods which can both be manufactured and used by these industries, they contribute directly to the acceleration of industrial growth. By fostering complementary relationships between small-scale industries, they contribute to strengthening this economic sector. Their work is complementary to that of technological research institutes in solving the problem of adaptation of equipment; to that of small-scale industries services institutes and industrial extension centres in providing specialized technological assistance and advice; and to that of educational and training institutions in providing specialized practical instruction.

Since the major function of Prototype Production and Training Centres is to facilitate the transfer and adaptation of technologies developed in the advanced countries, foreign assistance will in most cases be necessary to set up such institutions in the industrializing countries and to provide guidance and training in the first stages of their operation. In India, such assistance was provided under bilateral agreements. It is suggested that industrializing countries could usefully request it also from international organizations. In some cases, expert advice may be needed to conduct investigations prior to starting a programme of establishment of Centres. In many cases, the supply of funds to meet the foreign exchange cost, in particular, those of equipment, would be a useful adjunct to the provision of expert help, when permitted by the statutes of the contributing organization.

From the age-old inertia to a bright new source of energy to revitalize our village life.

NIRLON SYNTHETIC FIBRES & CHEMICALS LTD.

**Speech of the Chairman of the Meet.ng,
Shree S. Vaidyanatha Aiyar**

Gentlemen,

I extend to you all a hearty welcome to the 5th Annual General Meeting of your Company.

Before I proceed to matters specific to your Company, I must express our profound sorrow at the tragic assassination of President Kennedy and the demise of Shri M. S. Kanamwar, our Chief Minister and five top Officials of our Defence Services.

As participants in the Prosperity of your Company, you will appreciate that the whole project came into existence owing to the vision, the enterprising spirit and business acumen of the entrepreneurs, Shree Nanubhai Jhaveri and his brother Shree Promod Jhaveri, the well-known jewellers. The successful completion of the project owes much to their Highness the Maharaja and Maharani of Travancore and His Highness Madansinghi the Maharao Saheb of Kutch.

By and large, Nylon occupies a place of importance. It is a synthetic fibre created by modern technology and has proved to be vital for industrial development in many countries. In India, it is in great demand for several purposes. Apart from its high utility value for tyre cord, it is used for fabrics for rain wear, ground sheets, light-weight tents, gun equipment covers, safety belts and parachute harnesses. Its tensile strength, its resistance to water and its durability combined with lightness render it eminently suitable for commercial, industrial and defence requirements.

Because of this development, the establishment of the Nylon Plant of Messrs. Nanubhai Industries now known as Nirlon Synthetic Fibres and Chemicals Limited is of relevance and importance. Your Company will be of increasing importance in the years to come as India's industries and military requirements and resources develop. The new name of the Company encompasses admirably the purposes of this Organisation which was promoted and organised in 1958 and was intended to develop into an integrated synthetic fibre vertical unit.

The Company has, you will be pleased to learn, decided to go ahead with its Rs. 10 crore programme of expanding its present capacity for Nylon yarn production and of undertaking for the first time in this country the production of Nylon tyre cord and also of Caprolactam, the much coveted principal raw material for the Nylon industry.

The range of the Company's production, at present covers Nylon yarn of 15D, 20D, 30D, 60D and 70D. The Company's entire production is readily absorbed since there is an ever growing demand for Nylon yarn in the country both for civilian and Defence requirements. The quality of the yarn produced by the Company is satisfactory. This is naturally due to the rigid quality control enforced at

every stage of manufacture. The full production of the Plant is expected to result in an annual turn-over of Rs. 4 crores.

Further, with a view to meeting the speedily growing demand for Nylon, the Company has decided to raise its capacity for Nylon yarn production to 5.6 tons a day from 2 tons a day as at present. This is a happy augury for the future. The necessary industrial licence for expansion of capacity has already been obtained by the Company and negotiations with the U.S. Government Lending Agency for a Foreign Exchange Loan are in progress.

The expansion programme is expected to cost about Rs. 2.77 crores inclusive of Rs. 1.68 crores in foreign exchange. The original Nylon Plant of the Company has been so designed as to accommodate additional Plant and Equipment without any additional construction work. Your Company has chalked out plans to undertake within the licenced capacity manufacture of stretched Nylon yarn used by the Hosiery industry and Nylon tyre cord required by the Automotive, Tyre Industry. Nylon Tyre Cord is now fast replacing viscose tyre cord in the production of rubber tyres for automobile heavy duty vehicles and aircraft in U.S.A. and Europe.

For the main raw material Caprolactam, your Company depends on imports at present from Messrs. Allied Chemical Corporation, U.S.A. The imports of this material are paid for through exports of fabrics. The Company has commenced its export programme and has been able to export to Europe, Middle-East and Far East and has established some important connection in these areas. Further the Company has been able to secure firm orders for exports to meet all the foreign exchange requirements. This scheme will continue to operate till the Company's own Caprolactam Plant starts functioning. In order to save the foreign exchange expended on raw material imports, the Company has already secured a licence for the establishment of a Caprolactam Plant with a daily capacity of 12 tons. The Company is negotiating for collaboration with a firm of International repute, the largest producers of Caprolactam in the U.S.A., and the Central Government have indicated approval of the terms of negotiations. It is proposed to set up the Caprolactam Factory at Thana where Phenol required for the production of Caprolactam will be available. The over-all capacity of the proposed Caprolactam Plant will be big enough to meet the requirements of the Nylon industry in the Country. When the Caprolactam Plant is in full production, it is expected to yield 60 tons per day of Ammonium Sulphate, Nitrogen-rich fertiliser as a by-product. It will be also possible to tap Cyclohexanone, an important intermediary compound used in a number of industries such as paints, lacquers, pesticides and pharmaceuticals. We should be able to achieve these targets with the co-operation of all of you as well as those new members who are expected to join us.

Now, I turn to what is upper-most in your mind, the Accounts. The Accounts for the year ended 31st March, 1963.

December 27, 1963

reveal the position as follows:

Sales for the first 4 months of production. (The Company commenced production on 2nd December 1962) ..	Rs. 28,58,985
Profit before depreciation ..	Rs. 2,69,882
Deduct depreciation including extra shift allowance on Plant and Machinery.	Rs. 16,73,866
Net Loss carried to Balance-Sheet ..	Rs. 14,03,984

The loss is mainly due to our providing depreciation on the diminishing balance method which naturally would be heavy during the first few years. Development Rebate at 20 per cent on the value of Plant and Machinery installed is available under the Income Tax Act. Reserve for the Deve-

lopment Rebate will be created when sufficient profits are available.

The Sales for the subsequent 8 months from April to November 1963 amounted to Rs. 1,49,82,000. The shareholders can look with confidence and optimism to the future and expect a fair return on their investment.

I may inform you that we intend to enter the Capital market for the issue of 106,000 Equity Shares of the face value of Rs. 100 each for cash at par.

Before I conclude, I wish to express on behalf of the Board, my appreciation for the co-operation and valuable services rendered by our foreign collaborators and loyal services of our staff and workmen at the Factory.

Now, I move that the Accounts be adopted.

Bombay,
16th December, 1963.

TUBE INVESTMENTS OF INDIA LIMITED

Chairman's Review

Speaking at the Fourteenth Annual General Meeting of the Shareholders held on December 18, 1963 at the Registered Office of the Company at 52/53, Jehangir Street, Madras, the Chairman, Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon) said :

Gentlemen,

Let me extend to you a cordial welcome to the Fourteenth Annual General Meeting of the Shareholders of Tube Investments of India Limited. The Director's Report, the Audited Balance Sheet as at, and the Profit and Loss Account for the year ended 31st July, 1963, have been in your hands for some time and with your permission I shall take them as read.

The Directors' Report deals with the many problems that have faced the Company during the year under review. The production of cycles, which was our original objective and which still remains one of the main purposes of this Company, has fallen in number and has been ten per cent less than in the previous year. The fall in production is due to causes which are fairly familiar to industrialists particularly in this part of the country.

part of the country.

Tubes of the requisite type are obviously essential for cycle manufacture, and the Company, therefore, established a Tube Mill at the appropriate time, but the short production of tubes, the causes of which will be referred to later, has affected the production of cycles. To this was added a severe cut imposed by the Government of India in the value of import licences issued to the Company. Essential consumable stores, mostly chemicals, nickel, etc., could not be had in sufficient quantities. Above all, the almost complete cut in the supply of electricity by the Madras State Electricity Board, extending over a period of two weeks, led to the closure of the Factory and entailed, consequently, the failure to reach the planned targets for cycles and spare parts.

I referred to the fall in the production of tubes. The Cold Roll Mill installed in 1962, started production in March of that year with hardly any teething troubles, so long as imported skelp and strips were used. During the year the Company had to use steel from the Rourkela Factory and was glad of the availability of indigenous products for the purpose, but unfortunately experience showed that the sup-

plies were not of the requisite quality and specifications. The defect in the skelp supplied often became manifest only after the steel has been pressed and naturally resulted in the processed article being also discarded with considerable financial loss to the Company. The demand for our tubes and Cold Rolled steel strips has been steadily growing and the Company has under consideration a scheme for a substantial increase in our present capacity of Cold Rolled steel strips. Some of the details relating to the scheme are now under discussion with Government and our collaborators.

The costs of production have been increasing fast due to various causes. The last budget has added very considerably to the costs of the end products in most industries. While realising the need for meeting the needs of the Defence requirements, consequent on Chinese aggression, and desiring to play its part without reserve, Industry may be allowed to point out that some of these tax burdens may considerably add to the costs of manufacture without compensating advantages to Governments. The increase in the import duty on plant and machinery, the enhancement of inter-State Sales Tax, the increase in the import duty on essential raw materials not readily available, are some of the tax burdens, which one may venture to suggest, deserve a second and more thorough examination by the top authorities concerned.

METAL SECTIONS

The Directors' Report refers to the fact that in spite of all the setbacks, preparations have been made including selection of personnel for the special training required, and the erection of buildings to install the plants and machinery of this unit, but Government orders for capital goods licence have not yet been received.

T.I. DIAMOND CHAIN LIMITED

The Factory has made good progress. The production suffered only due to shortage of raw material and the power

cut, already referred to. The cycle chains manufactured in this Factory have been of such quality that they have been exported in considerable quantity to Nottingham and more exports are in contemplation. The production of Industrial Chains, it is hoped, will be commenced early in the new calendar year.

T.I. MILLER LIMITED

As the Directors' Report mentions, the Factory building has been completely constructed and most of the plant and machinery has been installed. The production of dynamo lamps is now expected to commence early in the new year.

In spite of the handicaps which have been mentioned above, the operating costs are fairly satisfactory, but those in charge of Management must feel a sense of frustration when on the one hand they are asked to have a productivity drive and show results and on the other hand for causes beyond their control, production falls even below normal. I feel bound to emphasise this point as the difficulties experienced at the present day are not confined to any particular industry or industries but are general and are the result of the complexities of the controls in operation which in their turn lead to unconscionable administrative delays. The obstacles in the way of establishment, maintenance and development of industries catering to the needs of the country, and even of the export trade, are legion and these, I believe, are also realised and even appreciated by persons in authority but

remedial measures have been tardy and haphazard. It is to be sincerely hoped that steps will be taken to remove, in the coming year, in good measure, the causes which hamper Industrial productivity and development.

I should like to record my deep thanks for and appreciation of the ready help and advice that the Company has continued to receive from our Associates, Messrs. Tube Investments Limited, of the United Kingdom, and other companies in their group. The foreign collaborators of our Subsidiary Companies have also continued to help us with their best advice and have placed their latest know-how at the disposal of our Factories without reserve. We are also grateful to the Government of India and the Government of Madras for their interest in the development of this Company and the facilities they have extended and the advice that they have given in its expansion programme. If in spite of their desire to help, either raw materials or the supply of electricity had to be cut, some at least of the blame must be attributed to nature.

We continued to have cordial relations with our Factory Workers and Office Staff both at the Factory and Head Office and I have great pleasure in acknowledging with thanks the co-operation they have extended to us and their enthusiastic support in the successful working of the Company.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

THE MYSORE KIRLOSKAR LIMITED

YANTRAPUR P. O. HARIHAR

Speech of the Chairman, Sri M. D. Shivananjappa, I.A.S., read on Saturday, the 23rd November, 1963, at Harihar at the time of the twenty-second Annual General Meeting of the Company.

Ladies and Gentlemen:

It is with great pleasure that I welcome you today to this 22nd Annual General Meeting of your Company.

Before proceeding with the regular work, however, I have a sad duty to perform. I wish to refer to the sad demise of Sri A. K. Phalnikar on the 6th October, 1963. Sri A. K. Phalnikar had been associated with this Company since its inception. He was a partner of the Managing Agency Firm—Messrs. KIRLOSKAR ASSOCIATES since December, 1956 to Messrs. 31st March, 1962, when he formally retired. Sri A. K. Phalnikar rose from a very humble position in the Organisation to the position of a Partner in the Managing Agency Firm and had been all along closely associated with all the factories in the Kirloskar Group of Companies. In his death we have lost a close associate. His mature counsel was always available to your Company. May his soul rest in peace.

Turning now to the regular business, the Balance Sheet of your Company as at 30th June 1963 and the other relevant statements of accounts as also the Directors' and the Auditors' Reports for the year ending 30th June 1963 have been already in your hands for sometime and I trust you may have gone through them with interest.

According to the usual practice and with your permission I take the same as read.

Taking the Profit and Loss Account statement of your Company first, you will have noticed that the net sales amounted to Rs. 2.23 crores during the year under report as against Rs. 1.81 crores in the previous year, showing a rise of about Rs. 42 lacs. In percentage terms, this rise is slightly more than 23 per cent over the previous year. This progress, though in itself, quite encouraging, would have been still more had it been possible for us to receive the imported components in time and had we been able to get quality Pig Iron. In spite of these difficulties, the Company has made some commendable progress.

As regards the several items in the revenue expenses during the year, raw materials including Stores and Work-in-progress with transport charges accounted for 37 per cent as against 41 per cent in the previous year. Salaries and Wages to employees accounted for 23 per cent. Power and Fuel expenses and depreciation remained steady at 3 per cent and 6 per cent respectively. Indirect expenses were also steady at 10 per cent. The tax liabilities, however, increased to 12 per cent from 9 per cent in the previous year. This is due mainly to the Super Profits Tax recently introduced, as a result of which about Rs. 6 lacs have to be paid. The ratio of turnover to employed capital has gone up from 82 in the previous year to 83 in the year under report, taking the employed capital at 100 as the base. The ratio of turnover to gross block has also gone up to 148 during the year under report from 144 in the previous year.

Turning now to the Balance Sheet, you will find that there has been an addition to the plant and machinery valued at Rs. 30.20 lacs during the year under report as against Rs. 6.84 lacs in the previous year.

The construction work of the building for the Foundry is well in progress and is expected to be completed by the end

of March 1964, though we have already commenced to use a part of the building.

Plans for the construction of the Machine Shop at our Hubli Branch are well underway. Orders have been placed for the import of the machinery required for the various expansion schemes.

The estimated amount of contracts remaining to be executed on capital account is about Rs. 53.70 lacs.

You will, therefore, notice that your Company has taken all the necessary steps in expanding its activities to meet the growing demand for its products.

Your Company has also proposed to diversify its activities by adding one or two new lines of Machine Tools. The negotiations in this regard for collaboration are in progress and it is hoped, they will bear fruit in the current year.

I would now like to make a few general remarks. At the time of the last Annual General Meeting, I had made a reference to the inadequate quantity and unstandard quality of Pig Iron. This has been a problem over the last several years and it is high time that some specific steps are taken immediately by the authorities concerned to relieve the situation.

The members might have read in the newspapers that the Secretary to the Government of India, Department of Iron and Steel, visited Goa and Hospet in connection with the establishing of a Steel Plant of a million ton capacity in Goa-Hospet region. The Technical Consultants are expected to submit their report within about a month or so and the Government of India would be taking a decision immediately thereafter. It is hoped that a decision would be taken expeditiously and a million ton Steel Plant with a provision to produce foundry grade Pig Iron in adequate quantities would be established in the region to meet the needs of the Engineering Industry.

I had also given you an idea about the extent of demand for Machine Tools as a whole within the country. The scope for expansion of the Machine Tool Industry is still quite considerable. We in our humble way have tried our best to play our part to the extent possible, under the present circumstances. However, there are various handicaps which are hampering partially the expansion programme of the Company. A large chunk of your profits which was being ploughed back for developing the industry is now being denied due to the imposition of the Super Profits Tax. The Super Profits Tax has worked as a damper on raising additional capital due to the tight money market conditions. It is no doubt true that attempts are now being made to revitalise the capital market and even if these efforts are successful, the damage done so far cannot be denied.

In my speech at the last Annual General Meeting, I had made a few suggestions for providing some tax reliefs vitally necessary to enable the industry to keep the plant modern and up-to-date and to stand the competition from foreign countries in the International market.

I had then particularly referred to the need for allowing tax-free replacement reserves. It is common knowledge that the depreciation allowance provided under the Income-tax Act meets only the original cost of the machinery and does

IT
DAGGER BRAND CUTTERS FOR LASTING PRECISION PERFORMANCE
BACKED BY 25 YEARS OF TRADITION and rigid control at every stage of production
DAGGER BRAND CUTTERS (available in metric and inch sizes) assure precision performance.
They are made of superior quality steel, specially heat-treated to ensure long life, and manufactured in India's biggest and most modern factory for Small Tools.
THE INDIAN TOOL MFRS. Ltd.
101 Sion Road, Bombay 22

ASP/IT-24

not provide for the rise in the cost of the machinery prevailing at the time of replacement. It is also common knowledge that the replacement costs have gone up to 2 to 3 times the original cost of machinery. Unless therefore adequate tax-free replacement reserves are allowed to be built up, the industry cannot maintain its plant modern and up-to-date. Unless this is done, the productivity of the plant also cannot be maintained.

I will not be shy in appealing to the authorities concerned year after year to appreciate the basic logic in the above suggestion and provide timely relief to enable the industry to run on efficient lines. The position has in fact been accepted by the Government while charging the premium on replacement price of the machinery under the Emergency Insurance Scheme and my own suggestion is that the same principle should be applied for allowing depreciation on machinery and building also.

I would like to make a further suggestion that the provisions under Sections 84 and 85 of the Income-Tax Act, 1961, in regard to tax holiday be extended for a period of eight years and should also apply to the expansion schemes of the

industry in addition to new undertakings. This tax relief is necessary particularly in the case of Machine Tool Industry where the expansion is generally a slow and difficult process, in that, a lot of preliminaries are involved, such as training of adequate personnel to man the expansion project and increasing the technical services all round to ensure quality production. It is for this reason that in a machine tool industry adequate tax reliefs are necessary over a longer period.

Ladies and Gentlemen, during the year under report the Management and the staff and the workmen have exerted their best in showing the commendable progress during the year under report and I take this opportunity of sincerely thanking them not only on my behalf but also on behalf of you all.

Ladies and Gentlemen, I also thank you for giving me a patient hearing.

I now propose that the Directors' Report and the Accounts for the year ended 30th June 1963 produced at this meeting be approved and adopted.

Note: The above statement does not purport to be a report of the proceedings of the Annual General Meeting.

THE SCINDIA STEAM NAVIGATION CO. LTD.

Summary of the Statement of Shri Dharamsey M. Khatau, Chairman, The Scindia Steam Nav. Co. Ltd., made at the 44th Annual General Meeting of the Shareholders on Wednesday, the 18th December, 1963, at Scindia House, Ballard Estate, Bombay.

The improvement in the Company's results in the year under review, observed Shri Dharamsey M. Khatau, Chairman of the Scindia Steam Navigation Co. Ltd., in his statement to the Shareholders of the Company at the 44th Annual General Meeting was due to improved performance and the upward revision of freight rates coupled with such rationalisation of the fleet and services as the Company achieved in its overseas trades having due regard to its essentially liner nature. The 10 per cent increase in the West-bound freights had come not a day too soon inasmuch as these freights had remained steady at the same level since 1957.

Regarding employment of 10/12,000 d.w.t. ships as tramps for carriage of cargoes presently being carried by Liner vessels, he said this would lead to wasteful competition. Shri Khatau requested the Government of India to bear this in mind and to see that no parallel service is sought to be established by tramp interests, as such a step would merely give a set-back to what has already been achieved by Indian shipping in the field of international shipping.

As regards the rates of freight on the Coast, Shri Khatau referred to the appointment of Shri T. S. Parasuraman, as a One-Man Commission to review the case of shipowners, and he hoped that the Commission would look into the urgent need of allowing the coastal operators an appropriate increase in freight rates so as to provide an adequate return on capital employed.

There was another aspect of coastal shipping which Shri Khatau dealt with in his observations: commenting on the occasional shift one noticed in the Government policy in allocation of coal cargo leading to withdrawal of some ships from coastal employment, he said it would be only fair that Indian shipping should expect to carry on the coast the increased quantity of the cargo that would be adequate for

increased coastal tonnage so that coastal operators did not have to face the serious situation about finding cargo for their increased tonnages.

Shri Khatau referred to the problem of mounting operating costs arising from increased benefits given to the dock labour under various Awards and also from increased port charges and he said it was very necessary that the steps should be taken to establish an appropriate machinery like the Tariff Commission to evaluate such rise in costs with a view to suitable compensation in freight rates.

He further advised the meeting that, out of the three 17 knots fast motor vessels — JALAKIRT type — ordered with Messrs Hindustan Shipyard, the first vessel is now expected to be delivered by about the middle of 1964, although its keel was laid as far as back as on 12th October, 1961. The second vessel is scheduled to be launched shortly and it will be ready sometime in 1965. Keel of the third vessel was laid on 26th April, 1963. He also referred to the recent addition to the Company's fleet of two second-hand motor vessels—one of 12,800 d.w.t. and another of 11,700 d.w.t. — both built in 1958 and having a speed of 14 knots. These vessels have been acquired on a deferred payment basis.

His observations about future prospects were that: "the recent spurt in the international freight markets about which a reference has been made earlier will, it is hoped, have a steadying influence on the general level of liner rates. I also hope that the findings of the One-Man Commission now examining the coastal freight rates will lead to recommendations of more reasonable upward revision. With the Government of India recognising the need to ensure economic freights for our shipping and by proper planning, both in coastal and international spheres, we can look forward with confidence to a steady

and planned progress of our industry."

As regards Konkani Services, Shri Khatau stated that the amounts in respect of a subsidy in lieu of 8 per cent increase in fares as well as the repair cost in excess of the Railway Committee's estimate for the years 1961-62 and 1962-63 had not been received as promised by the Government. As no agreement could be reached with the Government of Maharashtra in regard to the question of payment of dues payable by them, the Company could not resume the Konkani Services from 1st September, 1963. Thanks, however, to the good offices of the Central Government, the Maharashtra Government aid an 'on account' amount of Rs. 4 lakhs which enabled the Company to resume its services from 11th October, 1963. He further stated that the Committee that was proposed to look into the matter had not yet started functioning and urged that early steps be taken to set it up.

Shri Khatau thanked Shri Jagjivan Ram, the then Minister of Transport and Communications, and Shri Raj Bahadur, Minister for Shipping and the officials of the Ministry of Transport for the interest taken in the shipping problems. He also referred to the services rendered to the cause of Indian shipping by Shri G. L. Mehta, the First Chairman of the National Shipping Board and welcomed Shri C. H. Bhabha, the newly appointed Chairman of the Board and expressed his confidence that with his inspiration and efforts we would soon achieve and even exceed the target of two million tons for our national shipping.

He also appreciated the services rendered by the officers and staff and the Company's Agents abroad and in India and thanked the shippers and consignees for their continued support.

CONSOLIDATED COFFEE ESTATES (1943) LTD.

Summary of the speech of Mr. M. A. Sreenivasan, Chairman, at the twentieth annual General Meeting at Pollibetta, Coorg, on 6th December, 1963.

Quite a few men with intimate knowledge of coffee planting and its problems have spoken at meetings and conferences of the U.P.A.S.I. and other associations of Planters of the difficult time this industry has been having in recent years, and the disheartening outlook ahead. If I take this occasion also to speak on the subject it is because I feel that I should, on your behalf, add my voice to theirs in the interest of the great enterprise of growing coffee in which our Company has played and continues to play a leading part.

The history of Coffee planting is a long and fascinating one of which the country may well be proud. Even in the recent decade from 1950 to 1960 the performance of the plantations has been so outstanding as to serve as an example of agricultural enterprise and farming husbandry. In those ten years Coffee production was more than trebled. Not only did the producers prosper during that period and pay substantial sums to the Government by way of taxes, they also provided housing — with no subsidy from the Government — for other industries were given, water supply, dispensaries, canteens and creches to the workers and their families. In addition they earned valuable foreign exchange.

The record of our own Company in that decade was no less impressive. In those ten years our acreage under coffee was extended by over a thousand acres. Our production too was trebled, and we produced a record crop in 1961 of nearly four times of what we produced in 1950.

At a time when the pace of agricultural production in other fields is lagging behind and causing anxiety, and foreign exchange worth crores of rupees is spent on imports of such agricultural products like rice and wheat and cotton it is well to ponder how the coffee growers achieved results that are in such sharp contrast to the performance in other fields and farms. How did this happen?

There were, of course, many factors that contributed to the result. But the most important single factor was that the planters were left relatively free and undisturbed, without threat of insecurity and encroachment and worry over controls and permits—free to plant and to replant, to

plough back earnings to extend cultivation and improve yield, unharassed by bureaucratic meddling, unfettered by chains of Acts and Amendments, and unburdened by oppressive taxation. Till about the beginning of the last decade, as luck would have it, plantations did not attract the zeal of the agrarian reformer, or the solicitude of the ideologist.

But this freedom was shortlived. The conspicuous performance of the planters itself made them — large companies in particular — the target of increasing attention of many authorities, including a variety of taxing authorities at all levels, Central and State, Municipal and Panchayat. In 1962 the maximum rate of agricultural income-tax in the Mysore State (which only five years before had been stepped up from 25 per cent to 40 per cent) was further raised from 40 per cent to 60 per cent, outstripping the scale of taxation imposed by all other State Governments including Kerala. In the same year, Excise duty on Arabica was raised from Rs. 21 a cwt to Rs. 28 a cwt. In the very next year a surcharge of 20 per cent was imposed on the already raised excise duty on Arabica and on Robusta as well.

In his speech at the Annual General Meeting in 1961 Mr. Machia pointed out how taxation in that year had taken 41 per cent of the profits of the Company as compared with 23 per cent in 1951 and how, on a production of less than 1,500 tonnes of coffee in 1951, the Company had retained a surplus after tax of Rs. 17 lakhs, while on the production in 1961 of a record crop of nearly three times what was produced in 1951 the higher taxation left the Company with less than Rs. 5 lakhs more. In the next year, viz. 1962, taxation took over 50 per cent. In 1963 it took over 57 per cent, — more than double of the taxation in 1951. On a crop of over 3,000 tonnes for 1963 we were left with about Rs. 18 lakhs after tax which is what we got for half of that production in 1951.

I am quoting these figures to point out how the recent taxation has led to the paradoxical and disheartening situation in which we produce more and more to get less and less.

The introduction of the slab system in taxing agricultural income has resulted in putting a heavy and iniquitous burden

on shareholders of Companies like ours.

It is no exaggeration to say that large companies like ours give the lead to the industry not only in such matters as labour housing, medical facilities and labour welfare but also in farming techniques, quality production, the battle against pests, against maladies old and new, and research promotion. They produce the bulk of the coffee of export quality. Yet, being conspicuous, they offer easy targets. Unable to hide or divide themselves they are relatively more vulnerable. I doubt if it is generally realised that a hundred shares in a company like ours represent just a little over one acre of coffee; and that except for a few large shareholders like the Life Insurance Corporation, most of the shares are widely distributed and held by a large number of people. In fact, over two-thirds of our shareholders own shares that represent a fraction of an acre to 2 or 3 acres of coffee. And these small holders are all taxed at the maximum rate of 60%. Were it possible for a company like ours to divide and fragment itself it could save lakhs of rupees in taxes. This system of taxation has, in fact, already led to sub-division and fragmentation of plantations. In the seven years from 1953 to 1960 the number of holdings of 250 acres and above has declined from 227 to 157, and the number of those less than 10 acres has gone up from 27,000 to 38,000. The effect of this trend, even if only in the context of the pressing need for export, calls for consideration.

Before I leave the matter of taxation I must mention an ingeniously contrived new levy imposed on the industry which though fortunately not substantial, is of interesting significance. As you know, coffee curing works are under an obligation to take out a fidelity guarantee insurance policy in respect of the coffee they hold for the Coffee Board. Till 1962 the curers were free to do this with any of the insurance companies; and our curing works had been paying Rs. 105/- a year for the policy. Last year the Coffee Board, evidently under the direction of the Government of India, issued a directive to all curers that the said fidelity insurance should be placed only with one of two insurers named by it, and no other. Both these insurers charged a premium of Rs. 1,250/- a year for what our insurer had been and was still prepared to do for Rs. 105/-. We are thus forced to go to some one—one of them a subsidiary of the Government-owned Life Insurance Corporation—who charges over a thousand per cent over what we were paying for the same guarantee.

Last year a new law was enacted called the Mysore Land Reforms Act imposing ceilings on reserve land owned by planters and planting companies, as well as on the acreage on which they grew paddy. This year we have two more enactments—one called The Mysore Agricultural Income-Tax Amendment Act and another called The Mysore Forest Bill. Like many other instances of recent legislation both the Act and the Bill were quite obviously designed to meet certain High Court decisions that were against the Government and were in favour of the planter. Both the enactments make inroads into the timber assets of plantation companies. The former Act, which became law in October last, contains many clauses with retrospective effect among which is one that says the word 'timber' shall be and shall always be deemed to have been inserted in the previous Act. It also contains an extraordinary amendment that "shall be and is deemed to have been added with effect from the 1st April 1963" which lays down that any remuneration or benefit of any kind paid to a director of a company shall not be deemed to be expenditure laid out for the purpose of earning the income of the company, thus denying what the Companies Act envisages, and the Indian Income Tax Act allows. If the affairs of companies are to be managed by Directors who have responsibilities and liabilities under the Company law it is hard to see

how any—even the most modest—remuneration or benefit given to Directors including the Managing Director for services rendered can reasonably be deemed as not laid out for the earning of the company's revenue. One can only feel thankful that payments to work people are not likewise deemed.

The Mysore Forest Bill takes power to impose new controls and restrictions on trees in plantations. We, in the Mysore State, know how by tradition and long usage, sandalwood has come to be regarded as Royal, and accepted as a State monopoly. It is interesting to see the way the Bill uses sandalwood as a wedge to admit trees of all descriptions into the circle of bureaucratic control and to find Honne and Jalari, Kamara, Kiralbagi, Bore, Sagade, Mamidi and Mushini pushed in to enjoy the status once reserved for Royal sandalwood, ushering truly democratic socialism.

At the last Conference of the U.P.A.S.I. the President Mr. U. K. Lakshman Gowda pleaded for a new deal for the industry. On behalf of our Company, and of the entire industry I would warmly endorse his plea. I would go so far as to say that it would be a new deal in itself even if it were but a halt and a reversal of the kind of deal the industry has recently been having, and a restoration of the conditions of comparative freedom that it was permitted to enjoy in the decade that is past;—the decade in which, as I have pointed out, this field of agriculture was enabled to achieve an annual rate of growth of 30% which, if I am not mistaken, is five times the target of the Planners and ten times the present rate of growth achieved in other fields of agriculture. I would plead that this shining example should be maintained and magnified, and not allowed to fade and be lost. These green and smiling estates around us were jungle once, and can become jungle again if injured or uncared for. Ceilings and floorings are good for offices and houses; but for fields and farms the best flooring is the good earth, and the finest ceiling, the sky. Tractors do them more good than road rollers. As for controls, the only controls they need are strong fences, and the relentless control of pests.

It is now increasingly clear that all the crores of rupees spent and all the high-level Government attention focussed on the growing of more food grains in the last few years have failed to produce the expected results. Experience has shown that the best and most natural way to boost production is to create boom, or near boom conditions, be it for growing rice or chillies, wheat or mulberry, onions, cotton or coffee. When such conditions are created for a crop, and the grower prospers, even the authorities have found it difficult to get him to grow some other crop. Experience has also shown that paddy cannot be produced by legislation. Neither exhortations nor export drives can grow coffee or tea; they can only beat about the bush.

I am confident that if the industry is given another decade of the relative freedom it enjoyed in the last one, it can attain still higher peaks of production, and earn far more foreign exchange.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

A Phoenix Named Poland

ON JULY 22, Poland will celebrate the 20th anniversary of its liberation from the German occupation of World War II. This is an occasion on which the Polish people will be entitled to, and will, receive the admiration and goodwill of the peoples of the world, irrespective of differences in political beliefs or economic practices. For, over a thousand years of its tortured history, the Polish nation has shown an indestructible will and capacity to survive and endure and thereby written itself into the lore and legends of the human race.

In the last 20 years, the efforts of the Polish People's Republic to build a political and economic system based on Communist principles have been watched with a great deal of interest in the non-Communist world. It may be suggested perhaps that this interest has not been entirely unsympathetic. This is, above all, because of that special quality of the Polish people which is their sense of humour, their national characteristic of a capacity to laugh at themselves — and others. Typical of Polish political humour is this story of God, worried about the international situation, who sends Saint Peter down to earth to investigate and to report. On Saint Peter's return, the following dialogue ensues:

"What are the Americans doing?" asks God.
"They're afraid and they arm."
"And the Russians?"
"They're afraid and they arm."
"And the Poles?"
"They're not afraid and they don't arm."
"Oh, dammit, they're counting on me again."

God in the tale is not being strictly fair to the Polish people. If there is one lesson to be learnt from Polish history it is that Poles have never felt or acted

helpless. In the last 20 years, particularly, they have shown a resilience as well as determination of spirit hardly surpassed by any other people in all that grand chronicle of the restoration and re-building of Europe after the last War. It is true that economic progress has not been as spectacular in Poland as it has been in Western Europe, but, given its context, it has certainly not been either inconsiderable or discouraging. There has clearly been much diversification and expansion in industry as the accounts in the following pages will suggest. And it is, in any event, admittedly the case that, even within the rigid conditions set by centralized political organization or economic planning, Polish development procedures have managed to be, on the whole, pragmatic and flexible. To us in this country, particularly, the course of Polish economy, especially during the course of Poland's new five-year Plan, which is due to start next year, will be of special interest since Poland, like India, is confronted with the twin compulsions of stepping up agricultural production — where there have been disappointments — and expanding export capacities — where there have been difficulties.

Meanwhile, Poland and this country have come together in many ways in the last 20 years, not least in the sharing of international obligations, as, for instance, in South-East Asia. Poland, again, has extended friendly assistance to this country in its economic development and supplies of Polish machinery and development goods are playing a valuable rôle in building basic industries in this country. Indo-Polish commerce has been growing side by side with Indo-Polish goodwill and both may be expected to advance many times more rapidly in the next 20 years than they had done in the last 20.

Balance Sheet of Twenty Years

P. OGRODZINSKI

Polish Ambassador in India

TWENTY YEARS in the life of a man is a long period. In the history of nations, twenty years can only be but an episode of historical development, a continuation of processes evolved through hundreds of years. Was it not that many of us while in school sitting over books of ancient history did make mistakes in historical dates presuming that after all they were not of any essential importance? The tempestuous and dynamic epoch in which we live has, however, taught us to respect the dates. The events of this epoch have made many ancient nations to start recounting their history as if anew, as they entered a new and basically different stage of their development.

For India such a threshold was the year 1947 — when she became independent. For our country — for Poland, such a turning point was the year 1944. On July 22, 1944 in the town of Lublin on the first stretch of Polish soil liberated from the Fascist German occupation, the People's Government of peasants and workers — the first in the history of Poland — came into existence and it took upon itself the heavy burden of leading the country clear of the chaos of war losses and destruction.

The foreigners who came to Poland in the first years after the war reported that they found the country bombed, turned into ruins, burned, destroyed and levelled to the ground. Indeed, many towns had practically ceased to exist, among them Warsaw, the capital of Poland, a city of 12,00,000 inhabitants before war. More than six million Poles, or one-fifth of the population perished as a result of hostilities. One-third of the industrial potential and 35 per cent of the agricultural wealth were destroyed. The total loss of national wealth suffered by Poland on account of the war amounted to 38 per cent.

Backward Structure

Twenty years ago we had a still more difficult task, since we were starting from the ruins and ashes, from the removal of rubble, from curing of very deep wounds inflicted on the nation. The material means were less than modest if one also considers that pre-war Poland did not belong to well-off countries. The dependence of the pre-war economy on foreign capital was great and the economic and social structure was backward. Sizable unemployment, compulsory economic emigration, and even a fall in industrial output were other characteristics of the pre-war Poland.

Even the people opposed to democratic transformation that was being carried out in Poland admitted that the People's Government had undertaken the task which appeared to be beyond the creative and material possibilities of a few generations to come. They, of course, added that all the plans were likely to stay in the sphere of dreams and boasts as Poland's emerging out of so tragic a downfall was out of the question.

Today, after twenty years we, Poles, have the right to say that we have not gone astray and in the difficult moment we chose the best course and the only one, indeed. While removing the ashes of war we had at the same time started to build in a different way, anew. The effort of the people had been directed not only towards the economic development of the country, but also towards the transformation of the whole economic structure, in keeping with modern requirements. It included the radical land reforms, the nationalisation of the basic branches of national economy such as industry, mining,

banks, transport etc. On the basis of these fundamental changes, we started the industrialisation of the country consisting in both the development of the traditional branches of industry such as coal mining, black and non-ferrous metallurgy, and simultaneous construction of new, so far non-existent industries, e.g. shipbuilding, electronics, heavy machine tools, etc. Great attention was paid to the development of chemical industry which next to the coal mining has become the most important national industry.

In consecutive economic plans the direction of our investments has been determined not by temporary needs, but by the requirements of constant dynamic development of the whole Polish economy. Naturally, this was the most difficult road for the people, the one requiring greater efforts and not a few sacrifices; but, today, after twenty years, the face of Poland is changed completely. During the twenty post-war years, we have achieved a three-fold growth of the output of hard coal, iron ore and rock salt and almost five-fold increase in the output of zinc and lead ores as compared with the year 1938. We have started the exploitation of the new y discovered deposits of sulphur, copper and lignite, the raw materials of which nobody had even thought of in Poland before the war. Poland, which in the world's statistics of the output of sulphur had no place, now ranks second in this field.

Solid Foundation

The following data illustrate precisely the present condition of the Polish industry. While in 1960 the world industrial production was more than three-fold the level of 1938, Poland's industrial production rose seven-fold. (In 1963, our industrial production was 9 times that of pre-war level). Another comparison, no less illustrative is: the per capita industrial output of Poland was only 20 per cent of the corresponding average index of the U.K., France, Italy and Germany in 1937. It rose to 60 per cent in 1960 and will reach 80 per cent in 1965. The industrialization of Poland, her transformation from a backward agricultural country into a modern industrial one, has reduced the gap separating Poland from the highly industrialised nations of the world. It has changed her socio-economic structure. It has provided Poland with solid foundations for a constant, harmonious development of all branches of economy, foremost among them being agriculture — the second largest sector of the national economy. It is generally known that the rate of growth of agricultural production is much slower than that of industry; it is dependent on many factors in which we have scored considerable achievements during the past twenty years. As a result of agricultural investments, land improvement, mechanization of cultivation, the increased supply of fertilizers, construction materials, machines and implements, the average yield of the four basic cereals has risen during the last six years from 5.9 quintals per acre to 6.9 quintals per acre. At the same time the total agricultural output rose by 11.6 per cent. These, of course, are not yet satisfactory results. Poland is still compelled to import considerable quantities of grain, covering it by export of sugar, tinned meat, eggs, butter etc., but efforts are made to reduce this costly import as far as possible. Further investments in agriculture, the increased state credit assistance to the farmers, the supply of more than 1 million tons of fertilizers (in terms of nitrogen) in this year, of 20,000 new tractors, of large quantities of concentrate fodder, etc. will serve this purpose.

In a discussion of the economic situation of Poland after

20 years of independence, it is worth mentioning one more field of the economy which is often called the mirror of the economy of a country, I mean the foreign trade. The most significant phenomenon is the general change in the structure of the Polish export, as compared to the pre-war period. The place of Poland in world commerce was determined before the war by raw materials and agricultural produce. Today the pattern of Polish exports is completely different. The share of food products came down from 34.5 per cent in 1937 to 16 per cent in 1963 and that of raw materials from 62 per cent to 32 per cent. The opposite is being observed in the export of machinery and equipment. Their exports grew from less than one per cent of the total in 1938 to 33 per cent in 1963. It is estimated that during the coming years the export of machinery will grow to 40 per cent of the total and shall become the basis of our total exports. Machinery of different types as well as complete industrial plants constitute the main item of our trade with India. Our fruitful co-operation, for example, in the field of coal mining can be an ideal illustration of the changes that have taken place in Poland during the last twenty years.

Poland maintains today trade relations with 150 countries and the turnover of Polish foreign trade was in the last year twice as high as in 1956.

Dwelling upon the achievements of our twenty years of independence, I have devoted much space to the economic

problems and have often quoted percentages and figures. This is indispensable while presenting a balance sheet since 'all social changes are closely connected with the transformation of the economy of a country.

Shifts in occupational and social structure follow the development of industry. In Poland during these twenty years a considerable part of the population has found employment outside agriculture and the people living in towns are employed in industry, transport and services which now absorb half of the population. The youth, whether urban or rural, have uniform prospects of education, which is compulsory and free, and of gaining higher education, of choosing their profession and of promotion. Gradually we hope to extend to the countryside also the system of free medical care, of pensions and various schemes of social and state care. The removal of disparity in the level of living between urban and rural life seems to be one of the essential elements, or — to be more precise — effects of economic and social development of Poland of today.

I have presented the most important elements of the balance sheet of our 20 years of independence. These were difficult years, strewn with many obstacles. These have been twenty years of not only successes, but of sacrifices too, but for which it would not have been possible for us to look back with pride at the path traversed. We strongly believe that the next twenty years will be equally fruitful, because we are entering them armed with the experience gained in the past.

Polish Coal Industry

TOMASZ MIECIK

POLAND IS sixth in the world in the production of coal. In 1963, the Polish coal-mines are estimated to have produced 113 million tons of coal; in per capita production of this valuable fuel, Poland is second in the world. The coal industry, employing 3,450,000 people, is a mainstay of the Polish economy.

In the Polish fuel economy, coal is the chief item; for many years, it also was the key export item. This is the reason why coal mining is one of the most heavily invested Polish industries. In the years 1950-56, the annual investment outlays for coal mining averaged 2,860 million zlotys, which amounted to 17.5 per cent of Polish total industrial investment outlays; in the years 1956-60 average annual outlays rose to 5,800 million zlotys. Such enormous expenditures made it possible to complete the construction of several new coal-mines and of dozens of new galleries. Labour productivity kept upward pace: particularly good effects in this respect were recorded in the years 1956-60 when the annual extraction of coal rose by 10 million tons while employment in the industry fell by 10,000 workers, the working day was cut to seven hours and a half, and the average yield per worker per day rose from 1,147 to 1,326 kilogrammes in 1961.

In the current five-year Plan, 41,800 million zlotys have been earmarked for investment in coal mining, which accounts for nearly 16 per cent of the total value of industrial investment in this period. Out of this sum, 15,700 million zlotys have already been spent in the years 1961 and 1962. At present, 11 new pit mines and 52 new galleries are under construction. By 1965, construction of one more coal-mine will have been undertaken.

As a result of such an enormous investment effort, the capacity of the coal industry has been greatly expanded. Coal production rose from 78 million tons in 1950 to 109.6 million tons in 1962, or by 40.5 per cent over the span of 12 years. Ten new coal-mines have been completed since the war.

Demand Outpaces Supply

Nonetheless, the nation's demand for coal kept rising even faster, mainly due to the spectacular rate of development of the national economy. The economy consumed 52.4 million tons of coal in 1950, and 95 million tons in 1962, a rise of 81.3 per cent, while the extraction of coal — as stated above — increased by about 40.5 per cent, thus lagging far behind the swelling rate of demand.

This situation necessitated substantial cuts in the size of coal export. Whereas in 1950 26,570,000 tons (or 34 per cent of actual production) were exported, in 1962 only 17,313,000 tons of coal (15.8 per cent of production) were exported. Yet, even though exports decreased as did world coal prices in the meantime, coal is expected to retain its very important role in Polish export for many years to come. Among the Western countries, the bigger importers of Polish coal are Denmark and Finland, buying some 2.5 million tons annually each.

The considerable increase in coal production has been achieved not solely through the extension of old mines and development of new ones. Primarily, it has come in the wake of new technology being introduced into the mines. Nearly 4,500 million zlotys were expended for the mechanization and electrification of coal mining in the years 1956-1960. Technological and organizational progress has been directed mainly towards the concentration of production and increased labour productivity.

The years 1957 through 1962 witnessed a rapid rise in the

number of coal-mine machines of the basic types. The number of coal-cutting combines working the coal-face increased 3.7 times, that of gallery assemblies 4.1 times, and that of armoured combing conveyor belts 2.4 times. As a consequence of the introduction of thousands of new machines, all indices of mechanization rose rapidly, but above all rose the proportion of coal loaded mechanically: 18.12 per cent in 1957, 36.18 per cent in 1962, and an estimated 40 per cent in 1963. This means that in 1962 machines loaded some 40 million tons of coal whereas in 1957 only 17 million tons were loaded mechanically. Also in 1962, coal-cutting machines worked some 40 per cent of all coal extracted whereas in 1957 they worked only 34 per cent.

Higher Productivity

Technological and organizational progress has been directed towards a high concentration of production and towards a higher labour productivity. The degree of production concentration, achieved so far by the Polish coal industry, is evidenced by the realization of the maximum production capacity with a relatively small number of coal-faces worked. In 1958, 5,597 coal-faces were exploited for a total extraction of 96 million tons, and in 1962, 4,663 coal-faces yielded 109.5 million tons — a rise in production of about 14 per cent with a parallel decrease in the number of coal-faces worked by almost 17 per cent. In 1963, the number of faces exploited further fell to about 3,400, while production was estimated to rise to 113 million tons. The sharp decrease in the number of active coal-faces brings beneficial results in the form of a greater concentration of highly skilled personnel and technical supervisory staff, which in turn has a favourable effect on work safety: it further helps improve the distribution and utilization of materials and equipment, and the gainful utilization of man-power available. There is no other industry in Poland, where production capacity is used to the maximum degree so constantly as it is in the Polish coal-mines.

In consequence of the many technological and organizational improvements, labour productivity in the industry has been keeping an upward trend. The process is well illustrated by the following table:

PRODUCTIVITY IN KGS. PER DAY PER WORKER

	Year					
	1957	1958	1959	1960	1961	1962
Among pit miners proper	1619	1680	1737	1793	1865	1930
All over industry	1132	1188	1239	1286	1324	1354

The success achieved so far in the extension of coal mining does not satisfy all the needs of the expanding Polish economy. Therefore, in the next decades, too, the coal industry will continue to expand. Plans provide for the completion of another 25 new coal-mines by 1980. Even in the next fifteen years, construction will go on at 39 different mine sites. Geological conditions clearly favour such an intensified programme of building. Throughout the Silesian Coal Basin, extensive coal seams do not dip lower than a thousand metres (thus being accessible with the use of present-day technology) and their total deposits are estimated at 80,000 million tons. Thus, even with the continually growing rate of extraction the present deposits are not likely to be depleted for a few centuries. And a fast rise in the production of coal remains a necessity for the Polish economy.

Achievements of Iron & Steel Industry

FRANCISZEK KAIM, M.Eng.

(Deputy Minister of Heavy Industry for the Iron and Steel Industry)

DURING THE past twenty years the iron and steel industry in Poland took a big leap forward. Taking the production level in 1937 as 100, the growth of the basic iron and steel products achieved in 1963 is as follows:

	Growth index	Production in 1937 (tons)	Production in 1963 (tons)
Pig iron in terms of open hearth steel	613	880,000	5,395,000
Crude steel	556	1,441,000	8,004,000
Rolled goods	505	1,074,000	5,457,000
Pipes	590	80,300	473,000

Taking into consideration the tremendous war losses, one comes to the conclusion that apart from the workers in the iron and steel industry having put in their best, the efforts on the part of the State which allotted necessary means for the development of the industry have been commendable. It needs to be emphasised that in 1945 Poland's industrial enterprises were in various stages of devastation, only 5 enterprises, constituting 18 per cent of the total, were left intact. The most ravaged were the rolling mills.

Tottering Apparatus

The state of the installations in departments spared from destruction was bad. The plundering economy of the occupant, which believed in production at all costs, wore out the machines speedily: numerous coke batteries were extinguished, some blast-furnaces were frozen, many open-hearth furnaces collapsed. The majority of installations required capital repairs before putting them into operation again. Taking into consideration the disorganisation of the managing and production apparatus of the steel works, big losses in the personnel of engineers and technicians during the war, the difficulties in the post-war initial development period in the iron and steel production can well be imagined.

In the light of the above facts the following development stages in the iron and steel industry were planned: 1945 — setting into motion of works as well as the provisional patching up of the devastations; 1946 — further removal of war-devastations, increased production and the preparation to the three-year reconstruction plan of the iron and steel industry; 1947-49 — the implementation of the three-year reconstruction plan. The following stages, i.e. the six-year plan, the first five-year plan and the second five-year plan, encompassed wide expansion and modernisation of the iron and steel industry. During this period old steel works and production departments were thoroughly modernised. Thus in the field of blast furnaces, modernisation encompassed the change of Langen locks into up-to-date locks, the expansion of the utilised capacity of blast furnaces, armouring of furnaces, appliance of stronger blowers and raising of the blow pressure, reconstruction of the stoves and raising of the blow temperature,

mechanisation of the supply of charges, installation of ingot casting machines for pig iron, expansion and modernisation of ore agglomerating plants, building of stockyards equipped with reloading bridges, and diggers for ore blending.

Changes in the field of blast furnaces production are illustrated in the following table.

	1945	1950	1955	1960	1963
Average utilised capacity per 1 blast furnace (old works) sq. metres	345	370	451	465	465
Average utilised capacity per 1 blast furnace (including those of Lenin works), sq. metres	345	370	498	544	587
Average yearly production of pig iron per 1 blast furnace (old works), th. tons	19.7	80.7	112.3	137.0	145.2
Average annual production of pig iron per 1 blast furnace (including those of the Lenin works), th. tons	19.7	80.7	124.5	175.5	196.6

The comparison of the growth figures of average capacity of blast furnaces (including the Lenin works) with the annual, average production of pig iron per blast furnace proves that, in the years 1950-63, the 59 per cent growth in average capacity of a blast furnace was accompanied by an average production growth of 144 per cent, i.e. the growth in production of pig iron was 2.4 times higher than the growth of average capacity of blast furnaces. This was achieved by setting in

POLISH FOREIGN TRADE ORGANISATION

MOKOTOWSKA 49 WARSZAWA, POLAND

Representing the Polish Engineering Industry with 100 years traditions

Offers:—

Machine Tools
Textile Machinery and Equipment
Machines and Equipment for the Cellulose and Paper Industries
Wood Working Machinery
Air Conditioning, Dust Arresting and Ventilation Equipment
Pumps, Compressors
Various Machines: for Nail and Screw making, Glass and Optical Industry, Cable manufacture, Soil Drilling Apparatus
'KRET'.
Metal Goods of all kinds

motion of up-to-date blast furnaces of large capacity, modernisation of old furnaces, improvement in the preparation of charges and the introduction of modern technology.

In steel mills nearly all open-hearth furnaces in old works were reconstructed. The capacity of furnaces was increased by changing them into mazout-fired and coking gas-fired furnaces, and by introducing automatic controls of the furnace work. Steel mills were additionally equipped with strippers, charging machines, pig iron mixers and other auxiliary equipment. As a result the productivity of old open-hearth furnaces in 1963 increased by 57 per cent in comparison with the year 1945. In the year 1962, two installations for continuous steel casting were put into operation: an experimental one in the Baildon mill for casting alloy steel and the other one in the Jednosc mill for casting tube steel.

Rolling mills were badly devastated during the last war. It is estimated that the production capacity of rolling mills was lowered by about 60 per cent in comparison with the pre-war years. In the post-war period rolling mills in old steel works have been thoroughly reconstructed, which resulted in production surpassing the level of pre-war times. In old iron works 13 new roll lines were installed after the war, and 14 lines were modernised.

An important achievement in rolling mills in the post-war period is the production of a number of new articles such as rails for heavy cranes, watertight piles, special parts for wagons, steel sections for the building industry, pipes for steam heaters, sheets clad with acid-proof steel. Also introduced were high-speed heating of ingots made of austenitic steel, production of steel with ferro-structure and of high-speed steel, sections made of stainless and fire-resistant steel. Cleaning of charges was expanded. Touchless measuring of sheet thickness was introduced. Work on automation bloomers was started. Besides, work was conducted on increasing production of cold-rolled strips and piles. Finishing departments and departments of thermal working were expanded.

The building of the Lenin and Warszawa steel works was the turning point in the development of the iron and steel industry in Poland. These two new works are of decisive importance for the development of the production of the iron

and steel industry as well as for supplying the country with rolled goods. The works built on the basis of Soviet documentation and on the deliveries of basic equipment from the Soviet Union are the pride of the Polish industry and turn out at present about 30 per cent of the production of steel and rolled goods. These works will continue to be developed and by 1970 they should produce about 4.2 million tons of steel annually. The rate of reconstruction of the iron and steel industry and the production growth of steel are illustrated by the figures of per capita steel production in Poland as given below.

STEEL PRODUCTION ON PER CAPITA BASIS

Year	Kg. Per Head
1937	43
1949 (after a Three-Year Plan)	94
1955 (after a Six-Year Plan)	162
1960 (after a first Five-Year Plan)	223
1962	253
1963	265

The figures given above highlight the transformation process in Poland from a purely agricultural country into an agro-industrial one. This was made possible greatly through the particular attention given to science, technique, and economic development of the country in the post-war period.

In the period 1950-1963 over 40,000 million zlotys were earmarked on investment in the iron and steel industry. The several works of the Upper Silesian Industrial Basin crammed into the densely populated towns will be modernised and adjusted gradually to the production of articles made of quality and alloy steels, having in view the far-reaching specialisation of the different works. The other works such as the Bierut, Zawiercie, Labedy and Nowotko, having in their neighbourhood sparsely inhabited territories, will also be markedly expanded.

Science Solves Mining Problem

THE "ZGODA" technical equipment plant in Swietochlowice (upper Silesia) has become recently a very important experimental centre at which a problem of great importance for the world mining industry has been solved. It concerned the extraction of coal from beneath a factory without interrupting its work, with the simultaneous preparation of means for the protection of precision production. The "Polska" colliery, some of whose deposits are situated under a factory, has extracted already the first million tons of such imprisoned coal, an event without precedent in world mining.

Scientists from the Mining and Metallurgical school in Cracow have won much renown by the preparation of a method for extracting coal from so-called protection pillars, i.e., for extracting coal from towns, large industrial plants, etc. The deposits running under towns, large industrial plants, etc. The invention of the Cracow scholars was recognized as a very important achievement of modern mining science, but could not be used for the exploitation of deposits under factories whose production process is running with great precision, as is the case with the production of the "ZGODA" plant in Swietochlowice.

The main difficulty of this bold undertaking consisted in the working out of a system for protecting large machines and

machine tools from the possible effects of small subsidence. Experts from various disciplines carried out numerous examinations to find out which machine tools require special protection because of the precision of their work. They received first of all special type foundations. Regulation wedges were installed beneath them to bring them back to ideal level in case they began to lean sideways. Sensitive control indicators and devices registering all changes in the position of the machines were also installed.

The entire campaign was aimed at protecting the factory not from any "earthquakes", but only from deviations from the perpendicular of the order of 0.02 millimetre. The apparatus which registers such changes has been designed by scientists from the chair of machine tools of the Cracow polytechnic. They intend now to design devices which will not only indicate the inclination of machines, but also remove it automatically.

The achievement of the Polish scientists, technicians and miners permitted the selection of other plants under which rich deposits of coal are imprisoned. We shall avoid in this manner huge expensive investments in the shape of the construction of new mining levels in the existing mines or even wholly new mines.

Poland's Chemical Industry

JAN POJDA, Eng.

MUCH HAS been said and written in Poland in recent years about the chemical industry. Poland's chemical output has grown more rapidly than gross industrial production. This is due to the policy of modernisation of the country's industry and the progressive use of chemicals in the national economy. Between 1953 and 1963, for instance, the chemical industry grew fourfold as compared to the 3.5 times increase in the output of the entire socialised industry.

It was not easy for Poland's chemical industry to reach its present potential. The first stage of its growth was characterised by the creation of a foundation in the form of the inorganic industries: sulphuric acid, calcinated and caustic soda, chlorine, nitrogenous and phosphorus fertilizers, carbides, etc. This was followed by the development of the organic industry: dyestuffs and their semi-manufactures. The key processes were mastered of the chemical synthesis industry making possible the production of methanol, formalin, acetic acid, phenol, phthalic anhydride, etc. Considerable effort was put into the development of artificial viscous fibres industry, rubber, pharmaceuticals, pesticides, paints and lacquers and other industries. By 1949 the gross output of the chemical industry was already double that of 1938.

The growth of the production branches mentioned above rested in great measure on domestic raw materials; rock salt, limestone, sulphur-bearing substances, barytes, coke as well as the derivatives from coke — tar, benzol (benzene, naphthalene, xylene, etc.). The domestic base was supplemented by the import of scarce raw materials, mainly phosphorus, rubber, technical fats, vegetable oil, viscous cellulose.

The turning point in the development of the chemical industry came towards the end of the 1956-60 five-year period. As a result of considerable investment in heavy synthetic chemicals, the production was started of important modern products on a large scale: synthetic butadiene-styrene rubber (in 1959), polychloride vinyl (1957), keprolactam (semi-manufactures for polyamide fibres), processed plastics, for artificial fabrics, synthetic dissolvents, technical urea, etc.

Important Investment

One of the most important investments of the previous five-year Plan was the building of the Tarnobrzeg sulphur combine commissioned in 1960. It has enabled Poland to exploit the rich sulphur deposits discovered in that region along the Vistula River. Alongside coal and copper, sulphur, estimated at 125 million tons, is now one of Poland's most abundant raw materials.

Now, in the second half of the current five-year Plan gross production of the chemical industry (including the rubber industry) reached the value of 63 milliard zlotys in 1963, or 8.5 per cent of total industrial output value. In 1955 it constituted only 5.5 per cent. The same year the output of the basic products reached the following levels (in 1,000 tons): sulphuric acid — 888, calcinated soda — 543, sulphur — 235, carbides — 380, chlorine gas — 79, nitrogenous fertilizers in terms of N₂ — 330, phosphoric fertilizers in terms of P₂O₅ — 271, phenol — 29.5, methyl alcohol — 43.5, acetic acid synthetic — 14.7, dyestuffs — 12.9, pesticides concentrate — 7.6, total artificial fibres — 76.8, polyamide fibres — 8.1, synthetic rubber — 36.0, total rubber products — 171,000 tons, of which automotive tyres accounted for 1.5 million pieces. Value of pharmaceuticals was 5.1 milliard zlotys.

The rapid growth of the national economy confronts the

chemical industry with ever new tasks. Large investments are now being made in order to realise them. Among the most important new chemical combines built are the Plock refineries and petrochemical plants, Pulaw nitrogen plants, the Tarnow II organic nitrogen combine, the sulphur mine at Machow (near Tarnobrzeg), the tyre factory at Olsztyn, chemical plants at the Silesian sheet iron works, the artificial fibre mills at Torun and Lodz. Besides, 60 other chemical plants are being considerably expanded. Investment in the chemical industry in the current five-year period constitutes 12.4 per cent of expenditures for the growth of industry as a whole.

Within 2 to 3 years the chemical plants mentioned above will yield considerable results. Agriculture, for instance, will receive larger amounts of artificial fertilizers. The use of nitrogenous fertilizers per hectare of arable land will rise from 20.0 kg. of N₂ in economic year 1962-63 to 37.0 in 1966-67. Light industry will receive a new type of fully synthetic polystyrene ("Terylene" type) and polyakrylone ("Orlon" type) fibre. As a result, the total share of chemical fibre in the consumption of textile raw materials will grow from 37.7 per cent in 1963 to 44.4 per cent in 1966, while the assortment of these fibres will be modernized. The increased output of the artificial fibres will yield large savings from the reduced imports of corresponding quantities of wool and cotton. These savings are estimated at 90 million dollars per annum.

Production Doubled

The fact that the output of artificial fibres will by 1965 double that of 1962 will have a decided influence on many branches of the economy. Building construction, heavy industry, particularly the electro-technical, machine-building, ship-building, the rolling stock and precision industries as well as light industry (footwear, textiles, fancy goods), the paper and furniture industries will receive a great deal more artificial raw materials. This will, of course, enable a considerable saving of timber, coloured metals, leather and hides, paper, oils etc.

The intensification of chemical exports and the special growth of the output of import substituting products is now given priority. For many years Polish chemical exports were characterised by heavy weight and relatively cheap articles (soda, carbides, rock salt, etc.). But in recent years, in keeping with the growth of chemical capacity, there has been a rapid increase in the export share of highly precious articles: pharmaceuticals, dyes, photographic materials, paints and lacquers, rubber footwear, etc. Among the most important items of import limiting production are synthetic fibres, artificial rubber, synthetic lacquer raw materials and artificial fabrics. About 40 per cent of Poland's total chemical exports now go to the socialist countries. And the trade turn-over with these countries will continue to grow with the specialisation of chemical production fixed between Poland and the other members of the Council for Mutual Economic Aid.

The national economic development plan for 1966-1970 is now being elaborated. One of its central provisions is the continued emphasis on the growth of the chemical industry over that of the industry as a whole. Investment in the chemical industry in 1966-70 will be 35 per cent higher than in the previous five-year period. And among the most privileged positions in this growth will be occupied by the artificial fertilizers industry (with tripled output), the petrochemical and related artificial fibres industry as well as synthetic

Poland Builds Factories in 36 Countries

CEKOP, Poland's agency for exporting complete industrial plants, has a portfolio full of orders. It has concluded contracts valued at more than 500 million dollars with 38 countries of Europe, Asia, Africa and Latin America. In 1963 CEKOP made 80 million dollars worth of deliveries and completed the construction of 97 industrial units for abroad. Since it commenced to export finished industrial installations, i.e., since 1955, Poland has built or equipped more than 290 factories abroad. CEKOP is building new, deep coal mines in India; shipyards in Indonesia; sugar refineries in Iran, Morocco and Ghana; a powerhouse in Brazil, a foundry in Austria, zinc refining plant in Holland and dye plants in the United Arab Republic.

These are a few examples of many-sided activity embracing 70 types of factories in many branches of production—from large plants employing thousands of workers to comparatively small mechanical plants, chemical products workshops or modern automotive equipment factories, the cost of equipment of which does not exceed the average financial means of private industrialists in Asian or African countries.

Ninefold Growth

Poland entered relatively recently the market as an exporter of equipment for industrial plants and of commercial installations (liquid fuel tanks, rice and grain silos etc.) and of equipment for hospitals and other public utility enterprises.

This phenomenon is connected with the intensive growth of Polish industry, which in the course of 20 years increased its productive capacity ninefold. A number of new branches of production were commissioned in that period: heavy machinery and power equipment and installations, turbo-generators and high parameter transformers, combustion and electric locomotives — to mention only a few. There has also been developed a modern shipbuilding industry (which in respect of production volume and assortment of vessels built occupies ninth place today), an electronic industry and many others. The highest growth is marked by the electric machinery-building industry which was thirty-fold in the current 20-year period, while the chemical industry grew twenty-fold.

The numerical growth of the corps of highly specialised technical personnel has kept pace with the growth of industry. Poland now employs more than 100,000 engineers with highly technical education, besides a corresponding network of specialists with medium education. There are scores of specialised designing bureaux, hundreds of drafting and construction offices and technological laboratories. All this has created favourable conditions for the rapid growth of Polish exports not only of machinery and equipment but also of complete industrial plants and installations.

The Polish export of complete industrial plants began in 1955 with sugar refineries. Herself one of Europe's largest sugar raisers, Poland has great traditions and has acquired much experience in the production of the apparatus and in the assembly of factories in this branch of production. Between 1955-63 Poland has exported 24 complete sugar refineries even to such highly industrialised countries as the Soviet Union, beside Greece, Iran, Morocco (beet sugar plants), China, Vietnam, Ceylon and Ghana (cane sugar plants).

The export of complete coal mining installations has also

developed rapidly. Poland disposes of rich experience in this field too — as one of the leading coal producers. Poland specialises in building complete deep mines (very extensive work is being carried on now in this field in India in connection with CEKOP's contract to build nine mines) and supplies all kinds of equipment, such as coal washing and sorting plants. Among the first has been the export of liquid fuel tanks provided by Polish manufacturers with liquid roofs to prevent loss from evaporation. Poland exports such tanks mainly to the United Arab Republic (Suez Canal zone) as well as to Western and Northern Europe.

Favourable Terms

Chemical plants occupy an important place in Poland's export of complete industrial units (dye, sulphuric acid, sodium, artificial fertilizers plants), metal and structural steel plants, powerhouses, cellular concrete mills and other building material plants, including cement factories. It is worth noting that on the basis of Polish patents a cellular concrete mill produces yearly ceilinged and roofed wall panels corresponding to 6 million bricks, with 40 per cent lower building costs than with the use of traditional bricks. Poland has thus far exported 18 such plants mainly to European and Asian countries.

One of the factors inducing foreign customers to avail themselves of CEKOP services in undertaking important investments, are the advantageous credit conditions offered by Poland. This pertains in most cases to the developing countries of Asia, Africa and Latin America, who can repay the credits advanced by Poland with the export of their own goods. Thus by supplying these developing countries with machinery and equipment indispensable for their industrialisation, or for expanding the exploitation of their own natural wealth, Poland does not burden their balance of payments. On the contrary, orders for Polish supplies increase their exports to Poland.

Another requirement of the developing countries is technical, and often purely scientific aid. At the customers' desire Polish specialists conduct preliminary investigations, which are very important both for the exploitation of natural resources and for commissioning factories based on local raw materials. Polish specialists prepare complete technical and technological documentation of the units supplied, assure technical supervision over the assembly work or do it themselves. They make the plant going, train workers in the servicing and conservation of machinery and equipment, watch over the course of production in the first period and in case of need train technical personnel in Poland for the newly commissioned plants. In a word, the Polish supplier takes full responsibility for the proper operation of the factories built or equipped by it.

Need for Specialisation

CEKOP has ceased to be a monopoly in supplying from Poland complete industrial plants. The growing demand in other fields has induced the need for specialisation. Hence the enterprise "CENTROZAP" now applies itself to the export of foundries, equipment for mines and steel mills, installations for processing raw materials. The export of textile spinning and weaving mills is the domain of "METAL-EXPORTS". The division of labour and specialisation in the production of complete industrial plants enables a fuller satisfaction of customers' needs and the fulfilment of larger orders.

FOREIGN TRADE ENTERPRISE

7, Ligonja — Katowice,
POLAND

Exports:

COMPLETE PLANT AND INDIVIDUAL EQUIPMENT FOR:

BLAST FURNACE PLANTS

ORE AND COKE PREPARATION PLANTS

STEEL MAKING PLANTS AND

ROLLING MILLS

- BLAST FURNACES INCLUDING COMPLETE AUXILIARY EQUIPMENT FOR FULLY AUTOMATIC MELTING PROCESSES OF PIG IRON
- EQUIPMENT FOR AGGLOMERATION AND ENRICHMENT OF ORE
- EQUIPMENT FOR COKE OVEN PLANTS
- SIEMENS — MARTIN OPEN HEARTH FURNACES
- PIG IRON MIXERS
- EQUIPMENT FOR VACUUM DEGASSING OF STEEL
- EQUIPMENT FOR CONTINUOUS CASTING OF STEEL

—BLOOMING MILLS, COGGING AND FINISHING ROLLING MILLS

—PLATE AND SHEET HOT ROLLING MILLS
INDUSTRIAL PLANT EQUIPMENT IS DELIVERED COMPLETE WITH THE WHOLE SET OF AUXILIARY EQUIPMENT REQUIRED FOR FULL MECHANIZATION OF PRODUCTION PROCESSES

and

STEEL STRUCTURES OF ALL KINDS

—Industrial building structures, energetic and television masts, store and warehouse structures

PIPELINES OF DIFFERENT KINDS OF TANKS

FOR EXPORT OF COMPLETE
WORKS AND INDUSTRIAL PLANTS
P.O. Box 387, ul Mokotowska 49, WARSZAWA—POLAND
Telegrams: CEKOP WARSZAWA

CONTRIBUTES TO INDIA'S DEVELOPMENT
AMONG THE PLANTS ERECTED OR UNDER EXECUTION ARE
1. HEAVY INDUSTRY GROUP:

- two deep shaft coal mines—coal washery and ropeways
- magnetite preparation plant
- Negotiations are being held for:
- next seven deep shaft mines—collaboration in designing and erection of other coal washeries—pig iron plant—zinc smelter plant—Coal mining machinery plants—reconstruction and modernization of mines.

3. ENGINEERING:

- steel structure mfg. plants, machine tools factories including foundry and smithy departments—electric meter factory
- E.O.T. Cranes and hoists factory
- motorcycles and scooter factory
- Under negotiation:
- shipyards and other engineering plants for manufacture of similar products

5. CHEMICAL AND OTHER INDUSTRIES:

- Under negotiations only:
- sulphuric acid factory—phosphatic fertilizers factory—various chemicals manufacturing plants—slaughter houses and food processing plant—complete sugar factories and its individual equipment—grain silos—small scale industrial plants

6. THE SCOPE OF OUR OFFERS COVER:

- preliminary techno-economical investigations—preliminary project report—detailed project report—workshop, civil engineering and erection drawings—constructional drawings of the products to be manufactured (licence documentation)—supply and Poland—technical supervision personnel both in India putting in operation and first running period of the factory; or alternatively turn-key job.

July 17, 1964

EASTERN ECONOMIST

Polish Foreign Trade

WOJCIECH RYDYGIER

IN THE years 1947-1949 foreign trade of Poland played an important role in pulling out the national economy from the tremendous war damage. It rose in a dynamic manner during that period; the average annual increase of exports was 35.9 per cent, and of imports 25.4 per cent. In the years 1950-1955 export value increased from 2,500 million to 3,700 million foreign currency (F.C.) * zlotys, and import value from 2,700 million to 3,700 million (F.C.) zlotys.

Beginning with 1958, there was a considerable acceleration in the rate of increase of foreign trade turnover. The average annual import increase in the years 1958-1962 amounted to 11.1 per cent (as against 6.8 per cent in the years 1950-1955), and its value increased from 4,900 m. to 6,700 m. (F.C.) zlotys. The increase in annual export in the years 1958-1962 amounted to 11.6 per cent (as against 7.4 per cent in the years 1950-1955), while its absolute dimensions increased from 4,200 million to 6,600 million (F.C.) zlotys. Despite the acceleration of the rate of increase of export it did not keep pace with the rate of increase of import. The main reason for this was a drop in the revenue from the export of coal, which in the years 1947-1958 represented 33-43 per cent of the entire value of Polish export.

Taking the matter generally, the balance sheet of the Polish foreign trade in the years 1947-1962 was an adverse one. This was due, among other reasons, to the credits sought by Poland abroad for the development of her national economy.

But all these credits were received on conditions different from before the war. They are higher, the interest paid on them is immeasurably lower, they do not contain any clauses infringing the economic or political independence of the country, they do not open the road to the conquest of Polish industry by foreign capital.

Despite the considerable acceleration of the rate of increase of her trade turnover with abroad in comparison to the twenty years between the two world wars, Poland's share in the world import increased, it is true, from 1 per cent in 1938 to 1.3 per cent in 1962, but did not change as regards export and remained, in 1962, on the 1938 level of 1.2 per cent.

Commodity Structure

Raw materials, materials for production and fuels have been and still continue to be the main items in Polish import. The main items in the import of raw materials are: metalurgical products (their import has increased from 18 thou and tons in 1938 to about 537 thousand tons in 1962), iron ore (whose import increased from 588 thousand tons to 81 million tons), oil products (an increase from 6.5 thousand tons to 2.6 million tons), cotton (from about 75.5 thousand tons to 120.6 thousand tons), wool, crude oil, copper, coking coal, manganese ore, etc. Despite the fact that the 1962 import of raw materials, materials for production and fuels was in absolute figures 5.6 times higher than in 1938, its relative share in the total value of Polish imports dropped from 65 per cent in 1938 to about 46.8 per cent in 1962. This was due to the more rapid rate of increase of the import of other commodity groups.

The second largest item in Polish imports is machines, installations and means of transport. The 1962 import of machines and installations was twelve times higher than in 1938 and their share in the overall value of her import increased from 21.2 per cent to 33.2 per cent. The rapid rate of the increase of the import of machines and installations is connected with the social and economic changes which have taken place in Poland. This import (77.3 per cent of the entire

import of machines and installations came in 1962 from the Communist countries, including 30.8 per cent from the Soviet Union) has played and still continues to play an extremely important role in the industrialization of Poland.

The third largest item of her import is agricultural food articles. This import by 1962 increased nearly 9.4 times

COMMODITY STRUCTURE OF POLISH IMPORTS

(Percentage)

Group	1938	1950	1955	1960	1962	1962: 1938
Total imports ..	100.0	100.0	100.0	100.0	100.0	768.7
Machines, Installations, Means of transport ..	21.2	32.4	30.9	27.1	33.2	1,204.8
Raw materials, Production materials, Fuels ..	64.1	53.1	51.7	51.5	46.8	561.4
Agricultural food products ..	10.9	11.2	13.1	13.1	13.3	938.1
Industrial consumer goods ..	3.7	3.3	4.3	5.4	6.7	1,342.9

in comparison to 1938, and the share of agricultural food products in the total value of her imports increased from about 11 per cent in 1938 to over 13 per cent in 1962.

Much deeper changes in comparison to 1938 have taken

* While 84 domestic zlotys equal to Rs. 100, in terms of foreign exchange a zloty is equivalent to an Indian rupee.

place in the commodity structure of Polish exports.

Poland is a big exporter of iron and steel products, zinc, a number of chemical semi-finished products (calcined and caustic soda, carbide, naphthalene), sawn wood, paper and oil products. But the main role has been played by coal in her export of raw materials, and in export as a whole by coal. The export share of raw materials has increased from 56.9 per cent in 1938 to 64.8 per cent in 1955, while the share of coal in the years 1950-1956 represented 33.43 per cent of the overall value of Polish exports.

COMMODITY STRUCTURE OF POLISH EXPORTS

Group	(In per cent)				
	1938	1950	1955	1960	1962: 1938
Total exports	100.0	100.0	100.0	100.0	100.0
Machines, Installations, means of transport	1.4	7.8	13.1	28.0	30.0
Raw materials, Production materials, Fuels	56.9	56.0	64.8	43.8	39.0
Agricultural food products	36.4	24.0	14.9	18.1	19.2
Industrial consumer goods	5.3	12.2	7.2	10.1	11.8

Beginning with 1953 the role of raw materials in Polish exports has decreased, and their share has dropped to 37.40 per cent of the overall value of her exports.

The second largest item in the Polish exports is at present the group of machines, installations and means of transport. This is probably the most eloquent symptom of the changes which have taken place in the commodity structure of her exports. The share of machines and installations in the total value of Polish exports amounted in 1938 to a mere 1.4 per cent. As the industrialization of the country progressed, the situation underwent a gradual change. The share of machines and installations in 1950 amounted to 6.8 per cent and in 1955 to 13.1 per cent of the total value of exports. The export of machines and installations has increased in the years 1953-1960 by about 31 per cent, and its share in the overall value of exports to 28 per cent. As a result of these changes the commodity structure of her exports as regards the share of machines and installations has drawn closer to the commodity structure of the exports of highly industrialized countries.

Agricultural food products are the third largest group of commodities in Polish exports. Their share in the overall value of her exports has decreased, in view of the more rapid increase of the export of other commodities, from 24.9 per cent in 1950 to 14.9 per cent in 1955. Beginning with 1958 the export of agricultural food products shows a rapid increase, and its share in the total value of exports increases to 19.2 per cent in 1962.

Most Polish agricultural food products for export are sold to highly industrialized capitalist countries (75.6 per cent in 1962).

Industrial consumer goods are the fourth largest group of commodities exported by Poland as regards their share in the overall value of her exports. The 1962 export of industrial consumer goods was more than 16 times bigger than in 1938, although as regards the volume in absolute figures and the share in the total value of her exports this is the smallest commodity group.

Poland maintains trade relations with numerous countries. The rate of the increase of Poland's trade turnover with the Communist countries in the years 1949-1962 was more than twice faster than with the other countries and nearly twice faster than with abroad in general. As a result of this the participation of the Communist countries in her trade turnover with abroad has increased from 44 per cent in 1949 to 63.5 per cent in 1962.

Geographical Imperative

The share of the Communist countries in Polish imports has increased from 42.6 per cent in 1949 to 65.1 per cent in 1962. The Communist countries at present supply:

- over 77 per cent of Poland's needs as regards import of machines, installations and means of transport (in 1949 — 39.1 per cent),
- over 60 per cent of her demand for imported raw materials, fuels and materials for production (in 1949 — 41.3 per cent),
- between 40 and 50 per cent of her demand for imported agricultural food products (in 1949 — 51 per cent).

— nearly 90 per cent of her demand for imported industrial consumer goods.

The share of the Communist countries in Polish exports has increased from 45.4 per cent in 1949 to 61.6 per cent in 1962. As the result of this, the Communist countries are at present her market for:

- nearly 88 per cent of the export of machines, installations and means of transport (in 1955 — 95.0 per cent),
- nearly 59 per cent of the export of raw materials, fuels and materials for production (in 1949 — 47.7 per cent),
- over 24 per cent of the export of agricultural food products (in 1955 — 37.6 per cent),
- over 70 per cent of the export of industrial consumer goods (in 1955 — 56.4 per cent).

Thus the rate of increase, the share and finally the nature of Polish trade turnover with the Communist countries show that this is the main direction of the development of Poland's trade turnover with abroad.

But it is also the motto of her trade policy to develop widely economic relations with all countries of the world. Despite the fact that Poland's trade turnover with the other countries of the world was developing more slowly than with the Communist countries, it was nearly doubled in 1962 in comparison with 1949 and was nearly three times higher than in 1938.

INDIA AND POLAND: BALANCE OF TRADE (Rs. Million)

	Imports from Poland	Exports to Poland	Balance of Trade
1948-49	0.8	3.2	+2.4

A COMPREHENSIVE SERVICE FOR INDUSTRIAL PROJECTS

Poznanska, 15, Warszawa (Poland)

Backed by Polish designing offices, technical and scientific institutes and the whole Polish industry, offer their specialised services for setting up industrial plants

Their services include:

- * Supply of Technical documentation
- * Drawing up of technical and economic project reports.
- * Sending specialists for work abroad
- * Providing experts reports in Poland or abroad on behalf of foreign customers
- * Cooperation with foreign contractors with assistance of Polish specialists.
- * Technical assistance during initial period of operation.
- * Plant modernization and introduction of technical improvements.
- * Training and instructing technical and economic staff etc.

Twenty Years of Polish Maritime Trade

TADEUSZ DZIEKONSKI

THE LIST of countries maintaining trade contacts with Poland contains a round number of one hundred-and-fifty. Out of these 150 countries at least 120 are situated outside the European continent. So out of every five trade partners there are four that carry on trade turnover with Poland mainly, if not exclusively, by sea. True, Poland's most important contracting parties are the neighbouring socialist states with which she conducts trade by land. It is also true, however, that almost all her exports to such important geographical regions as Scandinavia or the British Isles, as well as imports from these regions, are carried by the merchant seagoing fleet. The greater, or at least a substantial part of trade turnover between Poland on the one hand, and Denmark, the Federal Republic of Germany, the Netherlands, Belgium, France and, of course, in Mediterranean countries on the other hand, is conducted by sea.

Over 20 million tons of cargo imported and exported by the Polish foreign trade agencies passes every year through Gdynia, Gdansk and Szczecin: coal, ores, liquid fuels, timber, grain. Apart from those "bulk shipments" there are about 6 million tons of goods, packed or single, the value of which is not measured by weight alone, beginning with wicker baskets and ending with locomotives and complete equipment of industrial plants, the handling of which often requires precise, complicated operations. And it is exactly general cargo that gradually takes the lead among the various categories of goods handled by the Polish ports. In 1965, eight million tons and in the next five years even 11 million tons of general cargo are estimated to be loaded and unloaded annually. This development trend is not accidental. It results from the changed structure of Polish foreign trade which, particularly in exports, is characterised by increased sales of machines, industrial equipment and other industrial articles.

Speaking about exports, one cannot omit a very important category of goods which, while not included in the statistics of goods handled by ports, reach their place of destination by sea. They are the vessels built in the Polish shipyards. Every year, 20-30 seagoing ships, 10,000-tonners, trawlers, motherships, etc., leave the Polish ports to fly the flags of other countries. The above mentioned transformations in the structure of export in favour of ready-made industrial goods are not the only feature of Polish foreign trade. They are accompanied by gradual changes in the geography of her foreign trade, her overseas trade partners playing a more and more important role. The developing countries of Africa, Asia and Latin America are gaining more and more importance in the total Polish turnover with overseas countries.

Natural Trade Partners

Contracts with the developing countries enable Poland to reach the direct sources of many raw materials and semi-products needed by her economy, such as cotton, wool, caoutchouc, phosphates, hides, oleaginous seeds and tropical agricultural and food articles. Poland, on the other hand, exports rolled goods, cement, chemicals, machine tools, power equipment, transport facilities, complete industrial plants and other goods the developing countries need for the expansion of their national economies. Thus those countries constitute a market easily absorbing Polish capital goods and durable consumer goods as well.

On the other hand, other highly industrialized European countries, and also the United States and Japan, work on the same principle and engage in a lively trade exchange with the same regions. To have any real chance in such a strong

competition one must not only have good products, good salesmen and good advertisement system, but also possibilities of efficient transportation. Speed and punctuality of deliveries constitute one of the conditions of success in modern trade. And here a merchant fleet comes as a great help. The fulfilment of this basic demand is made easier when Poland has her own direct shipping lines connecting Poland with the regions of interest to her foreign trade. One should not forget, moreover, that her fleet saves foreign currency on freights and earns substantial sums in foreign currency paid for the transport of cargo from other countries.

Across Three Oceans

Apart from lively trade exchange with Brazil, Argentina, India, Indonesia that have been among the leading Polish trade partners for several years now, the turnover with the Near and Middle East, North and Equatorial Africa, South Asia and Central America is constantly increasing. On the other hand, the Polish ports, thanks to their geographical situation, are most convenient points of reloading goods exported by Czechoslovakia, Hungary and the German Democratic Republic, a large percentage of which are also destined for the overseas countries. All this taken together results in the fact that the Polish merchant marine is consistently and speedily expanding. At present Polish ships are servicing 28 regular shipping lines, calling at over 300 important ports in about 100 countries.

The most distant line is to South-East Asia, linking Gdynia through west European ports (e.g. Rotterdam and Antwerp), the Egyptian, Indonesian and Malayasian ports, with China and Japan. Every two weeks the popular Polish "ten-tonners", fast motor ships of the Polish Ocean Lines, adapted to the transport of general cargo, leave Gdynia for South-East Asia. The line linking Gdynia with Brazil, Uruguay and Argentina is serviced by ships leaving the port every ten days; and some four or five ships monthly go to the Mediterranean ports. The ships going to the tropics are equipped with cooled holds. There are also regular lines to India and Pakistan, to the Red Sea ports and the Persian Gulf, and to Central America. For four years now, Polish ships have been regularly calling at the west African ports.

As Polish shipowners have established contacts with almost all the countries of the world, they now put emphasis on increasing frequency on these lines where traffic is particularly heavy. As a result more modern ships will be directed to service the Central American line, the East African line and the line linking Polish ports with Indonesia. It is possible that the latter will be extended so as to include some Australian ports.

Along with the development of regular shipping lines, the number of tramps calling at distant ports has also been increasing. In the next two years 10 big ships destined to carry bulk cargo will be added to the Polish merchant fleet. Obviously, Polish shipyards will supply most of the ships that will be added to her fleet up to 1965, the total tonnage of ships flying the Polish flag in that year being planned to reach 1,500,000 TDW, as compared with 1,200,000 TDW at present. Polish shipyards have won recognition the world over as producers of excellent merchant and fishing vessels.

The development and improvement of Polish merchant fleet will no doubt help her exporters in enlivening contacts with foreign partners and guaranteeing punctual delivery of goods carried by Polish ships to the most distant parts of our globe.

INDUSTRIAL PROGRESS OF POLAND: 1938-64

Indo-Polish Chamber

A GROUP of Indian businessmen and bankers interested in promoting economic and trade relations between India and Poland have set up, in co-operation with the Polish Trade Representation in India, an Indo-Polish Chamber of Commerce, with its headquarters in New Delhi. An office of the Chamber will also be set up in Poland. The main functions of the Chamber include (i) organising trade fairs and exhibitions, symposia, lectures and advertisement campaigns in India and Poland, (ii) collection and dissemination of relevant information (including statistics) on industry and trade, (iii) arbitration in commercial disputes arising out of business contracts between Indian and Polish firms, and (iv) representation of specific problems concerning trade, industry and technical collaboration to the Indian and Polish Governments. The promoter-members of the Chamber are: Escorts Ltd., The Punjab National Bank Ltd., The General Radio & Appliances Private Ltd., M/s. Harshadray Pvt. Ltd., and a few other firms. Any company, business organisation or institution interested in business or economic relations with Poland is eligible to join as a subscribing member on payment of admission fee of Rs. 500 and the recurring annual fee of Rs. 500. A few distinguished persons in the field of industry, trade, agriculture and public service will be co-opted as honorary members.

The annual trade turnover between India and Poland last year (1963) was of the order of about Rs. 24 crores both ways. According to the trade and payments agreement signed be-

tween India and Poland at the turn of the current year, the Indo-Polish trade during 1964 is expected to be of the order of Rs. 32 crores both ways. As envisaged by the mutual trade agreement between India and Poland, signed in June 1964, the annual trade between the two countries in 1966 may be around Rs. 38 crores both ways. In terms of these agreements India will export to Poland engineering goods including textile machinery and accessories, machine tools, diesel engines, cotton textiles, duplicators, handicrafts and handloom products, leather footwear, ready-made garments, collapsible tubes and razor blades in addition to the traditional export items such as iron ore, manganese ore, mica, tobacco, de-coiled linseed cakes, tea, jute products, spices shellac, groundnuts and cashewnuts. India's export from Poland will include mining machinery, machine tools, tractors and rolled steel products including alloy and special steels, textile machinery and chemicals. Poland will also be assisting India in the development of its mining industry, particularly coal mining, and will also train 10 to 20 Indian engineers at the Indian School of Mines, Dhanbad. Under an agreement signed between the two countries Poland will receive a number of Indian engineers to be trained in the construction of power plants, electric motors and textile machinery. Poland may also provide training facilities in India in the techniques of shipbuilding. Polish assistance is also being provided for the construction of nine deep coal mines in India.

quality conscious*

Quality Control and Standardisation

B. N. SINGH

MODERN TECHNIQUES of quality control have an important part to play in the improvement of quality, enhancement of productivity, creation of consumer confidence and expansion of exports and thereby help in the rapid development of the industrial economy of the country. When properly used, these techniques can lead to substantial improvement without any capital investment on new equipment or excessive drainage of foreign exchange. The knowledge and practice of these techniques has become all the more imperative in view of the vast increase in the number of industrial undertakings due to the implementation of successive five-year Plans. In the present national emergency also, which calls for more and more industrial production and conservation and man-power and materials by way of reduction in the amount of inspection, re-work, scraps, etc., quality control would be found eminently suitable to meet these needs.

It may be mentioned here that Japan had its economy almost completely shattered during the last World War, but its economic reconstruction thereafter has been something of a marvel. Today Japan has considerably improved the quality of its products and is also able to sell them comparatively at lower prices thereby emerging as a powerful competitor in the world market. Besides, it has also assumed a position of leadership in case of certain products. Quality control, which is now being very widely practised in Japan, has played a considerable part in this economic recovery. An idea of this can be had from the fact that, of all the companies employing 100 hands or more, 60 per cent of them are having full-fledged quality control programmes. Even of the remaining companies employing 10 to 99 hands, 30 per cent are having quality control programmes.

Considerable Saving

Judging from economic considerations alone, the application of quality control techniques may lead to considerable savings at the various stages of production. While the amount of savings will differ from plant to plant depending upon the nature of the existing quality of production, 10 to 15 per cent savings may not be uncommon and may even be as high as 20 per cent or more. For example, certain cotton mills as reported a saving of 15 to 20 per cent, jute mills about 18 per cent and engineering firms about 10 per cent. Again, the one engineering firm reported a saving of ten times the expenditure on the introduction of quality control within a year. Then, there is another aspect of this problem of economy. The extent of effort and money at present being expended in an unsystematic manner to keep the consumers satisfied, may be much more than it need be. British and American figures agreed in showing that the total cost of quality assurance mounted to between 4 and 12 per cent of the total turnover of manufacturing organizations. Eight per cent was the average figure and 10 per cent was by no means uncommon. By the application of quality control methods appropriate to the need, it should be possible to halve this figure within a year or two of starting the exercise. Thus, taking into consideration the aforesaid two types of savings, manufacturing organizations would be benefited considerably

from the application of quality control and at the same time the quality of the products would have been raised.

In the application of quality control techniques, standardization is of fundamental importance, for the first step in applying quality control cannot be taken unless the quality characteristics are assessed, specified and measured. In other words, the specification defines the quality and prescribes the means to evaluate it. Quality control endeavours to attain the specified quality level and maintain it at that level or improve it still further. Besides, the specification may also prescribe the sampling procedure for appraising conformance of a lot of manufactured items to the specified quality. Quality control and specifications are therefore closely related and each depends upon the other.

The Indian Standards Institution has been making extensive use of the quality control principles and techniques in its standardization effort with a view to bringing about overall improvement of product quality and building up consumer confidence at home and abroad. This paper attempts to describe briefly the contributions made by ISI to various aspects of quality control, namely, definition of quality, method of evaluating quality and inspection for appraising conformance to specified quality.

Control Chart

To propagate the principles of quality control and to assist manufacturers in controlling production, ISI has published IS: 397—1952 method for Statistical Quality Control During Production by the Use of Control Chart. This standard gives the basic principles of control charts in general and illustrates how these principles might be applied in specific cases. In other words, it gives the basic guidance to the manufacturer in evolving his own control charts and methods to keep production to the specified quality levels.

To assist consumers in tackling their sampling problems as also to help the various committees of the institution in evolving suitable sampling plans for individual specifications, ISI has issued IS: 1548-1960 Manual on Basic Principles of Lot Sampling. This manual explains the various statistical concepts underlying sampling inspection schemes and lays down some of the basic principles of lot by lot sampling.

The Indian Standards Institution has also undertaken the preparation of an Indian Standard on Sampling Inspection Tables for ready reference and use. This standard would help the consumers in selecting their own sampling plans for ascertaining the acceptability of their purchases. Part I of the Standard dealing with inspection by attributes and count of defects has now been published as IS: 2500 (Part I) -1964. The plans as given in this standard would be sufficiently flexible to meet a wide variety of quality requirements and administrative and technical conditions. Part II of the Standard dealing with inspection by variables is under preparation.

In the manufacture of any product, the first and foremost requisite is to specify what the product should be. This is achieved in two ways, either by providing a prototype of the product or by writing down the requirements for various characteristics which determine the quality or performance of the product. In the latter case it is essential that the require-

MADRAS

ments are written down in a language understood by everybody so as to give little room for doubts or discrepancies. Indian Standard specifications play an important role in this respect as the quality defined in these specifications is precise and represents the best compromise solution to the problems of quality. In arriving at the quality levels, it may be mentioned, the quality control principles can be made use of by studying the manufacturing processes of a product in the various units of manufacture and statistically analysing the data resulting therefrom. Attempts have been made to arrive at quality levels in this manner and specific reference may be made to IS: 564-1961 DDT Dusting Powders (Revised) and IS: 1300-1959 Phenol-Formaldehyde Moulding Powder.

Indian Standard specifications are constantly reviewed and, wherever necessary, revised to improve the quality of indigenous manufacture, statistical analysis of the production data helps considerably in determining the revised quality levels. Mention may be made here of IS: 564-1961 DDT Dusting Powders (Revised) wherein the requirement for average DDT technical content (as given in the old version) has been deleted in view of the inclusion of statistical criteria for conformity.

Evaluation of Quality

Method for measurement (or evaluation) of quality is another prerequisite for control of quality. Not only precise methods of tests but also agreements on the procedures are necessary so that a product evaluated at two different sources yields comparable results. To meet this need, ISI has formulated a number of Indian Standards on methods of test for quality determination. In the development of a new industry, these standards play an important role; reference may be made to IS: 326-1952 Methods of Test for Essential Oils whose publication as early as in 1952 enabled ISI to formulate specifications on a number of essential oils to assist their development.

While standardising a test method, it is important that its reliability, i.e., the variation between duplicate determinations be known in quantitative terms so as to serve as a guide to users of the test methods for judging the acceptability of test

results. The magnitudes of this variation when the determinations are made in the same laboratory or in different laboratories, are of practical significance. Numerical estimates for these variations are expressed in terms of repeatability and reproducibility of the test methods and their values have been specified in certain Indian Standards such as IS: 1350-1959 Methods of Test for Coal and Coke, & IS: 1448 (Part I)-1960 Methods of Test for Petroleum and Its Products.

In cases where different test methods are available for the same purpose, statistical methods have been used to decide on the choice of these test methods which are likely to lead to more reliable results.

The inspection of quality in order to judge the conformity of a lot to the specification, is an important aspect of quality control. In many cases it may not be possible to test every product in the lot and hence inspection has necessarily to be carried out on sampling basis. Attempts are being constantly made by ISI to provide suitable sampling plans in Indian standards so as to give objective guidance to the consumers for ascertaining the acceptability of their purchases. The sampling plans in such cases are evolved by suitably blending the theoretical requirements with practical considerations so that, while providing the necessary quality assurance, they lead to considerable savings in money and time and are acceptable to trade and industry. These sampling plans, besides specifying the frequency of sampling, also lay down the criteria for judging the conformity of a lot. There are a number of Indian standards wherein such sampling plans have been incorporated, for example, IS: 779-1961 Water Meters (Domestic Type) (Revised), IS: 1116-1957 Glass Globes for Hurricane, Lanterns, IS: 1970-1961 Hand Compression Sprayer for Public Health, etc.

Sampling of bulk materials like gypsum, iron ores, manganese ores, coal, etc. presents problems of a different nature. These materials consist of particles of various sizes which differ appreciably in respect of certain quality characteristics, thereby making it difficult to collect representative samples for test. Hence, to provide guidance for obtaining a reliable estimate of lot quality in such cases, ISI has prepared and is preparing a number of standards on the methods of sampling

INDIAN STANDARDS INSTITUTION

international level at the instance of ISI and will be meeting for the first time in India this month.

The scope of this technical committee (CDC 42) has been kept wide to deal with the following aspects of standardization of the raw rubber industry, namely:

- (i) Sampling and methods of test for natural, synthetic and reclaimed rubber;
- (ii) Packing and packaging codes for natural, synthetic and reclaimed rubber;
- (iii) Marking and issue of ISI Certification Marks when desired by the industry.

Its immediate concern is, however, to rationalise the grades of natural rubber and to prescribe simplified packing and packaging codes for internal transit and storage.

ISI Certification Marks Scheme — ISI Certification Mark is a third party guarantee. Presence of ISI mark on products conveys the assurance that they have been produced to comply with the requirements of a standard, under a well defined system of inspection, testing and quality control during production.

Packing and Marking — At present bales of various weights (ranging from 25 to 113 kg.) and dimensions are in vogue. It has been felt, however, that the bales should conform only to two weights and that the size and shape of the bales should be standardized. The mode of wrapping as well as painting has also to be codified. There also seems to be a real demand for rubber packed in smaller bales. Presented in a paper bag or polyethylene sack, displaying the trade mark or brand name could enhance the consumer-appeal.

Testing Facilities

The need to have a well equipped laboratory, which can conduct intensive work on indigenous produce based on the internationally recognized methods of test, is keenly felt. Without our own test data collected on the indigenous produce, it would do no justice to the cause of standardization. Attempt is, therefore, being made to establish a well equip-

ped research, development and testing laboratory by the Rubber Board, through the good offices of the rubber industry and the State, besides tapping the present laboratory facilities within the country. Such an attempt may facilitate our study of factors like co-efficient of variation in modulus for fixed vulcanizing conditions; study of certain rheological properties of practical significance such as the extent of recovery of a rubber compound from deformation after extruding or calendering, etc., which may to some extent contribute to a technical classification and a scientific grading.

Natural rubber is bound to play a greater role in the country's economy with reference to rubber production. ISI's approach to standardization of this vital product is based on the following considerations:

- (a) Reduction in the number of grades and types in the light of country's needs as we are not to export natural rubber for many more years.
- (b) Fixing up the minimum quality requirements based on authentic test data on indigenous produce, tested according to internationally recognized methods of test. In course of time, it may be necessary to further differentiate grading of general purpose natural rubber with the grading of speciality natural rubber.
- (c) A well laid out method of sampling.
- (d) Simplified and well defined code of practice for packing with particular reference to transit within the country.
- (e) Uniform marking practice.
- (f) Quality marking to ensure that the consumer gets the material of his choice.

Work has also been initiated to standardise the synthetic rubber and rubber latex produced in the country presently, to serve as guide to the rubber manufacturers to plan their production with the indigenously available raw material. The work on standardization of reclaimed rubber will also be taken up in the near future as and when this industry gains certain momentum.

Standardisation : Its Significance in Relation to Food

C. K. ROY

FOOD IS a combination of organic and inorganic chemicals which, in combination, provide nutriment to the body. For the proper maintenance of health it is essential that food must consist of nutrients in the proper, balanced proportion. The ingredients used for preparing food, that is the main food-stuffs, should not contain any extraneous and harmful matter other than its natural constituents.

Standardisation of various products helps the consumers in getting a material of good quality, free from adulteration. They can consume the product without any damage to their health as the certification mark stamped on the package assures them that it has been produced in a hygienic manner as laid down in the Standard and has been checked by experts. Let us take the example of a common item like atta (flour) which nearly every one of us consumes daily. We all know that atta is made from wheat but we do not want that the chapati made from the atta be gritty to taste or be rubbery or brittle in texture or that it should contain a high proportion of bran (chokar). To ensure that we get

atta which will make chapatis free from all these defects, the Indian Standards Institution has laid down a certain standard. This standard specifies the maximum permissible limits for sand and silica, the residual bran when the atta is sieved through a particular sieve for a certain period and the minimum amount of gluten (which is a part of the total protein in the atta and which helps in giving the proper texture to the chapati due to its own elastic texture). Similar standards have been laid down for certain fresh vegetables, oils, ghee, vanaspati, spices and condiments, pulses, sugar, boiled sweets, milk and milk products like butter, cheese, whole milk powder, skimmed milk powder, sweetened condensed milk, infant foods and tinned foods like tinned vegetables, fruits, jams, jelly and scores of other products packed in tin containers. Even animal feeds like bran, and oilcake and poultry feeds have been standardised. Such standards have been laid down by all progressive countries of the world for all products meant for internal consumption or for export. Having known the advantages of consuming standardised products, it should be our endeavour to use pro-

for the amateur flier

**PUSHPAK**

HAL now offers the PUSHPAK, cheap to buy, easy to fly and economical to operate. Rugged in design and simple to maintain, it is just the Aircraft to fulfil the immediate needs of flying clubs in India.

for service and commercial training

HT-2

The HT-2, an all-metal aircraft of robust construction, stressed to IOG, makes it an ideal aerobatic trainer. A proven aircraft, both in performance and standard of workmanship, the HT-2 is currently used by the Indian Air Force and the Indian Navy as a basic trainer.

HINDUSTAN AERONAUTICS LTD
BANGALORE DIVISION

of these materials. In case of certain materials like gypsum, it may be added, sampling investigations had to be conducted with a view to collecting relevant information for laying down rational sampling procedures. Some examples of such standards are: ISI: 1289-1960 Methods of Sampling of Mineral Gypsum, ISI: 1405-1960 Methods of Sampling Iron Ore, ISI: 1449-1961 Methods of Sampling Manganese Ore, etc

Certification Marks Scheme

To make quality goods available to the consumers, ISI operates a certification marks scheme according to which licences are issued to manufacturers for the use of ISI mark on their products to guarantee the quality in accordance with the relevant Indian Standard. To ensure that each marked product conforms to the relevant Indian Standards, the manufacturer has to agree to follow a scheme of routine inspection which is drawn up by ISI in consultation with the manufacturer. These inspection schemes are evolved on the basis of quality control principles and techniques. They include a sampling plan which takes into account the importance of the various characteristics, the number of tests that should be made at various levels of control and the criteria for determining the conformity of the control units to the relevant specification.

According to the inspection scheme, adequate records about the quality during production have also to be maintained by the licensee on suitable proformas prescribed for this purpose. From these records, the licensee can determine

whether or not the production line is progressing satisfactorily; if not, he can rectify the process so that the products conform to the relevant Indian Standard. Besides, ISI brings to the notice of the management of the licensee the benefits accruing from the use of quality control and assists them in introducing these techniques into their plants.

It is interesting to mention here that introduction of quality control techniques is making available systematic data on the capability of different manufacturing units for uniform production of quality goods conforming to Indian Standards. This information is most useful to ISI for revising Indian Standards from time to time to reflect the improved quality performance in the product.

In the application of quality control techniques in a manufacturing unit, innumerable difficulties are met at each stage. To solve these difficulties, it is essential that standardisation of quality, methods for evaluation of quality and sampling inspection is achieved. The work done by a national body such as the Indian Standards Institution in this respect represents sound, satisfactory and economic solutions to many of these quality problems. It is, therefore, in the interest of the manufacturer, as also of the country, that the Indian Standards are widely implemented which will go a long way in improving the quality of the products and increasing the productivity of the manufacturing concerns. This will also help in the promotion of export trade and in earning valuable foreign exchange.

Standardisation of Raw Rubber

N. R. SRINIVASAN

THE RUBBER goods manufacturing industry in India produces a wide variety of rubber goods. They may be broadly classified into (a) rubber goods for automobile industry (b) cycle tyres and tubes and (c) miscellaneous rubber goods like footwear, power transmission belts, conveyer belts, hoses, foam products, sports goods, surgical goods, etc. The demand for raw rubber, the main raw material of this industry, is partly met from natural, synthetic and reclaimed rubber available within the country and the rest by imports.

The production and consumption of natural, synthetic and reclaimed rubber since 1952 is given below:

PRODUCTION AND CONSUMPTION OF RUBBER IN INDIA
(Figures in metric tonnes)

Year	PRODUCTION		CONSUMPTION			
	Natural Rubber	Reclaimed Rubber	Natural Rubber	Synthetic Rubber	Reclaimed Rubber	Total Consumption
1952	20,181	—	21,398	17	2,121	23,536
1955	22,841	—	27,984	107	2,542	30,633
1956	23,819	—	29,460	2,447	3,313	35,220
1957	24,147	—	32,273	3,080	3,896	39,351
1958	24,717	—	35,312	3,304	4,116	42,732
1959	23,772	—	39,282	4,410	4,526	48,218
1960	25,192	200	45,941	5,561	5,327	57,829
1961	26,992	475	48,319	9,600	5,927	63,846
1962	31,357	750	51,776	10,409	6,577	68,762
1963	37,200	1,150	60,209	11,624	7,676	79,509

India's consumption of raw rubber was approximately 69,000 tons in 1962. Only 45 per cent of this total demand has been met from the indigenous raw rubber. The rest had to be imported. Although, our target for 1965 is about 45,000 tons of natural rubber, it is doubtful whether even 80 per cent of this figure can be reached.

On the synthetic rubber side, the progress is encouraging. A synthetic rubber plant has been set up at Bareilly to produce SBR-Rubber. This plant is based on styrene butadiene copolymer system with alcohol as basic feedstock. It has presently the production capacity of 30,000 tons per year. With the development of petro-chemical industries in the country, there are hopes of production of synthetic rubber based on polybutadiene. It is estimated that between 1965 and 1975, the demand for raw rubber may go up by about 200,000 tons a year which has to be partly met from indigenous production of natural rubber.

Reclaimed rubber or re-worked rubber can very well be an example of the principles of 'conservation' applied to the rubber industry. Presently certain units have started production of reclaimed rubber indigenously also. The advantage of such reclaims is low cost, uniform cost with far less fluctuations than natural rubber, lower power consumption and faster mixing and good processing properties. The production of reclaimed rubber is also likely to go up in the near future.

The Rubber Sectional Committee (CDC 42) of the Indian Standards Institution, set up on the request of Indian Rubber Industries Association through the Rubber Board, has taken up the problem of laying down standards for grading and packing of indigenously produced rubber in the interest of trade for quality production. It is not easy to introduce a standard specification for Indian natural rubber particularly because of the multiplicity of producing units and the extensive sampling and testing facilities that will be needed. Nevertheless, a beginning has been made. The work of this Committee has to be aligned with the work of similar nature at the international level by the special task group appointed for drawing specifications on raw natural rubber under Working Group 'C' of the Technical Committee, ISO/TC 45 Rubber of the International Organization for Standardization. Incidentally, this special task group has been set up at the

ducts which bear the ISI Certification Mark. This will help to wipe off the menace of adulteration which is so prevalent in the country.

Standardisation of articles has another great advantage. It opens the door for export of these standardised items to foreign countries. It must not be forgotten that the goods we export, if of good quality, can be our best ambassadors. The national character, integrity and skill are best advertised to the world by the kind of goods we export. Unless these are of good, uniform quality or of the type that we declare them

to be, we may lose very valuable foreign markets and a good deal of money in international trade.

Unscrupulous practices by some members of the trade have already cost India dear, particularly in certain agricultural commodities like spices, fruits and meat. India is producing several items which foreign countries are interested in buying, but due to lack of proper standardization, these products do not find ready markets abroad. If properly standardized and controlled by the export authorities these products will earn valuable foreign exchange and also reputation for the country.
