SINGLE COPY Rs. 1.25 JANUARY 3, 1964 ANNUAL SUBSCRIPTION Rs. 65

It follows that to the question we asked a year ago, "Will he deliver the goods?", it is possible now to give a more confident answer in the affirmative than was the case during the greater part of last year.

We have said that the greatest asset the nation has in the economic sphere today is that it has woken up to the urgent importance of positive economic development. This is also the chief advantage which the Finance Minister, who must necessarily be the architect of that development, now has for fulfilling the expectations of the people. The country is wearied of slow and uncertain economic progress. Lately, there has been much mid-term stock-taking of the third Plan. But as Mr. Krishnamachari pointed out in his address to the gathering of economists in Bombay, we are not only in the middle of the third Plan, but we are also exactly half-way through the 25-year perspective of development with which we had started at the beginning of the first Plan in 1951 Let us recall then what the first Plan had to say:

"In the last four or five decades, there has been considerable industrial development in India, accompanied by urbanisation and expansion of commerce. Large towns and cities have grown and transport and communications have developed extensively. The isolation of the village has been broken and the average citizen lives in an environment significantly different from the one in which he lived and worked fifty or sixty years ago. Indian enterprise has made considerable headway, and the country has now considerable experience in the fields of modern business, industry and finance. New economic and social relations have emerged, giving rise in turn to a general desire for more rapid change. But the development that has taken place is partial and limited when judged in terms of the industry's needs and potentialities. Industrialism and the use of modern techniques have affected only limited segments of the economy. Agriculture is still the mainstay of life for about 70 per cent of the population, and productivity in this sector is exceedingly low. The size of agricultural holdings has progressively diminished; the old cottage and small scale industries have been decaying, and the rural population which constitutes about 83 per cent of the total suffers from chronic underemployment and low incomes. Population has increased by more than 50 per cent in the last 50 years, but the growth of alternative occupations either in the rural areas or in the towns has not been on the scale which could absorb this growing population. In the limited spheres which have registered expansion, the level of productivity and the level of incomes have naturally been higher. But, for the community as a whole, the economic development of the last few decades has brought no significant improvement in standards of living and opportunities for employment and has perhaps accentuated to some extent inequalities of income and wealth."

Let us read that passage again carefully and let us ask ourselves whether, after two five-year Plans and in the middle of the third, we are in a position to say truthfully that the basic character of the national economy has substantially changed in quality from what it was at the threshold of the five-year Plans. In many ways such expansion in agriculture, trade or industry we have been having is a continuation of what had been going on in the four or five decades before the first Plan. It is true, perhaps, that there has been a little more of the same a little more quickly. But the emphasis is still on "same". India continues as a predominantly agricultural country, while the quality of agriculture has not improved substantially. Agricultural production and productivity are not matching now any more than previously the new demands arising from an increasing population as well as the general desire for better living. The process of urbanisation and industrial and commercial expansion has also no doubt continued — and continued perhaps at a higher rate — but our industrial expansion is still lagging far behind the tempo necessary for relieving appreciably the pressure on the land. Of trade and commerce, there is room for even less satisfaction. Our distributive systems and agencies have been often blamed for anti-social practices. It would be more to the point to criticise them for their sheer inefficiency, for their addiction to outworn methods of business in stocking or selling and for their not getting modernized even at the rate at which other sectors of the Indian economy, including agriculture, are attempting to move into a more modern world. Even hand-spinning has been changed by the introduction of Ambar Charkha, but the merchandizing system in the country goes on much as before. It is true enough that neither the producer nor the consumer is getting a fair deal out of the present distribution system, but this is less because the distribution system is dishonest than because it is incompetent. Whereas all over the world giant strides have been taken in cutting down distribution costs through modern methods of merchandizing, not a whiff of this wind of progress has been caught in this country.

And so, in many essential ways, thirteen years of planning have left us some considerable distance away from the mainstream of economic modernity. The Finance Minister pointed out to the economists at the Bombay gathering that the national income in the first two Plans had risen by 40 per cent and he suggested that "we could reasonably hope that it would rise by another 20 or 25 per cent over the third Plan". We hope too that he is guessing right, although we are not sure that he is not too optimistic over the probable performance of the third Plan. But even assuming that the national income does rise by about 60 or even 70 per cent over the three Plans, the nation would still be caught short of its expectations relating to the 25-year perspective of development. It is now generally agreed that the rate of investment should rise to 20 per cent of the national income and the annual increase in national income attain a level of seven per cent if enough resources are to be found for our being able to engineer a tempo of economic development which could make a noticeable impact on mass poverty and mass unemployment, and provide simultaneously for a minimum national scheme of social security. The basic issue in economic policy-making today is how — and how soon the national income could be made to grow at an

162867

annual rate of seven per cent and also the rate of investment stepped up to 20 per cent of the national income.

We are sure that the Finance Minister must be thinking out the answers. Meanwhile, it is obvious that he has been taking the necessary first step of hammering out an apparatus for coherent thinking and a consensus within the Government. This perhaps is Mr. Krishnamachari's most important achievement since he became Finance Minister. It is now clear that senior Ministers or Ministers, who are in charge of important economic responsibilities, are coming together in a group to do some joint study of immediate as well as long-term problems. The reactivisation of the Economics Sub-Committee of the Cabinet is a significant development in this sense. There are indications that the process of consultation on economic problems is being promoted earnestly among Mr. Krishnamachari, Mr. G. L. Nanda, Mr. Swaran Singh and Mr. C. Subramaniam within the Cabinet and between them and the Deputy Chairman of the Planning Commission, Mr. Asoka Mehta. That Mr. Asoka Mehta and Mr. Krishnamachari, in particular, are getting into the habit of thinking alike on many basic issues is certainly a most welcome development since a community of ideas between the Planning Commission, on the one hand, and the Central Ministries on the other, could make a very constructive contribution to the objective of a positive direction being given to the national economy. The big question, however, still remains: How far will the political compulsions of the Congress Party permit a positive economic policy to be pursued? Some kind of an answer may be forthcoming at Bhubaneswar. Meanwhile, the discussions at the Jaipur Session of the All-India Congress Committee and the subsequent Draft Resolution on Democratic Socialism of the Working Committee for presentation at the General Session of the Party at Bhubaneswar have given some indication of the shape of things to come. The general reaction in the national Press to the Working Committee's Resolution is one of relief. Leader-writers have been carried away by the feeling that, since the Working Committee could have done so much worse, it deserves to be congratulated on having done not so badly after all. This approach is not without its own logic. There were presistent Left Wing pressures on the Working Committee to make a radical socialist declaration. There were, in particular, demands for the nationalisation of banks and the establishment of State trading in foodgrains. It had also been urged that there should be an aggressive expansion of the public sector simultaneously with the de-concentration of wealth and what has been described as economic power in the private sector. The Working Committee has certainly succeeded in resisting these pressures up to a point, but it is clear that it has made dangerous concessions, both open and implied.

Thus, although the Working Committee has not conceded the demand for the nationalisation of banks, it has certainly uttered sounds which have the effect of considerably softening the firm stand taken on this issue by the Central Government at least up to the end of the tenure of Mr. Morarji Desai as Finance Minister. Whereas the former Finance Minister had clearly said that the Govenment did not consider the nationalisation of banking either necessary or desirable, the present Finance Minister diplomatically permitted his deputies to say in Parliament that the Government did not consider nationalisation to be necessary at the present time, but was keeping an open mind on what might be found desirable eventually. Now, the Working Committee has chosen to equivocate further. It says: "The Government should place itself in a position more effectively than is the case now to direct the means of credit and investible resources of the country along the lines of national priorities and our social purpose. At present small entrepreneurs or new comers are placed under a serious disadvantage in respect of availability of financial resources. There is also need for further steps for the removal of abuses and malpractices in financial institutions". It is true that this passage could be taken to mean that the Working Committee had cleverly employed a hundred words instead of one to say "no" to the demand for bank nationalisation. But it must be obvious surely that even by making such verbal compromises where important principles of policy are concerned, the ruling party could be dangerously weakening the hands of the Government.

In any case, the Working Committee's observations on this question are contrary to facts and are also illogical. It is strange, for instance, that the Working Committee should have even remotely suggested that the presence of the private sector in commercial banking is in any way responsible for small entrepreneurs and new comers being at a disadvantage in respect of the availability of financial resources. We know that the charge is only too often made that banks are discriminating in favour of big business and/or their (banks') established connections. But we must emphasize that no evidence has been produced to substantiate this charge. We hope to deal with this question shortly in factual detail so that wild allegations may be exposed. Meanwhile we cannot but deprecate the weakness of the Working Committee in even seemingly conceding one of the false arguments for nationalisation of banks. It is even more surprising that so soon after the Central Government has enacted a law vesting the Reserve Bank with sweeping authority and powers over commercial banking, the Working Committee should be found making the absurd statement that "there is also need for *further* steps for the removal of abuses and malpractices in financial institutions" (italics ours).

It is not only on this question of banks that the Working Committee has vacillated. Faced with the demand for State trading in foodgrains, it has tried to fend it off with the formula that States should progressively take over the operation of rice mills and other

units for processing agricultural produce. It is possible that the Working Committee had acted on the inarticulate assumption that, since this kind of declaration could only be a general recommendation to State Governments which they would not be in a hurry to implement, no great harm would be done. But an attitude of hypocrisy in matters involving directly or indirectly basic issues both of ideology and honest day-to-day administration, could clearly be a double-edged weapon. Once the Congress leadership falls into the habit of choosing the line of least resistance, it may soon find that it has lost the capacity to resist at all.

Finally, the Working Committee says: "It is necessary to bring about a limitation of income and property in private hands. This limitation should apply specially in respect of inherited wealth and urban property. The State should secure a larger share of capital gains and appropriate a much larger proportion of unearned income than is being done at present." Here again, it may be argued that this is a moderate reaction to the clamour of the lunatic Left fringe in the Congress party for a policy of levelling down. But while the sentiments themselves are, within the proper limits, quite respectable, it is obvious that the Working Committee's opportunist approach does violence to the genuine needs of rapid economic development. The Working Committee argues that "it is necessary to bring about a limitation of incomes and property in private hands". In modern civilised communities the only way this is done is through a progressive system of taxation and so far as *that* goes, our country certainly is one of the most modern communities in the world. But even a progressive system of taxation does not have only one purpose, namely the purpose of limiting incomes or property or even reducing disparities in income. While that should certainly be *one* of the purposes of any modern system of taxation in a democratic community, it is equally important for fiscal policy to work the principle of progressive taxation in such a manner that, first, saving and investment, leading to capital formation for the benefit of the economy, and, secondly, business enterprises, which would employ that capital in active production, may not be discouraged.

As with most things in life, the practical application of the principle of progressive taxation has to strike a balance between alternative, even if not conflicting, purposes, so that the net gain to the community may be the maximum. Exactly where the balance is struck must obviously be determined in the local context, but broadly speaking, in an underdeveloped economy, the egalitarian purpose cannot be pursued at more than a certain pace without the aggregate progress of the economy in terms of investment and production being depressed.

For a poor country to seek to tax capital and enterprise out of existence would be to sacrifice its future for no appreciable gain in the present. The Finance Minister has lately been stressing the importance of matching economic progress with social welfare. But there will have to be this economic progress out of which social welfare could come. Mr. Krishnamachari in a wholly admirable effort at demonstrating that the Government desires the weaker sections of the community to participate not merely in the remote gains but also in the current profits of economic expansion, has been coming out with limited welfare schemes for one group of people after another. He is no doubt aware that such measures cannot be financed by clever government book-keeping. The economy has to keep growing and keep producing more and more of goods and services which are the real "content" of welfare. That perhaps is why the Finance Minister stressed in his statement to Parliament the importance of reorienting the taxation system towards the objective of stimulating investment and economic growth. But the Congress Working Committee speaks of limiting incomes and property as if *that* would make any positive contribution to economic growth.

We are particularly at a loss to understand the Working Committee's recommendation that limitations on incomes and property in private hands should apply specially to inherited wealth and urban property or its suggestion that the State should secure a larger share of capital gains and appropriate a larger proportion of unearned income than is being done at present. In concrete terms all this could only mean an all-round increase in the various direct taxes on wealth or higher incomes. Surely, this directive, if it is a directive, cannot be easily reconciled with the Finance Minister's pragmatic desire for a reform of fiscal policy for the purpose of promoting economic growth. It is, of course, true that whether a particular rate of estate duty or wealth tax should be increased or not is in the nature of a decision on budgetary details, the virtue of which has to be considered along with other contemporaneous decisions on fiscal policy. But at the same time, it cannot be ignored that the essence of the Working Committee's approach seems to be that the total burden of direct taxation could be sharply increased especially with regard to the capital assets of the individual or what are called unearned incomes. It should, however, be seen on any serious consideration that if the net effect of any set of fiscal decisions would be to leave people with less capital or less income than at present, it is certainly not going to help increase saving or investment or business activity. On the strictly factual basis, any pursuit of egalitarianism, irrespective of the economic context, must come in the way of the pragmatic gearing of fiscal policy to dynamic development which the Finance Minister rightly seems to consider to be his primary responsibility in the present conditions of faltering economic progress.

This is not to say that the Working Committee's Resolution is entirely without virtue. To the extent that periodic statements of basic purposes are necessary to mobilise and maintain popular enthusiasm, the ruling

Party must reaffirm on appropriate occasions the goal of modernizing the economy and building up its productivity for the increasing benefit of more and more people. The major assumptions of these programmes are such that no civilized community can quarrel with, and provided the Congress Party pursues those purposes in a pragmatic manner, taking into consideration the immediate as well as long-term requirements of increased saving, investment and business activity for the more rapid expansion of the economy, it will naturally continue to have wide support among the people. The capacity of the Congress Party to ensure political stability has been happily established, but its continuing desire to uphold economic stability needs, unfortunately, to be reaffirmed from time to time. In this sense, it is testing time for responsible leaders of the Congress whose thoughts may now be turning towards Bhubaneswar.

Meanwhile, within the Central Government itself there has been, as we have noticed at the beginning, the immense gain of a revival and reassertion of positive thinking on economic matters. There is at last a considered and comprehensive strategy. Socialism is to take the practical shape of social welfare measures as they become progressively possible within the contemporaneous limitations of the economy. Mr. Krishnamachari, however, must make himself constantly conscious that welfare has to be paid for with production. As he himself told his audience of economists in Bombay, the Government's economic policy cannot become consumer-oriented without also becoming correspondingly investment-minded. If there is no sufficient investment, the welfare schemes will only result in inflation which would mean that the welfare sought would end up as a demagogic fiction.

It follows that every little attempt made by the Government to promote welfare must intensify the need for stepping up the tempo of the economy. The Finance Minister is to be congratulated on recognizing this compulsion. He has had the courage to say in Parliament that controls were not sacred cows and that they must serve positive purposes. We are glad to find the same sentiment echoed in the Working Committee's Resolution. It says: "Controls should be applied only when they become indispensable in the larger interest of the community. Every effort should be made to ensure the successful operation of such controls by efficient and honest administration and by enlisting the co-operation of the people." Since it is evident that the most important single condition of efficient administration of controls is that they should be small in number and individually clearly relevant to the economic or social context, it follows that the cutting out of dead wood in the structure of controls ought to have the highest priority. Mr. Krishnamachari has started rather timidly by removing a few marginal and minor price controls. It is to be hoped that, in the coming weeks or months, he would be emboldened to undertake some drastic surgery. Coal, oil, steel, cement, fertilizers, paper, cloth and sugar are some of the co modities in the case of which the interests of both p ducers and consumers have needlessly suffered by sound or unnecessary price restrictions. A bold decis which would free the productive apparatus of the cubus of restrictive controls would do immense good these important industries which could contrib powerfully to economic stability and economic growt

Hopes in the nation are running high, but patie is running out. People have rejected jam tomorr they must have bread today. The Prime Minister rightly been emphasizing that modern science and te nology have opened out grand vistas of economic p gress. But it remains unhappily within the politicia power to block the opening or put obstacles in the pa For 13 years now we have been talking more than a ing. We have been strong on ideology, but weak performance. We have no doubt stirred popular thusiasms and activated a good deal of popular eff We have also been fortunate enough to arouse the sy pathy and enlist the support of friendly peoples governments abroad. These are outstanding ga But it cannot be asserted by any means that we h yet been able to make the most of these assets. On contrary, we have often found ourselves paralysed our inhibitions and atavistic urges. We have yet cultivate a clean contempt for poverty. Essentially, have learnt so far only to fear poverty and being afr of it, we are inclined to worship it. The nation m fight out of this psychology of insecurity; otherwis cannot but remain the guinea pig of witch doctors.

Eastern Economist 20 Years A

JANUARY 7, 1944

FREEDOM IS always a function of security. The prin reason why liberty has flourished best in Great Britai the United States is that these countries have enjoyed ec mic and political security to an extraordinary extent ov to their insular position and command over great econ resources. The ascending degree of political freedom allo in, say, France, Great Britain and the United States du wartime reflect in a large measure their comparative sec from external dangers. It is certain that the "richnes life lies in pluralistic and not in monistic solutions, and greatest danger which faces planned economy is the tend towards monistic solutions." But monistic solutions bec inevitable when the aggregate available resources in the S become inadequate in relation to the essential requirem of security and there is no margin of safety. As Russ freed from the pre-occupation of security, it may be expe to be more tolerant and free; and already the trend tow greater tolerance is discernible. If the planned econom inevitable, the only practical problem is to ensure that democratically operated and in the interest of all. The no essential incompatibility between a planned co-oper economic system and political freedom; although there is as in every society, to ensure that the minority with wh dominate is kept away from capturing the essential ins tions of the State. The central problem is the 'tamin power' — a difficult but by no means an insoluble prob and on this the 'cui bono' of the totalitarian economy dep

Highlights of the Week

UIET SHINES THE SUN

E 11-YEAR cycle of sunspot activity enters its quiet phase solar minimum period during the years 1964-65. This has ompted a 50-nation scientific research effort styled the "In-national Quiet Sun Years" (IQSY), which would continue observations and studies made during the International ophysical Year (IGY) of 1958-59, which was a period of ximum solar activity. But while the sun may shine quietly the benefit of the earth's scientists, India's politicians seem termined to be fiercely active for the benefit of India's izens.

In Dehra Dun, Mr. Mahavir Tyagi, Member of Lok Sabha, reatened to stage satyagraha if the Government did not omptly move to bring down food prices in his constituency. ere was nobody on the spot to remind Mr. Tyagi that he is the one who not long ago kicked up a fuss because the lms Division of the Ministry of Information and Broadcast-g screened a news-shot of a Communist demonstration fore Parliament to protest against high prices and high xes.

The habit of satyagraha seems infectious and Mr. Atal hari Vajpayee, Jan Sangh leader, has served notice that he ould go on fast before the Prime Minister's house unless the legation made by Mr. Mohan Lal, Home Minister of the unjab Government, that the Jan Sangh had conspired with reign powers to overthrow the Nehru Government, was ther withdrawn or proved.

Meanwhile, Mr. Asoka Mehta seems to be actually in the iddle of a satyagraha of his own, but in keeping with the irit of the IQSY, his demonstration is of a quiet sort — a t-in strike, but of a special kind, since one foot of Mr. Mehta in the Planning Commission and the other in the Praja ocialist Party — which, incidentally, is what all the pother about. While we may be inclined to sympathise with Mr. . M. Joshi, who naturally does not want to be left merely rith Mr. Mehta's heart, while Mr. Mehta's tongue, a more useful rgan, is at the service of Mr. Nehru, we must point out in airness to the Deputy Chairman of the Planning Commission hat Mr. Mehta is not the first politician nor will he be the ast who would eat the cake and have it. Come to think of , some of those politicians do seem to get away with it too.

GOVT. AS SANTA CLAUS

'HE GOVERNMENT has lately been playing Santa Claus to he nation. On New Year's Day, the Railway Board announc-d a rebate of 25 per cent in freight rates for 65 items of ngineering goods consigned for export. But it had all started nuch earlier; in fact, days before Christmas week. On December 13, the Finance Minister announced a scheme under vhich widows of Central Government employees would get a ension for life provided their husbands had been regular mployees and had put in at least one year's service. The mount of the pension will be adjusted for different slabs of ay of employees, but will be between a minimum of Rs. 25 nd a maximum of Rs. 150 per month. The scheme which has one into effect from January 1, also provides for payments f allowances to minor children in the event of the widow's eath. The Finance Minister indicated that his proposal was n the nature of a step in providing social security to the veaker sections of the population.

Another instalment of this programme was indicated by the Home Minister on December 27, when he said that a scheme of family pension would be introduced for the benefit of industrial workers who are members of the Employees Provident Fund and the Coal Mines Provident Fund. This scheme would be on the analogy of the family pension scheme for Central Government employees. It is proposed to create a fund out of the difference between the old rate of contribution at 6¼ per cent and the enhanced rate of 8 per cent, that is, 3½ per cent of the wages including the employer's contribution of 1¾ per cent. Out of this fund a minimum family pension of Rs. 25 per month would be paid to the widow and minor children of members of the fund who die prematurely.

FOR THE LIVING TOO

THE GOVERNMENT'S concern for Central Government employees, however, is not confined to their widows. It has also tried to make life a little less disagreeable for its employees, while they are alive. Thus, on December 21, the Finance Minister announced his long-awaited decision on the upgrading of cities and towns for the purpose of dearness allowance for Central Government employees. In the place of the previously existing three classes, A, B and C, there have come into being, since January 1, four classes, A, B1, B2 and C. Under the old system, cities with population of two million or above were placed in class A, while other urban centres with population between half a million and two million were placed in B class and towns with population of 100,000 or above but below half a million fell in C class. Under the revised system, cities with population of 1.6 million or more would be in class A, while those with population of 8,00,000 or more but less than 1.6 million will be in class B1 and those with population between 800,000 and 400,000 in class B2. Towns with population of 100,000 or more but less than 400,000 are placed in class C.

Madras has been shifted from B class to A and is thus grouped with the three other cities already in that class—Calcutta, Bombay, and Delhi. Four erstwhile B class cities —Hyderabad, Ahmedabad, Bangalore and Kanpur — have been re-classified as B1 and three C class cities — Madurai, Allahabad and Jaipur — have been reclassified as B2. Other erstwhile B class cities would be reclassified as B2. The dearness allowance rates admissible for class B2 are the same as for the old class B while higher rates are allowed for class B1. The net effect of the reclassification is that over 150,000 Central Government employees working in eight cities have become eligible for increased rates of dearness allowance. This measure would cost the Government Rs. 2.59 crores per annum while the scheme for life pensions for widows of Central Government employees would involve an annual expenditure ultimately, in about 25 years' time, of about Rs. 12.15 crores on the civil side and Rs. 5 crores on the Defence side. While there have been no reports yet that the mortality rate among Central Government employees has risen, there is certainly agitation among that tribe in Bombay, Calcutta and Delhi that the three cities should be upgraded and reclassified as A1 cities — which, if done, would no doubt prompt a further series of pleas for another round of upgrading all over.

Thanks to all this flush and flood of the Yule Tide spirit, even the business community has been allowed to share in the bounty. The Finance Minister has suspended the collection of the emergency risk insurance premium. He has also excused industrialists from making pilgrimages to the Capital for licences for capital issues of Rs. 25 lakhs or less. Previously the exemption limit was Rs. 10 lakhs. Mr. Krishnamachari has lifted price controls in respect of 16 commodities, namely, rayon yarn, staple fibre, caustic soda, soda ash, hydrochloric

Thermocole®

GETS AROUND PIPES AT GLAXO

The pipes at the GLAXO Fine Chemical Factory live through the most exacting conditions with a sense of security. No wonder. THERMOCOLE protects them against temperature variation and moisture—the scourge of all low-temperature piping.

There are many organisations in India that know and use THERMOCOLE for vessel and pipe insulation and GLAXO is one of them.

THERMOCOLE is foamed polystyrene—the lightest rigid insulating material in the Industry. It has a very low thermal conductivity and is resistant to moisture. Available in handy, close-fitting sections, THERMOCOLE is the ideal material for pipe insulation.

The Trade Name—THERMOCOLE is your guarantee of Quality for Expanded Polystyrene

TC. 34-945

A&P/LIC-SP-42A

Overlooking the Arabian Sea at Bombay stands a gigantic new building. It's named 'Yogakshema'—a Sanskrit word connoting ' welfare '—a very apt name for the headquarters of the LIC, which the Prime Minister, Shri Jawaharlal Nehru opens on Thursday, December 26, 1963. We hope the LIC policyholders everywhere will share our joy on this occasion. Because 'Yogakshema' is more than a very handsome six-storey edifice—it's a statement of trust by the Corporation in the future of life insurance in India. And it is the measure of stability of an institution which guards the future of many millions.

LIC—YOUR COMPANION IN PROGRESS

acid, chlorine, calcium carbide, bleaching powder, Chilean nitrate, muriate of potash, sulphate of potash, washing soap, tyres and tubes, sheet glass, paper board (but not paper) and natural rubber. It is beside the point that the concessions are marginal. The private sector has for so long been getting the big stick that even a shrivelled little stump of carrot must seem tremendously important as a gesture.

OWN YOUR HOME

THE GOOD news for the New Year do not stop there. The Life Insurance Corporation has tried to do its bit for social security. LIC loans would be available to policy-holders for the construction of new houses, for carrying out extension in their own existing houses or for the purchase of recently-constructed houses in good condition. The scheme will not cover, however, the purchase of ownership flats in view of doubts in regard to the legal rights of ownership in such cases. The maximum amount of loans available under the scheme is Rs. one lakh to one borrower and the minimum is Rs. 10,000. In the case of approved housing schemes or when the loan is for the purpose of constructing extensions to an existing house, the minimum amount will be reduced to Rs. 7,500.

The policy-holder must assign to the Corporation the policy or policies having in aggregate a sum assured calculated at the rate of Rs. 10,000, for every Rs. 9,000 of the loan. For the purpose of determining the actual maximum loan permissible to an individual applicant, the policy-holders have been divided into two categories. In the first category are placed those who can satisfy the LIC about the stability of their employment, viz., those who are permanent or confirmed employees of (a) Central or State Governments, (b) Municipalities or Local Boards, (c) companies whose shares are Approved Investments as defined in Section 27-A of the Insurance Act, 1938 and (d) other categories of employers approved by the LIC. The second category consists of all other policy-holders. Loans to the first category will be computed on a slab system at the rate of 85 per cent for the first slab of Rs. 10,000, 80 per cent for the next slab of Rs. 10,000, 75 per cent for the third slab of Rs. 30,000 and 70 per cent for the last slab of Rs. 50,000. The higher percentages for the smaller loans are intended to enable more modest borrowers (who would normally stand in need of greater financial assistance) to obtain a larger part of their requirements. For the second category of policy-holders the maximum limit will be two-thirds of the value of the property. The loan amount is thus linked both to the policy amount and the value of the property.

The loans, besides being secured through the assignment of the policy to the Corporation, would also have the additional title of a first mortgage on the property. They will carry interest at the rate of 7.5 per cent, subject to a rebate of one per cent for punctual payment. The interest is to be paid on a monthly basis. The loans are repayable out of the proceeds of the life insurance policy or policies assigned to the Corporation, but the policy-holder would be free to make earlier repayment either partly or fully by multiples of Rs. 500. The loan is repayable within a period chosen by the borrower, provided the repayment term does not extend beyond the date of superannuation of the borrower, the date of his attaining 65 years of age, or the date exactly five years prior to the date of the expiry of the lease, if the property is leasehold. In the case of the second category of policy-holders, there is the additional condition that the repayment period should not exceed 20 years.

The policies against which housing loans would be granted are to be of the approved type, for instance, endowment insurance policies under which the term is not longer than the repayment term fixed under the loan. Such policies will have to be maintained in full force at all times and in the event of the premature death of the insured, the amounts consequently becoming payable on his life policy or policies would be adjusted against the liabilities in respect of the loan.

The building constructed with loans should be built according to plans and specifications within the estimated cost and through an agency, all previously approved by the LIC. The construction should be proceeded with as expeditiously as possible and the building should be completed and made ready for occupation within a period of 18 months from the date of sanction of the loan. The properties against which loans are granted will have to be maintained by the policy-holders in a state of good condition at all times and also duly insured.

The LIC presumably wants to make a success of this scheme. It is advising the public through advertisements in the press, that no intermediary is necessary to negotiate the housing loan and that those who intend to avail themselves of the scheme could deal with the LIC directly. Intending applicants are in fact being advised to do so. Nevertheless it is clear that the various conditions laid down by the LIC must considerably restrict the average man's access to the loan facility. Perhaps this is not altogether undesirable. As the Chairman of the LIC, Mr. B. K. Kaul, has been pointing out, the present scheme is still in the nature of an experiment which may have to be modified and improved in the light of its actual working. In the earlier stages it is just as well that a set of conditions is imposed which would serve to screen, more or less automatically, applicants and applications. The security of LIC funds must at all times be a very important consideration and public opinion should surely support a policy of gradualness and circumspection.

Being a vast, monolithic, impersonal bureaucracy, the LIC has certain inherent disadvantages in operating a scheme of this kind and it is only prudent that it protects itself against the consequences of its own limitations by adopting a relatively conservative and cautious policy in determining the scope of the scheme. For the same or similar reasons it has been rightly decided to restrict the immediate operation of the scheme to 26 urban centres and their suburbs which may lie outside the city or municipal limits but may be approved suburbs in the sense that the LIC agrees to consider them as part of the respective towns or cities for the purpose of the scheme. The cities and towns to be benefited are: Delhi, Bombay (Greater), Calcutta (Greater), Madras, Ahmedabad, Baroda, Surat, Jammu, Ernakulam, Trivandrum, Bhopal, Indore, Coimbatore, Madurai, Nagpur, Poona, Bangalore, Cuttack, Amritsar, Chandigarh, Jaipur, Kanpur, Lucknow, Hyderabad, Gauhati and Patna.

Other cities to which the scheme will be extended later are: Machlipatnam, Vijayawada, Shillong, Jamshedpur, Muzaffarnagar, Rajkot, Srinagar, Gwalior, Jabalpur, Salem, Thanjavur, Tiruchirapalli, Nasik, Satara, Sholapur, Hubli-Dharwar, Mysore, Udipi, Bhubaneshwar, Jullundur, Ludhiana, Ajmer, Jodhpur, Allahabad, Agra, Bareilly, Meerut, Varanasi, Asansol and Jalpaiguri.

RING IN THE NEW

AND SO the New Year has begun with Mr. Manubhai Shah sending a telegram of congratulations to Moscow on Indo-Soviet trade having reached a peak of Rs. 100 crores both ways in the Old Year and Mr. Lal Bahadur Shastri speeding on its way the diesel locomotive manufactured by the Indian Railways at their Workshop at Varanasi — a vehicle with the proud distinction of being the first to be manufactured in this country. May its tribe increase!

Basic Issues of Development

T. T. KRISHNAMACHARI

This is the text of the Inaugural Address delivered by the Union Finance Minister at the Joint Annual Conference of the Indian Economic Association, the Indian Society of Agricultural Economics and the Indian Society of Labour Economics, held in Bombay on December 25, 1963.

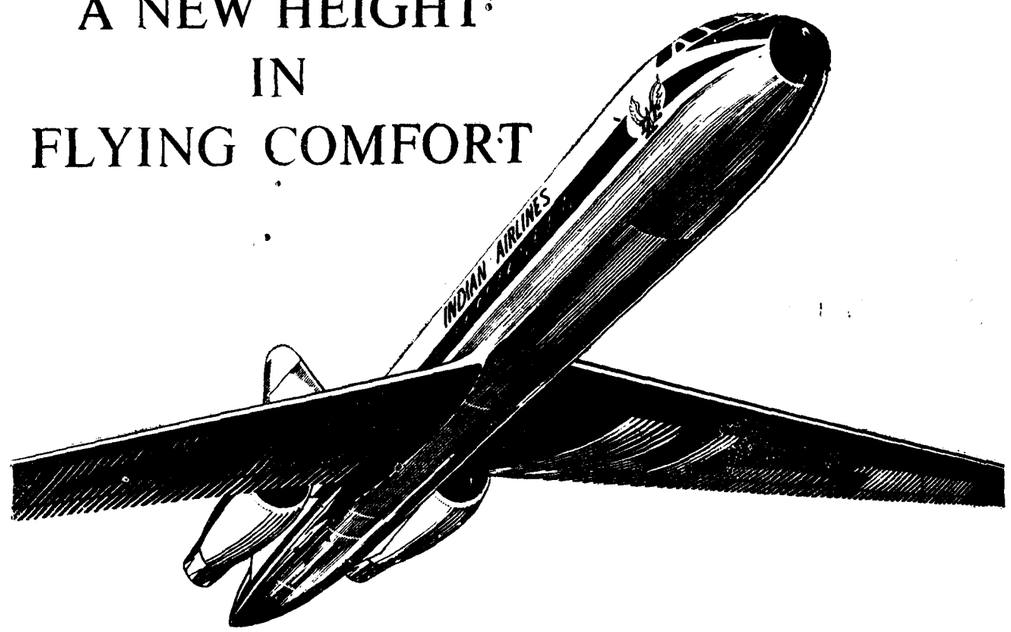
THE FACT that you have three Associations meeting today instead of one is, I take it, evidence of the increasing differentiation and specialisation within the field of economics. This, I am sure, is proof of your conviction that with this growing differentiation and specialisation you need also co-ordination and integration.

I am wondering what claim I can make to the right to be present here and to address you on this occasion. May I say that I share with you a certain propensity, perhaps a rash one, to speculate on economic matters. In the last few months I have devoted a great deal of attention to the immediate problems of the economy and I have already indicated to some extent the lines along which, and the measures through which, an improvement in the present economic situation could be sought. I do not wish to detain you on those aspects of our problems or our policies. Nor do I think it would be appropriate for me to offer observations on the various subjects you have on your agenda. I wish rather to direct my remarks and observations on some of the longer-term and basic issues relating to the development of the Indian economy. Whatever our immediate pre-occupations, it is essential for us from time to time to take a good look at the changing economic landscape and to try to see what new vistas we can open out in the years to come.

Great Achievement

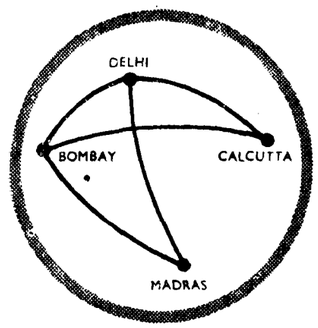
We are now exactly half way through the twenty-five-year perspective of development with which we started at the beginning of our first Plan in 1951. The last twelve years or so have a great deal of achievement to show. A great deal has happened that should give us courage and hope and urge us forward to larger effort. What the people of this country have achieved in the recent past is certainly creditable considering the great difficulties involved and the inertia of decades of stagnation that had to be overcome. The slow growth of national income in the first two years of the third Plan has tended to dilute enthusiasm in some quarters and the question is being asked whether our approaches to our Plans and the techniques of implementation that we have been following need, after all, some radical change. It is to problems in this field that I want to address myself this morning.

Let me say at once that there is no room at this juncture — nor was there at any time in my view — for complacency in regard to our economic and financial problems although national income over the first two Plans rose by about 42 per cent. And although we could reasonably hope that it would rise by another 20 or 22 per cent over the third Plan, this rate of growth in per capita terms is quite small and compares unfavourably with expectations of doubling the national income by 1971. Given the increase in population that we have to reckon with for a considerable period ahead despite all we do to promote family planning, the dimensions of the problem we have to face in order to make a sizable impression on the levels of living of the mass of the people are colossal. The resources available are on the other hand limited and we have several calls on them not only for civilian uses and for productive investment but also for defence. At the same time, I am of the view that the challenge posed has to be accepted and faced.



I think it is time that you as economists and statisticians and we as Government strated thinking seriously and intensively on the problem of the fourth Plan, the outlines of which will have to emerge in a year or so from now. Is the fourth Plan going to be a translation, shall we say in more detailed terms, of the broad projections that we have been giving in the earlier Plans? Or do we need to look again, re-examine those projections and perhaps shift our sights or perspectives or both? Do our strategy of development — involving heavy effort on basic industry — and our scales of priority determination continue to be correct or do they need a fresh look? Is our balance between consumption and investment, while politically wise, economically the optimum? On the institutional side, are we making the best use of productive energy whether in the Centre or the States and in the public and private sectors? Are we doing enough to generate the resources — human, physical and economic — for the targets that we deliberate? Are we in fact moving towards a new momentum in economic effort and an expanding environment for production or are we moving into a situation of excessive control and complicated institutionalisation? In short, does the experience of the last twelve years or so necessitate any change as to the underlying assumptions or the strategy appropriate to the stage of development that we have now reached? These are vital and difficult and indeed baffling questions. To me, it seems that the strategy and methods hitherto followed are basically correct. However, I have no doubt that the new Deputy Chairman of the Planning Commission and my other colleagues on the Commission will be studying these problems in all their aspects. All that I attempt at, at this stage, is to make a few observations that seem to me to be pertinent in the light of my thinking during the last few months.

Co-ordinated Advance



While it might appear to be a truism, nevertheless I should like to say that the success of the fourth five-year Plan will depend upon how effectively we are able to secure co-ordinated advance in all the major sectors of our economy. I have in mind in this context the relatively unsatisfactory performance of our agriculture in recent years. It is sometimes said that this is the result of some over emphasis in our Plans on development of industry and the allied fields of transport, power and the like. I completely disagree with this view. In all our Plans we have attached high priority to increase in output and productivity in agriculture. I do not see that by doing less in the field of industry or mining or transport we could do more in the field of agriculture. I need not emphasise here the dynamic role of industrialisation in a developing economy. Nevertheless, if agriculture lags behind, progress in other fields cannot proceed far and there is everything to be said for a close and methodical study and investigation of the factors that have limited our achievements in this direction so far.

The more I think on the basic approach and priorities in our Plans, the more I am convinced of their inherent soundness and the need for continuity. Our strategy has been to raise the rate of investment as far as we can consistently with securing some increase in consumption and the maintenance of internal financial stability and a balance on external account — on the basis, of course, of a significant inflow of resources from abroad by way of assistance. Naturally, we cannot afford any spectacular increase in consumption. Obviously too, we cannot ignore the minimal claims of consumption of the less well-to-do and disadvantageously placed classes of the population. I must say, however, that if we are to achieve substantial increases in living standards and employment and improvement on the balance of payments side within a reasonable period, we cannot think in terms of a consumption-oriented Plan. It has necessarily to be income-oriented. In-

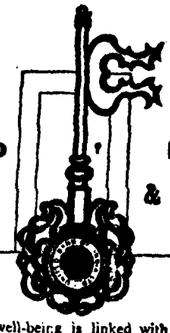
vestment, as a result, is not the only factor which determines the outcome of planned effort but it is a most important element in it.

I also think that situated as we are, we need to devote a substantial proportion of the investment we make to development of basic industries and the whole complex of operations and facilities that go with such development. The discussions on the second Plan began with emphasis on targets without these being specifically limited by the resources available. However, one good that came out of it was the considerable attention given to metallurgical industries. These industries will need to be developed further. We shall also need a vast variety of industries making capital goods and intermediate products of all kinds. The stress has to be on a continuation of the type of work we began with our second Plan and are trying to carry forward through the third Plan. The time has come, in my view, for a relatively larger emphasis on chemical industries, especially those based on the petro-chemical complex. These industries will require large investment, but they are capable of yielding a more than commensurate return not only in terms of output or profits, but in terms of their reaction on agriculture and a number of consumption industries as well. All this development has a significant bearing on our future balance of payments and I see no reason why we should depart from the emphasis that we have been placing on achieving, as early as possible, a large measure of self-reliance in the widest sense of the term for meeting the foreign exchange needs of further development. In fact, our efforts in this direction need redoubling. Even so we shall have to continue to rely for quite some time on the assistance of friendly Governments and international institutions.

Methods of Implementation



My emphasis on continuity and the need for adhering to the essential strategy of development we have followed so far implies as a corollary that we should ruthlessly re-examine our methods of implementation of the Plan targets and rectify our mistakes and shortcomings. I think developmental planning requires a considerable emphasis on both advance and consolidation. From time to time there has to be some stress on consolidation, so as to ensure that we reap in full and as quickly as possible the benefits of the various investments that we have made. I am not putting forward specific conclusions but I do recognise the possibility that in the initial period of the fourth Plan we might have to devote more attention to the problems of consolidation and of securing substantially larger outputs from inputs that have been or are being made.

In our efforts towards developing a planned economy, we have to some extent ignore the sociological reactions to such developments. It is time we remedy this lacuna. Planning has in the future to be as much the concern of the sociologist as it has been of the economist. Even as it is, simultaneously with economic development, our concern with social justice has taken a number of forms and it has been our endeavour to vary this emphasis from time to time on one or the other aspect of these particular forms. Institutional changes, such as, land reforms or the extension of credit facilities, encouragement to small scale and cottage industries, concern for employment and for reduction of regional disparities, a progressive system of taxation, controls of various kinds over private activities to curb the concentration of wealth and economic power, promotional activities to help the weak and forgotten sections of the community as well as the growing role of the public sector in development are among the various devices that we have used for promoting equity and social justice. We shall have to rely on these and possibly other new devices during the fourth Plan to secure the vital objectives in view.

I should like, on the basis of past experience, to stress particularly the need for larger exports in the fourth Plan. We have debated from time to time the question whether we should concentrate on import saving or over export earning investments. I should like to say that the choice is not whether we should have the one or the other, but rather what is, in our particular circumstances, the most practicable and profitable next stage in development. An underdeveloped economy has many obvious directions in which it has to initiate import substitution. The process inevitably starts that way. It must not, however, end there; for one thing, there is never question of wholly substituting or eliminating imports. No country can be self-sufficient in every respect. As we develop our basic industries and branch off into diverse capital goods and intermediate products industries, we must think more and more of those lines of development that promise the most favourable impact on the overall balance of payments position. It is possible that hitherto in our general desire to replace imports, we have perhaps not been selective enough and have spread our energies and our resources thinly over a wide front. What we need now is greater emphasis on seeking out opportunities for concentrated effort in selected industries so that a return in the form of reduction in potential imports is obtained as quickly and as efficiently as possible, even if this implies continued reliance on imports in certain other directions. I am laying considerable emphasis on this aspect of import substitution because, in a country where industry is almost devoid of cost consciousness, encouragement to indigenous manufacture of equipment, parts of these or spares which results in substantially higher cost of the end product is positively pernicious. The economics of indigenous production must ultimately decide the nature and area of import directions.

As in the case of imports, so in the case of exports, there is danger in spreading our resources too thinly over a wide front. The need in the field of exports also is for concentrated effort on lines that promise the best results in terms of comparative cost advantages and the availability of markets.

I wish only briefly to touch upon the question of the division of the responsibility for development among the different agencies in the country. Clearly, in a federal system, we have to assign an important role in development to the State Governments which are nearer to the ground and which have a closer appreciation of the needs of the people. At the

Key to Planning & Prosperity

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

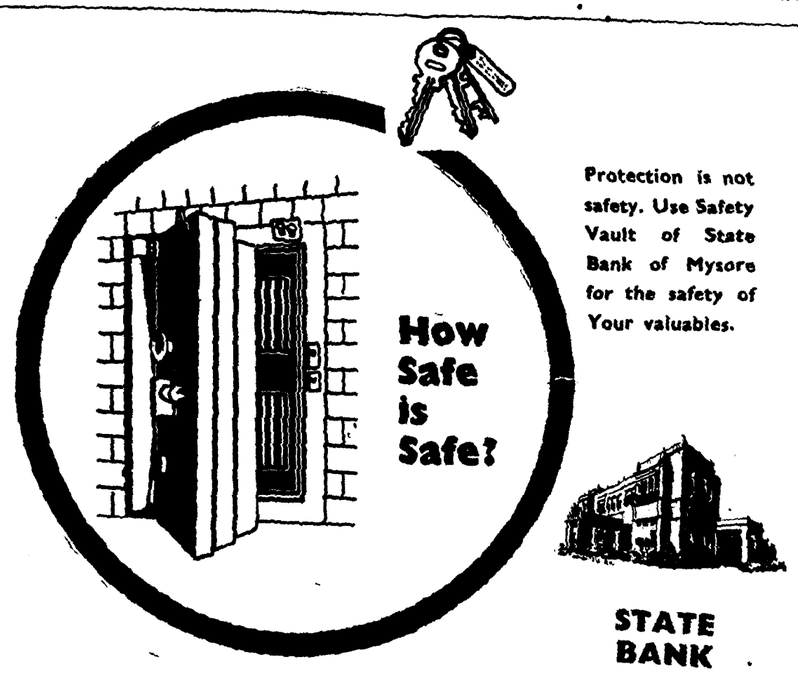
with branches all over India and East Pakistan, and correspondents in all important trade centres the world over.



offers complete banking service

same time, there is, I think, increasing recognition that, given the increasingly difficult financial position of the States and the importance of major projects in the field of irrigation and power development, it would be desirable for the Centre to shoulder more direct responsibility for these major areas of development which are at present within the States' sphere. One good that might come out of a change in the area of responsibility for such schemes might be that the economics of a project would receive greater consideration as against sentimental and parochial support that often goes with such a project.

As for the distribution of responsibility between the public and the private sector, there is, I think, nothing that has happened so far which calls for any radical change in our policy of giving to the public sector a dominant position in basic industrial development. Such shortcomings as have been experienced in the recent past have been spread equally over the public and the private sectors. If there is any need for a change in emphasis here, it is, I think, in the direction of devising new ways of co-operation between the two sectors and in determining their complementary character so that the national economy as a whole could grow fast.

In the matter of foreign private investment, our attitude has always been one where we have welcomed such investment and have given it fair and hospitable treatment. I think the stage has come when we would be justified in opening the doors even wider to private foreign investment as long as the burden that such investment might put on our balance of payments in future is not disproportionate to its contribution to our economic growth. In the early stages of development, there was, I think, every reason for us to take care that the vital areas of development were not mortgaged for ever to private foreign investment. But now that we have established the vigilant presence of the public sector in most of these vital areas, there is less reason to fear the domination of private foreign investment. In regard to assistance from friendly foreign countries and international agencies, our need for such assistance would remain great for some years to come. Nevertheless, it is not for us to decide how much of such aid will be forthcoming. Clearly, while we should continue to make every effort to enlist international goodwill in our cause, it would be only prudent to formulate our plans in a flexible manner and without excessive dependence on external assistance from the outset.

I hope the observations that I have made on the general strategy of our Plans will be of some relevance to your thinking and discussion not only in the next few days but in the months to come. Briefly, I wish to say that in my view, the direction of our effort and the basic lines of our strategy have been right. We have noticed certain shortcomings and even certain failures. These we must take into account fully while making our programmes and planning their implementation in the years ahead. At the same time, may I add, there is in this perspective no scope for any despair or for any slackening of effort on whatever account. I am optimistic about the future. I do not know whether economists tend to be optimistic or pessimistic. At one time economics used to be called a 'dismal science'. I am sure the charge is not true these days and that your delibrations will bear me out.

WINDOW ON THE WORLD

Neo-Colonialism in Development Aid

From Our Special Correspondent

PARIS:

EARLY THIS month will be published the report of the Jeanneney Commission on aid for developing countries. This body, presided over by a former Industries Minister, was appointed by General de Gaulle last March to review the whole question of French assistance for development and to suggest ways of making it more coherent and effective. The document is not yet public, but enough of its content has become known since we wrote on "France and India" ('Eastern Economist' of December 13, Pp. 1,222 et seq.) for it to be possible to return to the question with more precision. In general, M. Jeanneney and his experts confirm the evolution of French policies outlined here: aid for Africa will continue to receive priority but will not be exclusive of increased interest in Asian countries like India. Moreover, the French contribution to development should henceforth be directed less toward financing the current administration of former colonies and more toward promoting specific projects that promise a market for French capital goods.

The reasons for this shift in emphasis are frankly stated. On the one hand, there is dissatisfaction with the use made by many African states of lavish French aid. On the other hand, it is recognised that since they became independent (and since the Common Market got going) their trade has become less important to France: French exports to the franc zone were 36 per cent of the total in 1954, but only 18 per cent this year, while imports from that zone have declined as a percentage of the total from 27 to 21. Yet between 1956 and 1962 French development aid, expressed in dollars in order to correct for the intervening devaluation of the franc, has risen by 26 per cent. Most of this aid (exactly 85 per cent of bilateral public and private aid) has gone to countries in the franc zone. In other words, almost the whole of an expanding volume of aid has been going to a group of countries whose trade with the donor-nation has declined sharply in relative importance. It was inevitable that this concentration of assistance on a restricted number of beneficiaries should be reconsidered in favour of a wider spread. Incidentally, the trend in that direction mentioned here earlier has since then been illustrated in the grant of $30 million to Cambodia.

Interesting Criticism

The criticism made by the Jeanneney Commission of the use of French aid in Africa is extremely interesting. It is less an attack on the newly independent republics than a severe censure on French "neo-colonialism", meaning an attitude of well-intentioned but wasteful paternalism into which France has drifted more by default than by design. The error has been, says the Commission, to handle technical assistance on the same lines as the old colonial administration, and in some parts of Africa it would be hard to distinguish the new arrangement from the old direct rule. Genuine development aid, it is pointed out, requires that the beneficiary be really independent, and it will not be so until French civil servants in its administration have been replaced by local people. This has occurred so far only in Tunisia and the Indo-Chinese states, whereas in Morocco and Algeria French civilians still play a large role in the administration while in Negro Africa much of the former imperial administration persists under the new name of technical aid. This must be changed, says the Commission, and the only foreigners remaining in the employ of the assisted state, apart from school teachers, should be technical experts and a small number of top-level advisers.

Too much French aid, in these countries, is going to subsidising local budgets which are in deficit because of the absence of a local tax effort, because of exorbitant salaries in the newly independent administration and because of prestige expenditures. An example of these latter is the arms outlay of the African states which aims to provide them with the symbols of independence. Last year the African states of the former French empire spent 760 million francs (about Rs. 76 crores) on military outlays in addition to 110 million (Rs. 11 crores) received for that purpose from France.

The first recommendation, then, is that French development aid be, in turn, "decolonised" which means that the recipients themselves must be encouraged to seek for economic independence. For example, they should be dissuaded from prestige projects and spectacular public works financed by the foreigner, and urged not to model their political and administrative structure on the European example which is not necessarily adapted to their needs. Instead, they should be helped in developing local administrative talent and in reviving their traditional crafts. Outside aid should insist on a certain order of priorities: first the modernisation of agriculture, next light industries that use plentiful local labour and raw materials. Only then should heavy industries be considered, and these should be backed by international organisations or by a group of Western states, rather than by France alone. Finally, French assistance should go in preference to regional projects that group several developing nations, that is, the formation of small "common markets" should be encouraged in Africa and Asia.

Exemplary Operations

These considerations apply to countries where France is the principal provider of assistance, but, as noted, the Commission confirms the tendency to offer assistance to countries like India where French capital will probably always be modest alongside that obtained from other sources. What principles should be followed on those cases? The Commission there favours "limited and exemplary operations" with evident economic and political justification. That is, it recommends the Soviet approach of financing precise undertakings rather than offering general balance-of-payments assistance. Aid should be offered on a bilateral basis if the recipient prefers that, but in practice the limited volume of French aid available to countries outside Africa makes it better to combine assistance with that given by others. This multilateral approach could work through the existing international organisations, but equally well if not better through new European aid associations, i.e., some sort of Common Market co-ordination of development aid for India and other nations. Three fields are singled out where French help should be particularly useful to such countries; planning techniques as learned in France's own experience, the formation of local administrators, and the study of industrialisation programmes. In sum, M. Jeanneney's experts think that what France should offer in Asia, now that it has decided not to limit its effort to Africa, is primarily a form of educational or intellectual co-operation, plus certain "exemplary" projects and a measure of contribution to multilateral aid.

Remains the question of on what scale, in terms of cash, this wider aid effort should be made. As indicated here previously ambitions in this respect are fairly limited. In fact, the Commission virtually says that new candidates for French aid should receive only what is saved in Africa when the above-mentioned reforms in assistance programmes have been made. At least, the total French allocation for development assistance should not exceed its present percentage of the national product. The Development Aid Committee of the

OECD calculated this year that France is devoting 2.4 per cent of her national product to this task. Using different definitions both of national product and of development aid, the Jeanneney Commission says this percentage is 1.5, but however it is calculated it is admitted that the French effort exceeds that of any other nation. The Commission considers that this is quite enough, and that aid henceforth should increase only as the French national product increases, without taking a greater share of it. Since that product currently is rising by 5 per cent a year, this would guarantee a doubling of assistance in absolute terms in 15 years, so greater funds will be available without straining the economy further. An increase, it is said, would be possible if all the Western nations agreed to make it equally; e.g. if the members of the OECD all agreed to give 2 per cent of their national product to development aid, France would follow suit, but meantime (which means indefinitely) France should stick at the present figure.

Since the Jeanneney report has every chance of being favourably received at the Elysee Palace, the future orientation of French development assistance becomes fairly clear. Aid to Africa will remain the main concern but if that aid is "decolonised" as thoroughly as is recommended, there will be scope for a wider spread of effort in other parts of the world, especially if the percentage of aid allocations is maintained while the national product rises at its present pace. If the Jeanneney group's advice is heeded, assistance should become more rational and less paternalistic not because egoism is more paying than sentimentality but because the current aid policy is wide open to the charge of neo-colonialism. That vague and polemical term, incidentally, is given a precise definition in the report, where it means international assistance with these three features: confusion between technical help and old-style colonial administration, encouragement of a single export crop in an under-developed economy to meet the import needs of the donor, and finally the operation of big corporations that attain as much local domination as the old "colonial companies". To rid French aid to Africa of these three vices, it is suggested is not only politically advisable but economic, in that it will release funds for assistance in other parts of the globe where French influence is too modest to run similar risks. Thus M. Jeanneney has performed a useful task of self-criticism for a leading provider of development assistance.

A British Economic Miracle?

By JOSSLEYN HENNESSY

LONDON:

SIR ALEC Douglas Home's government has now pinned the whole of its vast schemes to increase public expenditure by no less than 27 per cent in 1963-64 and 1964-65 on the achievement of a four per cent growth rate in the economy, and one of Britain's most influential groups of independent economists has predicted that the 1964 target will be easily fulfilled. This forecast, in a recent issue of the National Institute of Economic and Social Research Economic Review, is also supported by a Federation of British Industries enquiry into business sentiment and investment plans among its members. The NIESR and the FBI agree that the economy has not yet reached top gear and is still accelerating.

Total national output has been rising at an annual rate of 5 to 6 per cent (i.e. above the minimum 4 per cent required) since December, 1962, with industrial production going ahead at 7 per cent. The Institute looks to a much bigger rise in output in 1964 than in 1963. This expansion may lead to a stock building boom in 1964, resulting in a worsening in the balance of payments, which would be "significant but not dangerous" because it would be a once-and-for-all phenomenon. Since overseas sterling area countries are likely to be building up their sterling balances, any less to reserves should be small.

The Government has already warned the electors that its programme precludes any tax cuts next April. It is relying on the buoyancy of the economy to provide growing tax revenue and on the continued expansion of private savings. The National Institute agrees that tax cuts would be inappropriate and adds that, on the other hand, it is far too early to contemplate steps to restrain the increase in demand.

Has the British "economic miracle" arrived? Can the government's spending programme be carried out without a "Stop" to the present enthusiastic 'Go"? What can, at least, be said is that the economy's gathering impetus follows the fruition of the very substantial investment in new plant and equipment during the past decade, and of the wage pause of 1961 and 1962. New techniques of controlling the economy have been emerging as the result of the Conservatives' twelve years experience in office. The National Economic Development Council is beginning to play an important role in influencing employers and workers towards a new vision of expansion. A new generation of younger leaders has been steadily assuming ever wider control over industry and commerce. Greater international resources and closer co-operation between central banks are now available to support the pound (and other leading currencies), and this should help to iron out the peaks and valleys of Stop and Go.

It is nonsense to believe that any country which has to earn foreign exchange to pay for its food and raw materials can indulge endlessly in an internal inflationary boom. The UK's notoriety for "Stop and Go" arises solely because of the exceptional extent to which it depends on foreign trade and because of its position as a world banker, but it has had no post-war monopoly of balance of payments crises followed by restrictionary measures; France, Holland, Sweden, Denmark —every country in Europe in fact — have periodically had to do exactly the same.

Difficult Choice

On the other hand, if restraint should become necessary in 1965 (when unemployment is expected to fall below 1.5 per cent, or even lower, and when private investment is expected to be rising fast in competition for funds with public investment), the National Institute urges that restraint should fall on private consumption or on current public spending. (This means increased taxes or cuts in public expenditure — neither of which are easy for politicians). The Institute is opposed to the previous methods of trying to curtail the rise in public or private investment, because cuts in these sectors take a long time to be effective, disrupt properly balanced programmes, and jeopardise future increases in productivity.

The trade unions control the prospects for a British economic miracle. If they are content with moderate wage rises and a stable currency to give them real buying power, we shall forge ahead. If they insist on wage rises in excess of the increase in output, we could still get by if the government refused to create the inflationary credit to pay for these rises. Equilibrium would then be restored, and the wage rise halted, by a warning rise in unemployment. But no government, Conservative or Labour, has ever dared to refuse to increase credit to finance wage increases. So, I repeat, it is up to the unions to decide whether they want a British miracle or not.

LISTENING POSTS

Socialists All, And Demagogues Too!

By Our Special Correspondent

NEW DELHI:

THE NEW YEAR has certainly begun on an anxious and uncertain note. Although the Draft Resolution of the Congress Working Committee on Democratic Socialism has generally been received with relief on the ground that it is, in the circumstances, a moderate document, many senior and responsible Congressmen do not trouble to hide their misgivings. They point out that the Menon-Malaviya elements are obviously exploiting the socialist slogan for creating split in the Party. Mr. K. D. Malaviya is certainly campaigning furiously for the immediate nationalisation of banks and has threatened to confront Bhubaneswar with an alternative resolution on Democratic Socialism. He has thus made it clear enough that he is seeking to put the Congress leadership on the defensive.

The surprise, however, is that some Congressmen, who ought to know better, seem to be playing the Menon-Malaviya game. Mr. Shyam Nandan Mishra, for instance, has thought it fit to revive on this occasion the exhortation to Congressmen to "Keep Left" and express dissatisfaction with the quantum of socialism in the Working Committee's Draft. More intriguing — and certainly more disturbing — is the support which Congressmen such as Mr. Chavan could be found giving to the demand for nationalisation of banks. The fact that the Maharashtra Pradesh Congress Committee had supported nationalisation does not seem to be warrant enough for the Defence Minister's action. Observers have been tempted to suggest that perhaps the issues are not being discussed only on the basis of principles or ideology. It is possible that the personal factor has also been brought in. In this reading of the currents and cross-currents of Congress politics the demand for nationalisation of banks could be seen as an attempt by some sections of the Congress Party to embarrass the Finance Minister. The Menon-Malaviya fringe had never had much use for Mr. Krishnamachari or his ideas on economic policy. What, however, may be of greater significance is that Mr. Krishnamachari's current effort to bring together for regular consultations the Ministers in the Government who are concerned with the management of the nation's economic affairs does not seem to have been to the taste of some of his colleagues. So far as the Finance Minister himself is concerned, he seems to be clear enough in his mind that there will be no gain to the community from the nationalisation of banks. He has much positive work to do and it would be surprising if he easily allows himself to be coaxed or coerced into unprofitable diversions. The point, however, is whether he can carry the Prime Minister with him.

Elusive Quantity

Mr. Nehru, as may be expected, is an elusive quantity, and, hence all this anxiety about Bhubaneswar. It has more often than not been the Prime Minister's practice not to declare his hand earlier than need be. At the recent Jaipur Session of the All-India Congress Committee for instance, there was nothing to prevent Mr. Nehru having second thoughts on Mr. C. Subramaniam's or even Mr. Nanda's draft on Democratic Socialism. A reassuring aspect to the present occasion is that the Finance Minister is believed to have discussed with the Prime Minister and kept him fully informed of the broad strategy of positive development which he proposes to follow. In Mr. Krishnamachari's plans or programmes for dynamic economic expansion the nationalisation of banks certainly does not seem to rank among the sensible courses to be pursued. It follows that a lot will have to happen at Bhubaneswar to make him change his mind.

Normally it is only fair to say that the Finance Minister himself is partly responsible for the fuss and furore which has been stirred up over the banks. For reasons best known to himself, Mr. Krishnamachari has chosen at least verbally to relax the firm stand that had been taken earlier on behalf of the Government. Mr. Morarji Desai upto the last — and even Mr. Krishnamachari on the first occasion he had to refer to the subject in Parliament after he had taken over from Mr. Morarji Desai — had stoutly maintained that nationalisation of banks was neither necessary nor would be desirable. It is a pity that instead of standing firm in this position, the Finance Minister should have allowed his Deputies, on subsequent occasions in Parliament, to qualify the Government's rejection of the bank nationalisation demand with such phrases as that the Government was keeping an "open mind" or that nationalisation was not to be considered "at present". If the intention was to ward off the extremists, it is clear that this particular exercise in diplomacy has not worked at all. On the contrary, Mr. Malaviya and his like have been persuaded, apparently, that the Government is weakening and that it should therefore pay to keep up the clamour.

**

Burmah-Shell, it is learnt, is not now biding for the oil refinery proposed to be set up at Madras. Its place has been taken by the Burmah Oil Company which, along with the Shell International, owns Burmah-Shell. The BOC, it is further understood, submitted its proposals to the Ministry of Petroleum and Chemicals some days ago, according to which the Madras Refinery will have a capacity of 2.6 million tonnes per annum, expandable to 4 million tonnes. It will be a very 'sophisticated" unit, designed to process a wide varieties of crude.

A new rupee company is proposed to be formed for undertaking the project. The Union Government will be offered 51 per cent share in it, the remaining 49 per cent share being equally divided between the Burmah Oil Company and the Shell International. The rupee finances for the venture will be arranged by the Government and all the foreign exchange requirements by the BOC and Shell International, partly in the form of their share in the equity capital and partly through the raising of loans as was done in the case of Oil-India which is a 50:50 partnership between the BOC and the Union Government, engaged currently in exploration and exploitation of the oil resources of the Nahorkatiya-Moran and adjacent areas in Upper Assam.

By virtue of its majority share in the capital, the Government will have greater representation on the Board of Directors of the Madras Refinery. It is proposed that the Board should consist of nine members, five to be nominated by the Government and four by the BOC and Shell International. The Chairman and the Financial Director will be the nominees of the Government and the Managing Director that of the BOC. The technical personnel for building and running the refinery in the initial stages will be provided by the BOC. Construction is to be completed in a period of from 28 to 30 months of the signing of the agreement.

Crude supplies are proposed to be arranged by the BOC from the Middle-East on more or less the same pattern which will emerge from the current negotiations of the Burmah-Shell with the Government in regard to supplies for the Burmah-Shell's Trombay Refinery. It is understood that Burmah-Shell is now willing to match its crude prices with those of any other supplier in a commercial sale against convertible foreign exchange, implying thereby that it will make available the same discounts over the Persian Gulf posted prices at which the Soviet Union is selling her crude to Japan. Indi-

BHARAT FORGE COMPANY LIMITED

Registered Office : 13, Elphinstone Road, Kirkee, Poona - 3

EXISTING AND PROPOSED ACTIVITIES

Bharat Forge Company Limited plans to erect a Modern Drop and Upset Forge Plant capable of producing 6,000 tons of forgings per annum on a single shift operation and 16,800 (Nos.) finished crankshafts per year.

Included in the project, in addition to modern Drop and Upset Forging Equipment, will be a completely equipped Die Shop, heat treat facilities and up-to-date equipment for Quality Control.

Complete facilities for the machining heat treatment, grinding and inspection of Drop Forged Crankshafts will enable the Company to produce these items from the billet to the completed crank.

The Company will produce a complete line of forgings and finished crankshafts in a variety of ferrous and non-ferrous metals for the rapidly developing manufacturing industries of India.

The Company has concluded collaboration agreement with The Steel Improvement and Forge Company, Ohio, U.S.A., for providing the necessary technical assistance and services. The Company has secured the necessary Foreign Exchange Loan and import licences.

LOCATION OF THE INDUSTRY

The Company has purchased from the Government of Maharashtra 61 acres and 34-8 gunthas of land in Mundhwa, within 3¼ miles from Poona City, to locate the Industry.

BOARD OF DIRECTORS

1. SHRI SHANTANURAO LAXMAN KIRLOSKAR
(Chairman)
Lakaki, Shivajinagar,

MANAGING AGENTS

Messrs. Kalyani Industries, Karad, a partnership firm is appointed as Managing Agents of the Company for a period of 10 years from 19-12-1961. The following are the partners of the said Managing Agency Firm.

1. Shri Neelkanth A. Kalyani, Karad.
2. His Highness Maharajasaheb of Kolhapur, Kolhapur.
3. Shri Chandrakant S. Kirloskar, Poona,

AUTHORISED CAPITAL

2,00,000	Equity Shares of Rs. 100/- each	Rs. 2,00,00,000
1,00,000	Cumulative Preference Shares of Rs. 100/- each	Rs. 1,00,00,000
		Rs. 3,00,00,000

SUBSCRIBED CAPITAL

75,380	Equity Shares of Rs. 100/- each at par in cash by Directors, their friends, associates and collaborators	Rs. 75,38 000
2,620	Equity Shares of Rs. 100/- each reserved for allotment to the collaborators	Rs. 2,62,000

PROPOSED ISSUE TO THE PUBLIC

77,000	Equity Shares of Rs. 100/- each at par and in cash	Rs. 77,00,000
75,000	9.3% Cumulative Redeemable Preference Shares of Rs. 100/- each at par and in cash	Rs. 75,00,000
		Rs. 1,52,00,000

The subscription list will open at the commencement of banking hours on Friday the 10th day of January 1964 and will close at the close of banking hours on Wednesday the 22nd day of January 1964 or earlier at the discretion of the Directors but not earlier than the close of the banking hours on Monday the 13th day of January, 1964.

Application forms along with copies of the Prospectus can be had from the Registered Office of the Company or from the Underwriters, Bankers & Brokers whose names and addresses are given below:—

UNDERWRITERS

The entire issue offered to the public is fully underwritten by the following underwriters :

1. GOVERNMENT OF MAHARASHTRA.
2. INDUSTRIAL FINANCE CORPORATION OF INDIA, Reserve Bank Building, Parliament Street, New Delhi.
3. THE INDUSTRIAL CREDIT & INVESTMENT CORPORATION OF INDIA LTD., 168 Backbay Reclamation, Bombay-1.
4. LIFE INSURANCE CORPORATION OF INDIA, Jeevan Kendra, Jamshedji Tata Road, Bombay-1.
5. THE INVESTMENT CORPORATION OF INDIA LTD., Ewart House, Bruce Street, Fort, Bombay-1.
6. CANARA BANK LTD., Canara Bank Bldg., 112 Jayachamarajendra Road, Bangalore.

HYDERABAD :
1. P. B. Afzulpurkar, Sultan Bazar, Hyderabad (A.P.)

genous crude, if and when available, however, is to be accorded priority. The Middle-East crude will be imported in Indian tankers.

The product-pattern proposed lays paramount emphasis on the production of middle distillates which predominate in the petroleum products requirements of the Madras area. It is hoped that these will be fully met right up to 1969-70 by a throughput of 2.6 million tonnes. The expansion to four million tonnes, therefore, will take place after 1969-70. Arrangements for exporting surplus products will be made by the BOC.

Although the estimated cost of setting up the refinery is being kept a closely guarded secret, it is said that the Madras project is expected to cost less than the 2.35 million tonnes Cochin unit which is being built by Phillips Petroleum.

★★

The Companies (Amendment) Act, 1963, except the provisions of Section 8, came into force with effect from January 1, 1964, according to a notification issued by the Government. The enforcement of Section 8, which provides for the exercise of voting rights by the public trustees in respect of shares held in trust in excess of the limits specified in the new Section 153B, will be notified later.

The amended Act inter alia provides for the constitution of a Tribunal for enquiring into cases against managerial personnel which may be referred to it by the Central Government, and also for transferring to the Tribunal the powers and functions under certain sections of the Companies Act which are at present conferred on the Court. It further gives powers to the Government to constitute a Board, to be called the Company Law Board, to exercise such powers and functions as may be delegated to it by the Central Government, and to appoint a person as public trustee for the exercise of voting rights in respect of shares held in trust. Separate notifications will be issued about the transfer of certain powers from the Court to the Tribunal and the delegation of powers to the Company Law Board when these bodies have been duly constituted.

The other important changes effected in the existing Act relate to Sections 81, 397, 398 and 408. The scope of Sections 397, 398 and 408 has been enlarged to provide for the entertainment of applications under these sections on grounds of public interest as well.

The new Section 153-B, inserted by Section 7 of the (Amendment) Act, makes it obligatory for persons holding shares or debentures in trust, to make a declaration to the Public Trustee to be appointed by Government, where the Trust is created by instrument in writing and the trust money invested exceeds the limits specified in Sub-section (4).

From 'Dry' to 'Damp'

From Our Special Correspondent

BOMBAY:

THE STATE Government announced on December 31 its new year present of a liberalized prohibition policy. Maharashtra, under the revised scheme, would still have a dry law, but this law would be directed more against illicit distillation and bootlegging than against individuals who drink. Drinks with not more than 3.5 per cent of alcoholic content and equally weak toddy will be legalised from April 1, 1964 and will be freely available. As regards foreign liquor, the quota would be increased to six units in the case of foreigners who would be permitted to entertain Indians or to be entertained by them with liquor.

Permits for foreign liquor will also be issued more generously to Indians. In the case of those above the age of 40, it is sufficient if a declaration accompanied by a medical certificate is made by the applicant to the effect that he needs alcoholic drinks for maintaining his health. In the case of others, the existing requirement that a certificate should be secured from a Medical Board appointed by the Government will continue. Persons above the age of 40 will also be given the further concession of a larger quota of four units. Those between 30 and 40 will be eligible for three units and those below 30 for two units. Simultaneously, the unit itself has been enlarged. Whereas one unit was so far equivalent to one bottle of whisky or other hard liquor or three bottles of wine or nine bottles of bear, it would fetch either four bottles of wine or 12 bottles of bear after April 1. Liquor permits will be available for two years in the case of those above 40 and one year for the rest. The logic of the more stringent restrictions put on those below the age of 40 seems to be that addiction to alcohol should be discouraged in the younger age groups when the habit may not have been formed already.

The State Government has decided further to increase the number of wholesalers and retailers in the liquor trade. It would also permit the manufacture of indigenous liquor (including that of the free 3.5 per cent variety) by sugar factories and breweries and also wine from grapes. Mr. V. P. Naik, Chief Minister, expressed the hope that following the liberalization and rationalisation of the dry law, its enforcement would secure greater public support and that the implementation of the revised prohibition policy would thereby be facilitated.

★★

The Presidents of the three professional bodies — Prof. S. K. Basu, Dr. B. N. Ganguli and Dr. Radhakamal Mukherjee — called for a re-orientation of the Government's policy for sustaining rapid economic development. The perscriptions suggested stemmed from a sharp criticism of Government policies. Prof. Basu pleaded for the introduction of a costly credit structure with the aim of rationalising the use of scarce capital resources in the country. He wanted a straight-forward use of the Bank rate without precluding the use of multiple discount rates to divert credit into useful channels. Prof. Basu suggested a preferential tariff rate system for easing the strain on balance of payments — as an alternative to devaluation. He recommended the constitution of a high-powered commission to inquire into the working of the Indian monetary and credit system.

Price Disincentive

Dr. Ganguli enumerated the difficulties and dangers of ad hoc price fixation of agricultural commodities in a developing economy. He showed how such price fixation actually acted as a disincentive to farm production by disturbing the intricate series of parities that influence farm response. The terms of trade of the agricultural sector had acted against it. Dr. Ganguli pleaded therefore for more investment in the infra-structure for agriculture, adjustments in the tax system in favour of agriculture and provision of cheap credit.

Dr. Radhakamal Mukherjee urged that the payment of bonus should be made obligatory on the employers. Bonus should be paid to mitigate the differences between actual wages and fair and living wages. The State should relinquish its responsibility for 'industrial remuneration and welfare decisions' and give the trade unions full opportunity for collective bargaining.

★★

The Indian Chemical Manufacturers' Association (ICMA), celebrated its Silver Jubilee recently. Founded in 1938 by the late Acharya P. C. Ray, it has presently a membership of 122 with a total capital investment of over Rs. 315 crores, employing nearly 1½ lakh workers.

Inaugurating the Silver Jubilee Celebrations, Mr. Asoka Mehta, Deputy Chairman, Planning Commission, said that although the chemical industry has steadily grown, and in the last decade its growth rate has been over 18 per cent a year, the mere fact that the programmes of development in health, agriculture, textiles, transport, etc. greatly depended on the rapid growth of the chemical industry called for a faster 'pick-up' than there has been so far. Capacity had increased to a considerable extent in the manufacture of inorganic chemicals, but even in this limited field, expansion was lagging behind the pressure of effective demand. In the field of organic chemicals the progress has been even less satisfying, he said.

Pinpointing the role of the chemical industry in the transformation of our stagnant economy and stratified society into a socially mobile and opportunity-cum-egality-oriented expanding economy, Mr. Mehta said that, along with the metallurgical and engineering industries, the chemical industry formed the three prongs of transformation. Mr. Mehta pointed out that in an industry of this kind, while it was necessary to get foreign know-how, it was not wise to depend on their processes wholly. He said: "We have to foster efforts that would enable us to utilise raw materials available in our country. The industry's real dynamism lies in its capacity to make science and technology augment and alter resources provided by nature." This could only be achieved through research for "research is the heart of the chemical industry and, unless the industry and science remain closely related, the industry's growth will not be lusty". Mr. Mehta said that the future of the industry depended on its ability to advance import substitution, of raw materials as well as intermediates, develop process knowhow, and help with competent consultants, our engineering firms to fabricate large parts of the machinery needed. Presently the industry with an output of over Rs. 300 crores, has been importing raw material worth Rs. 100 crores a year. To develop the industry with pressure in this measure growing on our external resources cannot be encouraged, he said. According to him the economy can become self-sustaining in its achievements and growth only when the appropriate orientation and effort enliven every sector and, indeed, every major industry.

Industry in the Eastern Region

From Our Correspondent

CALCUTTA:

THE EASTERN Regional Conference of the Indian Chambers of Commerce and Industry held here in the last week of December was remarkable for a discussion characterized by its awareness of a wider world. Mr. Bharat Ram, Mr. K. K. Birla and Mr. A. Ramaswamy Mudaliar, among others, showed keen concern for the proper alignment of the business community to the rest of the national life. They emphasised the importance of co-operative effort among business organisations for building up the right kind of platform for the industry and commerce of the nation. Mr. Bharat Ram pointed out that the business community should project a correct image of itself before the people. Mr. Mudaliar, agreeing, advised the business community to build a lobby with the people at large. He added that another lobby, a lobby with the Government, was also equally necessary. Mr. K. K. Birla pleaded that business organisations needed to be strengthened. He also underlined the fact that a large sector of trade and industry still remained unorganised into representative associations.

It was brought out at the conference by a number of speakers that it would be wrong to consider West Bengal as "over-industrialised." Mr. Bharat Ram made the telling point that, except in Calcutta and its environs, the Asansol-Durgapur region and the tea districts of Siliguri and Darjeeling, industrial development was conspicuous by its absence. Mr. K. K. Birla drew attention to the fact that, whereas population had increased by over 33 per cent in West Bengal in the decade ending 1961, there had been no corresponding progress in employment opportunities. One reason was that the State had been losing ground in the matter of new industrialization. Whereas in 1957-58, West Bengal had 360 new company registrations, it had only 327 in 1962-63. In comparison, Bombay had 293 new registrations in 1962-63 as against 191 in 1957-58 and Madras 252 in 1962-63 as against 80 in 1957-58. Mr. Sukumar Roy, President of the Bengal National Chamber of Commerce and Industry elucidated this aspect further. He pointed out that, between 1956 and 1961, the number of registered factories in Bombay rose from 1549 to 2686 — a rise of over 70 per cent. In West Bengal the figure was 1493 in 1956 and it went down to 1487 in 1961. During this period, the number of persons employed went up by 50 per cent in Bombay but only by 13 per cent in West Bengal.

The assembled business leaders agreed that not only West Bengal but the entire eastern region was in sore need of a well-planned industrialization drive.

Mr. K. K. Birla underlined the importance of proper advance planning of power development. He also pleaded for serious attention to be given to the problems of Calcutta port, both with regard to the handling of cargo and the continuously increasing port charges. Mr. Bharat Ram pointed out that the key to Assam's economic progress would be adequate transportation. In Orissa there should be strategic concentration on the development of metallurgical and metal-based industries. The industrial fortunes of Bihar would depend on how well the new industries in the Chota Nagpur region were able to flourish and multiply. The President of the Bharat Chamber of Commerce, Mr. Hari Shanker Singhania and the President of the Indian Sugar Mills Association, Mr. G. M. Modi, drew attention to another aspect. They said that the traditional industries of the region had to be given due importance too. The excessive controlling of the sugar industry was doing great harm to the economy of States such as Bihar.

Mr. K. K. Birla, concurring with the theme, pointed out that while the claims of relatively new lines of production such as the engineering industries (which, incidentally, were faced with serious shortages of steel and pig iron) had to be attended to, it would be disastrous if the continuing good health of traditional industries such as jute and tea, so important to the export trade of the nation, were not effectively ensured. In the tea industry, for instance, there was need for replanting of tea gardens on an extensive scale. In the jute industry, the mounting threat of competition from Pakistan where the industry enjoys the advantage of an export bonus scheme, could not be indefinitely ignored without dire consequences, not merely to West Bengal or the Eastern region, but to the whole country.

★★

Mr. Raj Bahadur, Union Minister for Shipping, Mr. Ashoke Sen, and Mr. Humayun Kabir, Union Ministers, and about 40 Members of Parliament visited the site of Haldia Port on Saturday, December 28, 1963. Considerable progress has been made in recent months for the detailed planning of the various facilities to be provided at Haldia and the preparation of tender documents and specifications. Soil borings at various sites of Haldia have been taken in order to determine the characteristics of the soil strata at the sites where deep struc-

tures carrying heavy loads have to be constructed. The hydraulic studies relating to the Haldia Reach are progressing satisfactorily. An esturaian dredger has already been ordered for improving the approaches to Haldia.

An estimate of Rs. 2 crores for the acquisition of 9.373 square miles of land (about 6.000 acres) required for the Haldia Project has been sanctioned. The land is being acquired. About 695 acres have already been handed over to the Commissioners. A further 300 acres of land is likely to be handed over shortly by the West Bengal Government. The West Bengal Government have also acquired land near the Port area measuring about 200 acres for rehabilitating the displaced families and are developing it. The estimated cost of developing the low lying land is estimated to be about Rs. 8.3 lakhs.

Plans for New Refinery

From Our Correspondent

MADRAS:

THERE IS much satisfaction here over the latest indication by the Union Minister for Petroleum and Chemicals that the fourth oil refinery in the public sector will be located near Madras and that there is every likelihood of its being commissioned into production in the first year of the fourth Plan. It was no doubt expected that Madras State would have an oil refinery as, from the geographical point of view, there was need for installing a big unit which would serve the growing needs of Madras City and surrounding areas without involving unnecessary expenditure on transport of petroleum products. It was not, however, clear where exactly this refinery would be located and whether it would be in the public or the private sector. Actually, reports were current sometime back that a project report had been submitted to the Central Government for installing a refinery having a capacity of 2.5 million tons by a prominent group of industrialists in collaboration with Shell International. The latest developments, however, clearly suggest that the refinery will have to be constructed at a place where the requisite harbour facilities already exist and there would be a large local market. These criteria are satisfied by Madras City and it has now been decided that the refinery should be erected near this centre.

The idea that foreign firms and Indian interests should be allowed to collaborate with Government on the model of the Phillips Petroleum Company of the United States and Duncan Brothers of Calcutta would seem to be not quite in favour and the latest reports indicate that the many foreign oil firms which have offered to collaborate with the Central Government would be asked to take a minority interest and at the same time be prepared to provide fully the foreign exchange required for importing the plant and machinery. It has been stated that Burmah-Shell is very keen on installing a plant which will be capable of producing up to four million tons annually without effecting any major additions to plant and machinery. Esso also has made an attractive offer while E.N.I. of Italy and others are in the field. It is highly interesting to be told that the capital cost of the refinery would be the lowest for any new unit in spite of the fact that many facilities would have to be newly created. Till recently, it was thought that the Cochin Oil Refinery was the cheapest. The figure mentioned for a unit having an initial capacity of 2½ million tons is only a little over Rs. 10 crores, cheaper than the Cochin Refinery by nearly one-third, even allowing for the latter's special features. In view of the scope for deriving a considerable saving in foreign exchange expenditure, with the commissioning of a new refinery, it is expected that an early decision will be taken, having regard to the various factors.

It is needless to point out that the oil refinery will form the nucleus of many other industries. Already Mr. Alagesan has stated that there is a proposal for erecting a fertilizer factory based on naphtha available from the oil refinery. Quite a few industrialists also are thinking in terms of starting petro-chemical industries which are expected to spring up in several parts of the country in the next few years in a big way.

**

The location of the new refinery may also prove to be advantageous in other respects. If, luckily, oil is struck in the Kaveri basin, the supplies can be used by this new unit. It is too early to speculate about the commercial possibilities of tapping oil from the Kaveri basin. But Russian geologists would, however, seem to be quite confident about oil being available in the required quantities without much difficulty. The drilling equipment for boring a deep well in Karaikal has arrived from the U.S.S.R. and is on the way to that centre and it is expected that drilling operations might commence in right earnest in the next few weeks. The New Year can, therefore, be said to have started under happy auspices for the Madras State.

**

If there are prospects of securing petroleum products from nearby sources, it should be said that the position in regard to the availability of power has improved considerably in recent weeks and the State Electricity Board is having a problem in regard to the utilization of capacity during nights while the peak demand cannot be met during day without a staggering of loads, arranging of shifts and holidays and the like. The State's Industries Minister announced a few days back that the supply of 20,000 kW power to Kerala from Neyveli during nights is proving helpful to both the States while existing industrial units are being urged to increase third shift working as power can be supplied to them freely. The position is expected to improve considerably after sometime as the fifth unit in Neyveli is scheduled to be commissioned in March next while the units of the Kundah project in Power House No. II might be commissioned by the middle of next year. It is not clear, however, whether the summer months will present any serious problems though the satisfactory North-East monsoon has resulted in the filling up of the main reservoirs to a safe level.

The State Electricity Board, however, is conscious of the need for firming up power availability. It has, therefore, been suggested that besides a substantial increase in the capacity of the Neyveli Thermal station, there should be a big unit at Ennore having a capacity of 300 mW based on coal imported from West Bengal or three units having a capacity of 100 mW each located at Madras, Cuddalore and Tuticorin. The Electricity Board has already submitted a scheme to the Planning Commission and it has been estimated that the cost of setting up a thermal station of 300 mW capacity at Ennore will be Rs. 29 crores. The alternative scheme of establishing three thermal stations of 100 mW each at Ennore, Cuddalore and Tuticorin is estimated to cost Rs. 34 crores. Since there is a large unsatisfied demand in the Madras region and there will be a considerable saving by installing a big unit, technical experts would seem to favour the proposal for constructing at Ennore a station having a capacity of 300 mW. Even with the use of high cost coal, it has been calculated that the net return on investment for the single big station will be 8.8 per cent and for the three different stations 6.04 per cent, based on coal in both cases. It is actually pointed out that the return on investment will be very much higher at 12 per cent if the boilers could be fired with furnace oil. The reaction of the Planning Commission for these proposals is awaited.

The moving finger writes

I SEE that the economists gathered in Bombay in Christmas week (and whose discussions were inaugurated by the Finance Minister) were agreed that the country was confronted with a crisis of character and the most important task before it was to try and raise moral values. I suppose that the Home Minister, Mr. G. L. Nanda, should now call a conference of sadhus to discuss with them the country's economic stagnation and how it can be broken.

Talking of Mr. Nanda and the sadhus, I am happy to record that knowledgeable sources tell me that after he has become Home Minister, Mr. Nanda is becoming increasingly impatient with the calls which the Bharat Sadhu Samaj is making on his time. I have been further informed that when the Sadhu papers come to him, Mr. Nanda, more often than not shrugs his shoulders and shoves them away (I mean, he shoves the papers and not, of course his shoulders, or those sadhus).

Persons working with Mr. Nanda have also been noticing other agreeable changes in him. It appears that the Home Minister is not merely crusading in public against corruption in administration. There were quite a few occasions recently, when he reportedly showed remarkable firmness in insisting on the proprieties in matters relating to very senior officers. I have heard it said on good authority that there was even a case where the Prime Minister more or less suggested that it was not necessary to take too strict a view of the background of a certain officer whose claim for promotion was being discussed. But it appears that Mr. Nanda — all honour to him — refused to budge from his stand that he could not be preaching about honesty in the Administration if he were not to insist on a record of integrity when it came to dealing with service matters relating to individual officers. This apart, the nature of much of the work that is being done in the Home Ministry is such that it is not possible for the public to know from day to day what is the quality of the new policies or the worth of the new approaches which are being tried. My sources, however, are confident that the good work which Mr. Nanda is claimed to be doing in many important spheres, such as the purity of the Administration or the adequacy of Central Intelligence, is bound to impress public opinion through its results over a period.

**

The Minister for Shipping, evidently, is a confirmed believer in looking at the bright side of things. Thus he was not unduly depressed when a research team of the Stanford University in California in the United States reported that a good percentage of American tourists who had been to India once did not want to visit a second time because of poor hotel facilities. Nor was he upset at another finding that a similar sizable percentage of tourists, who had decided that "once was enough", did so because they did not think much of our transport facilities. Finally, Mr. Raj Bahadur's exuberant spirits, certainly, were not dampened by the complaint that the swarming beggars in our tourist centres were also a deterrent to doing India 'again. And all because the Minister for Shipping and Tourism had been alert to notice the silver lining to the Stanford Report which had also said that not one of the "non-returners" had given our prohibition policies as an explanation. I am sorry to grouse, but it seems to me that when a visiting foreigner complains that our hotel amenities are nothing to write home about or that our transport is lousy, he cannot be rejoicing over the fact that in many places in this country he cannot have for the asking the bottle that inebriates so that he might be able to forget his other miseries.

**

Leafing through the early issues of "Eastern Economist", in search for "quotable quotes" for the feature "Eastern Economist 20 Years Ago", I came across a poetic effusion which a reader from Kanpur, ascribing it to a 17th century English poet, had sent for the issue of January 7, 1944. The Kanpur reader had also sent an accompanying note: "Let your readers substitute the word 'India' for 'Donkey' and the poem becomes very apposite as portraying the economic position of our country." I hope he is still a reader of "Eastern Economist", in which case I am sure he will agree with me if instead of 'India' we now say 'the third Plan' or even more appropriately, 'Democratic Socialism'. And now let us laugh with the poet.

THE DONKEY AND HIS PANNIERS

A Fable

Fessus jam sudat asellus,

Parce illi; vestrum delicium est asinus. — Virgil, Copa.

A Donkey, whose talent for burdens was wonderous,
So much that you'd swear he rejoiced in a load,
One day had to jog under panniers so ponderous,
That — down the poor donkey fell, smack on the road.

His owners and drivers stood around in amaze —
What! Neddy, the patient, the prosperous Neddy,
So easy to drive through the dirtiest ways,
For every description of job-work so ready!

One driver (whom Ned might have 'hailed' as a 'brother')
Had just been proclaiming his donkey's renown,
For vigour, for spirit, for one thing or other, —
When, lo, 'mid his praises, the donkey came down!

But, how to upraise him? — one shouts, t'other whistles,
While Jenky the conjuror, wisest of all,
Declared that an 'over production' of thistles —
(Here Ned gave a stare) — was the cause of his fall.

Another wise Solomon cries, as he passes, —
'There, let him along, and the fit will soon cease
The beast has been fighting with other jackasses,
And, this is his mode of transition to peace'.

Some looked at his hoofs, and, with learned grimaces,
Pronounced that too long without shoes he had gone —
'Let the blacksmith provide him a sound metal basis,
(The wiseacres said), and he's sure to jog on.'

But others who gabbled a jargon half Gaelic,
Exclaimed, 'Hoot, awa, mon, you're a 'gane astray', —
And declared that, 'whoe'er might prefer the metallic,
They'd shoe their own donkeys with papier mache.'

Meanwhile the poor Neddy, in torture and fear,
Lay under his pannier, scarce able to groan,
And — what was still dolefuller — lending an ear,
To advisers whose ears were a match for his own.

At length, a plain rustic, whose wit went so far
As to see others' folly, roared out, as he passed —
'Quick — off with the panniers, all dolts as ye are,
Or your prosperous Neddy will soon kick his last'!

Company Affairs

KESORAM INDUSTRIES ISSUE

KESORAM INDUSTRIES & Cotton Mills Limited, is issuing debentures to the extent of Rs. 1.75 crores to the public in order to finance a project for manufacturing cast iron spun pipes. Construction work has already started at Bensberia, District Hooghly and production is likely to start by the end of 1964. The plant will have an annual capacity of 30,000 tons of pipes from three inches to 12 inches nominal bore and fittings. The company has entered into agreements with Messrs. GHW-Gesellschaft Fuer Huettenwerksanlagen MBH of West Germany for the supply of plant and machinery, drawings, etc., for the installation of the plant. The collaborators will also provide the necessary facilities for training the company's basic staff. Moreover, a tripartite agreement on technical collaboration has been entered into between the company, its collaborators and Messrs. Buderus Sche Eisenwerke of West Germany, under which the foreign companies have agreed to provide all technical know-how for production and process control, technical consulting services and all research development to the company.

The authorised capital of the company is Rs. five crores and issued, subscribed and paid-up capital is Rs. 3,19,92,590. The present issue to the public is made up of 17,500 debentures of Rs. 1,000 each bearing interest at the rate of seven per cent per annum at par. The subscription list will open on January 9 to close on January 18 or earlier at the discretion of the directors but not before January 11. The issue has been underwritten by Life Insurance Corporation of India, Messrs. Harkisondass Lukhmidass, M/s. G.M. Pyne, the Central Bank of India, the United Commercial Bank of India, West Bengal Finance Corporation, the Oriental Fire & General Insurance Co. Ltd., M/s. Batlivala & Karani, M/s. Meconochie & Co., Canara Bank Ltd., M/s. Jhawar & Co., and M/s. M. Murarka & Brothers.

BHARAT FORGE ISSUE

Bharat Forge Company plans to erect a modern drop and upset forge plant capable of producing 6,000 tons of forgings on a single shift operation and 16,800 finished crankshafts per year. To finance this project the company proposes to enter the capital market to raise a sum of Rs. 1.52 crores by the public issue of equity and preference shares. The subscription list for this issue will open on January 10 to close on January 22 or earlier at the discretion of the directors, but not before January 13. The company has an authorised capital of Rs. 3 crores made up of 200,000 equity shares of Rs. 100 each and 100,000 cumulative preference shares of Rs. 100. Equity shares worth Rs. 75.38 lakhs have been subscribed by the directors, their friends, associates, collaborators and equity shares worth Rs. 2.62 lakhs have been reserved for allotment to collaborators. The present issue is made up of 77,000 equity shares of Rs. 100 and 75,000 cumulative redeemable preference shares (9.3 per cent) of Rs. 100 each. The entire issue offered to the public is underwritten by the Government of Maharashtra, Industrial Finance Corporation of India, Industrial Credit and Investment Corporation of India Ltd., Life Insurance Corporation of India, the Investment Corporation of India Limited, Canara Bank Ltd., Messrs. R.R. Nabar & Co., The Bank of India Limited and the Canara Industrial and Banking Syndicate Ltd.

The unit to be located at Poona will produce a complete line of forgings and finished crankshafts in a variety of ferrous and non-ferrous metals. The unit will be equipped with die shop, heat treat facilities and uptodate equipment for quality control. Complete facilities for the machining, heat treatment, grinding and inspection of drop forged crankshafts will enable the company to produce these items from the billet to the completed crank. It has secured the collaboration of the Steel Improvement and Forge Company of Ohio, USA for providing the necessary technical assistance and services. It has also secured the required foreign exchange loan and import licences.

NIRLON SYNTHETIC FIBRES

Within a period of four months of the commencement of nylon yarn production, Nirlon Synthetic Fibres & Chemicals Limited recorded sales worth Rs. 28.59 lakhs which show that the company can look forward to a substantial market for its products. This was revealed by Mr. S. Vaidyanatha Aiyar, Chairman of the company, while addressing the annual general meeting held recently. In fact, the record of the company for the subsequent eight months after the year ended March 31, 1963 shows that sales amounted to Rs. 149.82 lakhs which only confirms the confidence and the optimism with which the company has started. Nylon occupies a place of significant importance in the Indian economy as it has proved its utility for tyre cord, fabrics for rain wear, ground sheets, light-weight tents, gun equipment covers, safety belts and parachute harnesses because of its tensile strength and durability. The Chairman indicated that the company has decided to go ahead with an expansion programme which will raise its capacity for nylon yarn production to 5.6 tons a day from the present 2 tons a day. This Rs. 10-crore expansion programme includes the production of nylon tyre cord as well as caprolactam, principal raw material for the nylon industry. It proposes to produce a wide range of nylon yarn with a strict quality control enforced at every stage of manufacture. Even the present plant when in full production will have an annual turnover of Rs. 4 crores and is moreover so designed as to accommodate additional equipment without any additional construction work.

The proposed production of caprolactam, an important raw material for the nylon industry, is going to be a significant development for the company. At present, it is importing it from the Allied Chemical Corporation, USA, for which it pays through exports of fabrics. It has been able to secure firm orders for exports to meet all the foreign exchange requirements and this scheme is likely to continue till the company's own caprolactam plant starts functioning. The company has already secured a licence for the establishment of this plant with a daily capacity of 12 tons for which it has negotiated for a collaboration with a firm of international repute in the USA and the Central Government has indicated approval of the terms of negotiations. This factory is likely to be located at Thana, near Bombay, where phenol required for the production of caprolactam, will be available. The Chairman indicated that overall capacity of the proposed plant will be sufficient to meet the requirements of the entire nylon industry. The plant will also yield nearly 60 tons per day of ammonium sulphate, a nitrogenous fertilizer, as a by-product, besides producing cyclohexanone, an intermediary compound used in a number of industries such as paints, lacquers, pesticides and pharmaceuticals. Mr. Vaidynatha Aiyar informed the shareholders that the company intends to enter the capital market shortly for the issue of 106,000 equity shares of the face value of Rs. 100 each for cash at par.

ACC—PROGRESS AND PROBLEMS

Mr. Dharmsey M. Khatau, Chairman of Associated Cement Companies Ltd., reviewed the state of cement industry at the annual general meeting of the Company held recently. The industry has been facing the twin problem of rising costs and static selling prices which ultimately reduced the finances that

could be ploughed back for expansion and rehabilitation. As the Chairman indicated, the company even then has continued to struggle in its plans for expansion of capacity and higher productivity.

There has been a steady rise in the cost of production and over a period of two years alone, freight rates have gone up by nearly 15 per cent and coal prices by nearly 12.5 per cent. There have been several factors such as the rapid deterioration in quality of coal supplies, the imposition of power cuts, which further led to higher costs. In response to these increasing prices and rising costs, the company along with other producers approached the Government for revision in the retention prices which were allowed as late as on June 1, 1963. An increase of 2.75 per ton was granted which was accompanied by a cut in the selling agents' commission so that the net increase to the company was only Rs. 2.50 per ton. The Chairman also made a reference to the issue of packing materials where the Government had fixed the packing charges for cement on the basis of 50 per cent use of secondhand bags. The industry as a whole represnted to the Government about the impracticability of adopting such norms as they could not be expected to use such a high ratio of secondhand bags. Ultimately, the industry did persuade the Government to fix the use of secondhand bags at 33 per cent, which was more practicable.

Mr. Khatau reviewed the company's programmes of expansion and modernisation which were in various stages of progress. The production of 'slag cement' at Chaibasa works showed considerable improvement and the plant at Madukkarai works was being extended by 1.20 lakh tonnes. He indicated that the works at Mancherial could not operate to the rated capacity because of continued restriction in power supply. Similarly, the works at Bhupendra could not keep up the running capacity due to the shortage of limestone reserves. The company was approaching the authorities to allow the transfer of four kiln units from Bhupendra to Madukkarai works. The machine and fabrication shops of the new engineering works at Shahabad were completed according to schedule and went into production in 1963. Efforts were also being made to enlarge the scope of engineering activities at Shahabad by including new lines of manufacture in technical collaboration with Messrs. Hitachi Ltd., of Japan. The Heavy Engineering plant of ACC-Vickers-Babcock Ltd., which commenced production last year, has made steady progress. This unit was proposed to be expanded further for which a sum of Rs. 2.50 crores would be required. ACC proposes to contribute the required additional finance jointly with Vickers Ltd. and Babcock and Willcox Limited.

TUBE INVESTMENTS

Mr. A. Ramaswami Mudaliar informed the shareholders at the annual general meeting of Tube Investments of India Limited that the production of cycles, which was the primary objective of the company, had fallen during the year by nearly 10 per cent. This decline, the Chairman pointed out, was due to various reasons and perhaps the most important among them was the short supply of tubes. Moreover a severe cut imposed by the Government in the value of import licences issued to the company, had debarred it from importing essential consumable stores such as chemicals, nickel, etc. The third significant factor that caused this fall in output was a complete cut in the supply of electricity by the Madras State Electricity Board for a period of over two weeks.

The Chairman referred to the unsatisfactory nature of supplies of skelp from the Rourkela steel plant, as a result of which production of tubes went down in the company's cold roll mill installed in 1962. Skelp supplied by Rourkela was not of the requisite quality or specifications and to make matters worse the defects became manifest only after the steel had been processed which resulted in considerable avoidable financial loss.

The Chairman also referred to the taxes which had led to higher costs of production. The increase in the import duty on plant and machinery, the enhancement of inter-State sales tax the increase in the import duty on essential raw materials not readily available, were some of the tax burdens which, according to the Chairman, deserved a more thorough examination by the top authorities. He emphasised that the industry in general was having a sense of frustration because on the one hand it was being asked to show higher productivity and better results and on the other the costs of production were increasing alone with the complexities of controls and administrative delays which in their turn led to higher costs and lower production.

CONSOLIDATED COFFEE

Mr. M. A. Sreenivasan, the Chairman of Consolidated Coffee Estates (1943) Limited, utilized the occasion of the annual general meeting of the company to protest against unhelpful official attitudes towards the industry and pleaded for more constructive policies, particularly in the matter of taxation. He stressed that the burden of taxation — Central, State as well as local — has continued to increase very rapidly. In 1962 the maximum rate of agricultural income tax in the Mysore State, which only five years before had been stepped up from 25 to 40 per cent, was further raised from 40 to 60 per cent. In the same year excise duty on Arabica was raised from Rs. 21 a cwt. to Rs. 28 a cwt. It appears that as against 23 per cent taken away by taxation in 1951, 41 per cent was taken away in 1961 and 57 per cent in 1963. As a result of this rising taxation, this company recorded a surplus, after tax, of Rs. 17 lakhs in 1951 against an output of 1,500 tons of coffee and against this in 1963 on a crop of over 3,000 tons, its surplus was around Rs. 18 lakhs. In a way, as the Chairman pointed out, the manner of recent taxation has led to the paradoxical and disheartening situation in which the producer is producing more and more to get less and less in return. In the context of taxation, Mr. Sreenivasan also highlighted the fact that the slab system in taxing agricultural income has resulted in putting a heavy and inequitable burden on shareholders of larger companies which had given a lead not only in matters such as labour housing, medical facilities but also in farm techniques, quality production and research programmes. But it appears, as the Chairman indicated, the system of higher taxation of larger units has already led to sub-division and fragmentation of plantations. Between 1953 and 1960 the number of holdings of 250 acres and above declined from 227 to 157 and the number of those with less than 10 acres went up from 27,000 to 38,000.

Mr. Sreenivasan quoted a number of instances to illustrate the officious nature of official intervention in the affairs of the industry. For instance, till 1962, coffee curers were free to take out a fidelity guarantee insurance policy in respect of the coffee they held for the Coffee Board with any of the insurance companies and it usually cost them nearly Rs. 105 a year. Last year, the Coffee Board, apparently at the instance of the Government of India, issued a directive to all curers that the fidelity insurance should be placed only with one of the two insurers named by the Board and both these insurers charged a premium of Rs. 1,250 a year, which the company was forced to pay. Similarly, through some other acts and bills, the Government has reduced the manoeuvrability of producers and has taken powers to impose new controls and restrictions which have hindered the productive machinery considerably. Coffee plantations had more than trebled their total outputs in the decade 1950-1960, but this progress is unlikely to be maintained if official interference continues to be excessive and uninformed.

COMPANY MEETINGS

THE MYSORE SUGAR COMPANY LTD
Bangalore

Extracts from the speech of Sri V. Venugopal Naidu, Chairman and Managing Director at the Annual General Meeting of the Shareholders of the Mysore Sugar Company, Ltd., Bangalore, on Monday the 30th December, 1963.

1. As you are all doubtless aware, the year 1962-63 was an unfavourable one for the Sugar Industry as a whole. The set-back in production, witnessed in the preceding year, continued in an aggravated manner, with the result that the production in the country sharply declined to 21.6 lakh tonnes from the previous year's production of 27.3 lakh tonnes and 30 lakh tonnes of 1960-61. This poor performance was because of inadequate supply of sugarcane to factories. Unfavourable weather conditions, general shrinkage in cane crop and, in particular, large diversion of contracted cane for manufacture of jaggery and Khandsari were mainly responsible for this. This fall in production is most unfortunate for two reasons; firstly, the internal consumption has increased from about 21 lakh tons to 26 lakh tons and secondly there is a good demand for export, in view of the world price for sugar having reached phenomenal heights. In order to tide over the crisis of shortage, Government of India once again imposed control on price, movement and distribution of sugar with effect from 17th April, 1963.

2. As stated above, one of the main reasons why sugar factories did not get adequate cane supply during the year 1962-63, — in fact the same difficulty has been experienced this year also — was the attractive price the cane growers got by converting cane into jaggery or by supplying cane to jaggery manufacturers. Government have therefore increased the cane price this year to induce the growers to supply their cane to factories and the increase in cane price is as much as 25 nP per maund under the recovery formula. It is hoped that the Central Government — now that the sugar price is controlled — will take the full increase in cane price into consideration while fixing the ex-factory price of sugar. As far as the factories in the South are concerned, till now adequate increase in sugar price has not been given to compensate the increase in cane price.

3. In common with many other sugar factories in the country, the performance of the Mandya factory was also below expectation. The result is that for the year under review, the crushing was only 2,57,363 tonnes of cane with a production of 27,390 tonnes of sugar during a comparatively short season of 202 days. However, there was improvement in recovery from 9.77 per cent to 10.57 per cent. The total quantity of sugar sold during the year was 37,294 tonnes.

4. The working of the Distillery was also adversely affected because of the lower output of molasses in the sugar factory. The deficiency in molasses was, to some extent, made up by purchases from a neighbouring sugar factory. Government of India have passed the Molasses Control Order to assist the distilleries to obtain their requirements of molasses and it is left to the State Governments to give effect to this Act. However, the Act has not been introduced in our State so far and the State Government have been impressed of the urgency of this matter.

5. Government of India have decided to license an additional capacity of 5 lakh tons and as you know we have been asking since a few years for an expansion license to increase the crushing capacity from 1,400 tonnes to 3,000 tonnes per day. Your Directors are confident that the application will now be favourably considered. In fact, your Company has recently obtained permission from the Sugar Directorate to effect some additions and alterations to the Factory which we hope will be carried out during this off-season. As soon as the expansion licence is received it is expected that the rest of the additions and alterations would be effected during the course of next one or two off-seasons without disturbing the normal production and it is further expected that, on the average, your factory will crush about 6 lakh tonnes of cane a year thereafter. This will go a long way to improve the profitability of your concern.

6. I have already referred to the controls introduced in April 1963. The sugar industry has been subjected to alternative controls and de-controls ever since 1942. It will not be wrong to say that even in de-control period it is a highly controlled industry. Raw material price, i.e., cane price, is controlled and this constitutes about 45 per cent of sugar price; taxes, both Central and State, come to about 35 per cent; wages and salaries have been fixed by the Central Wage Board and prices of other stores materials such as fuel oil, coal, etc., are also fixed. But the sugar price is now fixed based on the Tariff Commission Report given in 1957 with certain adjustments, which does not take into consideration the actual conditions of our factory. The price fixed in our case is very uneconomical and it has been impressed upon the Government of India that they should revise the sugar price.

7. The production of sugar in our country for the last few years has seen violent ups and downs. It is therefore time to think of a long-term policy. To my mind, fixation of cane price every year is not in the interests of the industry; neither does it serve the interests of the consumers or the cane growers. This year you have seen cane price being varied three or four times for various reasons and one of them being the demand from the cane growers. Though, one of the considerations for fixing cane price is the cost of its production, yet cane price should have some relation to the price of other agricultural commodities and in particular, food crops. I hope the present high price fixed for cane will not react adversely on food crops next year. Government of India may have to think of fixing cane price for a long period, say 5 years, and any difficulty experienced by factories in procuring adequate supply of cane as in this year should be tackled by measures other than by changing the cane price.

8. Another point I would like to stress in this connection is the capacity of our factories. The average crushing capacity is so low in India that under normal conditions our sugar price will not be able to compete with the world market price. Now that Government of India are thinking of licensing additional capacities it is just right time to think of licensing bigger units and also raise the capacity of the existing small units to an economic level, say 2,000 tonnes crushing capacity.

9. About our capital re-construction and development plans I am happy to inform you that the Government of India have permitted us to issue one right share with a small

THE DYNAMIC MAKERS OF

PULP & PAPER MACHINERY

TATA-JOHNSON LIMITED, are the leaders in the country in designing and supplying top quality equipment for the Pulp & Paper Industry.

STANDARD EQUIPMENT:

Stock Pumps - Hot Liquor Pumps • Chippers - Chip Screens Chest Agitators - High Speed Refiners - Jordan Refiners - Jönsson Screens - Black Liquor Filters - Hydrapulpers - Vacuum Pumps Controllers. These and similar equipment are all supplied against Rupee Payment.

TAILOR MADE PLANTS:

Continuous Digester Plants - Batch Digester Plants - Blow Tanks and Blow Heat Recovery Plants - Brown Stock Washing Plants Bleach Plants - Black Liquor Evaporator Plants - Paper Mills.

The above type of plants are supplied with the highest indigenous content.

We are only manufacturing modern equipment as per our experienced collaborators' designs.

TATA-JOHNSON LIMITED, JAMSHEDPUR-10

BRANCH OFFICES: CALCUTTA • BOMBAY • NEW DELHI

92/TAL2A

premium of Rs. 2 and bonus shares thereafter in the ratio 1 : 4.

10. A word about our new venture. In my last year's speech I mentioned to you that we have secured triacetate know-how from Gevaerts, a well-known Belgium firm. A new Company by the name and style of "THE MYSORE ACETATE AND CHEMICALS COMPANY, LIMITED" has been incorporated to undertake this new venture. Based on this know-how, technical agreements have been concluded with foreign collaborators for supply of machinery and also for erection, supervision and initial running of the plant. A foreign exchange loan of Rs. 100 lakhs from the Eximbank and Rs. 54 lakhs from Industrial Credit and Investment Company, Limited, have been obtained and negotiations are being carried on for the balance of Rs. 21 lakhs. It is hoped that all the formalities will be completed within the next 3 or months.

11. As you know, the Mysore Sugar Company will b putting up an Acetic Acid plant as an adjunct to its Distiller and necessary Swedish credit has been obtained to purchas the plant and machinery. An agreement with the Swedis suppliers has also been signed for purchasing this plant. Witl the completion of the expansion and modernisation schem and with the commissioning of the Acetic Acid plant, th future of your Company, I dare say, is well assured.

Note: This does not purport to be a record of the Proceeding at the Annual General Meeting.

THE ASSOCIATED CEMENT COMPANIES LTD

Summary of the Chairman's Statement

The following is a summary of the statement issued to shareholders by Shri Dharamsey M. Khatau, Chairman, The Associated Cement Companies Limited, on the Company's working for the year ended 31st July, 1963. The Annual General Meeting of the Company will be held on Friday, the 17th January, 1964, at 4 p.m. at Patkar Hall of S.N.D.T. Women's University, 1, Nathibai Thackersey Road, Off Queen's Road, Fort, Bombay.

The world received with a sense of great shock and bewilderment the news of the assassination of President John F. Kennedy. We in India have lost a sincere and good friend and the world will be infinitely poorer for the absence of this great statesman of high purpose. And in Maharashtra, with the passing of Mr. M. S. Kannamwar, the Chief Minister, we have lost an able administrator who had endeared himself to the people by his simplicity, integrity and fairmindedness. These tragic losses, from far and near, will undoubtedly have their repercussions on all of us.

Though we operated under a far less tense atmospehere politically than in the previous year, the state of emergency caused by the Chinese aggression still continues. Government is naturally anxious to find additional funds to meet the great task of defending the country against all eventualities. Extra financial burdens have had to be borne by all. These levies, coupled with rising cost of production, have had a marked effect on the Company's working. It is hoped that in the coming year the indications given by the Finance Minister of reviewing fiscal policies would result in greater confidence and lead to increased industrial activity and production. The Directors' report has drawn attention to these and other difficulties that have affected the Company's operational results during the year, despite increased production and sales. Once again it has become necessary to draw from reserves to pay a reasonable dividend.

RISE IN COSTS

There has been a steady rise in the cost of production despite continuous efforts to hold it in check by improvements and innovations. In two years railway freight rates have gone up by some 15 per cent and coal prices by 12.5 per cent. The prices of consumable stores and spares have soared up by about 15 per cent. And the spiral has been urged upward by increased royalty rates, higher contributions to Government Provident Fund and State Health Insurance etc. Other important factors responsible for rising costs are the steady deterioration in the quality of coal available, the imposition of power cuts and restrictions on supply from electricity grids.

CEMENT PRICES

Since the retention price of Rs. 69.50 per tonne for the Company's cement was fixed on 1st November, 1961, there have been substantial increases in the cost of production — due directly to Government action. The Industry made repeated representations to Government to afford necessary relief, and it was only on 1st June, 1963, i.e., after 19 months that Government granted an increase of Rs. 2.75 per tonne, but there was a simultaneous cut in the selling agents' commission; thus the net increase to the Company was only Rs. 2.50 per tonne. This belated but welcome increase was, however, inadequate to cover the very heavy loss in returns amounting to over a crore of rupees already incurred by the Company. Costs have further increased since June 1963 on account of factors beyond the Industry's control, and I would urge that Government should at the earliest opportunity examine these increases and afford quick relief to the Industry in order to help it play its due part in the national development.

INDUSTRIAL POLICY

While on the subject of cement price and Government's pricing policy, I would like briefly to refer to the World Bank Mission's observations on Indian Economy, and the pricing and price control policy of the Government. The Mission's opinion appears to be that:

i. low prices will tend to discourage production, reduce the incentive to invest in expansion and will encourage the wasteful use of resources;

ii. the policy of controlling prices in key-industries has diverted capital from priority sectors — the very sectors where the need for expansion is greatest!

iii. the cost plus formula, the normal basis for price fixation, is singularly unconducive to efficiency and that

iv. there is a growing recognition in India that prices fixed for basic commodities such as coal, iron and steel, and cement are far too low.

We ourselves have had occasions to express similar views regarding Government's programmes and policies. The various Chambers of Commerce have already brought these observations to the notice of Government. The Cement Industry strongly urges Government to give due weight to these aspects of the Mission's report and to allow a satisfactory price, which will enable it to pay a satisfactory dividend, and also have something left over to plough back into the busi-

ness. This is essential for the expansion of this vital basic industry.

DEVELOPMENT AND REHABILITATION ALLOWANCE

I would also like to refer to the cumbersome procedure by which the Company is first required to deposit the net rehabilitation allowance after paying tax, in a separate account to be jointly operated by the Government of India and the Company. Rehabilitation expenses can be released from this account only on the strength of audited certificates of actual expenditure incurred on development and rehabilitation of plant and machinery. Even then, certain items of legitimate expenditure incurred such as on crane gantries, power houses, railway sidings, buildings for flotation plant etc., essential for efficient working and maintenance of the cement plant, are treated as inadmissible by Government. There does not seem to be any justification for this and we hope that Government policy and procedure will be suitably modified.

COAL AND PACKING MATERIAL

The position regarding coal supplies quantity-wise has eased considerably following the steady improvement in transport. Unfortunately, the quality continues to be a matter of serious concern, because this affects, very markedly, both the quantity and the quality of clinker produced, disproportionately increasing the cost of cement production. The quality of Indian coal of all grades has deteriorated over the last few years while its price has steadily risen. Government's action in encouraging the conversion of cement factories located in South India and Gujarat to oil-firing at a subsidised cost consequently comes as a welcome relief. The factory at Dwarka has been converted to oil, and the Madukkarai factory will follow suit shortly. In due course, the Kistna and Sevalia factories and the new factory at Porbandar, will also use oil instead of coal in their kilns.

So far as packing materials are concerned, we suffered heavily from Government's insistence on fixing the packing charges for cement on the basis of a 50 : 50 use of new and second-hand bags. The frenzied attempts of many companies to secure second-hand bags in as large numbers as possible served only to create an artificial demand which shot up prices of second-hand bags to a level far above the permitted packing charges. The Industry as a whole represented to Government the impracticability of such norms for the fixation of packing charges. Government revised the packing ratio of old to new bags from 1 : 1 to 1 : 2 from August 1963. Even this ratio is high, and efforts will have to be made by the Industry to persuade Government to fix the ratio at the more rational level of 1 : 3.

INCENTIVE BONUS SCHEME FOR CEMENT INDUSTRY

The announcement by Government early in 1963 of an incentive bonus scheme for the Cement Industry must be welcomed. Under the scheme, a manufacturer will be paid a small bonus for every tonne of extra production during the calendar year 1963 which is in excess of the best performance achieved by any unit during any of the years 1960, 1961 and 1962. This will of course mean bettering the best performance of the previous three years, and is, therefore, an excellent challenge to the Industry.

EXPANSION, REHABILITATION AND DIVERSIFICATION

The Company's programme of expansion and modernisation has been progressing as well as it could under the prevailing circumstances. The first unit of our new Jamul Works, which will manufacture "Slag" cement by utilizing granulated slag from the Bhilai steel plant, is expected to go into production by the end of 1964. The construction of the new "dry process" plant at Porbandar is also making progress. The production of special cements such as Silvicrete, slag cement, oil well cement, hydrophobic cement, etc., was stepped up and the manufacture of other ACC products — FIREBRICKS, ACCOCID, ACCOSET - 50 AND ACCOPROOF — also made steady progress. The machine and fabrication shops of the New Engineering Works at Shahabad went into production in the third quarter of 1963. Efforts are being made to enlarge the scope of the engineering activity at Shahabad in technical collaboration with Messrs. Hitachi Ltd., of Japan. The ACC Technical Training Institute at Kymore, started in 1957, is being enlarged to double the annual intake of apprentices. In course of time it will turn out skilled craftsmen to meet all our needs.

ACC'S CENTRAL RESEARCH STATION

Construction work on our Central Research Station at Thana is progressing satisfactorily. This station, the first of its kind in India, will devote itself primarily to technological and applied research on cement and concrete and other products manufactured by the Company.

ACC - VICKERS - BABCOCK LTD.

The Heavy Engineering Plant of ACC-Vickers-Babcock Ltd., which commenced production last year, has made progress. The working till 31st March, 1963 has shown a loss of Rs. 92 lakhs of which, as much as Rs. 72 lakhs is on account of unrecouped depreciation. This is inevitable since, in a heavy capital-intensive project, the attainment of a satisfactory level of output is a time-consuming process, which may take about 3 years. To provide the Company with certain balancing equipment to meet the demand for machinery, AVB has decided on a further expansion of their project.

LABOUR-MANAGEMENT RELATIONS

Labour-Management relations at the Works and Collieries continued to be cordial except at the Nowrozabad Colliery, where, owing to the misguided attitude of the labour union, it was not possible to operate the Coal Washery well for some considerable time. In August-September of the current financial year, there was an unjustified and illegal strike at our Kymore Works which lasted for 26 days. The strike was called off finally through the good offices of the Labour Minister of Madhya Pradesh and it was agreed to have the dispute arbitrated.

The Company's disputes pending before various Tribunals in respect of bonus from 1956-57 onwards have been satisfactorily settled with the majority of our unions which are affiliated to the Indian National Cement Workers' Federation. As part of the settlement and in the interests of industrial peace and increased production, we agreed to pay additional bonus amounting to Rs. 41 lakhs towards all the claims for the years 1956-57 to 1961-62. Only about 7 per cent of our labour force who are members of unions affiliated to the All India Cement Workers' Federation have not taken advantage of this settlement and are pursuing the dispute before the National Tribunal.

I would like to express on your behalf, the Management's warm appreciation of the loyalty, hard work and whole hearted co-operation of the Company's employees.

BOMBAY,

2nd December, 1963.

Note: The above summary is not a document purporting to be a report of the proceedings of the Annual General Meeting.

RECORDS AND STATISTICS

New Approach to Old Problems

THE FOLLOWING is the Statement on the Economic Situation which the Finance Minister made in Parliament on December 16.

During the time that I have been in charge of the stewardship of the Finance Ministry, I have placed before Honourable Members a number of proposals which have been designed to promote economic growth, I believe, with social justice. But I had not the opportunity of stating in Parliament my views on the economic trends and movements in the country. Last week, the Lok Sabha had occasion to discuss at considerable length the document from the Planning Commission on the Mid-term Appraisal of the third five-year Plan. My purpose today is not to return to the ground that had already been traversed. I propose instead, if I may, to think aloud on economic and financial conditions in the country in recent months and to share with Honourable Members certain tentative and general ideas on the course that economic policy might take in the months ahead.

The economic situation in the country as it confronts us today provides, so to say, a mixed bag. Some aspects of it are encouraging, others are less so. In regard to our foreign exchange situation, the position continues to be tight, though it may be said that we have, by prudent management, achieved a not too uncomfortable balance. Honourable Members are aware that our foreign exchange position turned difficult once again last summer and we had to renew our stand-by agreement with the International Monetary Fund for one more year. Fortunately, this decline in reserves was arrested after August and it has not been necessary for us to draw on the stand-by so far. In fact, we have repaid 25 million dollars to the International Monetary Fund. On the 6th December, 1963, the total foreign exchange resources held by the Government and the Reserve Bank of India, amounted to Rs. 282 crores as against Rs. 295 crores at the end of March, 1963 and Rs. 257 crores at the end of August last. We might in the coming months expect some further improvement. Even so, we expect that at the end of the current fiscal year the reserves would be of the same order as at the beginning of the year, i.e., about Rs. 300 crores or so. At this level the reserves leave only a very small margin for safety, and we shall have to continue to be as careful, as ever before, in the expenditure of foreign exchange.

Improved Export Earning

To a large extent, the satisfactory position of our external account was due to an improvement in export earnings during the first seven months of the current fiscal year which were higher than the earnings in the corresponding period last year by about Rs. 47 crores. The increases have been largely in conventional items. While this is reassuring, certain variations in the sources of our invisibles cause some concern and indicate that some of the concessions that we have given in regard to exports are being abused. We cannot afford to have our efforts at increasing exports nullified by a decrease in our earnings from invisibles. The position calls for careful watch and scrutiny. A steady increase in export-earnings must remain, for many years to come, a matter of the highest urgency and importance, and this urgency must be reflected in all our economic policies, be they policies pertaining to taxation, to controls, or to the relative emphasis given to different sectors in the programme of development.

Internally, the budgetary outlook for the current year is not unsatisfactory despite major concessions in regard to the compulsory deposit scheme, and the reduction on two occasions in premium rates for the Emergency Risks Insurance Scheme. Net receipts under market borrowings, as a whole, were somewhat lower than expected, and external loan receipts are also not likely to come up to earlier expectations. Further, the large number of budgetary imposts introduced last year have added to the cost of governmental operations, both normal and those relating to our developmental programmes. The Railways, for example, will have to spend more this year as a result of the additional imposts as well as increases in the price of coal and steel. What is true of Railways is also true of other programmes undertaken by the Centre and the States. As Honourable Members are aware, we have already agreed to increase Central assistance to the States for the Plan this year by Rs. 50 crores partly in response to the rise in costs and in part to enable the States to undertake additional programmes in the vital fields of agriculture and power. An extra provision for the Industrial Finance Corporation and the Industrial Credit and Investment Corporation of India will be made to enable these institutions to play a more active part in stimulating worthwhile investments in the private sector.

Buoyant Revenues

The shortfall in capital receipts and the additional items of expenditure to which I have referred will be off-set to some extent by an improvement in tax revenues. In regard to indirect taxes, the buoyancy witnessed earlier this year is not likely to be maintained, but, on the whole, we might expect to exceed the estimate, or at least to break even. In regard to direct taxes, it is expected that there would be a significant improvement mainly because of the more intensive collection drive. Besides, receipts under small savings have also shown a marked improvement this year so far and it is not unlikely that total collections might exceed the budget estimate of Rs. 105 crores for the country as a whole. On a realistic basis, we must also reckon with some shortfalls in expenditure.

Altogether, taking account of all the factors that I have mentioned, the overall budgetary deficit for the current year should be lower than the figure of Rs. 181 crores that was originally budgeted for. Even so, it would, in all probability, be appreciably higher than the deficit last year. Honourable Members will agree that in the present situation, in which there is considerable concern in regard to rising prices, there is no scope for complacency in the matter of deficit financing.

I am well aware that in this field of budgetary policy, we are passing through a particularly difficult period this year. Substantial additional taxation had to be imposed to meet the needs of defence and development precisely at a time when there was a significant decline in agricultural production and consequently a spurt in the prices of several basic necessities. The juxtaposition of these three factors has inevitably added to the hardships that were implicit in the higher requirements of defence and development. We have endeavoured to respond to the difficulties created by the combination of lower production, rising prices and higher taxation by some measure of relief through the modification of the compulsory deposit scheme. But in view of the budgetary position for the current year as I have already outlined, there is little scope for any further relief. Nevertheless, in view of business conditions in the country and the fact that we have already collected a substantial amount under the Emergency Risks Insurance Scheme, I have decided that for the coming quarter, namely, January-March 1964, there shall be no collections of premiums under this particular scheme. The Emergency Risks Insurance Scheme must necessarily be continued as long as the potential threat to the country remains. And let no one underrate it. It is my intention, however, to announce from quarter

to quarter the premiums to be paid under this scheme in the light of circumstances existing at the time.

As Honourable Members are aware, the two related problems which have caused us a good deal of concern in recent months are those of rising prices and an inadequate rate of growth. Over the first two years of the current Plan period, the general level of wholesale prices in the country had remained unchanged. The small decline in the first year was offset by a corresponding rise in the second year of the Plan. During the current year, however, there has been a more or less persistent upward pressure on prices, particularly of rice and sugar. On the whole, the outlook of agricultural production in the current season is better and this has begun to be reflected in the trend in wholesale prices in recent weeks. Seasonally, the price situation should show some improvement around this time of the year in any case. It would, however, be a mistake to allow any sense of complacency to develop as a result of a seasonal fall in prices.

Given the improvement in crop prospects this year it should be possible, by intensified measures of procurement as well as regulation of wholesale trade, to maintain the price situation under reasonable control. This would need both Government and people taking a long range view of the problem of prices and cost of living. Equally, we must all be prepared for the injection of a large degree of discipline in our economic system. Taken separately, the safeguarding of the interests of any distinct group or class of people appears reasonable, but when synthesizing various group and class interests and fitting them into the national interest it is inevitable that Government will have to call for sacrifices from all sectors of the population. When we speak about control of the strategic points of the economy, we have to take into account not merely the interests of the producers, but also those of the consumers, nay, even the interests of industry which consumes some of our cash crops. It is only when we are able to recognise that for every question, there is another point of view that has to be accommodated to some extent that we could progress further in the direction of establishing stable prices for the benefit of the community as a whole. This is a task which faces the Government today in all its grimness. The problem cannot be solved by Government alone without substantial assistance and support from Parliament and the public.

In the ultimate analysis, however, our success in dealing with our basic economic problems, be they problems of improving our balance of payments position, or of maintaining

a degree of stability in prices, or of raising resources for the Plan, will hinge on the success that we achieve in stimulating and sustaining production and productivity. I, for one, would not deny that in a developing economy, characterised by scarcity of resources all-round, there is a continuous need for a measure of restraint on consumption and on less essential investment. At the same time, nothing could be more short-sighted and self-defeating than the assumption that, no matter how big the problem in terms of the resources we need, it can be solved by policies of restraint. In a rich country trying to correct minor and temporary imbalances in the situation from time to time, restraint may well be the keynote of economic policy. Even in such countries, there is considerable doubt nowadays whether policies which seek to emphasize curtailment of demand, rather than augmentation of supplies, are really well-conceived. In our situation where a large section of the people are living on sub-marginal levels of existence and where there is considerable leeway to be made in raising production, our fundamental approach to any imbalance or shortage can only be in terms of ending this shortage or imbalance at higher levels of supplies rather than in terms of greater and greater restraint on demand. Let me repeat that I do not dispute the necessity of a measure of restraint. Much less do I plead for a complete abrogation of regulation or of a sense of priorities. But I have no doubt whatsoever that we shall succeed in solving our complex and difficult problems only in so far as we succeed in fixing our eyes steadily on expansion and higher production even as we seek to contain demand within reason at any given time.

Interest Policy

As Honourable Members are aware, we have, of late, taken a number of measures to stimulate economic activity in the country. The Reserve Bank has announced that it will ensure that credit for all legitimate purposes is available in the current busy season. But it is not our intention to usher in an era of cheap money policy in the country. For a country like India where capital is scarce, the accent of monetary and credit policy must necessarily be on realistic rates of interest which reflect adequately the real cost of capital to the economy. At the same time, the supply of credit should be adequate to meet the needs of growth. The enlargement of resources of the Industrial Finance Corporation and the Industrial Credit and Investment Corporation of India, the establishment of the Unit Trust, and the legislation which I intend to introduce for the setting up of a Development Bank, are all designed to strengthen the present institutional framework for meeting the legitimate financial needs of private industry.

While considerable attention has rightly been focussed, of late, on the need to increase agricultural production, we should not lose sight of the fact that industrial production also needs to be increased at a much faster rate than has been the case so far. The rate of increase in industrial production during 1962-63 was somewhat higher than in 1961-62. Indications, however, are that even with improvements in a number of directions, the rate of increase in industrial production during 1963-64 will be of the same order as in 1962-63, i.e., roughly 8 per cent or so. I do not wish to go into details here about production trends in different industries. Basically, I think, the situation that confronts us is very clear, namely, that unless industrial investment in a number of vital sectors is increased as quickly as possible, and unless production in some of the important consumer goods industries, such as, cotton textiles and sugar, picks up to a significant extent, it will not be possible for us to achieve an overall rate of growth in industrial production of the kind that we urgently need.

Speaking on this subject of growth on the All India Radio on the 11th of October I had mentioned that it was my intention to review the present fiscal and related policies with reference to the immediate needs of the economy as well as the requirements of growth and social justice in the years to come. Honourable Members would appreciate that this is not the occasion to announce any changes in the fiscal system. Around this time of the year it is customary to review our budgetary policy departmentally in the light of the requirements for the coming year and the emerging conditions in the economy. In the nature of things this examination of budgetary policy cannot be conducted in the full glare of publicity. At the same time, there is, I think, a certain advantage in taking Parliament and the people at large into confidence up to a point, well before the finalisation of the Budget proposals.

The budgetary outlay next year will inevitably be considerably higher than during the current year. Given the continuance of the emergency and the threat to our borders, of which I see no visible signs of abatement, there cannot clearly be any question of slackening our defence effort. On the other hand, the Plan outlay next year will have to be substantially larger. We are currently having discussions with State Governments on their plans for 1964-65 and indications are that Central assistance to the States next year for their plans will have to be significantly larger than in the current year. The outlay on the Centre's Plan next year will also have to be higher.

A certain order of increase in non-Plan expenditure is also inevitable. As Honourable Members are aware, we have already taken a few measures to enlarge the area of social security. It is my intention to extend these measures to the

maximum extent possible consistent with our ability to find the additional resources. This too, while conferring a direct benefit on the people, will impose an additional claim on public resources.

To a certain extent the increase in expenditure, both Plan and non-Plan, would be offset by growth in normal tax revenues and by greater utilisation of external assistance as the projects for which such assistance is earmarked begin to get completed. On the other hand, while it should be our endeavour to increase receipts from small savings even beyond the satisfactory levels for the current year, it will not be prudent, in the light of this year's experience and the requirements of the rest of the economy for funds, to plan for any significant increase in the resources to be raised by market borrowing. There is also no question of taking the lid off deficit financing at a time when the utmost vigilance is required on the price front.

I think it will be clear from what I have said that given the imperatives of the situation, the need for increasing the pace of mobilisation of resources remains as insistent as ever. In short, in any review of fiscal policies, the primary emphasis has to be on such forms of modification and rationalisation of the tax system as are calculated to improve the performance of the economy without disregarding the need for raising resources on an adequate scale. The relevant question before us, therefore, is whether there is any scope for making such changes as would stimulate savings, investment and production and thereby contribute even more to the buoyancy of public revenues than the present tax system does.

Unaccounted Money

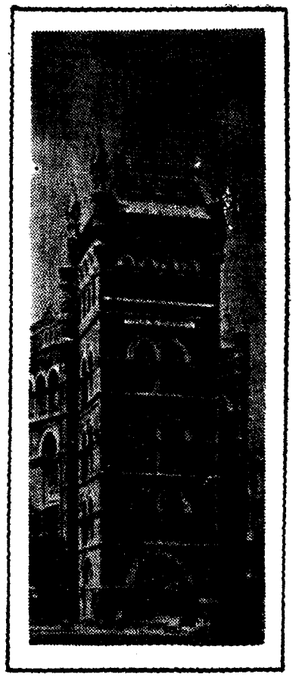
Honourable Members would recall that on a number of occasions I have referred to the prevalence of unaccounted money in the economy. It is a curious paradox of our situation that, while money for worthwhile investments and public purposes is in short supply, there is a great deal of unaccounted money circulating in the economy in search of further undercover gains. What is even more important, the social evil inherent in tax evasion gets doubly compounded as it necessitates greater and greater tax burdens on those who are law-abiding. Perhaps the most important problem that faces us in regard to fiscal reform is that of devising astute and stringent measures to meet this evil of tax evasion so that it might be possible to distribute the burden of taxation more justly and evenly between different individuals in the same or similar walk of life. We have thought too exclusively of social justice as justice between different classes or sections of the community and not enough of the injustice inherent in tax evasion as between different members of each class or profession and as between the honest tax-payer and the dishonest evader.

Another avenue which I think we need to explore is that of surpluses from public enterprises. It has been common knowledge for some time that the returns of investment in the public sector have not been commensurate with what we should expect. The mid-term review also brings out the fact that, while we are likely to exceed the target of additional taxation by a substantial margin, surpluses from public enterprises are not likely to come up to original expectations. There may be many unavoidable reasons for this into which we need not enter here. The fact, however, remains that the public sector cannot hope to play a dominant part in the development of basic industries, transport, power and the like unless our massive investments in these fields begin to earn a reasonable rate of return. Over the years to come, we shall have to rely relatively more on the profits of public sector enterprises than on taxation for meeting our needs if a proper balance between the two is to be kept. It may well be that profits of public sector enterprises can be raised in part at any rate, only by adjustment in their pricing policies. If so, we must be prepared to make the adjustments promptly. It is a major question for consideration whether such adjustments in pricing policies are not to be preferred to additional indirect taxation on commodities in the production of which society at large is already earning a reasonable overall return.

Pricing and Control

This question of pricing policy and controls has rightly received a great deal of attention in recent months. It has often been said, for example, that the growth of the economy is hindered by the controls that we maintain at present on a large number of commodities. A measure of control is undoubtedly necessary, nay even imperative, in a planned economy, particularly in regard to those basic items which are in short supply and where there is danger of monopolistic exploitation. At the same time, controls in their actual implementation often impede the operation of those very forces which might make for the elimination of the shortages and introduce some degree of competition. It is for this reason that we have been reviewing the operation of controls over a number of sectors in the economy for some time now and we have come to the conclusion that gradual and orderly relaxation of some of the controls would be in the interest of stimulating economic growth. Government have accordingly decided to abolish the present controls over the price of 16 commodities, viz., rayon yarn, staple fibre, caustic soda, soda ash, hydrochloric acid, chlorine, calcium carbide, bleaching powder, chilean nitrate, muriate of potash, sulphate of potash, washing soap, tyres and tubes, sheet glass, paper board (but 'not' paper) and natural rubber.

As Honourable Members are aware we have appointed at present a Committee to examine the present procedures in regard to licensing of industries, the grant of capital goods licences, the control over capital issues and similar other controls which affect the expansion of the private sector. Pending full enquiry by the Committee and in the light of our experience, we have decided that under the Industries (Development and Regulation) Act, the limit for exemption from licensing which was raised to Rs. 10 lakhs in 1960 will now be raised to Rs. 25 lakhs. Correspondingly, the exemption limit for purposes of the capital issues control is also being raised from Rs. 10 lakhs to Rs. 25 lakhs. In general, in the administration of all controls, including permissions for intercorporate investments, we shall be guided mainly by the need to promote the growth of essential industries. I hope that, quite apart from freeing a significant area of industrial investment from these requirements, the proposed change will also make it possible to deal with those cases which would still require a licence or sanction, with greater speed and efficiency.



In announcing these changes I should like to make two things abundantly clear. Firstly, in our present foreign exchange position, we cannot relax the scrutiny over the import of plant and machinery associated with any investment howsoever small. In sanctioning licences for the import of capital goods, therefore, Government will continue to have the utmost regard for the essentiality of industry and other relevant factors. I should also like to make it clear that even after this liberalisation no one should put up industries which would need steady supplies either of imported raw materials or of indigenous raw materials which are in acute shortage and the distribution of which is controlled by Government. The relaxation I have announced is therefore intended to simplify and expedite the present licensing procedures and to give a special fillip to the setting up of industries with indigenous equipment and using indigenous raw materials.

I venture to think that the steps we have taken and are now taking would help to lift the economy to a somewhat higher level of effort and enterprise than has been the case for sometime in the recent past. At the same time many more things will need to be done. My tentative thinking on the state of the economy and budgetary problems for the coming year will, I hope, help stimulate thought and informed discussion on these matters of vital public importance.

Whither India? Whither the World?

THE PRESIDENT of the United States of America and the President of the Indian National Congress are in many ways remarkably alike. Both are of the earth, earthy. Neither has pretended (or can ever pretend) that he is more than what he is; or what he seems to be. Consequently, the popular respect or the popular support that either might evoke is more solidly made than the mass enthusiasms inspired by more flamboyant politicians.

Mr. Kamraj has come to be the Congress President almost as unexpectedly and as abruptly as Mr. Lyndon Johnson came to be the President of the United States and the accession of both has prompted similar popular reactions of friendliness and goodwill, prompted by curiosity. If Mr. Lyndon Johnson makes a good President which in all probability he will, most Americans will be more than satisfied. Should he succeed in becoming a great President, they will be pleasantly surprised. Similarly, with Mr. Kamraj in the Indian (Congress) context.

It may not, therefore, be entirely an accident that, on the occasion of their most important public speech-making to-date in their present capacities, both Mr. Johnson and Mr. Kamraj have spoken much the same language in some ways. The U.S. President's State-of-the-Union Message to Congress and the Indian Congress President's address to the annual general session of the party at Bhubaneswar are both relatively short speeches, employing a minimum of rhetoric and expressing a whole series of realistic political judgments on the various affairs with which each is concerned. The U.S. President, in his speech, gives first thought to the forging of unity of purpose and a common course of action between the two political parties — Democrats and Republicans —, the two regional personalities — the South and the North —, the two wings of the Legislature. — the House of Representatives and the Senate — and the two limbs of Government — the Congress and the Administration — which must let themselves be bound closer together by the democratic processes of the American Constitution if the United States were to continue to help provide leadership in progress to more than one half of the world and security for all of it.

Mr. Kamraj, in his less dramatic and certainly much more limited jurisdiction, has also had to call for a consensus through a commitment to the largest national good. He emphasized that the political and economic organisation of this country would have to be based on the consent of the people and that it was necessary therefore for all those who had faith in the ideology of socialism and democracy to participate in the building up of a new society instead of frittering away their energies in small groups and organisations.

Again, just as the U.S. President would appeal to Congress to "demonstrate effective legislative leadership by discharging the public business with clarity and dispatch, — voting each important proposal up or voting it down but at least bringing it to a fair and final vote", Mr. Kamraj had to insist on the efficient implementation of legislative and executive measures in furtherance of accepted goals. If, in the list of priorities and administrative action, Mr. Johnson placed first the issue of Civil Rights and advised Congress that it should also make this session memorable in history as the one "which enacted the most far-reaching tax-cut of our time", Mr. Kamraj too was concerned with defining clearly the areas of

urgent legislative and executive action, mentioning land policy as a matter which called for competent implementation.

On the problems of a larger world, Mr. Kamraj, after referring to the efforts of the late President Kennedy and Premier Khrushchev to bring about a lessening of world tensions — efforts which have happily succeeded in large measure — dwelt on the importance of the Disarmament Sub-Committee of 18 nations meeting in Geneva discharging sincerely its great duty and responsibility to the people of the world. The United States has, of course, a very special responsibility in the matter of world peace. The highlight of the State-of-the-Union Message, consequently, was that President Johnson, after making it very clear that, in 1964, his country would be better prepared than ever before to defend the cause of freedom, committed himself to making new proposals at Geneva for the control and eventually abolishment of arms. Not less encouragingly, he said that, even if no agreement might be reached on Disarmament, he was convinced that the United States should not stockpile arms beyond its needs or seek an excess of military power that could be provocative as well as wasteful. The U.S. President pointed out that his Administration was cutting back its production of enriched uranium by 25 per cent shutting down four plutonium piles and closing down many non-essential military installations. The President indicated also that the budget which was to be submitted shortly would propose reduced spending on Defence consistent with the maintenance of that margin of military safety and superiority which, he claimed, had been obtained by the United States through three years of steadily increasing the quality and quantity of strategic, conventional and anti-guerilla forces.

President Johnson's indications of the U.S. Government's likely attitudes at the Geneva Disarmament talks came in the wake of the Soviet Prime Minister Khrushchev's declaration of January 3, calling for a "fresh wind" to soften the international climate, and proposing an international agreement renouncing the use of force in settling territorial or border disputes. If the cutting down of Defence budgets by the Big Powers is an earnest of their serious pursuit of world peace, the Soviet Prime Minister has also been talking of a further reduction in the numerical strength of the Soviet armed forces and the cutting down to a certain degree of military expenditure in the course of 1964. It is, of course, true that if the Soviet Union is proposing to trim its Defence budget, it is at least partly because the high cost of competitive nuclear preparedness is becoming too great a strain on nations, however powerful over its citizens or rich in resources. Even in the case of the far wealthier United States the point has admittedly been reached where the President is pledging his Administration not only to be efficient and honest but also frugal. His State-of-the-Union Message thus takes pride in the claim that the budget which is to be submitted shortly would cut the deficit in half, that is, from $10 billion to $4.9 billion, and would be, in proportion to the national output, the smallest budget since 1951. The US President, proceeding, pointed out that within the framework of the reduced budget, he would still be able to promise the largest Federal support in history for education, health, rehabilitation of the unemployed and relief of the economically and physically handicapped.

It is interesting that Mr. Khrushchev too has to think on similar lines. Apart from the fact that he desires to step up investment in the chemical industries and has conceded that the necessary funds would have to be diverted from other sectors of the economy, he has spoken significantly of the need to devote special attention to meeting more fully the requirements of the Soviet people through what he describes as "social funds", i.e., from public revenues. While, already hospitals, schools and educational establishments were being paid for by the State from social funds, he urges that with the growth of the material wealth of the society, more and more has to be done in that direction. For instance, children in nurseries and kindergartens should be provided with food and meals free of charge and then, gradually, they should be provided with free breakfast and lunches in the schools as well as with school uniforms and footwear.

But it is not only the relatively poorer Soviet Union which has to worry about the need for more social services. Even the President of the United States, the richest country in the world, has to take note of the poverty which exists in his country — "in city slums and small towns, in share-cropper shacks, in migrant worker camps and on Indian reservations, among whites as well as negroes, among the young as well as the aged, in boom towns and depressed areas," as he himself has put it. President Johnson has also had to call for special efforts for the benefit of the chronically distressed areas and of segments of American population consisting of the jobless, the aimless and the "hopeless youngsters" who have to be given opportunities for working on useful projects. He has even said that there is need for a domestic counterpart to the Peace Corps which — with American money and American organisation — is engaged in helping the economically handicapped in other countries of the world. The President has also insisted on the expansion of minimum wage laws to more than two million workers now lacking this protection of purchasing power and he has said that the United States should no longer postpone meeting its obligations in respect of medical care, proper housing or low-cost transportation for the poor and the elderly. Above all, he has told a nation that has been distributing vast agricultural surpluses around the world year after year that, in its midst, too, there is the needy for whom it must provide through a broader food stamp programme.

And how do those two great countries propose to do all this, that is, improve the lot of their peoples? Mr. Khrushchev is forthright on this point. Most emphatically he tells the Communist Party of the Soviet Union that "it is necessary to work hard in order to create the material boons of life". The cutting of Defence or other spending, whether in the United States or in the Soviet Union, could thus be only a part of the answer to the problem of securing more and more welfare for the people. Even in the richest or the most powerful countries of the world, the need for more and more production for the relief of poverty is both significant and urgent. It is, of course, true that poverty is for the most part a relative term, but when one out of five Americans has an annual income of less than 3,000 dollars while the national average is more than $7,000 and has, therefore, to live in conditions which (in the American sense) are characterised as sub-standard, then poverty, even in the American context, must cease to be notional to the Americans. And since, even Mr. Khrushchev, working within the Communist system, cannot call for hard work without promising better wages and better living conditions, it is obvious that the US cannot talk of more production in the United States economy without also talking of incentives. Hence President Johnson's emphasis on prompt legislative action for a programme of tax reduction which would add "$11 billion to the private spending stream and thereby create new jobs and new markets in every area."

What, now, are we, in this country, proposing to do about our own problems of poverty? The Congress President in his speech and the Congress Resolution on Democracy and Socialism have asked that the highest priority be given to assuring a national minimum in essential requirements to every citizen in respect of food, clothing, housing, education and health. If the United States, where only one in every five citizens is poor in the American sense, has to think in terms of greatly stepping up its production in order to improve the lot of its poor, can there be any limit at all to what this country will have to do in terms of stepping up its economic progress if it is to relieve poverty among a population of which more than nine in every 10 are poor, not just in the Asian sense of the word, but in the very special Indian sense of the poverty of, for instance, the pavement-dwellers of Calcutta or casual agricultural labourers almost everywhere in the countryside? It is on this question that much of the proceedings at Bhubaneswar would seem to be far from reassuring. It is often demanded in certain sections of the Congress that it is not enough to define the Party's goal as socialism but it is necessary also to detail the specific proposals for achieving socialism. Is it not at least as reasonable to ask, that besides saying that the people should be provided with the basic necessities of life, the Congress should also propose specifically how this is to be done? To the extent that this question has not even been properly asked in the Congress Session, the people are bound to doubt that the party is really concerned in a pragmatic way about improving the living conditions of the people for which more production is necessary. Mr. Khrushchev has a recipe for more production. He could demand that the Soviet people work harder and ever harder. Mr. Johnson too has a formula. He could cut unnecessary or wasteful Government spending, insist that the taxpayer gets a dollar's value for every public dollar spent and proceed to release more resources into the hands of the individual citizens for increased consumption as well as place more funds with the productive apparatus of the community for more investment. What the Congress Party in our country has done, however, is to debate whether banks and rice mills should be nationalized or State Governments should put up factories instead of maintaining roads, building hospitals and schools or providing irrigation.

On behalf of three countries, the United States, the Soviet Union and India, there have been attempts in the past few weeks to tell the world what they expect to do in 1964 and what they expect 1964 to do for them. It remains to be shown that India in 1964 would see satisfaction in either direction.

Eastern Economist 20 Years Ago

JANUARY 14, 1944

In his address to the Associated Chambers of Commerce last month, the Viceroy said that the full realization of the Sargeant scheme must wait on other developments. In his own words, "India at present has simply not the money for such a scheme. As the country acquires increased riches by industrial and agricultural progress, so it can afford to spend larger sums on education and health. This is, I think, the way in which the social services have developed in other countries." Mr. John Sargeant has now answered him. He suggests three sources of finance, viz., diversion of a part of defence expenditure to education on the assumption that there will be peace after the present war, freeing a part of the funds of religious bodies after meeting their due needs on the lines to be recommended by a charity commission which should be appointed for the purpose, and international rehabilitation credits. On the last one it is futile to rely, even though on grounds of justice India's social services are in the nature of the rehabilitation of a country devastated by exploitation, inflation and famine. The refusal of the U.N.R.R.A. aid to Bengal is enough evidence. The idea of a charity commission is commendable. It must be possible to get considerable funds from the religious bodies without in any manner prejudicing their religious and other social functions. Already these bodies are devoting some of their resources to education. But what is wanted is their pooling and liberalization and the pruning of less important expenses. Reduction of expenditure on defence is problematical in the extreme.

Highlights of the Week

BLOOD AND THUNDER

THE LAST few days have not been good for anybody's blood pressure. The surprise really is that more were not taken ill at Gopabhandhunagar. Mr. Lal Bahadur Shastri, for one, must have found it all a great strain. It must, however, be reassuring not only to the party faithful but to the people, by and large, that he could so confidently step into the breach and more or less take charge of the deliberations of the Steering Committee in the absence of an ailing Nehru. In fact, it is possible that the Prime Minister not being there served to impart self-confidence to the party elders and enable them to fight the wild men who were clamouring for the nationalisation of this, that, or the other.

Although much of the debating in the Steering Committee on the draft on "Democracy and Socialism" was sheer political exhibitionism, it was good that controversial issues were thrashed out and the "nationalisers" shown to be an isolated lot. Mr. Patnaik failed miserably in his attempt to bully the High Command into giving silent approval to the nationalisation of banks at some future date, if not now. Mr. Patil called his bluff and had it go on record that the nationalisers yet had to show that they were anything more than a minority of malcontents. In the event the attempt to use the Congress session to stampede the Finance Minister into a commitment to nationalise banks failed miserably.

DANCING DERVISHES

THE WILD men, however, had better success elsewhere, not, perhaps so much in the body of the Draft itself, as in the attendant speeches and the address of the Congress President. It seems now to be the case that Congress Governments in the States are being committed — at least in form — to a policy of taking over rice mills or flour mills or setting up public undertakings in medium industries producing consumer goods, or, perhaps, even capital goods such as machine tools. It is, of course, more than likely that much will be done in these directions since at least State Governments, by and large, are better aware of their limitations than the collective brain or brawn of the Congress Party politicking in Bhubaneswar pretended to be. What may do more real damage is the series of vague, but nevertheless potentially harmful, generalisations made with regard to the so-called concentration of wealth in the country. The Congress President spoke of this and urged measures for reducing disparities in income and wealth. Inherited wealth and what has been described as "unearned income", along with the "unaccounted money" of the Finance Minister's occasionally speculative economic philosophy, have been raised to the status of the nation's first three public enemies. It would be tragic, indeed, if the Finance Minister's essentially pragmatic thinking is to be distorted unduly by political pressures or personal vagaries. The stock exchanges have been sensible and subdued and the clamour of capital issues for public subscriptions in the New Year has been virtually drowned in the din and disturbance of the Congress session.

LEST WE DESPAIR

BEFORE LEAVING Bhubaneswar, we must gratefully note that the Steering Committee effected an amendment in the Party Constitution in order to make it clear that the Congress brand of socialism is socialism based on parliamentary democracy. Mr. Lal Bahadur Shastri, determined to be hopeful, suggested that this should help achieve the peaceful co-existence within the Congress Party -- but not surely within its Bombay organs? — of Mr. Menon demanding socialism and Mr. S. K. Patil desiring parliamentary democracy. Incidentally, while pledging itself to democracy, the Steering Committee would curtail democracy in the party's own functioning by depriving primary members of the right to vote in party elections. Resistance from the Floor, variously motivated, however, succeeded in keeping the proposal open for settlement by concensus in the Pradesh Committees. And, as if to remind the world that there was a man called Gandhi and that the Congress was his creation, the Faithful, spurning temptations, stood up and reaffirmed that they should continue as habitual wearers of khadi. That, at about this time, this country should be practising some modest space rocketry at Trivandrum did not, obviously, strike the khadi enthusiasts at Gopabhandhunagar as incongruous.

WITH SOUL INTACT

THAT THE Congress had not lost its soul whatever might be said or heard in the country or outside — was further proved by an impressive last-ditch fight for prohibition by Mr. Gulzari Lal Nanda. It would be uncharitable to suggest that Mr. Nanda was fighting not so much for a principle as for his portfolio, although, besides being Home Minister, he happens to be in charge of Prohibition as a Member of the Planning Commission. Thanks to a highly spiritual barrage mounted against him, Maharashtra's Chief Minister, Mr. V. P. Naik, had to agree ruefully not to proceed with his decision to give a spirituous slant to the "Dry" law in his State until, as suggested by the Congress President, the whole issue of Prohibition could be revived and settled on an all-India level.

QUIETLY DOES IT

NATURALLY, AMIDST all this excitement, many other lively happenings of the week did not receive their due attention either in the Press or from the public. Thus, the first diesel locomotive to be built in this country chugged and clanged out of the railway workshop at Varanasi, while in New Delhi, in a rather more quiet manner, Mr. Manubhai Shah was eased of his responsibilities for "Textiles", "Handloom Industry" and "Jute", which were transferred from the Ministry of International Trade to the Ministry of Industries, to which went also "Cement" from the Ministry of Steel, Mines and Heavy Engineering. While Mr. C. Subramaniam, who relishes describing himself as Minister for Mines, Metals and Machines, would, no doubt, be only too glad to be relieved of the untidy presence of an extraneous subject in his portfolio, it is hardly likely that Mr. Manubhai Shah is equally happy over the rationalisation treatment given to the Ministry of International Trade. It is, nevertheless, possible that Mr. Manubhai Shah may decide in favour of doing more with less. What is rather doubtful is that Mr. Kamungo, now in charge of the Ministry of Industries, would be left undisturbed in the larger responsibilities which have now been given to him. Mr. Sanjivayya should soon be coming into the Council of Ministers in some way or the other and it is more than likely that as part of the further changes that will have to be made with regard to persons or portfolios, the Ministry of Industries and the Ministry of International Trade are brought together by reviving the Ministry of Commerce and Industry and placing it under a Cabinet Minister who may not necessarily be Mr. Sanjivayya.

Indian Exports to Common Market

R. M.

THIS STUDY attempts to evaluate the consequences of the advent of the Common Market for India's exports. The analysis is mainly based on a comparison between the national tariffs of the six E. E. C. countries and the Common External Tariff of the Community. The conclusion drawn is that the formation of the Community will not adversely affect our exports. The difficulties we face in exporting to these countries are not the result of the formation of the E. E. C., but the legacy of the policies followed by the member countries before the Community was formed.

Indian exports to E. C. M. during 1958 are set out in Table I. It will be seen that our exports to E. E. C. went up steadily except in 1962-63, when there was a fall due to the reduced exports of coffee and leather. The shortfall in the case of coffee was due to a decline in production and consequent high prices. The main reasons for the decline in the export of leather were increased internal consumption, a shortage of raw materials and the fall in prices. However, the latest statistics show that the rising trend in our exports to E. E. C. has been restored. Exports to E. E. C. during April-August, 1963 have been 28 per cent. higher than our exports during the same period last year. The rise in the total exports during the same period is only 15.5 per cent. The export trends are significant considering that the E. E. C. countries have gone a long way towards reducing the differences between their national tariffs and the Common Tariff of the Community.

However, in order to examine the consequences of the Common Market for our future exports to E. E. C., it is necessary to consider, in detail, the effect of the Common Market on the important commodities which are exported to those countries. For this purpose twenty commodities, which together account for about 75 per cent. of Indian exports to E. E. C. and exports of each of which exceeded a crore of rupees in value during any one of the last six years, have been included in the list. Table II shows the exports of these commodities alongside of the country's total exports.

Of the twenty commodities in the list, the following will enter the community duty free—iron ore, manganese ore, mica, raw wool, raw cotton, rose wood, opium, coir yarn, groundnut seed, bones and oil-cakes. In the case of leather 90 per cent. of our exports, which consist of undressed sheep skin and goat skin, will enter duty free. In the case of lac and shellac, only bleached shellac has to pay duty at 3 per cent. Recently the Community agreed in principle to suspend the tariff on bleached shellac. All types of lac and shellac can thus enter the Community without paying any duty. Some of the commodities, which now enter duty free, had to pay import duties varying between 4 and 7 per cent to member countries according to their national tariff rates. With the rapid economic growth of the Community,—the rate is expected to be 5 per cent. per annum—the exports of all these 13 commodities on which no duty is charged can be expected to go up substantially.

Gatt Negotiations

There is another group of commodities, in the case of which the Community has agreed in principle to suspend the Common External Tariff. It can be reasonably expected that the suspension of duty will be consolidated in the GATT round of negotiations*. We can confidently expect that these commodities will enter the Common Market duty free. Among this group there are three commodities which are of interest to India: cashew-nuts, bleached shellac and tea. In the case of tea, in addition to the suspension of the Common External Tariff, the national tariffs, too, will be suspended from January 1, 1964. Before the formation of the Common Market, Indian tea had to pay an average of 35 per cent. import duty (Table III). As the elimination of the duty will considerably reduce the price of tea, exports are likely to rise appreciably.

Of the 20 important commodities chosen for examina-

TABLE I.

INDIA'S EXPORTS (INCLUDING RE-EXPORTS) TO E.E.C. AND THE WORLD

(Value in Rs. Lakhs)

Source: D.C.I. & S., Calcutta.

*The "Kennedy round" due to be held in March, 1964.

tion, 15 will thus enter the Community duty-free. The export prospects of the five important commodities that remain—coffee, pepper, cotton textiles, jute cloth and jute bags—will have to be examined in some detail.

The Common External Tariff on coffee was fixed at 16 per cent., but with the signing of the convention with the African States, the External Tariff has been reduced to 9.6 per cent. However, the exports from the Associated Overseas Territories will enter duty free. In spite of this preference enjoyed by them, Indian coffee is likely to hold its own. We export two types of coffee—Arabica, and Robusta. Arabica, which accounts for the bulk of our coffee exports, is not produced in large quantities in the Associated territories and does not, therefore, face any serious threat. Even in the case of Robusta, the Indian variety is considered to be far superior to the African variety. The possibility of the European consumers changing over from high to low-grade coffee appears remote. In fact the price of Indian coffee will go down in Germany which is our main market, as the E. E. C. Tariff is only 9.5 per cent as against the West German Tariff of 26 per cent. The coffee consumption in the E. E. C. is expected to go up by 50 per cent. by 1970. Indian coffee exports can, therefore, look forward to an expanding market in the E. E. C.

Exports of pepper are also likely to go up. The Associate Territories produce small quantities of pepper; only Madagascar produces more than a few tons for exports. India's main competitors—Indonesia and Sarawak—will also have to pay the same duty as India. The E.E.C. duty is only 17 per cent. as against a national tariff of 25 per cent. in Germany and 60 per cent. in Italy and these two countries constitute our main markets in the E. C. M. Hence, it can be safely assumed that the export of pepper to the Common Market will rise.

Jute Goods

India's exports of jute goods to E. C. M. have been valued at Rs. 5 crores. There exists a substantial jute industry in the Common Market. The tariff is also high; 23 per cent. on jute cloth and jute bags. Recent studies by the Economic Intelligence Unit and the Srivastava Committee have, however, established that India will be able to compete successfully with European industry in spite of the high tariff, if quota restrictions are not imposed. Among E. C. M. countries, France maintains rigid quota restrictions while Belgium, Netherlands and West Germany have been liberal in allowing imports. The future of our exports of jute goods to E. C. M. will, therefore, depend upon the commercial policy adopted by the Common Market countries. Again, the formation of the E. C. M has not adversely affected our exports, for these quota restrictions existed before.

More than 90 per cent of our exports of cotton textiles to E. C. M. consists of grey cloth of 32 counts and below.

Source: D.C.I. & S., Calcutta.

Our main competitors for grey cloth in the Community are not the E. C. M. countries, but non-E. C. M. countries such as China, Hongkong and Japan. Hence the tariff preference enjoyed by the Common Market countries should not pose a serious threat to our exports.

Of the five commodities, therefore, which cannot enter the Community duty free, only exports of cotton and jute goods are likely to be affected. Even this will be due not to the formation of the Common Market, for the tariff disabilities, high prices and quota restrictions existed before the E.C.M. came into being. This, of course, is not to preclude sympathetic consideration by the E.C.M. of India's need for trade. But it needs to be emphasised that the difficulties we face in our exports to E.C.M. countries are not to be ascribed to the formation of the Common Market. On the other hand it may serve to remove some of the impediments in our exports to these countries.

WINTER SHELTER FOR PAVEMENT-DWELLERS IS TOPICAL THEME IN THE CAPITAL

WINDOW ON THE WORLD

Brussels Before Geneva

From Our Special Correspondent

BRUSSELS:

THE SIX were committed to finding — before ringing the old year out — a joint stand to adopt in the Kennedy Round of Tariff Negoitations with their partners in GATT and, in the first place, with the United States. A few days before Christmas it was still doubted here that the subject could be cleared out by the December 31 dead-line, although it was hoped that a successful issue could result in the first fortnight of 1964. Now, in the light of the Christmas Agreement on a common agricultural policy, the belief here is that the elaboration of a common policy on tariff reductions inside the western world should not be long in coming, for the conflict of interests here is much less than is sometimes thought. Polemical exaggeration aside, it is evident that the Germans do not contemplate a tariff disarmament that would leave Europe at the mercy of the great US corporations, and the French are not systematically hostile to a reduction of duties that would open up new markets for their exports. To be convinced of this, it is enough to note that the Germans have shown their willingness, during the chicken war and the steel tariff dispute, to resist excessive American pretensions; and that the French throughout this year have practised a unilateral tariff disarmament (designed to steady their internal prices) that makes nonsense of charges of protectionism.

The interest of the case for countries such as India is plain, though, of course, much less than would have been true if John Kennedy's original scheme for total abolition of many tariffs had been carried through. As it is, there is still the hope that, if not in 1964 then within a year or so, the USA and the Common Market will halve, or at least greatly reduce very many of their import duties — and the benefit of this will necessarily be extended to India where she exports the goods in question, without her having to make equivalent concessions if that would endanger her own industrialisation. It is impossible to estimate India's likely gains but it is sure that a general lowering of tariffs in the industrialised world would be to her advantage.

Success Not Assured

To say that the Six could conceivably arrive in January at a joint position on the coming Geneva negotiations does not mean that those negotiations would be assured of success, or even that they could start on the date set (May this year) except for a formal rendezvous. A position that would satisfy all three, the Germans and the French would still be some distance from suiting the Americans, because no one in Europe is prepared to accept the original US proposals. To realise why, it is sufficient to recall a simple fact: if John Kennedy's system of halving all tariffs were applied, then more than 10 per cent of US import duties would remain higher than 10 per cent ad valorem, whereas only 6 per cent of Common Market duties would be as high as that. This disparity would be much greater for certain important products, but this global figure is enough to show that, whatever joint stand they adopt, the Six will not be going to Geneva to fall in with American suggestions. The bargaining will be intense and sometimes, no doubt, acrid and will take us well into 1965.

Before it starts however, the Six must agree on what to offer their partners in Geneva and primarily the Americans. As stated, it is a caricature of the present state of the negotiations here to assert that the Germans want to give them the world, and the French nothing. Indeed, the French case coincides with that of the supernational Common Market Commission, which defends the Community's interests and not those of any one national industry, so one is wide of the mark in bringing in General de Gaulle's anti-Americanism to explain the present deadlock. The Commission's point of view is clear. The average level of the ECM's common external tariff is already lower than the American, it is recalled (and much lower than the average of British and Japanese duties). Moreover, it is a fairly even tariff wall (the average is near the mean), while the American wall boasts lofty turrets as well as a few open gates; so to reduce it all round would bring across-the-board benefits to outsiders, but this is not true of the US protective barrier.

Next, the Common Market has no accounts to render on the subject of protectionism. It runs a large deficit in trade with the USA, and this deficit has swollen from $1,544 million in 1958 to over $2,000 million last year, and much more this year. In that same period, the Common Market has increased its imports from the rest of the world by 39 per cent, the USA by only 27 per cent. The Six's imports from the USA alone have jumped 58 per cent. Thus, on every score the Americans are the askers, who have little to fear from continuation of the existing situation and less reason to expect that the Six should concede everything asked for in a plan devised in Washington for, primarily, American benefit.

Primarily, but not of course entirely: provided the more outrageous inequalities in the American scheme are removed, the Six have gains to make also in a universal reduction in tariffs. If the Germans seem more attracted by those gains

"Look at the Dange group fighting the E.M.S. group and also the Asoka Mehta group fighting the S. M. Joshi group. It is all the success of our party's basic policy namely groupism."

than the French, the reason must be sought in the fact that the gains in question are less in the American market than elsewhere in Europe. In other words, the Germans have no more illusions than the French about the likelihood of the Six winning fresh markets in the USA, where protection is pervasive, disguised and based on much else besides mere published duty levels. But a reduction of duties that might turn out to be, as regards trade with the USA, a snare and a delusion would be a genuine liberalisation of trade if it were practised by Britain, Scandinavia and the Free Trade Association in general. It happens that West Germany has substantial trade interests in those regions (much more than France, for evident geographical and historical reasons), and they are beginning to suffer from the mutual preference awarded each other by members of EFTA. In a nutshell, the German attitude is: we have benefits to win right next door from a reduction in all Western tariffs, and if the distant Americans have even bigger gains to make that is the price we must pay for the military protection they give us and which can be had nowhere else.

The French, as is notorious, are less appreciative of this last-named boon. Rightly or wrongly, they doubt its value in case of real danger in the age of nuclear missiles, resent the dependence that goes with it, and are reluctant to pay a high price for it. They would still stand to gain, like the Germans, from a reduction in EFTA's preferences, notably in their traditional Swiss and British markets, but not enough to make them disregard greater gains that US exporters would make at their expense if tariff reductions were unequal. The ECM Commission thinks that the same is true for the Community as a whole, and that is why (starting from different positions) it finds itself largely in agreement with Paris.

There is little doubt how this dispute would have been settled before January this year, when General de Gaulle shook the Community's cohesion by his abrupt veto on British admission: the more narrowly nationalist German position would have been sacrified to the Community point of view, as had happened on many other occasions. But in the recent atmosphere of mutual suspicion, the Germans are moved to ask: "What is this Europe to which we are invited to sacrifice our particular affairs? That the French case happens to coincide with the European case as expressed by the Commission means little if the very conception of a united Europe has suffered a change this year". And of course in seeking guarantees that Paris's declared willingness to make a success of the Kennedy Round is translated into action, the Germans bear in mind the bolt from the blue of de Gaulle's January Press conference. He has another fixed for next month; before giving anything away, one must be sure there are no similar surprises in store.

That, briefly is the political climate in which the negotiations are going forward. At the technical level, they are governed by a document drawn up by the Hallstein Commission which contains a new definition of "gross disparities" between the American and European tariffs such as would call for special treatment as distinct from simple halving on both sides. The latest idea is to declare such a disparity to exist wherever one side's duty is more than twice the other side's on the same product provided more than ten points separate them. That is, where the respective duties were 9 per cent and 18 per cent both would be halved, but if they were 10 and 21 per cent some other form of harmonisation must be found. This would leave about 1,000 American duties in the situation of excessive protection as compared with European duties. The Commission would agree to disregard such excessive protection on goods that the Common Market did not import or did not manufacture, which is already a dangerously generous concession, when you recall that ten years ago Europe imported few American chemicals which thus would at that time have escaped the necessity to have their exorbitant tariffs lowered. As to what to do with the remaining instances of excessive US tariffs, the Americans are determined not to surrender them (the US chemicals corporations cling to their lavish protection), so they could be halved while European duties were cut by a quarter.

Indian Business Collaboration in Africa

By Our Special Correspondent

NEW DELHI:

AMONG THE many nations which are currently showing great interest in the economic opportunities offering in newly independent African communities, this country is taking its due place gradually. Although the Indian interest is certainly not as aggressive as China's or that taken by some of the West European countries, it is becoming increasingly clear that the Indian business community is taking a constructive and forward-looking view of the role it can play in the economic development of African nations. Simultaneously, the Government of India's policy is becoming more and more positive and it is obvious that it is now favourably inclined towards allowing, encouraging and assisting Indian business men in setting up industries in Africa in collaboration with local interests.

There are, however, quite a few restrictions on enterprises of this kind which the Government of India considers necessary to enforce. There is the condition, for instance, that the Indian investments should not exceed the value of machinery exported from this country in connection with such projects. Fortunately, this rule is not being rigidly adhered to and minor modifications are considered. Each proposal of Indo-African collaboration is being examined on its merits and with reference to its individual requirements, the basic approach being to give encouragement to such enterprises.

Indian industrial collaboration in Africa is, of course, not a new phenomenon. There is, for instance, a very successful textile mill in Ethiopia which the Birlas had set up some two years ago in association with the Ethiopian Government. It has always been known that there is good scope for setting up small and medium-sized industrial units in various African countries and now the newly independent African nations are willing to take a keen interest in developing sugar, cement, paper, jute, fertilizer and textile industries and steel rolling units. That Indian business houses are energetically responding to these opportunities, with the Government of India positively helping them, is clearly a very healthy development.

Local Participation

The Birlas, for instance, have signed an agreement with the Nigerian Government for setting up a light engineering unit in that country in collaboration with local interests. The venture has also been agreed to in principle by the Government of India.

It is proposed to take up initially the production of air-conditioning and refrigeration equipment. Ultimately, the range of manufacture is to include water coolers, steel furniture, electric fans, agricultural implements and bus and truck bodies.

The Birlas' subscription to the share capital of this venture will be to the tune of 50 per cent in the form of machinery supplies. A sum of Rs. 15 to 20 lakhs may be invested in the first instance, to be progressively raised to about Rs. 100 lakhs. The value of the machinery exported in excess of the 50 per cent subscription to the share capital will be treated as loan to the Nigerian unit.

Plans are also under way to set up a small asbestos/cement factory and a textile mill in Nigeria more or less on the same pattern of collaboration as has been agreed to in respect of the light engineering unit.

Nigeria is the second African country to which the Birlas have extended technical and financial assistance. Two years ago, they set up a textile mill in Ethiopia.

Some interest has also been shown by the Birlas in the establishment of small and medium-sized industrial units in the Sudan. There is a proposal to start here a fertilizer manufacturing unit with the help of some foreign collaborators. Subsequently, a light engineering unit, a textile mill and an asbestos/cement factory may also be set up.

The Mafatlal Group of industries is also stated to be interested in extending technical assistance to the newly independent African nations. A beginning may be made by it in Tanganyika with regard to which a scheme for a textile mill is being considered.

**

The Unit Trust proposed to be set up for mobilising the savings of the small man and the middle class for investment into industry, is expected to start functioning on February 1, provided the administrative arrangements are completed by that date. Mr. R. S. Bhatt, the Executive Director of the Indian Investment Centre, is being nominated as the first Managing Director of the Trust.

**

The Union Finance Ministry, it is learnt, will be bringing forward a Bill in the Budget Session of Parliament for the establishment of a Development Bank to replace the Industrial Finance Corporation. The Bank will offer financial assistance to industry in a more comprehensive manner than is being done by the IFC. For a short transitionary period, the IFC may however continue to function.

The Union Government is expected to license, in the next few days, another 500,000 tonnes sugar manufacturing capacity. This will raise the total licensed capacity to 3.86 tonnes. On the installation of this new capacity and that already under erection, effective capacity is expected to reach by 1965-66, 3.70 million tonnes, as against 2.68 million tonnes as at present. It is hoped that the 3.70 million tonnes effective capacity will be enough to meet the third Plan target of 4.0 million tonnes sugar output per annum.

For licensing new capacity, the Government, it is understood, is considering only the applications, both for expansion of the existing units and for setting up of new ones, received before June 30, 1963. As many as 78 applications had been received by that date for setting up new units — 46 from the co-operative sector and 32 from the joint stock sector. Another 80 applications — 21 of them were from the co-operative sector — had been received for the expansion of existing units. Some 56 applications for the expansion and installation of new units that have been made after June 30, 1963, are proposed to be considered later in terms of fourth Plan target.

Preference, it is further learnt, is being given to the expansion programmes of the existing units which can be implemented quickly and at small costs. For setting up new factories, co-operative ventures are favoured, provided adequate cane supplies are assured.

The equipment for the new capacity will have to be procured indigenously. Efforts are being made to get released adequate foreign exchange to the sugar mill machinery manufacturers for import of components not yet domestically produced, so that they may be able to meet the orders fully and in time for the new capacity to be commissioned by the end of the current Plan. The new units that are being licensed, will have a minimum capacity to crush 1,000 tonnes of cane a day, the maximum limit being 2,000 tonnes. Plants for these capacities, it is pointed out, can be fabricated in the country.

The current difficult situation in regard to sugar supplies is expected to ease in the near future. This optimism emanates from the fact that production up to December 31, 1963, was the highest so far recorded in any crushing season. At approximately 770,000 tonnes, it exceeded the output during the corresponding period of the last crushing season by nearly 152,000 tonnes. It was higher by about 50,000 tonnes compared to the production in the hitherto peak year of 1960-61.

The Development Council for the Sugar Industry is meeting at Etikoppaka, in Andhra Pradesh, on January 10. Among other things, it will deliberate upon the problems of the uneconomic units in the industry in the light of the findings of the Gundu Rao Committee which went into this question recently, and the development programmes for the fourth Plan period. Taking into consideration factors such as the increase in population, rise in the standard of living etc., the country's requirements of the three sweetening agents — white sugar, gur and khandsari — in 1970-71, have been estimated at 4.5 million tonnes (including 500,000 tons for exports), 6.78 million tonnes and 0.4 million tonnes, respectively. Sugarcane requirements have been worked out at about 135 million tonnes. Attempts are to be made to secure the additional cane supplies through improvement in unit-area yields rather than from extension of acreage under cane cultivation.

**

According to reports reaching here, the West German oil companies may in the near future intensify their oil exploration programmes outside the Federal Republic. A new Federal law which came into force on January 1, 1964, envisages progressive reduction of State subsidies on crude oil production within the Federal Republic and empowers the West German Government to give low-interest loans for exploration abroad. These credits, of course, will not be available for exploration in the other five countries of the European Economic Community under the Oil Protocol of the ECM Treaty.

A sum of DM 800 million is said to have been earmarked for assisting oil exploration by the West German companies in foreign countries during the six-year period to 1969. The loans are not required to be repaid unless and until exploration activities lead to commercial production.

Currently, West German oil companies are operating in 13 foreign countries i.e. Libya, Algeria, Morocco, Ethiopia, Syria, Turkey, Canada, Peru, the Netherlands, Spain, Switzerland, Austria, and Italy. They are said to be anxious to enter the Eastern Hemisphere on a big scale. Although their primary interest here will be in Iran, observers are of the opinion that some of them can be invited to India as well in view of the rapidly expanding market for oil products in this country.

**

Disappointed at the tardy progress made in the manufacture of printing machinery, the Union Government has expressed eagerness to entertain new well-drawn schemes in this line, preferably in collaboration with reputed foreign manufacturers. It is stated that production of printing machinery is not at present covered under the Industries (Development and Regulation) Act, 1951. No permission, therefore, is necessary for starting new ventures in this field. Approval of the Government, however, is required for import of capital equipment and collaboration arrangements.

After a review of the position recently, it has been concluded that the demand for various types of printing machinery will go up to slightly over Rs. 7 crores per annum by 1965-66 and up to Rs. 12 crores by 1970-71. During the last year of the current Plan, the requirements of the printing equipment (in numbers of units) are expected to be as follows: Precision Cylinder Proof Presses 300; Letter Press Proof Presses 1,000; Platen Presses — treadle and power operated — 3,000; Single Revolution Stop Cylinder Type Flat Bed Machines 600; Two Revolution Type Flat Bed Machines 300; Rotary Presses 20; Offset Machines (single colour) 600; Guillotines 550; Wire Stitching Machines 1,700; Board Shearing Machines 200; Folding Machines 300; Perforating Machines 200 and Book Sewing Machines 200. No estimate of the demand for composing machines is available, but it is expected to be fairly large.

From Our Correspondent

BOMBAY:

WHILE FOREIGN finance and technical collaboration are undoubtedly playing a large and dynamic role in this country's industrialisation, it is no secret that the quality of such collaboration is not always above reproach. There are collaborators and collaborators and there is, in fact, considerable dissatisfaction among Indian business men who have had some very disagreeable experiences. Indeed, many Indian industrialists, who feel that they have had a raw deal from their foreign collaborators, are even tempted to suggest that the Government of India should more positively enforce principles for such collaborations both as guidance to Indian business men and as a safeguard. This feeling, of course, is at variance with another widely held view, also among Indian business men, that the Government's interest in the terms of foreign collaboration should be confined to the minimum as otherwise undue procedural delays and difficulties over minor details might impede smooth and successful negotiations between Indian industrialists and their counterparts abroad.

In this context, the views expressed by Mr. G. L. Mehta, Chairman of the I.C.I.C.I., in his Pandya Memorial Lecture delivered under the auspices of the Indian Institute of Metals and the Indian Institute of Technology will be of keen interest. Mr. G. L. Mehta, who has unique knowledge of foreign collaboration in all its aspects, made no bones about cautioning Indian entrepreneurs against indiscriminate choice of foreign collaborators and advising them to be selective in their choice of foreign entrepreneurs from whom they seek technical assistance.

"In the course of our operations in I.C.I.C.I.," Mr Mehta said, "we have come across cases where attempts have been made by collaborators to sell obsolete processes or ou dated machinery, include items of unnecessary equipment in the essential machinery list and make exaggerated claims regarding the potentialities of the plant."

Mr. Mehta was equally forthright in exposing the worthlessness of consultancy firm, so called, which have sprung up during the last decade. Some of them are foreign based with or without Indian associates and others wholly Indian. Quite a few of them are in the nature of "mushroom growth," firms without adequate experience and organisation, some of which are mere agencies interested only in the supply of machinery. "I must frankly admit," he said, "that this has made us somewhat chary of relying on consultants' feasibility reports for the appraisal work in the I.C.I.C.I."

While Mr. Mehta has certainly done a great service by

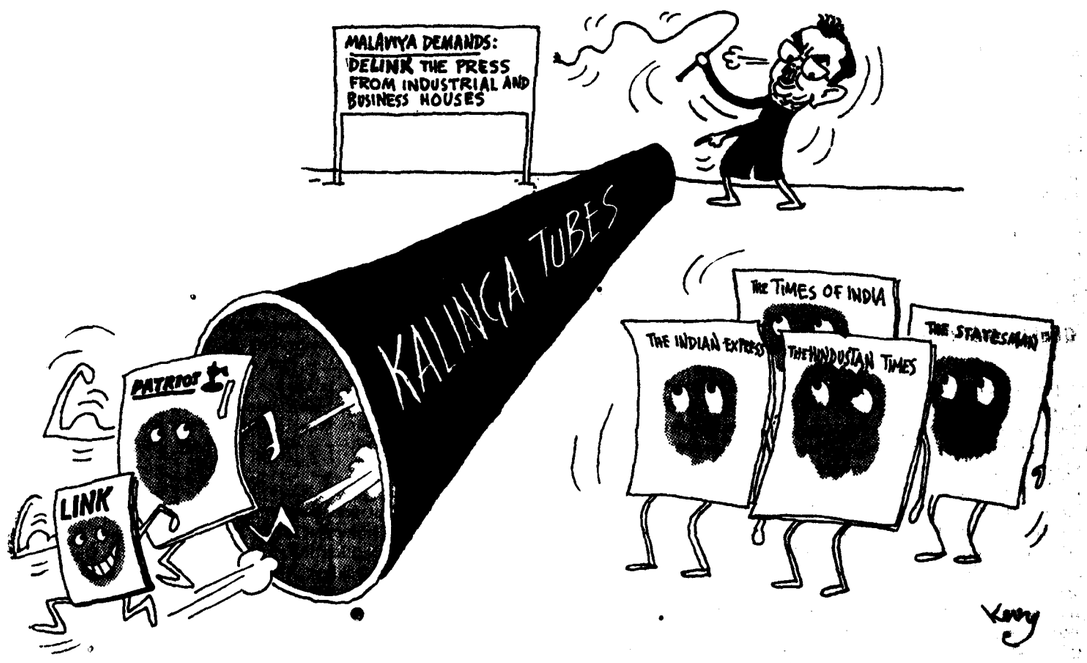
General Banking and Foreign Exchange Business Transacted
PRAVINCHANDRA V. GANDHI, Managing Director.

QB/6/199



pointing out these snags and pitfalls in foreign technical collaboration, it is less obvious that the remedies or correctives he has suggested are wholly practicable. For instance, he suggested that established manufacturers themselves should provide technical advice through their technologists to new units so that the latter may not have to go to consultants of dubious competence. This pre-supposes an ample supply of high technical talent in established business houses. But surely this is not the case. It is only too well-known that most established industrial concerns have their technical resources fully extended. This apart, there certainly does not exist enough trust or goodwill among business houses, which are often in a state of rivalry, outbidding each other for industrial licences. In the face of these facts, Mr. Mehta seems to be unduly optimistic when he advises established manufacturers to provide consultancy services to new units.

Secondly, while it is certainly true that Indian entrepreneurs should be selective in their choice of foreign collaborators, it must also be mentioned that very often the former are not in a strong bargaining position. For one thing the Government's general policy attitudes and procedural delays have not exactly made foreign collaborators vie among themselves for associating with industrialists in this country. Secondly, the Government's policy of dispersing industrial licences has often resulted in licences being issued to weak, inexperienced or unknown Indian parties who naturally cannot be expected to be in a position to be highly discriminating in their choice of foreign collaborators. Mr Mehta, no doubt, is aware of all these limitations on our side and if, nevertheless, he has chosen to emphasize the various problems in foreign technical collaboration, it is surely because the time has come for Government and the business community to consult on how best Indian interests could be safeguarded.

Mr Mehta was critical of wholesale resort to foreign know-how for setting up industries. He deprecated the practice in the public sector as much as in the private sector of the Indian side being content with receiving ready-made designs and plants from foreign collaborators. In his view "it is essential that the industrialists, whenever they enter into collaboration arrangements, should attempt to have their technologists associated with designing of plants." A connected point of basic importance which Mr Mehta rightly emphasized was that our technical education should be geared to emphasizing design aspects of engineering. Finally, Mr Mehta was critical of the slow materialisation of the fruits of the research done by the National Laboratories. He attributed this to the existence of "a development hump" which he described as "the obstacle between discovering things and applying them."

**

Scheduled bank credit expanded by Rs. 24.3 crores to Rs. 1,574.9 crores during the last week of December, 1963. The year-end increase brings the seasonal expansion in credit to Rs. 107 crores against only Rs. 32 crores in the corresponding period of last year (1962). There was an expansion of Rs. 10.6 crores in deposits (under demand) to Rs. 2246 crores and a reduction of Rs. 11.2 crores in investments (to Rs. 709.2 crores). During the calendar year 1963, total deposits of scheduled banks increased by Rs. 204 crores to Rs. 2,246 crores as against Rs. 217 crores in 1962. If the transactions of PL480 funds are taken into account, the increase in 1963 would amount to Rs. 234 crores as compared to Rs. 237 crores in 1962. An important feature of deposit expansion in 1963 was the sharp rise in demand deposits and a decline in the rate of growth of time deposits. Demand deposits went up by Rs. 172 crores to Rs. 991 crores in 1963, against Rs. 92 crores in 1962; time deposits increased, on the other hand, by Rs. 22 crores to Rs. 1,256 crores in 1963 against Rs. 125 crores in 1962. Inclusive of the transfer of PL480 funds, time deposits went up by Rs. 53 crores in 1963 against an increase of Rs. 145 crores in 1962.

"Come, pass the purity test."

Bank credit at the end of 1963 was Rs. 152 crores higher over the year-end, 1962; at the end of 1962, it was Rs. 155 crores higher than at the end of 1961. Scheduled bank investment increased by Rs. 57 crores to Rs. 709 crores in 1963 as compared to an increase of Rs. 73 crores in 1962. Inclusive of PL480 transfers, investments swelled by Rs. 87 crores in 1963 as against Rs. 83 crores in 1962. The banking system was in more comfortable position at the close of 1963 than at the end of 1962.

★★

The annual meeting of the Indian Institute of Metals was held recently at the IIT, Powai, Bombay. Speaking on the occasion, Dr. D. P. Antia, Director of Union Carbide India Ltd., and this year's President, told the members that the fact that the services of the Institute had been recognised inasmuch as November 14 has been named National Metallurgists Day, was no cause for the Institute to rest on its laurels. Rather it brought out that there were added responsibilities which the Indian Institute of Metals had yet to fulfil. Chalking out a programme for future activities, Dr. Antia said that to meet the nation's increasing need for qualified metallurgists, the Institute should not only provide vocational guidance to aspiring metallurgists, but also act as the liaison between industry and technical colleges to provide practical training for student metallurgists. In this context, he suggested a confidential survey among industrial units to ascertain employment and remuneration possibilities, to enable the Institute to give a clear picture of the profession to young metallurgists.

Citing the holding of a joint meeting in India with the Iron and Steel Institute of London in February 1963, Dr. Antia said that the Indian Institute of Metals should hold more such meetings with foreign institutes, since "such exchange of information with the visitors should make the task of absorbing more advanced ideas and technologies easier".

In outlining this programme for the Institute Dr. Antia pointed out that without financial support from the metallurgical industry, the Institute could not hope to take its rightful share in the changing economic scene of the country.

★★

Mr. J. S. Raj, Deputy General Manager of ICICI, has left for Europe on his way to Nigeria to take up the post of General Manager of the Nigerian Industrial Development Bank being set up there. In view of the initial problems of setting up a new organisation in that country, the World Bank and IFC (W) requested ICICI to spare the services of Mr. Raj during the early stages of the new Bank's development. ICICI has agreed to lend his services for a short period.

Prior to joining ICICI in mid-1960, Mr. Raj had served in the International Monetary Fund for six years from 1953 to 1959 and, thereafter, for a short period as Deputy Secretary (Stock Exchanges) in the Ministry of Finance of the Government of India.

The Nigerian Industrial Development Bank which is now being set up is a successor institution to the Investment Company of Nigeria (paid-up capital £1 million) which is being merged in the new Bank. The new institution is being set up with Nigerian and international participation and with larger funds to meet the growing requirements of the Nigerian economy. It will have a paid-up equity capital of £2 million, which will be divided between the A (national) and B (foreign) shareholders in the ratio of 50 : 50, and a preference capital of £250,000. IFC(W) has invested £0.5 million in the share capital. In addition, the Nigerian Government has agreed to give an interest-free loan of £2 million to the new Bank.

Jute From Many Angles

From Our Correspondent

CALCUTTA:

WEST BENGAL'S premier industry is currently very much in the news. Mr. G. C. L. Joneja, Jute Commissioner, who has just returned from leading a delegation to the ECM countries, the U.K., Sweden and Denmark, has underlined the impression strongly held in the industry that its presence in the overseas markets cannot be taken for granted, but must be nursed with vigilance and vigour. The Jute Commissioner, addressing a Press Conference here, said that the competition from Pakistan was a definite threat to the position held by the Indian jute industry in the world export trade in jute manufactures. He also referred to emerging Chinese exports, but said that China has not yet entered the trade in a big way.

Quality Standards

The Jute Commissioner urged the importance of steady improvement in the quality of Indian jute manufactures. Quality has certainly improved to an appreciable extent in the recent past and this, he said, was being well appreciated by our customers abroad. There was, however, scope in a big way for further improvement and he hoped that jute mills would not relax their efforts at producing better and better goods. The quality of manufactures depended no doubt on the quality of the fibre and here the Indian jute industry is at a conspicuous disadvantage vis-a-vis its competitor from Pakistan. Mr. Joneja referred to this aspect also. But he expressed satisfaction at the progress being made by efforts at improving the quality. This progress, he pointed out, is reflected in the fact that even in certain areas such as Bihar, where the produce is generally below average in quality, cultivators have been able this year to sell the tossa variety at between Rs. 35 and Rs. 36 per maund. Twenty-five centres have been set up in Bihar to demonstrate proper practices in retting and Mr. Joneja disclosed that number of such demonstration centres would be trebled next year. The Government of India has provided for a loan of Rs. 3 crores, free of interest for the first three years, for State programmes for improving the quality of raw jute. The Jute Commissioner hoped that the industry would co-operate in the schemes financed by this loan and thereby help to make them a success. Meanwhile, it is being generally admitted that State Governments in jute-growing areas have themselves been slow to take advantage of the Centre's loan offer.

The estimated Indian crop for 1963 was of the order of 7.3 million bales, while the availability during the season would be about 7.5 million bales. Mr. Joneja said that the compulsory quota system has so far absorbed about 5 million bales which leaves 2.5 million bales to be lifted in the future. The IJMA mills are being asked to lift during this month 700,000 bales and non-IJMA mills, 60,000 bales. The Jute Commissioner was confident that the offtake would be sufficient to stabilize prices and keep the raw jute market in a healthy state.

★★

A somewhat less confident assessment of raw jute market prospects had, however, been presented earlier by Mr. T. L. Sethia in his presidential speech at the Annual General Meeting of the Jute Dealers Association. He complained that the ample availability of raw jute and mesta during 1962-63, much in excess of official estimates, had kept the raw jute markets depressed. The fixation of quotas of jute for mill purchases as also for buffer stocks of raw jute, based on official estimates, could not bring about the desired effect on raw jute prices which had remained below the operational minimum during that year. While Mr. Sethia does not seem to dispute official estimates relating to the output or availability of the fibre this year, he emphasized that this year's crop would be the third big in succession and he expressed a doubt that the arrangements made for stabilizing the raw jute market would turn out to be adequate. He pointed out that the industry had already built up stocks to a point where the entire godown accommodation of many jute mills had been fully engaged with the result that large quantities of the fibre are stacked up in open spaces. Mr. Sethia would therefore plead for increased exports of raw jute as well as for the relaxation of conditions under which it could be sold for export.

Delayed Payments

Mr. Sethia was also critical of the attitude of jute mills many of which, he alleged, were unduly delaying payment of Seller's Value Bills for raw jute. Referring to the Government's decision that the State Trading Corporation should purchase jute to the extent of 1.5 million bales, Mr. Sethia said that, while the raw jute trade was in favour of buffer stock purchases to the extent they helped to stabilize prices at a remunerative level, it was also anxious that such stocks should not be built up to unmanageable sizes since they would in that event create problems of orderly disposal in the future. Another point he urged was that the State Trading Corporation should be prompt in making payments for its purchases. Here it may be mentioned that at the recent annual meeting of the Indian Central Jute Committee, there were complaints that the STC had not paid for jute bought by it as far back as May last year. Regarding the move of the Ministry of Food and Agriculture to set up Agmark standards for raw jute, Mr. Sethia expressed some uneasiness at the trend of conclusions favoured by a technical body of experts. He said that in the opinion of the Jute Dealers Association, the standards likely to be adopted might be about 30 per cent above the normal standards of the respective jute growing areas to which they might be related.

★★

Relevant to the Jute Commissioner's emphasis on the improvement of the quality of jute goods is the report recently considered by the Agricultural Research Sub-Committee of the Indian Central Jute Committee of the results obtained at the Jute Agricultural Research Institute and their application for improving the yield and quality of jute. The Institute has evolved three new strains of "obitorius" (Tossa) jute from crosses between Indian and Russian varieties, which are claimed to possess not only a higher yield potential than the existing improved strains, but also a whiter and a more lustrous fibre. To enable a speedy decision on their release for general cultivation, extensive trials with these new strains have been recommended both at Government research farms and in cultivators' fields in all the jute-growing States. The Institute has also been able to obtain a new strain each of mesta and roselle which could well replace the existing improved strains of these fibre crops to realize higher yields. Early steps for multiplying their seeds on a large scale were recommended.

The problem of saturating the country's jute areas with improved seeds could be solved, according to the ICJC Sub-Committee, only by concentrating seed multiplication efforts in areas where there would be no competition between fibre production and seed production. The Sub-Committee was apprised of the steps already taken to start seed multiplication work in suitable areas of Rajasthan and U.P. under the aegis of the National Seeds Corporation. The Sub-Committee also recommended that the agricultural engineers of the jute-growing States should meet and select a reasonably-priced model from out of the different designs of seed controls which have been brought out in West Bengal, Bihar and U.P. Another proposal made by the Sub-Committee was that the districts of Malda, Murshidabad and Nadia in West Bengal and Purnea and Saharsa in Bihar should be given the Package Programme treatment with special emphasis on the provision of liberal credit facilities to jute-growers for using fertilizers. The Sub-Committee noted that the yield per acre was the lowest at present in the districts named by it.

As advance action for the fourth Plan, when it is proposed to take up intensive cultivation of jute in 14 selected districts which account for over 80 per cent of India's total acreage under the jute crop, the Sub-Committee recommended the setting up of three 100-acre pilot projects in each of these districts during the remaining two years of the third Plan. It may be added that the Union Agriculture Minister, Dr. Ram Subhag Singh, told the Indian Central Jute Committee that the fourth Plan target of eight million bales of jute and two million bales of mesta had to be achieved wholly through higher yields per acre, as there was no scope for extending jute acreage.

★★

In a proposal submitted to the Union Minister for International Trade, the Indian Engineering Association has made out a strong case for making Haldia a free port. But Haldia will differ from other existing and proposed free ports in one important aspect and that is that while the other ports will attract all industries, Haldia will place the emphasis on export-oriented industries. Evidently, the idea of making this new port into a free zone has suggested itself to the Indian Engineering Association in view of the uphill task that faces the industry in promoting the export of engineering goods. Addressing a press conference in Calcutta recently, Mr. C. E. Cargin, Chairman of the IEA has pointed out that despite incentives engineering goods formed only 1½ per cent of the country's total exports. Many adverse factors are responsible for this poor performance. In the first place there is intense competition in world markets where our products have to compete with similar products from highly developed countries. Our products are also handicapped by high production costs brought about by high domestic taxation and the large idle capacity resulting from the meagre availability of imported raw material. These difficulties are likely to persist for quite some time because there is no likelihood of an easing in the present extremely stringent foreign exchange position.

Ideal Solution

Mr. Cargin has pointed out that if exports have still to be maximised notwithstanding these handicaps, the problem has to be tackled from an entirely different angle. It is in this view that a free port at Haldia offers an ideal solution. This new port that is being developed has several advantages that will help it emerge as an industrial complex. It is large enough (125 square miles) to accommodate several large industrial units and has a well developed hinterland with good communications. It can also easily obtain quite a large skilled labour force. The IEA proposal envisages a large measure of economic freedom and tax relief to the industrial units located within the free port zone. For all practical purposes the zone will be an independent region free as to production targets, imports, tax and duties. These advantages will not only attract Indian entrepreneurs to expand their business but will offer great incentives to foreigners also to set up units at Haldia. According to Mr. Cargin there will be no difficulty in meeting the administrative cost of the free port as low rates of tax on personal and business income and on import or excise duty on selected items, as in Hongkong, will suffice.

December 30, 1963, that the exports of chemicals and allied products had shown only slow improvement. As against exports (excluding unspecified items) valued at Rs. 6.35 crores in 1960-61, the trade yielded Rs. 6.67 crores of foreign exchange in 1962-63. In the first half of the financial year 1963-64, exports were worth Rs. 0.37 crores. The industrial manufactures falling within the purview of the Council at Calcutta — as a result of the bifurcation of the Council — dealing with paints, varnishes, pigments, printing inks, glass, ceramics, potteries, refractories, cement-asbestos, rubber tyres, paper and paper products and fertilisers showed much better performance. Between April-September, 1962 and April-September, 1963, the rise was as high as 15 per cent. Rubber and paints recorded increases by 25 per cent and 29 per cent respectively. Glass and ceramics, and paper and paper products progressed slower at 16 per cent and five per cent respectively. There was a fall in exports of unspecified items and organic fertilizer including crushed bones, bonemeal etc., which dropped by nearly a quarter but which could be improved if Government granted the assistance sought by the industry.

The analysis of the direction of exports of chemicals indicated that the main markets for Indian chemical products were: (1) the next-door neighbours, namely, Burma, Ceylon, Pakistan, Nepal and Afghanistan; (2) countries of West Asia and Africa and (3) the South-East Asia and the Far Eastern countries including Japan. Dr. Bannerji referred to the recent meeting at New Delhi of the chairmen and secretaries of all the export promotion councils and commodity boards and of about 26 of India's ambassadors in West Asian countries and Africa. The conference gave him the impression that there were new opportunities for exporters in the newly independent countries of Africa and in the countries of West Asia which would be lost if necessary steps were not taken in time. Other countries such as West Germany, Italy, Japan and some of the East European countries were operating actively in those markets. In the case of British East Africa particularly, the independence of the countries will reduce the importance of the crown agents and will create a vacuum which should be filled by India by a policy of aggressive salesmanship. Referring to the exports of this country to the U.K., the E.E.C. and the EFTA countries, the Chairman wondered why those highly developed countries had quotas and restrictive tariffs on imports from developing countries such as ours. There has been some success in getting tariffs abolished in 18 commodities so far in the case of the Common Market. A further extension of this list will be in the interest of both the parties.

A basic requisite for enhancing exports of chemicals and allied products is to lower the cost of manufacture by supplying indigenous raw materials at international prices. Because of insistence by the Government on the use by the industry of indigenously produced intermediate products, the capacity to compete in the international markets is reduced. If, however, imports are allowed for raw materials in the case of goods to be exported, the level of exports can certainly be increased significantly.

Market Survey

The Chairman laid stress on the future programmes of market surveys, market research, sales-cum-study delegations, publicity etc. Already the Council had submitted a comprehensive programme to the Ministry of International Trade for publicity and market surveys abroad. The Chairman also recommended to the members of the Council that they should increasingly take to export risk insurance cover. The Council is preparing a scheme of bulk cover for members whereby it is hoped to gain a straight reduction in premia rates up to 10 per cent.

Another element which has so far hindered the growth of India's exports to the West Coast of Africa and Latin America is high freight cost. The Chairman said that, but for prohibitive freight rates, this country could have sold to Nigeria alone glass bottles worth Rs. one crore. In the first 10 months of 1963 alone, the Freight Investigation Bureau reduced freight rates on 73 of the commodities (in which the Council was interested) and to 51 destinations. Special rates for samples were introduced, but a considerable further drop in freight rates is needed for making the products of the industry competitive in international markets.

Rice Prices and Prospects

From Our Correspondent

MADRAS:

RICE HAS been in the news. The State Government got alarmed over the increase in prices for the better grades of this cereal, following the ban on the movement of rice from Nellore. It naturally represented to the Centre that there was no meaning in imposing a partial ban on movement within a zone and that consumers in Madras City particularly were unnecessarily penalised on account of the stoppage of arrivals from Nellore. The Andhra Pradesh Government, for its part, represented to the Centre that the despatches of rice from Nellore were unusually heavy and consumers in their areas were obliged to pay high prices. It was in fact suggested that the ban should be continued for some time as the position was expected to improve only after the harvest of the standing crop and its actual marketing. The Central Government, however, has not agreed to a prolonged ban as the contention of the Madras Government has been accepted in principle. It has been indicated that the ban may be lifted by the middle of January when the new crop would stop moving. This prospect has led to some easing of rice prices in the city in the last few days, especially as liberal sales have been through fair price shops.

The developments in the past few weeks, however, have prompted the authorities to think in terms of stricter control over the wholesale trade in foodgrains in order to prevent violent fluctuations in prices. The Madras Government proposes to adopt a system of licensing which will enable it to keep a more careful watch on the trade. The Centre has suggested the introduction of a system of returns and codes in the determination of profit margins. This step is intended to check hoarding. Meanwhile it is proposed to intensify procurement. It is generally expected that the crop prospects are satisfactory and that an attempt should be made to procure at least 750,000 tons from the surplus States in the country. The quota of Andhra Pradesh for procurement has been raised to 250,000 tons and that of Madras to 150,000 tons. It is proposed to change the system of procurement in Madras as the voluntary system did not succeed in the last season. After a conference of millers in the City it has been announced that there would be a levy system and millers would be asked to procure up to 20 per cent of their transactions in Tanjore District and 15 per cent in other Districts. In Andhra Pradesh, the scale of levy would be 40 per cent of the turnover of millers and wholesalers. No changes have been made in procurement prices.

**

Meanwhile it is being questioned whether the State Governments of Andhra Pradesh and Madras are well advised in intensifying their procurement in the present conditions. The Andhra Pradesh Government has swooped down on rice millers in this region and requisitioned stocks up to 40 per cent because they had not complied with the terms of

voluntary procurement. Already, it has been promised that the procurement of rice would be raised to 250,000 tons from 175,000 tons for the last season. The procurement policy in Madras State would also seem to be revised as there was a conference of millers in the City a few days back. No doubt there is need for procurement for creating buffer stocks for being released to fair price shops during lean periods, but procurement should be carried in such a way that it does not result in a further rise in prices in the retail shops. The only satisfactory feature in the dismal situation is the report that the standing crop in Andhra Pradesh has not suffered on account of the recent heavy rains and the prospects in Madras also are good. If the surplus in Andhra Pradesh proves to be larger and Madras also has a marginal excess, it should be possible to bring down prices to reasonable levels before long. The veracity of crop reports will be borne out by the developments in the coming weeks.

**

The Andhra Pradesh Government has decided to extend old age pensions to a larger number of persons by stating that individuals, who had attained the age of 60 and who were physically incapacitated, can receive such pensions. At present, only those above 65 and have no means of sustenance, can receive pensions. The Budget appropriation for this purpose has, therefore, been increased to Rs. 25 lakhs from Rs. 4 lakhs. This gesture on the part of the Government has been appreciated and it is expected that other State Governments also will follow suit. In Madras, it has been found that old age pensions have benefited a large number of people and with the greater accent on social security measures, this is a move in the right direction. The Andhra Government has also decided to impart free education to girls up to the secondary school stage. Even earlier, it was indicated by the Madras Chief Minister that a scheme for giving free education to all up to the SSLC stage was being worked out. But as it was found that the cost would be very prohibitive, it was indicated later that free education of girls might be considered. The neighbouring State has actually taken a decision on this very question.

It is felt that much larger sums can be spent on social services and on the implementation of projects which will yield quick results, if the State Government's suggestion that the Nugarjuna Sagar Project should be taken over by the Centre is accepted. This question has been considered by the Central Government and there is somehow a feeling that the Centre might provide much larger assistance for projects which will take a longer time to be completed and the interest charges could not be paid easily during the construction stage. It will be a long time before the Nagarjuna Sagar Project begins to yield the maximum results. In the meantime, it is felt that the expenditure out of the State's resources would prove to be a heavy strain and the Central Government may probably be taking a helpful decision though it has been stated that, in future, the economics of working of bigger projects should be more carefully examined and the emphasis should be on the formulation of schemes which would yield results in a very short period. This was suggested by the Union Finance Minister when he addressed the gathering of economists in Bombay recently.

**

The Andhra Pradesh Government is keen on developing the film industry. Recently the State Cabinet decided on a series of measures to encourage the setting up of film studios in Hyderabad. The State Government would acquire 200 acres of land and make them available to entrepreneurs intending to set up film studios. In addition, financial assistance will be given to the industry. Apart from a loan of Rs. 2.5 lakhs to the only existing studio in the State Capital, other loans totalling Rs. 10 lakhs would be extended to new units. The loans will be free of interest for the first two years. Finally, an award of Rs. 50,000 will be made every year to the best Hindi or Telugu picture produced in the State. The first in this series of awards has already been given to a feature film based on the Salt Satyagraha campaign in Guntur during the freedom movement.

**

Work is proceeding briskly on the public sector project for the commercial production of photographic film, which is located in Ootacamund. The construction work was started towards the end of March last year and a major portion of the civil works has been completed. About 75 per cent of the machinery and equipment has already been shipped to this country and work on erection has started. It is expected that the plant will be commissioned within the third Plan period. The Hindustan Photo Films Manufacturing Company Limited, which is in charge of this project, has secured the collaboration of Messrs. Bauchet of France. The collaboration agreement covers the supply of machinery and equipment as well as the training of Indian technical personnel, assistance in the erection of plant and the establishment of production of the various manufactures in view. A sum of about Rs. 3 crores is payable to the French firm for its services, the payment to be made in equal half-yearly instalments starting from April, 1964.

The total cost of the project, excluding the township, is estimated at Rs. 7.4 crores, consisting of Rs. 4.45 crores on account of machinery and equipment, Rs. 1.7 crores for development of land and buildings and Rs. 77.45 lakhs for industrial services, and the rest towards initial expenditure, administrative expenditure during construction and expenses on the training of personnel. The annual production will be of the order of Rs. 6.5 crores of cine films, roll films, sheet films, X-Ray films, aerial films, photographic papers, etc. The largest single item of manufacture will be cinematographic film and a start will be made with black and white film.

The project is expected to serve as a nucleus for allied industries, schemes for which are being formulated by industrialists in the private sector. The manufacture of cellulose triacetate, methylene chloride and beryta-coated paper base are among the various lines of production which are being kept in view. Several small units in the region are also being encouraged to undertake the production and supply of items such as light fittings, plastic containers, and aluminium foils. There is also scope for entrepreneurs to produce, in due course, items such as dark-room accessories and cameras. Meanwhile, in order to familiarize the Indian market with the materials that are to be produced at the Ooty plant, Hindustan Photo Films are importing small quantities of photographic materials from their French collaborators and marketing them under the company's brand name "INDU".

**

The New Year has begun on a dull note in the Stock Markets. There was considerable concern over the pronouncements made by some of the Leftist leaders relating to the nationalisation of banks and consumer goods industries, state trading in foodgrains and other commodities, etc. But there was some relief when the draft resolution of the Congress Working Committee was published. Knowledgeable circles are inclined to believe that the Centre may not adopt any hasty steps, as the nationalisaion of banks particularly may have an unfavourable effect on the flow of foreign capital. Besides, there is now rigorous control over banks and with the new powers assumed by the Reserve Bank, a better use of available resources can be ensured while safeguarding the interests of depositors more effectively. The allaying of fears to some extent has been responsible for the slight recovery in prices in the past two days. But there will not be any disposition to push up values until it is clearly known that the Central Government would adopt a pragmatic approach when framing new policies and the next budget also would be drawn up on a realistic basis. The results of some companies have clearly shown that, without a reduction in the tax liability, it may not be possible to pay higher lividends or plough back fairly large sums into business.

The moving finger writes

PRESS REPORTS from Bhubaneswar speak of heated discussions in the Subjects Committee on the Resolution on "Democracy and Socialism". But it is, not only the temperature which seems to have shot up. Evidently, tempers too have risen. And also blood pressures. The Prime Minister's, happily, has quickly gone back to normal. One hopes that this indisposition is only a passing one. Men much younger than he, undergoing strain much less than he does, would be entitled to fall ill now and then. But, in Mr. Nehru's case, it may not be all that simple. While one does not naturally want to be an alarmist, it is in the public interest to say that the Prime Minister is certainly burning his candle at both ends — and the 70s are no age to do it in. There ought to be some one around him who could put a stop to this and I for one would certainly feel easier in mind if after Bhubaneswar, Mr. Nehru could be persuaded to go away to a quiet place for the mere physical rest that he so sorely needs. It is clear, of course, that this spell of quiet should be long enough if it is to do him any real good, but that ought not to present any formidable problem so far as the Central Government is concerned, for I just do not see any reason why Mr. Morarji Desai or Mr. Lal Bahadur Shastri should not be called back to the Central Government for caretaking.

**

Mr. Biju Patnaik, I concede, is a (wholly) clever and a (relatively) young man, but it is obvious that he could be wiser. Surely, it was foolish of him to have claimed in the Subjects Committee that nobody in the Congress Working Committee was opposed to the nationalisation of banks. Apart from the fact that what he said was just not true, he ought to have known that an assertion of that kind was bound to trigger a public controversy among Congressmen since the nationalisation of banks is, and has always been, a highly controversial issue within the Congress Party. When Mr. Patnaik attempted to make it appear that the nationalisation of banks had been accepted in principle and that the timing of it was a detail which had been left to be settled by administrative decision at the level of the Central Government, he was clearly trying to mislead the Congress Party as well as the country. Mr. S. K. Patil, and Mr. Morarji Desai, had no alternative to joining issue with Orissa's ex-Chief Minister and making a public affirmation of the fact that the Congress Party was not at all agreed on the nationalisation of banks as a necessary or desirable step. It was left, finally, to Mr. Krishnamachari as Finance Minister to clinch the issue which he did by firmly declaring that there was no case for the nationalisation of banks, since the Government would be able to exercise direct control over as much as some 50 per cent of the organised credit resources in the nation through the State Bank and the proposed Development Bank.

**

While Mr. Krishnamachari has undoubtedly been outspokenly firm in turning down the demand for bank nationalisation, I am inclined to say that the credit for the most sensible observations on this particular issue must go to Mr. Asoka Mehta. Considering that Mr. Asoka Mehta apparently still desires to have one foot in the Praja Socialist Party, I consider it politically courageous of him to have stated publicly that, although the P.S.P., which asked for the nationalisation of banks in its previous policy statements, might be inclined to find fault with the Congress leadership for rejecting the demand, he himself would not hesitate to say that there was no case for the State taking over and monopolizing commercial banking. Mr. Asoka Mehta pointed out that, while it was certain that there would be adverse psychological effects at home and abroad if banks were to be nationalized, the advocates of nationalization had not at all been able to show that there would be positive advantages to be set off against the very real disadvantages which he had mentioned.

The Deputy Chairman of the Planning Commission was speaking to journalists in the Capital who, combining business with pleasure, had invited him to a Luncheon meeting at the local Press Club. Mr. Asoka Mehta, of course, has a very alert intelligence, but even so I must confess that I was surprised not only by the quickness but also by the maturity of his comprehension of the problems of his present assignment which is not yet many months old. I was specially impressed by his pragmatic wisdom in stressing the fact that, among all our development resources, time was the most precious and also the least valued. He explained how not only the cost of executing a project was increased when there were delays, procedural or otherwise, but also a whole series of development schedules disarranged. I personally believe that this emphasis on the urgency of every individual programme or scheme is perhaps the most relevant factor to be respected at the present time when effective steps have to be taken to step up the rate of economic growth.

Elsewhere too, Mr. Mehta showed fine appreciation of the importance of reckoning with realities. In his view, so long as the productive apparatus of the economy had not developed sufficiently, social security in any significant sense of the phrase could not be provided for the people at large. It was, therefore, necessary to realise that while such limited welfare measures as could now be contemplated might be undertaken, they would at best be only "expressions of good intentions". In Mr. Mehta's view, an increase of at least seven per cent per annum in the national income has to be firmly secured before a national programme of social security could be made meaningful.

**

I forgot last week to share some good news with my readers to whom I must now apologise on that account. The year 1963, they will be happy to learn, has been a good year for "Eastern Economist". Its circulation has been steadily going up and it is now possible to claim that it has the largest circulation in its class. "Eastern Economist" has always had a good number of copies circulating abroad, and here again the last 12 months have seen an appreciable rise in the proportion of foreign subscribers to the total. Readers will have noticed that there have been more pages to most issues of the Journal in 1963 than was the case in the years before. In these days of high paper and production costs this has naturally meant more expenditure. I am, therefore, particularly happy to find advertisement revenue keeping ahead of previous collections. The advertisement support received for the Special Issues has been particularly encouraging and this, incidentally, has enabled us to place in the hands of our readers the sumptuous Annual Number, 1964, which they should have received this week.

V. B.

Trade Winds

FREIGHT RELIEF FOR EXPORTS

THE RAILWAY Ministry has decided to allow with effect from January 1, 1964 a general rebate of 25 per cent in freight on 65 products for the engineering industry booked from any station to any port for export. The rebate is intended to stimulate the country's export trade.

The rebate will also apply to Dhanushkodi when traffic is booked to Colombo via all rail routes and upto the border stations when traffic is booked to East or West Pakistan.

The commodities include, among other things, gramophones, steel pipes, refrigerators, aluminium and stainless steel utensils, brass ware, rice mill machinery, hard tools, bicycles, dynamos and zip fastners. This general rebate will be in addition to the 50 per cent rebate in freights already allowed in the case of 25 engineering goods such as motor vehicle batteries, hurricane lanterns, textile machinery and components when moved from producing centres to specific ports for export.

In regard to bicycles and their components, steel trunks, steel folding furniture, cast iron spun pipes, electric fans, oil mills machinery, tin containers, iron castings, diesel engines and bolts, nuts and rivets, the rebate of 50 per cent in railway freight is allowed for bookings from any station to any port.

Besides engineering goods, rebates in railway freights are also at present allowed for low-grade iron-ore from Rajasthan and manganese ore of all grades, non-essential oils, industrial raw material such as power alcohol, rectified spirit and fruits and vegetables.

With a view to promoting the export of bananas, low wagon rates have been recently introduced over the Central and Western Railways for movement of this fruit to Bombay port from Raver, Nimbhora, Sarda, Buhsawal, Jalgaon, Pachora and Kajgaon, Bardoli, Gangadhara, Chaltham and Timberva stations for export.

The following is the list of 65 commodities for which a general rebate of 25 per cent in railway freight will be allowed when booked from any station to any port for export: (1) gramophones, (2) crown corks, (3) incandescent lamps (pressure lamps), (4) steel furniture (non-folding cabinet with shelves, tables and sofa sets only), (5) steel pipes, (6) lathes (machine tools), (7) batteries, (8) fluorescent tubes, (9) room air-conditioners, (10) electrodes, (11) belting, (12) building hardware (steel butt hinges), (13) rice mill machinery, (14) motor vehicle noc, (15) electric motors, (16) house service meters, (17) barbed wire, (18) agricultural implements (crow-bars and shovels only), (19) R. S. pilfer-proof closures, (20) refrigerators, (21) paint brushes, (22) umbrella ribs, (23) aluminium utensils, (24) weld mesh, (25) conduit pipes, (26) G. I. buckets, (27) ghenellas, (28) hacksaw blades, (29) ferro-builders hardware, (30) power driven pumps (multistage industrial pumps), (31) hurricane lantrens, (32) C. I. flushing cisterns, (33) pressure stoves, (34) water fittings, (35) brass shells and circles, (36) brassware, (37) stainless steel utensils, (38) bicycle dynamos, (39) hard tools, (40) aluminium conductors, (41) enamelled copper wire, (42) D. C. C. copper wire, (43) single cotton covered copper wire, (44) power driven pumps (horizontal split case centrifugal pumps), (45) agridiesel, (46) storage batteries, (47) non-ferrous alloys (basic metal ingots), (48) zip fasteners, (49) construction machinery (lynx type 70 open tilting drum type concrete mixer), (50) gas plant (Manafield gas plant for Bunsen burners), (51) railway track fastners (dogspikes and round spikes and canted bearing plates), (52) C. I. pipes (other than spun pipes) (53) public address equipment (amplifier 35 volts), (54) jute mill machinery (jute shuttles and bobbins), (55) enamelled ware (mugs only), (56) industrial and scientific instruments: (a) surveyors' compass 4" with stand, (b) slinometer compass 3" dia in leather case, (c) prismatic compass 4" with stand, (d) sextant complete in a box, (e) theodolite with stand and box complete, (f) I.O.P. level complete with stand, (h) levelling staff (telescopic) 14', (i) rain gauge with stand, stainer etc., (57) ice cans, (58) air-compressor (broomwade type wr. 210 portable diesel), (59) steel tubular poles, (60) shaping machines, (61) T. L. towers, (62) motor cycles and scooters, (63) rolling shutters, (64) copper sheets, (65) power presser (40 ton non-geared vice).

In items No. 6, 7, 11, 15, 26, 31, 44, 45, 55 and 57, fifty per cent concession is in force between specific pairs of points. The 25 per cent rebate in freight will be allowed for movements other than those for which 50 per cent rebate in freight is already in force.

AUTONOMOUS COUNCIL FOR FAIRS

In pursuance of the recommendation of the Mudaliar Committee, the Board of Trade had advised the Government of India to establish an agency for organizing trade fairs and exhibitions with the active assistance of the business community. Following this an autonomous organization — the Indian Council of Trade Fairs and Exhibition — has been set up with its headquarters in Bombay. The object of the Council is to promote and participate in industrial trade fairs in India and abroad and organize visual commercial publicity for the purpose of export promotion. The Council will also concern itself with the establishment and maintenance of showrooms, trade centres and depots in strategic commercial areas abroad.

The Indian Council of Trade Fairs and Exhibitions, which will have representatives of trade and industry on it, has as its first Chairman, Mr. Keshub Mahindra of Mahindra and Mahindra Limited. The Federation of Indian Chambers of Commerce and Industry is represented on the Governing Body of the Council by its President, Mr. Bharat Ram; the All-India Manufacturers' Organisation will be represented by its Chairman, Mr. Prabhu V. Mehta; and the Basic Chemical Export Promotion Council by its Chairman, Mr. P. A. Narielwala, (Director of Tatas). The Governing Body will include senior officers of the Government of India, viz., Mr. P. K. Panikkar, Director of Exhibitions, and Mr. H. D. Shourie, Joint Secretary in charge of Export Promotion (both from the Ministry of International Trade) and Mr. N. S. Pandey and Mr. S Krishnamurthi, Joint Secretaries in the Ministry of Finance. A senior Government official will be its Executive Director. The various Chambers of Commerce and Industry, Export Promotion Councils, Commodity Board, Exhibitors, Associations, Trading Organisations and units, banks and insurance companies will have their nominees on the Council

BARAUNI AND KOYALI REFINERIES

Contracts for the preparation of detailed project reports for the expansion of the Barauni and Koyali refineries from two million tonnes to three million tonnes per year have been executed between the Indian Refineries Limited and the Oil and Natural Gas Commission on the one side and Messrs Tiajpromexport of Moscow on the other. The Soviet authorities will furnish the project reports before the end of the current financial year and the Indian parties are expected to communicate the acceptance or modifications of the project reports within a month. The expanded capacities of the two refineries are expected to be achieved by the end of 1965 or in the beginning of 1966.

CLOTH EXPORTS

The scheme of Compulsory Export Obligation operated by the Indian Cotton Mills Federation has been scrapped from January 1, 1964. It is not expected that the abolition of the scheme would make any difference to the trend of cotton textile exports. The idea of compulsory exports has never been very popular among mills and many of them had chosen to pay the prescribed penalty for not effecting the specified exports. The penalty, which goes into an export promotion fund, equals one-eighth of the value by which the F.O.B. price of export performance falls short of the corresponding export obligation. Apart from the fact that the industry, by and large, has not been in favour of the scheme, it has been found that compulsory exports tended to weaken the bargaining position of mills and shippers vis-a-vis buyers abroad. It has also been felt that an impression should not be created that the Indian cotton textile industry is exporting under coercion.

SUGAR MACHINERY

The Government of India has appointed a 12-man Technical Committee for drawing up specifications for sugar plants with daily crushing capacities of 1,000 to 1,500 tons, 1,250 to 1,750 tons and 1,500 to 2,000 tons of sugarcane. Besides officials of the Union Ministries concerned, members of the Committee include technical representatives of sugar machinery manufacturers in the country.

The Committee has been asked to submit its report within six months.

INDO-POLISH TRADE

A new long-term trade and payments agreement was recently signed in New Delhi between India and Poland. The agreement envisages a turnover of about Rs. 16 crores each way during 1964. The list of goods of Indian exports has been enlarged and diversified. India will be exporting engineering goods including textile machinery and accessories, machine tools and various other engineering products including diesel engines. India will also export cotton textiles, handicrafts and handloom products, leather footwear and other new items of manufacture such as duplicators, readymade garments, collapsible tubes and razor blades in addition to iron ore, manganese ore and mica. Other traditional items of export to Poland are deoiled cake, tea, jute products, spices, shellac, groundnuts and cashewnuts. Poland is an important supplier of mining machinery, machine tools, tractors, zinc and rolled steel products including alloy and special steels. Apart from other items, capital goods and generating equipment will also be supplied by Poland.

INDO-G.D.R. TRADE

The existing trade and payments agreement between India and the German Democratic Republic has been extended for another year. It is envisaged that the trade turnover will be of the order of Rs. 35 crores both ways. India will export engineering goods worth Rs. 2 crores including storage batteries, tyres, automobile components, precision castings, tropicalised motors, electric equipment, bolts and nuts, machine tools components and accessories, ophthalmological instruments, apparatus for chemical equipment, aluminium core cables, coal crushing and mineral grinding machines, household electrical appliances, telephone instruments and equipment, mobile workshop cranes and trolleys, industrial shutters and duplicating machines, textile machinery and accessories. India will also export chemicals including drugs and medicines, specially sodium bichromate, sodium perborate, quintine hydrochloride, harmones and synthetic vitamins.

Other items of exports from India are cotton and synthetic textiles, fruit juices and concentrates, handlooms and handicrafts, coir manufactures and leather footwear. India will increase her exports of jute manufactures, iron ore, mica and other mining products. Other items of export are tea, coffee, castor oil and deoiled cakes, etc. G.D.R. will export to India machine tools, capital goods including heavy electrical equipment, printing machinery and other items of machinery. Sizable quantities of muriate of potash, ammonium sulphate, sulphate of potash among the group of fertilizers will also be exported from G.D.R. to India. Other items of exports from G.D.R. to India are various organic and inorganic chemicals, cinematographic raw films, X-Ray films and various precision instruments including those for research and educational institutions.

RECORD EXPORTS IN NOV.

India's exports in November 1963 touched the record level of Rs. 73.7 crores which was Rs. 9.5 crores more than the value of exports in November 1962. This is the highest figure of monthly exports so far reached. Most of the export items showed an upward trend.

The total exports of India in the first eight months of the financial year 1963-64 were worth Rs. 512 crores. This was

Rs. 57 crores higher than the corresponding figure of Rs. 455 crores in the first eight months of 1962-63.

CENTRAL BOARD OF TAXES

The Central Government has constituted with effect from January 1, 1964, two separate Boards of Revenue known as the Central Board of Direct Taxes and Central Board of Excise and Customs, under the Central Boards of Revenue Act (Act 54 of 1963) which has been enforced from the same date. The composition of each of the two Boards is as follows:

Central Board of Direct Taxes: Mr. J. P. Singh (Chairman and Mr. S. A. L. Narayana Row (Member).

Central Board of Excise and Customs: Mr. B. N. Banerji (Chairman) and Mr. D. P. Anand and Mr. R. N. Misra (Members).

The Chairman and Members of the two new Boards have taken over their respective charges.

All correspondence relating to Direct Taxes should henceforth be sent to the Secretary, Central Board of Direct Taxes and that relating to Excise and Customs to the Secretary, Central Board of Excise and Customs.

EMERGENCY RISKS

It was announced in the Finance Minister's statement in Parliament on December 16, 1963 that no premium will be payable in respect of the quarter ending March 1964 under the Emergency Risks Insurance Schemes. The Emergency Risks (Goods) Insurance Scheme and the Emergency Risks (Factories) Scheme have been modified by the Central Government with effect from January 1, 1964 in order to implement this decision. The duration of policies issued under the two schemes which were in force on December 31, 1963 will be extended automatically by the Government agent without the payment of any premium for a further period of three months with effect from January 1, 1964 and no further applications will be necessary for this purpose.

As regards property which becomes insurable under the schemes for the first time on or after January 1, 1964, no premium will be payable at the present and the rates at which premium will be payable will be announced, if necessary, at a later stage by the Government. The rates of premium will be fixed with due regard to the nature of the risks and other relevant considerations and may be nil if the circumstances justify such a decision. Applications without treasury challans will be received, in the meantime, in respect of property which becomes insurable under the acts and schemes for the first time and policies will be issued subject to the payment of premiums at a later stage at such rates, if any, as may be fixed by the Central Government. Persons owning or interested in property insurable under the two schemes are advised not to pay premiums into treasuries or sub-treasuries in respect of any period after January 1, 1964 in the absence of any further information or notice.

ACTUAL USERS LICENCES

An Import Trade Control Public Notice issued by the Ministry of International Trade says that in the case of industries which have been granted licences for the first half-year's requirement as first instalment, the supplementary licences for the second half-year will be granted. The annual licences granted to established importers and actual users for April 1963 - March 1964 need not be presented to licensing authorities for endorsement regarding utilization of the second half. Such licences will be deemed to be automatically valid for utilisation of the second half without application of any cut. The validity period of such licences will also be deemed to be extended by another six months for utilization of the second half of the licences.

In cases where fresh annual licences are yet to be issued to actual users both in the scheduled and non-scheduled sectors for April 1963-March 1964, the annual licences will be granted for the total yearly entitlements. The licences will be suitably endorsed to permit the import of the goods in one lot within the validity period of the licence. A notification issued by the then Ministry of Commerce and Industry on May 17, 1963 had said that established importers and actual users who had been granted annual licences for the period April 1963 - March 1964 were required to present such licences after 30-9-1963 to the licensing authorities for endorsement for validation of the second half of such licences, subject to such changes in values as might be decided upon. The notification had also said that the second half of the annual licences after application of cuts, if any, could, however, be utilized only after the expiry of the first six months from the date of issue of such licences and within the extended period of validity of six months allowed by the licensing authorities.

PRICES OF TYRES

Following the abolition of price control on 16 commodities, as recently announced by the Finance Minister, Mr. T. T. Krishnamachari, tyre manufacturers are reported to have increased the prices of all types of tyres by six per cent. This should particularly help newly established units in the industry.

According to a spokesman of a leading tyre company, the six per cent price rise would, for the time being, apply only to manufacturers' prices, as retail prices could be increased only with the approval of the Government.

The price of caustic soda is also reported to have been increased by eight per cent. A similar increase in the price of soda ash could be expected soon.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)

Notice is hereby given that the Board of Directors of this Company have declared payment of an Interim Dividend on the Company's Ordinary Stock at the rate of £3½ per cent net (tax applicable at 7s. 9d. in the £) for the year ending 31st March, 1964. Payment will be made on 15th February, 1964, to those stockholders whose names are registered in the Company's Stock Register on 28th January, 1964.

Applications for transfers received in this Office before 12 O'Clock noon on Tuesday, the 28th January 1964, will, if otherwise satisfactory, be registered at the date for the purpose of participation in the above dividend.

BY ORDER OF THE BOARD
D. P. M. KANGA
AGENT

VICTORIA HOUSE,
CALCUTTA, 9th January, 1964.

Company Affairs

SCINDIA STEAM

AT THE annual general meeting of the Scindia Steam Navigation Company Ltd., Mr. Dharamsey M. Khatau, the Chairman observed that there was considerable improvement in the performance of the company which had been achieved through efficient running of the vessels, rationalization of the fleet and services in the overseas trade and upward revision of freight rates. The 10 per cent increase in the West-bound freights had not come a day too soon because these freights had remained static since 1957. He added, however, that the problem of mounting operating costs arising from increased benefits given to the dock labour under various awards and also from increased port charges, had made the establishment of an appropriate machinery like the Tariff Commission necessary to correlate the rise in costs with compensation in freight rates.

The Chairman informed shareholders that, out of the three 17 knots fast motor vehicles — Jalakrit type — ordered with Messrs. Hindustan Shipyard, the first vessel was expected to be delivered by about the middle of this year and the second would be ready sometime in the next year. Keel of the third vessel was laid on April 26, 1963. He also referred to the recent addition to the company's fleet of two second-hand motor vessels — one of 12,800 d.w.t. and another of 11,700 d.w.t. — both built in 1958 and having a speed of 14 knots. These vessels have been acquired on a deferred payment basis.

Referring to the appointment of a one-man Commission to review the freight rates of shipowners operating on the coast, he hoped that the Commission would look into the urgent need of allowing an appropriate increase, which would provide an adequate return on capital employed. In addition to the freight rates, the occasional shift in the Government policy in the allocation of coal cargo led to the withdrawal of some ships from coastal employment. It would only be fair to the coastal operators that such element of uncertainty was eliminated so that they could plan for the carriage of freights over a certain period. As regards the Konkan services, Mr. Khatau indicated that the State Government had promised to pay a specific amount in respect of subsidy in lieu of 8 per cent increase in fares as well as the repair cost in excess of the Rau Committee estimate for the years 1961-62 and 1962-63, which it did not honour. The Company, therefore, did not resume the Konkan services from September 1, 1963. It was only after the intervention of the Central Government that the Maharashtra Government paid "on account" an amount of Rs. 4 lakhs and the company resumed its services from October 11, 1963. This wastage of time could definitely have been avoided if the Government paid sufficient attention towards such essential services.

MYSORE KIRLOSKAR

Mr. M. D. Shivananjappa, Chairman, the Mysore Kirloskar Ltd., informed shareholders at the annual general meeting, held recently, of the steps that were being taken to accelerate the activities of the company to meet the growing demand for machine tools. The construction work on various schemes was progressing well — the building for the foundry was expected to be completed by the end of March and plans for the construction of the machine shop at the Hubli branch were well advanced. Orders had been placed for the import of machinery. The company proposed to diversify its activities by adding one or two new lines of machine tools for which it was negotiating foreign collaboration. The record for the year ended June 30, 1963, also confirmed this trend: Net sales approached nearly Rs. 2.23 crores, 23 per cent more than the last year's figure of Rs. 1.81 crores.

At a time when the demand for machine tools in the country was increasing rapidly and the company was trying hard to meet it by continued efforts at expansion, various handicaps, Mr. Shivananjappa pointed out, were hampering its progress. For instance, sufficient foundry grade pig iron was not available in adequate quantities. He expressed satisfaction over the proposal for the establishment of a steel plant of one million ton capacity in Goa-Hospet region. He made one or two interesting suggestions in respect of income tax deductions from profits. He pointed out, for instance, that depreciation allowance which was provided under the Income Tax Act met only the original cost of machinery and did not provide for the rise in the cost of machinery at the time of replacement. This, indeed, was quite illogical because the depreciation provision should be able to cover the cost of replacement of machinery. Secondly, he suggested that the tax holiday given for a period of eight years to new units should also be extended to expansion schemes. This could be particularly helpful to capital-intensive industries such as machine tools.

J. K. STEEL

Mr Lakshmipat Singhania, Chairman, J.K. Steel Ltd., reviewed the working of the company during the last decade, while addressing the annual general meeting held recently. During these ten years its gross block increased from Rs. 12 lakhs to Rs. 98 lakhs and its sale proceeds went up from Rs. 30 lakhs to Rs 176 lakhs. It has increased the variety of manufactures too. Starting with jute bating-hoops, it now manufactures cold rolled strips, box strappings and steel wire ropes in addition to the proposed manufacture of electric hoists and chain pulley blocks. The plant for the manufacture of electric hoists and chain pulley blocks has already been installed but the production could not be started because of some official delays. It was, indeed, unfortunate that such a scheme of pioneering nature had taken more than five years for completion on account of avoidable delays in the issue of industrial licences, approval of collaboration agreements, issue of import licences for capital goods, raw materials and components. The company's project to double the capacity of steel wire ropes plant was also delayed for similar reasons. It had obtained industrial licences for doubling the capacity of the plant for the manufacture of cold rolled strips and the manufacture of electric overhead travelling cranes.

Mr Lakshmipat Singhania, recounted in detail the difficulties faced on account of raw material shortages. The supply of billets for the manufacture of jute baling hoops continued to be inadequate. The actual average monthly receipt of billets during the year was nearly 62 per cent of the "entitlement" fixed by the Iron and Steel Controller, which, in other words, meant nearly 37 per cent of the original quota. Even this inadequate quantity was received at irregular intervals. In fact, the company had to shut down the operations for nearly a month and a half on account of the shortages of billets. Similarly, the supply of hot rolled strip continued to be insufficient and was of the order of 25 per cent of the requirements. The problem was further accentuated on account of the inability of the Rourkela Plant to supply hot rolled strip of particular quality and specifications. It was certainly a compliment to the company that in spite of these problems, it recorded peak sales of the order of Rs. 1.76 crores during the year ended June 30, 1963, as against the

previous year's figure of Rs. 1.14 crores. The profits also were higher and the directors recommended a higher dividend of 15 per cent.

MYSORE SUGAR

The sugar industry in India has witnessed a crisis of production during the last three years and it still lingers on. The output declined to 21.6 lakh tonnes during 1962-63 against last year's production of 27.3 lakh tonnes and 30 lakh tonnes during 1960-61. This poor performance was apparently due to inadequate supply of sugarcane to the factories. One would agree with Mr V. Venugopal Naidu, Chairman and Managing Director of the Mysore Sugar Company, who addressed the annual general meeting held recently, that this crisis assumed more unfortunate dimensions for two reasons; firstly the internal consumption increased from about 21 lakhs to 26 lakhs and, secondly, there was a good demand for export, in view of the world price for sugar having reached the phenomenal heights. One reason why sufficient cane supply did not reach the sugar mills was the attractive price, the cane growers got by converting cane into jaggery or by supplying cane to jaggery manufacturers. The Government tried to induce the growers to supply their cane to factories at higher prices. Mr Venugopal Naidu hoped that the Central Government would take this increase in cane price into consideration while fixing the ex-factory price of sugar. So far as sugar factories in the South were concerned, no adequate sugar price had been given to counter this increase.

The Chairman outlined the efforts of the company to expand its capacity at a time when the Government had decided to license additional capacity of 5 lakh tonnes. He expected that the company's demand for an expansion licence to increase its crushing capacity from 1,400 tons to 3,000 tonnes per day would be considered favourably. In fact, the company had obtained permission from the Sugar Directorate to effect some additions and alterations to the factory which it hoped to carry out during this off-season. The remaining additions and alterations would be effected after the licences for expansion were received which would increase the annual crushing capacity to six lakh tonnes of cane.

VOLTAS ISSUE

Voltas Ltd. entered the capital market on January 9 with an issue of 10,000 debentures of Rs. 1,000 each (7 per cent, taxable) at par. The subscription list will close on January 15 or earlier but not before January 13. The Company has an authorised capital of Rs. 5 crores and subscribed capital of Rs. 2.55 crores. It proposes to set up in Thana, near Bombay, an up-to-date factory to manufacture a wide range of air-conditioning and refrigeration equipment, mining equipment, materials handling equipment, electrical equipment and a few other allied items for which the company is negotiating for collaboration with leading manufacturers abroad. The issue has been underwritten.

MAHINDRA UGINE

Mahindra Ugine Steel Company Limited will enter the capital market on January 14 with a public issue of Rs. 1.57 crores of which Rs. 1.07 crores will be in equity shares of Rs. 10 each and the balance of Rs. 50 lakhs will be in redeemable 9.3 per cent cumulative preference shares of Rs. 100 each. The subscription list will close on January 24 or earlier but not before January 17. The entire issue has been underwritten. It will produce alloy steels of a wide range using chromium, nickel, manganese, molybdenum and vanadium as alloys. The capital cost of the project is estimated at Rs. 6.5 crores and the foreign exchange component is expected to be of the order of Rs. 2.8 crores. This will be met from the loan-cum-investment of Rs. 1.50 crores from the International Finance Corporation, and from the loan of Rs. 65 lakhs in foreign exchange from the I.C.I.C.I. It has secured a rupee loan of Rs. 1.50 crores from the Industrial Finance Corporation of India. The promoters — Mahindra and Mahindra Ltd., and Ugine, a French company — have agreed to subscribe Rs. 40 lakhs to the equity capital of the company. The International Finance Corporation have agreed to take up, in terms of their investment agreement, Rs. 40 lakhs of equity shares. Nearly Rs. 20 lakhs of equity shares have been reserved for allotment to shareholders of Mahindra and Mahindra and staff of that company and of its associated companies.

CHEMICALS AND FIBRES

The subscription list of Chemicals and Fibres of India Ltd. for the public issue of shares worth Rs 62.50 lakhs will open on January 20, and will close on January 25 or earlier but not before January 22. The company has an authorised capital of Rs. 10 crores and the present issue is for Rs. 3 crores out of which 1,500,000 equity shares of Rs. 10 each have been agreed to be subscribed by Imperial Chemical Industries Ltd., London, 125,000 equity shares of Rs. 10 each by the Life Insurance Corporation of India and nearly 300,000 shares by the directors and employees of Chemicals and Fibres of India Ltd. and the directors, employees and distributors of companies associated with it. Equity shares of Rs. 10 each, numbering 625,000, are offered for public subscription. The issue has been underwritten. The company will manufacture polyester staple fibre and has entered into a technical collaboration agreement with Imperial Chemical Industries Ltd., U.K. The unit, to be located near Thana in Maharashtra State, will cost nearly Rs 5.85 crores and will commence production in 1965. Imperial Chemical Industries has consented to pay in sterling for the shares to be allotted to it against which plant and machinery can be imported from the U.K.

A.P.V. ENGINEERING

The A.P.V. Engineering Company Limited will enter the capital market on January 13, with an issue of 170,000 equity shares of Rs. 10 each out of which A.P.V. Holdings Limited will be allotted 35,000 equity shares, Port Engineering Works Ltd., Calcutta, 40,000 equity shares and the directors of the company and their friends, 2,500 equity shares. 92,500 equity shares of Rs. 10 each are offered at par to the public. The subscription list will close on January 22 or earlier at the discretion of the directors but not before January 15. It has entered into collaboration with A.P.V. Company Limited of U.K., William Gardner & Sons (Gloucester) Limited, U.K. and Thomas The Sabroe & Company Limited of Denmark.

AHMEDABAD ELECTRICITY

The Ahmedabad Electricity Company Limited proposes to raise Rs. two crores by the issue of 20,000 seven per cent debentures of Rs. 1,000 each at par, in the first instance to the present debenture holders. Each debenture-holder will be entitled to two 7 per cent debentures in respect of every existing three 5-1/2 per cent debentures held. The whole issue is underwritten. This amount is to be utilized to finance partly the company's expansion plans including the installation of a second 30 MW set at Sabarmati project. Applications for these debentures have to be made before January 20.

FIRTH STERLING

The subscription list of the public issue of Firth Sterling Steel Company of India Limited for Rs. 27 lakhs in equity shares of Rs. 10 each will open on January 15, and close on Januray 25 or earlier, but not before January 17. It has an

BIRD'S CENTENARY YEAR

MINERALS IN MULTI-MILLION TONNES FOR STEEL

India's rising steel production demands an increasing supply of raw materials. To help meet this demand, the total minerals output of the Bird-Heilgers Group has increased in the last five years from just under 4 million tonnes to over 7 million tonnes per year. The Group is among the biggest mining organisations in the world—and still growing— producing coal, iron ore, limestone, manganese and dolomite.

Deploying the skills acquired over a hundred years, the Bird-Heilgers Group is making important contributions to the economy . . . through planned diversification and expansion.

FOILS FOR PACKAGING...

WAGE WAR ON ADULTERATION

India Foils Limited

(Incorporated in Great Britain)

Calcutta Bombay Madras New Delhi

authorised capital of Rs. 1 crore and an issued and subscribed capital of Rs. 11.43 lakhs. The present issue is for Rs. 38.57 lakhs out of which a sum of Rs. 11.57 lakhs has been reserved for the technical collaborators—Firth Sterling Inc. of the USA. It proposes to manufacture high speed steels and high alloy constructional steels at its factory near Thana, in three stages and the first stage is expected to go into production during the third quarter of this year. The cost of the unit by the end of 1966, when the third stage will be completed, will be Rs. 101.50 lakhs.

MAFATLAL FINE SPINNING

Mafatlal Fine Spinning and Manufacturing Company Limited proposes to enter the capital market shortly with an issue of Rs. 108.75 lakhs made up of 29,000 equity shares of Rs. 100 each at a premium of Rs. 275 per share. The proceeds of this issue are to be utilized to finance partly Navin Flourine Industries, promoted by the company, which will manufacture flourine chemicals. The project is estimated to cost nearly Rs. 280 lakhs. Of the proposed 29,000 equity shares, 14,500 shares will be offered at the same price to the existing shareholders of the company as rights in the ratio of one new share for every four shares held and the remaining 14,500 shares will be offered for public subscription. The company is negotiating with the Gujarat Mineral Development Corporation for securing the basic raw material—acid grade flourspar—for its factory which will be located in Surat district and is expected to commence production by the end of 1965. It proposes to enter into technical collaboration with Buss Limited, Basle, Switzerland and Eisenbau Wyhlen A.G. West Germany.

GUJARAT MACHINERY

Gujarat Machinery Manufacturers Limited will enter the capital market shortly with a public issue of Rs. 25 lakhs to finance its machinery manufacturing project. The authorised capital of the company is Rs. one crore divided into 100,000 equity shares of Rs. 100 each of which shares of the value of Rs. 8.63 lakhs have already been subscribed and fully paid-up. It now proposes to issue shares of the value of Rs. 30 lakhs of which shares worth Rs. 5 lakhs will be taken up by directors, their friends and relatives. The company has been licensed to manufacture 4,800 tons of structural steel work including tanks, chimneys, ductings, etc. It also proposes to manufacture glass lined chemical vessels and printing machinery for which its application is being considered by the Government. It proposes to secure the collaboration of a Hungarian company. The total financial outlay on the project will be nearly Rs. 87.57 lakhs, a part of which will be met through borrowings.

JEEVANLAL LIMITED

Jeevanlal (1929) Limited proposes to enter the capital market next month with a public offer of Rs. 78 lakhs—Rs. 48 lakhs in equity shares of Rs. 10 each and Rs. 30 lakhs in 9-1/2 per cent cumulative redeemable preference shares of Rs. 100 each. It has an authorised capital of Rs two crores and issued and subscribed capital of Rs. 72 lakhs. It proposes to set up a full-fledged modern rolling mill at Tiruvottiyur and to supplement the needs of raw metal supplies, namely, aluminium steels and circles, of the company's existing plants. The technical collaborators are Aluminium Laboratories, Canada.

CHEMICALS AND PLASTICS

Chemicals and Plastics (Chemplast) of India Ltd., has received an Export-Import Bank credit of $3.1 million (Rs. 1.5 crores) to purchase United States machinery, equipment and technical services for the construction of a polyvinyl chloride plastics resin plant and a plastics products plant. The resin unit will be located at Mettur Dam where raw material and power are available and the plastics products plant will be located in Bombay. The B.F. Goodrich Company of Akron, Ohio, will design the plans and supervise the construction. A U.S. engineering firm for construction will be selected on a competitive basis and will work with Indian engineers and technicians. The total cost of the two projects will be Rs. 3.2 crores.

PREMIER AUTOMOBILES

During the year ended June 30, 1963, the Premier Automobiles Ltd. has recorded a net profit of Rs. 22.43 lakhs, subject to bonus for 1959-60, as against last year's figure of Rs. 39.53 lakhs. A sum of Rs. 19.15 lakhs has been provided for taxation, Rs 13.75 lakhs for development rebate reserve and Rs. 63.47 lakhs for depreciation. Another sum of Rs. 15 lakhs has been allocated to general reserve. The directors propose to pass over the dividend for the year because there was a fall in net profits. The company had to reopen with a drop in the production of Fiat cars as a sequel to a cut in foreign exchange allocation. It also had to face the rising cost of materials and components, especially indigenous items, overheads and interest charges. The company's turnover was lower at Rs 20.11 crores as against Rs. 21.47 crores last year. Nearly 4,350 cars and 5,712 trucks were sold against 7,193 cars and 5,324 trucks sold last year. The shift was partly dictated by the state of emergency. It was revealed that as soon as the sheet metal plant starts its operation—which might be towards the middle of this year—the Indian content in the car will reach 85 to 90 per cent and it will be possible to produce more cars.

ASHOK LEYLAND

Ashok Leyland is proceeding with its programme of expansion and it was recently announced by the directors of this company that additional capital will be raised by the issue of new equity shares at par in the proportion of one share for every nine shares held. The foreign exchange provided by the British collaborators would be useful. It has been emphasised, however, that, on account of the difficulty in securing foreign exchange for importing components and parts, production cannot be stepped up appreciably. With the new loan granted by the Government, the position is expected to improve to some extent.

In spite of various difficulties (such as the suspension of production for 58 days due to delays in the issue by the Government of import licences for raw materials), the company has done fairly well during the year ended September 30, 1963. Even though the dividend on equity capital has been reduced to seven per cent from eight per cent taxable for the previous year, the shareholders will actually benefit on account of a larger capital ranking for dividend purposes. The amount required was actually higher at Rs. 32.07 lakhs against Rs. 29.39 lakhs in 1961-62. There was a small decline in net profit before taxation and after depreciation in 1962-63 to Rs. 72.96 lakhs from Rs. 76.82 lakhs in the previous accounting period. This provision for development rebate is Rs. 14 lakhs against Rs. 16.42 lakhs formerly and taxation Rs. 21.45 lakhs against Rs. 22 lakhs. It has not been possible to transfer any sum to general reserve against Rs. 5.41 lakhs previously.

RENAULT ENGINEERING

Mr. P. Zins, Chief Engineer of Renault Engineering, who is also in charge of project work and Mr. M. Telinge, Export Manager, were in New Delhi recently in connection with some of the projects which are under implementation and some others for which project reports are being prepared. Renault Engineering is a subsidiary of Regie

Renault, which is a French Government undertaking and is known throughout the world for manufacturing of automobiles. In this country, it is currently enagaged in the execution of a number of projects covering an extensive range of fields. No less than five contracts have already been signed between Renault Engineering and Indian firms for different products. For Republic Forge, Hyderabad, a 9,000 tons per year forge plant is being erected. For Orissa Industrial Development Corporation, Bhubaneswar, a cable plant for 3,600 tons per year is under construction. In Punjab, a tools and dies plant is under erection for Messrs. Tools and Electricals (India) Limited. Two forge plants are being erected in Calcutta, one with a capacity of 9,000 tons per year for Mr. C. R. Das Gupta and another with a capacity of 3,600 tons per year for Eastern Engineering, Calcutta. Project reports are being prepared for malleable casting plant, steel casting plant, fly wheel gear plant, straw board panel plant and valve spring plant.

International Equipment Corporation Private Limited with offices at Bombay, New Delhi, Calcutta, Madras and Secunderabad undertake all services, on behalf of the French principals, relating to designing, engineering and supply of plant; they also arrange supply of machinery on credit terms, technical assistance and training of personnel for the various projects. The industries covered are automobiles forges and foundries, special and transfer machine tools, agricultural equipment and all kinds of mass production techniques.

SYNDICATE BANK

The Canara Industrial and Banking Syndicate Ltd., more commonly known as the Syndicate Bank, has made substantial progress during the last decade, when its deposits increased from Rs. 4.72 crores in 1953 to a substantial figure of Rs. 32.65 crores by the end of 1962. The advances have also moved ahead from Rs. 3.08 crores to Rs. 18.27 crores during the same period. The bank has been able to record this brilliant performance through various imaginative measures carried out by its network of over 180 branches, mostly located in six States of Mysore, Kerala, Maharashtra, Madras, Andhra Pradesh and Gujarat. It has been a pioneer in the region in pooling the savings of low income groups through schemes like 'pigmy deposits' and has made itself popular by opening 'ladies branches' exclusively staffed by women as also by providing finance to students going abroad for advanced studies or pursuing technical education within the country. During the last few years the expansion has been more marked when gross operating earnings have increased from Rs. 1.34 crores in 1960 to Rs. 1.99 crores in 1962. During these three years, the number of deposit accounts have also increased by more than 100,000 from 260,323 to 382,295. Exploring various centres where banking facilities were not available, the Syndicate Bank has grown into one of the 12 biggest banks in the country.

CAPITAL ISSUES

The following 82 companies were authorised to raise capital by the Controller of Capital Issues. In all cases, the consent is valid for 12 months.

The Great Eastern Shipping Company Limited, Bombay, is issuing three lakhs fully paid-up bonus shares of Rs. 10 each to be issued to the existing shareholders after the existing partly paid shares have been paid up fully on capitalisation of some of the company's free reserves.

The Modi Sugar Mills Limited, Modinagar, U.P., is to issue further capital of Rs. 36,69,480 divided into 3,66,948 equity shares of Rs. 10 each for cash at par. The shares will first be offered to the company's existing shareholders on pro-rata basis and only the shares not so taken up will be offered to the public. The proceeds will be utilised to install electric furnace, re-rolling mill and wire drawing plant of Modinagar for the manufacture of billets, rounds and wires.

Tools and Electricals India Limited, Calcutta, is issuing capital of Rs. 50 lakhs being Rs. 40 lakhs in equity shares and Rs. 10 lakhs in 9 per cent cumulative non-redeemable preference shares. The capital is required for manufacture of tools and dies and moulds etc. for which a factory will be established at Faridabad. The total capital cost is Rs. 102 lakhs.

Shardlow India Limited, Madras, is to issue capital of Rs. 40 lakhs in equity shares of Rs. 10 each for cash at par. Of this, shares of the value of Rs. 13,33,330 will be offered to Ambrose Shardlow and Company Ltd., U.K. against supply of capital equipment of equivalent value. The proceeds of the issue will be utilised for the manufacture of forgings and stamping for automobile, industrial marine and aircraft engines.

Chemicals & Fibres of India Limited, Bombay, is to issue capital of Rs. 250 lakhs of which 60 per cent will be allotted to the Imperial Chemical Industries Ltd., London. The capital is required for the establishment of a factory near Thana, Maharashtra, for the manufacture of polyester staple fibres. The total capital cost of the scheme is estimated at Rs. 535 lakhs which will be met by issue of capital of Rs. 250 lakhs and by loans from the Life Insurance Corporation of India and banks for the rest.

Vitamins India Limited, Bombay, a new company, will issue capital of Rs. 15 lakhs consisting of Rs. 12 lakhs in equity shares of Rs. 10 each, and Rs. 3 lakhs in 30,000 9.5 per cent. cumulative redemable preference shares of Rs. 10 each. Of this, equity shares of the value of Rs. 3 lakhs will be issued to Vitamins Limited, London. The capital will be utilised for the manufacture of vitamealo concentrates and animal compound feeds.

Union Carbide Ltd., Calcutta, has been granted consent to the issue of 340,000 equity shares of Rs. 4 per share. The shares will be issued to the existing shareholders in the ratio of three new shares for every ten held. The capital is required for the expansion of the company's factory at Bombay.

The Travancore-Cochin Chemicals Ltd., Alwaye, Kerala, is raising capital of Rs. 90 lakhs divided into 900,000 equity shares of Rs. 10 each for cash at par. The capital is needed for financing the expansion scheme of the company to increase the manufacturing capacity of its caustic soda plant and hydro-sulphite plant, in addition to the manufacture of new chemicals.

Telepole Manufacturing Co. Ltd., a company incorporated in Delhi, is to issue capital of Rs. 20 lakhs divided into 16,000 equity shares of Rs. 100 each. Out of this 6,400 equity shares will be offered to Josef Stainbichle of West Germany against supply of plant and machinery and the balance shares (including 2,053 shares already subscribed and paid up) for cash at par and 4,000 9.5% cumulative redeemable preference shares of Rs. 100 each for cash at par. The money will be used for the construction of a factory for the manufacture of telephone poles, etc.

Karnatak Bank Ltd., Mangalore (Mysore), is raising further capital of Rs. 10,00,000 divided into 50,000 equity (designated as 'A' shares) shares of Rs. 20 each for cash at par. Out of these, 25,000 shares of Rs. 20 each would be offered to the existing shareholders in the proportion of one share for every two shares held by them. The balance of 25,000 shares would be offered to the public.

Vardhman Spg. and General Mills Ltd., Ludhiana, is issuing capital of Rs. 30 lakhs divided into 100,000 equity shares of Rs. 25 each and 5,000 9.3% cumulative redeemable preference shares of Rs. 100 each for cash at par. The proceeds would be utilized for the construction of a factory for the manufacture of cotton yarn. The entire capital will be subscribed privately by the directors and their friends.

Coromandel Fertilizers Private Ltd., is to issue capital

of Rs. 8.49 crores in equity shares of Rs. 100 each at par, partly for cash and partly for consideration other than cash for the establishment of a fertilizer factory at Visakhapatnam. The total cost of the scheme is estimated at Rs 32.47 crores. A consortium of American companies and E.I.D.-Parry Ltd. are the promoters of the company. The details of the proposed capital issue are indicated below.

	For Cash	For consideration other than cash
1. California Chemicals Co., USA	Rs. 1,53,42,500	58,17,700
2. International Minerals and Chemicals Corps., USA	Rs. 1,36,05,700	51,59,100
3. E.I.D.-Parry Ltd., Madras	Rs. 43,11,300	6,35,400
4. Public Offer	Rs. 4,00,75,200	Nil
Total:	Rs. 7,33,34,700	1,16,12,200

Tata Power Company Ltd., Bombay, have been granted permission to the issue of debenture stock of the value of Rs. 110 lakhs in units of Rs. 1,000 each. The proceeds will be utilized in meeting a portion of the local expenditure on the project for installing a fourth unit of 125 m.w. at Trombay.

Andhra Valley Power Supply Company Ltd. Bombay is to issue Rs. 110 lakhs debenture stock in units of Rs. 1,000 each. The proceeds will be utilized in meeting a portion of the local expenditure on the project for instaling a fourth unit of 125 m.w. at Trombay.

Indo-French Forges Ltd., Calcutta (proposed) will raise capital of Rs. 100 lakhs divided into 750,000 equity shares of Rs. 10 each and 25,000 cumulative redeemable preference shares of Rs. 100 each. The capital is required for the establishment of a factory in Purulia district for forgings and heavy structurals the total capital cost of which is estimated at Rs. 350 lakhs.

Indo-French Suedes Ltd., Bombay, is issuing capital of Rs. 25 lakhs divided into 25,000 equity shares of Rs. 100 each at par. Of this such number of shares as would enable the company's shares to be listed on recognized Stock Exchanges will be offered for public subscription for cash at par and the balance will be subscribed privately. The money will be used to establish a new undertaking for manufacture of suedes.

Karamchand Premchand Private Ltd., will issue Rs. 50 lakhs value of debentures in units of Rs. 1,000 each carrying interest at the rate not exceeding 6½% (taxable) per annum. The debentures will be pledged with a bank, banks and/or issued for cash at par. The proceeds will be utilized to finance the expansion of its production activities.

Indraprastha Steel Industries Ltd., Delhi is to issue capital of Rs. 25 lakhs, divided into 170,000 equity shares of Rs. 10 each, for cash at par and 8,000 9.5% cumulative redeemable preference shares of Rs. 100 each for cash at par, free of company's tax but subject to deduction of taxes at source at the prescribed rate. Out of the above, equity shares of the value of Rs. 8.4 lakhs and the entire preference shares will be offered to the public by prospectus. The proceeds would be utilized for the construction of a factory at Sonepat for steel castings and forgings.

Lloyd Insulations (India) Ltd., Delhi, is issuing Rs. 15 lakhs in equity shares of Rs. 10 each. Shares of the value of Rs. 3 lakhs—Rs. 1.5 lakhs free shares for technical know-how and Rs. 1.5 lakhs for cash at par and to utilize in the import of plant and machinery—will be allotted to John Manville International Corporation, USA.

Jaya Shree Textiles and Industries Ltd., Calcutta, is raising capital of Rs. 71.18 lakhs divided into equity shares and preference shares of Rs. 24.95 lakhs each and Rs. 22 lakhs in 7% debentures of Rs. 1,000 each. The capital is required for manufacture of insulators at the Rishra factory and for the establishment of a spinning mill at Midnapur with 12,000 spindles.

National Rubber Manufacturers Ltd., Calcutta, is to issue capital of Rs. 50 lakhs in 500,000 equity shares of Rs. 10 each for cash at par. The shares are proposed to be issued to the existing shareholders in the ratio of one new share for every share held. The capital is required for expansion in the manufacture of industrial V and fan belts, bicycle tyres, etc.

Mysore Sugar Company Ltd., Bangalore, is issuing further capital of Rs. 32,68,920 divided into 217,928 equity shares of Rs. 10 each to be issued on rights basis for cash at a premium of Rs. 2 per share and therefore 108,964 equity shares of Rs. 10 each on capitalisation of the share premium money of Rs. 4.36 lakhs available after making the above rights issue and the balance of Rs. 6.54 lakhs from the company's general reserves. The bonus shares will be issued in the ratio of 1 : 4. The money will be utilized to finance the programme of rehabilitation, modernization and expansion of the existing sugar factory.

Vijay Spinning Mills Ltd., Vijayawada, has been granted revised consent to issue capital of Rs. 25 lakhs divided into 170,000 equity shares of Rs. 10 each and 8,000 preference shares of Rs. 100 each (instead of 200,000 equity shares and 5,000 preference shares respectively, consented to earlier) to be issued for cash at par. Of these such number of shares as would enable the company's shares to be listed on recognized Stock Exchanges will be offered for public subscription by prospectus. The proceeds would be utilized to set up a spinning mill with an installed capacity of 12,000 spindles in Krishna district.

Ramakrishna Electrodes Ltd., a new company to be incorporated in Kerala, is to issue capital of Rs. 15,00,000 divided into 120,000 equity shares of Rs. 10 each and 30,000 preference shares of Rs. 10 each to be issude for cash at par. Of this such number of shares as would enable the company's shares to be listed on recognized Stock Exchanges will be offered for public subscription by prospectus. The proceeds will be utilized for setting up a new industrial undertaking for manufacturing welding electrodes.

Cooper Precision Industries Private Ltd., a company proposed to be incorporated in Maharashtra, is raising capital of Rs. 12 lakhs divided into 12,000 equity shares of Rs. 100 each to be subscribed privately. The money will be used for setting up a tool room in Bombay for the manufacture of jigs, fixtures, gauges, preso, tools, etc.

Ideal Jawa (India) Private Ltd., Mysore, will issue capital of Rs. 15 lakhs divided into 15,000 equity shares of Rs. 100 each to be subscribed privately. The proceeds will be utilized to increase the working capital consequent to the expansion programme undertaken by the company.

The proceeds will be used for the promotion of small-scale industries in the State of Madhya Pradesh.

Punjab Export Corporation Limited, Punjab, will issue capital of Rs. 25 lakhs divided into 25,000 equity shares of Rs. 100 each for cash at par. Eighty per cent of the shares will be subscribed by the Punjab State Government and 20 per cent by the public. The proceeds will be utilised for organising and effecting export of goods manufactured in the State of Punjab.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 — during the period of four weeks ending December 28, 1963. The list contains the names and addresses of the licensees, the articles of manufacture and annual installed capacity.

(During the week ending December 7, 1963)

IRON AND STEEL

Cooper Engineering Ltd., Chinchwad (Satara Road, Maharashtra) — Meehanite High Duty Iron, Castings 12,600 tons per annum, Change of location from Chichwad to Satara Road, Maharashtra (Shifting).

COAL

The Perfect Pottery Co. Ltd., Hanuman Tal, Jabalpur, Proposed name: "Hindustan Lalpeth Colliery" (Maharashtra) — Coal capacity after expansion: 1963 1,32,000 tonnes, 1964 1,44,000 tonnes, 1965 1,80,000 tonnes, 1966 1,80,000 tonnes. Western Bengal Coalfields Ltd., 15, India Exchange Place, Calcutta-1 (West Bengal) — Coal capacity after expansion: 1963-63 3,96,000 tonnes, 1963-64 3,96,000 tonnes, 1964-65 3,96,000 tonnes, 1965-66 4,75,000 tonnes, 1966-67 4,75,000 tonnes. Western Bengal Coalfields Ltd., 15, India Exchange Place, Calcutta-1 (West Bengal)—Coal capacity after expansion: 1962-63 2.97 lakh tonnes, 1963-64 3.21 lakh tonnes, 1964-65 3.72 lakh tonnes, 1965-66 3.72 lakh tonnes, 1966-67 3.72 lakh tonnes. Shri Gobind Prasad, At & P.O. Mahagama, Distt. Santhal Parganas, Proposed name: "Laimalia Colliery" (Mouza Rongamatia, Distt. Santhal Parganas Bihar) — Coal capacity: 1st year 8,000 tonnes, 2nd year 10,000 tonnes, 3rd year 12,000 tonnes, 4th year 14,000 tonnes, 5th year 15,000 tonnes. J.A. Trivedi Brothers, West Barkuni Colliery Balaghat (Madhya Pradesh) — Coal capacity after expansion: 1963 45,000 tonnes, 1964 60,000 tonnes, 1965 120,000 tonnes, 1966 1,20,000 tonnes. Amiyabala Ghosh and Sons, New South Baraboni Colliery, P.O. Baraboni, Distt. Burdwan (West Bengal) — Coal 6,000 tonnes per annum.

TEXTILE MACHINERY

Pearl Mechanical Engg. & Foundry Work: (P) Ltd., G.T. Road, Pearl Building Ludhiana (Ludhiana, Punjab) — Woollen and worsted spinning machinery, annual capacity after expansion: Spindles 8000 Nos., High speed Gill Box with auto eveners 8 Nos., High Speed Gill Box with 2 heads and 2 bobbins 8 Nos., Combine Bobbiners 8 Nos., Ring Frames 20 (400 spindles each), Twisting Machines 16 (300 spindles each).

INORGANIC HEAVY CHEMICALS

The Phosphate Co. Ltd., 14, Netaji Subhas Road, Calcutta-1 (Rishra, Hooghly, West Bengal) — 1. Synthetic cryolite 540 tonnes, 2. Sodium Aluminate 1800 tonnes.

DRUGS AND PHARMACEUTICALS

Hind Chemicals Ltd., M/336, Rail Bazar, Post Box No. 227, Kanpur (Uttar Pradesh) — Di-amino-di-phenyl-sulphone 12 tonnes. British Drug Houses (India) Private Ltd., Imperial Chemical House, Graham Road, P.O. Box No. 1341, Bombay-1 (Maharashtra) — Ethinyl Oestradiol B.P. 3.6 kgs. Synbiotics Ltd., Post Box No. 28, Ahmedabad (Gujarat) — Carbetopentane 240 kgs. Smith & Nephew (India) Ltd., Contractor Building, Nicol Road, Ballard Estate, Bombay-1 (Maharashtra) — 'Jelone' brand Paraffin Gauze Dressing 24,000 tins each containing 24, 10 cmex 10 cm. dressing. Johnson and Johnson of India Ltd., 30, Forjett Street, Post Box No. 6531, Bombay-26 (Maharashtra) — Biosorb powder 60,000 kgs.

COTTON TEXTILES

Niranjanlal Dalmia, 163-165, Sheikh Memon St., Bombay-2, Proposed name: "New Bombay Dyeing & Bleaching Mills" (Maharashtra) — Processing (excluding printing) of cotton textiles 120 lakh meters. Capital Cloth & General Mills Co., 22-E, Bungalow Road, Delhi-6, Proposed name: "Capital Cloth and General Mills Co." (Muradnagar, U.P.) — 1200 spindles for the manufacture of cotton waste yarn. Amitabh Textile Mills Ltd., Premnagar, Dehradun (Lucknow, U.P.) — 11,536 spindles for the manufacture of cotton yarn. Swadeshi Cotton Mills Co. Ltd., Kanpur (Uttar Pradesh) — 6,160 spindles for the manufacture of cotton yarn. U.P. Co-operative Spinning Mills Ltd., Handloom Section, Directorate of Industries, Uttar Pradesh, G.T. Road, Kanpur (Etawah, Uttar Pradesh) — 12,680 spindles for the manufacture of cotton yarn.

PULP

Titaghur Paper Mills Co. Ltd., Chartered Bank Buildings, Calcutta-1 (Choudwar, Orissa) — Pulp 16,000 tonnes.

(During the week ending December 14, 1963)

ENGINEERING PRODUCTS

Indo-Flex Private Ltd., 1, Tilak Marg, Jaipur (Rajasthan): Existing activity: (1) flexible tubes metallic 10.8 lakhs meters per annum; (2) specialise precision rivets for railways and aircraft, 240 tons per annum; (3) pressure die casting for automobile ancillary 600 tons per annum; (4) precision type metallic press work for automobile industry and machine tool industry — 300 tons per annum. New articles: (1) braided type hydraulic hoses and tubes 1.2 lakh meters per annum; automobile components — (1) fuel pumps 10,000 nos. per annum; (2) water pumps 30,000 nos. per annum; (3) carburettors 22,000 nos. per annum.

Guest Keen, Williams, 41, Chowringhee Road, Calcutta, (16 Shalimar, Howrah, West Bengal): rolling of bars and rods 37,656 tonnes per annum.

Universal Radiators, Coimbatore (Madras): sheet metal (change of location from Coimbatore to Madras) shifting.

Gandhi Manufacturers Syndicate, Kansarawada Chakla Kapadwanj (Gujarat industrial estate) (Ahmedabad, Gujarat): battery-operated platform trucks — 300 nos. per annum.

COAL

Selected Kajora Jambad Coal Co., 135, Canning Street, Calcutta 1, (Mouza Bahula Chak Dasdiha Purnia Dist. Burdwan, West Bengal) — coal 1963 — 85,000 tonnes 1964 — 1,00,000 tonnes 1965 — 1,20,000 tonnes.

TEXTILE MACHINERY

Tex-well (P) Ltd., 28 B.T. Road Calcutta (West Bengal): (1) broad looms 45 nos.; (2) warpstop motions 1,000 sets; (3) automatic cop./changes 1,350 pieces; (4) silver can accessories 63,000 sets; (5) shuttle covers 630 gross; (6) swell and box end spring 45,000 pieces; (7) spring clips nine lakh pieces.

MACHINE TOOLS

Harbanslal Malhotra and Sons (P) Ltd., 18, Netaji Subhas Road, Calcutta 1, (Belgheria, 24 Parganas West Bengal): tool bits, wood cutting handsaws, web saws, pit saws, hack saw frames, metal slitting saws.

Mr. Girdharilal Mukhandlal Pittie, 5 R.B. Motilal Rd., Poona (proposed name: Pittie Raymond (Engineers) India Ltd.): Heavy press tools, jigs and fixtures, boulds of heavy and medium type, special purpose machines worth Rs. 36 lakhs per annum.

FOOD PRODUCTS

Mr. P. I. Alamanla, Ramaka Bldg., Ahmedabad (Bulsar, Surat Dist. Gujarat): instant foods from banana, lime, mango, tomato and milk 1,000 metric tons per annum.

Indian Foods and Aldoses, Nanabhoy Lane, Fort Bombay 1 (Perumbavoor, Ernakulam Dist., Kerala): (1) amylo malt 1,200 tonnes per annum; (2) dextrine B.P. 600 tonnes per annum; (3) amylum food 300 tonnes per annum; (4) infant food (other than whole milk infant food) 300 tonnes per annum; (5) manioc meal 1,200 tonnes per annum.

VEGETABLE OILS

Mr. Ratan Lall Marurka, 4 Cullon Road, Alleppey (Kerala): vegetable oil from coconut oilcake by solvent extraction process 30,000 to 34,500 tons in terms of oil cakes per annum.

(During the week ending December 21, 1963)

IRON & STEEL

Gorakhpur Steel Industries, Hindi Bazar, Chaudry Niwas, Gorakhpur (Ghaziabad, Uttar Pradesh) — Cast iron castings (change of location from Gorakhpur to Ghaziabad). Hindustan Forge Ltd., 16, Durga Bhavan, Rashtrapathi Road, Secunderabad (Warangal, Andhra Pradesh) — Steel forgings 9,000 tons. Indian Hume Pipe Co. Ltd., Construction House, Ballard Estate, Bombay-1 (Antop Hill, Wadala, Bombay, Maharashtra) — Welding electrodes 360 tonnes.

ELECTRICAL EQUIPMENT

Beni Ltd., 1, Crooked Lane, Calcutta-1 (West Bengal) — Turbo Generators for Railway locomotives 720 Nos.

MIXERS AND REACTORS

Britannia Engineering Co. Ltd., 3, Netaji Subhas Road, Calcutta-1 (Titaghur, West Bengal) — Mixing Rolls Vulcanising Presses, Reduction Gears, Extruding Machines, Spreading Machines Rs. 16.14 lakhs.

SPEED REDUCTION UNITS

Vulcan Trading Co. (P) Ltd., Indian Mercantile Chambers, Nicol Road, Ballard Estate, Bombay-1 (Bombay-Poona Road, Near Pimpri Poona, Maharashtra) — Spur and Helical, Gears of Dia 10-666 mm. and Module 0.5-6, Ground Gears of Dia 30-315 mm, Module 1.5-6 600 Nos. (worth approximaetly Rs. 6 lakhs).

MACHINE TOOLS

Partap Steel Rolling Mills, Partap Estates, Chheharta (Punjab) — Rolling Mills 10 Nos. per annum, Rolling Machines 26 Nos. per annum, Ancillary Machines Rs. 8.5 lakhs worth. Textool Co. Ltd., Ganapathy Post, Coimbatore-6 (Madras) — Hot Blast Cupolas 6 Nos.

DRUGS AND PHARMACEUTICALS

Oriental Pharmaceutical Industries Ltd., 64/66, Tulsi Pipe Road, Mahim, Bombay-16 (Maharashtra) — Streptophenical syrup 18,000 litres, Streptophenical Capsules 24,00,000 Nos.

PAPER BOARD AND STRAW BOARD

The Yamuna Syndicate Ltd., Yamuna Nagar, Railway Station, Jegadhari (Yamuna Nagar, Punjab) — Straw boards 2,000 tonnes, Pulp 3,000 tonnes.

FIRE BRICKS

Shri Rajinder Kumar Bhalla, C/o M/s. Boogee Corporation Private Ltd., Factory Area, Patiala (Punjab) — Bricks and tiles 6,00,00,000 Nos.

(During the week ending December 28, 1963)

NON-FERROUS METALS

The Hindustan Aluminium Corporation Ltd., UCO Bank Building, Parliament Street, New Delhi-1 (Renukoot, Mirzapur Distt., Uttar Pradesh) — (i) Aluminium conductor rod-draw rods 6,000 metric tons, (ii) Aluminium rolled products of various thicknesses, widths and lengths 13,000 metric tons, (iii) Aluminium extrusions 3,000 metric tons. Southern Industrial Corporation Ltd., No. 6, Armenian St., P.B. No. 113, Madras-1 (Madras) — Brass/copper close tolerance strips 3,000 metric tons.

COAL

Shri Thakur Rama Autar Singh, Baramessia Colliery, P.O. Tundoo, Distt. Dhanbad (Bihar) — Coal 12,000 tons. Shri Guljhari Lal Agarwalla, M/s. Mahabir Coal Co., Amalapara, P.O. Jharia, Distt. Dhanbad, Proposed name: South Marma Colliery (P.O. Mugma, Distt. Dhanbad, Bihar) — Coal 36,000 tonnes.

INTERNAL COMBUSTION ENGINES

Sak Industries, 15/1, Parliament Street, New Delhi (Gurgaon, Punjab) — Engine valves, change of location from Delhi to Gurgaon (Punjab) (Shifting).

ELECTRICAL LAMPS

Tungsten of India Ltd., United Bank of India Building (2nd Floor), Sir P.M. Road, Fort, Bombay-1 (Poona, Maharashtra — Tungsten wires and filaments 60 Million Meters per annum.

ORGANIC HEAVY CHEMICALS

Atul Products Ltd., Atul Post, Via Bulsar (W. Rly.) Distt. Surat (Gujarat) — Dichloroacetic Acid 75 tonnes per annum, Dichloroacetic Acid Methyl, Ester 60 tonnes per annum.

FINE CHEMICALS

Biochemical and Synthetic Products Ltd., Sanat Nagar, Hyderabad (Andhra Pradesh) — Para Hydroxy Benzoic Acid and its derivatives — 30 tonnes.

COTTON TEXTILES

Mahavir Cotton Mills Industrial Area, Azambad, Hyderabad (Azambad, Andhra Pradesh) — Cotton yarn 18,000 spindles.

ART SILK

Kapal Dyeing and Bleaching Works, 40, New Silk Market, Bombay-2 (Maharashtra) — Art silk power looms 56 Nos.

FLOUR

Shri J. Doongursee, 'Sham Bhuvan', 22, Bund Road, Poona-1 (Kutch, Gujarat) — Wheat products 7,500 tonnes (in terms of wheat).

COSMESTICS

Martin & Harris (P) Ltd., Merchantile Buildings, 4th

Bazar, Calcutta-1 (West Bengal) — Oatine Shampoo 2,400 litres.

REFRACTORIES

The Managing Director, U.P. State Industrial Corporation Ltd., P.B. No. 413, Kanpur (Bageshwar, U.P.) — Dead Burnt Magnesite 36,000 tonnes.

CHANGE IN NAMES (Owners or Undertakings)

(This information refers to particular licences)

(During the four weeks ending December 28, 1963)

From M/s. Himco (India) Private Ltd., Bombay to M/s. G.M.C. Himco Industries Ltd., Delhi. From Shri V.A. Muthu Manickam, Madras to M/s. Prabhuram Mills (P) Ltd., Madras.

Mr. I. M. Pai, Bombay, Messrs. Speed Tools Private Ltd., Bombay; M|s Indian Air Products, Kanpur, M|s Indian Air Gases Ltd., Kanpur.

COMPANY MEETING

CHAIRMAN'S SPEECH

J. K. STEEL LIMITED DOES WELL

Shri Lakshmipat Singhania's Review

Gentlemen,

I have great pleasure in welcoming you to the Tenth Annual General Meeting of the Company. The Annual Report and Accounts for the year ended 30th June, 1963 have already been circulated and the Directors, in their report to the Shareholders, have dealt with the salient features of the Company's working during the year.

WORKING OF THE YEAR

The Sales during this year reached a peak of Rs. 1.76 crores as compared to last year's figure of Rs. 1.14 crores. The profits are also higher in this year and the Directors have recommended an increased dividend of 15 per cent. The year under review has been a very difficult one for India, overshadowed by the Chinese Aggression, which brought in more strain on our foreign exchange resources, necessitating further curbs on available foreign exchange to the Industry in general. Your Company also suffered on this account with shortage of imported raw materials, stores and spares. Super Profit Tax was introduced and Emergency Risk Insurance was levied. Further, during the year Calcutta area suffered from a serious shortage of power, necessitating restriction in and staggering of power supply as well as frequent load sheddings, with the result that some of the day shifts of your factory had to be transferred to work during night. The cost of material, labour and services also increased substantially during this period. All these resulted in loss of production and increased costs. Viewed in this background, the results of this year should be considered as satisfactory. The profits could have been still better had the Government fixed the Retention Price of Jute Baling Hoops for the year under review for which the Company has claimed an increase.

THE COMPANY COMPLETES 10 YEARS

The Company has completed 10 years of working. During this decade, there has been gratifying increase in the size and activities of the Company. The gross block, which stood at about Rs. 12 lakhs at the beginning of the decade, stands at Rs. 98 lakhs at the end of this year. Sales have risen approximately by Rs. 30 lakhs to Rs. 176 lakhs. When the Company commenced production, it employed about 175 persons and today it is employing more than 725. Apart from providing such substantial employment opportunities in the State, the Company employed and trained over 650 East Bengal Refugees, a good number of whom are still in our employ, while others, after their training, have engaged themselves in other gainful employments. The total employment potential, thus created, is appreciable taking into account the fact that for every direct employment there are 9 indirect employments. The average earning of an employee has reached Rs. 2,200 per annum.

The Company, which started with the manufacture of Jute Baling Hoops only, now also manufactures cold rolled strips, box strappings and steel wire ropes. In addition, the manufacture of Electric Hoists and Chain Pulley Blocks is to commence very shortly, factory for which is already complete. All of these new lines of production, adopted by the Company, are of pioneering nature. These items, which are very much needed for the Country's requirement, were imported at the cost of enormous foreign exchange. We can derive satisfaction from the fact that manufacture of these new items by us has so far saved for the country approximately Rs. 2 crores worth of foreign exchange. Apart from these new items, the Company's initial product, namely Jute Baling Hoops, which is an important ancillary to the Jute Industry, being used for packing the entire jute goods production in the country, has continued to serve the country well by earning foreign exchange through exports. It may be added that in spite of very high increase in cost of materials, labour and taxation, there has been comparatively very little increase in Selling Price of the hoops and the Company has been working at low margins of profit in order to make available these hoops to the Jute Industry at prices which are comparatively very much lower than those of other similar rolled products.

The total earnings of the Company, during the last 10 years, have been distributed as follows:

62.41 %	.. on materials and stores.
8.57 %	.. to employees
7.63 %	.. to Government Taxes and Duties
9.94 %	.. on Depreciation, Administrative expenses and interest on borrowings
6.77 %	.. for funds ploughed back in the industry itself
2.89 %	.. as dividends
1.79 %	.. to Management

It will be seen that the shareholders only received 2.89 per cent of the earning of the Company. The total taxes and excise duty paid directly by the Company during these years amounted to Rs. 74 lakhs and the Company ploughed back as much as Rs. 66 lakhs for expansion of the Company's activities and for the manufacture of new articles.

It will be clear from the above that an Industry of this kind is a National Institution providing greater employment, creating and contributing to the wealth of national economy and making the country self-sufficient in respect of essential manufactured goods for which the Nation had to depend on imports from other countries.

EXPANSION

The Company is going ahead with its various expansion programmes, though the progress was very much affected on account of various handicaps. The plant for the manufacture of electric hoists and chain pulley blocks has been installed, but the production could not be started as yet on account of non-availability of import licences for essential raw materials

and components, though these represented a very small percentage. It is unfortunate that this scheme, which is once again of pioneering nature, has taken more than 5 years for completion on account of unnecessary, wasteful and avoidable delays in the Government machinery in respect of Industrial Licensing, approval of Collaboration Agreement, Issue of Import Licences for capital goods and raw materials and components, etc. If this plant could have started even two years before, the country would have saved foreign exchange to the tune of Rs. 1 crore by now. It is high time that definite steps are taken to remove these impediments in the speedy growth of the Industry in the country.

Our project for doubling up the capacity of Steel Wire Ropes Plant was similarly delayed. On account of non-availability of foreign exchange the Company had to go to the Industrial Credit and Investment Corporation of India Ltd. for a foreign exchange loan. I am happy to report that the I.C.I.C.I. Ltd. have agreed to sanction the necessary foreign exchange loan. Orders for the machinery have already been placed and it is now expected that the expansion shall come into effect in a year's time.

Other schemes of the Company are also receiving the Company's full attention. Meanwhile, the Company has obtained Industrial Licences for (1) doubling the capacity of the plant for the manufacture of Cold Rolled Strips and (2) manufacture of Electric Overhead Travelling Cranes.

RAW MATERIALS

Last year I had dealt with in detail the difficulties that we had been facing in regard to raw material supply. I regret to inform that the problem continued without showing any sign of improvement this year also. Supply of billets for the manufacture of Jute Baling Hoops — which is directly linked with the export of Jute Goods — continues to be far from satisfactory. The actual average monthly receipts of billets during the year were 750 tons or 62 per cent of the so-called "entitlement" fixed by the Iron & Steel Control — a figure supposed to represent the minimum supply that can be realistically made in a situation of short supply of billets in the country. It will be recalled that this figure of "entitlement" in itself is 60 per cent of our original quota of 2,000 tons to which we were entitled during 1960-61. Thus the actual receipts are nearly 37 per cent of our original quota and a process of progressive reduction in raw material supply seems to be in operation. Even this inadequate quantity was received by us in a most irregular manner and in many months the actual receipts were not more than 25 per cent of the "entitlement", due to which we had to encounter many a time slowing down of production and threats of imminent closure of the works. In fact, we had to shut down the operations for nearly 1½ months during October/November, 1962, on account of shortage of billets. This naturally resulted in short supply of Jute Baling Hoops to the Jute Industry. The fact that this industry is supposed to enjoy a certain amount of priority in regard to supply of billets further raises the question of efficacy of control of production and distribution of steel.

Similarly the position in regard to the supply of Hot Rolled Strip, which is the raw material for the manufacture of Cold Rolled Strips and Box Strappings, did not show any sign of improvement — rather deteriorated during the year. Ever since the plant has been set up, it has been starving for raw material, supply of which has been of the order of 25 per cent. The indigenous supply of Hot Rolled Strip was very much inadequate to meet the requirements and the position was further accentuated on account of the inability of the Rourkela Plant to supply Hot Rolled Strips in slit widths, which it was supposed to do two years back. Import of raw materials was not allowed, whereas import of Cold Rolled Strips continued in one form or other. The Company is capble of manufacturing various types of Cold Rolled Strips and Box Strappings, but the country has been deprived of savings in foreign exchange of nearly Rs. 1½ crores because of the failure on the part of Government to supply raw materials to such an important plant and utilise its capacity. One wonders at the advisability of creating capacity for production without adequate planning for supply of essential raw materials for the same.

The Minister for Steel, Mines and Heavy Engineering has himself acknowledged that there is a great shortage in the country of flat steel products and the shortage is likely to continue for some time to come. The flat products, which include strips, serve as basic raw material for many engineering industries and it is therefore necessary that, till indigenous production of such flat products comes up, arrangements should be made to import hot rolled strips and sheets rather than cold rolled strips or other finished products.

PERSONNEL AND PRODUCTIVITY

Under the existing conditions of industrial development in the country every effort should be directed towards increased production. Taking into account that we have to export more and more with a view to earning foreign exchange, it will also be necessary to modernise our productive methods and reduce costs. Unfortunately, the tendency on the part of the labour leaders is not to enthuse into the workers this sense of emergency. During the year under review, even though there had been no conflict with the labour in general, yet the tendency of slow down and indiscipline had been manifest. In spite of the fact that a number of channels have been devised, through which the demands of the workmen could be settled, the general tendency has been to by-pass these channels and take the law in hand. This attitude has only resulted in a lower productivity, which is a great loss to the country.

On account of the rapid industrial development taking place in the country, a vacuum has been created for technical and administrative hands. Unfortunately imparting training in specialised jobs has become more difficult on account of frequent changes that such personnel now make in this situation of shortage of their supply over demand. I think, it is in the national interest to ensure that we not only educate more technical hands, but also train specialists in specified jobs. It should be recognised that specialisation can only be acquired by continuity of experience in a particular line. It is also necessary that the educational system is moulded to suit the pattern of new employment opportunities that exist or are being created.

EXPORT

Another point which I may touch is in regard to making available raw materials for export of finished goods. We have been endeavouring for some time past to export Jute Baling Hoops. However, it has not been possible for us to do on, so account of two factors: (1) non-availability of raw material, i.e. billets and (2) non-availability of any export incentive either in the shape of concessional price of raw materials or otherwise. We have been pleading with the Government to help us in establishing this export line, but we have not been successful so far. We are, however, continuing in our attempts.

RAJ COMMITTEE REPORT

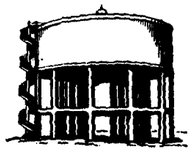
As you are all aware, the Government of India constituted a Committee to enquire into the system of planning and distribution of steel. This Committee known as the Raj Committee has submitted its report in October, 1963. The Committee has made far-reaching recommendations some of which can be called bold inasmuch as they favour decontrol to a large extent. While basically I am always in favour of decontrol, the problem connected with decontrol in times of extreme shortage in the availability of steel against demand, both as raw material and finished product, has to be reckoned with. I hope Government will take suitable action on the Report in due course, after taking into consideration all the pros and cons of the subject.

CONCLUSION

Gentlemen, any industrial undertaking in India today is no longer a concern only of the shareholders, Management or of the Labour directly engaged in the undertaking. It subserves the overall economy of the country trying to expand as fast as possible. The economy, no doubt, has grown over the past decade of planning, but during the first two years and even in the current year of the Third Plan, the rate of growth has slowed down. Those of us in business have been pointing to this stagnation for some time past and I am happy that the Government is also getting more and more cognisant of the realities.

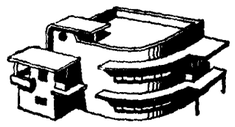
One thing that I would like to stress is that economic well being can be achieved really only by greater production. Therefore to my mind the question 'who does it faster and better' is more important today than 'who should do it'. After all economic success is more important than anything else and this should not be affected by policies based on doctrinaire considerations. Economic policies would have to be such as to promote initiative and capital formation.

Further a greater stress is to be laid on increased efficiency and hard work by everyone. It is only through greater productivity and higher efficiency that we can really hope to achieve our aims.



Gentlemen, on your behalf I must express my appreciation of the good work done by all sections of the employees. Our thanks are also due to the Managing Agents for their very valuable services and to our esteemed customers for their continued co-operation.

Note: This does not purport to be a record of the proceedings at the Annual General Meeting.



ACCOPROOF

-ACC's CEMENT WATERPROOFING ADDITIVE-

SOLVES YOUR WATERPROOFING PROBLEMS!

Reservoirs and water-tanks

Wall renderings and roofs

Water-supply conduits

Reservoirs, water supply conduits, swimming pools—any water-retaining structure can be made water-tight by using ACCOPROOF with cement. When mixed with cement before it is stirred in with the aggregate, ACCOPROOF makes stronger and denser concrete and reduces the capillary absorption of moisture. Damp-proof courses, wall-renderings and roofs require the use of ACCOPROOF to increase their resistance to moisture movement.

ACCOPROOF is readily available from

The Prime Minister

THE NATION is naturally cheered as its anxiety has been relieved by the reassuring medical reports on the Prime Minister's health. Mr. Nehru is dear to his people who certainly pray as one man for his early and complete recovery. At the same time, a heavy responsibility is cast on those who are personally and politically close to him to face certain hard facts and in the light of those facts guide him properly in the larger interest of the India which he loves so well. Mr. Nehru is now in his 75th year and this is the second occasion of serious illness that he has had to endure since he crossed 70. In the light of such information as is available to the public regarding medical opinion on his physical condition, it appears that there is nothing against his being able to lead a life which is normal to people of his age — provided, of course, he submits himself to the necessary discipline of the "seventies". From this point of view there is certainly sense in the advice which is being given to him in the Press and elsewhere that he should avoid unnecessary mental and physical exertions, eschew merely ceremonial activities and otherwise adjust the tempo of his living to his physical state.

But at the same time, it must be realized that, even if he abides by the advice and practises the utmost economy of mental or physical effort, it would still be true that the essential responsibility that he must carry, if he were to continue as Prime Minister, could still be excessive for a man of his age who no longer enjoys the physical fitness that was his until recently. It is, therefore, only proper that the question of his retirement from the Prime Ministership should be considered in a calm and mature manner. In our view it would be best to leave the decision to Mr. Nehru himself. He is an exceedingly conscientious person and the nation may rest assured that he will not continue to be Prime Minister a moment longer than he considers himself to be physically and mentally fit to discharge the obligations of that vital office. Our appeal then is really to those around him who might have influence with him. We suggest to them that they should not use their influence with him to persuade him to follow any course of action which is contrary to his own judgment. We consider this appeal to be necessary for a number of reasons. The country has learnt to think that Mr. Nehru is indispensable and this is a view which those who are close to him are naturally apt to hold very strongly. While it is, perhaps, possible to harbour such faith in respect of a Nehru who is in normal health and is mentally and physically capable of discharging the duties of Prime Ministership without undue strain, it would surely be nothing more than sloppy sentimentality to maintain that even an ailing Nehru of 75 years could or ought to carry on indefinitely as Prime Minister. A proposition of that kind would clearly be unfair to him and unfair to the country.

It is a disagreeable fact of public life that vested interests of all kinds tend to cling and cluster to the man in power — and Mr. Nehru has been in power for some 17 years now. It would be but human nature for those who, in varying degrees, are personally or politically dependent on him or his position, to hesitate to contemplate the consequences of his retirement. It follows that to such people it might become easy to transform — perhaps, unconsciously — their inarticulate personal considerations to a highly vocal expression of public needs in an attempt to plead that Mr. Nehru should continue. It, therefore, becomes the duty of those who can take a more detached view to plead that those who, in the fateful days or weeks to follow, could influence Mr. Nehru's sentiments or judgment,

for good or ill, should make a great effort to be dispassionate and objective.

It is clearly necessary that the important issue of an orderly transition to a successor leadership should now be considered calmly and sensibly. Here, Mr. Nehru himself could do the country a service which will be no less important than any that he has rendered so far. Just as Mr. Harold Macmillan, in not dissimilar circumstances, succeeded recently in the United Kingdom in handing over the leadership of the Conservative Government to a successor who, in his judgment, was in the best possible position to ensure both unity and strength for the party and good government to the country, Mr. Nehru, once he has recovered from his present illness, may well address himself to the series of steps that may have to be taken, starting from now, to effect a smooth handing over of party and government leadership. In the wake of his illness, his functions in the Government are being shared by two of his ablest colleagues. This, in the circumstances, is certainly the most practicable arrangement, but it cannot obviously be a prolonged one. It has been suggested in some quarters that Mr. Lal Bahadur Shastri may be invited to re-join the Central Government. We would say that not only Mr. Lal Bahadur Shastri but some of the other senior Congress leaders, who had left the Central Government in accordance with the Kamraj plan, will have to be brought back to strengthen the Central Government in the event of Mr. Nehru's retirement. We are confident that they and their colleagues, acting individually or together, would conduct themselves in a manner which would enhance the prestige of the Government, protect the solidarity of the Congress Party and serve the best interests of our people. We have faith in their patriotism and we have no doubt that, when the occasion arises, there will be found among them not one Rab Butler but many who, whatever their personal views or feelings may be, would nobly agree to subordinate their claims or aspirations to the interests of their party and the country.

Prescribing for Parkinson's Disease

AFTER THE recent sojourn of its leaders in the rarefied atmosphere of Gopabandhunagar, the Government seems to have come down to solid earth again. A political holiday can only be an occasional diversion from the hard and humdrum task of administration and it is good to find the Government being aware of it as is indicated by the workmanlike decisions taken by the Ministry of Industry on the extremely helpful Interim Report submitted by the Swaminathan Committee on the simplification of industrial licensing procedures. It is not often that the Government or a Committee set up by it functions as quickly as has been the case on this occasion and it is incredible but true that it was only as recently as in September, 1963 that the Ministry of Industry had appointed a Committee of 10 — five officials, including the Chairman and five representatives of the business community — under Mr. T. Swaminathan to review the operation of controls applicable to the establishment of additional industrial capacity under the Industries (Development and Regulation) Act, the import of capital goods, the issue of capital, foreign investment and collaboration and to suggest such modifications as would reduce delays in decision. Three months and three days after it was set up, the Committee was able to submit an Interim Report and even more encouragingly, the Government has been able to announce its decisions on the Report within a period which is actually four days short of one month. And as if there is to be no end to miracles in the New Year, the Government has been able to accept, in principle, the interim recommendations of the Committee and announce that appropriate steps are being taken to implement them.

The text of the Interim Report is published in the "Records and Statistics" section of this issue. In this Report, the Committee has made two important recommendations. The first relates to a speedy procedure for according clearance in principle, to the establishment of additional industrial capacity, that is, the issue of a "letter of intent", as this is commonly referred to. The second recommendation relates to a special procedure for the speedy processing of all applications relating to specified "key" industries.

Explaining its recommendation relating to the issue of "letters of intent", the Committee points out that it is a matter of the utmost importance that the applicant should know as early as possible whether the Government would be prepared to consider favourably the proposal put forward by him, as it will be difficult otherwise for the entrepreneur to negotiate with foreign collaborators or suppliers of machinery. In the course of its study of eight cases selected at random, the Committee found that the time taken ranged from 61 to 396 days and in six out of eight cases, the period involved was more than 150 days. The Committee believes that this situation has to be (and can be) changed radically so that a "letter of intent" is issued within a month or so of the date of receipt of the application. In its view this can be done by reducing consultation on files to the minimum and taking decisions within a prescribed number of days of the receipt of applications at meetings consisting of representatives of the Ministries primarily concerned.

The Committee, therefore, proposes that only "letters of intent" should first be issued except in cases where licences under the Industries (Development and Regulation) Act can be issued straightaway. A small, separate section will have to be set up in the Ministry of Industry to deal exclusively with such applications and while the applications are to be processed by the administrative Ministry concerned, they will be considered by a Sub-Committee of the Licensing Committee consisting of the Secretary to the Government of India in the Ministry of Industry as Chairman, the Secretaries to the administrative Ministries concerned or their representatives, the Secretary, Department of Economic Affairs or his representative, the Secretary, Department of Technical Development or his representative, a representative from the Company Law Division of the Ministry of Finance and a representative of the Planning Commission. This is the key recommendation of the Swaminathan Committee and in agreeing to the setting up of such a Sub-Committee the Government has said that the other members of the Licensing Committee stationed at Delhi may also be associated with the work of the Sub-Committee, without causing any undue delay on this account.

The "letter of intent" is required to indicate broadly the conditions subject to which the Government would be prepared to accord a licence and should also indicate that, within a specified period, varying, say, from six to 12 months — depending on the nature of the industry — the party should come up with definite proposals regarding (a) terms of foreign collaboration, if envisaged, (b) import of capital equipment, if involved, and (c) issue of capital, if involved. An interesting recommendation in the Interim Report is that the "letter of intent" should make it clear that if, within the prescribed period, the applicant does not submit all the remaining applications for the various clearances, the "letter of intent" shall automatically be deemed to have become inoperative. In its view this provision for automatic cancellation would eliminate the delays and difficulties at present being experienced by the Government in weeding out infructuous licences.

The second main recommendation of the Swaminathan Committee is in favour of a special procedure for "key" industries. In the case of industries thus designated, it is advised that once a "letter of intent" has been issued the Sub-Committee of the Licensing Committee should itself consider simultaneously applications for all other clearances involved, such as approval of the foreign collaboration terms, approval to the issue of capital and issue of import licences. So that all these clearances could be dealt with at one meeting by the Licensing Sub-Committee, it has also been proposed that the Chief Controller of Imports and Exports, and when necessary, the Controller of Capital Issues should be co-opted as additional members. At the time of considering applications for the "letter of intent", the Sub-Committee, it is recommended, might, in the case of key industries, give wherever possible an indication of the source from which foreign exchange is likely to be available. Subsequently, in considering the various clearances required, appropriate priority may be given to the key industries in respect of foreign exchange and domestic capital issues.

The Swaminathan Committee has given a list of 22 industries which it considers to be key industries for the purposes of the special licensing procedure. Included in this list are: Pig Iron, Alloy Steel, Industrial Machinery, Machine Tools, Fertilizers, Pesticides, Petro-Chemicals, Paper and Paper Board, Cement and Pulp, among other industries. The list has been compiled in the light of the need for making up for the shortfalls in the effective establishment of capacities for the attainment of Plan targets and the need for speedily establishing additional capacity in certain industries which are important for the promotion of self-sustaining industrial growth. The Committee acknowledges that the list compiled by it is not exhaustive and that it should be reviewed from time to time, say, every six months. It also promises that in its final Report it may suggest additions, if any. While it might generally be advisable to make this list as liberal as possible it may also have to be taken into account that if the list becomes too large from the administrative point of view, the benefit of the special procedure will become nominal. The logic of a selective list is that it should remain selective.

At the same time, it will no doubt be possible for some useful suggestions to be made from within the business community as well as the Government for consideration in the final Report. There seems to be need, for instance, to treat captive power generation as a key industry and encourage industrialists to put up their own power-generating plants to the utmost extent possible. In fact, it might even be recommended that wherever proposals are made for captive power gene-

Eastern Economist 20 Years Ago

JANUARY 21, 1944

When the control of capital issues was promulgated in May last, the Government categorically stated that it was not intended to handicap the legitimate industrial expansion of the country or to hold up the promotion of companies leading to war effort or civilian production. While we were prepared to take this assurance at its face value, we expressed the fear that there might be long and unconscionable delay in granting permission and that Government might have no rational or acceptable criteria by which to regulate the new issues. We further pressed for constituting a machinery of consultation composed of the representatives of industry, commerce and banking. Seven months of working of the order have confirmed our fears and strengthened our demand. Often long delays occur and months pass without any action being taken ..... Sensible post-war planning calls even now for the formation of companies which can place orders for plant and machinery to be delivered after the armistice. The Viceroy recognized this in recommending Indian industrialists to visit Britain. How can these men place orders for plant for starting new industries, unless the first step, viz., the formation of companies is permitted to be taken?

ration, along with applications for additional industrial capacity, the Government should be disposed to view them favourably and deal with them simultaneously. The Interim Report has done well in including industrial machinery in the list of key industries. There is certainly great need for stimulating the manufacture of industrial equipment of all kinds within the country and while the Government's policy in this respect is to be welcomed, it has also been noticed that expansion in certain industries, such as cement, has been restricted to some extent because entrepreneurs proposing to put up cement plants have not found it possible to satisfy the condition that they should go in for indigenous machinery. There is not at present enough capacity in the country for orders for cement machinery or certain other categories of industrial machinery to be executed on a sufficient scale and within the required time. Hence, it is certainly important that the Government should pay special attention to avoiding procedural delays in creating additional capacity in such essential industries. It seems, however, to be a serious omission that the list does not include heavy electrical machinery. We are aware that the manufacture of this equipment is now being undertaken in the public sector and that there are plans for expanding output in that sector. But it ought to be clear to all concerned that the public sector alone cannot develop this industry as fast as emerging needs for heavy electrical equipment would demand. It is possible that the question of permitting the private sector to undertake the manufacture of heavy electrical equipment or set up captive power plants freely is a policy question which the Swaminathan Committee may not consider itself competent to go into. But so far as we are aware there is nothing in the Industrial Policy Resolution or any other similar declaration of the Government to keep the private sector out in these cases. We would therefore suggest that the Swaminathan Committee in its final Report should consider whether these lines of industrial activity may not also be included in its list of key industries.

The Interim Report recognizes that the success of the speeding up procedures advocated by it would depend in the last resort on the prescribed time-limits being kept at the relevant levels in the Government machinery. Although its scheme aims at reducing file-pushing among different Departments or Ministries, there must still remain a hard core of Secretariat routine which could conceivably provide lazy or incompetent officials with adequate alibi. The human material, therefore, is very important and an obvious implication of the Interim Report is that it must be accepted as the responsibility of those who would be working the new procedures recommended, to watch for the human blocks and bottlenecks and remove them. From this point of view it is good that the Interim Report prescribes very specifically that the proposed Licensing Sub-Committee should itself go into every application on which action has been delayed beyond six weeks. This should serve to create an atmosphere and create the context in which the individual officials concerned at various points will have to function and discharge their responsibilities properly in the matter of cutting out red tape. This perhaps may not be the least important of the contributions which the Swaminathan Committee may ultimately have been found to have made to the pruning of Parkinsonian maladies in the Government.

EASTERN ECONOMIST
Annual Number 1964

The Nation's leading economic weekly with the largest circulation in its class proudly presents in its latest Annual Number a stimulating discussion of the highly topical theme "THE BATTLE OF INDUSTRIAL PRODUCTION". It critically examines developments in major industries and relevant Government policies. Illustrated with colour-graphs, charts and statistical tables, this sumptuous Number is priced Rs 10/- per copy; available to subscribers of Eastern Economist without extra payment; Annual subscription Rs 65/-.

His blood has saved many lives

Way back in 1935, at Jamshedpur's Main Hospital, a man lay dying. Only a transfusion of blood could save him. In those days, most people thought that blood donation permanently damaged health. But a young man came forward and voluntarily gave his blood to sustain the ebbing life. Between 1935 and 1955, the same man freely gave his blood no less than 40 times—on an average twice a year—for victims of industrial accidents, to save men critically ill.

This extraordinary man is T. S. Balam, a typist with Tata Steel at Jamshedpur, a happy, healthy family man of 50. Although he still wants to donate blood, doctors decline his offer in view of his advancing years.

Inspired by the selfless example of men like Balam, many, many others in the steel town have donated blood. No less than 20,000 employees of Tata Steel have had their blood tested and grouped, while many more are coming forward regularly for testing and grouping . . . to help prevent avoidable deaths . . . to save families from sorrow and ruin.

This is yet another instance of the fellow-feeling, born of the indivisible bond of labour, that binds together the steelmen in Jamshedpur, a city where industry is not merely a source of livelihood but a way of life.

NANDA TO THE FORE

THE PRIME Minister returned to the Capital on Sunday. The subsequent medical bulletins have been reassuring, but it is conceded that he cannot be expected to get back to work except perhaps after a sufficiently long period of rest, recovery and recuperation. Meanwhile, temporary arrangements have been made for his portfolio. All subjects dealt with by the Prime Minister, except External Affairs, are being handled by the Union Home Minister, Mr Gulzarilal Nanda. Files from the Ministry of External Affairs are being sent to the Finance Minister, Mr. T. T. Krishnamachari, for disposal.

Mr. Nanda has been having no easy time these days. The communal disturbances in Calcutta, for instance, had to be firmly dealt with. Accompanied by the Union Law Minister, Mr. Asoke Sen, the Home Minister went to Calcutta on January 12 and stayed there while a military administration took charge of the disturbed areas and succeeded in restoring law and order.

Mr. Nanda returned to Delhi on January 14. Next day the Secretary to the Ministry of Home Affairs, Mr. V. Viswanathan, came back from Srinagar. But it may be premature to conclude that either Hazratbal or Calcutta has ceased to be political dynamite. Mr. Nanda certainly argued with great force in Calcutta that the Government's first duty was to restore law and order and protect the lives and properties of threatened citizens. Now that this has been accomplished, the political task of restoring confidence among the Hindus of West Bengal and convincing them that their co-religionists in East Pakistan would not continue to be persecuted remains to be attempted. The Nehru-Liaqat Pact, which provides for joint tours of the disturbed areas on either side of the border by representatives of the two countries, has been invoked by our Deputy High Commissioner in Dacca, who has asked to tour Khulna. This step may perhaps be the minimum necessary to discourage scare mongering and wild rumours and dissuade frightened communities from panic flight across the border. This is one of the many urgent issues which the Emergency Committee of the Cabinet, which meets frequently these days under the chairmanship of the Home Minister, will have to deal with.

AID AIMS

THE UNION Government is understood to have tentatively decided to make a request to the Aid-India Consortium for approximately $1,050 million assistance during the fourth year of the current Plan. Final decision in this regard, however, is likely to be taken soon after the detailed assessment currently being made of the foreign exchange requirements of the 1964-65 and 1965-66 Plan programmes is over.

The tentative decision is said to have been arrived at in the light of the discussions that the Union Ministry of Finance and the Planning Commission have been having with Mr. B. K. Nehru, India's Ambassador in the United States.

Mr. Peter Wright has also arrived in New Delhi to make an assessment, on behalf of the World Bank, of India's foreign exchange requirements in the next year and also of the current state of the Indian economy. As in the past, his report will form the basis of the Consortium deliberations scheduled to start in Paris on March 10, 1964.

The fears expressed in some circles that the U.S. interest in India's economic development has been waning of late as a sequel to the none-too-happy performance on the development front during the first two years of the third Plan, are being discounted by knowledgeable circles. Not only President Johnson's assurance of all possible help for India's economic development, soon after his ascendency to the U.S. Presidency after the assassination of President Kennedy, is being recalled in this connection, but a good deal of significance is also being attached to the proposed visit in the middle of next month, of Mr. Harc Lindon, the President of the U.S. Export-Import Bank. It hoped that as a result of Mr. Lindon's visit, more funds w be available for India's development from the U.S. Expo Import Bank.

There is stated to be growing appreciation among the mer bers of the Aid-India Club of the case for extending assistan in the form of untied loans. India is likely to plead that at lea half of the $1,050 million aid to be sought from the Consortiu for 1965-66 should be in the untied class. Another heartenin development is stated to be that the U.S.A. is not now likel to insist on the other members of the Consortium togethe matching its contribution with theirs.

The Government of India, of course, is said to be keen tha the Consortium at its next meeting should also indicate th assistance that may be expected from it during the termina year of the current Plan. But this plea is not likely to be pressec in view of the difficulties that some members of the Consortium have indicated recently. Discussion of the foreign exchange requirements of India in 1965-66 and the first half of the fourth Plan, however, is not ruled out in the light of the advance action that has been initiated on various crucial fourth Plan projects.

COUP IN ZANZIBAR

IT IS a nervous habit that was once fashionable—and still is in some parts of the world—to see red in every coup. On January 12, a Sunday, a coup was effected swiftly if not bloodlessly, in Zanzibar to which the British had granted freedom recently. The Sultan, who, with his personal staff, later sought and obtained asylum in Tanganyika, and Mohammed Shamte Hammadi, the head of the Government and leader of the Pemba People's Party, were both deposed. Writing on June 14, the 'Times of India' correspondent in London was perhaps only voicing British fears when he saw the hand of the Communists in the Zanzibar coup—for London still remains the most reliable centre for the evaluation of sudden African news. It is true that Abdulla Hanga, the new Prime Minister, was educated at Moscow and Mohammed Babu, the foreign Minister, had Chinese affiliations, but the coup was more the outcome of dissatisfaction with the results of the 1962 elections, which, thanks to some gerrymandering reform earlier, did not adequately represent the relative electoral strengths of the national groups in Zanzibar.

Principally, the country consists of the two main islands of Unguga and Pemba, and its population of 3,00,000 people includes an overwhelming majority (about 70 per cent) of Africans. Many of them are of mixed stock and the African Shirazis claim descent from Persian invaders. The Arabs constitute only 15 per cent. of the population and the Indians about six per cent. The issues in both the 1959 and 1962 elections were racial and territorial. The Arab-dominated Nationalist Party, which was overthrown, wanted the Arab traditions of Zanzibar to continue while the Afro-Shirazi party wants closer ties with the countries of mainland Africa. Although, in 1959, the Afro-Shirazi Party won six out of the eight elected seats, it was unable to form a Government as the ruling Nationalist Party nominated twelve official members. In the 1962 elections, held after the constituencies had been re-formed, the Nationalist Party won 18 out of the 31 seats with the help of the Pamba People's Party, which represented local interests, in spite of the fact that the Afro-Shirazi Party had won 54 per cent. of the votes. The immediate reason for the coup appears to have been the banning, on January 4, of the left-wing Umma party which enjoys the support of the Afro-Shirazis. News agency reports became less alarmist after January 14, when the British High Commission informed London that the new revolutionary regime wanted British help and also that the 400 British citizens in the country were safe.

WINDOW ON THE WORLD

The Common Market in 1964

From Our Special Correspondent

PARIS:

"BEFORE I DIE", Konard Adenauer once said, "I should like to cross and tangle the threads between the Six so tightly that the Devil himself could not undo the knot". Looking back across the Christmas agreement on a common agricultural policy, one realises that the stage wished for by the former Chancellor must have been reached some time ago — and that is why the Six were condemned to succeed in an enterprise where failure not only seemed possible but was widely feared. At all events, it is certainly reached by now, for no ties are so binding as farm policies and common practices in growing and commercialising crops. (That is why agriculture is the most intricate, intractable, contradictory and irrational part of any Western nation's economy). Having decided at last that, in principle, Europeans should feed Europeans, that, at the very least, European consumers should give a preference to food grown inside the Common Market, the Six become so many eggs in the one omelette.

Some may ask, remembering the stormy events of 1963, if this means that one party (e.g. de Gaulle) can henceforth have his way by delivering an ultimatum (like those Paris launched last year, on Britain's exclusion and on farm policy) which the others will have to accept because the alternative, disruption of the Community, has become impossible. The answer is negative, for three reasons. First, the inextricable imbrication of interests has gone so far that no ultimatum, of which the sanction was unilateral withdrawal from the Community, can any longer be credible. Bluff cannot work when the bluffer is quite unable to implement his threat. Second, the number of issues on which national governments have a veto will dwindle as the second stage of the Rome Treaty is applied, as it now can be. More questions will be settled by a qualified majority, which permits any one nation (even West Germany or France) to be outvoted.

Unified Market

Third and most important, the occasion for spectacular opposition by one party disappears with the appearance of a genuine unified market that covers both agriculture and industry. French truculence was necessary to ensure that the Common Market did not pursue its one-sided development into a free-trade area in manufactures, from which farm produce would be excluded. Farming interests, and governments in which such interests are influential, had to stop that at any price, and this was the origin of the two crises in the Common Market in 1963. In the first, industrial interests, and governments obedient to them, were trying to hand over the Continental food market to Britain's food-producing allies and dependents; in the second, to the US food exporters. Determined opposition, accompanied by the still credible threat to break up the union rather than permit such a perversion of the Treaty, was needful to prevent that. The foundations of a generalised Common Market having now been laid, there is no reason to expect repetition of similar crises.

Of course, this does not mean that disagreement, often acute, will not arise, just as it does within nation-states, whose unity is not thereby called in question. We must expect to see such disagreement in coming months as the Christmas accord is translated into reality, for in some respect it is both vague and contradictory. The vagueness will not disappear until precise regulations are framed, between now and the end of March, putting black on white the terms of the recent agreement, and until the prices at which Continental food crops are to be supported have been settled. As for the contradictions, they are glaring. The Germans won the "victory" in Brussels of having attached to every present and future regulation on trade in farm produce a simultaneous reference to Article 39 and 110 of the Rome Treaty, which happen to say almost opposite things. The former says the Six must guarantee "an equitable standard of living" to their farmers, and the latter recalls their desire to develop world trade by suppressing tariff barriers. On many particular issues, e.g. trade in wheat, these two objectives are incompatible.

However, any written Constitution is both vague and contradictory (as you may verify by looking up the articles on civil rights and national security), but that does not detract from the importance of a decision to adopt and live by one. Last month's agreement in Brussels is tantamount to such a decision, and that is why it will rank in historic importance with the other landmarks in the progress of European unity. For all its importance, it remains a mere landmark, a point in a continuous process, the "perpetual invention" of Europe, so one may look ahead and see what the next stages in that process are likely to be. The new year, indeed, brings objectives that, when their hour strikes, will seem as epoch-making as the great crises of 1963.

Restrictive 'Liberalism'

The first, obviously, (once last month's agreement has been framed in detailed regulations) will be the test of the tariff-cutting negotiations with the USA, scheduled for the month of May. For these talks, the ECM Commission has been given a mandate that is rather more vague and general than is suggested by British newspapers, who have jumped wishfully to the conclusion that the Brussels pact marked the "triumph" of free-trading German doctrines. On the contrary, the Six, while agreeing to make the GATT negotiations a success, have firmly indicated their will to remove the discrepancies between American and European tariffs that would persist if both were simply halved; they have said that where their tariffs are lower by far than American, then the US duties must be cut more heavily; and they have not committed themselves to securing a 50 per cent reduction of most or many tariffs — 50 per cent remains a mere "working hypothesis" of ideal objective. In other words, while consenting to be "liberal", the Six leave it open to adopt fairly restrictive interpretations of "liberalism" wherever their own industrial or agricultural interests would be jeopardised by too great generosity toward the Americans.

The Kennedy Round, in any case, is not an objective the Six set themselves but results from American initiative. The tasks for 1964 that flow from their own project of unity concern monetary co-operation, economic programming for the whole region, the merger of the three executives and the powers of the European Parliament. All of these will be in the news during 1964, so we may briefly indicate what is involved. The first was outlined in a scheme put up by the ECM Commission in 1963 and commented upon here at some length. The first goal for 1964 or 1965 will be to freeze exchange rates between the six currencies of the Common Market, so that their parities could not vary between themselves but could still vary simultaneously in relation to gold or the dollar. Though it may not be immediately apparent, this amounts to introducing a single European money, of which marks, francs, florins and liras are just coins differing only in value the way a 10-pfenning piece does from a 50-pfenning piece. Just for that reason, it is a very ambitious

project and its implementation would mark another epoch in European unity.

The merger of the three executives will probably be the first task taken up, now that French objections have diminished. This means that the three supernational administrations — the Common Market Commission, the Coal and Steel Pool, and Euratom — will be fused into one organism, responsible to the Council of Ministers. In practice the Common Market Commission would swallow the other two, not only because it is bigger and more important but because it has worked brilliantly while they have run into serious difficulties. The gain to European unity from such a merger is evident: the six nations would then have the embryo of a supernational government in the shape of a single administration answerable to a single cabinet of ministers. The difficulties, though real enough, are not prohibitive. Luxemburg is host to the Coal and Steel Pool and does not want to lose the benefits, both material and political, of this location by having that body transferred to Brussels — or wherever the Six elect to have their capital. For the merger will re-awaken the dispute about selection of a capital city in a fairly acute form. A matter of more substance is that the three treaties setting up these executives are to a different extent supernational: e.g. there are more surrenders of national sovereignty in Euratom than in the Common Market. In being merged, they will have to be harmonised on this point.

Finally, the powers of the European Parliament become a live issue just because of the success of last month's negotiations. For a start, the final agreement creates a fund worth hundreds of millions of dollars to be used to support and modernise agriculture, and this princely sum will have to be administered under some sort of democratic control. For that matter, the whole course of last month's critical bargaining revealed the immense importance and influence of the ECM Commission, whose role is now at least as substantial as that of Paris or Bonn — yet it is a nominated bureaucracy that is not controlled by any one elected assembly. The case for converting the rump parliament in Strasburg into a genuine democratic house chosen by the people of the region becomes more convincing as Europe progresses in unity. Here again, opposition is not wanting, and it can invoke quite respectable principles, so the upshot is far from assured. That is true of all the tasks for 1964 that confront the Common Market, but the direction of the union's evolution is clear.

East and West Pulls on Britain

PAUL BAREAU

LONDON:

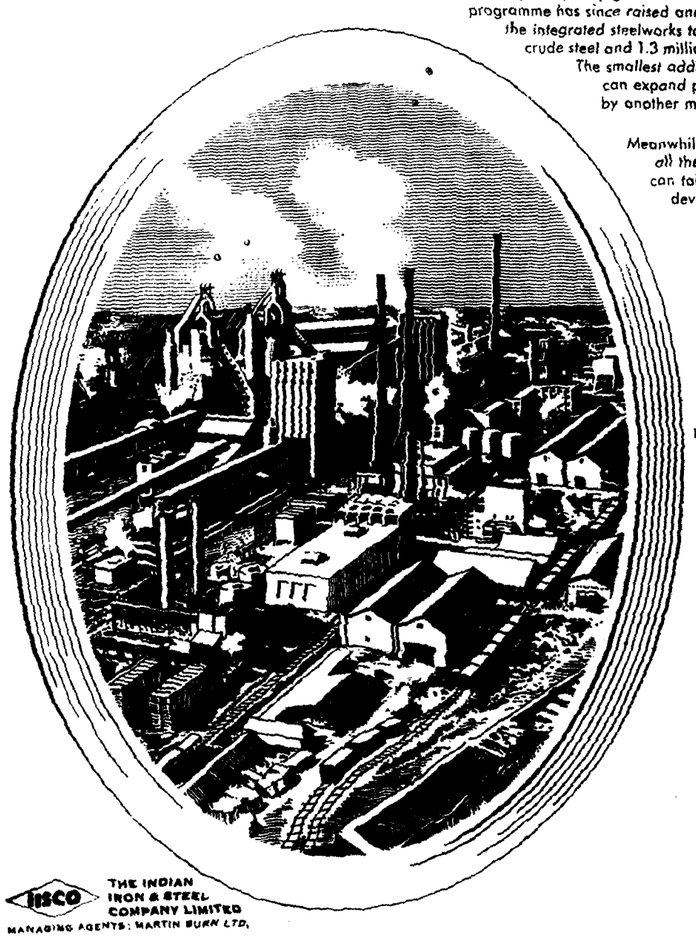
BRITISH ECONOMIC policy is being affected by influences pulling it towards Western Europe, others towards the United States and others still towards the bloc of communist countries. This susceptibility to divergent and often conflicting influences is in part the result of Britain's exclusion from the Common Market, which was announced with such devastating finality about a year ago. This event, which was at the time generally regarded as a disaster, both in Britain and in many countries of Europe, may well have proved a blessing in disguise — at least on short run considerations. Apart from preserving a position of independence and of flexibility from which considerable political and economic advantages may yet be secured, it has also insulated Britain from some at least of the inflationary influences that have been operating in Common Market countries during the past 12 months. One has only to look at the extraordinary expansion in British exports to those countries to realise how far relative cost and price changes have moved in favour of British industry and have enabled it to overcome with ease the tariff differentials that have begun to obtain as between trade within the Common Market and its imports from other countries.

This, however, is only a temporary phenomenon. As time passes the discrimination which will be applied by Common Market countries against the outside world will increase and Britain will be made more painfully aware of the results of exclusion from the European Community which at the moment still represents the most rapidly expanding market for British manufactures. The pull of that Community for Britain is likely to increase. The fears (or in some breasts the hopes) that the Common Market might collapse at the end of 1963 by reason of the inability of its member countries to reach agreement on a common agricultural policy, were wildly unrealistic. General de Gaulle had, admittedly, set a time limit to the agricultural negotiations in Brussels but this was no more than a tactical move and he showed his readiness for conciliation when he accepted the mere chapter headings to an agreement. These were all that the experts in Brussels were able to secure before 1963 passed into 1964. The detailed chapters of the agreement have yet to be written but it is already evident that once again France has won the victory. It is now certain that European agriculture will remain highly protected.

From this fact Britain can derive one major reassurance: this will tend to maintain a high level of food prices within Europe, while British industry will continue to have the advantage of cheap imported food. Agricultural protection in Europe will also drive Britain and the United States closer together. In spite of the new German Chancellor's visit to President Johnson in his home state of Texas, it looks as though we shall hear a great deal more in the coming year about "chicken war" and all that appertains to it. The United States and other food producing countries will find themselves increasingly hampered in their exports to Western Europe and this fact will have not merely economic but major political consequences. It will certainly tend to drive United States and Britain into one another's arms.

The opportunity for this reinforcement of what we may call the Anglo-Saxon bloc, will occur with the tariff negotiations under the aegis of GATT, which it is to be hoped will still carry the name of "Kennedy" round. This will be the real test of the economic philosophy of the Common Market. It will show whether the agricultural agreement between the six countries which has yet to be filled out in all its details, permanently stamps the European Economic Community as a liberal or an inward looking entity. However the doubts on this score may be resolved, it seems certain that in these tariff negotiations Britain and the United States will be fighting on the same side. Here lies the major westward pull on British economic policy.

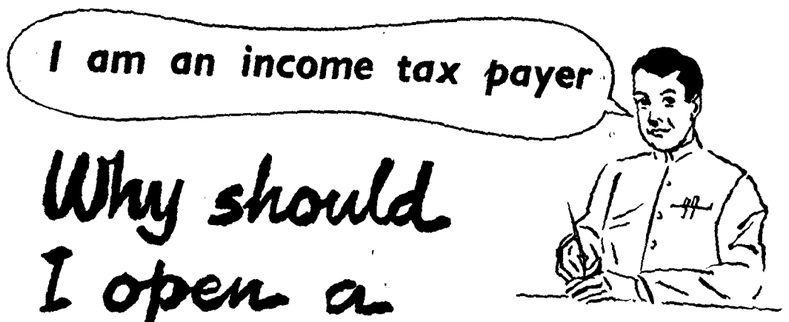
Another pull which is taking British commerce and finance eastward is in the development of trade with the communist bloc. This trade is growing by leaps and bounds. Britain itself has done little to satisfy the vast Russian needs for cereals, save that the London bullion market has absorbed almost all the sales of Russian gold and thus provided the cash with which the wheat and other cereals are being paid. But Britain enters the ambitious campaign for building chemical and fertiliser plants which owes its origin to the succession of disastrous harvests in Soviet bloc countries. British firms have been approached to provide the equipment and also to extend long term credit facilities in financing these costly projects.



This is an issue on which an unmistakable clash of opinion has taken place between the United States and Britain. State Department officials have recently been in Europe to

BURNPUR
—A PORTRAIT
IN STEEL

A busy steeltown. Alive to the problems of the day, prepared for the challenge of tomorrow. Thousands live and work here day and night. All of them think in terms of steel—and more steel, for India.



Yet less than ten years ago, the rated annual capacity at Burnpur was about half a million tons of crude steel and a similar quantity of pig iron. A two-step expansion programme has since raised annual production at the integrated steelworks to 1 million tons of crude steel and 1.3 million tons of pig iron. The smallest additional capital cost can expand production further, by another million tons of steel if need be.

Meanwhile, IISCO steel—in all the shapes that steel can take—serves India's developing economy.

Why should I open a Cumulative Time Deposit Account?

1. BECAUSE you earn income tax rebate on the deposits. If your earned income is Rs. 20,000 a year, by opening 10 or 15-year Cumulative Time Deposit accounts in your name or in the name of your wife, children or other dependents of Rs. 300 per month, you reduce your income-tax liability by Rs. 598 per year.

2. BECAUSE you get tax free interest on your deposits. You get tax free compound interest of 3·8% per annum, equivalent to 5·4% taxable compound interest at current rates of taxation on 10 year accounts and of 4·3% per annum, equivalent to 6·1% taxable on 15 year accounts.

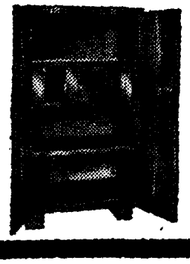
NATIONAL SAVINGS ORGANIZATION

BA 63/453

organise a united front against the extension of long term credit facilities to the USSR and other communist countries. They have met with little success in Britain, and British trade with the communist bloc is likely to stride ahead in the months to come.



What emerges from this conflict of contending influences? The Atlantic Alliance will certainly endure but with the gradual easing of political tension between East and West, the Alliance will tend to lose the essentially military and political inspiration which gave it birth and which has sustained it so far. It will become more economic in character. One of its objectives will be greater assistance to the industrially emergent countries. The Alliance as a whole, comprising as it does the richest and industrially most developed countries in the world, will be called upon to step into shoes which until now have been too exclusively filled by the United States.

Another objective must be greater freedom of world trade. Here we have within the Alliance opposing tendencies: the philosophy of European self-sufficiency which is represented by the policy of General de Gaulle and which appeals to some vested interests in Germany; and against this the more outward looking attitude which will be upheld in the coming year of tariff negotiations by the United States and Britain and which will have its supporters among such members of the Common Market as the Netherlands. This cause of commercial liberalism would be helped if Britain joined the European Economic Community. It is probably in this way that the contending forces pulling on British economic policy could best be reconciled.

Disciplining the Public Sector

By Our Special Correspondent

NEW DELHI :

THE UNION Finance Ministry contends to exercise stricter control over the financing of industries in the public sector. It has been found that many State undertakings use Government loans given for capital purposes to finance their working expenses. Public sector undertakings are therefore being told that this practice must cease and that they should secure their working capital in the normal way by going to the State Bank or other banks for advances on the usual commercial terms.

It appears that similar principles of financial discipline will also be adopted should any State Government seek to set up public sector undertakings in the field of medium industry as has been suggested in the Congress Resolution on Democracy and Socialism. The procedure prescribed for the State Governments will require them to raise capital by approaching the Industrial Finance Corporation of India or the proposed Development Bank which may be set up in the course of this year. The point is that State Governments cannot expect to obtain industrial capital in the form of direct loans from the Centre.

★★

Mr. T. T. Krishnamachari's recent visit to the Heavy Electricals plant at Bhopal seems to have been related, at least partly, to the feeling that the British collaborators could and should improve their performance. It is interesting that the Finance Minister was accompanied by the U.K. High Commissioner, Sir Paul Gore-Booth. The highlight of the Minister's one-day visit to the Bhopal plant was the friendly reception he was given by the workers of this factory which has had a troubled labour history.

Mr. Krishnamachari's study of the Bhopal plant may also have provided him with information relevant to the forward planning of the manufacture of heavy electrical equipment in this country. It appears that current official projections of demand of heavy electrical equipment in the fourth Plan period might be unduly conservative. It is likely that two more plants for the manufacture of certain categories of heavy electrical equipment may be needed in addition to the two projects which are being set up at Ramachandrapuram near Hyderabad and Ranipur near Harwdar. It is understood that certain US firms have shown interest in these proposals.

★★

The Oil and Natural Gas Commission is believed to have expressed misgivings over the availability of private loans from abroad for building up petro-chemical industries in India on the basis of the Union Government's present terms for such loans. It is understood to be of the view that very few private loans can be negotiated on the stipulations that no payment should be made on signing of a contract or the starting up of an industrial unit established with foreign private financial collaboration and that repayment of the foreign credits should start only after at least ten years from the commissioning of the plant and be completed in three or four instalments spread over two or three years.

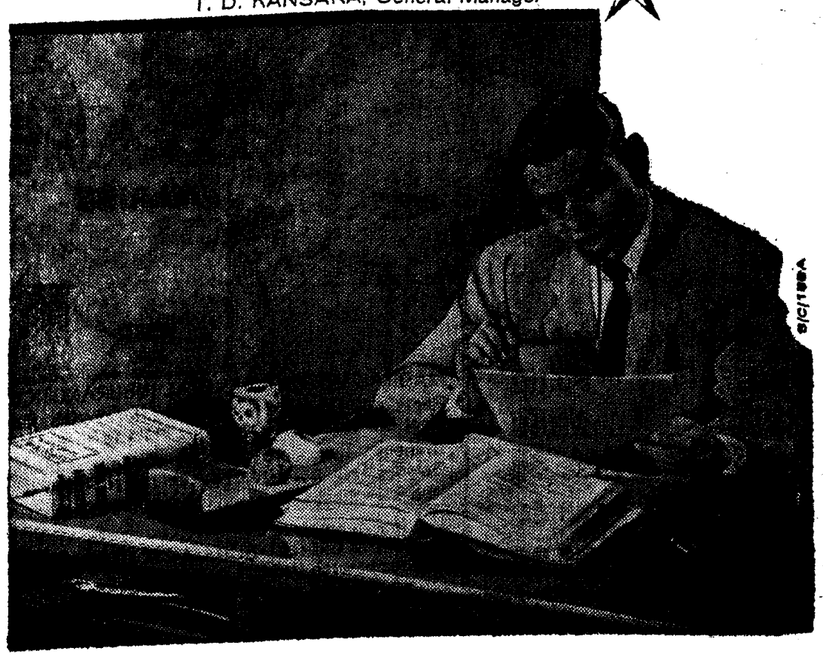
Even if loans on these terms are available, the ONGC feels that the Indian erection costs of petro-chemical units will become prohibitive, exceeding West European or US construction costs by as much as 200 per cent. This will make production of petro-chemicals impossible at a price anywhere near 130 per cent of real domestic prices prevailing in advanced countries, as suggested by Dr. Henry of the French Institute of Petroleum. As possible alternatives, the Commission is understood to have suggested the relaxation of repayment terms for foreign capital so that the plant cost differential is not higher than 140 per cent or allocation of foreign exchange to the petro-chemical industries from the credits available to the Government. The latter course, it is thought, will help in reducing the cost differential to even below 140 per cent. But steps in this case will have to be taken to see that such loans are negotiated expeditiously. In support of the relaxation of repayment terms, the Commission is said to have pointed out that foreign exchange is more freely available for petro-chemicals and to an extent not available to other industries and that the savings resulting from the local manufacture of petro-chemicals are extremely attractive: in the case of a number of important petro-chemicals, such as synthetic rubber or synthetic fibre, a net foreign exchange saving can be effected in a period of about two years, after taking into account all possible exchange remittances on account of royalties, technical know-how, start-up expenses, catalyst imports, spare parts, etc.

In regard to the payment of royalties, the Commission is believed to favour outright purchase of a particular process if it is certain to be adopted in more than one unit that might be set up, and then licensing it out to the intending parties. Further investigations, however, have been suggested in this respect in view of the limited knowledge available at present and the diverse practices prevalent in other countries.

Scheme Endorsed

By and large, the Commission is understood to have endorsed the scheme of petro-chemical complexes suggested by Dr. Henry. But it is said to be of the view that Dr. Henry's scheme should be taken as a guide and not as a firm, inviolable programme. In view of the likelihood of larger supplies of naphtha being available from the Trombay refineries of Burmah-Shell and ESSO and of associated gas from Ankleshwar and Kalol than assumed by Dr. Henry, the Commission feels that some modifications may have to be made in the production programmes recommended by the FIP expert. It may be possible, for instance, to manufacture at Bombay polyisoprene synthetic rubber from the propylene which may be available from the Mafatlals' 200,000-tonne naphtha cracker. Changes in the manufacturing programme of the Bombay complex have repercussions on the exact plans of utilization of Olefins from the steam cracker in Gujerat. There may well have to be further changes of this sort in the complexes proposed for South and East India.

In the interest of reducing production costs, the Commission favours setting up of as big plants as possible (plants should be generally of the same size as those foreign competitors will have when the Indian plants go on stream), avoidance of prejudicial interference between productions from various plants and complexes and ready utilization of the intermediates produced.



The Commission accepts as basically correct Dr. Henry's conclusions that there should be no export stipulation in respect of petro-chemical units and that these should be set up for replacing imports and for adding an impetus to internal economic growth. Exports of intermediates at world prices will entail an unduly high burden on the domestic consumer industries, thus hampering the exports of finished products. But it is believed to be of the opinion that when the plants begin to approach 90 per cent of their rated capacity, the Government

may examine the impact of setting export quotas on internal selling prices. Expansion of plants beyond their rated capacity, the Commission feels, may, of course, be made dependent on substantial exports being made.

As against Dr. Henry's recommendation of setting up, by 1966-67, petro-chemical units in Bombay and Gujarat costing Rs. 80 crores, with a foreign exchange component of Rs. 60 crores, the Commission is understood to be in favour of a plan for establishing complexes costing Rs. 100 crores, with a foreign exchange component of Rs. 70 crores. The output pattern suggested is: Benzene 32,700 tonnes; Oxylene 10,350 tonnes; P-Xylene 8,050 tonnes; Polythylene 15,000 tonnes; PVC/PVA 6,000 tonnes; Ethylene Oxide 8,000 tonnes; Acetaldehyde 20,000 tonnes; Propylene 36,000 tonnes; and Polybutadiene, Polyisoprene and Butyl 80,000/90,000 tonnes. The corresponding product-pattern recommended by Dr. Henry was: Benzene 80,000 tonnes; Oxylene 10,000 tonnes; Polyethylene 8,000 tonnes; PVC/PVA 10,000 tonnes; Polyethylene Oxide 5,000 tonnes; Propylene 18,000 tonnes and Polybutadiene, Polyisoprene and Butyl 40,000/50,000 tonnes.

On the basis of the product-pattern recommended by the ONGC, the complex being built around the Union Carbide's 60,000 tonne high severity naphtha cracker will produce 17,500 tonnes of Ethylene, 5,950 tonnes of Propylene and 5,850 tonnes of Benzene. The complex proposed to be built around the 200,000 tonne medium severity naphtha cracker of Mafatlals will turn out 15,000 tonnes of low-pressure Polyethylene, 20,000 tonnes of Acetaldehyde, 8,000 tonnes of Ethylene Oxide; 6,000 tonnes of PVC, 15/16,000 tonnes of Polyisoprene and 30/40,000 tonnes of Butadiene. The product-pattern of the Gujarat (Koyali) complex is to be as follows. Benzene 32,700 tonnes; O-xylene 10,350 tonnes; P-xylene 8,050 tonnes; Polyisoprene 40,000 tonnes and Methanol 4,500 tonnes.

The sale value of the products of the two complexes being built at Bombay and that proposed to be set up in Gujarat, when working to full capacity by 1968-69, is estimated at Rs. 43/46 crores.

The decisions on setting up petro-chemical complexes in southern and eastern India and about the expansion of the Gujarat complex, it has been recommended, should be taken by the end of 1964 so that these schemes may yield results by 1970-71.

★★

After high-level confabulations early this week, a decision is said to have been taken to fix the fourth Plan oil refining capacity target around 30 million tonnes, as against 26/27 million tonnes talked about last month. The Union Government now appears to be veering round to the view that in the case of such vital industries as petroleum, there is need to aim at self-sufficiency or even marginal surpluses than to depend on imports to wipe out the deficits in the crucial products — kerosene/AFT and diesels. The demand for petroleum products in 1970-71, it is felt, is likely to be of the order of 27/28 million tonnes a year.

The decision on how to raise the refining capacity beyond 22/23 million tonnes (for which plans have already been prepared), however, has been deferred till the time fairly firm estimates are available of the likely fourth Plan demand pattern for various products.

Esso's proposals for the Madras Refinery, it is understood, envisage setting up of a four-unit petroleum complex instead of establishment of only an oil refinery. The complex will consist of (i) a 2.62 million tonnes per annum throughput refinery; (ii) a 100,000 tonnes capacity lubricants plant; (iii) a 100,000 tonnes capacity ammonia plant; and (iv) a 120,000 tonnes capacity asphalt unit. The total cost of building this complex, within 30 months of the formation of a new company to handle it, is estimated at Rs. 20 crores, of which foreign exchange expenditure will be of the order of about Rs. 13 crores.

The new company will be a partnership between the Union Government and Esso. The former will have 51 per cent share in it and the latter 49 per cent. No participation from the Indian public is envisaged. All the foreign exchange required for the project will be supplied by Esso, partly in the form of its share in equity capital of the undertaking and partly in the form of loans. The rupee finance will have to be provided by the Government of India.

The refining unit is proposed to be specially designed to meet the petroleum products requirements of the Madras area where the demand for middle distillates predominates. This implies that efforts will be made to keep the production of gasoline at the minimum. It is presumed that after meeting the requirements of the Madras area and those of the ammonia plant, there will not remain any surplus gasoline for export. The cost of setting up the refining unit alone will be about 40 per cent lower than that of any refinery in operation or being built in the country at present. This should suggest that it will be slightly over Rs. 10. crores.

Crude supplies are to be of Esso's choice and from its own sources for a period of 15 years. The management also has to be in Esso's hands; for this purpose a management contract is proposed. No guarantees about refining margin are being sought. The products will be sold in the Indian market at competitive prices.

Submarine Pipeline

Since the Madras port cannot take large-size tankers, it is proposed to lay an under-water pipeline to bring crude from off-shore. The cost of laying this pipeline, of course, is included in the overall cost of the complex.

Two other projects have also been suggested outside the complex. These are an 80,000 tonnes capacity complex fertilizers plant and a 100-MW. thermal generating station. Esso has offered all technical assistance for these two projects right upto their commissioning stage on no-profit basis. The fertilizer plant is estimated to cost Rs. 11/12 crores. It will receive its feedstock from the ammonia plant.

If Esso's proposals are accepted, it is suggested that the foreign exchange savings on petroleum products alone will be of the order of Rs. 10.8 crores per annum over a period of 15 years. The Exchequer will gain to the tune of Rs. 7 crores per annum by virtue of its share in the profits of the complex and income from taxes. An additional foreign exchange saving of approximately Rs. 4.3 crores a year should accrue from the fertilizer plant.

In all, seventeen proposals are said to have been received by the Government for setting up the Madras Refinery. The two notable additions recently have been the proposals from Caltex and Mobiloil of the United States.

The Kuwait Government is also stated to have indicated that it is interested in making investments in the Indian oil industry. The funds proposed to be made available for this purpose will come out of the proceeds of the sales of petroleum products which Kuwait may supply if the negotiations now being carried on by a three-member Kuwaiti delegation, led by Mr. Ashraf Lutfi, bear fruit. The Kuwait Government is stated to have offered to supply India petroleum products at considerably cheaper prices than the country pays at present. According to some sources the Kuwaiti products may be available even at discounts comparable to those offered by the Soviet Union. The India-Kuwait talks have a special significance at the present

Canada's loans to India are now running at the rate of $12.5 million a year. The loans granted upto 1963 end totalled to $37.5 million. Among the loan agreements signed recently, one is for $8 million for a hydro-electric project at Ranapratap Sagar; another for $7.7 million for the supply of 37 diesel electric locomotives; and a third for $1 million to cover the extension of the aluminium smelter at Indian Aluminium Company Limited in Alwaye (Kerala). Three more agreements are in the negotiation stage. These pertain to: (i) $8 million for a hydro-electric project at Kotah; (ii) $3.5 million for a wind-tunnel at Bangalore; (iii) $1.6 million for a zinc smelter project in Kerala and for a smelting furnace for the Hindustan Furnace Steel Project. Canada has also recently signed agreements to the value of $37 million in regard to the atomic power project at Ranapratap Sagar. Some other projects are also in view. All the loan arrangements signed provide credits on long-term basis, the period of repayment extending from 15 to 25 years, including a grace period of three to five years. The interest to be charged is 6 per cent per annum.

Canada is also supplying aid to India under the Colombo Plan. During 1963-64, this aid totals $19.5 million. Under it Canada is to help in the setting up of a major hydro-electric project somewhere in South Kerala. The aid will also be utilized for supplying the much needed industrial materials such as non-ferrous metals. Canada has undertaken to supply component parts of machinery to the value of $2.25 million.

It has been further announced by Canada's Ministry of External Affairs that in addition to the three grants under the Colombo Plan and the present long-term arrangements, the Canadian Government will introduce new, "softer" long-term loans for under-developed countries. In what quantities and at what terms such funds will be allocated to India is not, however, as yet clear. One thing, of course, is certain that by this means, Canada is achieving a degree of flexibility and range in her external assistance which will be highly acceptable to this country.

Meanwhile, indicative of this country's growing interest in trade and economic relations with Canada is the decision of the Government of India to participate in the forthcoming British Columbia International Trade Fair to be held at Vancouver (Canada) from the 13th to the 24th May, 1964. This Fair will offer an opportunity to Indian exporters to publicise their goods not only in British Columbia but also in the entire region of West Canada. Recently the Government of Canada removed surcharges on import duties on a large variety of goods and this should be of welcome interest to many countries, including ours which would be participating in the Vancouver Fair.

**

The Union Ministry of Finance is understood to have veered round to the fact that the Central assistance for the 1964-65 State Plans will have to be stepped up substantially beyond the Rs. 500 crores agreed to by the former Finance Minister, Mr. Morarji Desai. An indication, it is learnt, has already been given to the Planning Commission that it could depend upon the Centre contributing to the next year's State Plans to the tune Rs. 550 crores.

The Rs. 50 crores step-up in the Central assistance, however, is not considered enough in knowledgeable circles. The total outlay suggested in the 1964-65 State Plans is stated to be of the order of slightly over Rs. 1,000 crores. According to the assessment made by the Planning Commission, following its discussions with the State Governments last month, the States may be able to raise funds from their own sources to the tune of about Rs. 325/350 crores. In spite of the increased Central assistance, there will thus remain a gap of nearly Rs. 100/125 crores to be filled if the proposed State outlays are not reduced. Among the problem-States are stated to be Assam, Madhya Pradesh, Mysore and Rajasthan;

The Elta Enterprise of Transformers and Traction Apparatus in Lodz, Poland, represented by the Elecktim Foreign Trade Agency, has been granted a contract for supplying 24 medium and high power transformers to India in 1964. Some of the machines will be delivered in the next few months. Funicular railways, one of the installations of a coal processing plant under construction in the South Karanpura coal basin, have been supplied by Poland. The funicular railways are fully mechanised and automated.

It may be interesting to note that the output of heavy industry in 1963 in comparison with the last year in Poland was 8.6 per cent higher. The increase was about 3 per cent in the iron and steel industry and over 12 per cent in the engineering industry. The heavy industry produced among other products about eight million tons of steel, i.e. over 300,000 tons more than 1962, about 5.5 million tons of rolled products, 12.7 million tons of coke, 17,340 metal-cutting machine tools, over 24,000 lorries, nearly 17,000 tractors, over 500 passenger railway wagons and about 14,500 goods wagons, 3,350 buses, 40 electric railway engines and 225 diesel railway engines. Hard coal mines reported that they had executed ahead of schedule the increased extraction tasks for 1963, supplying 112.5 million tons of coal.

**

The Department of Mines and Metals, in the Union Ministry of Steel, Mines and Heavy Engineering, is understood to be re-examining the possibilities of setting up, during the fourth Plan period, some Low Temperature Carbonisation Plants for the production of domestic coke. Establishment of three such plants was thought of early during the current Plan also, but none of these proposals could be implemented due to lack of financial resources. Interest has again revived in this programme in view of the urgency to save the forest wealth of the country and for sparing animal-dung for manureal purposes.

Apart from domestic coke, the Low Temperature Carbonisation Plants will produce many useful by-products such as Benzene, Toluene, Xylene, Naphthalene, Phenol, etc.

Cement: A New Peak in Capacity Utilization

From Our Correspondent

BOMBAY:

THE CEMENT MANUFACTURERS' ASSOCIATION has released production figures of 19 member-companies for 1963 as compared to 1962. The total output of cement at 8.78 million tonnes in 1963 was higher than 1962 by 0.66 million tonnes. In 1962, the number of reporting companies was 18 as compared to 19 reporting companies in 1963. If the estimated output of the two public sector units — one at Churk in Uttar Pradesh and the other at Bhadravati in Mysore — is taken into account along with the output of the Mysore Cements Ltd., Bangalore, which, though a private sector unit, is not a member of the Association as yet, the production total will rise to about 9.3 million tonnes, which is, no doubt, encouraging but hardly sufficient to meet the demand.

An interesting feature of the industry's performance is that no less than 11 companies, out of 19, registered output above the installed capacity. Madras Cement Ltd. recorded a rise of 19.3 per cent in production above its installed capacity. The overall utilisation of capacity of all the members taken together was 97 per cent — indicating a sizable improvement over the capacity utilisation in 1962 at 93.6 per cent. The increase in production can partly be explained in terms of the increase in the selling price of cement allowed by the Government in November, 1961. Even though it did not meet the full demand of the industry, it did provide incentive enough to raise output to the best possible limits under the present working conditions. Another praiseworthy decision taken last year was the sanction of foreign exchange allocations in regard to some of the licencees because it was felt that the indigenous manufacturers were not in a position to deliver all the units which were needed for the country to meet the rising demand.

**

In August, 1963, the Government of Maharashtra referred the dispute about the computation of the Bombay cost of living index to a special committee headed by Prof. D. T. Lakadawala. The labour organizations had been agitating for a revision of the old series based on a family budget enquiry conducted in 1934. The committee has now submitted its report to the Maharashtra Government indicating that the price indices of four items, namely, ghee, ready-made tea, house rent and clothing group, required adjustment. The committee has estimated that the overall impact of the provision in the indices of all these four items will be to raise the average general index figure for 1960, which was at 420, by 29 points to 449. The new series may be linked with the current series at 1960 by a simple ratio linking, the factor used being 4.49. The State Labour Minister, Mr. N. M. Tidke, will have discussions with organisations of both employers and trade unions before taking a decision on the report. The findings of the Committee are, however, extremely disturbing from the point of view of the employers. A rise of 29 points or 7 per cent in cost of living, if translated immediately into a rise in the dearness allowance of labour, will increase the wage bill of the textile mills. There are no less than 400,000 industrial workers in Greater Bombay who are likely to benefit from an upward revision. Indian cotton textiles have already been slowly losing ground in the international markets; any fresh burden is likely to raise not only the prices of indigenous cotton textiles, but will have an unhealthy impact on India's exports. A cautious policy needs to be adopted in this case, because it is likely to have very wide repercussions. It is feared that agitation for revision in the cost of living indices in other cities will also gather momentum.

**

Proposals for licensing additional sugar capacity during the remainder of the third Plan and probably during the fourth Plan are being viewed favourably in Maharashtra. The Centre is believed to have decided on a four-fold criterion for future licensing of sugar mills. These are recovery percentage, absence of gur competition, condition of cane development and preference for the co-operative sector. The fourth Plan target is likely to be 45 to 50 lakh tons and by and large, Maharashtra and Southern States are likely to get the lion's share. The co-operative sugar factories, in contrast to some of the private sector units, are up-to-date in payment to cane growers. Several of them have been able to pay cane prices much above the statutory minimum by virtue of high recovery from sugar cane. Since Maharashtra is one of the pioneering States in the field of co-operative sugar factories, the prospects of further location of sugar capacity in the State seem bright.

**

An overseas selling agents' conference — the first of its kind to be held in the country — which was convened by the Raymond Woollen Mills, Bombay, was attended by delegates from the United States, the Continent and the Middle East Addressing the gathering, the Textile Commissioner, Mr. R. Doraiswamy, pointed out that the export of woollen textiles from India had not yet reached the stage which would cause disruption of markets in their (delegates') countries. The wages of the woollen industry in India compared very favourably with those obtaining in advanced countries and as such the charge of 'sweated labour' could no longer hold good. While the industrially advanced countries could go in for the production of sophisticated items, importers of Indian woollen goods should take into account the kind of goods that India could produce at the present stage of industry's development. Modernisation could make it possible for the Indian industry to produce more sophisticated items. The selling agents from different countries rightly stressed the need for maintaining quality at a high level and supplying goods in time and at an attractive price in keeping with the changes in consumer preferences.

**

The Reserve Bank of India has published the preliminary results of a survey conducted into rural debt and investment. The survey was spread over all the States covering 2,057 villages during the period July 1961 to June 1962. Nearly 62 per cent of the rural households had outstanding loans in cash at the end of June 1962. The average debt per rural household was about Rs. 654, Rs. 719 for cultivator households and Rs. 429 for non-cultivator households. The survey has also shown that the average value of recorded assets for household worked out to Rs. 5,358, with the Punjab and Assam accounting for the highest (Rs. 10,482) and the lowest (Rs. 3,115) respectively. The average level of assets (all-India) for cultivators was Rs. 6,696 as against Rs. 1,678 for non-cultivators. Fixed capital formation was estimated at about Rs. 50 per household. Nearly 50 per cent of the rural households had borrowings during the period, the proportion being low in Assam and Orissa (20 per cent) and high in Rajasthan (over 70 per cent). The average amount borrowed for every rural household during the year was Rs. 180. Repayments averaged about Rs. 90 [illegible] — half the amount borrowed.

Violence: Point Counterpoint

From Our Correspondent

CALCUTTA:

THE GHOSTS of a pestilential past had been crowding upon the minds and moods of the people of this State for the past few days. For some days preceding January 10, public opinion was being excited and inflamed by reports of widespread and continuing disturbances in Khulna and Jessore districts of East Pakistan, where the Hindu population had been subjected to violence to property and person. The communal aggression in East Pakistan had followed the exploitation, for political purposes, by the Press, politicians and even Government leaders in Pakistan of the theft of the Prophet's hair from the Hazratbal Shrine in Kashmir and its subsequent restoration.

On January 9, the External Affairs Ministry in New Delhi impressed on the Pakistan High Commissioner the need for urgent action to end quickly the disturbances in East Pakistan and afford protection to the minority community. On the same day, the West Bengal Government sent a strong note to the East Pakistan Government expressing its apprehensions that if effective steps were not taken to stop immediately the violence which was being committed against Hindus in Khulna and Jessore districts, there might be repercussions in West Bengal. This fear, unfortunately, was borne out the next day when hooliganism broke out in the form of arson and rioting in some places in the south eastern part of West Bengal. The police had to fire on several occasions in the 24 Parganas and a dusk-to-dawn curfew had to be imposed in many places. The trouble had spread to the eastern areas of Calcutta itself by Saturday when troops had to be called out to assist the civil authorities in maintaining law and order. Curfew had also to be imposed. On January 12, military authorities took over the administration of five Thana areas of Calcutta at the request of the Chief Minister. On the same day the Union Home Minister, Mr. Nanda, arrived from Delhi to affirm the Central presence in the troubled city and assume direct Central responsibility for the protection of life and property of all citizens and the early restoration of law and order. The stern measures taken to quell the disturbances had their effect and by Monday of this week the situation had been brought under control. The curfew could be relaxed in all the areas on the following day although the military administration had to be extended to some more areas. Overall, there was improvement to the point of permitting the Home Minister to return to the Capital on Tuesday evening. According to official figures, 52 had been killed in Calcutta and 57 in the surrounding districts in the incidents till Monday evening. During the same period 325 were injured in Calcutta and 126 in the districts. In addition, 36 persons were killed by police action in Calcutta and five in the districts, while 103 sustained injuries. Most of the casualties in the disturbances were among members of the minority community while casualties resulting from police action were mostly among members of the majority community. The Home Minister disclosed that over 7,000 persons had been arrested and of them 4,000 had been rounded up in Calcutta City.

Firm Handling

Although the problems of physical and emotional rehabilitation of the persons who suffered in the disturbances remain to be dealt with, it would now appear that the worst is over—thanks to the total firmness displayed by the authorities from the very start. While it is true that the induction of the military administration and the presence of the Central Home Minister played a decisive role in quelling the disturbances early, it must be said to the credit of the State Government that it was not remiss at any time in the discharge of its own responsibilities. Unfortunately, it had to reckon with two serious limitations. One was that, although the actual indulgence in violence against the minority community was confined to hooligan elements, mob activities were often backed by mass sympathy. It may be true that there was no overt resort to large-scale violence by the majority community as a whole, but that, thanks to the reaction to events in East Pakistan, the Hindus in the disturbed areas of Calcutta and other parts of West Bengal were, in large numbers, disposed to countenance retaliation cannot be gainsaid. Secondly, a high proportion of the police force consists of Hindus from East Bengal and this certainly did not make it any the easier for the West Bengal Government to enforce law and order.

**

Mr. A. S. Bam, Chairman of the Tea Board, stated on January 9, 1964, that a new record in tea exports was attained in 1963; the total value of tea exports was Rs. 132 crores while the total volume of tea exported was 491 million lbs.—highest since 1959 both quantitatively and from the point of view of foreign exchange earnings. The new peak in exports was achieved despite the fact that the production of tea in 1963 had not exceeded that of 1962. Mr. Bam, however, was sceptical that the third Plan target of 900 million lbs. would be

162867

SL
Xm21, N49EE N49.2

attained. He said that knowledgeable people in the tea industry felt that a more realistic target would be 820 million lbs. In order to fix a realistic target of exports for the fourth and the fifth Plans, the Planning Commission had set up a Working Group which had held its first meeting in New Delhi in December, 1963. The second meeting will be held in Calcutta in the current month. The Tea Board has launched a two-pronged programme about export promotion. One aspect of the export promotion scheme relates to the propagation of the image of tea as a beverage through tea councils in different countries; the other is a publicity campaign through "tea centres" in world capitals and commercial centres. Because India and Ceylon together produced 80 per cent of tea in the world, the two countries were jointly undertaking tea promotion in several European countries.

**

At the third annual general meeting of the West Bengal Hosiery Association on January 4, 1964, Mr. A. K. Choudhuri, President of the Association, said that there was need for taking effective measures for export promotion of Indian hosiery goods by way of necesary simplification of elaborate foreign exchange controls and regulations, manning Indian Trade Commissions and Consulates with experienced hands with adequate commercial background and zeal for doing useful work, and ensuring availability of adequate raw materials and cheaper machineries for effecting reduction of cost structure of the industry. The increasing domestic demand for superior class of hosiery goods and the mounting demand for quality goods in overseas market could be met only with adequate and regular supply of finer counts of cotton yarn, synthetic woollen yarn etc. to the industry. If any restraint on home consumption was desired, it could be so designed as to ensure export of quality goods in larger volume to augment foreign exchange earnings of the country. Mr. Choudhuri also suggested that the code of conduct already introduced for exporters should be extended to the home market to successfully eliminate any chance of conflict between business interests and general interests of the consuming public.

The implementation of the recommendations of the Study Group, Mr. Choudhuri observed, will enable the hosiery industry to get rid of its basic problems. Much more welcome were the decisions of the West Bengal Government in removing the hurdles of Sales-tax on hosiery goods and of the Central Government in recently announcing to decontrol yarn.

A Good Record in Industrial Finance

From Our Correspondent

MADRAS :

THE MADRAS Industrial Development Corporation Limited is the largest and, possibly, the most successful among similar financial institutions in this country. In the 14 years of its working it has steadily increased its assistance to industrial borrowers with the result that the cumulative total of loans disbursed by it had reached Rs. 9.78 crores at the end of June, 1963 as against the cumulative total of loans sanctioned at Rs. 11.66 crores. The Corporation has been specially helpful in the floatation of new enterprises by underwriting or participating in the equity capital of company floatations. This has certainly been a source of strength for new industries in the State which may not otherwise have been able to get a good financial start.

Here it is relevant to note that, side by side with taking a bold interest in new industries, the Corporation has also stuck to sound principles of industrial finance with the result that it has an excellent record of recoveries in respect of loan capital or interest charges, which, incidentally, also reflects credit on the Corporation's customers, many of whom are relatively small or new entrepreneurs. Apart from cash loans, the Corporation has also been issuing guarantees to machinery suppliers in respect of deferred payment for machinery sold to its constituents. It has also been giving guarantees to commercial banks with whom its customers have arranged for loans. These activities have been greatly facilitated by the Madras Government having decided to back these guarantees to the extent of Rs. 5 crores, in the first instance.

An important source of finance for the Corporation is secured from the public in the form of fixed and call deposits and cash certificates. The cumulative total of such receipts stood at Rs. 3.04 crores at the end of June, 1963. With the business community in the State making increasing demands on the Corporation's services, it is clearly necessary that its resources should be strengthened. Hence the view is strongly expressed in the speech of the Corporation's Chairman (which is due to be delivered at the annual general meeting next week and is now being circulated to shareholders) that the powers recently given to the Reserve Bank to regulate the receipt of deposits by financial institutions, such as the Madras Industrial Investment Corporation, should not be so used as to create difficulties in the way of its attracting deposits from the public. It is also pleaded that the Central Government should review its policy towards the State Finance Corporations and assume a measure of positive responsibility for strengthening the finances by placing with them generous amounts from PL-480 funds or advising the Life Insurance Corporation to divert to them some of its investment funds.

**

The failure of the south-west monsoon last year has created a problem for Kerala and it has now been indicated that, notwithstanding the commissioning of the first set having a capacity of 15,000 kW in the Panniar Project, it would be necessary to impose a cut of 40 per cent from the middle of this month. The level of storage in the various hydel reservoirs is unsatisfactory and the position is not expected to improve to any great extent until the Sabarigiri project takes shape. Even so, the dependence on hydel power will create problems during the summer months and it has been emphasized that planning for power generation during 1966-71 should be carried out on an integrated basis. The supply of power by the Madras Electricity Board of 20,000 kW during nights to Kerala has, under the circumstances, been greatly appreciated though it is felt that this power availability could be increased in the coming weeks and that the Madras Government should adopt a more helpful attitude.

There are at present three units generating up to 150,000 kW of power at the Neyveli thermal station, one unit being shut down for annual overhaul and repairs. As the steam turbines have to be continuously operated, the Neyveli thermal station is now serving as a base load station and it is expected that the fifth set, which is being erected, will be commissioned in time for use in the summer months. The first unit which has been shut down for overhaul will also be started again as early as possible so that power from this source will be available to the maximum extent in the critical months between April and July. As the demand for power during nights is not large, the Madras Government is now using the hydro-electric stations for meeting the demand during peak periods and only irrigational discharges are being regularly harnessed. The level of storage in the Nilgiri reservoirs, Mettur and Papanasam is considered satisfactory though at Periyar it is not so as compared to the level at this time last year. But it is hoped if there is no undue delay in the onset of south-west monsoon, a cut in power supply could be averted by the Madras State Electricity Board. With the commissioning of additional units in the Periyar, Kunda and Mettur Tunnel schemes in the next two years and the completion of the first stage of construction of the Neyveli thermal plant, there may not be any serious difficulty in meeting the additional demand for power though it is pointed out that future planning may present some difficulties and greater thought will have to be given to the drawing up of schemes by the Madras Government.

**

With available water power resources mostly harnessed, the State Government can think of adding to installed hydel generating capacity only in a small way as, besides the Kodiar scheme in Kanyakumari District, the potentialities of other small falls are being examined. It is, therefore, felt that the Madras State Electricity Board would like to concentrate its attention on the generation of additional thermal power and firm up the grid system specially as the surplus hydel power from Mysore and Kerala, after sometime, might prove to be helpful. The prospects of working the Hogenigal Project on a joint basis between Mysore and Madras have of course improved and it has latterly been suggested that this project should be even handled as a central undertaking. The Mysore Government has a feeling that much larger quantities of power can be generated if the scheme as prepared by the Madras Government was altered and the dam was located even on Mysore territory. How this proposal will ultimately take shape is difficult to anticipate at this stage.

But in Neyveli there would seem to be a confident feeling that the capacity can be increased to one million kW without difficulty and if the Madras Government's proposal for a large-sized unit at Ennore also fructifies, there could be an exchange of power between Kerala and Mysore particularly as, apart from larger availability, the cost also can be kept down, hydel power in Kerala and Mysore being generated much more cheaply. There is no doubt that the find of lignite in Neyveli has been a great boon as export of power has been in very large quantities during the first nine months of 1962-63 and it is estimated that in 1964-65 the supply could be raised by a further 25 per cent in spite of an increase in consumption by the integrated project at Neyveli itself.

Increasing Tempo

After the initial difficulties and unjustifiable delays there is now evidence of an increasing tempo of construction work in this new industrial complex. It is now anticipated that the sixth set having a capacity of 50,000 kW will be got ready early next year while the seventh set of 100 mW is scheduled to be completed in the first quarter of 1966. The fertilizer project, which was given Cinderella treatment till recently, has taken good shape and there is a possibility that at least one of the two streams will be commissioned before the end of this year and the production of urea on a commercial scale will begin by the middle of 1965. There is every prospect of the briquetting unit starting operations in sections by the end of this year as it is not necessary to complete the whole project, as in the case of the fertilizer scheme, in order to produce briquettes. The possibilities for further development during the next Plan are being exploited and it will not be surprising if the capacity of the Neyveli thermal plant is expanded beyond 600 mW while the fertilizer project may be expanded to produce additionally 50,000 tons of urea. In any case, the Neyveli Project has earned for itself a very prominent place in the regional economy and can be operated on an economic basis if the full potentialities are intelligently exploited.

**

The successful firing of the second two-stage rocket to study outer space at the Thumba rocket site, near Trivandrum, a few days back has created a feeling of great confidence in the scientists and technicians working on this project. The capability of Indian personnel has been greatly appreciated and it is now felt that this rocket fire range might be utilised more effectively for getting a better idea of the temperature of region of the earth atmosphere above 40 kilometres. The rocket weighed 1,600 lbs and carried a pay load of 62.5 lbs of sodium vapour, like the first one fired on November 21, last year. It reached an altitude of 116 miles and developed a maximum velocity of 2,400 miles per hour. The weather was ideal and all the camera stations situated at Kanyakumari, Palayamkottai, Kottayam and Kodaikanal reported satisfactory observation conditions for photographing the sodium vapour clouds. In view of the successful experiments and the ability of the Indian personnel, there is every likelihood of this site being designated as the first international space facility under U.N. sponsorship.

**

The declaration of higher dividends by the major banks has greatly encouraged investors. Excepting one or two banks all others which have published their working results for 1963 have raised dividends in equity capital. While the higher dividend recommendations in the case of United Bank of India, Devkaran Nanjee Banking Company, Bank of Baroda and Bank of India have been welcome, so far as this part of the country is concerned, the State Bank of Travancore has raised its distribution for 1963 to 6 per cent, taxable, from 5 per cent taxable for the previous year. Bank of Mysore, however, will be only maintaining the dividend at 10 per cent, taxable while Indian Bank Limited has announced that the cut in the dividend effected last year would be restored. Accordingly, a total dividend of 15 per cent, taxable, is to be paid against 14 per cent, taxable, previously. The Bank has made impressive progress and in the last two years has added to its deposits by more than Rs. 10 crores. At the end of 1963, total deposits stood at Rs. 49.83 crores against Rs. 44.04 crores in 1962. There was an increase in the net profit for the last year, after taxation and all adjustments, to Rs. 17 lakhs from Rs. 15.25 lakhs in 1962. The transfer to reserve was only slightly higher at Rs. 3.40 lakhs (Rs. 3.10 lakhs). The Indian Overseas Bank also has made good progress, there being an increase in its deposits during the same year by about Rs. 4 crores to around Rs. 40 crores. The big new building of this institution was inaugurated on Monday and the chairman and directors of the Bank were justifiably proud of the progress made in recent years.

**

Several new issues are coming on the market. Lakshmi Machine Works Limited is expected to offer to the public Rs. 1 crore in equity shares, the balance of Rs. 1.5 crores out of the issued capital being taken up by the promoters and Swiss collaborators. This project is estimated to cost Rs. 6 crores and will be one of the largest producers of textile machinery in this country. Andhra Sugars also has a big programme of expansion. It has already successfully diversified its lines of production having a sugar factory, a distillery, a sulphuric acid and superphosphate plant and acetic acid and acetic anhydride units. The last two units were commissioned sometime back. It is now proposed by the directors of this company, to erect a caustic soda-chlorine plant and a hydrochloric acid plant in Andhra Pradesh near the existing sugar factory. This scheme is estimated to cost a little over Rs. 2 crores. But it has been proposed to raise only Rs. 13 lakhs by issuing equity shares at a premium of Rs. 3 per share. The balance will be found to the extent of Rs. 1.40 crores from the Industrial Finance Corporation and from internal sources and suppliers' credit. As the earning capacity has been increasing and during the current account period it is expected that larger profits could be made the distribution on increased equity capital can be easily maintained.

The moving finger writes

IN THE wake of the Prime Minister's illness three men have come to occupy the centre of the national stage. The first is Mr. Lal Bahadur, who seemed to take charge effectively and effortlessly at Gopabandhunagar. To say this is not to detract from the quality of the new Congress President's leadership. Mr. Kamraj's forte, however, is personal or small group discussions. This apart, his linguistic limitations have to be allowed for in large multi-lingual gatherings. In the circumstances, the large political role which Mr. Lal Bahadur played in Gopabandhunagar was natural and legitimate. It must, however, be pointed out that both Mr. Kamraj and Mr. Lal Bahadur were greatly helped by the constructive co-operation they received from the delegates. Much has been written about the Congress Session in various sections of the Press in serious criticism or facetious fault-finding. But it would be churlish not to acknowlege the restraint and sense of responsibility which the nation's principal political parties showed under the shadow of Mr. Nehru's illness. I have heard it suggested that one of the most encouraging factors in these uncertain days is the capacity shown by the Congress Party at the recent session to pull itself together under stress. I am inclined to agree.

**

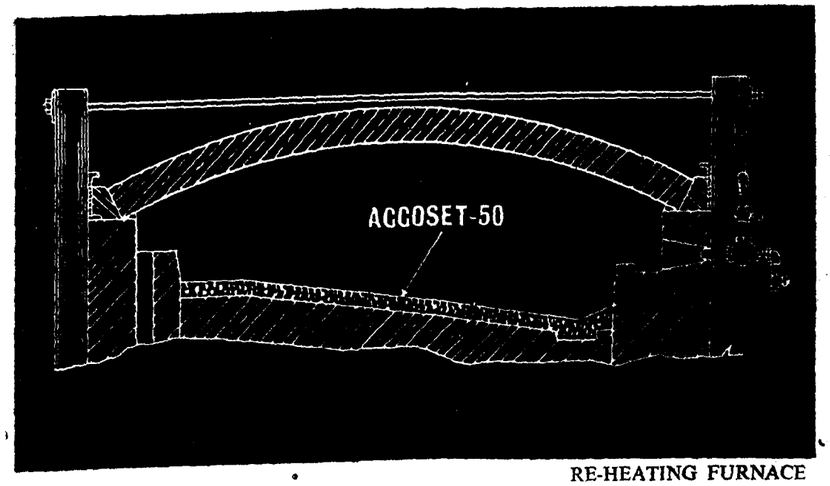
Next to Mr. Lal Bahadur, Mr. Nanda has risen in public estimation. Even before the Prime Minister's illness, he has shown with regard to the Hazratbal episode that he could discharge his responsibilities as Home Minister as well as a senior leader of the ruling party with both firmness and dispatch. After Mr. Nehru's illness had thrown more responsibilities on him, he demonstrated even more convincingly that he could function in a decisive manner when the occasion called for it. It is no exaggeration to say that his handling of the Calcutta disturbances has shown that there is enough mature material in the Congress leadership for the country to rely on in circumstances of stress and strain.

**

The third man on whom the nation's spotlight has been turned is Mr. T. T. Krishnamachari. He shares with Mr. Nanda the onerous responsibilities of the ailing Prime Minister. To those who have been disposed to regard Mr. Krishnamachari only as an economic technician, it may perhaps have come as a surprise that he has been chosen almost automatically to discharge much wider functions in the Government. The fact, however, is that the Finance Minister is a very versatile person. His potentialities as a policy-maker or administrator need not be regarded as being restricted to any limited sphere of government. It is well-known in political circles that Mr. Nanda and Mr. Krishnamachari have lately come together a great deal and that they have found it advantageous to function in mutual trust and increasing co-operation. Their sharing of new responsibilities should further strengthen this partnership.

**

In the last few days, there has naturally been much speculation about the political consequences of the Prime Minister's illness. Mr. Lal Bahadur has been most talked of as the person to whom much of the Prime Minister's responsibilities and most of his political status must shift whether as an interim arrangement or on a more permanent basis. At the same time, other possibilities are not to be lightly discounted. I for one do not see how Mr. Morarji Desai can be ignored. In any strong or stable leadership which is to be organised to take the place of Mr. Nehru in the Congress Party or in the Government, Mr. Desai is bound to play a big part. Mr. Nanda is another person whom it would be unwise to disregard in speculations of this kind. I have enough faith in the patriotism of these leaders to believe that a decorous and dignified understanding is possible among them. Mr. Nehru, of course, will have a larger say in these matters, as also the Congress President; but due weight must also be given to the influential role which the Chief Ministers of various States would be able to play. It is even possible that a purposive group of Chief Ministers, acting together, would determine the future leadership of the party.



**

Mr. K. C. Neogy's resignation from the Chairmanship of the Committee on Transport Policy and Co-ordination in the Planning Commission, cannot have come as a surprise to those who have had some idea of what has been going on behind the scenes. The report of his resignation and its acceptance by the Commission has been released to the Press to the accompaniment of several explanations some of which are obviously inspired. Thus there is no truth in the suggestion that he has resigned on health grounds or for personal reasons. It has also been said that Mr. Neogy was unhappy over insufficient response from State Governments or other concerned organisations which had failed to provide the data needed by his Committee. The truth appears to be that Mr. Neogy has resigned in circumstances of deep policy differences over the scope and nature of his committee's responsibilities. It has been mentioned that he had objected to the terms of reference which were given to the World Bank mission on Coal Transport on the ground that the sphere of work entrusted to his committee was being encroached upon. A full account of his difficulties in the Planning Commission may, however, be available only after some time when he himself decides to take the public into his confidence. Meanwhile, all that may be said is that Mr. Neogy has resigned only after prolonged correspondence with the Prime Minister who, it appears, had at all stages tried to be most helpful and responsive to his representations.

**

On Monday of this week most newspapers carried on the front page a picture of Mr. Nehru driving home from Palam airport on his return from Bhubaneswar the previous day. "The Statesman" had come out with a particularly striking newsphoto which is reproduced on the cover page of this issue by courtesy of "The Statesman". I would also like to share with my readers the following legend which accompanied the picture on its original publication: "'That's enough, and thank you', said Mrs. Indira Gandhi, stretching her hand protectively in front of her father as our photographer waylaid the Prime Minister's Cadillac on its way to the city from Palam airport on Sunday. Mr. Nehru only smiled."

RE-HEATING FURNACE

ACC

HIGH TEMPERATURE REFRACTORY CEMENT

ACCOSET-50

for firebrick joints and linings that last longer.

To obtain maximum service from refractory bricks it is essential to join them firmly. ACCOSET-50, which has very little shrinkage in service, sets to a rock-like hardness, adheres rigidly to the brickwork and bonds so strongly that the lining becomes virtually monolithic.

ACCOSET-50 is recommended for jointing, bonding, monolithic and rammed linings, gunning, repairing and patching cracks in furnaces.

Technical literature sent free on request.

RELAXATION IN INDUSTRIAL LICENSING

ACCORDING TO a Government notification, there will now be no need for industrial undertakings with fixed investment up to Rs. 25 lakhs to apply for an industrial licence under the Industrial (Development and Regulation) Act, 1951. This relaxation of the exemption limit will not apply to the few industries (coal, vanaspati, roller flour milling, oil seed crushing, leather, match and powerloom) which, for special reasons, had not been covered even by the old exemption limit of Rs. 10 lakhs. The position will be reviewed from time to time and the Government of India may, if necessary, withdraw the relaxation for any industry. The present relaxation will, however, cover not only new units but also cases of substantial expansion.

This relaxation is intended to give a special fillip to industries which require indigenous plant and equipment as well as indigenous raw materials. Only for statistical reasons, such units will be required to formally register themselves with appropriate authorities.

Where a project involves the import of capital equipment or raw materials, the necessary sanction for the import of capital goods will have to be obtained in the same way as in the past. It will be necessary for all such units to be borne on the books of the appropriate Central Government agency, such as the Director-General of Technical Development, the Iron and Steel Ctntroller, the Textile Commissioner or the Jute Commissioner. In case assistance is needed by the unit in the matter of allocation of scarce indigenous materials, such as steel or cement, it has to approach the authority with whom it is registered.

Since the Licensing Committee will not hereafter have the opportunity of examining the cases of units with fixed assets up to Rs. 25 lakhs, the entrepreneurs of such units are advised, in their own interest, to satisfy themselves about the availability of power, rail transport, water and other facilities at the site where the unit is to be located.

FOREIGN EXCHANGE FOR BUSINESS TOURS

The applications from large business houses for the allocation of foreign exchange required by their representatives to travel abroad in connection with export promotion, will now be considered by the Reserve Bank of India. This facility will, however, be admissible only to those business houses whose annual exports during the past two or three years average at Rs. 20 lakhs or more. The business houses will be required to furnish to the Reserve Bank the estimates of the likely travels abroad of their representatives for a 12-month period. After due scrutiny, the Bank will initially allow only 50 per cent of the amount considered necessary for the first six months period. The balance 50 per cent will be made available a little before the expiry of the first six months. As soon as a journey is completed, the allottee will be required to report to the Reserve Bank the exact purpose for which the journey had to be undertaken and the results achieved by way of additional exports.

PROCESS CONTROL INSTRUMENTS

A contract has been signed for the setting up of another instruments plant (at Palghat in Kerala) in the public sector with Russian technical and economic co-operation, the first one being at Kotah in Rajasthan. It is expected that with the coming up of these two plants, the country's need of process control instruments would be largely met and this will lead to a saving of foreign exchange to the tune of Rs. 20 crores per annum.

The Palghat project will have an annual production capacity of 2,871 tons of mechanical, hydraulic and pneumatic instruments, including pressure, vacuum, flow and level measuring and control instruments, automatic hydraulic regulating units, control desks for automatic controllers and also various other pneumatic devices.

OUR FIRST DIESEL LOCOMOTIVE

The first India-built diesel electric locomotive rolled out of the Diesel Locomotive Works at Varanasi on January 3, 1964. During the third Plan, 83 diesel electric locomotives are expected to be turned out by the Varanasi Works. Equipped for a planned annual production of 150 diesel locomotives to be achieved by 1967-68, the project will effect a saving of about Rs. 20 crores of foreign exchange when the works reach the optimum output. In addition, the benefits to indigenous industry will be in the order of Rs. 10 crores. Provision has been made for further expansion of the production capacity when required. The indigenous components of the diesel locos are expected to go up progressively to 90 per cent when the peak production is achieved. The components will be manufactured in Railway Workshops excepting for the electrical equipments like generators, motors, transmitters etc. which would be obtained from the Heavy Electricals, Bhopal. At the full production stage, the factory will employ nearly 4,000 men, about 3,000 of whom will be directly connected with design, research and production activities. The Rs. 20-crore project has been set up in technical collaboration with one of the foremost manufacturers of diesel electric locomotives, ALCO, of U.S.A., which in addition to providing the know-how is also training up Indian technicians.

NANGAL FERTILIZERS

The rate of fertilizer and heavy water production achieved by the Nangal Fertilizer and Heavy Water Factory of the Fertilizer Corporation of India during the first nine months of the current financial year is ahead of production targets set for 1963-64. With the present rate of production, the factory is expected to exceed the target for 1963-64.

Production of fertilizer (Calcium Ammonium Nitrate) from April to December 1963 was 280,435 tonnes, while that of heavy water was 8,739.55 Kg.

The target for 1963-64 is 370,000 tonnes of fertilizer and 11,500 Kg. of heavy water. The rated annual capacity of the fertilizer factory anticipated (though not guaranteed) by its designers is 380,000 tonnes. Production in 1963-64 is likely to come very near this full rated capacity.

Despatches of fertilizer from the factory touched the highest during these nine months. Fertilizer despatched to the various destinations in the country during the period was 293,562 tonnes.

During the first two years of its working — 1961-62 and 1962-63 — the factory exceeded its production targets. Production of fertilizer during 1961-62 was 200,790 tonnes against the target of 200,000 tonnes and during 1962-63 was 284,322 tonnes against the target of 280,000 tonnes. The production targets in the earlier years had to be kept low as the third hyper-compressor, which was damaged in transit on the high seas, had to be completely replaced. Replacement having been effected in November 1962, the factory has since then been operating at full load.

The heavy water plant, which was commissioned in August 1962, also exceeded its production target during 1962-63. Production of heavy water was 5,249.51 Kg. against the target of 4,000 Kg. The designed capacity of the heavy water plant, assuming most favourable conditions of concentration

of distillate hydrogen is 14,000 Kg. per annum but normally it is expected to yield only about 12,000 Kg. a year.

BAN ON MICA EXPORTS

Export of mica on consignment basis has been banned with effect from February 1, 1964. The export of mica scrap and waste will, however, be allowed by the Chief Controller of Imports and Exports. The following f.o.b. floor prices have been fixed and the exporters of mica are welcome to send their views regarding these prices to the Ministry of International Trade, New Delhi, before January 25, 1964:—

Book Forms Splitting Quality No. 4 @ Rs 17|- per lb; quality No. 5 @ Rs. 13 per lb; quality No. 5½ @ Rs. 8 per lb; and quality No. 6 @ Rs 5 per lb. No. 4 loose splittings dusted and|or undusted @ Rs 11.50 per lb. from Calcutta port and Rs 11 per lb. from Madras Port; No. 5 loose splittings at Rs 8 per lb; No. 5½ loose splittings @ Rs 4 per lb; No. 6 loose splittings at Rs. 0.75 per lb. and No. 6 cheap loose splittings at Rs 0.50 per lb.

PATENTS ON THE INCREASE

According to the latest report of India's Patents Office, 5,813 applications were received for patents in the year 1962 in India. Of these, only 814 originated within the country. West Bengal and Maharashtra accounted for more than 57 per cent of these applications. The inventions forming the subject of patent applications covered almost all fields of industry and technology, chemical industries accounting for the largest number of applications.

The inventions originating in this country related to synthetic drugs, antibiotics, cooked food, treatment of paddy and cane sugar, baby food, etc. Inventions in the field of iron and steel related to the conversion of phosphorus containing pig iron into high grade steel. Other important inventions related to such items as, pressure cookers, oil stoves, agricultural implements, medical instruments, sanitary equipment, cement and bricks, soil testing, rock drilling, typewriters in different Indian scripts, automobiles, power transmission, steam generators, permanent magnets, telephone instruments, radio and transistorised equipment, etc.

For the registration of designs, as many as 4,470 applications were made during the year 1962. Of these, over 80 per cent related to textiles. Applications of foreign origin accounted for even less than 2 per cent of the total applications.

DECLINING EXPORTS OF WOOLLEN CARPETS

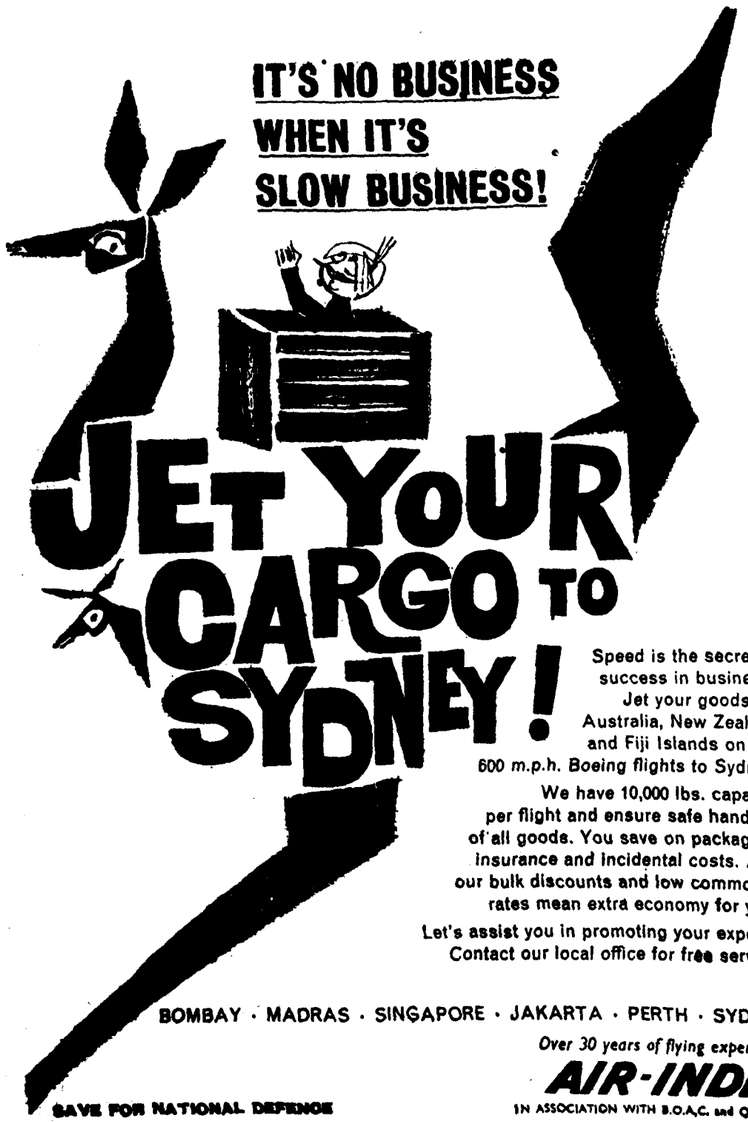
Exports of woollen carpets to U.K. have shown continuous downward trend since 1959. The Rs. 2.77 crores export figure of 1958 fell to Rs. 2.66 crores in 1959; Rs. 2.42 crores in 1960-61; Rs. 1.94 crores in 1961-62 and to Rs. 1.78 crores in 1962-63. The main reason for this decline is understood to be the recent production of cheap tufted carpets on large-scale by the British manufacturers. This has ousted, to a great extent, the cheap Indian carpets from the British markets. The exports of Indian carpets may, however, be increased if quality varieties are produced for the purpose. It is also learnt that the British manufacturers of machine made carpets are spending extensively on publicity. This calls for more publicity for Indian carpets in U.K.

REHABILITATION OF GOLDSMITHS

The Government of India have forwarded to all State Governments a comprehensive scheme for the rehabilitation of those unemployed goldsmiths who were mainly dependent on the manufacture of gold ornaments for their livelihood, for a period of at least one year prior to January 10, 1963, when the Gold Control Scheme was promulgated. Priority will be given to displaced goldsmiths in Government services by relaxation of age limit, educational qualifications, etc. Settlement in agriculture is also contemplated by providing land and rehabilitation grants on the pattern of assistance for landless people. Loans will also be sanctioned to displaced goldsmiths, under the State Aid to Industries Act, in order to enable them to enter the field of small-scale industries. The children of certified goldsmiths as well as of employees and outworkers of dealers will be given educational assistance on the same basis as members of backward communities. Technical training facilities will also be provided for the children of goldsmiths as well as goldsmiths themselves who are below the age of 35 years and wish to give up the profession of goldsmithy. The Gold Control Officers at State Headquarters will be the co-ordinating authorities for all these schemes and will invite applications for rehabilitation before 31st March, 1964.

RUBBERISED COIR FIBRE

Coir, which is one of India's export specialities, is now acquiring a new shape as "Rubberised Coir Fibre". A few factories are being set up in Madras and Kerala States for the manufacture of this new item which has immense domestic and export possibilities. The product can be used in the form of mattresses, cushions and sheets. It will also serve as a very good material for upholstery and can be used with advantage by the automobile industry, railways and the furniture manufacturers. Its industrial uses would include packaging as well as thermal and sound insulating material. A special advantage enjoyed by this product is that it is very light and has good compression properties. The product can be moulded into various forms and shapes and it being of airy construction, water flows through it and moisture gets dried up quickly due to the continuous flow of air inside.



The production of rubberised coir fibre is quite simple. Strong, special quality coconut fibre is curled with the help of machines and on curling the coconut fibre forms into small and noiseless permanent springs of high elasticity. The springs are bound together and coated with a layer of high quality latex film. The finished product is permanently elastic, strong and almost indestructable.

TRAVEL CHEAPER

There will always be cynics in this world, and about Air-India's profit-making performance it has been suggested that there is nothing wonderful about it since Air-India has the twin advantages of Indian costs and American prices. That, of course, is a shallow judgment and can in no way detract from Air-India's impressive announcement of substantial reductions in air fares between India and the United States from April 1, 1964. The present Bombay/New York first class round trip fare will be reduced from $1989.50 to $1856.30 — a reduction of $133.20; and the economy class round trip fare from $1191.30 to $1127.90 — a reduction of $63.40. Mr. B. R. Patel, Vice-Chairman and General Manager, Air-India, has further disclosed that Air-India would wish to bring about, in due course, further reductions in air fares in order to encourage travel between the United States and India. He has also said that Air-India, thanks to its low operating costs and high utilisation of fleet, is well-placed to make available the benefits of lower fares to the public which should result in the expansion of the travel market.

Air-India's fare reductions follow the agreement recently arrived at a meeting of the International Air Transport Association in Montreal, under which international airlines have agreed to cut their prices, particularly in order to encourage larger traffic on the trans-Atlantic routes. It is interesting to note that not only are passenger fares being cut but also cargo rates. Representatives of the member-airlines of the International Air Transport Association, who assembled at Miami in December last, had been able to reach complete agreement on reductions in trans-Atlantic cargo rate structure and levels.

Company Affairs

OIL INDIA'S INTERIM DIVIDEND

OIL INDIA Limited has declared an interim dividend of Rs. 40 per share of Rs. 1,000 each for 1963.

It had declared a dividend at the rate of 9 per cent per annum for the 9 months in respect of the period April 1 to December 31, 1962, which was the equivalent of 6¾ per cent for the accounting year. There were limitations imposed upon actual production and sales of crude oil due to delays in the completion of IRL's Barauni Refinery Project, but otherwise the operations during the year 1963 were considered satisfactory. Sales of crude oil during the year to the Gauhati Refinery and also to the Assam Oil Company Refinery at Digboi were around 750,000 tonnes. During the year, 29 wells were drilled as against the target of 30 wells bringing the total number of wells completed to 171 of which 132 proved successful producers of oil and gas, 22 awaited further testing and 17 proved dry. Its 720 mile long Nahorkatiya — Gauhati — Barauni pipeline was completed throughout its entire length early in 1963. It also undertook exploration and test drilling in its Exploration Licence Area, granted in January 1963, under a Rs. 2 crore programme which will continue in 1964 and 1965.

UNION CARBIDE

The Government have accepted in principle the Union Carbide's proposal for the import of second-hand equipment required for its project for the manufacture of naphtha cracker, polythylene and other organic chemicals at Trombay. The import is expected to save about one million dollars in foreign exchange. It is indicated that the company is facing difficulty in regard to water supply required for the project. The Maharashtra State Government has, however, revealed that the matter is being discussed with the Fertilizer Corporation of India to find out if Union Carbide can share on an ad hoc basis some of the water reserved for its plants by the Bombay Municipal Corporation. Final arrangements for the additional requirements would be met towards the middle or the end of 1967. The Union Carbide India Ltd. is one of the largest affiliated companies of Union Carbide Corporation outside the USA. Mr. Birny Mason Jr., President and Chief Executive Officer of Union Carbide Corporation is now in this country on a two week tour to visit the various factories and offices of Union Carbide.

LAKSHMI MACHINE

Lakshmi Machine Works Limited will enter the capital market on January 27 to offer for subscription 99,000 equity shares of Rs. 100 each. The subscription list will close on February 6 or earlier, but not before January 31. The company proposes to manufacture textile machinery in three stages and expects to commence trial production by the middle of this year and commercial production 18 months later. The capital outlay on the project for the first two stages to be taken up till 1965 will be Rs. 5.22 crores, including foreign exchange requirement of Rs. 1.26 crores. The capital outlay for the third stage to be taken up in 1966 is estimated at Rs. 3.30 crores. The imported machinery will start arriving from March and land has been acquired at Perianaickenpalayam near Coimbatore. It has entered into a technical collaboration agreement with Rieter Machine Works Limited, Switzerland.

BHARAT STEEL TUBES

Bharat Steel Tubes Ltd. will enter the capital market on January 28 with an issue of 1,200,000 equity shares of Rs. 10 each and 30,000 preference shares of Rs. 100 each. Out of this, the American collaborators, Messrs. Abbey Etna Machine Company, Ohio, USA, will subscribe to the equity capital of the value of Rs. 47.40 lakhs. The promoters, their associates and nominees have already taken up equity shares worth Rs. 30 lakhs. The balance of Rs. 429,000 equity shares of Rs. 10 each and 30,000 preference shares of Rs. 100 each will be offered to the public. The company proposes to set up a factory for the manufacture of iron and steel tubes and pipes with an annual installed capacity of 36,000 tons per shift. The project will cost Rs. 3.05 crores.

GAIKWAR INDUSTRIES

Gaikwar Industries Ltd. proposes to undertake a Rs. 3-crores project with an annual capacity to manufacture 6,000 tons of steel castings at Badlapur, near Bombay. It is negotiating for technical collaboration with Mitsubishi Heavy Industries, Tokyo, as well as other European firms. The project is likely to be financed through equity capital to the extent of 60 per cent. The company will have an authorised capital of Rs. 5 crores and issued capital of Rs. 1.75 crores. It proposes to offer equity shares of the value of Rs. 68 lakhs to the public some time in July this year. The foreign collaborators are also expected to participate in the equity capital.

PUNJAB NATIONAL BANK

The Punjab National Bank proposes to pay a final dividend of Re. 1 making a total of Rs. 2 per share or 20 per cent for the year 1963 — the same as paid for the previous year. According to the preliminary figures which are subject to audit, the bank earned during the year ended December 31, 1963, a higher profit of Rs. 126.47 lakhs as against Rs. 113.83 lakhs during the previous year. Together with the sum of Rs. 15.21 lakhs brought forward from the previous year, there is a total of Rs. 141.68 lakhs. Out of this amount a sum of Rs. 20 lakhs has been utilized for payment of interim dividend, and a similar amount will be absorbed for the payment of the proposed final dividend. The directors have proposed to transfer to the reserve fund nearly Rs. 80 lakhs — double the last year's amount. Provision for bonus to staff is higher at Rs 47.50 lakhs as compared to last year's figure of Rs. 40 lakhs.

BANK OF BARODA

The directors of the Bank of Baroda Ltd. have recommended a higher distribution of dividend for the year 1963 by stepping up the final dividend from 8 per cent to 10 per cent making a total of 18 per cent against 16 per cent last year. This higher dividend was on increased capital and has been rendered possible by the substantial improvement in net profit from Rs. 63.19 lakhs in 1962 to Rs. 75 lakhs this year. With a surplus of Rs. 3.47 lakhs brought forward from the previous year, the total distributable amount was Rs. 78.47 lakhs against Rs. 66.22 lakhs last year. Allocation to the reserve fund has been raised to Rs. 15.50 lakhs against Rs. 12.75 lakhs, and a special reserve of Rs. 20 lakhs has been created out of which the final dividend will be paid. The total dividend distribution for the year will absorb Rs. 36 lakhs against Rs. 28 lakhs last year. A sum of Rs. 26.97 lakhs is to be carried forward subject to payment of bonus to staff for which a sum of Rs. 22 lakhs was utilised. The deposits have grown by 22 per cent in the year and the number of branches opened was 33 against 20 in the previous year.

BANK OF INDIA

The Bank of India Ltd. proposes to issue, subject to the sanction of the Controller of Capital Issues, 40,500 fully paid bonus shares of the face value of Rs. 50 each in the proportion of one bonus share for every 20 existing shares. The bank has earned a higher net profit of Rs. 1.25 crores in 1963 against Rs. 1.11 crores in the previous year. Taking into account Rs. 13.09 lakhs brought forward from the previous year, there is a sum of Rs. 1.38 crores available for distribution. A sum of Rs. 25 lakhs has been separated towards the reserve fund. An interim dividend at the rate of 8 per cent on increased capital absorbed Rs. 32.40 lakhs and the directors

now propose to pay the final dividend at the rate of 10 per cent which will make a total of 18 per cent for the year against 20 per cent paid in the previous year. The final dividend will absorb Rs. 40.50 lakhs and a sum of Rs. 40.19 lakhs will be carried forward subject to the payment of bonus to staff.

UNITED BANK OF INDIA

The United Bank of India Ltd. recorded a higher net profit, after payment of bonus to staff and providing for taxation, of Rs. 26.39 lakhs for the year ended December 31, 1963, against Rs. 21.20 lakhs in the preceding year. The directors have proposed to increase the dividend from 6 per cent to 7½ per cent, less tax, which will absorb Rs. 20.20 lakhs. After allocating Rs. 5.30 lakhs to statutory reserve, the balance together with the sum brought forward from the previous year's account, amounts to Rs. 4.15 lakhs, which will be carried forward. Deposits of the bank increased by mtre than Rs. 7 crores during the year to nearly Rs. 72 crores.

DENA BANK

The net profit of the Devkaran Nanjee Banking Company Ltd. for the year ended December 31, 1963, including Rs. 3.19 lakhs brought forward from the previous year, amounts to Rs. 29.78 lakhs, against Rs. 26.59 lakhs in the previous year. The Directors have recommended a final dividend of Rs. 4 a share making in all Rs. 6 for the whole year or 12 per cent less tax. The distribution of dividend absorbs Rs. 12 lakhs. The provision for reserve fund is Rs. 10 lakhs which brings the total reserves to Rs. 1.10 crores. The provision for bonus to staff is Rs. 6 lakhs and the carryover is Rs. 1.78 lakhs.

INDIAN BANK

The net profit of the Indian Bank Ltd. for the year ended December 31, 1963, after making usual provisions, subject to audit, is Rs. 17.00 lakhs as against Rs. 15.25 lakhs last year. An interim dividend at the rate of 5 per cent plus bonus of 2 per cent, subject to deduction of tax, was paid in August, 1963. The directors now propose to recommend the payment of a final dividend of 5 per cent and a bonus of 3 per cent subject to deduction of tax, making a dividend and bonus for the year at 15 per cent as against 14 per cent last year. The transfer to reserve fund is Rs. 3.40 lakhs as aganst Rs. 3.10 lakhs last year. The deposits of the bank improved from Rs. 44.04 crores at the end of the previous year to Rs. 49.83 crores, on December 31, 1963.

AIR FRANCE

It is reported that Air France Caravelle has carried 7,000,000 passengers ever since its operations started in May 1959. This huge figure reflects the suitability of the Caravelle for high density net-works and Air France has the largest Caravelles fleet operation. The 39 Caravelles together have covered over 100 million kilometres and the 7,000,000 passengers carried up to December 11, 1963, show an average of 180,000 passengers flown at 800 kilometres an hour.

CALCUTTA ELECTRIC

Calcutta Electric Supply Corporation Limited has declared an interim dividend of 3¼ per cent for the year ending March 31, 1964. The dividend is subject to tax.

CAPITAL ISSUES

The Controller of Capital Issues has authorised eight companies to raise fresh capital aggregating more than Rs. 8.51 crores. Of these, five are issuing capital exceeding Rs. 1 crore each. The issue of one company is on a rights basis while another is issuing bonus shares. Two are issuing preference shares partly. Three companies involve foreign collaboration and in one a State Government will hold 51 per cent of the share capital. One company is offering part of its new capital to the public thrpugh prospectus. There is a bank issuing equity capital. The consent for all these issues is valid for 12 months.

Bayer (India) Limited, Bombay, will raise capital of Rs. 261 lakhs in equity shares of Rs. 100 each, for cash at par. Out of this, 146,160 shares may be offered to Farben Fabriken Bayer A.G. of West Germany. Of the balance, such number of shares as would qualify the shares to be listed on recognised stock exchanges would be offered to the public by prospectus. The proceeds will be utilised in the manufacture of insecti- issues is valid for 12 months.

Durgapur Chemicals Limited, Calcutta, will raise capital of Rs. 2 crores in 20,00,000 equity shares of Rs. 10 each partly for cash and partly for consideration other than cash. The capital is required for the establishment of a factory at Durgapur for the manufacture of caustic soda, chlorine, phenol and by-products. The total capital cost of the scheme is estimated at Rs. 650 lakhs. The Government of West Bengal would participate in the share capital of the company to the extent of 51 per cent.

The Metal Box Company of India Limited is to issue 16,10,000 equity shares of Rs. 10 each for cash at a premium of Rs. 2.50 per share to be issued to the existing shareholders in the ratio of one right share for every share held. The capital is required for conversion of existing loans of Rs. 124 lakhs obtained from Metal Box Company Overseas Limited, London, into shares, in connection with the company's expansion programme which has already been completed.

Delhi Cloth and General Mills Company Limited, Delhi, will issue Rs. 110 lakhs capital (inclusive of the permium amount of Rs. 10 lakhs) in 200,000 equity shares of Rs. 25 each, for cash at a premium of Rs. 5 per share to be offered to the existing shareholders of the company and 200,000, 9.3 per cent redeemable, cumulative preference shares of Rs. 25 each for cash at par to be offered to the public. The money will be used for meeting the increase in the cost of its two projects for manufacture of P.V.C. and Rayon Tyre Cord.

Saru Engineering Corporation Limited, Uttar Pradesh, is to issue Rs. 1 crore capital. This is divided into 320,000 equity shares of Rs. 25 each, and 20,000 9.5 per cent (free of company's tax but subject to deduction of tax at source at the prescribed rates) redeemable, preference shares of Rs. 100 each. All the shares will be issued for cash at par, except equity shares of the value of Rs. 1 lakh which will be for consideration other than cash. Out of the capital consented, equity shares of the value of Rs. 55 lakhs and the entire preference shares will be offered to the public by prospectus.

Punjab and Sind Bank Limited, Dehra Dun, is raising further capital of Rs. 10 lakhs divided into 20,000 equity shares of Rs. 50 each.

Usha Martin Black (Wire Ropes) Limited, Calcutta, will issue capital of Rs. 5 lakhs in 50,000 equity shares of Rs. 10 each at a premium of Rs. 2 per share to the Commonwealth Development Finance Company Limited, London, towards meeting cost of capital equipments. The company is also obtaining a loan of Rs. 20 lakhs from the C.D.F.C. for the same purpose.

Bajaj Tempo Limited, Bombay, will issue Rs. 486,450 in equity shares of Rs. 10 each to be allotted as bonus shares to the existing shareholders of the company in the ratio of one bonus share for every two equity shares held. The shares will be issued on capitalisation of company's reserves to a like extent.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 during the week ending 4th January, 1964. The list contains the names and addresses of the licensees, the articles of manufacture and annual installed capacity.

COAL

Shri D. K. Samanta, P.O. Pathardih, Distt. Dhanbad, Proposed name: Kumarkhala Colliery (Mouza Kumarkhala, Distt. Burdwan, West Bengal) — Coal 1,20,000 tonnes. West Chunch Coal, P.O. Barakar, Distt. Burdwan, (Dhanbad, Bihar) — Coal 16,000 tonnes.

ELECTRICAL CABLES AND WIRES

Asian Cables Corporation Ltd., Narsari Building, 240, D. Naoroji Road, Fort, Bombay-1 (Maharashtra) — Paper and cotton covered wires and strips 500 tons.

DRY CELLS

Estrella Batteries Ltd., Yusuf Building, Veer Nariman Road, Fort, Bombay-1 (Maharashtra) — Dry Batteries (Layer type) 35 million cells.

REFRIGERATION PLANTS

Voltas Ltd., 19, Graham Road, Ballard Estate, P.B. No. 1198, Bombay-1 (District Thana, Maharashtra) — Refrigeration and air-conditioning equipment (Change of location from Cinchpokli Road Distt. Bombay to Pokhran Road, Distt. Thana) (Shifting).

JUTE MACHINERY

Shalimar Industries (P) Ltd., 25, Ganesh Chandra Avenue, Calcutta-13 (Howrah, West Bengal) — Sliver cans for jute industry 60,000 pieces.

SMALL TOOLS

The Small Tools Manufacturing Co. of India Ltd., 33-1A Upendra Chandra Bonerjee Road, Calcutta-11 (West Bengal) — (I) (Substantial Expansion) 1. Ground Thread taps all types 2,70,000 Nos., 2. Conventry type chasers 36,000 sets. 3. Tangential chasers (Milled thread & Ground thread) 12,000 sets, 4. Milling Cutters 7,800 Nos., (New Articles) 1. Screw plug & ring gauges 500 sets, 2. Plain plug & ring gauges 500 sets, 3. Snap gauges 250 sets per annum, 4. Miscellaneous gauges 100 Nos., 5. Thread Rolling Dies 1,000 sets, 6. Form tools of various sizes 5,000 number. Voltas Ltd., 19, Graham Road, Ballard Estate, Bombay-1, Proposed name: Indian Rock Drills Ltd. (Thana, Maharashtra) — Roller Rock Bits 14,000 Nos., Drag Bits 1,500 Nos., Reconditioned Rock Bits 3,000 Nos.

COTTON TEXTILES

Shri Haridas Mitra, 30, Bentinek Street, Calcutta-1 (Kolaghat, West Bengal) — Cotton yarn 12,500 spindles. Shri D. A. Patil, Chief Promoter, Yeotmal Distt. Co-operative Spinning Mills, Yeotmal (Distt. Yeotmal, Maharashtra) Proposed name: Yeotmal Distt. Co-operative Spinning Mill — Cotton yarn 12,000 spindles.

WOOLLEN TEXTILES

Panipat Woollen and General Mills Co. Ltd., Kharar Near Chandigarh Kurali (Rly. Station) (Kharar, Distt. Ambala, Punjab) — Automatic looms forl the manufacture of woollen fabrics and blankets 24 Nos.

PAPER

Shri V. Devraj, Poriaswam yRoad (West) R.S. Puram, Coimbatore-2 (Palghat, Kerala), Proposed name: Adhi Lakshmi Paper and Boards Ltd. — Paper 3,000 tonnes, Pulp 3,000 tonnes. India Paper Pulp Co. Ltd., 8, Clive Row, Calcutta (Hazinagar, Calcutta, West Bengal) — Paper and Board 4,000 tonnes, Pulp 4,000 tonnes.

CANNED FOOD

Shri G. S. Dugal & Bros., Jeevan Vihar, 4, Parliament Street, New Delhi-1 (Jalgaon, Maharashtra) — Dehydration of Bananas, Mangoes and other fruits, vegetables and milk etc., 4 lakh kgs. per month.

CHANGE IN NAMES (Owners or Undertakings)

During the week ending 4th January, 1964

(Information pertains to particular licences only)

From M/s. Ratansi Morarji Private Ltd., Bombay to M/s. Morarji Dorman Smith Ltd., Bombay.

LICENCES REVOKED OR SURRENDERED

During the week ending 4th January, 1964

(Information pertains to particular licences only)

M/s. Swaika Oil Mills, Calcutta — Cottonseed oil. M/s. New Standard Engineering Co. Ltd., Bombay — Air compressors.

Our fleet of nineteen modern freighters offers fast, regular and dependable service between

INDIA—U. K. & THE CONTINENT • INDIA/EAST PAKISTAN—SOUTH AMERICA
INDIA—BLACK SEA & EASTERN MEDITERRANEAN PORTS
INDIA—POLAND Also around the INDIAN COAST

"INDIA STEAMSHIP HOUSE", 21, OLD COURT HOUSE STREET, CALCUTTA-1
Managing Agents: — LIONEL EDWARDS (PRIVATE) LTD.

COMPANY MEETING

THE MADRAS INDUSTRIAL INVESTMENT CORPORATION LIMITED

23, Nungambakkam High Road, Madras-34

Extracts from the speech delivered by the Chairman, Mr. A. M. M. Murugappa Chettiar at the Fourteenth Annual General Meeting held on the 14th of December, 1963

During this year our net profit was Rs. 4,51,770 as against Rs. 2,69,834 during the last year. Our investments in the shares of new companies which stood at Rs. 2,15,50,750 on 30-6-1962 rose to Rs. 3,21,07,202 showing an increase of Rs. 1,05,56,452 during the year. But for a negligible amount, our investments in the shares do not give us any yield, as these investments are in the shares of new companies which are setting up their factories and cannot be expected to give any yield in the first few years. But for the massive support given by our Corporation to these new ventures, many of them would not have come into existence at all. In spite of the increase of what is at present unremunerative investment to the tune of more than Rs. one crore, it is gratifying to note that our net profit has actually shown a rise of nearly Rs. two lakhs. This satisfactory result is accounted for by an increase in our business of all departments. The loan outstanding rose from Rs. 4,80,41,773 on 30-6-1962 to Rs. 6,93,45,727 on 30-6-1963. Our guarantees outstanding in respect of our guarantees to machinery suppliers and bankers showed a phenomenal rise from Rs. 28,12,687 on 30-6-1962 to Rs. 2,14,07,648 on 30-6-1963.

It is a matter for gratification that the entire demand of Rs. 57,31,995 for the year ended 30-6-1963 has been collected. Our borrowers, especially those whose units are in the formative stage, are to be congratulated for meeting their commitments in full, thus making our recoveries hundred per cent of our demand.

We continue to receive a number of applications from entrepreneurs wishing to start industries. These applications are for term loans and for underwriting and equity participation. As has been described in the Directors' Report, our own resources are not sufficient to meet all the demands of our industrial borrowers. We have, therefore, devised the method of giving guarantees to commercial banks who give loans to our parties. In view of the magnitude of the guarantees which we are called upon to give, it was considered necessary that our guarantees should be backed by the Government of Madras. We are thankful to the Government of Madras, who have guaranteed our guarantees to the extent of Rs. 5 crores in the first instance. In one case, we agreed to give "pari passu" rights to a commercial bank which advanced part of the loan requirements of one of our borrowers. Loans for smaller amounts and loans for new types of industries are given from our own funds.

The inadequacy of Bank credit and provision of finance by Finance Institutions has been recently well recognised by the Government of India. The Government of India has also recently placed a sum of Rs. 20 crores at the disposal of the two All India Finance Institutions, viz. The Industrial Finance Corporation of India and the Industrial Credit and Investment Corporation of India Limited. I would plead for similar support to other Corporations, such as ours, operating within the geographical limits of a State and functioning nearer home to industrialists of each State, and that we should be provided with more resources either by a liberalisation of refinance facilities (which are now limited to a sum equal to our paid-up capital) or by placing liberal amounts from Life Insurance Corporation funds or P.L. 480 funds.

Reference has been made in the Directors' Report to the fall in the rate of flow of deposits as a result of the Emergency. To counter-act this tendency, we offered quarter per cent over the normal schedule of rates in respect of deposits of Rs. one lakh and more for three years and more. I am glad to say that this evoked substantial response from our depositors. In the context of this successful performance, it is rather unfortunate that the recently introduced Banking Laws (Miscellaneous Provisions) Bill is likely to have the effect of hampering the flow of funds to this institution. I hope and trust that the State Government would make appropriate representations to the Centre with a view to ensuring that the good work of this institution is enabled to be continued without any let or hindrance. I also hope and trust that our knowledgeable Union Finance Minister will appreciate the position with his usual foresight and awareness of Industry's needs in this respect and do the needful in the matter.

The total guarantees given by us in respect of deferred payment purchase of machinery on behalf of our constituents to machinery suppliers and banks amounted to Rs. 1,97,67,030 up to 30-11-1963 as against Rs. 1,61,25,787 up to 20-6-1963. Besides the above guarantees, we have given guarantees to banks for loans sanctioned by them to our customers to the tune of Rs. 1,33,00,000. Our loans on 30-11-1963 stood at Rs. 7,57,87,979 as against Rs. 6,93,45,727 on 30-6-1963.

RECORDS AND STATISTICS

Industries Development Procedures Committee

Interim Report

A COMMITTEE was set up by the Government of India in September last year to recommend measures for simplifying and speeding administrative procedures relating to industrial licensing. The Committee has Mr. T. Swaminathan, currently Secretary, Department of Supply and Technical Development, Ministry of Finance, as Chairman, and 9 other Members of whom four are officials and the remaining are representatives from the business community. The officials are: Mr. N. C. Srivastava, presently Secretary (Mines), Ministry of Steel, Mines and Heavy Engineering, Mr. P. Govindan Nair, Additional Secretary, Department of Economic Affairs, Ministry of Finance, Mr. V. K. Ramaswami, Economic Adviser to the Government of India, and Mr. K. J. George, Deputy Secretary, Ministry of Industry. The Members from the business community are: Mr. Bharat Ram, President, Federation of Indian Chambers of Commerce and Industry, Mr. A. R. Foster, Mr. Lakshmipat Singhania, Mr. A. M. M. Murugappa Chettiar and Mr. P. Chentsal Rao. The Committee has submitted an Interim Report and the Government's decisions on its recommendations were announced by the Ministry of Industry in a Resolution dated January 13, 1964.

The text of the Interim Report of the Swaminathan Committee and the relevant portions of the Resolution of the Ministry of Industry giving the Government's decisions on the Committee's recommendations are reproduced below:

PART I

Introduction

The Government of India in the Ministry of Industry, by their resolution No.4(22)Lic.Pol/63, dated the 24th September, 1963, set up a Committee consisting of the undersigned to review the operation of controls applicable to the establishment of additional industrial capacity under the Industries (Development and Regulation) Act, the import of capital goods, the issue of capital, and foreign investment and collaboration and to suggest such modifications as would reduce delays in decision. The Resolution also provided for the Committee submitting interim reports as and when necessary. This is an interim report which the Committee wishes to submit.

2. The Committee has so far held three meetings in New Delhi and has generally reviewed the existing procedures regarding the issue of licences under the Industries (Development and Regulation) Act, the import of capital goods, the issue of capital, and approval of foreign investment and collaboration. It has also undertaken a few studies of cases selected at random involving these various processes. These studies have disclosed delays at various stages, partly due to the long time taken in the movement of files from one authority to another and partly due to delays inherent in a system involving consultation with multitudinous authorities. The Chairman of the Committee, in his capacity as Secretary to Government, is bringing to the notice of the individual Ministries concerned the reports on the case studies, so that they may independently taken such action as may be considered appropriate to prevent the type of avoidable delays that are taking place.

3. In this interim report the Committee is confining itself to two main recommendations which it considers to be very important and speedy action in respect of which is likely to assist in the expeditious operation of the controls in the fields to which they relate. The first recommendation relates to a speedy procedure for according clearance in principle to the establishment of additional industrial capacity, i.e., the issue of a "letter of intent", as this is commonly referred in. The second recommendation relates to the speedy processing of all applications relating to certain "key" industries which are either important for the promotion of self-sustaining industrial growth or are industries in which we are substantially lagging behind in the achievement of our Plan targets.

4. The Committee has noted in the course of its case studies that all procedures involving frequent movement of files between various offices and at various levels entail delay. Therefore the most expeditious way of ensuring early clearances would be to resort to a procedure which eliminates (sic) consultation on files to the minimum and involves taking decisions, within a prescribed number of days of the receipt of applications, at meetings consisting of representatives of Ministries primarily concerned.

5. Rule 15 of the Registration and Licensing of Industrial Undertakings Rules, 1952, lays down a period of three months within which decisions should be taken on applications for industrial licences. For various reasons, this provision, has in practice, remained inoperative. In fact, in respect of eight cases selected at random for case study, the time taken ranged from 61 to 396 days, and in six out of the eight cases, the period involved was more than 150 days.

PART II

Procedure for 'Letters of Intent'

6. In the Committee's view, it is a matter of the utmost importance that the applicants should know as early as possible whether Government would be prepared to consider favourably the proposal put forward by them. It will be difficult for the entrepreneurs to negotiate with foreign collaborators or suppliers of machinery without such an indication from the Government. The Committee, therefore, favours a speedy procedure under which a "letter of intent" can be issued within a month or so of the date of receipt of the application.

7. The Committee's first recommendation, therefore, is that only "letters of intent" should first be issued except in cases where a licence under the Industries (Development & Regulation) Act, can be issued straightaway. Intending applicants, it is suggested, should be advised through a Press Note regarding the proposal to issue "letters of intent" instead of industrial licences in the first instance. The present form or application for an industrial licence will be the basis on which issue of "letters of intent" will be considered. The applicant should be advised to send the application, in original, with 10 spare copies, to the Ministry of Industry, which will act as the co-ordinating Ministry. The Committee would suggest that there should be a small separate section in the Ministry of Industry which will deal exclusively with the receipt of all such applications, and their subsequent prompt distribution to all authorities concerned.

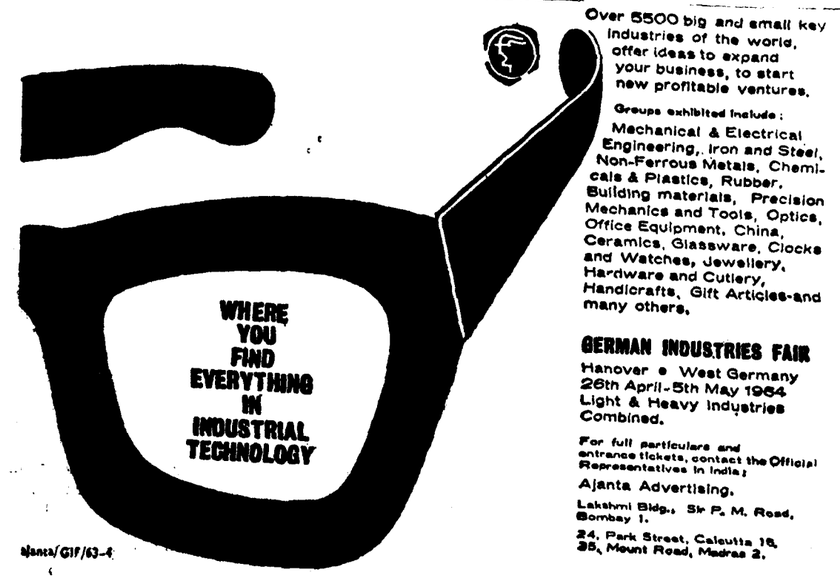
8. The receiving section in the Ministry of Industry should promptly distribute a copy each of the application to the following authorities:

1. Secretary to the administrative Ministry of the Central

Government concerned.

2. Industries Division of the Planning Commission.
3. Department of Economic Affairs (Ministry of Finance).
4. Company Law Division of the Ministry of Finance.
5. The Directorate General of Technical Development (D.G.T.D.)/Textile Commissioner/Iron & Steel Controller/Technical Advisers concerned.
6. Director of Industries of the State Government concerned.

To facilitate linking up in the various Ministries etc. of the papers relating to a particular case, it is suggested that each application should be serially numbered in the order of receipt in the receiving section of the Ministry of Industry and that the endorsements of copies to other Ministries etc., should bear this Serial No. Each applicant should be informed of the Serial No. allotted to his application for purposes of future reference and all future correspondence on the application, whether from the Ministry of Industry or other Ministries/Departments of Government will indicate this reference number. As, during the course of case studies it has been noticed that undue delays have often taken place in the process of mere physical distribution of applications, the Committee would suggest that it should be ensured that copies of the applications are sent out within three days of their receipt in the special section.



9. The primary responsibility for processing all applications expeditiously will be that of the administrative Ministry concerned. The receipt Section in the Ministry of Industry should, however, immediately on receipt of applications, write to the Director of Industries of the State Government concerned, in a prescribed form, inviting his attention to the application and calling for his comments, if any, to be sent direct to the administrative Ministry concerned, within three weeks from the date of receipt of the application by him. It should be made clear in this letter that if no comments from the State Government are received within this period, it will be presumed that the State Government have no objection to the proposed application and that this will be further processed on this assumption.

10. The Directorate General of Technical Development should initiate action immediately on receipt of their copy, either direct from the applicant (as many applicants do send copies direct to the DGTD) or through the co-ordinating Ministry. It has been noticed during the course of case studies that movement of files from one Directorate to another within the DGTD through the co-ordinating Section of the DGTD and from one Development Officer to another, has been a time-consuming process. The Committee would, therefore, suggest that resort should be had by the DGTD as far as practicable, to the procedure of meetings of all officers concerned, for formulating their views, or for according clearances. The DGTD should finalise their views and communicate them to the administrative Ministry within a period of 3 weeks.

11. The applications for "letters of intent" should be considered by a sub-committee of the Licensing Committee consisting of the Secretary to the Government of India in the Ministry of Industry as Chairman, the Secretaries to the administrative Ministries concerned/or their representatives, the Secretary, Department of Economic Affairs or his representative, Secretary, Department of Technical Development or his representative, a representative from the Company Law Division of the Ministry of Finance, and a representative of the Planning Commission. It will be the responsibility of the administrative Ministry concerned to send, within a period of one month of the receipt of the application, a brief note making appropriate recommendations, incorporating also the technical views of the DGTD, to the Secretary of the Licensing Sub-Committee for placing the case before the Sub-Committee. It will be the duty of the Secretary to the Sub Committee to bring to the notice of the Sub-Committee any cases where applications have been pending for more than 6 weeks without being brought before the Sub-Committee.

12. The notes for the Sub-Committee of the Licensing Committee to consider applications for "letters of intent"/industrial licence should be in a form to be prescribed. The Committee would suggest that the Sub-Committee should meet normally once a fortnight, and more frequently, if this should be necessary.

13. In making the above recommendations regarding the procedure for issue of "letters of intent", the Committee has not provided for a strict scrutiny in each case from the point of view of availability of fuel, power, rail transport and other facilities. The entrepreneurs are required to give information

regarding their requirements in the application form. It would be reasonable to assume that the entrepreneur gives an adequate measure of consideration to these factors before deciding on the project and a particular location. Having regard to the fact that in practice very few applications are even now being turned down on the ground of non-availability of fuel, power, etc. the Committee does not think it would be worthwhile doing a rigorous or time-consuming scrutiny. The Committee would suggest that the Ministry of Industry, as the co-ordinating Ministry, should arrange to send periodically, to the authorities, concerned, consolidated statements giving requirements of fuel, power, etc. in respect of approved schemes, so that these may be taken note of. If the Ministries concerned with the provision of fuel, power, etc., feel at any time that, in any particular area, fresh licensing should not be done because of any anticipated shortages, it would be open to these Ministries to advise the Ministry of Industry accordingly.

14. The "letter of intent" should broadly indicate the conditions subject to which Government will be prepared to consider the grant of a licence and should also indicate that within a specified period, varying, say from 6 to 12 months, — depending on the nature of the industry — the party should come up with definite proposals regarding —

(1) Terms of foreign collaboration, if envisaged;

(2) Import of capital equipment, if involved; and

(3) Issue of capital, if involved.

15. It should be made clear in the "letter of intent" that if within the prescribed period the applicant does not submit all the remaining applications for the various clearances, the "letter of intent" shall automatically be deemed to have become inoperative. The period which should be allowed to the applicant to submit the remaining applications should be determined by the Licensing Sub-Committee while considering the case.

16. One particular advantage the Committee visualises in this procedure is that the difficulties in regard to the prompt weeding out of infructuous licences can be overcome to some extent. Under the existing licensing procedures, licences are as a rule issued in the first place. For one reason or another, it happens that a large number of licences merely remain paper-licences without being implemented. Revocation of licences in such cases has to follow a statutory procedure which takes time. It often therefore happens that substantial capacity is blocked by such infructuous licensing. Under the procedure that is now being suggested, under which only letters of intent will be first issued, if the party does not make adequate progress within the stipulated time, the letter of intent would be automatically deemed to have become inoperative. The Committee trusts that this procedure will help substantially in dealing with the problem of prompt cancellation of infructutous licences.

PART III

Special Procedure for Key Industries

17. Having regard to the shortfalls in effective establishment of capacity for the attainment of our Plan targets, and the need for speedily establishing additional capacity in certain important industries for our industrial development, the Committee has drawn up a brief list of industries, which should be regarded as "key" industries. This list is appended to this report. The list is by no means exhaustive and is intended to be one of immediate practicability: accordingly certain other important industries, for example aluminium, copper, zinc, lead, tungsten carbide etc., which were considered for inclusion, have been left out as these industries would require special 'ad hoc' treatment for various reasons, e.g. availability of raw material, requirement of large power resources, the need for further expansion in existing units rather than through licensing of new units. Such a list will obviously have to be reviewed from time to time — perhaps every 6 months. The Committee will further examine this list and suggest additions, if any, in the final report.

18. Once a "letter of intent" has been issued, it is the Committee's recommendation that in respect of the "key" industries, a special procedure should be evolved for dealing simultaneously with all other clearances involved, such as approval of foreign collaboration terms, approval to the issue of capital and the issue of import licences. The Committee's recommendation in this regard is intended to apply only to the procedure to be followed in respect of 'key' industries.

19. After a "letter of intent" has been issued, in accordance with its terms, the party has to submit his applications for other clearances within a stipulated period. In the case of the 'key' industries, it is the Committee's recommendation that all further clearances required should be considered simultaneously by the Sub-Committee of the Licensing Committee referred to in para 11 'ante', the Chief Controller of Imports and Exports being co-opted as an additional member of the Sub-Committee as also, when necessary, the Controller of Capital Issues.

Exceptional Extensions

20. It will be the responsibility of the administrative Ministry concerned to keep a watch over the time limit allowed to applicants, as prescribed in the "letter of intent". Extensions of the timelimit should be the exception rather than the rule. Extensions should be granted only by the Licensing Sub-Committee after due consideration of all factors. Intending applicants should be advised in a Press Note that all the applications for the clearances required in the case of the 'key' industries such as foreign collaboration approval, issue of capital, import applications, etc. should be submitted simultaneously, so that they may be considered at one meeting by the Licensing Sub-Committee. They should also be advised to send the required number of copies of all their applications to the Ministry of Industry. The special section in the Ministry of Industry will, immediately on receipt of the application, transmit copies to the following authorities, giving the same Serial No. as given earlier to the application for industrial licence:

1. Secretary of the administrative Ministry concerned.
2. DGTD/Textile Commissioner/Iron & Steel Controller/Technical Advisers concerned.
3. Secretary, Department of Economic Affairs.
4. Planning Commission (Industries Division).
5. Chief Controller of Imports & Exports (copy of import application only with Treasury Challan).
6. Controller, Capital Issues (copy of Capital Issue application with Treasury Challan and of proposals regarding foreign collaboration, wherever foreign equity participation is involved).

21. Immediately on receipt of the application, it will be the responsibility of the administrative Ministry concerned to initiate action and ensure that within a period of three weeks of the receipt of the applications a brief summary of the relevant aspects of the case is sent to the Secretary to the Licensing Sub-Committee for consideration at the next meeting of the Sub-Committee.

22. The DGTD should, immediately on receipt of the copies of the applications, initiate all action required on their part regarding technical advice and in particular take up the question of clearance in regard to indigenous non-availability of items contained in the import application. Clearance of the entire import list applied for should not be held up if there is some doubt about only a part of the machinery regarding indigenous non-availability. Further, as has been suggested earlier, clearances in this office should normally be

on the basis of meetings of officers concerned and on known availabilities with relation to the state of the order books of principal suppliers rather than on the basis of leisurely movement of files or on the basis of time-consuming individual references to suppliers.

Ministry's Responsibility

23. The administrative Ministry should, to the extent practicable, prepare the notes for the Sub-Committee after discussion with the concerned officers in the DGTD so that it may be possible for them to finalise the note for the Licensing Sub-Committee within a period of three weeks. It should be the responsibility of the administrative Ministry to ensure that applications are placed before the Sub-Committee not later than five weeks from the date of their receipt. The Secretary to the Sub-Committee should bring to the notice of the Sub-Committee, at each meeting, cases which have been pending for more than six weeks and have not yet been placed before the Sub-Committee.

24. It is the Committee's recommendation that the industries included in the "Key" industries list should be given special preferential treatment in respect of release of foreign exchange and regarding all other clearances such as permission for issue of capital.

25. In order that final decisions may be taken at the meetings of the Licensing Sub-Committee without waiting for further consultation with the applicants by correspondence, in all cases where such consultation is likely to be necessary, a representative of the applicant may also be asked to make himself available on the day of the meeting of the Licensing Sub-Committee, for consultation, if required by the Sub-Committee. The Committee makes this recommendation since it may be possible for the Licensing Sub-Committee to take a decision at the meeting in the light of such clarification, written or otherwise, which the applicant or his representative, may be able to give on the spot.

26. The Committee has suggested the inclusion of the CCI&E, on the Licensing Sub Committee so that he is in touch with the decisions of the Sub-Committee and import licences can issue without any further checking or observance of routine formalities and without undue delay in his office.

27. The Committee has considered whether in view of its recommendation regarding simultaneous consideration of all clearances in the case of 'key' industries, an integrated application form for all these clearances should be evolved. It is felt that it would be preferable to continue to have separate applications, which would, however, be submitted by the applicants simultaneously, so far as the 'key' industries are concerned.

28. The Committee further recommends that at the "letter of intent" stage, the Sub-Committee of the Licensing Committee should give special attention to the applications relating to 'key' industries, with a view to indicating, if possible, the source from which foreign exchange is likely to be available.

PART IV

General

29. The Committee further recommends that for the convenience of the Licensing Sub-Committee, all notes put up to the Sub-Committee for "letters of intent" should be grouped into two parts — Part I relating to 'key' industries and Part - II relating to other industries.

30. Government have been from time to time publishing a list of industries in respect of which industrial licences will ordinarily be rejected without reference to the Licensing Committee — the list commonly referred to as the 'banned' list. The Committee would suggest that this list, along with the list of 'key' industries should be reviewed at intervals of 6 months. It has been suggested to the Committee that it would help intending applicants if, in addition to the list of banned items, a list of other industries which will be licensed on merits is also simultaneously published. In view of the importance attached to such a notification by industry for psychological reasons, the Committee would recommend that Government should consider the need for and the feasibility of such a notification.

31. The Committee would suggest that meetings of the full Licensing Committee, as constituted at present, including representatives of State Governments, should be held at suitable intervals to review all the decisions taken by the Sub-Committee proposed in these recommendations.

32. The main objectives in this interim report have been to suggest —

(i) an expeditious procedure for the issue of "letters of intent" in all cases;

(ii) a special procedure calculated to avoid delays in the case of all clearances in respect of 'key' industries.

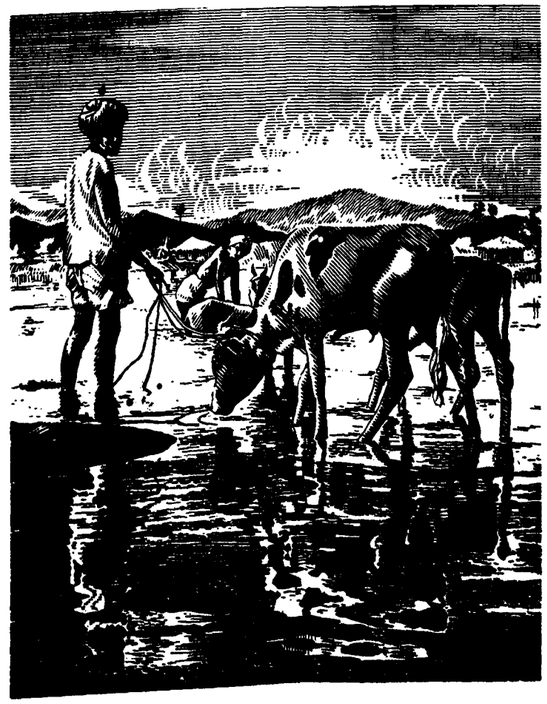
Because of the important bearing that the achievement of this objective will have on our industrial development, the Committee has thought fit to submit this interim report. It would suggest that the special procedure recommended herein for 'key' industries should be tried out with immediate effect.

33. The Committee is giving further thought to other aspects of the matters referred to it, including the procedure to be adopted for industries other than those included in the list of 'key' industries. These will be dealt with in the Committee's final report. For the time being the existing licensing procedures may continue in the case of industries other than 'key industries' except for the substitution of "letters of intent" for licences in the first instance where licences cannot be issued straightaway.

List of Key Industries

Pig Iron; Alloy Steel; Ferro-Chrome and other Ferro Alloys except Ferro-Manganese and Ferro-Silicon; Malleable Iron Castings; Steel Castings; Steel Forgings; Structurals (Heavy); Industrial Machinery; Cranes; Machine Tools including Small Tools, Dies, Jigs, and Fixtures, Automobile Ancillaries; Coated Abrasives; Electric Winding Wires; Fertilizers; Sulphuric Acid; Caustic Soda and Soda Ash; Rubber Chemicals; Petro-chemicals including Synthetic Rubber; Pesticides; Paper & Paper Board; Cement; Pulp (Cellulosic).

Govt. Decisions on Recommendations



Government accept in principle the above recommendations of the Committee.

As regards the composition of the proposed Sub Committee of the Licensing Committee, Government are, however, of the view that the other members of the Licensing Committee stationed at Delhi may also be associated with the work of the Sub-Committee, without causing any undue delay on this account.

The list of 'key' industries has been drawn up by the Committee, having regard to the shortfalls in effective establishment of production for the attainment of Plan targets and the need for speedily establishing additional capacity in certain industries which are important for the promotion of self-sustaining industrial growth. This would involve speedy licensing of additional capacity under the Industries (Development and Regulation) Act in certain cases, while, in others, where adequate capacity has already been licensed, only expeditious sanctions will have to be given for matters like Capital Goods Clearance, Capital issues, approval of foreign collaboration terms etc. Government accept this recommendation.

Appropriate steps are being taken to implement the commendations of the Committee.

Gently flows the quiet river

In the heat of the noon-day sun, the humble cowherd waters his cattle. His is a life of quiet contentment. He asks for nothing more than God's good gifts of food and water, home and family.

The folk of rural India are the salt of the earth. Hardworking and humble, simple and good.

The **State Bank of India** is proud to serve them through its many branches throughout the land.

Banks Are Not for Banging

ALTHOUGH THE artificial agitation for the nationalisation of banks, engineered for the benefit of the annual session of the Congress Party, has died down for the time being, it will not be prudent to suppose that the demand for the nationalisation of banks has been destroyed for good. A controversy is bound to be raked up again and an attempt made to keep it alive by periodical lobbying at several levels and at different places. It is therefore necessary — while public memory of recent discussions is still fresh — to expose the lack of substance in the two main arguments put forward by those who believe, or claim to believe, that the nationalisation of banking would be justified on social and economic grounds.

Let us take first the argument that State ownership of banking is necessary to ensure that bank funds are not employed to the advantage of only big business interests in the trade and industry of the nation. If it is to be assumed that State ownership is a guarantee of bank funds being used or not used in a particular manner, it is submitted that those who are arguing for the nationalisation of banks should be prepared to concede that at least some 30 per cent of the bank money is being properly used, i.e., properly used in the sense in which *they* would employ the phrase. This is because about 30 per cent of banking resources are already being controlled and disposed of by the State Bank of India. But we have nowhere heard it said that those who demand the nationalisation of commercial banks are satisfied with the way in which the State Bank is handling its resources. So far as the question of the proper use of funds by commercial banks is concerned, the advocates of nationalisation are, in effect, arguing that ownership could prevent what direction, guidance and supervision are allegedly unable to check. But this contention has never been argued with any respect to facts or logic. If this thesis is to be accepted then the entire idea of the State regulation of any activity in the community becomes pointless.

By the same token all banking legislation from beginning to end would stand condemned as being devoid of any utility. We are sure that the advocates of bank nationalisation are fully aware of the absurdity of the stand taken by them in this regard. If, nevertheless, they pretend to stand firm, it is only because of a certain frustration. They are aware that the latest legislation (passed only in the last Session of Parliament), which has given vast authority to the Reserve Bank for policing the nation's banking system, has knocked the bottom out of pleas for nationalisation. Hence it is that they are driven to argue that regulation is no substitute for or alternative to nationalisation. But their contention is untenable. The record of Indian banking is there for all to see. During a period of rapid growth, bank failures have been few and far between and none of the leading banks, which account for the bulk of the banking business, has its solidity seriously questioned at any time. This has been partly due, no doubt, to the generally sound and healthy lines along which the nation's banking has expanded. But it is also due in part to the powers progressively taken by the Reserve Bank to keep a watch over banking practices in the country as well as the particular activities of individual banking companies. The Banking Companies Act (1949) gave authority to the Reserve Bank to control banking business in general, conduct annual inspections of banks and direct their mergers and amalgamations. The Reserve Bank was also empowered to inspect the banking companies at any time. The Banking Laws (Miscellaneous Provisions) Bill which was introduced and passed in the last Session of Parlia-

ment has vastly extended the disciplinary jurisdiction of the central banking authority. The Reserve Bank has acquired sweeping powers to remove any person associated with a banking company if it considered necessary or desirable in the public interest to do so. Seeking to check the concentration of bank share ownership or management control, this enactment has reduced the voting powers of single shareholder from 5 per cent of the voting rights to 1 per cent. In order to deny undue or privileged access to bank resources to business interests associated with bank managements, the Reserve Bank has been authorised to direct banks not to grant advances to any specific person or company. At the time this legislation was introduced in Parliament, this Journal had criticized the extension of powers sought for the Reserve Bank as arbitrary, aggressive and unreasonabe. Now that Parliament has passed this legislation, we consider it our duty to point out that to ask for nationalisation of banking at this point would be to make the preposterous assertion that a Government which cannot be trusted to exercise its powers of control and supervision may, nevertheless, be trusted to exercise efficiently the responsibility of ownership and direct operation.

While there is thus no substance in the contention that nationalisation alone would give the Government the necessary authority and opportunity to prevent misuse or privileged utilisation of bank funds, it is equally impossible to press the other main argument for nationalisation which is that commercial banking has ignored the requirements of rural and small-scale industries. An analysis, presented in the issue of the Reserve Bank of India Bulletin for the month of August, 1963 has effectively disproved the allegation that banks have been neglecting the credit needs of industry and trade outside the area of big business. The table below, taken from that article, shows that scheduled banks had nearly doubled their credit facilities to the small-scale industries and co-operative institutions between the period from June, 1960 to December, 1962. Over those two years and six months advances to small-scale industries had increased from Rs. 19.5 crores to Rs. 37.2 crores. During the same period advances to co-operative institutions had gone up from Rs. 6.3 crores to Rs. 9.9 crores. Outstanding advances to both small-scale industries and co-operative institutions which amounted to Rs. 28 crores for the period January-June, 1960 had risen to Rs. 51 crores in the period July-December, 1962.

It has been alleged in recent discussions that because commercial banks are privately-owned they do not care for the credit needs of small business men and that those needs can be adequately met only if there is State ownership. Consequently, it is interesting to find that whereas the total outstanding bank advances to small-scale industries stood at Rs. 39.44 crores in December, 1962, the State Bank's contribution to this total was only Rs. 5.99 crores. In other words, the advances granted to small-scale industries by the private sector in banking were five times more than what were given by the Government-owned State Bank of India. When it is considered that the State Bank holds 30 per cent of the deposits of the entire banking system, it will be seen that, in comparison with the public sector in banking, the private sector has extended credit facilities to small business more than in proportion to its resources and not less. This comparison becomes all the more significant when it is recalled that the Imperial Bank was nationalised on July 1, 1955 with the ostensible objective of providing "short-term finance for rural and small-scale industries". How far has this objective been fulfilled in the last eight years? The table below shows that the activities of the State Bank of India have multiplied on the average by two-and-a-half times since its nationalisation. Deposits have risen by 143.8 per cent from Rs. 231.13 crores in 1954 to Rs. 563.66 crores in 1962. Advances have improved by 164.3 per cent from Rs. 102.32 crores in 1954 to Rs. 270.48 crores in 1962.

SCHEDULED BANK ADVANCES TO SMALL-SCALE INDUSTRIES AND CO-OPERATIVE INSTITUTIONS

(Amount Rs. crores)

Average during the half year	January to June 1960	July to Dec. 1960	January to June 1961	July to Dec. 1961	January to June 1962	July to Dec. 1962
No. of reporting banks	83	77	83	77	75	77

Profit (Rs. crores)	0.34	2.68	+688.2

* Imperial Bank of India until July 1, 1955.

The credit extended to small units in 1962, however, was about one per cent of the deposits and about two per cent of the total advances of the State Bank. As will be seen from the figures given below, the State Bank has extended credit to 3,153 units in all to the total extent of Rs. 11.82 crores, while the outstanding amounts at Rs. 5.8 crores work out to 2.2 per cent of the total advances made by the Bank.

ADVANCES BY STATE BANK TO SMALL-SCALE INDUSTRIES: 1962

	Intensive Centres	Other Branches	Total
Number of units assisted	1,978	1,175	3,153
Limits sanctioned and in force (Rs. lakhs)	777.1	404.7	1,181.8
Amounts outstanding (Rs. lakhs)	412.1	185.7	597.8

We would hasten to make it clear that these observations should not be taken to mean that we are criticizing the State Bank for being too slow in assisting small borrowers. On the contrary, what we are trying to make out here is that, in spite of a deliberate, semi-political policy compulsion, the State Bank has found that it cannot extend itself overmuch in making advances to small business, without violating prudent banking practices. The funds of the State Bank, even as the funds of banks in the private sector, are the trust money of depositors. The first duty of the State Bank is to its depositors just as the first duty of other banks is also to their depositors. At Bhubaneswar strange principles were attempted to be enunciated for the providing of credit facilities. It was said that a man's capacity to produce should be the criterion for giving credit, not his assets. It may be readily granted that the personal factor is one of the important factors in judging the credit-worthiness of individual borrowers. Actually this personal factor must be, and is, taken into account when banks lend money to customers. But creditworthiness is something which has to be judged in each case, not enunciated as a political principle from party platforms. As the custodian of the funds entrusted to it by its depositors, every bank has a right to judge the creditworthiness of those to whom it would lend from its resources. Nationalisation or no nationalisation, this is a discretionary responsibility which cannot be taken away from banks by a political edict. It goes to the credit of the State Bank of India that despite its being a nationalised institution, it has stood firm in its loyalty to its traditions of prudent banking and to the interests of its depositors.

The comparison of the respective extents to which the State Bank on the one hand, and the private sector in banking on the other, have been lending to small-scale industries also proves another significant point. It is that in the case of dealing with small clients, the private sector in banking seems to be at an advantage as against the State Bank rather than otherwise. We have pointed out that lending to small borrowers involves the exercise of discretion; and there is certainly greater scope for discretionary lending in the case of banking in the private sector than in the case of State-owned banking. We have no doubt at all that as branch-banking extends, even the big banks in the private sector will have to take an increasing interest in the credit needs of small business communities in the smaller towns and elsewhere and would consequently have to give more latitude and discretion to their branch managers in dispensing credit facilities to their local clientele. Meanwhile it is only fair to note that in broad terms,

Eastern Economist 20 Years Ago

JANUARY 28, 1944

WHILE THE Bombay Plan for post-war economic development has been received with enthusiasm in some quarters, in others the dimensions contemplated in the Plan have produced nothing but incredulity and suspicion. The economic development of our country has proceeded at such a slow pace up till now and both the Government and the public have been used to such order of smalls as a few lakhs or a few crores of rupees, that when a plan is put forward involving thousands of crores of rupees, the natural impulse is to look askance at it. The present economic crisis has opened our eyes as never before to the fact that the great masses of our people live even in normal peace time perilously near or below the barest subsistence level. No mere tinkering or patchwork could give our economy the narrowest margin of safety and only planning "in a big way" could be of any avail. The Bombay planners have correctly said that "money is not the master of a country's economy, but its servant and instrument. The real capital of a country consists of its resources in materials and manpower, and money is simply a means of mobilizing these resources and canalizing them into specific forms of activity." But it is not easy for all to get away from the trammels of orthodox thinking and adjust themselves to the conceptions and dimensions of an adequate economic plan. Consequently, many have expressed the doubt whether the Bombay Plan involving an investment of Rs. 10,000 crores at 1931-39 price level over 15 years is not too ambitious and whether it is not likely to break down on the financial front. A high economic expert of the Government is reported to have described the level of investment envisaged as 'fantastic"; some are suspicious that a third of the capital is raised by so-called "inflation"; some have averred that the plan involves crushing taxation and that "industry must be prepared to be taxed heavily as also all incomes above Rs. 1,000."

the country's banking system has certainly played its part well in the matter of serving the credit requirements of industrialisation. The table below would show that advances made to industries by the scheduled banks constituted 34.3 per cent of the total advances at the end of 1954, but had increased to 57.2 per cent by March 31, 1963.

ADVANCES OF SCHEDULED BANKS ACCORDING TO PURPOSE

(In crores of rupees)

	December 31, 1954	March 31, 1963
Industry	190.0 (34.3)	921.2 (57.2)
Commerce	277.9 (49.9)	444.0 (27.6)
Agriculture	4.5 (0.8)	4.1 (0.2)
Personal and Professional	47.6 (3.5)	111.7 (6.9)
All others	36.1 (6.5)	129.7*(8.1)
TOTAL:	557.0(100.0)	1,610.7(100.0)

*Including finances.

Finally, in the heat and dust of the nationalisation controversy it becomes somewhat difficult for the public to be aware of the fact that, even as it is, banking in this country is not today an exclusive or even a predominantly private enterprise. As we have pointed out, while the State Bank already accounts for 30 per cent of the total deposits of the banking system, the Finance Minister is reiterating his intention to build up further the share of the State Bank. He has been credited with the view that the State Bank and its working need to be reviewed and modernized if the purpose of raising further its relative position and status in the banking world is to be achieved. It has been suggested that Mr. Krishnamachari believes that the State Bank could grow faster than the private sector by improving its banking techniques and business practices. We are sure that the private sector in banking too, could, and ought to, compete in the healthy race for greater efficiency.

Considering the great advances which banking methods and organisation have made in other countries, it may certainly be said that the banking public in this country is not getting all the services and facilities which a really progressive and modern banking system can give to it. The need, therefore, is not to dissipate energies in an arid discussion of nationalisation but to turn our efforts into the fertilizing channels of modernising banking functions and facilities not only in the public sector but also in the private sector of banking. It is an encouraging sign of the times that many leading and progressive banking institutions in this country have lately been showing more and more awareness of the need to provide better banking services and we would urge that this tendency should be encouraged by all responsible politicians through a decision to discountenance all attempts to keep alive an artificial demand for the nationalisation of banks.

Thirteen Years of the Colombo Plan

ECONOMIC AID is much more than the taking and giving of funds. Following the spectacular succees of Marshall funds in providing relief and in reviving normal economic life in Western Europe, the idea of aid was extended to those under-developed countries which showed the will and gumption to help themselves. The aid-absorbing capacity of a receiving country is limited by its general rate of economic growth and of aid-giving, by the willingness and ability of the donor. The effectiveness of all aid is, of course, judged by the results thereof, and capital aid, in the initial stages of development at any rate, tends to be tied to specific projects. The benefit that accrues to the balance-of-payments position or the foreign exchange resources of a country is only incidental. However, India, whose five-year Plans of development are more broad-based than those of other aid-receiving Colombo Plan countries, has found that aid, which is tied to specific projects or can be expended in the donor's country alone, needlessly restricts freedom of operation, quite apart from the fact that it detracts from the ideal of free international trade. The Government of India has made the point more than once on the forum of the Aid India Consortium but this is a problem peculiar to countries which have traversed the best part of the runway and are about to take off.

The founding members of the Colombo Plan who met in Ceylon in 1950 felt the need for extending, to a large circle of the new independent countries, the kind of economic co-operation which was the single most important basis of the British Commonwealth. The Plan has gone a long way since then, and according to a report for 1963, finalized by the Consultative Committee at its 15th meeting in Bangkok, there has been considerable progress (and one may add sophistication) in foreign assistance techniques. It, however, hastens to warn that, in view of the needs of the developing countries, there is no room for complacency during the second decade of the Colombo Plan.

Aid is provided mostly by Australia, Britain, Canada, India, Japan (who joined the scheme in 1954), New Zealand and the United States to the 14 countries of the region. The aggregate of aid provided for countries in South and South-East Asia by members outside the region amounts to $13,820 million to date, and this sum was used to finance technical assistance schemes, loans, grants and the provision of agricultural commodities and equipment. Of this sum, $1,820 million was received during 1962-63, the year under review.

While the amount of capital forthcoming from the six principal donor countries has been a vital factor in the economic growth of the region, technical assistance, which serves to develop human resources, has formed a significant area of co-operative effort. Technical cooperation as between member-countries within the region has also increased. It includes the

facilities, services of experts and equipment, and such aid provided by member-countries over the 13 years of the duration of the Colombo Plan has been valued at $405 million; 24 per cent of the sum was spent on trainees, 39 per cent on experts and the remaining 37 per cent on equipment. In all 6000 men and women from the region were trained in various parts of the world last year; 28,495 persons have been trained over 13 years and the services of 5000 experts were provided for member-countries. The contribution of India, which, during 1962-63, maintained her position as the largest donor in the region, was mainly in the field of technical assistance. The two individual projects which received the combined attention of the extra-regional members are the Mekong River Survey Project in Laos and the Indus Basin Development in the Indian sub-continent. It will be recalled that the integrated development of the Indus Valley, as suggested by a committee of international experts, was what provided *modus vivendi* for the protracted river-water dispute between India and Pakistan. Britain has so far contributed £7.767 million towards this project and New Zealand about £300,000.

The United States alone contributed $1.86 billion during 1963, consisting of loans, grants and technical assistance. These payments were channelled through the Agency for International Development, the Export-Import Bank or they were made under Public Law 480. The 1305 Peace Corps personnel sent out to member-countries accounted for the bulk of the US outlay on technical assistance. A part of the US aid came through UN institutions, such as the UN Special Fund, the UN Expanded Programme of Technical Assistance, the IBRD and the IDA. During 1962-63, the US Government also trained 2667 persons in "third countries" under a scheme by which the costs of such training are shared by the receiving third country. The US Government furthermore guaranteed private investment by its nationals in the Colombo Plan region to the tune of $123 million against inconvertibility, expropriation and damage resulting from war, and the sum represents a significant increase over the corresponding figure for the previous year.

Canada does not list her technical assistance schemes under a separate head. Beginning from 1951, she has provided $115 million for the purchase of wheat and flour and since 1961, she has accorded extended credits to India and Pakistan.

During the year under review, India provided 2300 training places for the nationals of 17 countries, Nepal alone accounting for 1524, and the courses of study ranged over a variety of subjects, such as insurance, banking, parliamentary affairs and cost the exchequer Rs. 14 million. The country loaned the services of 60 experts in such diverse fields as irrigation, sericulture and skills in the manufacture of iron and steel. The Trisuli Hydel Project, the Kathmandu-Tribuli Road, the Tribhuvan University and the National Archives are among Nepal's more important projects which receive valuable assistance from India under the Colombo Plan.

"FORWARD: LEFT RIGHT, LEFT RIGHT..."

Highlights of the Week

LAL BAHADUR "DE-KAMARAJED"

AS HAD BEEN expected in the wake of the Prime Minister's illness, Mr. Lal Bahadur Shastri has re-joined the Central Cabinet. A communique issued from Rashtrapati Bhavan on Wednesday announced that he would be Minister without Portfolio. Although the Prime Minister has lately been showing every sign of being eager to resume his responsibilities, it is clear that, even if he cannot persuade himself to retire or even rest, he should at least be coaxed into shedding some of his chores. Mr. Shastri's re-entry into the Central Cabinet has precisely this significance. His responsibilities as well as his relative status among Cabinet Ministers will no doubt have to be defined early enough. The ranking is relevant because, as it is, both Mr. G. L. Nanda and Mr. T. T. Krishnamachari would be senior to him. If the intention is that Mr. Shastri should preside over Cabinet meetings in the absence of Mr. Nehru, it will be necessary clearly to rank him above his other colleagues. Otherwise, even if Mr. Shastri discharges some of the Prime Minister's functions on his behalf, the Home Minister's claim to preside over Cabinet meetings in the absence of Mr. Nehru will have to be respected. These interesting details apart, it could be assumed that whatever the formal arrangements may be, so long as Mr. Nehru's health does not permit him to resume in its totality the active leadership of the government, the powers and responsibilities, overall, will in practice be shared among Mr. Shastri, Mr. Nanda and Mr. Krishnamachari.

The same Rashtrapati Bhavan communique also notified the appointment of Mr. D. Sanjivayya as Cabinet Minister for Labour and Employment, a charge which Mr. Nanda had hitherto been holding (and subsequent to his assuming the Home portfolio, holding as a temporary charge). The new Minister of Labour and Employment, who will be 43 next month, has the distinction of being the youngest member of the Central Cabinet. Among his earlier credits were that he was the first Harijan to become the Chief Minister of a State and the first Harijan also to become President of the Congress Party.

PAKISTAN AGAINST PEACE

IN HIS LETTER of January 13 to the President of India, President Ayub Khan had made the following points: (a) that the situation in Calcutta had "got out of control" and that "military rule" had been established in the five affected districts of West Bengal; (b) that 20,000 Muslims left India following the disturbances and crossed over into East Pakistan, bringing up the total of such refugees, obliged to leave this country as a result of the Indian Government's policies, to 115,613 over two years. The President furthermore cited reports in "foreign papers" that about 400 persons had been killed in the disturbances. It was too early on that date for any official figures to be forthcoming from the West Bengal Government and, if the Pakistan President had received any intelligence from his own diplomatic representatives in this country, they could presumably not be used to subserve his purpose.

That President Ayub Khan should employ the expression "military rule" to refer to the taking-over of the law-and-order situation by the Indian Army, which is under the control of the Central Government, from the police, which is subject to the authority of the State Government, was a pardonable error since these subtle constitutional arrangements are peculiar to a democratic country; but what is more surprising and rather difficult to countenance is that Pakistan, with its own domestic arrangements, should at all object to "military rule". Of course, the views of President Ayub Khan on civil government, on democratic devolution of power or their suitability for his country, cannot properly be the subject of comment by Indians. Our worthy neighbour in this sub-continent owes its most recent designation of its political independence—the Islamic Republic of Pakistan—to President Ayub Khan and when he does eventually give that country the constitution that it has been promised, he would be obliged, neither by precedent nor by adumbrated principle, which had also been adhered to, to protect minority rights and lives. Neither India nor Pakistan, we feel sure, would desire to accept Khulna, which was hardly mentioned in President Ayub Khan's communication, as a precedent.

Appeal Goes Unheard

It is against this background of facts that President Radhakrishnan's answer must be studied. Meanwhile, not only has the situation in Calcutta returned to normal, but the stage is well set for a definitive solution of the problems arising from the unhappy Hazratbal incident. The Kashmir leaders are here in Delhi to explain the situation in the State to the Congress Parliamentary party. It is a fair measure of the Union Government's fulfilment of its obligation to its minority citizens that the majority community in that State not only showed exemplary patience in the face of an affront to its religious susceptibilities, but manifested a preferential "vote of confidence" — so to speak — in the impartiality of the Central Government. In Calcutta curfew hours have been reduced and much looted property has been recovered. Malcontents are being mopped up, 14,353 displaced persons are being returned to their homes and discommoded families are being fed at public expense. Chief Minister P. C. Sen further disclosed in a Press Conference that 104 persons had been killed in the disturbances — "pace" President Ayub Khan — and that military surveillance would continue until complete "normalcy" had been restored.

President Radhakrishnan, in his note of January 17, proposed that the two Presidents make a joint appeal to the citizens of both countries as a prelude to co-ordinated measures by the two Governments to end this "recurring cycle of communal disturbances". It is believed that the Presidential communication, as handed over by our High Commissioner, enclosed a draft for the joint appeal. In his reply, the President could, for the rest, do no more than emphasize the unequal nature of the relationship between the two countries. India is a secular State and apart from the 50 million Muslims, it had minorities of other diverse faiths living peacefully and contentedly within its borders. They were all governed and protected by a single secular law. President Radhakrishnan also drew attention — diplomatic restraint would allow him to go no further — to the "unfortunate pronouncements" by both the President and Prime Minister of Pakistan who attributed the theft of the holy relic from the Hazratbal Mosque to designing Hindus and to the hate campaigns let loose in the Pakistan Press in contravention of inter-governmental agreements on the subject. He also referred to the wilful misrepresentation by Pakistan which insists on treating unlawful Muslim immigrants returned from this country as refugees and to the mounting and continued inflow of Hindus from East Pakistan into this country.

Flogging a Dead Horse

Pakistan's practice of using normal diplomatic correspondence as an instrument of propaganda is perhaps not unprecedented in the international politics of our times, but why the head of that State should earnestly essay such "exaggerated figures" was a disturbing thought. So was the disquieting three-day silence that followed the handing over of the note, while some sections of the Pakistan Press described the Indian move for Peace as a "trap" and the note as one that may not be touched even "with a pair of tongs". Even a ministerial conference was proposed in one of the papers to "discuss the eviction of Muslims from Assam and other States."

Although the ground had thus been prepared for the announcement of Monday, January 20, that the Security Council of the United Nations was being called upon to meet in special session and to "interdict" the Government of India from taking any steps "to integrate the State of Kashmir with the Union", it was nevertheless surprising. It did sound a strange response to a gesture of peace. For, at the Press Conference hurriedly called for the announcement, Mr. Zafrulla Khan declared that he foresaw "nothing but intensification of trouble between the two sides".

That the Pakistan Government should want to make great play of her imaginary grievances on the forum of an international organization, whose directions to vacate aggression she has treated with such scant respect in the past, is her business. That the people of Kashmir reposed great trust in the Union Government and looked up to it in expectation was manifested most clearly during the recent confusion in that State. In the circumstances, India's constitutional arrangements cannot wait indefinitely upon Pakistan's pleasure, and it is in the interests of Kashmir as well as India that the Union Government should be free so to act as effectively to discharge its legitimate responsibilities. That course is also bound to serve the cause of Indo-Pakistan relations well.

Washing His Hands

"I am unable to accept the information supplied to you or the contentions based on those premises ...." replies President Ayub Khan on January 21, but is wholly silent on Mr. Nanda's proposal that Indian and Pakistan leaders should together visit the disturbed areas in both countries. "Recriminations", he adds, "would deflect attention from our real purpose". What is the real purpose? It is good form not to want to get behind what is told one and look for motives. One should perhaps accept as hard-headed realism the Pakistan President's neat rejoinder: "I do not know how a second appeal by me would have greater effect." If this tactical curtness were not linked to the overall strategy of re-opening the issue in the United Nations and re-enacting the weary farce, one would even be mollified by his assurance that he intends to take stern measures against miscreants in Dacca and Narayangang. This, we fear, is no concession but the minimum conditions of a rule of law — unilaterally so and quite independently of the appeal for amity by the Indian President.

To begin with, Pakistan sent her troops to territory she had no legal title to of any sort. She then denied that they were there at all. They have not only stayed there but the Pakistan Government proceeded to barter away a part of that territory. Like a desperate man who lives on his capital, it used its principles and affiliations in pursuit of its designs on Kashmir. As India's representative in the United Nations pointed out, nothing has happened following the exchange of letters several weeks ago on the integration, so called, of Kashmir with the rest of India. What does Pakistan hope to achieve at the United Nations besides an international audience for moth-eaten grievances? Even the rancour must have gone out of them now.

VOTE OF CONFIDENCE FOR SHILU AO

ONE OF the important elements of Congress policy, as revivified at the memorable Bhubaneswar session, received pragmatic support in Nagaland. Especially in the case of institutions like a political election, it is useful to rediscover the values that it concretizes. It brings out into the open every interest and aspiration that the Government of the day has to contend with. Of course, democracy serves a different purpose in each historical context; in our own, the Constitution of India recognizes the principle of the franchise as a means to the achievement of economic and social justice for the electorate.

Phizo, who harbours his resentment in exile, need not now be a looming reality who, by dissenting absence, is able to hold up others wanting to get on with the job. Such residual influence as he still wields over some minds did manifest itself during the recent elections in Nagaland. The attempts of the Naga hostiles to disrupt the elections, unseemly as they were, were only a bad example at the worst. In retrospect, the gains have not been inconsiderable: the detensioning has taken place without conspicuous damage and has, into the bargain, served to underline the fairness of the elections which resulted in such a decisive vote of confidence for Mr. Shilu Ao and his party.

The ultimate answer to the problem which Phizo represents is material prosperity and that must be secured within the framework of Nagaland's religions and culture. In an Assembly of 46 seats, the ruling party has decisively won 33 and 11 of them have gone to the Democratic Party. The elections have thus defined Mr. Shilu Ao's problems: Phizo will be a continuing reality and the Democratic Party, of whose policies nothing much is yet known, is strong enough for its essential function of an Opposition. The pre-election achievements of Mr. Shilu Ao's regime were outlined in the December 6, 1963, issue of this journal. He has, however, a long way to go yet, but in his endeavours, he is bound to enjoy the sympathy of all peace-loving and democratic forces.

HALF-HEARTED HOUSING

DISAPPOINTED AT the slow utilization of the funds allocated under the third Plan for housing programmes in the State sector and the poor response evoked by his letter to the State Governments about three months ago, asking for expediting implementation of the housing schemes, the Union Minister for Housing, Mr. Mehr Chand Khanna, is understood to have requested the Planning Commission to issue a directive to the States banning diversion of funds specified for housing to other development projects. He has suggested that if the State Governments fail to arrest this diversion, the Central assistance for housing programmes should stand reduced proportionately. A similar step, it may be recalled, was taken recently by the Planning Commission in regard to the funds provided for agricultural and co-operation development.

Of the Rs. 80 crores earmarked in the third Plan for the housing schemes of the State Governments, an expenditure to the tune of Rs. 43.20 crores had been approved under the phased programme for the first three years of the Plan. Actual expenditure during these years, however, is likely to be only in the neighbourhood of Rs. 29.88 crores — showing a shortfall of nearly 17 per cent. During the next financial year, instead of making up to some extent the deficiency of the first three years, the States have proposed an outlay of only Rs. 12.85 crores. At this rate, it is feared, the State Governments will not be able to utilize more than Rs. 55 crores out of the Rs. 80 crores stipulated outlay.

The housing schemes of the Central Government and the Union Territories, for which an outlay of Rs. 42 crores was proposed in the Plan, are stated to be making satisfactory progress. The rate of utilization of L.I.C. funds on the scheme is also stated to be keeping to schedule.

Fatigue and Industrial Efficiency—I

RAJA RAM JAIPURIA

INDUSTRY, it may be assumed, should exist for the benefit of the people at large. It should, therefore, at once produce goods as cheaply and in as large quantities as possible. Those engaged in industry should receive wages as high as possible in the circumstances in return for the minimum number of hours of work. If these aims, stated dogmatically, are all desirable, they are also *mutually opposed*. It is, therefore, necessary for a practical economist (and industrialist) to balance them against each other to arrive at the optimim length of working time and wage that would help to produce the most economical quantity of products at the most just cost.

Of all the problems that baffle not only the industrialists, the economists, the statesmen, the psychologists but labour as well is that of the efficiency of industrial workers. We would, however, confine our study to a particular aspect of the problem — mainly that of the *impact* of fatigue on workers' efficiency and the usefulness of rest pauses which have witnessed a remarkable success in the industrial life of western countries particularly England, USA, Germany, etc.

Going back to the early years of the industrial revolution in Europe and until recently in our own country, one notices a tendency to abstract work from the workers and to assume that the primary concern of the employer is work and work alone, particularly the efficiency of his labour force and that he otherwise does not bother at all about it. He is little or not at all bothered about the *health and happiness* of the worker and, if by chance, he really makes an effort to improve the worker's condition, it is more or less designed to achieve better output and more efficient production. In our country it may not be an exaggeration to say that the employers care more for their machines because they are more difficult and expensive to buy than the worker, which they can employ in any number and at a comparatively lower cost. It is because of the fact that there is an abundant supply of labour particularly of unskilled workers that the employers have an advantageous position in bargaining over wages.

What Efficiency Means

While there is general agreement upon the desirability of increasing efficiency of performance, there is disagreement as to what efficiency means. To some, increasing efficiency means merely increasing output. Others would also take into account how much the workers are paid. There are yet others who think in terms of the economic efficiency of the whole enterprise, relating the output to the total cost of the enterprise including machines, repairs, overhead expenses, rent, etc. Efficiency has also been used to refer simply to the amount or quality of the product regardless of cost. Again efficiency is sometimes used to refer to some quality inherent in the human organism. Yet such terms as working capacity or willingness to work suit the case much better.

The term "efficiency" has also been defined as the "ratio of output to input". Thus a machine that requires 100 units of energy in order to produce 10 units of work is said to have an efficiency of 10 per cent. A machine that requires the same input but produces only six units is considered to be less efficient. This argument is true in the case of human beings. Because if out of two workers having the same input, one produces only half as much as the second, the first is said to be less efficient. In another case where the conditions of work are different and production is the same but where greater input is needed, then the condition of work will be termed as less efficient.

According to the above definition, it is necessary to have a complete knowlege of both input and output before efficiency can be determined. It may sometimes happen that only output may be known and not the input, thereby rendering the determination of comparative efficiencies of different machines and human beings impossible for want of a basis for comparison. For instance, in case a machine turns out 10 per cent more finished articles than another or it, under one condition of work, individuals produce twice as much as under another, no conclusion can be drawn on the basis of this data. Nobody can characterize that one is more efficient than the other because of the fact that only one aspect of efficiency (output) has been taken into consideration while the other (input) has been ignored. It may be possible that a machine producing more may be consuming more, that is, entail more expenditure also. Similarly, a group of workers under one condition may be utilizing more energy expenditure than another group of workers. It may therefore be argued that, whether it is a machine or a man, efficiency cannot be determined for any situation in which information in regard to the relative costs of production is wanting. It may only be said that there are differences in the output and no comparison whatsoever between the relative efficiencies can be made.

Public Good

It has been said that the optimum conditions of production cannot be reached unless all concerned aim at maximum efficiency. To take a simple case, if we regard an absolutely efficient factory, employing an absolutely efficient workman, he will produce more articles at less cost than a poorer one operating in an ill-equipped factory. Such articles could consequently be sold at a smaller price and if desired, the workman, instead of turning out so many articles at such a small cost, could work fewer hours at the same wage or could work the same hours for a higher wage. Efficiency, therefore, becomes the test of whether this or that form of industrial organization makes for the public good. For the maximum efficiency to be achieved, it is necessary to have maximum efficiency in management as well as in labour, in distribution as well as in production, in development as well as in the exploitation of that which has already been developed. What, then, is likely to make for the maximum efficiency? It will be observed that we have so far reckoned only material advantages; many and cheap products; high wages; reduced hours involving much leisure. This involves the further acceptance of material gain as the main motive force of human activity. It follows that material rewards are the best incentive to efficiency.

It may be of course urged that the well being of the community rather than the efficiency of the industry should be the goal to be aimed at, but then it can be shown that well-being and efficiency are mutually dependent terms. That efficiency and well-being depend one upon the other is a maxim of economists which not one has yet succeeded in disproving.

But the important consideration in industry or business which no other word expresses as well as efficiency is the relation of product to cost. Taken in this way efficiency refers to the amount and quality of the product at any given standard cost. To be exact, efficiency is said to be greater or less according as produce/cost of production and since the denominator in this ratio may vary as much as the numerator, efficiency might also refer to the cost at which any given standard production was obtained but this reverse method of stating efficiency is what we refer to as "economy". Fundamentally, "efficiency" and "economy" refer to the same relation of product and costs though efficiency directs attention to the possibility of varying the product while economy has primarily to do with the possibility of varying costs.

These definitions are not as precise as might be, because the kind of units in which product and costs are to be measured are left to imagination or, worse still, to inference. A business man may naturally think in terms of the relation of his money returns to his money expenses i.e. with the total sales of his product as against the payment he must make to induce persons to work for him or to lend him land or capital. To him efficiency, therefore, means the rate of profit. While an economic approach to efficiency is the legitimate concern of management, the position can be studied from the psychological point of view — a point of view which is not contrary to the economic point of view in the long run but which is broader and fairer to all concerned. This point of view has been referred to by the psychologists as "human efficiency".

Human efficiency takes into consideration performance from the point of view of the individual doing the work. His *output will* be measured in relation to *what the work costs* him as an individual, and what he puts into the work. As the individual works, he uses his energy and exerts himself. As the work goes on, he tires, he runs risks of accident and injury, he uses time which he might be devoting to amusement or rest. In some cases the work may injure his health or increase his rate of ageing. He may also be bored with his work. As against this, he receives his pay and he may also gain satisfaction and a positive pleasure from the work or the product he turns out, and he may enjoy working with his fellow-workers. Human efficiency has, therefore, been called the relationship between these positive gains and the costs or input for the task.

If the amount of work which the management expects of the workers, takes too much in human costs, resulting in too much fatigue or requiring too much effort, the worker either produces less or he is likely to leave the job permanently or temporarily through excessive absenteeism. If he quits, it would entail the hiring of another worker who will have to be trained and acquainted in the job. Such replacement would naturally mean a substantial monetary loss and reduces the economic efficiency of the enterprise for both lowered production and increased absence reduce profit and increase the overhead cost. The human cost of work is as important to economic efficiency as sales, market conditions, cost of supplies, etc. *Until recently, indeed*, employers thought of no other factor than the material or the mechanical. The plea of Robert Owen to his fellow-employers over a hundred years ago is still relevant that "if the care which you bestow upon machinery can give you such excellent results, may you not except equally good results from the care spent on human beings with their infinitely superior structure?"

Fatigue

Where the muscularly weak are asked to lift excessively heavy materials, or the maimed, to use parts of the body they have lost, the same degree of incapacity would invariably be displayed. Variable incapacity can be analysed into incapacity due to excessive activity previously undergone under certain conditions (capacity tending to decrease with increased work) and incapacity due to insufficient previous activity (capacity tending to increase with increased work). The former case may be denoted "fatigue", the *latter lack of practice or inexperience.*

Among the factors affecting capacity to produce, the most important, according to the generally accepted theory, is industrial fatigue. Marshall called fatigue the main discommodity of labour and one of the "real costs" of production, while Mr. Gilbreth, a noted engineer, talked about the 'fatigue study' or 'fatigue control' as practical factory politics. Mr. J. A. Hobson, a prominent publicist, pleaded for a permanent place for 'fatigue' as a value to be provided against in industry.

Fatigue is the subject that interests both the employer and the employee. Since a fall in the production is ascribed to the tiredness of the workers, the employer naturally would like to eliminate this fall in production by eliminating fatigue. The employee on the other hand views fatigue as a feeling of tiredness or pain. He also treats it as intrinsically unpleasant and, therefore, he is also interested in its decrease or elimination. For these reasons industrial fatigue, despite its elusive nature, has been the subject of many investigations from the economic, physiological and psychological points of view.

Knotty Problem

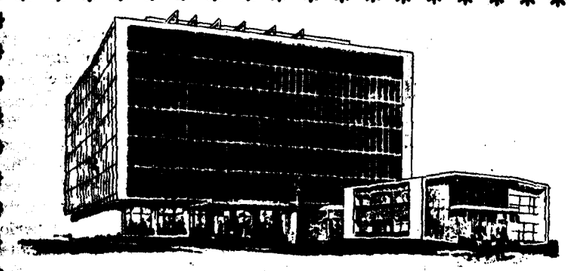
There is no problem that perplexes the department of industrial relations more than the problem of fatigue. This is one knot that cannot be disentangled by general formulas or even by individual prescriptions. It seems to vary not only with every job in an organization, but also in every person; and to make the problem still more complicated, it varies in the same person at the same time on different days and at different periods during a day.

Fatigue may be defined as a reduction in the ability to do work because of work already done. This definition does not attempt to describe the nature of fatigue but rather uses the result as its criterion. As soon as we attempt to determine the nature of fatigue, differences of opinion arise, for it is highly probable that the reduction in ability to do work is caused by a variety of changes, ranging from the chemical to the psychological. It is said that previous activity of a particular part of the body alters its ability for continued function and some of the changes produced by this activity can be specifically localized.

We may also approach the problem of fatigue by studying the feelings of the fatigued person. When a man says he is tired out, to what extent is he describing the localized changes? Do they always correspond with the psychological experiences? It might be supposed that the two approaches measured different aspects of the same thing. Unfortunately the various evidences of fatigue do not always agree. On the one hand a person may feel completely rested, but his work record may show a rapid decline under conditions of strong motivation. However, men may continue to work following periods of time without being aware of fatigue whereas, under other conditions, they may feel fatigued before they begin to work.

Before the advent of the present century there were no prescribed hours of work for the workers in general and industrial workers in particular. The industrialists believed in keeping their workers engaged for as long as possible. They were totally unaware of the fact that, if given proper rest, the workers were likely to be more efficient. The industrialists considered themselves to be the born industrial psychologists and that was why they were reluctant in prescribing hours of work for their workers. But the 'thirties saw a rapid development in the field of industrial psychology and sound industrial and human engineering. The importance of welfare activities and prescribed hours of work with proper rest pauses also came to be realized during this period. The employers believed that welfare activities should not be considered obligatory on their part and instead, they should provide those activities voluntarily in order to increase the efficiency of their workers.

During the past 50 years the trend toward a reduced



number of hours in the working week as well as a shortened working day has been fairly constant. This change has been due partly to the feeling that life for labour should not be "all work and no play," but it also has been due in no small measure to an increased recognition by management that employees do not reach their greatest efficiency when the number of working hours is excessive. Many experiments have been conducted to determine the relation between hours of work and production. The reduction in hours of work has been largely justified by these experiments. Miles and Angles report that, when the hours of work in a plant manufacturing boxes were reduced from 48 to 56 per week, an average hourly output increased from 793.5 to 834.0 units of production. In another experiment dealing with women engaged in turning fuse bodies, a 68 per cent increase of hourly output and an increase of 16 per cent in total production followed a reduction from 66 to 48 and 6-10 in the number of hours of work per week. In yet another study, it was found that an increase in working time above 60 hours per week was accompanied by increase in time lost owing to sickness, injury and absence without permission. The increase in working time was also accompanied by a decrease in both hourly and weekly output and an increase in labour turnover. Murray reports that a reduction of the working hours to less than 48 per week was followed by increases in both hourly and weekly production as well as by decreases in absenteeism and turnover. The general conclusion suggested by these and similar studies is that output is frequently increased if the number of working hours per week does not exceed 40.

Fatigue is, thus, a state in which the organism is exhausted and requires rest. It is also a state of diminished output. The quality as well as the quantity is affected during the state of fatigue. "The medical man, concerned about what happens in the body during fatigue, might have to say: during fatigue, there occurs a using of sugar fuel products, the accumulation of fatigue substances in the body (which would normally be eliminated) and accompanying inadequacy of oxygen to the body tissues; when rest is allowed, working power is restored, in this way blood washes out of the tissues accumulated fatigue substances and brings to these tissues food and oxygen."

Bitterman defines fatigue as reduced efficiency and he defines efficiency as the ratio of performance to expanded effort. More generally fatigue has been referred to as effect of work, those that, during a period of continuous work, such as muscular aches, eye strain and fogginess and the carry-over effects of work, interfere with our activities. The fatigued person's working power and quality of work are lessened and he finds it increasingly difficult to concentrate on his work. The skilful worker is likely to become less skilful and the person who is less skilful to start with is more likely to tire first because, in being less efficient, he uses more effort.

(To be concluded)

Enduring symbol of stability and service

THE INDIAN OVERSEAS BANK'S
New, Fully Airconditioned
Administrative Building at Mount Road, Madras 2
was opened on January 13, 1964
by the Hon'ble Shri C Subramaniam
MINISTER FOR STEEL, MINES AND HEAVY ENGINEERING GOVT. OF INDIA

Functional, spacious and modern, the new I.O.B. Building is a picture of streamlined efficiency. It is truly a symbol of the Bank's basic soundness, geared to service and progress.

Twentysix years have rolled by since the Bank's inception. Built on the firm foundation of your confidence, I.O.B. today is among the leaders in banking, offering comprehensive service in India and abroad. I.O.B. faces the future with enthusiasm, inspired by the challenge of finding newer and better ways of serving those who need a progressive bank with a modern outlook.

THE INDIAN OVERSEAS BANK LIMITED

Central Office: Madras. *Over 80 branches spread over India* Overseas offices in Bangkok, Colombo, Hong Kong, Ipoh, Klang, Kuala Lumpur, Malacca, Penang, Singapore. *Correspondents in commercial centres the world over.*

The Little Wars of Europe

ASHOK V. DESAI

THE CHICKEN war began on the 1st of August 1962, when the Council of Ministers of the European Economic Community imposed a sluice gate levy on chicken from third countries. This levy brought the price of all imported chicken to DM 2.92 a kilo — a price high enough to protect the least efficient producers in the EEC.

Chicken might hardly seem worth writing home about; but the Americans took it very seriously. Owing to rapid advances in their efficiency in recent years, they had been able to double their chicken exports to Germany in the last two years: in the first seven months of 1962 they provided 45 per cent of the chicken imported into Germany and probably about a third of all chicken consumed there. The EEC levy was obviously aimed at them — their share in German chicken imports fell to 11 per cent in the first four months of this year. And behind the chicken levy lay the important issue of agricultural protection in Europe. France looked upon the Common Market as an arrangement to get a sheltered market for her expensive agricultural surpluses in Germany and the Benelux, while the Americans were determined to have access to these markets on equal terms. The chicken duty seemed a portent for the exclusion of American wheat, rice and maize; so the Americans had to make a stand.

Normally, agricultural issues split the Community wide open. On rice, for example, the French and the Italians want a 45 per cent duty, while the Germans would hear none of it: they much prefer the American Patna rice (rice whose grains remain separate when boiled) to the soggy Mediterranean types. Even the Germans agreed to a duty on chicken, however, for the American exports were causing distress to their own backyard producers, who are perhaps the least efficient producers in Western Europe. Nevertheless, the Germans remained ambivalent, and it was, apparently, due to their laxity in enforcing the sluice gate levy that the EEC Commission imposed a further unconditional duty of 0.25 DM.

Conflicting Interests

The temperature rose as summer progressed. The Council of Ministers, being a committee of conflicting interests where each country has a veto, is rather elephantine in its movements: its responses to the American overtures were slow and inadequate, and the Americans got more and more incensed. By last August, chicken had become an American national issue and a symbol of European independence; the US Trade Department drew up a list of articles worth $112 million mainly imported from the Common Market, including flower bulbs, trucks, brandy, scissors and cheese. They threatened retaliatory tariffs on goods worth $46 million, the loss of trade they said the US had suffered.

This was all very exciting: a serious tariff war had not been witnessed since the last War. (Comprehensive economic warfare broke out between India and Pakistan after partition, but there was no economic or other calculation behind it). Besides, economists have written a great deal in recent years about the best tariff from the national standpoint, and about possibilities of gain from a tariff war: it seemed that their expertise might soon be of use. And even if they did not do very well in the game of tariff-making, they could write articles about it for years afterwards.

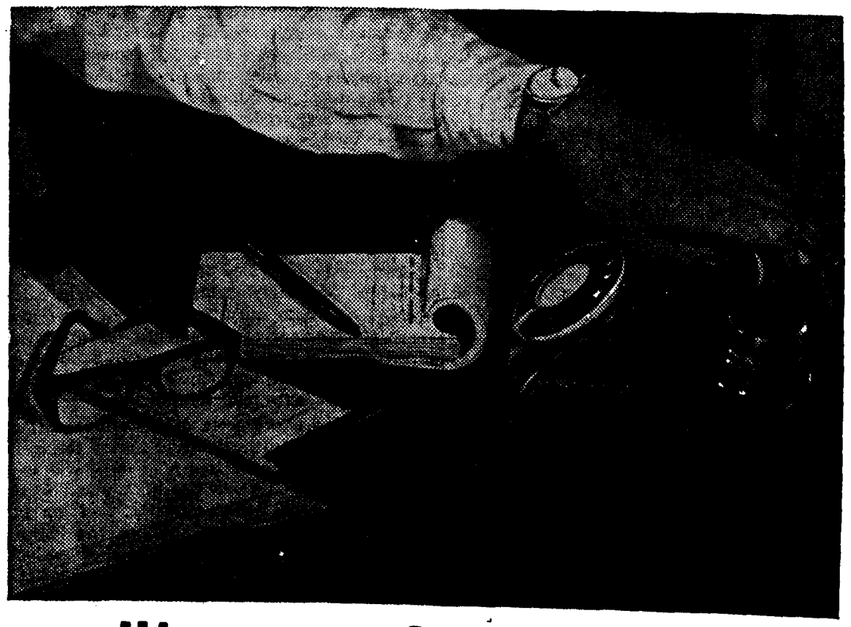
And then — the Americans retreated. They proposed arbitration by the GATT, and after some delay, the EEC accepted. The panel appointed by the GATT reported recently and fixed the American loss of trade at $26 million. The US Trade Department has been considering levying tariffs on trucks and chemicals of this value. Thus, the chicken war ended with an American defeat.

Recently, however, there have been rumblings of a steel war. British exports of steel to the Common Market have risen sharply; and the French steel producers, whose fuel costs are comparatively high, have been especially loud in their complaints. The European Coal and Steel Commission has tried to reduce competition by, for example, prohibiting imports outside trade agreements from Eastern Europe; it has been ineffective, however. There have also been informal agreements between British and Continental producers to prevent price cutting; these have been bypassed by British traders.

The French have complained that the British producers are dumping steel. There may well be some truth in this. Many European steel-makers, and especially the British, have surplus capacity in these days of slackening demand; since the fixed costs in the steel industry are high, additional quantities of steel can be produced at much below average costs in these circumstances. Now, the British cannot reduce prices at home: since they normally sell at the minimum prices fixed by the Iron and Steel Board, it would be illegal. And even if it were legal, it would be inconceivable for British producers to undercut their own compatriots. But the times are hard, and customs change when you cross the English Channel....

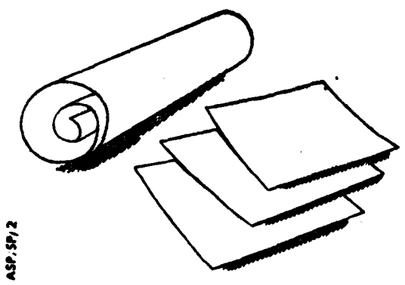
And so do the rules of diplomacy. A few months ago, the British Government refused to prevent sales of steel to Russia, for Britain must trade for its livelihood. Now the French Government has threatened to take measures against the British steel exports unless the ECSC does so. Since the French are not the only ones whom the shoe pinches, the ECSC will probably take some action.

So there are prospects of a steel war. I am not sure, however, that it will be fought. For in the reckoning of the British Government, the cost of a tariff war in terms of the loss of European currency earnings must be rated high, in view of the weak British reserves, and the prospects of a British win would be bleak, since the losses Britain can inflict on the EEC in terms of loss of exchange earnings, unemployment in Continental export industries, loss of raw material supplies etc. would not be regarded as serious.



Rarity of Tariff Wars

This argument is of quite general application and helps us explain the rarity of tariff wars. For a trade war to take place, both belligerents must think that they can afford it and that they would obtain favourable terms in the eventual compromise. Quite apart from other losses, most countries today cannot bear the loss of export earnings a serious tariff war would entail, owing to their weak reserve position; and even if they could they would tend to value the loss of earnings more than the exchange ratio would indicate, since there is a widespread restriction of imports that are considered less essential. Further, the countries cannot expect a win in tariff war unless both can inflict heavy losses on each other — i.e. unless they are closely and equally dependent on each other. Now, there are a great many countries which depend closely, but very few which depend equally, on each other.



This points to the singularity of the chicken war: it was a war between powers which could afford one, and which could both entertain reasonable expectations of inflicting damage on each other and winning. It could, therefore, have led to greater battles.

Its outcome was also of some significance. The Common Market is known to be protectionist: it levies heavy duties on whatever it can produce and other commodities besides, and it has developed its own system of imperial preferences. This hurts many countries; of them, however, only the United States had the strength to counter the protectionist tendencies of the EEC. Now that it has failed, it is unlikely that bargaining will change the EEC policies much. The countries whom they make unhappy must go back to making conference speeches — and simple autarchy.

Present-Day Problems in Polish Agriculture

MIECZYSLAW JAGIELSKI

(Minister of Agriculture, Poland)

THE FAVOURABLE weather conditions in September and October markedly improved the situation in agriculture which had been rather difficult because of last year's setbacks, heavy winter and summer drought prevailing on a large area of the country.

Two months ago there could be some grounds for worries over cattle breeding in view of possible fodder shortage in the coming winter period. Difficulties in supplying potatoes to the population were looming and prospects for the sugar campaign were rather unfavourable. Whereas today facts are speaking for themselves: the average yield of potatoes, according to the last estimates of the State Inspection of Crops, amounts to over 150 q per ha, i.e., by 20 q more than last year and by 15 q more than the average yield in the last five years. This means that there are no grounds for fears as to the provision of population with potatoes and that fodder situation has also improved.

We can give no final data as yet on the sugar beet production because purchases will last for further few weeks. The yields will surely be better than initially expected though with a lower sugar content. It should also be kept in mind that this year area under sugar-beat is 58,000 hectare smaller than last year. The cereal yields have slightly surpassed 17 quintals per hectare, whereas last year they were 16.1 quintals per hectare.

It is worth remembering the high yields of vegetables when characterising this year results in vegetable production. These are estimated at 3.5 million tons, i.e. by 24 per cent more than in the previous year. Owing to this fact the fruit and vegetable processing industry implemented the annual plans by two months ahead of schedule and the value of processed vegetables and fruit to be delivered to the market will be 350 million zlotys higher than initially planned. The high production of tobacco this year amounting to 59,000 tons should also be mentioned, last year results having been only 37,000 tons.

Smaller results were obtained in growing oleaginous plants. Their yields are lower than last year and the area under cultivation has diminished.

Favourable Conditions

Winter caused considerable losses in horticulture, still there is evidence that fruit production this year will be not much lower than last year. The relatively favourable situation in plant production creates good conditions for the development of animal production next year. But the present situation in animal breeding is not satisfactory and causes certain difficulties.

The June census showed a drop in pig population of nearly two million head. The number of sows has considerably fallen as well as that of sucking-pigs. The main reasons for this fact are the low cereal and root-crops yields in 1962. But it should be said that many pig-breeders considered the situation as worse than it was in reality and consequently reduced not only the number of pigs for fattening but also the number of sows despite the fodder assistance secured by the State.

Therefore purchases of live pigs have been smaller owing to the drop in pig population. Within 10 months of this year purchases of pigs in terms of meat have been 129,000 tons lower as compared with the same period of last year. This loss has partly been covered by increased deliveries of beef by 31,000 tons higher than last year. Purchases of all animals for slaughter are 109,000 tons lower in terms of meat than in the same period of last year. In order to prevent a considerable drop in meat deliveries to the market the Government have reduced the export of meat by 75,000 tons, of animal fats by 20,000 tons, and have imported 45,000 tons of meat.

In cattle breeding the situation is better. It was a hard problem, for a long period of time, to achieve the pre-war level in cattle population, i.e. 41 head per 100 hectare of arable land. Today we have nearly 10 million head of cattle, i.e. 49 head per 100 hectare of arable land with a by far higher weight of cattle. Milk purchases amounted to 3,116 million litres in the ten months of this year, i.e. by 257 million litres less than in the same period of last year.

On the whole the present situation cannot be considered as a satisfactory one althogh improvement is visible.

We can state after examining the total results of plant and animal production, that the current year brings about a three per cent increase in the agricultural production in comparison with the last one.

Fertilizer Deliveries

The Government undertook a decision to secure a sufficient growth of fertiliser deliveries in the future. A long-term agreement has been concluded with the Soviet Union on the deliveries of phosphorites and potash salts. It envisages joint investment outlays, and the work on the investment scheme has already been started. We also endeavour to increase import of potash fertilisers from the German Democratic Republic. But apart from this the adverse effects of not sufficiently speedy growth in fertilisers employment can and should be lessened by a better utilisation of this amount of fertilizers which is at our disposal, by improving the use of manure and by expanding papilionaceous plants cultivation.

While increasing the flow of production means into rural economy we do not forget the improvement of economic conditions for farmers. Guaranteeing the profitableness of agricultural production by the system of supply and purchase prices and by other economic incentives, we follow decidedly the principle of raising the agricultural production in a way favourable both for the State and for the peasants.

Last year, as it is known, the profitability of agriculture dropped. The incomes of the countryside which were particularly high in the economic year 1961-62 after the record yields of 1961 were threatened by low yields of potatoes and sugar beet in 1962. The drop in production of live pigs linked with the above fact has reduced the farmers' income by about 2,900 million zlotys this year, which situation has still been worsened by a loss of further 700 million zlotys caused by a drop in milk sales.

The first reaction of the Government was the assistance granted to farmers in sowing in autumn 1962 and spring 1963. Next, fodder assistance was organised, the supplies of fodder concentrates being increased by 300,000 tons. The terms of contracts for future deliveries of certain plant and animal products have been changed to the benefit of farmers. We have also improved the terms of contracts for future deliveries of vegetables so as to help the small-scale suburban farmers make their economy more profitable. Consequently this year's vegetable production will substantially increase the income of the farmers. Consumers have also benefited

by these changes because the prices of vegetables have been lower throughout the whole season this year as compared with the previous ones.

As far as sugar beets are concerned, the Government has established more convenient terms for deliveries of sugar beets on contracts basis in the economic year 1963-64 and obliged industry to improve the supply to the farmers growing sugar beet of tools which facilitate labour absorbing work.

A decision of far-reaching consequences taken this year is the rise of purchase prices of milk. Owing to this fact the incomes of the countryside will grow by more than 1,000 million zlotys per year.

Besides, two months ago, the terms of pig purchases were improved in several eastern and central voivodships bringing farmers additional 250 million zlotys.

Planned Concentration

A few months ago we decided that further mechanisation development should be based on the principles of planned concentration of tractor and machines sets at the existing State Machine Centres and at their work-shops, and on the speedy expansion of the village repair shops. Considerable organisational and investment efforts of the State are required so as to put modern technique at the disposal of agriculture. As many as 1,200 million zlotys are envisaged for the building of 400 new stations of State Machine Centres in the next two years.

The provision of agriculture with melioration equipment is a matter of organisational and investment activities. The same is the case with the modernisation of fodder economy and animal feeding. By delivering high-quality mixed fodder to the farmers we bring about reduction in consumption of cereal as fodder. At present district co-operatives have at their disposal a sufficient amount of mixed fodder and can exchange them with the farmers for cereals on conditions favourable for the farmers.

The implementation of our fodder plan, besides the expensive import, calls for considerable investment outlays so as to build modern industrial enterprises and furnish them with proper equipment.

The State farms are the core and essential basis of our seed plan. In the next years the State farms should more speedily expand their deliveries of qualified cereal seeds, seed potatoes, and vegetables, develop the production of papilionaceous and fodder plants for the needs of the entire agriculture and export.

Their possibilities, if we take into consideration the 2.5 million hectare of land, can be evaluated as large. But if we take into consideration that a small number of farmers is equipped with proper machines for cleaning and sorting the seed material then we must state that the deliveries of qualified seed, doubled in the last three years, required a lot of effort. Similar is the case with the potential of State farms in the field of breeding as they are short of sheds for livestock. The State farms, having at their disposal a 2-3 times lower number of man power per 1 unit of the area in comparison with the peasant farms are badly mechanised both from the point of view of the number and the range of the machines. This fact also diminishes the production possibilities of State farms, especially in northern regions.

Therefore some months ago a decision was taken on a speedy liquidation of the shortage of basic production means in State farms.

The essential problem in agriculture is the growth in efficiency of the farmers themselves and of all the agricultural workers in using the ever wider and ever richer range of production methods and means. With this aim in view we expand a training basis for improving the qualifications of the agricultural personnel of various ranks and in various production directions. Expenses of the Ministry of Agriculture on agricultural education in 1964 are to amount to more than 840 million zlotys, i.e. nearly twice as much as 5 years ago. We intend to open 35 new schools and 80 training centres and particularly we strive to expand the range of education and to raise the level of training of tractorists and other mechanical workers in agriculture. The increase in the number of agricultural stations and veterinary stations is a factor playing an ever more essential role in improving agricultural culture.

Besides the problem of introducing new scientific and technical achievements into practice there is in Poland a serious problem of a wide employment of those means and ways which both science and many-year experience of the best farmers proved to be the necessary condition of rational farming and proper utilisation of the land. With this aim in view the Council of Ministers, supporting the initiative of the Second National Congress of Agricultural Circles, adopted a resolution in October on the general appliance of agricultural minimum. The necessary factor for the implementation of agricultural minimum is the adaptation of the programmes of winter training, encompassing the farmers and organised by agricultural circles, to the agricultural minimum determined for the given village for the nearest year.

Production Means

The leading idea of the activity conducted by the Party and Government in the field of agriculture is the improvement of its production basis by an ever better supply of production means. Closely connected with this is the constant strengthening of State farms, the raising of their role in the planned shaping of the development of the entire agricultural economy. Hence also the State support for the movement of agricultural circles aimed at the introduction of mechanisation and modern production methods in private peasant farms.

The entire policy of strengthening and improving the production basis of agriculture is aimed at convincing the peasant masses that it is worthwhile speedily to develop production, which consequently leads to growing well-being and culture of countryside.

Despite certain shortcomings of our agriculture, optimistic views dominate because we have favourable crops this year in spite of the changeable weather, and good prospects for overcoming the transitory setbacks in the production of livestock. My conviction about favourable prospects for agriculture is based on the following facts:

The developing national economy can at present allot ever bigger means for the improvement of agricultural production;

The necessity of increasing outlays for this aim finds a just and full understanding of the Government and in the wide circle of economic and social workers;

The successive national economic plans allocate ever more means for agriculture and industrial branches servicing agriculture; and

Our ability of employing these means is gradually growing, methods of managing are improving, the range of economic and organisational measures becomes ever more richer, allowing for a rational utilisation of the growing State assistance.

WINDOW ON THE WORLD

ECM: Half Way to Unity

From Our Special Correspondent

PARIS:

THE COMMON Market this month passes the half-way stage between its official inauguration on Jan. 1, 1958, and the date set for its complete realisation on December 31, 1969. True, of the first six years, one — the year 1958 — was spent in merely getting ready for the initial duty cuts that came on January 1, 1959; and the remaining distance may well be covered in less than six years, since tariff disarmament is running ahead of schedule. But on any count, the association is today at the mid-point in its formative career, and this is a suitable moment to review its achievements to date and to assess its weight in the international economy. Naturally, in adding up the achievements of the six members to get a group total one is not arguing either that they yet constitute an economic unit in the sense the USA or Britain do, or that all their progress is due to the existence of the Common Market alone. Yet these reservations become less important with each month that passes. The unity of the Six is growing so fast that their affairs increasingly deserve to be treated as a single entity. And the persistence of an unusually high level of business activity over so long a period must have some connection with the process of unification, rather than (as at first seemed possible) being just the coincidence of recovery and modernisation in the six separate economies.

As to the pace of business expansion, the barest figures are eloquent. Between 1958 and 1963 industrial production in the region rose by 44.7 per cent, against 33.5 per cent in the USA and 16 per cent in Britain. Though this figure is the average between Italy's spectacular 72.3 per cent and Luxemburg's modest 12 per cent, it is still significant: the major industrial members (West Germany, France, Belgium) are grouped around 30-40 per cent, while Italy's rapid progress represents the process of equalisation that was to be expected in a united economy. (Luxemburg's lag is due to the stagnation in steel, the tiny Duchy's only important product.)

Industrial Growth

This fast growth of industrial output is among the main causes of the similarly striking rise in national product. GNP per head has risen by 26.4 per cent in those same years, compared with 22.5 per cent in the USA and 14.1 per cent in Britain. Italy and West Germany have done rather better than the average, France not quite as well, and the laggard is Belgium.

Between 1958 and 1963, again, trade within the region has grown mightily: by 130 per cent for both exports and imports between the partners. Naturally, this is much faster (just three times as fast) than the increase in trade between the Six and non-members, that being the whole idea of the customs union. However, what is surprising (and what was not expected by outside critics in 1958) is that the Six's business with non-members has increased faster than the foreign trade of the other industrial powers. Thus, the Common Market's imports have risen by 53 per cent, whereas the USA's have grown by only 33 per cent in the same period and Britain's by 25 per cent. Certain outsiders may have lost part of their market on the Continent because of mutual preference between the Six, but clearly there is no room for accusations of protectionism. In absolute terms, the region increased its lead as the world's main importing unit: in 1962 it bought $22,327 million worth of goods *abroad*, compared with $16,236 million for the USA, $12,578 million for Britain and some $6,000 million for Russia.

The Common Market's exports also increased considerably: they are up 35 per cent in the period against 25 per cent for both the USA and Britain. This rise was not sufficient to match the boom in imports, so the region has begun incurring a substantial trade deficit. Once again, it is plain that the formation of the union has been beneficial to non-members' trade, notably for the USA and Britain who have sold most of their extra exports to the Six. Despite the trade deficit, the Six have achieved a payments surplus because of the inflow of foreign capital seeking to get a footing in the world's most dynamic market.

To the extent that the above trends depend on the progress of the six-nation customs union, there is no reason why they should not continue during the second half of its formative phase, up to 1970. Of course, they depend on other things too; the level of the region's imports will be affected by success in current efforts to combat inflation; the size of its export sales will depend on that, on the pace of growth in the USA and Britain, on the fortunes of developing countries, etc. So there is no question of predicting what will happen in the next six years. It is simply that there is nothing in the Six's programme for the period that is inconsistent with continuation of the trends that have emerged since 1958. The abolition of remaining internal tariffs, the installation of the common external tariff barrier and the implementation of a joint agricultural policy should stimulate growth in industrial production, national income, internal trade, foreign commerce and investment just as much as the measures taken since 1958. It is safe to forecast that the apprehensions about the ravages of a joint farm policy on outsiders' food sales in Europe will turn out to be as exaggerated as similar fears expressed in 1958 and belied by the above figures.

At this stage, one can set the Six as a unit against Britain, the USA and Russia, as is done in the following table; the figures there, the latest available, are for 1962 and all should be taken as somewhat lower, for the Common Market, than what will appear when the 1963 statistics are compiled.

	ECM	UK	USA	Russia
Population (millions) ..	173	53	190	223
Steel output (m. tons) ..	72	20	91	76
Energy consumed per head (tons of coal-equivalent) ..	2.6	4.9	8	2.9
Auto output (millions) ..	4.8	1.6	6.6	0.5
Cereals output (m. tons) ..	52	9	174	121
Meat output (m. tons) ..	7.9	2.1	16.4	8
Milk output (m. tons) ..	61	12	57	58
Imports ($000 m.)	22.3	12.5	16.2	5.8
Exports ($000 m.)	20.6	11.0	21.3	6.0
Gold and $ reserves ($000m) ..	16.8	2.8	16.1	..

This is the picture of the Common Market at the half-way point of its formation. What remains to be done, according to the treaty, in the remaining six years? First internal customs duties, already cut by 60 per cent, are to be entirely abolished and it seems probable that this will be completed by Jan. 1, 1967, three years in advance of the timetable. That applies to trade in manufactures; for commerce in farm produce, progress has been somewhat slower to date but if the Mansholt plan for a uniform cereals price is accepted there will be a notable acceleration there too. The common external tariff (which is, in general, the arithmetical average of the old national tariffs, minus 20 per cent) will come into full effect, and here again the task will probably be completed by Jan. 1, 1967, well in advance of original plans. Needless to say, the actual level of the common external tariff will depend on the fate of the Kennedy Round, but the existence of a single duty barrier around the union is assured. The last

moves will be made in this period toward a common external trade policy, e.g. negotiation of trade pacts with outsiders by the Six as a unit represented by the Brussels Commission. However in this matter the provisions of the treaty are less important than achievement in actual practice of a joint stand in such affairs as the Kennedy Round, the UN world trade conference, negotiations with developing countries, and relations with Britain and the Free Trade Association.

There exist detailed timetables for the introduction in the coming six years of free movement of labour and capital, common regulations on competition and monopolies, a measure of harmonisation of tax systems (notably sales taxes), more uniform social welfare and security policies, a joint policy on transport and finally some sort of overall economic programming or at the very least co-ordination of budgetary and monetary practice. To judge from the beginnings that have been made, and from the plans for further progress drawn up by the ECM Commission, there is no reason to doubt that advance in all these fields will be smooth. One must speak with more caution of progress toward a joint agricultural policy, for although the ground was prepared for it in the recent Brussels settlement, much will depend on the prices at which crops are to be supported. Finally, there is at least one domain where progress toward unification is nil and where the future is still in doubt: the writing of a joint policy on fuel and energy. The opposition of interests in this field is stark, and the sole reason for optimism is that unification in all the other above-mentioned departments of the economy will eventually force a harmonisation of policy in the basic question of energy.

The development of the union in its second phase, then, should be easier going than in the 1958-63 period. Indeed, as far as concerns the mutual relations of the Six, the issue is beyond doubt. But, precisely because of their success, the development of their association is increasingly dominated by its external relations, notably with the USA. These will monopolise attention in the 1964-70 phase, and will decide the shape of united Europe.

U.S. Economy Crosses $ 600 Billion Mark

WASHINGTON:

IN HIS ECONOMIC report to Congress on January 20, the President of the United States pointed out that the Gross National Product (GNP) for the fourth quarter of 1963 rose to a record rate of $6 billion, but emphasized that an unemployment rate of 5½ per cent of the labour force "continues to cast a long shadow over our pride in this achievement". President Johnson then pledged himself to promote policies which would increase employment and production at home and abroad, aid and assist in expanding international trade.

Following are some of the main points made in his report:

The record $100 billion expansion since early 1961 has carried the U.S. past important milestones in the march toward a better life. In 1963, for the first time in history GNP passed the $600 billion mark, by year-end; average earnings in manufacturing exceeded $100 a week; personal income (before taxes) reached an average rate of some $2,500 per capita; after-tax income of individuals exceeded $400 billion, for the year; corporate profits exceeded $50 billion before taxes and $25 billion after taxes; residential construction passed $25 billion; and civilian employment exceeded 70 million.

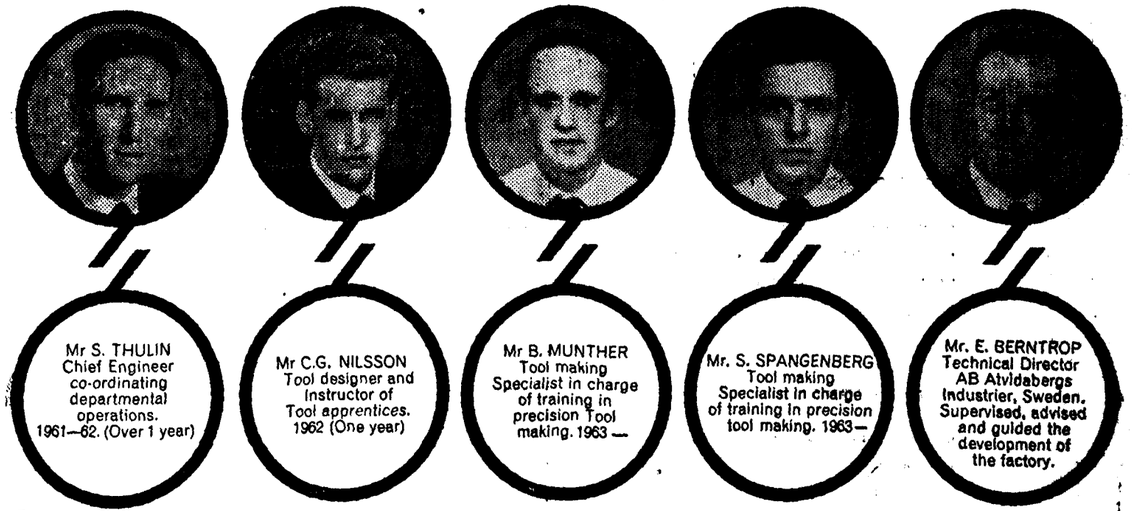
In the nearly three years of unbroken expansion since early 1961 GNP is up 16 per cent, measured in constant dollars; industrial production is up 23 per cent; civilian non-farm jobs are up 2¾ million; personal income is up $70 billion, or 17 per cent; corporate profits before taxes are up $17 billion, or 44 per cent; net income per farm for 1963 is up almost $675 or 12 per cent; total after-tax income of the American people is up $56 billion, or 16 per cent; and real disposable income per family is up more than $600, or 8 per cent.

Unparalleled Rise

The $100 billion rise in output in 2¾ years knows no parallel in the peacetime economic annals of the United States. The advance of $51 billion in labour income is also unparalleled. Average real income of non-farm workers has risen by $945 a year, a gain not exceeded in any previous comparable period. The rise in corporate profits from a rate of $38½ billion in early 1961 to roughly $55 billion at the end of 1963 is notable.

The 1961-63 advance — though impressive, sustained, and non-inflationary — has, however, not gone far enough and fast enough to create the jobs needed by the unemployed, restore the growth rate of productive potential to the pace which was taken for granted in the early post-war period, raise the incomes of farm families to a level more comparable to those of non-farm families, or expand investment and profits to levels that will hold more of the capital funds at home and thereby shrink the external payments deficit.

Five-and-a-half per cent of the labour force is still idle, even after a year-to-year advance of $30 billion in our GNP. Taking into account the added workers who seek employment as jobs become more plentiful, at least two million more jobs are needed today just to get rid of stubborn excess unemployment. About two million new jobs are needed each year to offset the labour-saving effects of rising output per worker. More than a million added job seekers enter the labour market each year — indeed the U.S. economy should soon provide 75 million jobs. Operating rates in manufacturing still average only 87 per cent of capacity, against the 92-per cent rate preferred by business managers. Men, machines, and materials that lie idle today could readily add about $30 billion more to our $600 billion GNP. Although sharply reduced by the determined steps announced in July, the balance of payments deficit is still there. And gold outflow — though only half as large in 1963 as in 1962, and less than half as large in the three years 1961-63 as in 1958-60 — has not been eliminated.



Task Ahead

The President, outlining the task ahead, said: "If we are to master these problems, we must above all enact the tax bill — not in one or two or three months; but now — not in diluted, but in strengthened form, with an immediate drop from an 18-per cent to a 14-per cent withholding rate ..... The economics of efficiency is in no way inconsistent with the economics of expansion. By combining efficiency with expansion, frugality with compassion we shall hold the fiscal 1965 budget below the fiscal 1964 budget, and cut the deficit in half; we shall get a dollar's value for a dollar spent, while not fearing to spend a dollar when and where the nation will reap a full dollar or more in benefit; we shall strengthen our programmes to meet pressing human needs; fully satisfy our defence requirements; and respond to the demands of economic progress; and we shall, at the same time, provide an unparalleled fiscal stimulus to the economy.

"The tax cut will give a substantial lift, year-in and year-out, to the American economy. When fully effective in 1965, it will send well over $11 billion annually coursing through the arteries of the private economy ..... With the tax cut, promptly enacted, our gross national product for 1964 should rise from $585 billion for 1963 to a projected $623 billion..... With the tax cut, the state of business confidence is strong: business forecasters today foresees a 5 to 6 per cent, or even greater, rise in GNP from 1963 to 1964. With the tax cut, profits will continue to rise, avoiding the decline that usually sets in after the first year or two of a business expansion. With the tax cut, our balance of payments will benefit from basic improvements in our ability to compete in world markets as costs are cut directly through lower taxes and indirectly through

HALDA'S HIGH QUALITY & PRECISION ARE NO ACCIDENT!

IWT/RCH-2550a

FACIT's Technical Chiefs, Engineers and Specialists working relentlessly for years in close collaboration with Indian engineers and technicians have helped Rayala to manufacture and place on the Indian market a quality typewriter—HALDA. Every stage of progress was marked by thorough and careful planning, expert experienced supervision, intensive and continuous training and education of Indian workers and technicians, and high standards of quality-control.

HALDA is indeed a triumphant combination of supreme technical skill and world-renowned Swedish steel. HALDA's unique quality, precision construction and dependable performance are by no means an accident!

Manufactured in India by

THE RAYALA CORPORATION PRIVATE LIMITED

25-A, Mount Road, Madras-32 in technical collaboration with Messrs AB. ATVIDABERGS INDUSTRIER, STOCKHOLM, SWEDEN. modernization; and in our ability to retain and attract capital as returns on domestic investment rise with higher volume and lower units costs. With the tax cut, consumer spending — fuelled by the extra $8.8 billion of take-home pay — will propel the economy forward in 1964. With the tax cut, business fixed investment should rise more in 1964 than in 1963, and housing and automobile demand should remain strong. With the tax cut, in short, 1964 will be a year of strong, sustained economic advances ..... Prospects are favourable for continuing in 1964 our good record of price stability and stable unit labour costs .....

"Our balance of payments will continue to benefit from the special programme launched last July. This requires early enactment of the interest equalization tax, designed to raise the costs of foreign borrowing in our capital market without forcing up domestic interests rates, further economies in dollar outflows from government programmes, without compromising our efforts to maintain the strength of the free world, and continued price stability and export promotion to maintain or improve the competitive position of our exports.

"The Kennedy round. The United States' 20-year campaign to reduce barriers to world trade — and the intensified pursuit of that goal signalled by the passage of the Trade Expansion Act of 1962 — will reach a climax in 1964 ..... Reduced trade barriers will expand exports and help an increasing number of developing countries to become self-supporting. Our development assistance effort must and will be more sharply focussed and rigorously administered. We shall encourage others to share more of its burden and seek a larger role for private-investment. But a strong development assistance programme continues to be vital to our pursuit of peace and stability in the free world ..... "

Behind the Smoke-Screen in U.K.

JOSSLEYN HENNESSY

LONDON :

THE NATIONAL Economic Development Council (Neddy), of which Mr. Maudling is the Chairman, and in which government, employers, and trades unions meet together in a joint effort to promote growth, is running into difficulties.

Neddy's first report, which came out in February, 1963, was greeted with acclaim, because it outlined a 4 per cent growth policy, and since, at that time, there was a margin of unutilised capacity in the economy this growth rate was quickly attained. The result was, of course, that union after union began putting in for higher wages, irrespective of productivity, thus facing the government with the anguishing problem that faces all democracies enjoying full employment, namely, whether, on the one hand, to create the credit necessary to enable consumers to pay the higher prices that higher wages impose on those particular products in which productivity is insufficient to cover increased costs, thus boosting the inflationary spiral, or whether, on the other hand, to refuse to create the credit and face an increase in unemployment due to consumer resistance to higher prices.

Faced with such electoral dynamite, politicians of all parties, in all countries, put up a smoke-screen in hopes that somehow or other their problem will solve itself in the ensuing confusion.

Incomes Policy

Today, the fashionable smoke-screen to evade the consequences of inflation is an "Incomes Policy", and Neddy, which was set up to deal with long-term problems of growth, is now being asked to find a short-term solution for rising wages, incomes, profits, and prices, the responsibility for which should, I suggest, rest with the government of the day.

The professed object of an Incomes Policy is to prevent inflation by stabilising prices and incomes, so Mr. Maudling wants the representatives of the employers and workers in Neddy to agree on a declaration which would call for (1) a new national body to which "unfair" increases in prices could be referred, (2) legislation for taxes on profits if they rose by a greater percentage than wages. In return for these two points the T.U.C. would advise the unions to restrain wage demands. The employers associations — the Federation of British Industries, the National Association of Manufacturers, and the Association of British Chambers of Commerce — took the initiative in accepting these ideas in principle. The Trade Union representatives were, on the other hand, reported in the press as having been taken aback by the employers' proposals, which they described as "too rash, too ill-advised, and too sudden".

The refusal of the unions to accept the offer of price reviews and taxes on profits, on which they have always insisted as the prerequisites for wage restraint, may seem bewildering until it is remembered that an election is in the offing, and that the unions are the Labour party's biggest single source of finance. If the unions were now to join in the proposed declaration, the ensuing wage and price pause and the general easing of anxiety in industry and commerce, would give the Conservatives a big push towards victory.

All the above is, however, at any rate as I see it, a vast smoke-screen behind which Conservatives and Labour have retired to avoid taking unpopular decisions. For the basic fact is that if you avoid inflation, you do not need an Incomes Policy, and if you have inflation no Incomes Policy can work. An Incomes Policy is supposed to stabilise wages, prices, and profits. If you have no inflation, wages, prices, and profits are stable, although not static — that is, they change the relations between each other in response to supply and demand. If you allow inflation, wages, prices, and profits cannot be stable. They can, of course, be controlled, thus distorting production by suppressed inflation, by black markets, and by diverting resources away from the production of controlled to uncontrolled goods or services.

Mr. Maudling still has, however, one or two realistic possibilities open to him. Neddy's office is reported to be urging him to abolish resale price maintenance and to inaugurate tariff cuts, both of which would induce greater competitiveness, and would lower a fair number of retail prices in the shorter run. In the longer run, neither could withstand the inflationary creation of credit, which emerges when political parties compete to promise electors investment in health, pensions, education, houses, defence, and the nationalised industries, on a scale in excess of current national resources.

Let us end on a more cheerful note. Many of the omens for the UK economy in 1964 are good. The higher incomes and profits being currently earned and distributed should maintain consumer demand at a high level. Increased demand for capital goods is forecast from both the public and the private sectors. Expansion should therefore continue throughout 1964, and perhaps into 1965. There are still large areas of industry working below capacity to maintain an anti-inflationary margin. Against this, bottlenecks in the service and particularly in the construction industries may build up. UK exports should benefit by the climate of expansion that has set in throughout the United States and Europe, as well as from the recovery in commodity prices which should enable the primary producing countries to import more. The Western Communist bloc, headed by the USSR, will continue to buy Western food, at any rate until their next harvest, and they are lengthening their order books for capital goods.

Steel Target for Fourth Plan

By Our Special Correspondent

NEW DELHI:

THERE IS every possibility of the fourth Plan steel production target being finally fixed at about 16 million tonnes, as against 18 million tonnes recommended by the Steel Steering Group in September last. The main reason for this likely scaling down, it is understood, is that it may not be feasible to accommodate in the next Plan's outlay of Rs. 14,000-15,000 crores, an investment of the order of Rs. 2,000 crores in the steel sector alone. There is also likelihood of coal supplies falling short of the requirements of an 18 million tonne steel target. Foreign exchange is another bottleneck and suppliers' credits are not considered to be a good substitute for long-term assistance from the friendly countries.

Bokaro, of course, is to be accorded high priority in the fourth Plan steel expansion programme; firstly, because a good deal of preparatory work has already been finished in regard to this project, and secondly, owing to the fact that it will be a plant producing flat products for which the country's requirements are going up at a rapid pace. Expansion of the five existing steelworks at Burnpur, Jamshedpur, Durgapur, Rourkela and Bhilai is also to be accorded an equally high priority. Which of the two plants proposed in the Vishakhapatnam and Goa areas should be taken up in the first instance in the fourth Plan period will be decided on receipt of their project reports which are expected to be submitted in about four months' time.

For a successful implementation of the fourth Plan steel programme, it is pointed out that the funds will have to be arranged by next year. Part of the allocations may have to be made during the current year itself. Any delay in this regard, it is feared, will upset the plans. It is also felt that if West Germany insists on completion of Rourkela's expansion to 1.8 million tonnes before committing itself to provision of funds for further expansion, it may create complications.

Foreign Exchange

Bokaro's foreign exchange requirements are likely to figure in the discussions at the next meeting of the Aid-India Club. The Government is anxious that some assistance should be available from this source for financing Bokaro. That will reduce the burden on the country's foreign exchange resources.

For mitigating the hardships caused to foundry-owners by shortage of pig iron, the Union Ministry of Steel is understood to be negotiating import of 150,000 tonnes of this commodity from the Soviet Union. The main hindrance in the finalization of this deal is stated to be the price factor. The indigenous supply of pig iron during the current year is estimated to go up to 1.2 million tonnes. A slight liberalisation in the foundry quotas is said to have been already effected on this score. Further liberalisation should follow if the deal with the Soviet Union materialises.

The Durgapur and Bhadravati alloy steel projects, it is learnt, are now making satisfactory progress. Bhadravati may be able to produce even 85,000 tonnes of alloy steel per annum. The production of equipment for the Durgapur project is stated to be at an advanced stage in Japan. The Japanese collaborators are understood to have indicated that they will be able to adhere to the schedule proposed for the equipment supplies.

Government decisions on the Raj Committee's recommendations on steel decontrol are expected to be announced shortly. The matter, it is understood, will go before the Cabinet in the next few days. Indications are that whereas controls on such categories of steel as structurals, railways material, etc., which are in good supply, will be abolished completely, stricter controls may be enforced on the scarcer varieties. Among these are included plates, sheets and tinplate. There is also a good possibility of the Raj Committee's suggestion for setting up a Joint Plant Committee being accepted. The Secretaries Committee which considered the Raj Committee's report for suggesting Government action is believed to have agreed with this proposal, but with one modification. The official committee is understood to be of the view that the Joint Plant Committee should not be concerned with the determination of the base prices of those categories of steel on which controls may be continued. The freight equalization system for steel is likely to be maintained as hitherto.

★★

With a view to pulling the agricultural economy of the country out of the morass into which it has tumbled during the past three years, the Union Ministry of Food and Agriculture has taken a number of decisions in the last few days. At a meeting of the recently constituted Agricultural Production Board, held on Monday, it was decided that the Central assistance for intensive cultivation of cotton and oilseeds should be continued for one more year and that assistance on a similar pattern should be extended for the cultivation of wheat and rice as well. It was also suggested that in the areas selected for intensive cultivation, special attention should be paid to the entire crop economy of an area instead of concentrating efforts only on the predominant crop there. Further, the approach should be on district-wise basis instead of block-wise basis as hitherto; the contiguous areas should also be included in the intensive cultivation programmes. The Centre was urged to support the selected districts agriculture programme upto about 300 blocks during the next agricultural year.

Earlier at a meeting of the Chief Ministers and Ministers of Agriculture, Co-operation and Community Development of the States of Northern Region, comprising Punjab, Rajasthan, Uttar Pradesh, Himachal Pradesh and Jammu and Kashmir, it was announced by Mr. Shriman Narayan, Member (Agriculture), Planning Commission, that a provision of Rs. 150 crores had been made in the 1964-65 plans of the States for agricultural development, as against the current year's allocation of Rs. 115 crores. Mr. Shriman Narayan also indicated that further funds for this purpose could as well be made available, if considered necessary. He hoped that as a sequel to the recent directive of the Planning Commission to the State Governments, the States will take care that the funds made available for the development of agriculture and co-operation would not be diverted to other schemes. There is a proposal to include in this category also the funds being provided for community development programmes.

The Reserve Bank is believed to have assured the State Governments that it will try to meet the credit requirements of agriculturists to the maximum possible extent. But a necessary condition for this is that the co-operative structure at the central and primary levels should be strengthened.

The Union Ministry of Food and Agriculture has also impressed upon the State Governments that they should make efforts to make available iron and steel to agriculturists at reasonable prices. It intends to supply chemical fertilizers to farmers at as low a price as possible. The revised prices of chemical manures are expected to be announced shortly.

The States have also been advised to take concerted action to implement minor irrigation schemes and to forge closer liaison between the various departments dealing with matters pertaining to agriculture. They have been further asked to make up the leeway left in the implementation of the intensive cultivation programmes.

Two other important steps for agricultural development have also been indicated by the Central Government. One of these relates to power supply to agriculturists at cheap rates and the other to stabilisation of the prices of agricultural commodities at reasonable levels. The Union Government appears to favour an upward revision in the support prices fixed for various farm products. A Committee of Secretaries represented on the Agricultural Production Board, has been asked to submit a report on this issue by February 19.

As regards supply of power to agriculturists at cheap rates (the concensus of opinion is that the rate of power supply to agriculturists should be around 9 nP. per unit), the State Governments are stated to have put forth two suggestions for consideration by Central Government. The first suggestion envisages increase in the power rates to industry so that the State Electricity Boards may be able to make up the loss that will result from providing power to farmers at low cost. The second proposal is that the Centre should provide subsidy for this purpose.

Licensing New Units

Meanwhile, to meet the growing demand for agricultural tractors, the Union Ministry of Steel, Mines and Heavy Engineering has decided to license further capacity in this line. Preference in licensing new units is proposed to be accorded to schemes envisaging production of tractors in the lower h.p. ranges.

Till now, four companies have been licensed for the manufacture of agricultural tractors in the ranges 12-18 DBHP and above and two for the production of tractors in the lower ranges. Of the former, three—Eicher Tractor Corporation of India (P) Ltd., New Delhi (licensed to manufacture annually 2,000 Eicher tractors in the ranges 12-18 DBHP and 20-30 DBHP), Tractors and Buldozers (P) Ltd., Bombay (licensed to produce per annum 2,000 Zetor tractors in the ranges 20-30 DBHP and over 35 DBHP) and Tractors and Farm Equipment Ltd., Madras (licensed to turn out per year 3,500 Ferguson tractors in the ranges of 20-30 DBHP and over 35 DBHP)—have already gone into production. The production level achieved by them, so far, however, is not high—only 1,627 tractors were produced by them in 1962 and 782 during the first seven months of 1963. Mahindra & Mahindra Ltd., Bombay, is licensed to manufacture 3,500 International Harvester tractors per annum in the ranges of 12-18 DBHP, 20-30 DBHP and over 35 DBHP. This company is likely to commence production this year. Another scheme, that of Ghaziabad Engineering (P) Ltd., New Delhi, envisaging production of 3,000 Renault tractors a year in the range 20-30 DBHP has been agreed to in principle.

Neither of the two schemes, of the East Asiatic Company (India) (P) Ltd., Bombay, envisaging manufacture of 24,000 Landmaster power-tillers annually and of Krishi Engines (P) Ltd., Hyderabad, proposing production of 3,000 Akitu power-tillers per annum, has yet fructified. Two more schemes, one of V.S.T. Motors (P) Ltd., Bangalore, and the other of Orissa Industrial Development Corporation, Bhubaneswar, have also been agreed to in principle for the manufacture of power-tillers, but their manufacturing programmes and collaboration arrangements have yet to be finalised.

The demand for tractors, excluding power-tillers, is now anticipated to be nearly double the 10,000 nos. target fixed for their manufacture under the third Plan. The new licences are proposed to be issued liberally so that the production level may match the demand early in the fourth Plan period. This should imply that new licences may be issued for a capacity to produce approximately 10,000 tractors a year.

★★

Announcing his company's intention to enter the capital market early next month, the Managing Director of the Cochin Refineries Ltd., Mr. John Wilson Loy, reiterated here last week that the proposed 2.5 million tonne Cochin Refinery would go on stream, as planned, by October, 1965, and shall attain the rated capacity shortly thereafter. The basic design and engineering specifications of the project, he added, had been nearly completed and the major part of the heavy construction work sub-contracted to Pacific Procon Ltd., a US firm of world-wide experience in refinery construction. He expected that actual construction would start in the next few months and that licences for import of equipment would be available soon.

The company is having initially a capital of Rs. 7 crores. Fifty one per cent of the capital is being subscribed by the Union Government, 25 per cent by Phillips Petroleum of the USA (the foreign collaborators) and 2 per cent by Duncan Brothers of Calcutta. Of the remaining 22 per cent — 1,54,000 shares of Rs. 100 each — 50,000 shares have been allocated to the Kerala State Government. The public issue will consist of 1,04,000 shares. Contrary to earlier expectations, no shares have been allocated to the LIC. It may, if it so desires, apply for some shares out of the public issue. No underwriting is contemplated. Phillips Petroleum, however, has offered to take up all the shares not subscribed by the public, subject, of course, to the consent of the Government. The directors feel that this contingency may not arise as the investors would find these shares attractive in view of the guaranteed process margin of $1.35 per barrel of crude processed (later on, this margin is to be reduced to $1.30 per barrel).

The major products of the refinery will be: gasoline 19 per cent; kerosene 20 per cent; diesel 20 per cent and fuel oil 20-25 per cent. Phillips Petroleum has negotiated a long-term agreement for the supply of light Iranian crude to the refinery at a price not exceeding $1.94 per barrel, subject to escalation of world tanker rates from the base of last April. This crude, it is stated, is best suited for the proposed product pattern. Indigenous crude, if and when available, is to be given preference for processing.

Import of equipment is also being arranged by Phillips Petroleum. The whole of it, however, may not come from the United States. Other sources of supply may also be tapped to keep the cost of the refinery within the stipulated limit.

The refinery is expected to cost nearly Rs. 13 crores. Including working capital and the cost of ancillaries, the total cost is estimated at Rs. 22.8 crores. To meet the foreign exchange expenditure over and above its subscription to the

share capital of the refinery, Phillips Petroleum has arranged medium and long-term loans totalling $18 million. The loans carry interest at the rate of 5¾ per cent per annum.

The capacity of the refinery will be capable of expansion through elimination of bottlenecks, by at least 10 per cent. Nearly 100,000 tonnes of high octane motor spirit are proposed to be exported from here to earn valuable foreign exchange.

In this column last week, the French Institute of Petroleum expert, Dr. Henny, was inadvertently described as Dr. Henry. The error is regretted.

Cotton Mills Will Display in New York Fair

From Our Correspondent

BOMBAY :

THE DECISION of the Indian Cotton Mills' Federation to participate (in co-operation with the Cotton Textile Export Promotion Council) in the coming 1964-65 New York World Fair is to be welcome. It provides a unique opportunity for the Indian textile industry not only to display its products in all their richness and variety but also to tell the story of this country's oldest organised industry. This story needs to be told now, and it can be and must be done with telling effect. For here is a wonderful chance to impress upon the American citizen that India's cotton textiles are not the product of sweated labour as some interested American textile interests have been telling him. Fortunately, (or is it fortuitously?), thanks to the one price formula that has since been accepted, the industry has been spared the task of having also to defend itself against the charge, one used to hear so often until only a few days ago, of importing US cotton at a price lower than what the American cotton mills had to pay in their own domestic market and thereby enjoying an "unfair" price advantage over them and that in their (American) market itself.

No Under-cutting

Now what is the story that the Indian cotton mill industry must tell to the American people? It is that the Indian textile industry has no intention of under-cutting its American counterpart in the latter's own home market. This should be done by vividly presenting, by means of suitable graphs, charts and statistics, the cost pattern of our cotton mill industry. The break-up of Indian textiles manufacturing cost should convince anyone that its wage or labour component is a stiffly high percentage of the total cost, notwithstanding the lower per-worker wage figure, 'vis-a-vis' the wage of the American mill worker, in absolute terms. The seemingly lower wage and the admittedly lower productivity of the Indian worker, when placed alongside the relatively higher figure of both wage and productivity of the American worker, should knock the bottom out of the argument that Indian labour is sweated labour. It may not also be out of place to compare the wage levels of a textile worker and those of other workers in India to establish the obvious fact that wages in the cotton mill industry are among the highest paid by any industry in this country. By doing all this, the Indian cotton mill interests can expect effectively to counteract the campaign of U.S. textile interests against larger imports of Indian cotton textiles and thus look forward to building, in due course, an increased export trade with the United States. Even the U.S. business men who are not unfamiliar to the phenomenon of sharply increased labour costs — since 1939, unit labour costs in the U.S. have more than doubled and, as in the case of the Indian cotton mill industry, these increased costs reflect increases in both wages and fringe benefits—would be impressed with this and, may be, that would serve to soften their opposition to increased textile imports from India.

**

The reaction of the labour leaders to the recommendations of the Lakdawala Committee, namely, that the Bombay Cost of Living Index should be revised upwards by 29 points, was unanimous. The labour representatives appear to have urged that the full data of the family enquiry report of 1958-59 should be made available to them. The new series should not be immediately implemented till the question was discussed and their view-points taken into account. The demand was to correct the index numbers of the old series with modifications suggested. Further, the implementation should be given retrospective effect from 1960. The appointment of a tripartite committee on a permanent basis was suggested to act as a liaison in correcting the index numbers. A bout of consultations with employers was also launched by the Maharashtra Government in view of the far-reaching impact of the revision on the wage bill of industries. The resources of the various industries, particularly the textile mills, have been strained to the utmost by modernisation and expansion and any lumpsum disbursement of arrears of dearness allowance for a relatively long period will undoubtedly affect the fortunes of this vital industry. The State Government will take decisions after the joint talks with employers and employees in view of the far-reaching importance of the matter both to employers and employees.

**

The Muranjan Committee has at last submitted the much awaited report on cost reduction in textile industry. The Committee has emphasized the urgency of keeping the competitive efficiency of the industry, especially from the point of view of export performance. This is an opinion on which there is no room for any difference of opinion. It was estimated in 1960 that the cost of modernisation would be Rs. 180 crores in terms of 1958-59 prices. The costs must have gone up further in view of the rise in the price level subsequently. The World Bank has blamed the industry, in a recent report, for neglecting modernisation. The Muranjan Committee has rightly suggested that the new cloth prices should be fixed to provide an element of subsidy to carry out modernisation. In the case of inefficient units, the money collected from the consumer should be credited to the reconstruction corporation and this should be spent only on units which give promise of reaching the efficiency of the average level. The corporation should act as a liquidator of those mills which cannot be rehabilitated with reasonable investment and should act as the new management for those units which can be rehabilitated by investing some additional capital. A special cess should be imposed on the textile industry to finance a programme of rehabilitation of uneconomic and inefficient units. In the context of the new burdens arising from the impending revision of the cost of living index on the industry, the entire question seems to require a fresh review.

**

The commodity markets seem to be under the grip of 'bulls'. The prices of cotton and oilseeds are touching new levels. This is not surprising because the inflationary conditions are gathering momentum as evidenced by a record rise of notes in circulation in recent weeks. The prices of Digvijay cotton, a popular variety with cotton mills, have been scaling new heights. The total Digvijay crop is expected to be around 600,000 bales comprising 450,000 bales from Broach, 100,000 bales from Surat and 50,000 bales in AP line. Ac-

TATA-JOHNSON LIMITED ★ JAMSHEDPUR ★

THE DYNAMIC MAKERS OF

PULP & PAPER MACHINERY

TATA-JOHNSON LIMITED, are the leaders in the country in designing and supplying top quality equipment for the Pulp & Paper Industry.

STANDARD EQUIPMENT :

Stock Pumps - Hot Liquor Pumps - Chippers - Chip Screens Chest Agitators - High Speed Refiners - Jordan Refiners - Jönsson Screens - Black Liquor Filters - Pulpers - Vacuum Pumps Controllers. These and similar equipment are all supplied against Rupee Payment.

TAILOR MADE PLANTS :

Continuous Digester Plants - Batch Digester Plants - Blow Tanks and Blow Heat Recovery Plants - Brown Stock Washing Plants Bleach Plants - Black Liquor Evaporator Plants - Paper Mills.

The above type of plants are supplied with the highest indigenous content.

We are only manufacturing modern equipment as per our experienced collaborators' designs.

LEADING TYRE MANUFACTURERS RELY ON HARVEYS FOR THEIR INDUSTRIAL FABRICS!

Unbeatable quality and perfect construction have made Harvey industrial fabrics the first choice of leading tyre manufacturers like Dunlop, Goodyear, Madras Rubber Factory, etc. Today Harveys supply them, and countless other major industries, with a variety of essential fabrics from Tyre Cords and Jacket Ducks to Canvases.

Harveys step up their industrial fabric production!

The installation of additional new high-speed looms and up-to-date precision machinery—among the world's most modern—now enables Harveys to accept many more orders of varied character. Harveys can produce almost anything you require in industrial fabrics. They have the men, machines and know-how to manufacture material to the most rigid specifications. And relentless quality control throughout the manufacturing process makes Harvey industrial fabrics equal to the world's best.

cording to market circles, about 300,000 bales have been sold already in advance. The price rise is mainly attributed to the tendency on the part of the mills to go in for one specific variety of cotton. The Textile Commissioner is stated to be keen on taking some drastic measures in order to prevent a further rise in the prices of cotton. The preventive steps are expected to take the shape of requisition of stocks or sealing of specific cotton growing areas.

Governor on State's Progress

From Our Correspondent

MADRAS :

THE MADRAS State Government can be legitimately proud of the progress made in the industrial and agricultural sectors in the past decade. The Governor, Mr Bishnuram Medhi, stated when he addressed the Legislature last week, that his Government had made good progress with the different plan schemes and that the tempo of work had gained considerable momentum. Indeed, the budgeted outlay of Rs. 60 crores during the current year was expected to be exceeded appreciably, the actual expenditure being anticipated at Rs. 68 crores. On the basis of the progress already achieved and the ability of the administrative machinery to tackle the various projects, total expenditure can even be Rs. 325 crores against the original target of Rs. 291 crores. Out of the additional outlay of Rs. 34 crores, power projects alone are expected to account for an extra Rs. 11 crores. Irrigation projects also are being speeded up and construction work on the Parambikulam-Aliyar project has been greatly speeded up.

The achievements of the Madras State Electricity Board are noteworthy and the current year and next will stand out as an important landmark in its history. The larger outlay is due to the inclusion of some schemes which were expected to be taken up in the fourth Plan. Thus, Mettur Tunnel is scheduled to be completed in both its stages during the current Plan while an additional 30 mW set will be installed at the Basin Bridge thermal station. The Kodaiyar hydel project in Kanyakumari district, estimated to cost Rs. 8 crores, will also be implemented in the next few years while it is being examined how the various small falls can be harnessed economically. The first stage of the Mettur Tunnel Scheme will be completed in the latter half of this year and power from the first two sets may become available during the irrigation season. Some additional sets in the Kundah Project will also come on stream while power from Parambikulam will be available sometime later. The fourth unit at Periyar will also be constructed within a short period.

The addition to hydel generating capacity will, therefore, be appreciable and with the Neyveli station functioning effectively, the water storage in various reservoirs has been conserved. The position in Madras State is not so precarious as in Kerala where, as indicated last week, a cut of 40 per cent has come into force from January 15 and will last till the onset of the monsoon. As it is pointed out that consumption has increased by over 15 per cent in Kerala in the past year, it remains to be seen whether a further cut can be avoided. The supply of 20,000 kW of power from Madras is proving to be very helpful and the situation would be very much worse but for this arrangement.

Thermal Plants

In Madras, the difficult summer months are expected to be got over satisfactorily while it may be possible to supply larger quantities to Kerala later in the year. The Madras State Electricity Board is concerned at the present moment with its programme for the fourth Plan as apart from the installation of relatively small hydel power stations in Madurai and Tinnevelly districts, it will have to think in terms of erecting large-sized thermal units. The question has therefore, been asked whether it will not be more advantageous to expand the capacity of Neyveli thermal station to beyond 600 mW as only during the week it was reported that an agreement had been reached on the rate which will be paid for power supplied by Neyveli. It is now reckoned that the cost of power generation at the Basin Bridge station is 6 nP. per kWh while it is only 5.4 nP. per kWh and the actual rate that will be paid by the Madras Electricity Board will be only 5.2 nP per kWh. If the atomic power station is to be constructed by the Central Government and bigger expansion is decided upon at Neyveli, the Board will have to concern itself mainly with the construction of the Hogenekal hydro electric project on an inter-State basis and the development of such other reservoirs as can be carried out economically.

There are also indications that the State Government by itself may embark on some industrial schemes. The policy of helping new companies is being pursued vigorously besides creating the basic facilities in the form of industrial estates. Efforts are being made to float a shipping company in a big way. Only a few days back the South India Shipping Corporation Limited was formed with an authorised capital of Rs. 5 crores. It has been felt for a long time that a shipping company should be promoted by the industrialists in this State. The Madras Government are keenly interested in this new venture and are reported to be prepared to participate in the issued capital upto 20 per cent.

**

Considerable interest has been aroused by the announcement that Cochin Refinery Limited, which will be constructed in the public sector in collaboration with Phillips Petroleum of U.S.A.will be offering 1.04 lakh equity shares of Rs. 100 each for public subscription early next month. For a long time, it has been agitated that the investing public should be afforded an opportunity for their participating in the equity capital of oil refineries. But the three refineries in the private sector did not provide any such opportunity to Indian investors though they were asked to subscribe for debenture and preference issues. Since it is emphasised that the Cochin Refinery will be constructed at a much lower capital cost than its counterparts in the public and private sectors, and will have an initial capacity of 2.5 million tons, the prospect of subscribing to equity shares in this venture has been welcomed.

Meanwhile, it has been asked whether the owners of the existing refineries will be releasing for public absorption a part of the equity capital and whether a similar procedure will be followed in the case of the new refinery which is proposed to be set up in Madras. The offer of equity shares in Cochin Refinery was made possible by a pruning of the shares of Duncan Brothers Limited from 25 per cent to 2 per cent. In the case of the Madras Refinery, Esso is reported to have submitted a tempting offer to the Central Government accepting minority participation of 49 per cent. Whether the Central Government will insist on the same proportions as in the case of Cochin Refinery is not known. But Esso's offer has some special features as it is proposed to construct, besides a 2.5 million-ton refinery, a lubricating oil plant, an asphalt plant and also an integrated ammonia plant.

Esso has suggested besides that a fertiliser project and a 100 mW thermal station can be constructed using cheap fuels from the refinery. The assistance for constructing the various projects outside the refinery is to be provided on a 'no profit' basis. The prospect of a large industrial complex being developed near Madras is certainly encouraging inasmuch as the cost of the refinery is estimated to be 40 per cent lower than the cheapest refinery.

The moving finger writes

WE ARE, indeed, a very remarkable people. Not long ago everybody was asking who would be succeeding Mr. Nehru and when. Now, however, the question seems to be whether Mr. Nehru will be attending the Republic Day parade or not. Let me not be misunderstood. I am as glad as the next man that the Prime Minister is recovering fast, but I am not prepared to agree that his present illness should be treated as a minor and passing indisposition which need not make any difference to the leadership of the government. In the first place, the public is entitled to know what the real nature of his illness is and what the actual state of his health. In all democratic countries the state of health of the head of the government is treated not only as a matter of public concern but also as a matter of public interest and the usual practice is for all the relevant medical information to be made available to the public. This is important because where the highest office in the government is concerned, no power vacuum of any kind can be permitted.

★★

Last month the Finance Minister was telling a gathering of economists in Bombay that our economy could not become consumer-oriented. Rather predictably, Mr. Asoka Mehta repeated this statement a few days ago. I could certainly agree with them to the extent that saving and investment need to be specially emphasized for the purposes of economic development. At the same time, I should hesitate to discount consumption as a growth-promoting factor. After all, how is investment itself activated? When you ask a foreign investor or entrepreneur what aspect of the Indian economy appeals to him most, the answer invariably is that the attraction lies in its potentialities and prospects of mass markets for goods and services. The same motivation is present also in the case of domestic business. It is because there are chances of mass consumption being built up for a wide range of goods that it becomes worth while to invest capital in the industries which produce those goods. It is no doubt true that government direction of resources into certain specified industries, such as the capital goods sector, might for a time function independently of the ultimate consumption aspect. But even then the consumption factor cannot be indefinitely ignored.

The classification of industries into capital goods industries and consumer goods industries could, in certain contexts, be dangerously misleading. Even the products of the capital goods industries can be absorbed into the economic system only if there is a simultaneous and corresponding development of consumer goods industries. I am sure that Mr. T. T. Krishnamachari and Mr. Asoka Mehta would both agree that more steel and more cement would help economic development, but there is no point in producing more steel and more cement if more houses are not to be built with them and when houses are built their occupation and enjoyment give rise to a whole series of new consumers needs, such as, for instance, a demand for furniture. I am surprised that Mr. Asoka Mehta should have thought that the dynamic of consumption is a blessing reserved to a particular economic milieu, such as West Germany. I am sure that he has spoken often of "the revolution of rising expectations" in our country. What does that phrase mean except that people are becoming more and more conscious of consumption requirements which must be satisfied in an increasing measure?

As for the Finance Minister, he himself has lately been sponsoring so many social security measures. Surely the point of those measures is to make it possible for more and more people to raise their consumption standards. How can Mr. Krishnamachari advocate ever-increasing social welfare on the one hand, and an economy biassed against consumption on the other? I wish there had been more clear thinking on these issues. To my mind such difficulty as there might be seems to arise from the fact that some of us seem disposed to assume a conflict between consumption and investment which may not necessarily be there. It is, no doubt, true that at any given moment, where the available resources are to be taken as a fixed amount, consumption could increase only at the expense of saving and investment or 'vice versa'. But, where development processes are concerned, resources themselves acquire the character of a moving stream which is being constantly replenished as the various factors of growth act and react on one another and produce a total effect which is something quite different from the mere end-result of mechanical subtractions or additions. Over any but the shortest period (which really is not relevant to the development context), the available resources are not a static pool but a quickening river fed through the channels of economic activity as consumption activates production and more production sustains both increased consumption and increased investment.

★★

What is happening in Tanganyika? Our E.A. Ministry obviously does not know. The question is whether it cares. There have been disquieting reports of violence against the Indian community. Shops, it is said, have been looted and even lives, it appears, have been lost. It is strange that the E.A. Ministry here is conducting itself like the three Japanese monkeys. In any other country an attempt surely would have been made to take the public into confidence. But, here, no official spokesman has been heard to say anything. There have been no Press conferences and no Minister or senior official has gone on the air either. A lot has been said over the years about India's foreign policy — for or against. In the matter of protecting Indian communities abroad, I am afraid, we do not even seem to have tried to learn our business.

★★

We cannot surely have too many people speaking out for the things they believe in. I, therefore, welcome unreservedly Mr. Morarji Desai's decision to campaign publicly for prohibition. For the same reason I am glad that Mr. S. K. Patil has not hesitated to champion the other side. Such debates are, indeed, the stuff of public life in democratic communities and I am interested as well as amused to find that both Mr. Desai and Mr. Patil agree at least on the one point that prohibition has failed at the point of enforcement. Only, Mr. Patil argues that since prohibition is not enforced effectively, it must be scrapped, whereas Mr. Desai contends that, where a State Government has failed to enforce prohibition properly, it is not prohibition which should be made to go but the State Government. Both sound plausible and my own suggestion would be that let us, by all means, have prohibition when we have succeeded in finding a government which can enforce it. That should satisfy Mr. S. K. Patil, I think. Whether it would also satisfy Mr. Morarji Desai, I confess I do not know.

V.B.

Trade Winds

AIR FREIGHT REDUCTIONS

REPRESENTATIVES OF the member-airlines of the International Air Transport Association, who assembled at Miami in December last, had been able to reach complete agreement on reductions in trans-Atlantic cargo rate structure and levels. Rates which previously had been determined for a two-year period, from April 1, 1963, were re-adopted to apply from January 15 to March 31, 1964. New rates commencing April 1, 1964, subject to approval of interested governments, involve reductions at various weights on many commodities which comprise the major volume of trans-Atlantic air cargo traffic. The agreement also includes a variety of specially low rates designed to develop new traffic and afford the advantages of air transportation on a regular basis to shippers of many commodities which currently move by air only in limited quantities.

The new rates for the above and other items represent reductions of 15 per cent to 20 per cent, and much more in some cases, by readjustments of, not only the rates per kilogramme, but the minimum weights to which they apply. In addition, some experimental rates at low levels are directed at specific markets. General cargo rates remain at present levels and weights, descending from $2.50 per kilogramme, ($1.14 per pound) for shipments under 45 kilogrammes to 85 cents per kilogramme (39 cents per pound) for shipments in excess of 500 kilogrammes. Minimum charges for small shipments also remain as at present. Minimum rates for aircraft charters for cargo carriage are established at specified rates per mile by aircraft type. Under the formula agreed, the charter rates will amount to from 12 cents to 16 cents per available ton-mile, depending upon the type and capacity of the aircraft.

NO TARIFFS ON TEA

A tariff ordinance of the West German Finance Ministry provides that tea shipped in bulk to the Federal Republic of Germany is freed completely from external duties. The tariff on tea in packings of less than three kilograms each has been fixed at five per cent. The consumption is gaining ground in the Federal Republic of Germany. Present consumption is 8,500,000 kilograms annually. About 90 per cent of the total quantity of tea consumed in West Germany comes from India and Ceylon.

At the beginning of this year the price of tea in the Federal Republic of Germany fell by 2.35 to 3.00 D-marks per kilogram for different quality grades.

COFFEE AGREEMENT

The international coffee agreement has become effective. The rules of the agreement provide that it enters into force if the import countries which have ratified the agreement represent at least 80 per cent of the world coffee consumption and if the export countries wishing to join the agreement equally represent at least 80 per cent of the world coffee production. The coming into force of the agreement means that all measures on the settlement of the international coffee market and on the creation of a balance between coffee producers and coffee consumers agreed upon after protracted negotiations with the UN in October 1962 will become effective. The international coffee agreement is one of the first international raw material agreements aiming at a ceratin stabilisation of the world's raw material market.

FERTILIZER DEMONSTRATIONS

Large-scale fertilizer demonstration programmes were initiated in India in 1954-55 and since then a large number of demonstrations have been conducted every year by the Central Government, the State Governments and the fertilizer manufacturers. About two lakh demonstrations are being held out at present by all these agencies. In an interesting study entitled "Village Level Workers, their Work and Result Demonstrations", conducted under the auspices of the National Institute of Community Development, the shortcomings of official fertilizer demonstrations conducted by the village level workers have been described. It has been pointed out that (i) the village level workers are not equipped with enough technical knowledge and its sound applications, with the result that they often failed to meet the situation and this ultimately destroyed the base of the demonstrations; (ii) the workers did not appreciate the need for making the technical practices involved in the demonstrations precise, easy and clear enough to the farmers with the result that fertilizers lost their identity; (iii) late arrivals of fertilizers resulted in "top-dressing" demonstrations contrary to the schedule for using fertilizers; (iv) the workers' visits were not geared to any specific purpose and took place without any relation to any particular event or stage of the demonstration such as the time of application of fertilizers, etc. Many times farmers were not present at the time of these visits; (v) The economics of improved methods of cultivation was not adequately explained, with the result that the farmer tended to think "that one gets as much as one puts into his field"; (vi) no visual records such as photographs, specimens of stalks or sheaths of grains were kept and accordingly the results could not be shown to the farmers later on; and (vii) the workers did nothing to see that after the demonstrations were conducted, the practice was followed by the neighbouring farmers.

From the above, it is evident that quality is more important than quantity in any demonstration programme. A large number of demonstrations conducted without proper care and publicity are a waste. If a large-scale demonstration programme cannot be undertaken for lack of adequate staff, it is better that fewer demonstrations are conducted efficiently.

INDUSTRIAL CLEARING HOUSE

A clearing house for manufacturers who want things made and the firms who have engineering capacity to make them has been set up in London. It operates for firms within Britain and on a two-way basis between Britain and overseas. Foreign patent agents, chambers of commerce or individual companies, can be helped to produce new products under licence in Britain and British manufacturers can be helped in respect of production overseas. New products already handled on this basis range from large equipment for handling concrete to a special camera for underground inspection work. No product is too large or too small provided it involves engineering techniques.

The organization, known as the Engineering Capacity Exchange, 31, Queen Anne's Gate, London, SW-1, has already built up a massive index of basic information about British engineering facilities. Fees charged to member firms represent a fraction of one per cent turnover and a once-only charge of up to 1½ per cent is made to each sub-contractor on work introduced through the Exchange.

LUFTHANSA LOWERS AIR FARES

With effect from 1st April, 1964, and subject to Government's approval, Lufthansa German Airlines will drastically lower their air fares across the North Atlantic. The reductions go as high as US $190 in the first class and US $100.70 in the economy class. These concessions are valid all the year round except during the 10 weeks of high season traffic, i.e. between 22nd May and 3rd August (east bound) and 17th July and 28th September (west bound). The new 21-day return fare will also become effective from 1st April. For example, if a traveller wishes to go to the USA and spend minimum of 14 days there or a maximum of 21 days, his

round trip from Frankfurt to New York would be $99 cheaper than the normal round trip in the economy class. This concession is applicable during certain periods only and cannot be used for travels on weekends.

Incidentally, within the eastbound North Atlantic air cargo market, Lufthansa German Airlines moved up from sixth to fourth place during the first three quarters of 1963. The carrier increased its share among the 19 international carriers from 8.4 per cent during the same period in 1962 to 9.3 per cent this year. Its revenue cargo volume on this stretch rose 25 per cent, while the industry average increased by 13.2 per cent during this period. Lufthansa's best increases were registered during the months of January and April with gains of 60.5 per cent and 32.3 per cent respectively over the same months in 1962.

ECM & DEVELOPING COUNTRIES

In a lecture delivered this week under the auspices of L'Alliance Francaise de Delhi, Mr. A. Wendelen, Ambassador of Belgium in India, tried to remove the impression that the coming into being of ECM has discouraged the exports of developing countries. He referred to a study 'Indian Exports to Common Market' recently made (the study, incidentally, appeared in "Eastern Economist" dated January, 10) where it was indicated that India's exports to the EEC during April-August, 1963, increased by 28 per cent as compared to the same period last year. He hammered home the point that if dependence on aid was to be lessened, it could only be by bringing about an increase in exports. Although assistance to developing countries has been extended on a generous scale, Mr. Wendelen underlined that the selection of assistance targets based on political criteria is not conducive to best results. The present trend towards selecting beneficiaries of assistance through economic criteria seems much more promising.

INDO-BRITISH TRADE

In the annual report of the Far-East Section of the Manchester Chamber of Commerce released recently, it is stated that Indian tea is gaining popularity among the tea-loving people of Britain. The report notes that tea was the chief item in India's improved exports to Britain in 1963 which were worth Rs. 133 crores. Imports of tea to Britain in the first nine months of 1963 increased by 7 per cent to Rs. 51.9 crores. Textiles, yarns, fabrics and medium goods were also a big factor in improving India's export figure. They accounted for Rs. 22.6 crores — 10 per cent higher than the previous year.

British exports to India recovered during the period under review. The figure of Rs. 133.6 crores was Rs. 19.2 crores more than the figure recorded in the first three quarters of 1962. The trade has generally followed the pattern of recent years comprising machinery, vehicles, engineering and other capital goods.

SHOW WINDOW OF WORLD INDUSTRY

The German Industries Fair at Hanover is a typical multi-industry exhibition. On the one hand there are the producer and capital goods industries, around which the event centres and which can be broadly divided into electrical engineering, general engineering and machine construction, office equipment, iron and steel, tools, chemicals and plastics, precision engineering and optical equipment, and the building industry. Then there is an extensive display of consumer goods, covering 40 per cent of the exhibition area with 371,000 square metres. Among the more important branches of consumer goods production represented at the fair are porcelains and ceramics, glassware, hardware and metal-work, fancy goods, jewelry, clocks and watches, silverware, flatware and cutlery.

In 1964 the Hanover Fair is taking place from April 26 to May 5. Later on in the year two other prominent exhibitions will be held in the city. First, the 48th DLG-Exhibition —International Agricultural Show is opening on May 31 and lasting through June 7. On display will be agricultural machinery and equipment, livestock, and products for farming. It is being followed in the fall from September 20 to 29, by the Machine Tool Exhibition, at which many companies from Germany and other countries will be taking part. Almost simultaneous with the Hanover Fair, the German Aviation Show will be opening (April 24—May 3). This is an event at which the international achievements in aviation and space technology are reviewed for the specialist world and the general public.

INDO-CEYLON TRADE AGREEMENT

In the recent talks between Ceylon trade delegation and Indian delegation at New Delhi, measures for a smoother and quicker flow of goods on either side were discussed and details of the arrangements for the year 1964, more or less on the lines of those for 1963, were worked out, subject to ratification by the two Governments. The agreement for 1963 provided for the exchange of certain specified commodities like dried fish, cane jaggery and tamarind from India and, rubber and copra from Ceylon. The present agreement involves a volume of trade amounting to Rs. 7 crores out of an overall annual trade of about Rs. 52 crores both ways. The working of the agreement will be reviewed once in three months.

RUMANIA TO SET UP POWER PLANT

A Rumanian trade delegation which visited Chandigarh recently held discussions with Mr. S. S. Gill, Technical Adviser to the Industries Department of the Punjab Government regarding the setting up of a thermal power plant at Hissar. The Rumanian delegation is led by Mr. Gheroghe Leonte, Director of the Rumanian Ministry of Foreign Trade. It is estimated that the project may cost Rs. 1 crore. The plant may be commissioned side by side with a pig iron plant at Hissar early in 1966 if the Rumanian offer is accepted by the Government of India. It is likely that a decision may be arived at regarding this project by the end of this month.

SPECIAL SAVINGS ACCOUNT

The introduction of special savings account at the branches of the First National City Bank at Bombay, Calcutta, Madras and New Delhi is a step in modernising banking facilities in this country. Personalised cheque service will be available to all savings account holders of the Bank with the name of the depositors printed on each cheque. This facility till now was available only to preferred current account holders. Another facility of current account extended to special savings account is the mailing of machine posted statements every quarter.

SOVIET TRACTORS FOR INDIA

The Kharkov tractor plant will produce 700 wheel tractors for India in 1964. The plant has already produced the "first machine" to be sent to India. They have been produced keeping in mind the tropical conditions in India. The Kharkov tractors are considered to be the world's best in their class and they were awarded a "diploma and a gold medal" at the Brussels Fair.

WORLD JUTE OUTPUT

According to a report prepared by the U.S. Agricultural Department, world production of jute last year totalled an estimated 4,855 million lbs.—100 million lbs. below the figure of 1962. An increase of 93.2 millin lbs. in India's output of jute was offset by respective decreases of 200 million lbs., 7.5 million lbs. and 1.8 million lbs. for Pakistan, Burmah and Thailand. India and Pakistan put together now account for only 94 per cent of the world production of jute as compared to 96 per cent in 1961 and 98 per cent in 1960.

HOW THE LABEL 'SANFORIZED' CAN HELP TO STEP UP TEXTILE EXPORTS

Indian textiles are a major earner of foreign exchange; the export of cotton cloth in 1961-'62 added Rs. 48.39 crores to the nation's coffers. Exports will expand still further as new foreign markets are being tapped. Only textiles that are competitive in quality as well as price can hold their own in tough world markets. Indian mills are producing increasingly better quality cloth and the label 'Sanforized' is helping them to do so. The trademark is an international word denoting a uniform standard of shrinkage control. Millions of consumers in 49 countries look for the label 'Sanforized'. It is known and trusted on every continent.

Such a label, recognised the world over as synonymous with quality, can help to increase exports of India's cotton fabrics, and enable them to earn more and more foreign exchange.

Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark 'SANFORIZED', or permit its use by authorised registered users, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay 2.

Company Affairs

UNITED COMMERCIAL BANK

THE DIRECTORS of the United Commercial Bank Limited have good news for its shareholders. They propose to recommend at the next annual general meeting the issue of bonus shares of Rs. 50 each for every 14 shares held. This bonus issue will be financed by capitalizing a part of the premium on shares. All this, of course, will be subject to the sanction of the Controller of Capital Issues.

The bank has reported an increase in the net profit from Rs. 73.33 lakhs to Rs. 76.43 lakhs for the year ended December 31, 1963. The Directors have proposed to maintain the dividend at 12 per cent, less tax, but on the increased capital. Adding Rs. 18,992 (Rs. 2.07 lakhs) brought forward from the previous account, there is an available sum of Rs. 76.62 lakhs (Rs. 75.40 lakhs). From this, the following appropriations have been made: Rs. 2.26 lakhs (Rs. 2.15 lakhs) for donations to the National Defence Fund and others; Rs. 17 lakhs (Rs. 28.00 lakhs) for reserve fund; Rs. 4 lakhs (same) for gratuity trust fund and Rs. 19 lakhs (16.50 lakhs) for bonus to staff. After paying the dividend which absorbs Rs. 33.60 lakhs against Rs. 24.56 lakhs, there is a balance of Rs. 75,942 (Rs. 18,992) which is carried forward to next year.

TELCO PLANS

Telco hopes to be the first among the automobile manufacturers in this country to achieve 90 per cent indigenous content in its Tata-Mercedes-Benz trucks. The encouraging note was struck by Mr. Moolgaokar, Director-in-Charge of the company, at a press conference arranged here last week to introduce to newsmen Mr. Walter Hitzinger, Chairman of the Board of Directors of the Daimler-Benz Corporation of West Germany, the concern which is collaborating with Telco in the manufacture of these trucks.

Mr. Hitzinger revealed that Telco would be turning out trucks at the rate of 1,500 nos. per month by July next and at the rate of 2,000 nos. a month in another two years' time. A licence for this capacity had already been received by the company. The 90 per cent indigenous content in these vehicles is likely to be achieved by July-August, 1964.

Mr. Hitzinger had talks in the Capital with the Union Minister of Finance, Mr. T. T. Krishnamachari, and the Minister for Steel, Mines and Heavy Engineering, Mr C. Subramaniam. Telco's expansion programmes came up for discussion at these two meetings. The company is stated to have put forward two new projects having an immediate bearing on the development of road transport in India. No details of these schemes, however, are being given out. The proposal to manufacture passenger cars at Telco, it is understood, was discussed only informally in view of the Government's disinclination to license any new unit in this line till the existing manufacturers are able to expand their production to the economic levels.

The expansion of Telco's truck manufacture to 24,000 nos. per annum should help in cutting down production costs. But Mr. Moolgaokar parried questions in this regard saying that the first thing to be done was improvement in specifications. Reduction in the price of trucks, he further pointed out, depended on various other factors such as labour and raw material costs, over which the management had little control.

UNION CARBIDE

The President of the Union Carbide Corporation of the United States, Mr B. Mason (Jr.) indicated here last week that his company's subsidiary, Union Carbide (India) Limited was interested in expanding its activities further in this country. They are already putting up two new plants—Carbon Arcs Plant and Midget Electrodes Plant—at Cossipore, near Calcutta. Plans are under way to set up an Acetylene Plant (capacity approximately 2 million lbs. per annum) at Trombay. The former two units are expected to go into production later this year. The Acetylene Plant may be commissioned next year.

The company also expects to expand manifold in the near future, the present output from its 60,000 tonne high severity naphtha cracker at Bombay. Currently, it is producing at this plant four chemicals—Butyl Alcohol, Butyl Acetate, Acetic Acid and Ethyl Acetate. Production of five more chemicals has been planned here. These are: Ethyl Hexanol; Dioctylphlate, Benzene, Propylene and Ethylene.

Mr. Mason opined that nationalization of banks in India is bound to create apprehensions in the minds of foreign investors who at present consider this country a good market for investment.

STATE BANK

The State Bank of India has made a net profit of Rs. 274.82 lakhs for the year ended December 31, 1963 and with Rs. 45.67 lakhs brought in, the disposable amount is Rs. 320.49 lakhs. The directors have transferred Rs. 55 lakhs to reserve fund, Rs. 8.61 lakhs to pension fund, Rs. 82 lakhs to bonus to staff, Rs. 5 lakhs to staff welfare fund and Rs. 5 lakhs to staff co-operative housing fund. A dividend of Rs. 23 per share, including the interim dividend of Rs. 10, has been recommended which will absorb in all Rs. 129.37 lakhs. The balance of Rs. 35.51 lakhs has been carried over.

CANARA BANK

The Canara Bank Limited has shown considerable progress during 1963. After provision for bonus to staff and taxation, the bank recorded a net profit of Rs. 24 lakhs against Rs. 15.44 lakhs for the previous year. The directors propose to maintain the dividend of 15 per cent on increased capital which at the end of 1963 was Rs. one crore against Rs. 75 lakhs in 1962. Deposits registered an impressive increase from Rs. 50.88 crores to Rs. 72 crores. Advances during the same period went up from Rs. 26.93 crores to Rs. 42 crores. Investments at the end of the year were also higher at Rs. 20.64 crores against Rs. 17.80 crores last year. Reserves increased from Rs. 76 lakhs to Rs. 1 crore.

BANK OF MAHARASHTRA

The directors of the Bank of Maharashtra Limited have proposed to maintain the dividend at nine per rent for the year ended December 31, 1963. The additional capital of Rs. 10 lakhs issued during the year also ranks for pro rata distribution. The profit, after making all necessary provisions, amounts to Rs. 9 lakhs against Rs. 8.43 lakhs earned last year. The directors have transferred Rs. 5 lakhs to the dividend reserve out of which the proposed dividend is to be paid. Its deposits have grown from Rs. 24.76 crores to Rs. 29.45 crores and advances have risen from Rs. 11.83 crores to Rs. 14.87 crores. Investments have also increased from Rs. 9.50 crores to Rs. 13.43 crores.

SYNDICATE BANK

The name of the Canara Industrial and Banking Syndicate Limited has been changed to Syndicate Bank Limited since January 1, 1964. The registered office of the bank has also been shifted to a new building at Manipal, a town about three miles from Udipi, South Canara District, Mysore State. The existing share certificates of the bank with the shareholders will continue to be valid and it is not necessary to get the new name of the bank endorsed immediately on the share certificates or deposits receipts, pass books, cheque books

or other documents with the public. The new name will be impressed or endorsed on these documents when received by the bank in the ordinary course.

DEVIDAYAL CABLE

Devidayal Cables Industries Limited — a company engaged in the manufacture of cables and wires—proposes to enter the capital market on January 27 to offer for public subscription 250,000 equity shares of Rs. 10 each and 100,000 redeemable cumulative preference shares (9½ per cent) of Rs. 10 each. The new capital issue is of Rs. 37.50 lakhs comprising 275,000 equity shares and 100,000 preference shares, out of which directors, their friends and associates have taken 25,000 equity shares. These funds are being raised to finance the proposed expansion in the manufacture of super enamelled paper covered and cotton covered wires and strips and the new units for the manufacture of steel, alloy steel and glass insulated wires. After the expansion programme, the annual turnover will exceed Rs. 2.3 crores. It is indicated that the company has been granted provisional exemption under the substantial expansion clause wherein 6 per cent of a substantial portion of the share capital and reserve will be exempt from the tax.

ANDHRA SUGARS

The Andhra Sugars Limited entered the capital market on January 20, with a public offer of 100,000 equity shares of Rs. 10 each to finance its caustic soda, chlorine and hydrochloric acid unit. The subscription list was to be closed on January 25 or earlier but not before January 22. The authorised capital of the company is Rs 1 crore dividend into 700,000 equity shares of Rs. 10 each and 30,000 preference shares of Rs. 100 each. An amount of Rs. 80 lakhs in equity and preference shares has already been subscribed and paid-up. The present issue is at a premium of Rs. 3 per share and is underwritten. The project to be located at Kovur in Andhra Pradesh is estimated to cost Rs. 2.1 crores. Plant and machinery required will be obtained from East Germany, Japan and the USA.

DEEPAK INSULATED CABLE

Deepak Insulated Cable Corporation Limited proposes to enter the capital market after three months with a public issue of Rs. 20 lakhs. It has an issued capital of Rs. 30 lakhs in equity shares of Rs. 100 each out of which Rs. 10 lakhs have been subscribed by the promoters and their friends. The company has been formed to manufacture all kinds of copper wires. It has an initial annual licensed capacity of 650 tons of enamel covered copper wires and 200 tons of double and triple paper covered copper wires and strips. The total capital outlay on the project is esitmated at Rs. 55 lakhs. The factory to be located in Bangalore is expected to go into production by the middle of the next year. An agreement has been signed with the Furukawa Electric Company Limited of Tokyo for technical collaboration.

GLASSTEK LIMITED

Glasstek Limited — a new company formed jointly by the Investment Corporation of India Limited, a Tata concern, and Pfaudler Permutit Inc., of the USA — will undertake the manufacture of Pfaudler glassed-steel, alloy process equipment, ionac water and waste treatment equipment and chemicals at its factory in Chinchawd near Poona. It has received an indusrtial licence for the production of goods worth Rs. 94 lakhs every year out of which glassed-steel equipment will be worth Rs. 55 lakhs. The indigenous content of the products will be about 75 per cent initially to be raised to 90 per cent. The authorised capital is Rs. 1 crore and the initial issued capital Rs. 60 lakhs. The foreign collaborators will own 50 per cent of the share capital, the Investment Corporation of India Limited 25 per cent and the balance will be offered for public subscription. The company is likely to meet the demand for highly specialised process equipment in chemical, pharmaceutical and allied industries. It will also export its products to the Middle East and South East Asia.

VOLTAS RIGHTS ISSUE

The directors of Voltas Limited propose to issue right shares to the existing shareholders in the proportion of two new shares for five existing shares at a premium of 25 per cent subject to the sanction of the Controller of Capital Issues. After meeting all expenses and providing for depreciation, bonus to staff and setting aside Rs. 9.80 lakhs to staff gratuities, it recorded a profit of Rs. 178.87 lakhs for the year ended August, 1963 as against Rs. 137.48 lakhs in the previous year. The directors have provided Rs. 94 lakhs for taxation against Rs. 71 lakhs last year. A sum of Rs. 18.31 lakhs has been separated towards general reserves, Rs. 1.57 lakhs towards development reserve, Rs. 3 lakhs towards staff gratuity reserve, Rs. 36 lakhs towards additional taxation reserve and Rs. 36 lakhs towards dividend reserve. The directors have recommended the payment of the dividend of Rs. 14 per share, less tax, the same as last year, which will absorb nearly Rs. 35.70 lakhs.

INDIAN OXYGEN

Indian Oxygen Limited has launched a major expansion programme covering various projects at a cost of nearly Rs. 6 crores spread over four years. The British Oxygen Company Limited has agreed to give a sterling loan of £500,000 for the projects. In addition to using the internal resources, the company will require finance to the extent of Rs. two crores. The Punjab National Bank Limited has agreed to lend this sum as a medium term loan subject to the consent of the Controller of Capital Issues.

Sales of the company increased from Rs. 8.88 crores in 1961-62 to Rs. 10.21 crores during 1962-63. The profit also improved from Rs. 1.35 crores to Rs. 1.40 crores. The smaller rise in the profit was partly because the provision for depreciation had to be higher and partly because the production of electrodes was held down by an acute shortage of core wire. The taxable ordinary dividend of 12 per cent has been repeated. Provision for taxation absorbed Rs. 69.34 lakhs. A sum of Rs. 19 lakhs has been separated towards development rebate reserve, Rs. 69 lakhs towards general reserve and Rs. 59.66 lakhs towards depreciation.

GREAT EASTERN SHIPPING

The Great Eastern Shipping Company Limited during the year ended June 30, 1963 carried larger freight so that the freight and charter hire earnings stood around Rs. 4.51 crores as compared to Rs. 3.25 crores last year. The gross profit, before providing for fleet depreciation, development rebate reserve, etc., amounted to Rs. 126.41 lakhs as against Rs. 74.30 lakhs last year. The net profit was Rs. 57.24 lakhs.

The directors have proposed to increase the company's paid-up capital from Rs. 90 lakhs to Rs. 135 lakhs and issued capital from Rs. 120 lakhs to Rs. 150 lakhs. In view of this proposal for capitalisation of reserves, the dividends have been proposed to be skipped over. Bonus shares are being issued in the proportion of one fully-paid equity share of Rs. 10 each for every two fully-paid equity shares held. The directors also recommend that proportionate benefit may be made available to holders of partly-paid equity shares. These recommendations will be implemented after the sanction of the Controller of Capital issues is received.

At the end of the year, the company's investment on fleet amounted to nearly Rs. 10.26 crores. It has acquired five ships at an approximate cost of £1.3 million or Rs. 1.75 crores and has also placed orders subject to the approval of the Government, with a Japanese shipyard for building a bulk carrier of 36,000 tons with an option to build a second bulk carrier at an approximate cost of Rs. 2 crores for each of them. These carriers are to be used for bulk cargoes like ores and foodgrains.

BARODA RAYON

During the year ended September 30, 1963, the Baroda Rayon Corporation Ltd. registered substantial progress. Its rayon plant was formally inaugurated by the President towards the end of December 1962, and its auxilliary plants — sulphuric acid, carbon di-sulphide and power plants — were also commissioned in October. 1962. By the end of June, 1963, the teething troubles experienced by the power plant were overcome and the rayon plant also attained its rated capacity of 6.25 metric tonnes per day on 100 denier basis. The directors have pointed out that being a high cost one, it has submitted to the Tariff Commission that it cannot afford to give away a substantial part of its production under distribution control order at the rate fixed by the Textile Commissioner and has urged the Tariff Commission to recommend higher prices for their new high cost unit. The company has received an industrial licence to increase its production capacity of rayon yarn by 1½ tons on the basis of 100 denier. A licence for the import of additional machinery required to implement this expansion is awaited as also its application for an industrial licence to put up a plant to manufacture 20 tons of staple fibre per day.

J K STEEL

During the year ended June 30, 1963, J. K. Steel Ltd. attained a record turnover of Rs. 176.2 lakhs as against Rs. 113.76 lakhs in the previous year, showing an increase of about 55 per cent. The rise in the turnover has been reflected in the gross profits which, before depreciation, stepped up to Rs. 32.37 lakhs this year as against Rs. 23.23 lakhs in the previous year. Consequently, the directors have proposed the payment of a higher dividend of 15 per cent on equity shares as against 10 per cent paid last year. The directors add that the results would have been still better had it not been for the unsatisfactory position of the supply of raw materials, shortage of power and non-revision of the retention price of jute baling hoops.

It is indicated that the company is going ahead with its expansion programmes. The electric hoist and chain pulley blocks plant have already been installed and will start production shortly. Progress is also reported in the expansion of wire rope project of the company. The Industrial Credit and Investment Corporation of India have sanctioned a loan of Rs. 36 lakhs and orders have already been placed for the plant and machinery. It is hoped that the expansion programme materialises in a year's time. The company has further obtained industrial licences to (i) expand its cold rolling mills for production of additional 4,800 tons per year and (ii) to manufacture electric overhead travelling cranes.

CAPITAL ISSUES

Four companies have been authorized to raise fresh capital aggregating Rs. 4.42 crores. Of these, one is issuing capital worth Rs. 2.54 crores and offering the entire issue to the shareholders on 'rights' basis. Three companies are issuing equities and preference shares. One of them involves foreign collaboration.

The consent of the Controller of Capital Issue is valid for one year in all cases.

ACC-Vickers-Babcock Limited, Bombay, will be issuing Rs. 254 lakhs equity capital in shares of Rs. 100 each for cash at par to be offered to the shareholders of the company on 'rights' basis. The money will be utilised for meeting the increase in custom duty, rise in prices of equipment already planned, additional balancing equipment now required for boiler plant, additional housing for workers etc., and establishment of an engineering institute for training apprentices in metal working trades.

Shama Forge Company Limited, incorporated in the State of Delhi, is to issue capital of Rs. 70,00,000 divided into 5,00,000 equity shares of Rs. 10 each and 20,000 preference shares of Rs. 100 each, to be issued for cash at par excepting 2.16,500 equity shares to be offered to Kropp Forge Company, Chicago (USA) against supply of reconditioned plant and machinery etc. The capital will be utilised for setting up a new industrial undertaking for the manufacture of mild and alloy steel forgings.

Jeewanlal (1929) Limited, Calcutta, is to issue capital of Rs. 78 lakhs divided into equity shares of Rs. 48 lakhs and Rs. 30 lakhs in 9½ per cent cumulative redeemable and convertible preference shares. The capital is required for the establishment of a new aluminium rolling mill at Madras at a total estimated cost of Rs. 241 lakhs.

Ashoka Paper Mills Limited, Calcutta, will be issuing capital of Rs. 40 lakhs divided into Rs. 25 lakhs in equity shares and Rs. 15 lakhs in preference shares. The capital is required for the completion of the project for the manufacture of paper and pulp at their factory at Sarkalighat, Bihar.

BOOKS BRIEFLY

Digesting the Indigestible

Elements of Indian Income Tax: By R. N. Lakhotia; Price Rs. 6.

Practical Problems on Income Tax: By the same author; Price Rs. 9.

Both published by Asia Publishing House, Calcutta.

Reviewed by "J"

BOTH THE BOOKS under review have an exceedingly modest aim. They are meant primarily as text books for under-graduates and students of law doing an elementary paper on the law relating to the taxation of income in India. Within the limits the author has set for himself, he has succeeded admirably in his task. It is not easy to present in an easily digestible form the involved provisions of the Indian Income Tax Act without altogether ignoring or blurring the many subtle distinctions that the language of the enactment gives rise to. Mr. Lakhotia has succeeded in a large measure in this hazardous enterprise. He has wisely avoided discussion in too great a detail of conceptual conundrums like capital and revenue in income and expenditure, the nature of "receipts" and of "remittances" of income, the treatment of income with different places of accrual and a hundred other problems that have made tax law the most fruitful field for legal ingenuity. Nor has he entered into provisions that have complex accountancy and legal implications like the taxation of foreign companies and of companies in which the public are supposed to be not substantially interested. Discussion of these topics would merely have confused the beginner who needs a not too intimidating introduction to the basic concepts. The procedural part of the law is also treated rather pertunctorily since the books are meant for examinees rather than assessees. But on the substantive law, there is adequate discussion and detailed illustration. The several modes of assessments of different kinds of income and assessees, and the broad categories of exemptions and rebates are dealt with lucidly and concisely. The second book in particular will be found very useful by students since it has worked out in detail a number of representative hypothetical assessments. In these examples trouble has been taken to illustrate specific points of law that have been settled by judicial interpretation.

The fact that both the books have run into several editions in a short time is a measure of their usefulness. The latest editions, have taken note of the extensive revision made in the law in 1961. Since the changes made in the recent codification are more in the manner of presentation and arrangement than in substance, the original conceptual structure is largely intact. This has made the author's task of revision easy. But wherever important changes have been made, they have been discussed adequately. There is also a useful chapter on the Super Profits Tax and the CDS in relation to income tax payers, which still survives. Mr. Lakhotia's presentation is lucid and unpretentious and not burdened with needless erudition. Both the books are therefore sure to provide a painless introduction to a difficult subject.

VARIED FARE

American Labour Review: Special Edition: Published by the American Embassy, New Delhi; Pages 128.

THIS SPECIAL edition of the 'American Labour Review' containing a variety of articles provides a good insight into developments in the labour field in the United States. Taken from previous Labour Reviews, the articles depict the growth and structure of labour movement, labour-management relations and the role of government in the field of labour. As a matter of fact, there is hardly any aspect of the labour problems which does not come under the purview of these articles. The articles on development of collective bargaining, voluntary arbitration, report on automation and the work of the National Labour Relations Board are specially interesting. Photographs included are apt and well chosen. Ambassador Bowles' message on Labour Day observed since 1894 is inspiring. The lay-out and get-up of the special edition is excellent.

The programme of workers' education is brought out clearly in the article, "Techniques and Methods in American Union Education". Workers' education programme covers a wide range of subjects relating to Union administration, collective bargaining, economic and social problems and international affairs. Week-end seminars in this context are quite popular. In some cases, workers' education programme is conducted in co-operation with State universities. Workers' education programme in India being in a nascent stage, we could definitely draw some lessons from the way the workers' education is progressing in that country.

Readers' Roundtable

NATURE OF DEMOCRACIES

Sir, — 'Eastern Economist', dated November 29, 1963, has published (pp. 1115-1116) the text of the Andrews Memorial Lecture delivered by Mr. C. Rajagopalachari on November 22, 1963. The second paragraph of the article begins with this sentence: "Constitutions refusing freedom of action to none but a single party which has seized power are not democracies." The meaning of this sentence, either literal or implied, is that Constitutions which refuse freedom of action to none except the party in power are not considered as democracies. This, surely, could not have been what the elder statesman had meant in this regard. Constitutions are to enable the party in power, whichever one it may be, provided it has faith in a written Constitution, to govern the country through a government. But no party in power would be able to govern if freedom of action is denied to it. Surely, one cannot think of a Constitution providing freedom of action to all and denying or refusing the same to the party in power.

New Delhi. V. V. SUBRAHMANYAM.

Mr. C. Rajagopalachari writes:

"In the first place 'none but' is a mistake that has slipped in by oversight, the double negative being the pitfall. It should be 'Constitutions refusing freedom of action to any party but the one which has seized power'. This however is not what has puzzled Mr. V. V. Subrahmanyam. 'Freedom of action' has been misunderstood by him. What I meant by 'freedom of action' is the right to function as a political party. I am of the view that if as in Soviet and certain other countries, no political parties can function publicly except the ruling party, it is not a democracy even though it may call itself by that name.

"Mr. V. V. Subrahmanyam has obviously misunderstood freedom of action to mean the right to govern. Of course the party that has won in the elections has the right to govern. But in democracies other parties should have the right to function and grow."

ANNOUNCEMENT REGARDING THE PROPOSED ISSUE OF CAPITAL

This is only an announcement and not a Prospectus and persons interested are requested to ask for a copy of the Prospectus for full details.

BHARAT STEEL TUBES LIMITED

(Incorporated as a Private Limited Company on 20-11-1959 under the Companies Act 1956 and converted into a Public Limited Company on 29-8-1962)

Registered Office: **14-15F, Connaught Place, New Delhi-1.**

EXISTING AND PROPOSED ACTIVITIES OF THE COMPANY

The Company was incorporated with the objects stated in the Memorandum of Association and with the immediate object of setting up a factory for the manufacture of Steel Tubes and Pipes, both galvanised and black within the size range of 3/8" to 6" diameter for the flow of gas, water, steam, oil and petroleum, with an annual installed capacity of 36,000 tons per shift.

The Company, besides producing Steel Tubes and Pipes to I.S.I. specifications, will also produce to certain specifications laid down by A.P.I. (American Petroleum Institute) to contribute towards the speedy execution of projects in the country, where pipe lines are required for various purposes.

The Company has concluded Financial and Technical Collaboration Agreement with Messrs. Abbey Etna Machine Co., Perrysburg, Ohio, U.S.A., for providing U.S. Dollars one million in the form of equity capital, besides technical know-how and services at all stages of the project. The Company has secured the necessary foreign exchange loan and import clearance, required for the purpose.

LOCATION OF THE INDUSTRY

The Company has acquired, through the Government of Punjab, approximately 130 acres of land in Ganaur (Near Railway Station) in the State of Punjab, about 35 miles from Delhi, to locate the industry.

RECORDS AND STATISTICS

Cooley Fund Loans for Indian Industry

THE UNITED STATES Information Services have brought out an informative and illustrated brochure entitled "This is the Key", which states simply and effectively how a portion of the US counterpart funds in India, accruing from the sale of commodities given as aid to this country under United States Public Law 480, are utilized. Funds are loaned from it to private firms under certain conditions. The textual matter of the brochure, reproduced in full below, describes the procedure and conditions for the issue of these loans.

"This key, labelled Cooley Fund Loans, unlocks a door to economic growth by providing critically needed development capital. Additionally, it encourages American private investment in India which supplements aid provided by the Government of the United States and brings to India the know-how of a highly efficient industrial America which has provided for the American people the highest standard of living in the world without sacrificing their personal or political freedom.

For agricultural commodities sold to India, United States Public Law 480 (US-PL 480) allows payment in rupees. To encourage the investment of dollars in India by private American industry, an amendment to this law, sponsored by Congressman Cooley and known as the Cooley Amendment, provides that a percentage of these rupees may be used by the United States Government for loans to private firms in India which are affiliated with American firms or to Indian firms which assist in marketing American agricultural products.

Contributing Factor

Under the Cooley Amendment, the United States Agency for International Development (AID) is authorised to make loans to Indian firms and their American participants for undertakings that will develop industry and expand trade. The availability of rupees which can be loaned at reasonable rates of interest is a contributing factor to American participation in the developing of a modern industrial India. The amount of the rupees reserved for Cooley Fund Loans is fixed by agreement with the Government of India. The interest rate is currently 7 per cent per annum conforming with interest rates prevailing in India for comparable development loans.

Both existing and new Indo-American ventures may apply to the Government of the United States for a Cooley Fund Loan. Enquiries should be addressed to the Office of Programme and Finance, Agency for International Development, New Delhi. The United States requires that the recipient company have a significant American participation in its equity. Applicants must state the amount of the proposed loan, and the desired repayment period; the general objectives of the proposed loan, including the kind and amount of products or services that would result; the total cost of the proposed activity; the additional equity investment contemplated and the funds to be borrowed from sources other than AID. Investigations of the project and liaison with the Indian firm are carried out by AID-India and recommendations are forwarded to Washington, D.C. The loan application is either approved or rejected by the Government of the United States in Washington. At the same time, the views of the Government of India are sought and the loan is granted only if there are no objections. Rupees are disbursed under approved loans in this manner: United States Government to Agent Bank to the Indo-American firm. The loan, plus interest, is repaid in the same manner — firm to Agent Bank to the Government of the United States.

PL 480

Under U.S. Public Law 480, up to 25 per cent of the agricultural commodities sales proceeds may be used for Cooley Loans. This has varied from agreement to agreement; in some cases the full 25 per cent has been set aside for Cooley Loans and in other agreements none of the proceeds have been allocated for this purpose. The average amount under all agreements in India to date is 7 per cent. As of June 30, 1963, there is still Rs. 56.39 crores available for additional loans.

By helping to open the door to economic development in India through financial assistance to private industrial enterprises, the United States is supporting an economic system which has proven that it produces abundantly and steadily. Cooley Fund Loans encourage investment in India by American firms interested in a volume of profit resulting from a volume of sales — not high profits per unit. The search is for a modest profit per unit with large sales over a long period of operation in a climate of economic stability. Cooley Fund Loans are a key to bringing America's store of knowledge, equipment, methods and capital as impetus to the industrialization of India."

Up to the end of December, 1963, 38 industrial enterprises had been authorized Cooley Fund Loans, totalling Rs. 37 crores (Rs. 37,07 lakhs) or $77.8 million. Details of the loans and of disbursements which amount to Rs. 15.9 crores (Rs. 15,91 lakhs) or $33.4 million are given below :

COOLEY CREDITS AS ON DEC. 31, 1963

(Entries within brackets under Column (3) are Dates of Authorization of Loan Agreements)

Primus Inter Pares?

THE PRIME Minister has displayed his innate good sense in what he has done as much as in what he has not done. The suggestion made in certain quarters that Mrs. Indira Gandhi should be drafted to the Central Cabinet as Minister for External Affairs betrayed poor judgment, if not a certain lack of decency. If the implication was that Mr. Nehru needed to be baited thus into gradual withdrawal, the thought was hardly fair to him. If, again, the argument was that the Prime Minister would not have sufficient confidence in any other person where this important portfolio was concerned, the insinuation would be equally unfair to many senior Congressmen, whether in office or presently out of it. Quite possibly, the name of Mrs. Indira Gandhi might have been thrown up in the misguided impression that there was a risk of Mr. Krishna Menon being thought of and, consequently, there was need for a "Stop Krishna Menon" strategy. We do not believe that the ex-Defence Minister could be resurrected at all. As for Mrs. Indira Gandhi herself, she enjoys in her own right a high standing in the public life of this country and should she ever choose to serve the nation in an official capacity, both the privilege and the responsibility could be hers in a perfectly normal manner and without special pleading of any kind.

The re-appointment of Mr. Lal Bahadur as Cabinet Minister has met with general approbation. His leaving the Government last year — Kamaraj Plan or no Kamaraj Plan — was a mistake, not only on his part but also on the part of others who let it work out in that manner. There must at all times be sufficient political ballast in the composition of the Central Cabinet and Mr. Lal Bahadur's low physical poundage surely belies his political weight. If, as is sensible and likely, some kind of collective leadership is to take over after Mr. Nehru, Mr. Lal Bahadur might well be found to be the most eligible "non-candidate" for the role of *primus inter pares*. Meanwhile the arrangements so far announced relating to the functioning of Mr. Lal Bahadur as Minister without Portfolio are obviously incomplete. It is perhaps natural that this should be so since over Mr. Nehru's plans for himself there still hangs the more or less eternal question mark, which has now been underlined by his decision to ask Mr. Lal Bahadur to assist him in his Prime Ministerial and other Ministerial responsibilities, while allowing Mr. Nanda to continue to enjoy the privilege of presiding over Cabinet meetings in the Prime Minister's absence. Such a situation, inevitably, has its disadvantages. We, however, hope that they will not prove too crippling of initiative in the Congress leadership. On Mr. Lal Bahadur, perhaps, more than on any other senior Congress leader, has fallen the important, but unenviable responsibility of striving for a smooth transition. This is an obligation which is bound to be embarrassing to him in many ways, but which will nevertheless have to be discharged with wisdom and courage in the interest of the nation. His immediate task will no doubt be to act as an under-study to the convalescing Prime Minister. But that, surely, cannot be his most important task. On the contrary, he must now engage himself in building up a sufficiently solid team in terms of political status and administrative expertise. This, of course, is not a job for him alone, but a job to be shared with the Congress President, the Central Parliamentary Board of the Party and the various State Chief Ministers. It is a task which has to be undertaken sooner or later and the sooner it is attempted the better are the prospects and possibilities of Mr. Lal Bahadur and the Congress President receiving all the co-operation that they must have from their colleagues in the leadership of the Party as well as from the Party as a whole.

The Giant and the Dwarf

THE SYMPOSIUM on the "Importance of Family Planning in the Context of India's Development" which the Indian Chamber of Commerce, Calcutta, conducted last week is symptomatic of the spreading concern in informed circles over the consequences of the giant growth of population dwarfing such economic growth as we may be able to achieve through the five-year Plans. Interest in the population problem has lately been active. There was, for instance, the Asian Population Conference held here last December under the auspices of the Economic Commission for Asia and the Far East. That Conference naturally viewed the population problem in its regional context. The ECAFE region incorporates about 54 per cent of the world's population into one-sixth of the world's land area. Some 67 per cent of the region's population — and over one-third of the world's total — live in two countries, China and India. In each of the three countries — Indonesia, Japan and Pakistan — live more people than in any country outside the region except for the Soviet Union and the United States. The ECAFE Conference was prompted by the feeling that population growth and rapid rural-urban migration were having adverse effects on the region's economic development. Censuses taken around 1960 had shown that the region's population growth rate was accelerating and could be expected to increase still further during the present decade. The Conference underlined the fact that the achievement of an annual growth rate of five per cent in aggregate national income by 1970 in the developing countries (which is one of the basic goals of the United Nations Development Decade) depended to a large degree on the extent to which population increase could be prevented from eating up economic gains.

Within the enormous womb of this Asian population problem, India's own population puzzle is spread out in monstrous proportions. As the Indian Chamber of Commerce, Calcutta, has noted, next to China India is the most heavily populated country in the world. It has to support about 14 per cent of the world's population with but 2.3 per cent of the world's total land area. A World Bank document presents the situation even more graphically:

"The presumed rate of India's population — less than 0.2 per cent a year between 1881 and 1921 — was 1.2 per cent a year between 1921 and 1951 and rose to 2.1 per cent a year during the past decade. The acceleration is the combined result of a very sharp decrease in the mortality rate with no change in the fertility rate. Despite the substantial drop over the last 30 years, the mortality rate of the Indian population is still high and should reasonably be expected to continue falling for some time. Fertility has not increased but is not likely to fall spontaneously until the per capita income has reached a level far beyond the reach of the Indian economy for the next two or three decades, or until the bulk of the population moves away from the rural areas, which is equally out of the question in the foreseeable future.

"Recent official projections of Indian population show a dramatic explosion between 1961 and 1976 when population is assumed to grow at an average rate of 2.4 per cent a year. A net increase of 187 million people is forecast by 1976 which would bring the total population to 625 million. By that time the population of working age would be about 100 million greater than now, and the likely increase in the labour force is in the region of 70 million, which is equal to the size of the present total labour force of the United States and two-and-a-half times the size of the labour force of Britain. Clearly, the task of providing employment for all this additional manpower is well-nigh impossible.

"As far as the employment problem over the next 15 years is concerned, little can be done now apart from stepping up investment in the economy, since the entire addition to the labour force that will be seeking employment by 1966 has already been born. But action is still necessary to prevent the position from deteriorating further after that date. In any case, the prospective growth of population poses many other problems besides employment. The primary object of economic development is to raise consumption per head. In doing so, there is no sense in concentrating exclusively on measures to raise production while ignoring measures to check population. The huge existing population of India means that a failure to slow down the rate of population increase would in the long run be disastrous."

There has recently been impressive Indian endorsement of this diagnosis. Thus, inaugurating the Asian Conference on Population on December 10 last, the Prime Minister pointed out that, if the alarming growth of population in India and other Asian countries were not checked, it would ultimately lead to all kinds of tremendous political and social conflicts. On the following day, Mr. G. L. Nanda, presiding over that Conference, admitted that the impact of economic growth on the standard of living in this country had been rendered negligible by the constant addition to the population. Earlier this month, Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, addressing the fifth All-India Conference on Family Planning, held in Patna, emphasized the disagreeable truth that unchecked population could and did make a mockery of the best plans for India's economic growth. He pointed to our recent experience which has shown that a rapid rise in the number of people "can use up increments in income that would otherwise have been used in the provision of education and productive equipment — that is, intangible and tangible tools of growth."

The question now is: where do we go from here? Having recognised the gravity of the problem, are we essaying a solution which could be regarded as realistic and adequate? It ought to be said at once that the gains made so far are certainly encouraging. After all there are very few governments which have adopted population control as a deliberate act of policy. The Government of India has the distinction of belonging to the select few which have done so. This in itself is a major advance. Secondly, not only has the policy been adopted but its implementation has been included among the more important programmes of the five-year Plans and its financial and organisational requirements made a charge on the nation's resources. This too is a considerable step forward. Thirdly, a recent review of the family planning measures taken in the last 10 years has indicated that widespread awareness of the need for family planning has been created in the country and that simultaneously an organisation is being evolved to provide instructions as well as contraceptives to the people.

One very encouraging factor is the responsiveness from the people. Studies on family planning practices and attitudes show that 70 per cent of adults desire a limited number of children at an interval of from three to four years. About 75 per cent women of 30 and above with four children appear to be ready to learn family planning methods. Even in rural India between 10 and 20 per cent of married women have some knowledge of contraception. A recent National Sample Survey round showed that the average number of children born in urban areas was 2.6 when the wife was Intermediate, 4.2 if Matriculate, 4.5 if Middle School and over 6 if illiterate. Nearly 70 per cent of urban husbands are aware of family planning methods, 27 per cent have knowledge of at least one method and 12 per cent have used some method, while 14 per cent were found indifferent. An analysis of cases at eight Central Health Service clinics in Delhi during 1955-58 showed that in 1,515 cases the pregnancy rate was 63 per 100 before use of contraceptives, but came down to 9.6 per 100 after use, which meant a reduction of pregnancy rate by about 85 per cent. During the period 1955-61 the birth rate for an experimental population of 8,000 in Singur near Calcutta was reduced by 18 per cent from 1956 level or about 14 per cent when compared to the 1961 birth rate of the controlled population.

Rather remarkable has been the response to the facilities made available for free voluntary sterilization. In 1956 the number of operations reported was 8,753 (2,333 male and 6,420 female). In 1962 this number increased to 129,514 (96,418 male and 33,096 female). From January, 1956 till the end of November, 1963 over 400,000 people have been operated, including over 250,000 males. It is possible, however, that these figures are conservative. In any case, in limited areas the recourse to sterilization operations has certainly been of impressive proportions. One district has reported for two consecutive years the achievement of the target of 5 sterilization operations for one thousand persons in each year. Some other districts have done nearly half as well.

The number of centres where contraceptives and advice on their use are now available is over 9,000, including over 7,000 in rural areas. The off-take of diaphragms has gone up over 19 times, condoms about 125 times, jellies seven times and foam tablets 31 times since 1956.

All these developments bring into bold relief two very significant factors. One is that the people as a whole are inclined towards family planning and that where education, instructions and facilities are being provided, they are not only being availed of but are also being reflected in the moderation of the fertility rate. It follows, therefore, that this country, its people and its Government are entitled to take a positive view of the practicability of an organised nation-wide family planning programme and its vast potentialities. At the same time, it is necessary to realize that the scale on which the family planning effort has so far been carried out or is evidently being proposed to be carried out in the future may not be adequate in terms of the challenge posed.

As the World Bank report points out, of all the countries that have consciously attempted to control

Eastern Economist 20 Years Ago

FEBRUARY 4, 1944

The most disquieting feature of the economic conditions in our country is perhaps the progressive deterioration in the occupational distribution in the face of the great pressure of population on our economy in recent years. The net reproduction rate in our country cannot be properly calculated from existing data but the absolute growth in our population during the last inter-censal period has been at the enormous rate of about 5 million per annum. In the face of this terrific pressure of population, our economic system has failed to show sufficient growth of classification adopted in the earlier censuses; it has been estimated that the percentage of population dependent on agriculture has been steadily increasing from 61.1 in 1891 to 65.5 in 1901, 72.2 in 1911, 73.0 in 1921 and 75.0 in 1931. In an old, thickly populated country the scope for extension of the area of cultivation has been limited, food production has been unable to keep pace with growth of population, and the pressure on soil has been progressively increasing. Ours has been predominantly an agricultural country and the rate of growth of industries has been totally unable to check the "progressive ruralization" or lift the excessive pressure on land . ..... The experience of the last two decades has made it abundantly clear that the vicious circle of our rapidly deteriorating demographic and economic trend could be broken only by determined and concerted measures of heroic dimensions and "small means do not merely produce small effects; they produce no effects at all". The dimensions of the Bombay Plan have to be judged not by the insignificant efforts of programmes of a Government unused to thinking in a big way, but by the essential adequacies of our demographic-economic set-up.

increasing population, Japan is the only one that has done it on a scale even faintly comparable with what is required in India. The Deputy Chairman of the Planning Commission recently claimed in Patna that funds would not be a bottleneck. We are not so sure. It is true, of course, that a petty provision of Rs. 65 lakhs for family planning in the first Plan was stepped up to Rs. 5 crores in the second and has been raised further to Rs. 27 crores in the third Plan. It is also true that during the first three years of the third Plan the amount utilised has not added up even to Rs. 10 crores. In this sense, perhaps finance is not immediately a bottleneck. But it does not follow that the Government has in fact provided enough finance for an adequate family planning drive. The small financial provision, as a matter of fact, reflects the absence of "big thinking" on a positive population control policy. The point is that the large organisation needed for an adequate family planning effort should be conceived in sufficient dimensions and the financial provision should be matched with it. Only then can it be truthfully said that finance is not a bottleneck.

In the World Bank report there is the interesting observation that "it has been estimated that expenditure of up to Rs. 600 per prevented birth would be a cheaper way of attaining a given level of per capita consumption in India over the next two or three decades than comparable investment in activities needed to generate the extra income that would otherwise be required. On this basis, an annual average investment of Rs. 200 crores a year on measures to restrain the growth of population over the next 15 years could be justified if it resulted in reducing the rate of increase in population by one-third". We are today providing roughly some Rs. 2,000 crores a year for development expenditure. The amount of Rs. 200 crores a year for family planning which is mentioned in the above passage would amount to 10 per cent of our total development expenditure. Even if we cannot at once find funds on this scale for family planning programmes, we should at least make available, to start with, some Rs. 50 crores annually if our intentions of dealing with the population problem are to be taken seriously at all. A financial provision of that order would, of course, directly imply that the programme itself should be so drawn up and implemented that the utilisation of the funds would be at a rate and on the scale assumed in the provision.

Once the finance is provided, it will be necessary to think of the organisation that would employ the money effectively. Here we should give up thinking in terms of a few thousand field workers and start organizing in terms of some hundreds of thousands of field workers who, among themselves, could reach a significantly high percentage, say, about 60 per cent, of the adult population in the country over the next five years.

Then comes the question of the contraceptives and contraception techniques which are to be selected for mass propagation. At the present time, family planning propaganda and facilities are concentrated on chemical and mechanical contraceptives, with some marginal attention being given to voluntary sterilization. In our view this approach will have to be considerably revised. We publish elsewhere in this issue a review of a report on contraception techniques which was brought out last year by "Which?", a consumer research organisation in Britain. This study has made it clear that there is a wide choice in contraceptives and contraception techniques. Given the massive dimensions of our population problem, it is only reasonable that the family planning campaign should be a multi-pronged attack which would use every weapon and instrument in its armoury. At the same time, for concerted effort over a short period of time, a certain degree of selection has to be exercised.

We have no doubt that propaganda and facilities relating to chemical and mechanical contraceptives should continue on a large scale and schemes should be undertaken on a high priority basis for the large-scale manufacture of chemical and mechanical contraceptives in the country. There are currently many crash programmes for the expansion of production of essential or scarce commodities. A crash programme for the manufacture of chemical and mechanical contraceptives does seem entitled to such special attention. Secondly, a bolder and more positive approach than is presently prevailing should be adopted towards the popularisation of surgical sterilization. As we have mentioned earlier, sterilization has already found a certain measure of acceptance and this advantage should be vigorously pursued by the government family planning machinery as well as the voluntary organisations associated with it.

Unfortunately, there has been some confused thinking here and an attempt has been made to mix up questions of voluntary sterilization and State-regulated eugenics. We strongly protest against this muddled thinking. The question of selective human breeding does not at all enter the picture at this stage. What we have to deal with is a simple quantitative problem of population and our only concern ought to be to select and concentrate on all the practicable techniques which could reduce the overall fertility rate in the short period. We are sure that current official or officially-sponsored family planning schemes, where the popularisation of sterilization is concerned, are still unnecessarily feeble or apologetic. Between wholly voluntary sterilization and State-enforced compulsory sterilization, there is a wide area where positive propaganda and persuasion could play a legitimate role in influencing people and their attitudes. We strongly recommend that decisive advice in favour of sterilization should be given in all cases where there are already two children in the family

and it appears unlikely that the parents concerned would or could regularly accept the discipline of mechanical or chemical contraceptives.

Some token money grants are already being given to those who volunteer for sterilization. It should be possible to increase the amount offered. We would recommend a graduated scale beginning with, say, Rs. 200, where sterilization is undergone after the second child and proceeding with progressively smaller sums for larger families until a minimum of Rs. 50 is reached. Again, free sterilization operations are at present being performed only in government hospitals or other public or semi-public hospitals, apart from special hospitals run for the benefit of their employees by industrial or other establishments. It is worth considering whether private medical practitioners with the appropriate qualifications should not also be brought into the scheme so that individuals who go to them would be entitled to the incentives admissible. Under this arrangement the Government would of course bear the operating surgeon's fees. Here, it is interesting to recall that, long before surgical sterilization was given the publicity that has now become its, the operation was not by any means uncommon in, for instance, Bombay City where, in the late Forties, it was in fact known among mill workers as "the sixty-rupee operation", the "sixty rupees" being the fee usually charged by the surgeon. Perhaps this amount could now be adopted as the standard payment by the Government or local bodies for surgical sterilization operations carried out by private medical practitioners. Incidentally, some enlightened business houses have started the practice of giving special increments to staff who volunteer for surgical sterilization. This is an example which should certainly be emulated widely and here is a matter where industrial managements and trade unions should co-operate to the benefit of the workers.

The World Bank document to which we have referred earlier, had mentioned the impressive Japanese effort in population control. The legalisation of abortion has played a prominent role in that effort. In this country, however, there has been a certain squeamishness even in discussing this matter. We are unable to understand this. In almost every country in the world where abortion is illegal, a certain number of abortions, nevertheless, take place clandestinely. This is also the case in this country. Here, in the Capital, for instance, many family planning clinics do certainly undertake this operation on the sly and both the medical profession and authorities are winking at the practice. The disadvantage in this situation is that, where expert medical assistance is sought, it has to be paid a very high fee commensurate with the risk which the surgeon takes in violating the law. It appears that as much as Rs. 300 per surgical abortion is being demanded and paid in this country. This places an intolerable and entirely unnecessary financial burden on middle or lower middle class families which choose to seek this particular solution of their own individual population problems. Worse still, where abortion is illegal, the temptation to go to quacks and back-street practitioners is strong. The amateurish and unhygienic operations which are performed under such conditions constitute a grave hazard to life or health. Surely, there is no reason why in any civilized community a more rational attitude should not be adopted towards surgical abortion.

It is, of course, necessary to take steps to discourage abortion being adopted as a regular substitute for other methods of family planning. But where an unwanted pregnancy has occurred, it is desirable that the family planning agencies should render all assistance and facilities to the mother desiring its surgical termination. In such cases certain conditions could be insisted upon. For instance, abortion could be legalized where the mother already has two children living and where the mother or the father is prepared to undergo surgical sterilization. In such situations, the public health services or specially scheduled private medical practitioners should be authorised to perform surgical abortions, consistent with maximum protection to the mother's life and health, at a moderate fee which, in special circumstances, might be met fully or in part out of public funds provided for the family planning schemes. It must be realized here that in many countries, notably Britain, informed opinion is buildng up in favour of legalising abortion and a country such as ours, which has a colossal population problem to deal with, cannot afford not to consider this matter rationally.

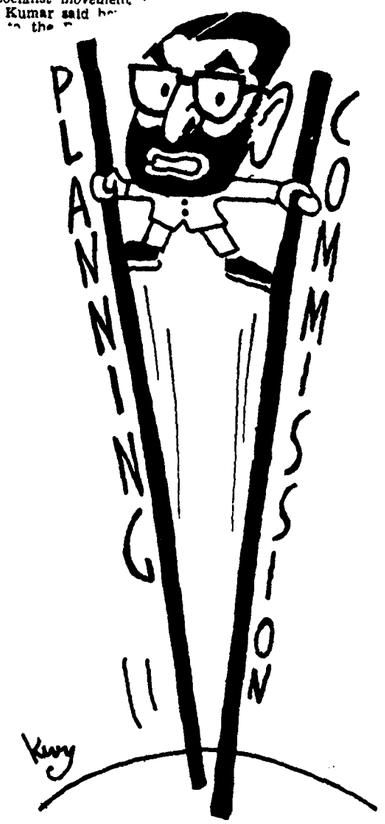
Finally, we come to the highly interesting theme of oral contraceptives, more popularly known as "birth control pills". These pills have now definitely left the phase of experimentation behind and are being produced on a commercial scale and used by large communities in quite a few parts of the world. There are three questions which arise in connection with the pills: (a) whether they are effective; (b) whether they are safe; and (c) whether they are economical. On the first two points answers already obtained are quite reassuring. On the third, the situation is fast improving.

About the effectiveness of birth control pills no reasonable doubt exists now. According to authoritative medical opinion, based on large-scale statistical studies, the pills have been successful in reducing the chances of unwanted pregnancies to about one in one hundred. On one important question whether the pills are a health hazard, it was recently stated at a meeting in New York of the American Chemical Society that there is no evidence that the pills increase the chances of embolisms or blood clots or that they have any effect on blood pressure. Rather interestingly, several helpful advantages seem to have been experienced by regular users of the pills. For instance, marked reductions in the development of varicose veins

have been reported as also greater cyclic regularity attended, in the majority of cases, with reduction in discomfort or pain. A three-year study of several hundred women, it is claimed, has shown that the development of uterine cancer among those who use the pills regularly is only about one-third that of non-users. It is also reported that there is evidence that the pills may stimulate the activity of thyroid glands, an important regulator of metabolism. Finally — and this is a double-edged effect — the pills have "a pregnancy rebound effect", that is, if a woman discontinues using the pills she has twice as great a chance of becoming pregnant as a non-user.

We now come to the cost factor which is critical to the issue of popularisation of birth control pills through Government subsidy in a vast and poor country such as ours. Currently eight different compounds have been widely tested and are being made available to millions of people. Already growing competition among manufacturers and steady improvement in production methods have succeeded in lowering costs which now seem to range between Rs. 18 and Rs. 25 per month per user. So far as families with incomes of Rs. 500 or more per month are concerned, an expenditure of even up to Rs. 25 per month for the avoidance of unwanted children may not only not be regarded as an unreasonable imposition but could be reckoned as an exceedingly profitable investment, or, rather, insurance. This is for the simple reason that raising even one additional child would make a much deeper dent on family finances than Rs. 25 per month.

In the case of what may be described as "middle-middle" or "upper-middle" classes, it should be possible for the State to popularise oral contraceptives by subsidizing them for an initial period of, say two years in respect of each couple after which that family might be expected to buy them in the market in the normal way. Once the habit is established and its effectiveness is shown, such families may generally be expected not to give it up. In the case of lower-middle class families and the still poorer sections of the community, the Government should not hesitate to undertake a large-scale programme of subsidies. If the argument is accepted that this country could afford to spend up to Rs. 50 crores a year on family planning and, in fact, cannot afford to do less, a massive subsidization of oral contraceptives becomes a reasonable part of national population control policies and programmes. It is of course desirable that steps should be taken to organise the manufacture of oral contraceptives within the country and here we should take whatever assistance is available or can be made available by other countries, either through their governments or through their pharmaceutical industries and from the various international agencies, such as the World Health Organisation. The important point is that we should stop regarding oral contraceptives as still an experimental proposition and boldly accept the experience of other countries as a basis for our employing this aid to family planning as one of the main means of population control in this country.



Finally, we cannot too strongly emphasize that it is just not enough if we have the conviction that the growth of population in this country should be drastically controlled. We ought to have the courage of our conviction as well and proceed to take all those measures which promise to be effective in achieving a substantial moderation of the fertility rate of our people. There is no room here for sentimentality. On the contrary, we should be savagely realistic. Population control, indeed, is an issue of life or death for the nation and no government or individual has the right to deny to the nation its right to survive.

Asoka Mehta accused of creating personality cult

PATNA, Jan 16 (PTI)—Mr Sisir Kumar, Joint Secretary of the All India Praja Socialist Party, today accused Mr Asoka Mehta of trying to build a new personality cult in the Socialist movement [illegible]

Mr Kumar said he [illegible] of "responsive cooperation with the Government.

"In view of the decision of the party (asking Mr Mehta for having [illegible]

Highlights of the Week

THE REPUBLIC

THE ANNIVERSARY of the Republic, more solemn than festive, induces the historical mood. Pageants and parades are, of course, a necessary reminder for the mass of the people who have either no access to history or cannot meaningfully recall the events that gave the State of today its political character; a reminder, too, that the obligation to the authority represented by the State has been the highest since the time of Aristotle and before is rooted in Man's innermost nature. The Government of the day gives reality and content to the concept, but the State itself can do no wrong. While the achievements of Government add to this stature of the State, it lies beyond indiscretion and misdemeanour. In that role, the parade and the pageant are indeed an attribute of sovereignty. That is the simple and truthful rationale for the "overheads" of government of which cavilling criticism speaks so often. For the same reason also, the occasion ought never to be misused by those in power who can only add but not take away from the State. The thought at once justifies and limits.

The historical mood must be used with caution for memory is not Man's most creative faculty. Of course, literature is in a sense the art of remembering and memoirs have a place in the literature of a nation. Mr. Sri Prakasa, for instance, usefully remembers that it was on the 26th day of this month in 1929 that the Indian National Congress pledged itself to Purna Swaraj. It is useful to return to history, re-learn and reflect on our origin and so refresh the mind, beset as it is with the confusion of practical affairs, so that we may be truer to our nature and our character. Thinkers in the United States thus often speak reverentially of the Founding Fathers and their intentions — a posture of the mind in which it becomes easier to resolve the conflicts and uncertainties of the present. Our own Republic Day is marked by the advent of the Constitution which we gave ourselves on this day in 1950 and by which we seek and consent to govern ourselves.

Without postulating a state of nature, it is easy to see that the monarchy was the first organized natural authority to emerge. Man's cupidity soon ended personal rule, which perhaps best accorded with the temperament and needs of civil society of the time. Either because a ruler lost touch with or defied the interests of his people or more venally, because of a failure of imagination, he soon encountered resistance to his authority. In some places, however, the hereditary monarchy even survived while kings over a period of time assented to and acquiesced in legitimate and just limits to their power until they eventually became no more than symbols. The Republic is, however, the more natural correlate of democracy which, as the President emphasized the other day, does not believe in the infallibility of an individual or a group. The Republic has its origin in less happy circumstance for assistance to authority in the name of a principle always throws up a plurality of representative leaders. For us in India, however, it is a happy thought that our republicanism was not marred by any hatred of monarchy but simply seemed to us to be the most natural form of political organization in our own times. It is thanks to Gandhiji that the day of our freedom as indeed the anniversaries of that occasion and of the Republic, are remarkably free from any hatred that so burden and narrow the mind. Mr. Rajagopalachari, one of our elder statesmen, rightly pointed out that the republicanism of the Congress did not suffer from any negative relationship and reflected the truly democratic character of the struggle for independence. There is no call to dramatize but for the first time after 1950, the Government of India ceased to be an ornate superstructure over a society to which it was quite unrelated. Within a short time the idea of civil government spread to remote villages creating a new sense of identity and belonging.

The fifteenth Republic Day was an occasion for mixed feelings. The Prime Minister, whose illness caused much anxiety, is now well and watched the parade, which he has done regularly for fifteen years now. The assassination of President Kennedy is still remembered in this country with shock and indignation at the "senselessness" of it all and admiration for the cause of liberalism which he so helped to enrich. Along with Mr. Khrushchev, he boldly helped to create a climate of international peace which is especially valuable to the underdeveloped world. The danger of further aggression on our northern borders appears to have receded, but the Chinese have intensified diplomatic manoeuvrings in the capitals of the world. There has arisen the periodical crisis in Indo-Pakistan relations. If Chinese misbehaviour revealed grave weakness in our defence, the "mid-term appraisal" showed up the faults in our planning which still has to justify and establish itself in this country. If the idea underlying the Republic is to be realized, life must become more meaningful in the villages which is where — let us remind ourselves — the bulk of Indians still live. What difference has the Republic made — on may well ask — to agriculture in this country?

One perhaps ought also to mention the Bhubaneshwar session of the Congress for in many ways it was a unique one. The leaders in this country have still to learn the simple art of relating pious intention to social action; folk wisdom suggests the ideal adjustment which consists in doing more and talking less. It was surely a most unconventional Republic Day message that came from the President: "...the tolerance of our society for weak, inefficient and unclean administration is not unlimited....We have barely made a beginning at transforming ourselves into a modern industrial society". Who is the accuser? And who the accused? We may not pause for an answer.

AIR's AGRICULTURAL EXTENSION WORK

AN INTERNATIONAL seminar was held last week in New Delhi under the auspices of FAO to discuss the techniques of broadcasting used for agricultural extension work. The seminar, which was paid for by the National Committee of the Australian Freedom for Hunger Campaign and the Oxford Committee for Famine Relief and was attended by delegates from the predominantly agrarian countries of the Far and Near East, helped, as Mr. Swaran Singh pointed out, to emphasize the common pre-occupation of the participants. They are all poor countries whose populations are excessive in relation to their unexploited resources and are dependent, for the most part, on the land for a living. Subsistence agriculture is the rule and physical productivity low. The diet of urban and rural people alike is starch-based and deficient in animal proteins, minerals and vitamins. Dietetic experts believe that these deficiencies lead to apathy and indifference in the mass of the people which are a primary cause of inefficient exploitation of natural resources. These people are underfed because they are poor which, in turn, makes them less efficient — the classic vicious circle. The countries, which grow food for the market, do so with the aid of highly developed fertilizer and agricultural engineering industries whose production is sufficiently large for their products to be inexpensive. Advanced agriculture is, to speak metaphorically, aided by an invisible infra-structure consisting variously of cash subsidies, cheap, if not free, education and research in agriculture.

The preparation of the farmer in developing countries for risk-taking, commercial agriculture need not, thanks to audio-visual aids such as the cinema and the radio, wait on the fruits of policies designed to spread literacy and education although the latter alone can furnish an abiding solution in

the long run. For India, the farm forum programmes of AIR, inaugurated 25 years ago and further expanded and strengthened under a UNESCO project in 1956, have sought to carry the light and findings of science from the laboratory to the farm. In 959, there were 8,000 rural forums in the country (to be increased to 25000 by 1966) in which farm broadcasts having a distinctive listener-bias are listened to by large groups of people. These broadcasts disseminate scientific information which cater for felt needs and include programmes intended to entertain and inform. The follow-up work is entrusted to extension staff (village-level workers in India) who watch the farmer, help him and refer his difficulties back to the extension and broadcasting centres. It is true that the success of AIR programmes has evoked international attention and that, from all accounts with which the delegates to the seminar were regaled, all the agencies on the spot associated with agriculture work in perfect co-ordination although they function under the control of a number of ministries of the State and Central Governments.

THE PEACE CORPS IN INDIA

MR. R. SARGENT Shriver, Director of the US Peace Corps, who was recently visiting India to discuss Peace Corps affairs with Planning Commission officials among others, declared that the number of volunteers in this country would be increased from 168 to 250. While their aggregate number was to be increased from 3800 to 7200 in the 46 countries where these volunteers were deployed, these would be used primarily to concentrate existing strengths rather than to extend the programme. At a Press Conference in the Capital, Mr. Shriver claimed that the volunteers were doing a fine job and that their morale was high.

We owe the Peace Corps to the liberal inspiration of the late President Kennedy who set up the service in March 1961 for the benefit of developing countries. Since December, 1961, when the programme was inaugurated, 193 persons have been here. Twenty-five of them completed their 21-month tenure last autumn before leaving and the remaining 168 are still here doing valuable work in such diverse fields as poultry-farming, animal husbandry, agricultural extension, nursing, teaching and physical education. These trained Americans have volunteered for a variety of social and educational tasks, go where they are needed, live and work with the common people whom they seek to help. Incidentally, they function as simple unofficial ambassadors of their country, uninhibited by diplomatic or consular discipline, both in their work and personal lives.

According to Mr. Shriver, the Peace Corps seeks (a) to provide qualified volunteers in developing countries so as to meet some of their needs for skilled man-power; (b) to create a better understanding of American people among the nations abroad; and (c) to provide a better understanding of other people to the Americans.

EAST AFRICA

FOLLOWING THE Zanzibar coup, disturbances broke out in Tanganyika, Kenya and Uganda where two thousand mutineers from the Army rioted for higher pay. The three new members of the Commonwealth promptly appealed to the British Government for help and Nairobi reports dated January 25 say that the riots had been put down. Both Mr. Kenyatta, Prime Minister of Kenya and Mr. Julius Nyerere, President of Tanganyika, broadcast to their respective nations during the emergency. Mr. Kenyatta refused to deal with the mutineers and President Nyerere declared that "no popular Government can tolerate an army which disobeyed instructions". On January 24, Sir Alec Douglas-Home said in a television interview in London that it "looked very likely" as though Communists were behind the disturbances in East Africa. Earlier, the American State Department was reported to have denied that Cuba nationals had had a hand in the Zanzibar incident. The Tanganyikan Government issued a statement on January 27 to say that there was no evidence to suggest that Communists had anything to do with the events, in the East African mainland, of the previous week. On January 26, Russia had warned that any "forcible acts" towards the new Zanzibar regime "by those who do not wish to abandon their former colonial privileges" (Britain clearly in this case) would be "full of dangerous consequences". These are the published facts about the East African situation in which developments have been rapid during the last week, but the highly personal accounts that continue to emanate from Dar-es-Salam, Nairobi, London and elsewhere often hopelessly contradict one another.

As was argued in an earlier issue, the events in East Africa, as indeed those in the entire African mainland itself over the last twelve months, can be explained in terms of the low standards of living of Africans and of their expectations heightened by the attainment of independence without invoking incitement by Russia or Cuba. For instance, Communist aid in Guinea and Ghana was not as well received as one might have expected. In some of these countries, Indian nationals, who are traders for the most part, have been involved in these incidents. Yet it would only be fair to acknowledge that President Nyerere insisted, even before his country became free, in the face of opposition from his followers that people of any race who chose to become Tanganyikan citizens should be free to do so. Only recently he ordered that discrimination in favour of Africans for civil service appointments in the country should cease.

On January 27, he called for an emergency meeting of the Organization for African Unity to discuss the grave danger created by Army revolts in East Africa. The Organization of African Unity was formed during the conference at Addis Ababa, in May last, of the heads of 34 independent African States. However, one cannot evade the truth that the Addis Ababa organization for African unity is still inhibited from any constructive action by a number of contradictory forces and pressures brought to bear on it.

LEFT OUT!

Fatigue and Industrial Efficiency—II

RAJA RAM JAIPURIA

(The first part of this article appeared in the issue of "Eastern Economist" dated January 24.)

UNNECESSARY FATIGUE, however, can be thought of as that decreased capacity for work which is caused by unfavourable conditions of work and can be greatly reduced. Over-exertion is one such that comes readily to mind but it is by no means the major condition. Others that are relevant to the reduction of fatigue are postures, inadequate ventilation, uncomfortable temperature, cramped working spaces, insufficient or glaring illumination and resulting eye strain, excessive noise and vibration, uncomfortable clothing and lack of sanitation and rest-rooms. In short we can say that there is a correlation between working conditions and fatigue. To make working conditions favourable, proper ventilation, normal temperature, adequate humidification, adequate lighting arrangements and a comparatively noiseless place of work are needed. Studies on time and motion have shown that, with economy of movement, achieved by eliminating unnecessary movements, fatigue can be reduced and efficiency increased.

It sometimes also happens that, because of boredom, monotony and lack of interest, fatigue sets in. Ordinarily, men like work and if they do not, it is more because the psychological and social conditions of work are unsatisfactory than because there is anything wrong with the workers. The fatigued worker first experiences loss of interest in his work followed by boredom. If he continues working, he experiences increasing annoyance and irritation and finds it impossible to carry on even with the greatest amount of effort. Production is adversely affected and the output reduced. That fatigue also predisposes the individual to illness or accident or neurosis has been shown by experiments.

Influencing Factors

One's working environment is an important aspect of one's vocational satisfaction. Admittedly fatigue results from work and so cannot be eliminated. But proper setting of pace as by a long-distance runner will enable one to maintain a good level of production throughout the day. Control of industrial fatigue can increase production, decrease waste of materials, reduce accidents and save days lost due to illness. Fatigue is caused by muscular work more specifically by contractions which are so rapid that certain chemical changes take place faster than their reverse action which can bring about recovery. Fatigue, therefore, is accumulated; the longer one works, the more fatigue products accumulate and the less energy is available. The theory sometimes advanced that fatigue will be relieved if one changes the activity is obviously false. If one is genuinely tired — not so much bored as cramped — nothing but rest will suffice for restoration.

Modern methods of production have lightened the burden of human toil, but have not reduced fatigue in the worker. In the competition of sensitive nerve and muscle with the insensitive, the former succumbs to the evergrowing demands of a mechanism that knows neither time nor tiredness. According to Mosso, "Machines are not made to lessen human fatigue as poets were wont to dream; the velocity of the flying wheels, the whirling of the hammers and the furious speed at which everything moves: these things tell us that time is an important factor in the progress of industry and that here in the factory the activity of the workers must conquer the forces of nature."

With the introduction of machinery and the specialization of labour, it has become possible considerably to increase the speed of the individual worker. Mechanical aids to increased speed are supplemented by piece-rate and other financial incentives which further urge on the worker. The increased tension under such conditions of work appears to offset the savings in muscular force made possible by the machine. Tension, speed, specialisation of work and rythm uncontrolled by the individual cause fatigue, characterised by "a decreased power to work, decrease in pleasure taken in work and decrease in the enjoyment of the hours spent away from work".

Social Consequences

With the objective effects of industrial fatigue, in the form of decreased production, increased spoilage of work etc., are combined certain less tangible but equally real adverse influences on individual and social affairs. An individual's entire emotional nature may change under the effects of continued fatigue. Things which were important tend to become trivial and trival things take on undue importance. The "cross" behaviour so commonly observed in the fatigued child is duplicated in the unreasonable attitudes and the changed behaviour-patterns of the adult under the influence of fatigue. "When a man is tired out, he not only broods darkly but he does not think clearly. He does things he would not do when rested. He is easily depressed. He readily imagines injustices. He cannot turn his mind from imaginary wrongs against himself to focus it upon the wrong in what he is doing. Worst of all, a tired man is as quick to anger as he is slow and stupid in thought... An angry man does without hesitation things which he would never do when he is in his right mind." Much labour unrest and hostile employee-employer relationship may be due to grievances, and injustices thus imagined. If employee-employer relationship is to be made more cordial the influence of fatigue should be reduced to the minimum.

A physically exhausted worker is incapable of performing adequately the functions of the head of the household. This applies not only to the manual worker, but is true of the "tired businessman", who fatigued by the demands of an over-charged daily programme becomes the proverbial unpleasant tyrant of the family circle. According to early investigators industrial fatigue affects not only the adjustment of the individual, but influences very directly the welfare of society at large. It is quite likely that factors other than fatigue, such as living conditions in industrial centres, are in large part responsible for many of the evils attributed to it by the crusaders against the long working day. At the same time industrial fatigue remains one of the most important problems in the scientific organization of work. Its elimination or prevention, its utilization as a source of knowledge of the factors involved in adaptation to work are among the fundamental questions for economic and industrial psychological enquiry in the industrial plant. The word fatigue, refers to three related phenomena already explained above: (1) An overt manifestation in the form of reduced output on the task, known as work decrement; (2) a physiological state involving changes in organic functions and the production of chemical products of fatigue; and (3) a feeling of fatigue or tiredness.

Recovery from fatigue is effected through rest. It is equally true that nature's own cure is sleep. The efficiency of industrial workers will greatly depend on the conditions

under which the worker obtains his nightly sleep. Fatigue is influenced not only by hours of work but by the opportunity provided for rest in the course of the work. Efficiency engineers in England and America have come to the conclusion that "in general more output can be achieved by applying oneself steadily for short periods, and then resting, than by applying oneself less steadily and having no rest periods." It is no wonder, therefore, that rest pauses have been universally accepted as an aid to increasing production and reducing fatigue by employers in industrialised countries in the West.

Many investigations on the effect of rest pauses have been conducted by industrial psychologists but such work has not even been attempted in this country. The investigators considered employees engaged in both heavy and light work as well as those paid wages by the hour and others paid under a wage-incentive plan. The work of Vernon and his associates in this field is outstanding. They found that rest pauses usually result in increased production though causing reduction in working time. Miles and Skillback discovered that "two 15-minutes change of work periods resulted in a 14.2 per cent efficiency increase."

Duration of Rest

The time required for work to reach its maximum will vary with the work, the environment and the individual worker. The time and the manner in which fatigue shows itself will be similarly conditioned. The introduction of pauses at proper intervals and of the right duration will enable a high level of efficiency to be maintained. The right intervals and the duration of the pause can be practically determined for different types of work and for different individuals. The investigations by Griffith, Kerr, Mayo and Topal can often be helpful in determining the proper time. On the basis of the replies to a questionnaire received from about 379 employees in an industrial concern, these investigators concluded that the workers experienced fatigue during the fourth and eighth hours of an eight-hour shift. The results were remarkably similar for the manual, office and supervisory employees covered by this study. Suitably distributed rests produced tremendous results by way of increased efficiency. This proposition has been admirably illustrated by a trench-digging competition cited by Muscio, Myers and others in which two squads of soldiers were put to a test as to which could dig a greater length of trench. The leader of one squad divided his men into three sections each of which was asked to work for five minutes at the top of its strength and was thereafter rested for ten minutes. There was thus only a third of the men working at a time. The leader of the second squad adopted no definite system at all but employed all his men on the work until they were tired out. As soon as they felt that they had sufficiently rested, they resumed work. The competition resulted in an easy win for the first group.

Improper spacing of pauses may actually decrease production without reducing fatigue. It is generally agreed, however, that rest periods should be brought in before serious fatigue sets in. Most outstanding, perhaps in the literature of rest-period experimentation, is the one carried out by Taylor in respect of pig-iron carriers, representative of the heaviest type of physical labour. This was found to be most efficiently performed when the men worked only 42 per cent of the time and rested for the remainder at frequent intervals. The result was that the output increased from 12.5 to 47.5 tons per man per day. Generally the more exacting the work, the longer should be the rest relatively to the duration of work. At the Bethlehem Steel Works in England, men employed in loading pig-iron into railway trucks reported that men should not be worked under the necessary load — 92 lb. — for more than 43 per cent of the working day of 9 hours i.e. for a total time of 3¾ hours. The men had been specially selected for the work and were kept working for periods of seven minutes and after each such period were required to rest for 10 minutes. They were trained to lift the pigs of iron most efficiently and in a variety of other details. This scheme of work brought about an increase of 300 per cent in output, a decrease of 66 per cent in costs and an increase of 60 per cent in wages. Above all, the worker who could only lift 12.5 tons per day previously was now able to lift without any increase of fatigue an average of 47.5 tons. The duration of the rest period should vary with the type of work, the possibilities of the work situation, the estimated time for recovering from fatigue. Too brief a pause may cause considerable loss of swing and incitement and only a slight recovery from fatigue. Too long a pause may be equally unfavourable. The rest pause should be long enough to restore the worker but should not so hinder continuity that warming up after the pause becomes necessary. There should be a balance between the time lost and the gain resulting from fatigue deduction. Each job should be studied empirically to arrive at optimum arrangement. Generally the location of the rest period should be at mid-morning and mid-afternoon. In individual cases, it can be determined only by a careful study of the working situation and the output curve. Rest pauses have, however, proved most beneficial when they are introduced at the point of maximization of output. These then act in a preventive rather than a curative capacity. It helps to retard the onset of factors that are detrimental to output and will help maintain working activity at a high level throughout working hours. The most beneficial duration of rest periods has varied from two to 15 minutes under different conditions and the number of rest periods during the day have varied from one to five or even more.

Mental Work

Many laboratory investigations have been carried out in the West to fix the optimal length of the rest pause. The earliest of these was concerned primarily with mental work. Graf discovered that in a 40-minute period of mental work two minutes' rest was found to be most beneficial and five minutes' was ideal when the duration of work was 80 minutes. We have an authority in Ambargo on the same subject. According to him a pause of five minutes had a salutary effect on productoin. He, however, contended that a pause of 15 minutes introduced half-way during a work-period of one hour had an adverse effect on production.

Any one concerned with such investigation should not become impatient with his findings because the beneficial effects of rest periods on fatigue, boredom or output are usually not observed immediately; in fact it may take months for the results to appear.

The type of rest is also of importance. Rest-pauses, availed of or given at random such as waiting for material or for some other uncontrolled reason, have been found likely to produce fatigue because of tension specially in the case of a piece-rate worker who cannot relax during a random pause because he does not know when he may start work again.

Herbert Moore has pointed out that rest pauses are necessary for the worker under the following conditions:

(1) when the work is repetitive and monotonous, or when it is such that intense concentration of attention is necessary;
(2) when the work is such that continuous sitting or standing is necessary;
(3) when workers are under constant severe physical strain;
(4) when workers are exposed to extreme heat or unfavourable ventilation conditions.

We can by experiment find a pause of such length that the efficiency of work before and after will be exactly equal. This has been termed as the "equilibrial pause". A pause of

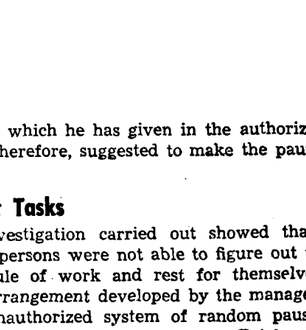
such duration which gives greatest gain in efficiency can also be experimentally found. Such a pause is termed as "most favourable pause".

Many of the effects of the length and number of rest periods on long term production and trends were first studied in a systematic manner by the British during the World War I. The result of the investigations was that not only had the worker worked harder and faster when rest-pauses were introduced but he also took fewer single days off so that he was found actually working a higher proportion of the time.

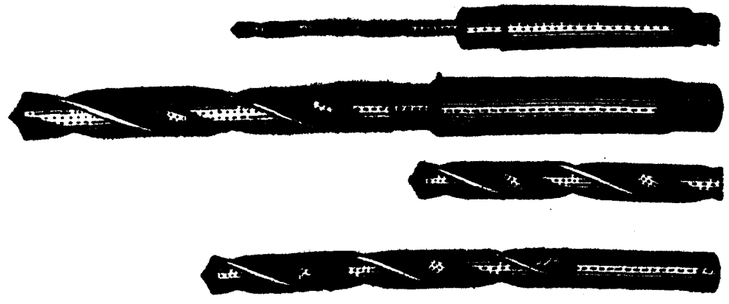
Rest Pauses

We have now to study the problem of systematic, authorized or planned rest-periods as opposed to unauthorized and haphazard rest-pauses. It has been observed that, if rest periods are not provided, the workers take time off any way whether management approves or not. Practical conditions in a factory do not involve truly continuous work. Consequently in estimating the effects of rest periods under industrial conditions, it is a matter of comparing discontinuous with continuous work, work interrupted by rest at definite times of definite duration with work interrupted by unrecognized rests. The latter does little or no good to the worker or to his output or efficiency. Undoubtedly, many of the workers did need some rest but the trouble is that the schedule of unofficial pauses that the tired worker sets for himself may not be the most efficient. On the other hand it has been found that planned, systematic and authorized rest periods have tended to increase the rates of production. A worker who avails himself of an informal pause when the supervisor is not looking, actually experiences emotional tension and does not really relax but in cases of authorized pauses the worker tends to cut down his unauthorized breaks more than the actual time which he has given in the authorized periods. It has been, therefore, suggested to make the pauses official and authorized.

Intelligent Tasks



An investigation carried out showed that even highly intelligent persons were not able to figure out the most effective schedule of work and rest for themselves. Hence, a scientific arrangement developed by the management is better than an unauthorized system of random pauses. There is sufficient evidence to show that after official pauses are introduced, the unofficial ones tend to decrease. In one case clerks had been taking out about three minutes per hour unofficially but after the management introduced regular pauses, the unofficial time of rest dropped to 1.2 minutes but production jumped from 20 to 26 units.



Rest periods can be effective only when a favourable atmosphere has been created for introducing them. The management needs to be convinced that the introduction of rest pauses will enhance the morale, improve the condition of the worker and even increase output. It should be introduced only after arrangements have been made for utilising the rest period in the manner which would be satisfactory to all concerned.

Only one of the many factors which affect efficiency of workers has been discussed in this paper. Fatigue is no doubt a great impediment and it must be reduced if not eliminated. There are many questions still left unanswered about the efficiency of workers. A concerted effort to raise the efficiency of the worker should be the ultimate goal. "A car will not run without gasoline, but neither will it run very well if the springs are broken. The whole car needs to be kept in good shape."

ITT DAGGER BRAND DRILLS FOR LASTING PRECISION PERFORMANCE

BACKED BY 25 YEARS OF TRADITION and rigid control at every stage of production
DAGGER BRAND DRILLS
(available in metric and inch sizes)
assure precision performance.
They are made of superior quality steel, specially heat-treated to ensure long life and manufactured in India's biggest and most modern factory for Small Tools.

WINDOW ON THE WORLD

A Budget of 'Economy & Progress'

WASHINGTON:

The following are excerpts from President Johnson's budget message to Congress:

This is the budget of the United States Government for 1965....I am satisfied that the budget which I am sending to the Congress will advance our nation toward greater national security, a stronger economy, and realization of the American dream of individual security and equal opportunity for all of our people.

In formulating my budget, I have been guided by two principles: I have been guided by the principle that spending by the Federal Government, in and of itself, is neither bad nor good. It can be bad when it involves overstaffing of government agencies, or needless duplication of functions, or poor management, or public services which cost more than they are worth, or the intrusion of government into areas where it does not belong. It can be good when it is put to work efficiently in the interests of our national strength, economic progress, and human compassion.

I have been guided by the principle that an austere budget need not be and should not be a standstill budget. When budgetary restraint leads the government to turn its back on new needs and new problems, economy becomes but another word for stagnation. But when vigorous pruning of old programmes and procedures releases the funds to meet new challenges and opportunities, economy becomes the companion of progress.

This is, I believe, a budget of economy and progress. On the one hand, it calls for a reduction from the preceding year in total administrative budget expenditures—and it is only the second budget in nine years to do so. It calls for a substantial reduction in total civilian employment in the executive branch — and it is the first budget to do so since the practice of totalling the employment estimates in the budget was initiated in January 1956. It cuts the deficit in half, and carries us a giant step forward in the achievement of a balanced budget in a full-employment, full-prosperity economy.

Safeguarding the Peace

On the other hand, this budget safeguards the peace by providing for the further strengthening of the most formidable defence establishment the world has ever known; it recommends continued military assistance to those nations menaced by Communist aggression, direct and indirect; it includes economic assistance to those nations which are willing to take the steps necessary to guard their freedom and independence through economic self-help; it provides the funds necessary to advance our mastery of space toward the achievement of a manned lunar landing in this decade; it provides for the sound management and development of our natural and agricultural resources and in its recommendations relating to education, housing, manpower training, health, and employment opportunities for youth, it provides more funds than ever before in our history for the fuller development of our nation's most important resource — its people. Moreover, this budget makes provision for the initiation of a new and major effort to break the vicious circle of chronic poverty which denies to millions of our fellow citizens a just participation in the benefits of life in our country.

I will shortly send to the Congress a special message conveying my recommendations for the attack on poverty. The urgent and necessary programme increases recommended in this budget will be financed out of the savings made possible by strict economy measures and by an exhaustive screening of existing programmes. My proposals call for administrative budget expenditures in 1965 of $97.9 billion — $900 million less than was requested in the 1964 budget and $500 million less than I now estimate will be spent in 1964....

Administrative budget receipts are expected to increase in 1965 to $93.0 billion, $4.6 billion over 1964. This increase, reflecting the expectation of a strongly growing economy spurred by prompt enactment of the tax programme, takes into account the estimated revenue losses from the new tax rates.

The resulting administrative budget deficit of $4.9 billion for 1965 is $5.1 billion below the deficit now estimated for the current year and marks an important first step toward a balanced budget.

I believe — as did President Kennedy — that the primary impetus needed to move our economy ahead should come, in present circumstances, from an expansion of the private sector rather than the public sector. Therefore, the earliest possible enactment of the tax reduction bill now before the Congress is an integral and vital part of my budgetary proposals.

Our country is currently in its fourth post-war period of economic expansion — a period which started in February 1961, and has now lasted nearly 3 years.

Preliminary estimates indicate that the nation's total output of goods and services — our gross national product — rose to $585 billion in calendar year 1963, an increase of 5.4 per cent over 1962.

Over the same period, personal income rose 4.7 per cent, industrial production 5.1 per cent, and corporate profits 10.5 per cent.

Price stability has been maintained for the sixth consecutive year.

This is a record of strong expansion — and yet the expansion has not been strong enough to absorb the margin of idle workers and idle plant capacity which continues to tarnish our economy's performance.

Almost three years after the trough of the last recession, and despite the creation of 2½ million new jobs in our economy, the unemployment rate now stands at 5½ per cent. Our factories continue to produce below their optimum rate.

As a nation we are producing at a rate at least $30 billion below our comfortable capacity. This is a gap for which we are paying high price in idle resources, both human and physical.

This gap must be closed. It must be closed — as President Kennedy urged a year ago — by loosening "the checkrein of taxes on private expending and productive incentives." It must be closed promptly, for the unemployed have already waited too long for jobs which can be created simply by allowing our people to spend and invest a greater part of the money they earn...

Economic Expansion

With prompt enactment of the tax programme, economic expansion in 1964 should proceed briskly. Reflecting the effects of the first stage of the tax reduction, the gross national product in calendar year 1964 should rise to about $623 billion, plus or minus $5 billion. This is substantially higher than the GNP which could be expected in the absence of prompt enactment of the tax legislation. In fact, since expectations of a tax reduction have been incorporated into the forward planning of many business firms, the effect on the economy of failure to pass the legislation swiftly might be deeply disturbing.

As the tax reduction takes full effect, its stimulus to private consumption and investment will shrink the $30 billion gap between the nation's actual and potential output, and provide approximately 2 million additional jobs for the unemployed and the new workers entering the labour force. As economic activity expands, and personal and business incomes increase, Federal revenues will also rise. The higher revenues, combined with continuing pressure for economic efficiency in Federal expenditure programmes, should hasten the achievement of a balanced budget in an economy of a full prosperity....

Between 1955 and 1965, our population will grow by almost 30 million people, about 17 per cent, with largest increases in the very young and the very old age groups....

We will continue to experience rapid population growth while we ask to improve the rate of economic growth, and over the long run this will put upward pressure on government expenditures for civilian purposes. Nevertheless, wherever and whenever possible, we should try to reduce costs, curtail less urgent activities, and find other savings to permit essential new or growing services to be financed at the least cost to the tax payer. That has been the policy in this budget. Essential services have been provided while administrative budget expenditures decline by over one-half billion dollars between the fiscal years 1964 and 1965.

In this budget I have provided over $1 billion in new obligational authority to begin an all-out attack on the problem of poverty in the United States. In a nation as rich and productive as ours we cannot tolerate a situation in which millions of Americans do not have the education, health, and job opportunities for a decent and respected place as productive citizens. The vicious circle of poverty—in which one generation's poverty, ignorance, and disease breed the same problems for the next—must be broken. I shall shortly transmit the Congress legislation initiating this attack and authorizing, in 1965, $500 million of new obligational authority specifically for this purpose.....

National Defence

To preserve freedom and protect our vital national interests in these recent years of uneasy peace, this nation has invested heavily in the improvement of its defence. We have chosen not to concede our opponents supremacy in any type of potential conflict, be it nuclear war, conventional warfare, or guerrilla conflict. During the past 3 years, we have achieved notable increases in military readiness, including a 100 per cent increase in the number of nuclear weapons available in the strategic alert forces; a 60 per cent increase in the tactical nuclear forces deployed in Western Europe; a 45 per cent increase in the number of combat-ready army divisions; a 35 per cent increase in the number of tactical fighter squadrons; and a 75 per cent increase in airlift capability to improve mobility.

National defence expenditures will remain high. These payments, estimated at $55.2 billion (54.0 billion in the administrative budget) in 1965, will provide for all essential military purposes, including substantial improvements in our present and planned military capabilities. For example, the 1965 budget provides for additional Minuteman missiles, further improvements in our air, land, and sea tactical forces, procurement of additional airlift aircraft, and continued research and development to ensure our ability to counter new threats..... Although, we continue to seek a relaxation of tensions, we cannot relax our guard. While the nuclear test ban treaty is a hopeful sign, neither that treaty nor other developments to date have, by themselves, reduced our defence requirements. We will continue underground nuclear testing, maintain our above ground test facilities in ready condition, maintain strong weapons laboratories, and continue the development of detection devices. However, because of the nuclear strength we have achieved, it will be possible to cut production of enriched uranium by 25% and to shut down four plutonium piles...Our inventories of strategic and critical materials are being reviewed to assure that they are necessary for current civil and military defence requirements.....

International Affairs

The less-developed nations are engaged in a critical struggle for political independence and economic betterment. Through our programmes of foreign assistance, we provide aid to these free peoples and thereby advance our own vital interests. It is essential that we continue, with a small portion of our great resources and technical knowledge, to promote in the emerging nations hope and orderly progress, replacing misery, hostility, and violence..... The 1965 request reflects the success we have had in reducing the dependence of some nations upon the low-cost foreign aid loans made by the Agency for International Development; by 1965 a number of countries will have turned to other sources and types of loans more consistent with their increasing economic strength. ....

Our partners in the Alliance for Progress will continue to receive our most determined support and generous cooperation. Recent improvements in the organization of the Alliance should permit an acceleration of this programme

U.S. BUDGET AT A GLANCE

For the 1965 fiscal year (beginning July 1, 1964 and ending June 30, 1965) President Johnson is proposing, for regular government programmes financed out of treasury revenues, $97,900 million — to pay bills, contracts, and other obligations as they become due. (This figure, $500 million less than that of last year, is called "administrative budget expenditures.")

From Trust Fund transactions and other special programmes having their own sources of revenue (such as the Highway Trust Fund and the Social Security System), his programme would result in projected fiscal year 1965 outlays of $29,400 million.

Adding those two figures together (and subtracting $4,600 million that would otherwise be counted twice) shows that Mr. Johnson is proposing total government outlays of: $122,700 million — for all Federal Government programme ("total cash payments to the public"). This figure is the same as that for the fiscal year 1964.

Of the $122,700 million, 44 per cent would be for national defence; 2 per cent for conduct of international relations; 24 per cent would be for Social Security payments and other Trust Fund transactions; 7 per cent would be for interest charges on Federal Government debt; 4 per cent would be for space research; 4 per cent would be for agricultural programmes; 4 per cent would be for veterans' benefits; 11 per cent would be for other programmes, including natural resources, commerce, transportation, housing, community development, health, labour, Federal aid for education and general government.

Of the money needed to finance these payments, 40 per cent would come from individual income taxes; 21 per cent would come from corporation income taxes; 14 per cent would be employment taxes paid into Trust Funds that finance workers' benefits; 23 per cent would come from other taxes; 2 per cent would be borrowed from the public.

The estimated administrative budget deficit for 1965 is $4,900 million, compared to a deficit of $10,000 million in fiscal 1964.

The proposed 1965 budget is the first in nine years to reduce administrative budget spending below the previous year's total, and the first in at least eight years to call for a reduction in civilian government employment.

and foster for greater hemispheric unity. I am therefore proposing an expanded bilateral programme for the Alliance in 1965. ....

Space Research

Our plan to place a man on the moon in this decade remains unchanged. It is an ambitious and important goal. In addition to providing great scientific benefits, it will demonstrate that our capabality of space is second to no other nation's. However, it is clear that no matter how brilliant our scientists and engineers, how far-sighted planners and managers, or how frugal our administrators and contracting personnel, we cannot reach this goal without sufficient funds. There is no second-class ticket to space. Appropriations enacted for 1964 for the National Aeronautics and Space Administration were $600 million below the amount requested. As a result, major development programmes leading to the manned lunar landing have fallen behind schedule.

For 1965, I am requesting appropriations of $5.3 billion, $63 million above the 1964 amount, including the proposed supplemental appropriation. The 1964 and 1965 recommendations represent the minimum amount needed to achieve our goals in space..... In addition to the manned space flight programme, though related to it, funds are included to support unmanned space flights for lunar exploration and supporting research and development. Funds are also included for scientific satellites, planetary probes, and experiments with meteorological and communications satellites.....

The recent improvement in the U.S. balance of international payments represents progress toward eliminating our persistent payments deficit.

Preliminary estimates indicate that the gross balance of payments deficit in the second half of calendar year 1963 was roughly one-third that of the first half. For the year as a whole, these estimates show the deficit to be the lowest since 1957.

Three factors in particular have contributed to the improvement during the past year: the continued price stability of U.S. products, a proposed interest-equalization tax on foreign securities which would be effective as of July 1963, and an increase in short-term interest rates. Anticipation of the proposed tax, which is intended only as a temporary measure, has already had a favourable effect.

Balance of Payments

During the past one and a half years, all Federal Government activities affecting the balance of payments have been under continuing scrutiny for the purpose of finding savings —large and small—which can be made in payments abroad. In some cases, purchases or activities formerly conducted overseas have been restricted to the United States. In others, they have been eliminated. Over 80 per cent of the current obligations by the Agency for International Development for loans and grants to developing countries now must be spent for goods and services produced in the United States. In addition, defence offset agreements with certain of our European allies, the prepayment of funds previously loaned to foreign governments, and the sale of special non-marketable, medium-term treasury bonds to foreign central banks have been particularly helpful to our balance of payments.

As a result of the reviews and actions undertaken, the net annual outflow from Federal Government programme—payments less regular receipts—is estimated to drop by $800 million between 1963 and 1965.....

E.C.M. Development Aid

From Our Special Correspondent

PARIS

THE JEANNENEY report, of which a preview was given on this page earlier this month, was published in Paris on Jan. 14 under the title "The Policy of Co-operation with Developing Countries". Although its main lines were known in advance, its appearance is worth noting on several scores. First, the fact that it is immediately made public by the French Government shows that, if it has not entirely adopted the conclusions of this independent commission, it at least finds nothing in them contrary to its policy. This is significant because, for reasons of international political strategy, the question of Western aid for development is expected to be made a major issue by General de Gaulle in the course of this year; the first signs of that may be forthcoming in his Jan. 31 Press conference. He has several motives for placing emphasis on this question. Certain conflicts of interest between the USA and the Common Market (for example, over the disposal of food surpluses) could, it is hoped, be resolved by setting disagreements between these industrialised nations in the wider context of their common responsibilities to developing countries. Moreover, the Common Market could not easily assert its "individual personality", i.e. its independence of American policy, in the matter of development aid, where US action is bound by dogmas to which most Europeans do not subscribe (for example, aid to socialist regimes in backward economies). The Jeanneney report, then, in so far as it reflects official thought in Paris, could foreshadow the direction in which de Gaulle will seek to inflect Western action generally, and specifically that of the Common Market Six.

Second, and taking the document on its intrinsic merits before seeing what effect it has on Western policy, it ranks as one of the most thorough examinations of the aid problem so far undertaken. The commission was required to answer three questions, which are primarily of interest to the French Government: what are the reasons for a French policy of co-operation with developing nations?; how much can France devote to that purpose without compromising her own development?; and finally, to what countries and by what channels should French aid be directed? In answering them, the commission has, however, largely and correctly exceeded these national terms of reference, to offer a comprehensive study of the problems of under-development, the role of foreign aid of whatever source and nature in resolving those problems, and lastly the connections between French assistance and that of all Western nations. In other words, to the French Government's question "What should we do?" it is answered: "That cannot be separated from the wider question of relations between the developed and under-developed worlds generally".

Hence the interest of the technical reports attached to the commission's own document, reproducing the opinions of the experts it consulted on such matters as rural development and economic growth, big firms and little nations, the capital needs of all developing countries, the geography of underdevelopment, and monetary areas like the franc zone. Written by specialists like the agronomist Dumont and the economist Francois Perroux, these studies make the commission's report a veritable encyclopedia of the development question. Perhaps these studies will concern mostly other specialists, so it is useful—that he who runs may read—that Professor Jeanneney should have given the outlines of this commission's conclusions at a Press conference on the occasion of the official publication.

His principal recommendation to the Government, he indicated, was that the present proportion between development aid and the nation's gross national product should be maintained. This proportion is variously calculated at 1.5 or 2.41 per cent but it is in any event the highest of any industrialised nation. To maintain it would assure, given the annual growth of the French national product, an absolute increase of about 5 per cent a year in the sums distributed as development aid, which would attain Rs. 580 crores by 1965 and Rs. 750 crores by 1970. There would be a doubling of aid allocations between 1963 and 1975, granted that French expansion was as planned in that period. This seems a sufficiently generous effort to Professor Jeanneney, in relation to what the country's industrial rivals are doing; to increase the percentage of the nation's wealth allocated to aid would require a heavier tax burden and thus further disadvantage in the industrial competition inside the West.

Effective Aid

French aid, on the contrary, could be made much more effective without increasing in proportion to the national product. In recent years, 95 per cent of State aid and 85 per cent of bilateral assistance has gone to countries in the franc zone, and almost half of that (45 per cent) has gone to Algeria (which includes the Sahara). This concentration on a limited list of beneficiaries seems excessive to the commission, which recommends that assistance be more widely distributed, though Africa would continue to enjoy a certain preference. Such a wider scatter of assistance would no doubt fit in with General de Gaulle's notions of an extension of French interest and influence beyond the bounds of the former African empire, but that is not the reason the commission has for suggesting it. Rather, it points out that part of the money spent in territories that were till recently colonies is not really development aid at all but expresses perpetuation of relations of dependence and domination after attainment of political sovereignty.

That is why a new geographical distribution of aid implies new methods of assistance, for a European nation does not help China or India in the same way as it helps Dahomey or Tunisia. The commission goes into great detail about the types of aid, the choice of projects, the various priorities in different development situations and so on, everywhere suggesting that a modernisation (a "decolonisation") of development assistance could produce, at the same cost, better results both for the donor and the beneficiary. The general principle should be, it urges, that where France is acting alone the stress should be on light projects and the provision of intellectual assistance (the training of administrators, rural betterment, the revival of handicrafts, etc.); but once major, heavy projects are in view, Western aid should come from a pool, formed by the industrialised nations and in the first place by the Common Market Six. On this point, then, the commission foreshadows a French proposal in favour of a single development aid policy for the Common Market.

Thus when it speaks of the advantages, in many circumstances, of multilateral over bilateral aid, it is thinking less of the global organisations (World Bank, and the like) than of the existing institutions of the Six. Here again, one recognises a line of thought that would be endorsed, though for more political motives, by the Gaullists. "To promote collective (as against bilateral) assistance", said Professor Jeanneney, "we could increase the resources and widen the geographical scope of the Common Market's institutions. At present, the European Investment Bank operates only inside the Common Market, while the European Development Fund is concerned only with the former colonies of members. Just as the Common Market is required by the Rome Treaty to have a single commercial policy vis-a-vis the rest of the world, so it should have a common development aid policy". He evidently considers that this can be attained by empowering the above-mentioned European Bank and Fund to lend outside the Common Market and its former dependent territories.

Cumbersome Procedures

This is a suggestion that will get careful attention not only in the Continental capitals but in those of developing nations, for it obviously carries with it at least a faint suggestion of the familiar Gaullist criticism of global organisations in which the USA dominates, and the equally familiar preference for an independent European venture. Professor Jeanneney indirectly criticised the Washington-based institutions when he said, "Multilateral aid passing via international organisations better respects the susceptibilities of the assisted nations, as well as making spoliation by them more difficult, but existing procedures are cumbersome and sometimes inefficacious. The narrower and less rigid European framework would often be preferable to the global framework. That is why the commission recommends an extension of multilateral aid by way of an improvement of European mechanisms". This is the first time that it is authoritatively claimed that the Six could make a better fist of development aid than US-dominated bodies, and could just as well escape the charge of neo-colonialism.

To support that latter point, the professor stressed the political aspect of development aid just where French attitudes differ most from American: "It is a matter of coming to the help of poor nations for reasons of human solidarity while respecting their sovereign choice. It is not a matter of carrying on a crusade in favour of one sort of economic system. Our aid should be maintained in countries that choose socialist structures and could be extended to those that already are socialist...French aid should aim at reinforcing economic independence in the countries assisted, by promoting whatever political and social structures fit in best with their exact possibilities". These European and political parts of the report may be further developed in the months to come.

The Battle for the Middle of the Road

JOSSLEYN HENNESSY

LONDON:

WEEK BY WEEK political commentators emphasise, with an air of surprise, that the differences between Conservative and Labour policies are being narrowed as both parties hotly pursue the middle vote or the uncommitted or loosely committed vote, so that, as the "Times" said, neither Sir Alec nor Mr. Wilson can go for a bath without losing a garment or two. It may throw some light on the present and future of contemporary British politics to recall the circumstances of, and the sequel to, the allusion here made, which is, of course to Benjamin Disraeli's speech in the Commons in 1845, when he said of the Premier, Sir Robert Peel, "The right honourable gentleman caught the Whigs bathing and walked away with their clothes".

Peel's premiership witnessed the agitation of the Chartists for political and social reforms and the controversy over the abolition of the laws which kept up the price of corn. Although steadfastly anti-radical, Peel saw that the Conservatives would be driven into the wildnerness if they opposed social reform, especially if they tried to maintain high prices for the corn grown by Conservative land owners. The reason why everybody is familiar with the names of the great historic families of England — the Cecils, Churchills, Douglas Homes and others — and why the historic families of France — like the Gontaut-Birons — are unknown, is that whereas the old French aristocracy clung to their privileges, and shirked the

responsibilities of public life, until Revolution swept them into obscurity, the British ruling class has kept its position by its readiness at all times to admit able new men to its ranks — today, for example, such influential Conservative figures as Reginald Maudling, Iain Macleod, and Enoch Powell are meritocrats — and by its readiness to withdraw from untenable positions rather than be driven out of them. Thus the Tory Peel stole the Whigs' clothes by administrative reforms and by abolishing the Corn Laws.

Political Realism

But the Tories have no monopoly of political realism. For all his fieryiness against the House of Lords, the radical Whig Lloyd George was glad to end up in it, and Clem Attlee is there today. In the short run, British politics look like a mad battle between irreconcilables. In the longer historical run, they emerge as a pendulum swinging into a middle course.

In these pre-election months, Conservatives and Labour are competing in promises to spend more public money on health, education, pensions, houses, roads, ports and so on. It would seem, therefore, that they are as alike as Tweedledum and Tweedledee. In what ways, then, do they differ?

The aim of the Conservatives, who fear that the electors may be bored with twelve years of their government and ready for not too drastic change, is to show that they can plan an economy as well as, or more probably (as they would argue) better than, inexperienced Socialists. The aim of Labour, who fear that the electors may think them too doctrinaire, too keen on controls, and on the nationalisation, which has proved so frustrating to the workers and so inefficient in nearly all spheres, is to persuade the voters that Labour can be progressive without being doctrinaire.

In foreign affairs, Mr. Wilson would put an arms embargo on South Africa at once. This would, in fact, only carry Tory policy to its logical conclusion with an added flourish. Then the Tories believe in the UK's continued possession of the nuclear deterrent. Labour's middle-of-the-way retort to this is that while they will not add to the UK's nuclear amoury, they will retain its present contents, and they will seek to share political control of the West's nuclear deterrent rather than uphold the UK's claim to independent bombs of her own.

In the economic sphere, Mr. Wilson would abolish the National Incomes Commission, but this would not indicate that he would not hope to achieve the unpopular Nicky's aims by other means. Mr. Wilson is as convinced as Mr. Maudling of the imperative need to keep wage increases in line with productivity. He must hope against hope that, in order to keep Labour in office, the unions will agree to moderate their demands, providing the profits are also kept in line by agreement or by taxation. This is the biggest, and as yet wholly unanswered, conundrum facing both parties.

Biggest Headache

As in every other Western country, farmers remain the politicians' biggest headache. Somehow or other a way must be found to set a limit to the national burden of maintaining farmers in that state of comfort to which their strategically distributed voting rights entitle them. Both Tories and Labour see a solution in the restriction of temperate zone agricultural imports. Labour, however, rejects the Conservative scheme for import levies, which they denounce as preparations for another attempt to get the UK into the EEC, and as a tax on food. Labour would create commodity commissions to fix import levels, and they hope to get low Commonwealth prices in return for long-term agreements. (It is an ironic swing of the pendulum that whereas the Tories stole the Whigs' clothes by abolishing import duties on corn in 1945, today both parties are seeking to dish each other by restoring them!) It seems to me that if the EEC, the USA, and the Commonwealth, are all going to create artificial high prices for their farmers, we shall see world agricultural over-production on a scale that would bankrupt the most affluent nations. Perhaps this possibility will force abolition of the world's Corn Laws in favour of the counter-cyclical lending, and international insurance funds, envisaged in the United Nations publication "International Compensation for Fluctuations in Commodity Trade" (New York. March 1961).

What the middle range of uncommitted voters will make of all this middle of the road "me-too-ism" remains to be seen. (I am frivolously reminded of the two drunks who were standing outside the front door of a house on which a brass plate said "Knock and ring". After studying this, the first drunk said to the second. "Don't let's do either. Let's keep them waiting").

By Our Special Correspondent

NEW DELHI:

IT WAS claimed by Falstaff for Falstaff that he was not only witty in himself but the cause that wit was in other men. Of the new Deputy Chairman of the Planning Commission, it could be said, perhaps, that not only is Mr. Asoka Mehta brimful of bright ideas, but he also seems to be the cause that there is so much scintillating cerebration among his colleagues. A meeting of the Planning Commission held last Saturday, for instance, was reportedly seething with intellectual adventurism of a very impressive kind. Mr. Pitambar Pant, for instance, seems to have come out with the suggestion that this country should plan for consumption of fertilizers of the order of six million tons of nitrogen by the year 1975-76. Once we decide to indulge in tall talk there is, of course, no reason why we should be prevented from getting up on the Qutab and shouting.

It may not be proper perhaps to blame Mr. Pitambar Pant too much. After all, as years go, he is a young man and his elders in the Planning Commission, I am afraid, are not setting any too good an example. Take, for instance, Dr. V. K. R. V. Rao. It would be no exaggeration to say that he is forgetting his economics as fast as he is learning his politics and now that Bhubaneswar has let go a war-cry for democratic socialism, what else can Dr. Rao do but go one better and say that we must have socialism, democracy or no democracy. At the meeting to which I referred, this economist-member of the Planning Commission is reported to have argued that disparities in income and wealth are bound to increase as economic development takes place unless measures are deliberately taken to redistribute income. Pursuing this line of thought, he seems to have offered the rather original suggestion that it should be the policy of the State to take away the wealth and incomes of the top tenth of the population and distribute them among the bottom tenth. I had said a little while ago that Dr. Rao seemed to be educating himself in politics at the expense of his past learning in economics. Perhaps it is also true that he never had much use for arithmetic and is not going to begin having any at this time of his life. A simple calculation will show that if money is taken away from the top tenth to be given to the bottom tenth, all that would happen is that a tenth of the population would be changing places with the disparities themselves remaining as before. It is possible that Dr. Rao could find some peculiar satisfaction in this re-arrangement, but to less gifted minds the only merit of his suggestion would be that it is an obviously disinterested one, since Dr. Rao, I know, does not belong to the bottom tenth, nor does he belong, I presume, to the top tenth.

**

According to an official spokesman, the next meeting of the Aid-India Consortium will be held in Paris on March 17 and 18, instead of on March 10 and 11 as reported earlier. The Union Ministry of Finance, it is understood, is anxious that at least 50 per cent of the aid that may be committed by the Consortium for the fourth year of the current Plan should be in untied form. This is considered necessary in view of the greater flexibility or pragmatism that is proposed to be imparted to the industrial policy of the country in the interest of stepping up production during the next two years.

Official sources have indicated that India will be presenting to the forthcoming meeting of the Consortium a detailed picture of the next year's foreign exchange requirements and rough estimates for the subsequent two or three years. The development plans of the next two years are proposed to be phased in such a way that the fourth Plan may start with the different sectors of the economy reasonably balanced.

No commitments are expected to be made by the members of the Consortium at the Paris meeting; these will follow later. At the Paris meeting, only discussions will take place on India's foreign exchange requirements. The exact demands that are to be made on the Consortium are being finalised.

**

The Union Government's decision on increase in coal prices is likely to be announced in about two weeks' time. The Swaminathan Committee, which went into this question last year, is believed to have refrained from making any clear cut recommendation on the quantum of increase that should be allowed in coal prices, presumably in view of the opposition this proposal encountered from the Ministries of Railways, Steel and Industry, when it was mooted early last year by the then Minister for Mines and Fuel, Mr. K. D. Malaviya. The Committee is understood to have confined itself to explaining the adverse consequences that would follow if an increase in coal prices is not sanctioned.

The decision on how much increase in prices should be allowed and for which grades of coal, is likely to be finalised after the Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, holds discussions next week with representatives of the three organisations of coal interests—the Indian Mining Association, the Indian Colliery - owners' Associafion and the Indian Mining Federation.

**

A twelve-member team, consisting of Government officials and technical experts from both the public and private sector steel plants in India, is expected to visit Japan during the latter half of next month for a three-week tour of that country. The team will be led by Mr. N. N. Wanchoo, Secretary, Department of Iron and Steel in the Union Ministry of Steel, Mines and Heavy Engineering.

Special interest is attached to this team's visit to Japan at the present juncture in view of the fact that India's fourth Plan steel expansion programme is now due for finalisation. The team will study the cost structure and operation of the Japanese steel industry which during the fifties has registered a phenomenal progress. It is felt that India can profitably draw upon this experience.

During his stay in Japan, Mr. Wanchoo is also likely to hold talks with the Japanese steel manufacturers who have shown interest in assisting us in the establishment of the Bokaro steel plant. Japan is also helping this country in putting up an alloy and special steels plant at Durgapur. Problems relating to this public sector unit are likely to figure prominently in the discussions Mr. Wanchoo will have in Japan.

**

It has been decided to set up in the Ministry of International Trade, a composite organisation for effecting complete integration in planning, follow-up action and periodic appraisal of the iron ore export programme. The responsibility for actual execution of the various schemes under this programme, however, will continue to rest with the Ministries concerned, namely, the Ministry of International Trade,

the Ministry of Steel, Mines and Heavy Engineering, the Railway Board and the Departments of Transport, Shipping and Ports. A Joint Secretary is understood to have been already entrusted with the task of building up this composite organisation. The decision follows the recommendation of the Secretaries Committee to the effect that if the 30 million tonne iron ore export target is to be achieved by 1970-71, concerted action will have to be taken for an orderly implementation of the development programmes connected with these exports.

The 30 million tonne iron ore export target implies stepping up of these exports by 14 million tonnes over the likely exports at the end of the current Plan period. This is estimated to involve an outlay of approximately Rs. 330 crores over and above the cost of the schemes already included in the third Plan. The foreign exchange component in the additional outlay is estimated around Rs. 70 crores. An approach is likely to be made soon to the World Bank and its affiliate, the International Development Association, for extension of assistance for this purpose. The Planning Commission is understood to have had discussions in this connection last week with the two World Bank experts, Mr. Peter Wright and Mr. Pentanalli, who are currently in Delhi for making an assessment of the present state of India's economy and its requirements of assistance from the Aid-India Consortium for the next financial year. The World Bank experts are reported to have opined that creation of facilities for accelerating operation of iron ore mines and development of transport and ports, especially Pradeep and Haldia, should be accorded priority. Mechanisation of mining operations has been particularly stressed.

**

Details are now available of the eight fourth Plan power projects accepted by the Planning Commission in principle for advance action during the current Plan period. The total cost on these schemes is estimated around Rs. 91 crores.

Two of these projects—Kothagudam Extension and Ramagundam Extension—will benefit Andhra Pradesh. The Kothagudam Extension Scheme is estimated to cost Rs. 10 crores and will create a generating capacity of 120 MW. It is likely to be commissioned by 1967-68. The Ramagundam Extension Scheme will cost Rs. 18 crores. It will have a total capacity of 200 MW. Capacity to the tune of 66 MW is likely to be commissioned by 1967-68 and the remaining 134 MW by 1968-69.

Two schemes have been accepted for Madras. These are the Kodayar Power Project and the Basin Bridge Power Scheme. The former will have a capacity of 75 MW and will cost Rs. 8 crores. The latter, with a capacity of 30 MW, is anticipated to cost Rs. 3 crores. Both these projects are expected to be completed by 1968-69.

The other four projects are located in Gujarat, Maharashtra, Uttar Pradesh and West Bengal. The Dhuvaran Scheme in Gujarat is expected to cost Rs. 23 crores and will have a capacity of 250 MW. Fifty per cent of this capacity is likely to be commissioned in 1967-68 and the remaining half in 1968-69. The Purli Power Project, costing approximately Rs. 7 crores, will have a capacity of 60 MW. It is envisaged to be completed in 1968-69. The Harduaganj Extension Project of U.P. will have a capacity of 100 MW and will cost Rs. 10 crores. The West Bengal Durgapur Extension Scheme will provide capacity to the tune of 140 MW and will be implemented at a cost of Rs. 12 crores. Both these schemes are scheduled for completion by 1967-68.

The preliminary work on all the eight schemes is stated to have already been taken on hand. The State Governments concerned have been asked to submit detailed proposals.

Many other power projects have also been finalised by the Union Ministry of Irrigation and Power for authorisation in 1964-65 and 1965-66. The Planning Commission will be approached shortly for clearance of these schemes.

According to the mid-term appraisal of the power programmes included in the third Plan, the total generating capacity in the country by the end of the third Plan period will be of the order of 12.5 million KW. The benefits in the fourth Plan from the schemes continuing from the third Plan are estimated at about 5 million KW, bringing the total capacity to about 17.5 million KW.

**

Following an agreement reached by the Union Government and the U.S. Administration last week, the Industrial Finance Corporation and the Industrial Credit and Investment Corporation of India have been given each a credit of Rs. 10 crores out of the sale proceeds of the agricultural commodities supplied to this country under the U.S. Public Law 480. With these new lines of credits, the borrowings of either of the two Corporations from this source amount to Rs. 20 crores. The IFC and the ICICI utilise these loans for extending assistance to the private sector industries.

Besides providing credits out of the P.L. 480 funds, the U.S. Administration has also made available to the two Corporations foreign exchange loans. The IFC has till now received two loans in U.S. currency totalling $30 million from the U.S. Agency for International Development and its predecessor the Development Loan Fund. The ICICI has been the recipient of a foreign exchange loan of $5 million from the Development Loan Fund. It has also utilised a credit of Rs. 7.5 crores from the sale proceeds of steel supplied to India under the USAID Fund.

**

In addition to building a fertiliser factory at Gorakhpur (U.P.), Japan will be constructing a fertiliser plant near Baroda in Gujarat State. The deal with the Gujarat State Fertiliser Company has already been put through. It is now awaiting the sanction of the Central Government. The Fertiliser project in Gujarat will cost $30 million. Japan is prepared to give a part of the yen credit for this project this year and a part of it from the next yen credit that may be decided at the Aid-India Consortium meeting to be held in March. The Japanese yen credit is at present running at the rate of $48 million a year. The total yen credit at the end of 1963 amounted to $240 million. The first yen credit to the tune of $50 million was extended in 1958.

The fertiliser factory at Gorakhpur will cost $25 million and the finance is being provided in three stages. Already the Japanese Government has given $10 million, $7 million is being given this year and the rest amounting to $8 million will be provided next year. Machinery for this project is expected to arrive by the end of this year or early next year. Another major project which Japan is assisting under the yen credit is the Durgapur Alloy and Special Steels Plant. This project will cost $40 million. Japan is giving for this project $16 million this year. The rest of the funds will be provided next year. Construction has started and the Japanese technicians and machinery are expected to arrive by the end of the year. The other projects being assisted by Japan under the yen credit are the rayon plant at Baroda, poly-vinyl chloride plants at Kotah and Madras and the caustic soda plant at Calcutta. Several items of power equipment are also being supplied by Japan for various other projects such as Bhakra in Punjab, Hirakud in Orissa, Kosi in Bihar, Harduaganj in U.P. and the watch factory in Bangalore. Electric locomotives for Indian Railways are also being supplied by Japan. Recently a floating crane was provided by Japan for Bombay Port Trust.

Besides these credits, there are two more credits made available by Japan for the development of iron ore mines in India. One of these is a credit of $8 million for Kiriburu iron ore mines (completed and now awaiting inauguration) and the other amounting to $21 million for Belladilla iron ore mines. An expert team from Japan made a survey of Orissa State last year. With the increasing demand for iron ore by Japan from India, the key point is the development of iron ore resources in this State, the construction of a hundred-mile inland road and the improvement of Pradeep Port. Japanese officials are hopeful that talks regarding the development of Orissa State will be resumed again this year.

The talks between the Japanese Government and the Government of India regarding the construction of a shipyard at Cochin are stated to be progressing satisfactorily. It is expected that a decision on this collaboration arrangement will be announced soon. The Cochin shipyard will be the second State shipyard in India, the first one was established at Vizag.

There are indications that Japan might also construct many power stations in Assam and Andhra Pradesh. The capacity of the Harduaganj power project in U.P. is also expected to be increased with Japanese assistance. The main hurdle at present is that the current yen credit is not considered sufficient by the Government of India and its stand is that Japan should either increase the yen credit or provide facilities under the deferred payment formula. Meanwhile, deferred payment facilities for the import of textile machinery and big ocean-going ships from Japan have been extended to India from time to time.

**

The shipping agreement signed recently between India and the United Arab Republic will establish a permanent and regular shipping service between the ports of the two countries. The service will commence as soon as the competent authorities come to an agreement on various issues still to be settled. The main point to be thrashed out pertains to the taxation on freight earned in Indian ports.

All payments arising out of this agreement will be made in accordance with the provisions of the Trade and Payments Agreements between the two contracting parties that may be in force from time to time. Any dispute arising from this agreement is to be settled by negotiation. The contracting parties will grant to each other "the most favoured nation" treatment, on equal terms with any other third party. Each contracting party will endeavour to grant the other contracting party for transportation by ships of its flags 50 per cent of the cargoes from the United Arab Republic to India and from India to the United Arab Republic, providing that the share of either party flag vessels of freight must be 50 per cent of the total freight resulting from the transportation of the cargoes moving between the two countries at the end of every year. Each contracting party will nominate the competent authorities to conclude appropriate agreements for the distribution of cargoes, for fixation of the tariff rates and for the settlement of other questions resulting from the present agreement. The shipping organisations of each contracting party shall independently manage the exploitation of its ships and bear the responsibility for both financial results and all claims which may arise in connection with the exploitation of the ships.

The contracting parties are to establish a Joint Committee for the purpose of evaluating and reviewing the working of this agreement and for the purpose of consultation between the two countries on further improvement of sea transportation in accordance with the principles determined by the present agreement. The Joint Committee will meet upon request by either party and at least once a year The Joint Committee shall be established by exchange of letters between the Egyptian General Organisation for Maritime Transport of the U.A.R. and the Ministry of Transport of India.

The agreement will remain in force until 1st January, 1969, unless either contracting party terminates it by giving the other party a notice in writing three months prior to the expiry date.

**

The Birlas are understood to be working on a scheme to set up in collaboration with some well-known Western machinery manufacturers, various industrial units in the Far East, West Asia and Africa. The mechanism evolved envisages meeting the requirements of simpler types of machinery items of these units from India and of the more sophisticated categories from Western suppliers. If the machinery items made available from here are semi-processed, these will be finally processed by the concerned collaborators at their works abroad. This, it is hoped, will give a fillip to machinery exports from this country. The first project of this kind — a fertiliser factory — is proposed to be set up in Nigeria.

These machinery exports will be routed through Eastern India Services and Marketing (a Birla enterprise, located in Calcutta and New Delhi) which has been recently recognized as an export house. Besides handling machinery exports, the EISM will be specialising in the export of non-traditional items, particularly engineering goods, such as air-conditioners, refrigerators, electric fans, air-conditioning and refrigeration equipment and grey iron castings, manufactured by Birla industries as well as other manufacturers. Particular attention is proposed to be paid to the provision of after-sales service in regard to all these exports, in the importing countries. Arrangements are stated to be in progress for opening three branches of EISM in Kuwait, Beirut and Dusseldorf. A fourth branch at New York is also contemplated.

The EISM is stated to be of the view that confidence is growing in African and West Asian countries in regard to the quality of Indian engineering goods and about the competence of Indian manufacturers to supply know-how and technical collaboration for setting up industrial units there. Prejudice against Indian engineering goods on the Continent is also said to be wearing out.

The EISM, it is further learnt, has ambitious plans for undertaking exports of a wide range of handicrafts too.

Bonus Commission Reports

From Our Correspondent

BOMBAY:

THE BONUS COMMISSION signed its report on January 18 recommending that a minimum bonus of four per cent of the total annual wages should be paid to the workers irrespective of the fact whether an establishment makes a profit or loss. The definition of annual wages is given as the total emoluments consisting of basic wages plus dearness allowance. The maximum bonus limit is placed at 20 per cent of the total annual wages. The Commission has also recommended that bonus must be paid within eight months of the finalising of the accounts for the year concerned, and that the bonus payment should not be held over.

The Commission has accepted the definition of bonus as additional remuneration payable to workmen out of the available surplus so as to cover the difference between workers' actual earnings and the living wage. The employers had put forward the plea before the Commission that the surplus available after meeting the prior charges should be

distributed equally between the shareholders, the workers and the industry. The Commission has turned down this request and has recommended that 60 per cent of the surplus after meeting prior charges should be disbursed as bonus. Rehabilitation reserve has not been allowed to be included in the prior charges which will cover depreciation, taxation excluding the Super Profits Tax and return on owned capital, i.e. paid-up capital and the free reserves. The Commission has sanctioned a return of seven per cent on the paid-up capital as against six per cent permitted under the LAT formula. On reserves used as working capital, the Commission has allowed a return of four per cent against two per cent under the LAT formula. The exclusion of Super Profits Tax and the rehabilitation allowance from the calculation of the prior charges will reduce the volume of funds available for ploughing back into industry. In his note of dissent, Mr. N. Dandekar is reported to have suggested a rate of return of 8.5 per cent on paid-up capital and six per cent on reserves. He has also suggested that S.P.T. and the rehabilitation allowance should be taken into consideration while computing "prior charges."

**

A few days ago, giving the third lecture under the auspices of the Economic Research and Training Foundation (B. F. Madon Memorial Lecture series), Mr. S. G. Barve, Maharashtra's Industries Minister, gave expression to certain points of view which are, to say the least, hardly appreciative, if not critical, of the policies of the Government of India and the Planning Commission. Although he qualified his observations by saying that the picture of our progress today is broadly not such as to generate alarm or despair, he had no doubt that it has been such as to cause serious concern. And he also acknowledged the urgent need for a critical self-analysis and a dispassionate re-appraisal of the position.

Perhaps one must thank the civilian background of Mr. Barve for his clear appreciation of the place of the mixed or, as he described, plural economy. "A clearer appreciation of the nature of the mixed or plural economy within which we have chosen to function," he averred, "is necessary amongst all those who rule our national economic destinies." It is significant that those who rule our national economic destinies, according to him, include not merely the politicians, (policy-makers and legislators) but also captains of industry, and leaders in banking, the commercial life of the community and the labour movement, all of whom have their own share and responsibility in determining the texture of our economic life in their respective spheres of authority. Coming as it does from a Government spokesman, the following viewpoint is noteworthy: "In the philosophy of the plural economy, private initiative is accepted and recognised as a valuable economic stimulus. There is nothing dishonourable about private profit legitimately earned within the laws, nor in the enterprise of starting industries or of owning shares in the country's productive equipment as permitted by law. In fact, what we want is a widespread blossoming out of enterprise among the people at large rather than its monopolisation by a few; we also desire for industrial shares a far wider and more popular base of ownership especially including the working classes than is the case today." At the same time, Mr. Barve maintained, but for some large State undertakings, the country could not have made the progress that it has recorded. Even so, he was frank enough to say: "We have yet to evolve appropriate methods and procedures for ensuring a sufficient degree of cost-consciousness and zeal for productive efficiency in the management of public sector undertakings." Here then is a spokesman of the party in power who can view things dispassionately and take note of both the merits and the demerits of the respective systems. More, he has the good judgment, too, to point out that these merits and demerits derive not so much from their innate virtues and pieties as from the operative systems of law, procedures, practices within which they respectively function and the personnel resources that each can command. This appraisal is as far a cry from Gopabandhunagar as one can conjure up. If more people were to come out and say so openly (provided, of course, they are convinced) that, if the benefit of private enterprise is to be derived, it must be allowed to operate on the terms appropriate to it, and also work for it, the economic advancement of this country would any day be more rapid and pronounced than it has been so far.

Arising from this appraisal, it was only to be expected that Mr. Barve would urge the abolition of all futile and frustrating controls. And so he did when he said: "A few strategical control measures, coherently conceived and competently administered, would seem to be the best pattern for us to work towards." It was really courageous of him to make the statement that the administration today is by no means "distinguished for its initiative, understanding and that touch of lightness without which a complicated system of economic controls cannot be satisfactorily administered ..... the tasks are pragmatic and not amenable to heroic ideological stances. What is wanted is realism, skill, a clear comprehension of objectives alongside full mastery of details and an unremitting disciplined enthusiasm."

Attitude to Technology

On the question of technology and our national attitude to productivity also, Maharashtra's Industries Minister was for affording a reasonable measure of shelter to the products of our artisans and village handicrafts, for social reasons, but he was not at all for perpetuating such treatment for all times. It was only till such time that our artisans and village handicraftsmen could improve their techniques and marketing organisations that he was prepared to intervene and cushion the sudden and unrestricted impact on them of modern technology. As regards organised industry, however, he had no doubt that it should keep abreast of the latest developments and technology. This ought to be especially so in the case of our export industries. It may be noted here that even in countries like America and Japan, where automation has advanced spectacularly almost to the point where they have begun to pose the threat of large-scale unemployment, labour unions are not opposed to the application of the most up-to-date automation techniques in respect of industries which have to cater to, and compete in, the world's markets.

Two other observations of Mr. Barve also deserve notice. The first is his criticism that, by and large, our economic system does not encourage productive industrial enterprise sufficiently as against trade or commerce or mere speculation. It is, therefore, imperative, as Mr. Barve says, that a conscious and deliberate effort be made if our investment resources are to be directed into socially fruitful channels. The second point that Mr. Barve made relates to the link between the rate of our economic growth with the rate of our new investment into the economy, and he blamed the existing banking structure for the lagging behind of the latter. The fact is that today there is no adequate provision for medium and long term credits by our commercial banks. This is, to some extent, a legacy of the British Rule and the system of British banking which we have chosen to follow. Moreover, our commercial banks have been deliberately shut out, as it were, from the spheres of medium and long-term investments, because the Government has its own agencies directly, as in the case of Central and State Industrial Finance Corporations, and indirectly as in the case of the agencies manned and managed by the Reserve Bank, such as the Refinance Corporation. The main snag, on the other hand, is the Government's attitude towards production. However fascinating and, from the point of view of achieving popularity, facile the unrelieved stress on distribution may be, it is the slant on production that yields and has yielded results even in the industrially advanced countries, whether of the West or the East. Unless this is realised by those in charge of our economic destinies and their policies re-oriented accordingly, we may not hope for that rate of accelerated growth of our economy as the compulsion of the present circumstances warrant.

Population Rise Retards Progress

From Our Correspondent

CALCUTTA:

IN A SYMPOSIUM organised by the Indian Chamber of Commerce on the importance of family planning in relation to India's plans for economic development, Mr. K. K. Birla pointed out that a spectacular rise in the rate of economic growth coupled with a decline in population was essential to improve sizably the living standard of the people within a reasonable period of time. He said that the rise in population in 1962-63 at more than two per cent completely wiped out the increase of two per cent in national income, thus lowering the per capita income slightly. It was this neutralization of the rise in national income by the increase in population which had not allowed the standard of living in general to rise, and it was in this context that the problem of family planning assumed greater urgency and importance.

Illustrating his point regarding the impact of steadily rising population, Mr. Birla said that the increase in India's population in the decade 1951-1961 was about 78 million which was equivalent to the almost total increase registered in the preceding two decades at 82 million. In the case of West Bengal, the rising population was swelling the numbers of the unemployed and was thus lowering the standard of living. Between 1951-61 the population in West Bengal increased by more than 8 million. According to the forecasts made by the demographers, it was expected to rise from about 35 million in 1961 to 40 million in 1966 and about 45 million in 1971. Because of the acuteness of the unemployment problem in West Bengal, it was necessary that the economic development schemes of the State should make adequate provision for effective implementation of the programme of family planning. The industry, Mr Birla said, had played a significant role in raising the standard of living of the workers. The wage increase in the first ten years of planning ranged from 33 per cent to 100 per cent in major industries such as textiles, cement, sugar and plantations. There was great need to make the workers conscious of the fact that they could enjoy a better standard of living only if they limited the size of their families. The symposium passed a resolution that industrial and trade organizations should participate actively in the family planning programmes. It also stressed the importance of greater co-operation between the Government and the industry for encouraging "planned parenthood" among the workers.

**

According to a Press note issued by the Indian Jute Mills Association, a decision has been taken to scrap the working time agreement in view of the favourable long-term outlook for jute goods. This decision is not expected to result in any material change in the existing level of production; currently the industry is operating to full capacity. According to the existing agreement, working in the jute mills had been regulated on the basis of 49 hours a week. This agreement had been reviewed by the jute committee last year suggesting that the agreement should be scrapped as it was no longer necessary in view of the continued demand for jute products in the international markets. Two successive bumper jute crops have also made abundant supplies possible to the factories. The installation of additional productive capacity in terms of both spindles and looms required the proper approval of the Jute Commissioner and the Government of India; this requirement, however, remained unchanged.

**

On January 22, 1964, Mr. Theodor Schwartz, Vice-President, Import and Export Division of the West German Bags and Canvas Importers Association, said that a committee had been set up in his country to deal in Indian imports and that the volume of imports of Indian jute goods was likely to increase three-fold in the next three years provided the quality of goods was maintained. West Germany had allowed unrestricted import of jute goods from July this year. Currently, Indian exports to West Germany were around 15,000 tons per annum. Mr Schwartz laid stress on the quality of Indian jute goods saying that West German buyers wanted this country to supply goods of at least the same quality as those supplied to the USA. There was a great need to study the requirements of West Germany and make the best use of the liberalization of the import policy if this country was keen to bridge the vast gap between imports and exports. He also dropped the hint that West German importers had experienced some difficulties in getting timely supplies from West Pakistan and, therefore, their interest in Indian jute products had increased.

**

Mr. A. S. Bam, Chairman of the Tea Board, said in a message to the Tea Council of West Germany on the occasion of its tenth anniversary that it was necessary for it to dedicate itself to the task of reviewing its responsibility in the field of promoting consumption of quality teas. The Federal Government had generously removed the external tariff on all teas, thereby "giving tea a sacrosanct position among beverages." He, however, expressed concern over the increasing consumption of cheap teas at the expense of quality teas in the West German markets; the increasing use of herbal teas was jeopardising the position of quality teas. In the past the tea industry in the Federal Republic of West Germany had patronised the finest teas in the world coming from Darjeeling and Assam. It may be stated that the German Tea Council was founded by the Tea Board of India in 1964 in co-operation with some tea importers in W. Germany. Even though West Germany is a coffee drinking country, the intensive promotional activities of the Council had doubled the per capita annual consumption of tea from the pre-War level of 63 grams to 120 grams per head.

**

The Engineering Export Promotion Council has taken a decision, which was long overdue, to open two offices in Western Europe; the places selected for this purpose are London and Dusseldorf. The Council believes that there is a wide range of engineering products such as cast iron components, special machinery or equipment (which may have become obsolete in Europe), hardware, stainless steel, cutlery, locks and sewing machines which this country can sell in the West

European markets. Ample evidence to support this view is provided by the figures of exports of these products. India's exports to the Common Market countries in the first ten months of 1963 at Rs. 6.5 million were nearly 3½ times the exports in the corresponding period in 1962 at Rs. 1.8 million. Similarly, exports to the EFTA countries multiplied 2½ times from Rs. 1.7 million during January-October, 1963. The new offices will provide direct contact between the Indian manufacturers and the European buyers and will assist in giving up-to-date market information to the suppliers.

Industrialisation in Kerala Active

From Our Correspondent

MADRAS:

IT IS GRATIFYING to note that the Governor of Kerala also struck an optimistic note regarding the implementation of third Plan schemes when he addressed the State Legislature a few days back. The tempo of development has gained momentum in the last two or three years and it is confidently expected that during the current financial year the targets will be substantially fulfilled and even exceeded in certain directions. More ambitious targets have been fixed for the next year and the outlay of Rs. 44.17 crores sanctioned by Planning Commission should result in a considerable boosting of agricultural and industrial production and power generation. The main bottleneck is power availability and the Governor, Mr. V. V. Giri, practically admitted that the position would have been even more difficult but for the supply of 21,000 kW of energy from the Madras State. There is need for completing urgently the various power projects though it is expected that by the end of 1966, 442 mW of hydel capacity would have been newly created. The first set of Pannaiyar project was commissioned recently while the Solayar scheme is in an advanced stage of construction and the first set is expected to be commissioned by the end of this year and the remaining two units by March, 1965. The construction work on the Sabarigiri project also is being expedited and the first unit will start generating power by the end of 1965 and all the six generators are scheduled to be in operation by 1966. With the completion of the second stage of this project and progress on the Edikki scheme which will ultimately have a capacity of 1,000,000 kW, there is the distinct possibility of exporting hydel power during 8 months in the year to neighbouring States, after two or three years. Meantime, Kerala's needs will probably have to be met to a greater extent by Madras as the difficulties might become more pronounced till the generators in the Sabarigiri power station begin to work. The year 1965 will truly be an important landmark in the history of hydel power generation in the South. The Sharavathi project also will start yielding results in a big way in that year. As two large thermal stations are being constructed at Ramagundam and Kothagudem in Andhra Pradesh and the Neyveli authorities are confident of being able to expand the capacity of the thermal station in an ambitious manner, the firming up of the regional grid in an intelligent way should be thought of from now. The Madras State Electricity Board also will have to concentrate its attention on the creation of thermal capacity.

Buzzing with Activity

As for Kerala, the Cochin-Alwaye area is becoming very important. It has been naturally claimed that the industrial complex in this region will make complete difference to the region's economy especially as it has been accepted that the proposal to erect an oil refinery at Cochin is "an event of major significance" in Kerala's industrialisation. With the Ship-yard and Machine Tool unit being implemented as Central projects, the whole area will be buzzing with activity in the next few years. Even now many big schemes in the private sector are being implemented and a petro-chemical complex may take shape before long. Consumer goods industries also are being developed and great priority has been accorded to the erection of medium-sized spinning units in different areas in order to cater to the requirements of the handloom weavers.

At the same time, a number of industrial estates are proposed to be established in Trivandrum, Ernakulam and Palghat while small industries are expected to spring up with the easier availability of power. With the proposal to develop railway communications as well, it is expected that in the next few years, the complexion of Kerala's economy will be changed vastly.

**

Mr. R. Venkataraman, Madras Minister for Industries, is known for his pragmatic approach to the problem confronting industry and trade. At the meeting held last week to inaugurate the opening of the new building of the Indian Overseas Bank by Mr. C. Subramaniam, Mr. R. Venkataraman stated that the banking system cannot expect to make any significant progress if it is bound hand and foot by red-tape and regulations and could not extend credit freely to worthy borrowers by undertaking some healthy risk. When there is so much talk about nationalisation of banks and there is the cry that there should be regimentation of the credit structure and greater powers for the Reserve Bank, the observations of the Industries Minister seem to be somewhat out of tune with those made by other political leaders. Indeed, Mr. C. Subramaniam's speech was somewhat defensive as he was inclined to suggest that there would be no need to take over banks if they 'behaved' properly and conducted their affairs in a manner which did not invite criticism. Banks can obviously be a lot more helpful in mobilising resources if they were given greater freedom.

**

The practical approach of Mr. R. Venkataraman to the problems relating to industrialisation is borne out by his statement in the Legislature that the objective of the Government was not so much to nationalise industries merely for nationalisation sake as the control over them in order to ensure that they were conducted for benefiting the general public. Actually, he stated that "our main objective is not nationalisation. It is not control, it is not free economy as such, but to maximise production by whatever means available". The difficulty in nationalisation arose from the fact that large sums had to be paid to the owners of industrial concerns, that were taken over, by way of compensation. If the road transport industry had to be nationalised, about 4,000 buses will be involved requiring probably the compensation of Rs. 200 crores while, according to Mr. R. Venkataraman again, with a fresh outlay of Rs. 50 crores it would be possible to run air-conditioned buses all over the Madras State. This same reason will bring out the impracticability of taking over the rice mills in the State in pursuance of the suggestion made at Bhabaneswar. The interests of growers are being sought to be safeguarded by having strict control over millers. As representations have been made by growers that the procurement policy has had a depressing effect on the market, it is being examined whether maximum prices can be fixed and direct purchase from the growers also effected so that the millers do not make any attempt to derive undue advantage of the easier position in regard to the availability of rice after the harvest. There has latterly been a downward trend in prices and it has even been suggested that, at the end of the current Plan period, Madras might be in a position to export as much as 500,000 tons of rice to neighbouring areas.

The moving finger writes

IT WAS wonderful of the Prime Minister that he should have braved the biting cold of the Republic Day morning and sat through the entire parade past the saluting base at Raj Path. Mr. Nehru, however, did make three concessions to human frailty. He did not take his usual brisk stroll past the saluting base before going into the VIP enclosure. Instead he drove down a short distance in his Cadillac, acknowledging the cheers of the people. Secondly, it was the Defence Minister who received the President and not, as was the practice in previous years, the Prime Minister. Finally, there was a woollen blanket over Mr. Nehru's knee which was about the only reminder of his recently having been ill. No one, incidentally, had to help Mr. Nehru out of the car when he left it to enter the VIP enclosure.

The Prime Minister's presence at Raj Path this Republic Day is perhaps his way of telling the world that he was not quitting. But I hope that the defiance will not be overdone. A country must, indeed, be in a desperate condition to demand of the oldest of its citizens in high office that, well or ill, he continues to stay at his post.

**

The President's Republic Day broadcast, surely, had some rather unusual passages. I am referring, in particular, to his statement that "it would be well to recognise that the tolerance of our society for weak, inefficient and unclean administration is not unlimited". The implication of this remark can only be that the administration has become so weak, inefficient and unclean that there is danger of the people's patience being exhausted. I, for one, would say that such an assessment would be a gross exaggeration. It would not have surprised me to hear such words from Mr. C. Rajagopalachari, but it does surprise me to hear them uttered in the President's broadcast to the nation on Republic Day. In any case, to the extent that the President's public statements are, in Constitutional terms, to be taken as being made on the authority of the Cabinet, it is at least slightly ridiculous that the Government itself should describe its own functioning as "weak, inefficient and unclean". If it really believes that it is all this, it should have the decency to resign and get out.

**

Since everybody these days seems determined to prove his patriotic bona fides by talking about the prevalence of corruption, it is highly likely that the reports which appeared in the Press in the last few days of the places of some Central Government officials being searched and incriminating evidence found will have a disproportionately serious impact on the public mind. The fact is that, out of the four officials who had been involved in these incidents, three are small fry and only one of them has been holding a post of any considerable responsibility or importance. Unfortunately, in the preliminary stages of investigation or inquiry, it is apparently not possible for the Government to publish the names and designations of the officials affected. In the circumstances there is wide and often irresponsible speculation and the names of the innocent and the guilty alike are bandied about in a most disturbing fashion. The Home Minister, who is so rightly concerned with cleaning up the administration, should give some attention to this aspect also and see whether anything can be done to avoid unnecessary and often damaging embarrassment to officials who might be blameless but might still be preyed upon by rumours.

**

I see that Dr. V. K. R. V. Rao wants the Press to be run by public trusts so that Business pressures might be prevented from acting on the Government or the Legislature through newspapers and periodicals. I wonder whether something also should not be done about our economists so that some kind of distinction may be maintained between academic economists on the one hand, and professional economists of all kinds on the other, in order that, when any given economist makes a pronouncement, his audience might be enabled to know something of the "who" and the "why" of it.

Again, when we are talking about this business of who corrupts whom and how, it is just as well to remind Dr. Rao that prospects or positions in the administration might also be a means of the Government exercising pressure on the judgment of economists. I have great respect for Dr. V. K. R. V. Rao, but I do happen to remember that he was among the very few economists who "out-Morarjied" Mr Morarji Desai in inventing virtues for the super profits tax which, if it were to go, come February 29, would surely go unwept, unhonoured and unsung by virtually everyone. In any case, when a newspaper or a journal says something, the reader has means of being aware of who owns the publication, but when one of our many eminent economists, academic or otherwise engaged, gives an opinion or makes a judgment, it is far less easy for the public to find what might be behind it all.

**

The Readers' Digest recently invited its subscribers in this country to say what factors they thought contributed most to public health. The questionnaire specified seven factors, but respondents were told that they might add any they thought "important." Out of the 1,191 respondents, 68 per cent, it appears, considered "more and better food" as the most important public health factor, giving it the first or the second place, while another 17 per cent gave it the third or the fourth place. "Better housing" followed close, 44 per cent placing it first or second and another 37 per cent placing it third or fourth. "Better health education of the public" was mentioned first or second by 36 per cent of the respondents, while another 37 per cent of them gave it the third or the fourth place. The fourth important public health factor was "better drainage," 64 per cent of the respondents placing it in one or the other of the first four places. Then came "better government health services and hospitals" which was mentioned for one or the other of the first four places by 41 per cent of the respondents.

I am rather inclined to applaud the results of the survey because it shows that the segment of public opinion reflected by it is certainly both intelligent and well-informed. The intimate connection between public health and economic progress, for instance, has been clearly recognised by the high importance given by respondents to "more and better food" and "better housing." Secondly, the "preventive" aspect of the public health campaign has received greater emphasis than the "curative" aspect. Thus, while "hospitals" figure as the fifth important factor determining public health, "better drainage," "better health education of the public," "better housing" and "more and better food" are all ranked above it. I am particularly attracted by the high place given to the health education of the public. This suggests a high sense of citizenship responsibility since it takes note of the fact that public health can be promoted only through the informed efforts of the people themselves.

V.B.

Trade Winds

ENGINEERING INDUSTRY PROTESTS

A MEMORANDUM has been submitted by the Indian Engineering Association to the Committee headed by Dr. V.K.R.V. Rao, which is currently enquiring into problems of external assistance. The increasing entry of the public sector into the sphere of various industries, according to the association, is likely to create difficulties for the private sector in its efforts to compete on equal terms with the public sector. There is apprehension that in cases where a public sector unit runs into difficulty because of its neglect of basic factors making for economic viability, the political pressure on the Government will be too heavy to be resisted, reducing the competition between the two to a farce.

The Association has given two concrete examples to support this point of view. The first case relates to an engineering firm in Bombay which is likely to be debarred from manufacturing electronic controls, despite the fact that a letter of intent has already been issued to it. It may be stopped from going ahead with its plans because two public sector units are currently being set up for the manufacture of industrial instruments and process controls. The preparations made by the Bombay firm — which received the letter of intent in 1961 — will go waste. It is in a position to commence production within the next eight months while the public sector units are not likely to materialise till 1967. The firm is planning to make use of its existing plant and resources. The equipment needed is valued at not more than Rs. 5 lakhs and only 20 per cent of its needs to be imported from abroad. It is estimated that after making allowance for the import of raw materials and components, the savings in foreign exchange in the first year will be equivalent to Rs. 12 lakhs and in the second and subsequent years at Rs. 35 lakhs. The foreign exchange cost of the plant will thus be recovered in the first two months.

In the second case which has been cited by the association, a private firm has put forward the claim that it can produce 300 tons of ophthalmic glass. The capital outlay is estimated at Rs. 60 lakhs and the unit can go into production within 15 months of the receipt of the Government approval. The Government is also simultaneously processing its plans for a State-owned unit with Soviet collaboration. The capital cost of this project will be Rs. 3 crores, while the volume of output of glass will be the same. It is claimed by the firm that Soviet collaboration for ophthalmic glass is unnecessary. Indian staff has been trained for the past seven years in glass technology and the British collaborators who assisted the firm to manufacture sheet glass in the past are willing to provide technical know-how for the manufacture of ophthalmic glass along with the necessary foreign exchange.

SUGAR INDUSTRY COMPLAINS

The Indian Sugar Mills' Association has expressed its concern regarding the policy being pursued by some of the States of taking over sugarcane farms from factories under the Land Ceiling Acts. Both in U.P. and Maharashtra, cane farms of factories have been brought within the purview of the Land Ceiling Act. The Maharashtra Government proposes to acquire the farm land held by the sugar companies to hand it over to the State Farming Corporation. The Bombay High Court recently gave the opinion that Section 28 of the State Act was ultra vires of the Constitution. Under Article 31A of the Constitution, taking over lands from the Corporation and handing them over to the State did not amount to "fairer distribution of land" according to the judges. To that extent, the Act itself was considered discriminatory in character.

The Association has referred to the recent statement of Mr. A. M. Thomas, Minister of State in the Union Ministry of Food and Agriculture, regarding the cycles of surpluses and shortages of sugar production. The Minister was right when he stated that increasing sugarcane output was possible only by intensifying cultivation and by application of better and more scientific methods. While the urgency of increasing cane productivity is realised by all, the measures taken by the State Governments are not conducive to the attainment of this objective. The sugar industry has brought to the notice of the Government on a number of occasions that the most practical, economical and speedy way to improve cane production in the country is by promoting and encouraging the function of large-scale composite mechanised farms attached to sugar factories. Such farms serve as practical research stations establishing the commercial importance of new cane varieties and new agricultural practices. They also serve as extension service centres to the neighbouring cane cultivators and induce them to adopt more scientific methods in cultivation. The sugar factories in the State of Maharashtra had done pioneering work in converting jungles into prosperous sugarcane farms. Their cane yields and sugar recovery were higher than in many parts of the country. The sucrose content of cane cultivated in the farms of such factories was also high. The average yield of cane in these farms was as much as 60 tons per acre — about four times of the all-India average. Unfortunately, acquisition of efficient and mechanized farms in Maharashtra and U.P. has taken place in utter disregard of the recommendations of the Planning Commission which favours exemption of sugar factory farms from the land ceiling legislation. The Association has therefore asked for the "free functioning" of the sugarcane farms attached to sugar factories if a long-term solution to the problems of the industry is to be found.

EXPORT MARKETING

Speaking at the concluding session of a two-day seminar on Export Marketing held at the Small Industries Service Institute, New Delhi, the US Counsellor for Economic Affairs, Mr. James Lanigan, said that there was no market in the world that India could not tap because, like Japan, India enjoyed the advantage of cheap labour. He encouraged the small industrialists present there by saying that his country would be willing to offer more technical assistance to the small units that engage in exports (not necessarily to the United States).

Dr. P. S. Lokanathan referred to the necessity of market information for exports and said that small-scale units should be constantly exposed to new processes and changes that are taking place in the demand pattern of the world. Citing the case of "Woolworth", he remarked that out of 35,000 products being sold by them, 15,000 were "new" in the sense that the same did not exist ten years ago. Therefore, production without reference to the people's wants would put the producers out of date. Commercial growth and exports did not depend so much on material factors as on information, education and training.

The seminar was organised by the Management Alumni Association of the Institute with the active co-operation of the Small Industries Associations, All-India Manufacturers' Organistion, exporters, marketing experts, Government officials and representatives of the Ford Foundation and the State Trading Corporation. The subjects discussed at the seminar included: Market Information for Exports, Cost Reduction, Sales Representation and Government Assistance to Small Units for Exports. The seminar was inaugurated by Mr. N. K. Mukarji, Development Commissioner, Small-Scale Industries. The prominent speakers included Mr. H. D. Shourie, Joint Secretary, Ministry of International Trade; Mr. Morton C. Crossman of Ford Foundation; Mr. Dass Gupta of Delhi University, Dr. S. L. Sharma, Director, Economic Investigation (Ministry of Industry); Mr. N. R. Thadani, Marketing Controller, D.C.M.; Mr. Robbins of the Institute of Management, Calcutta; Mr. G. A. Major of State [illegible]

Mr. Duleep Singh, Director National Productivity Council.

There were in all 130 participants. Some of the important suggestions made by the group after two days' deliberations were:

(i) The Central Small Industries Organisation, with a network of its Institutes all over the country, should immediately take up the responsibility of helping the small industrialists in the matter of specific market information for exports. In order to procure useful information regarding changes in the external demand and prices of the products of small industries as well as for exploration of new markets for such products, the Central Small Industries Organisation should make arrangements for sending abroad parties of experienced officers and representatives of small industries associations. These parties should also take with them samples and book orders for small industrial units;

(ii) Co-operative Export marketing for groups of industrialists should be encouraged by developing export houses; and

(iii) The Central Small Industries Organisation should create a cell of production engineers with a view to helping small units in cutting their cost of production by adopting better production processes and proper use of materials and equipment etc.

EXPORT FINANCE

In accordance with the recommendations of the Mathrani Committee on export finance, an Export Credit and Guarantee Corporation has been set up with a paid-up capital of Rs. 2 crores (authorised capital Rs. 5 crores). The ECGC would take over all the functions of the Export Risks Insurance Corporation. The new Corporation will grant credits and guarantees in foreign currencies to facilitate the import of raw materials or semi-finished goods for the manufacture or processing of export goods. The Corporation will grant these credits from a modest import-export revolving fund which had been suggested by the Ramaswami Mudaliar Committee. It will also furnish guarantees to banks and provide them with supplementary credit facilities. The Corporation will largely play a co-ordinating role and take up residuary functions. It will not compete, but collaborate, with banks in the provision of export credit facilities.

As stated by Mr. Manubhai Shah, the Government is also considering further steps to make export finance cheaper in terms of financing and interest charges.

ELECTRICALS INDUSTRY MEETS

Inaugurating the 16th Annual General Meeting of the Indian Electrical Manufacturers' Association held in the Capital recently, the Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, said that while the growth of indigenous content of the industry had been generally satisfactory, there were still some important products such as transformers which required a high import content, as high as 50 per cent. One of the main reasons for this is the shortage of virgin metals in the country. He said the Government programmes for the expansion of non-ferrous metals industry were being stepped up to meet the situation.

Mr. Subramaniam advised the manufacturers to consider and decide on methods of standardisation of the imported components of the industry as this will help build up ancillary industries. The Minister said that so far the industry had not been subjected to any price controls nor had the Government any intention of clamping down controls on this industry. But at the same time, the industry was urged to initiate suitable studies for cost reduction with a view to reducing prices. Regarding the fixation of prices, Mr. Subramaniam commended such standards as fixing the prices at certain percentages above or below the landed cost of the imported items. The Minister also advised the Association to organise a common designs organisation which can continually look into the various problems of designs imposed by Indian conditions.

In his presidential speech, Mr. B. P. Poddar said that the electrical industries have made considerable progress during the last 12 years and supported his statement by giving out figures for important items. During this period (1950-51 to 1962-63) the production of electric motors rose from 0.01 to 1.03 million h.p.; transformers from 0.18 to 2.42 million kVA; switch-gears and control-gears from nil to Rs. 6.50 crores; ACSR and all aluminium conductors from 1.7 thousand tons to 32,055 tonnes; VIR and PVC cables from 39.4 million yards to 306.7 million metres and paper insulated power cables from nil to 2,139 kilometres.

Mr. Poddar pointed out that in the field of storage battery industry, the emergency created by the Chinese aggression brought new demands and for the first time the manufacture of special W.T. batteries, which energise radio equipment, the only means of communication in forward areas, has been developed. So also has been developed the battery charging equipment suitable for use in forward areas. Similarly, the manufacture of fully aerobatic aircraft batteries has also been developed.

In the past, the electrical industry was not able to record any export performance partly because it was still developing and had not established itself and partly because the cost of goods manufactured in India was much higher than the ruling prices in international markets. However, during the last one year or so, Mr. Poddar pointed out, the industry has made substantial exports of electric motors, starters, and switch gears, cables and wires and even transformers. All this has been possible due to the reorientation introduced by the Government in their export promotion schemes.

Mr. Poddar said that the Association was thinking of setting up a co-ordinating committee which will advise the industry regarding the testing and research facilities available with the various research laboratories and institutions. This committee will also approach the various institutions to extend their services to manufacturers on an appropriate charge. It will keep abreast of developments and, where necessary, make suitable recommendations to Government and the industry. The committee will also be responsible for taking steps to secure national standard specifications for such items for which we have still to depend on foreign specifications.

Mr. P. R. Dheshpande of Crompton Parkinson Limited, Bombay, has been elected as Chairman in place of Mr. B. P. Poddar.

CONSUMPTION OF NITRO FERTILIZERS

In the fiscal year 1962-63, the world consumption of nitrogenous fertilizers amounted to 15.6 million tons, surpassing that of the previous year by five per cent. The increase in consumption was the greatest in the U.S.A., Western Europe, India and China. About 4.5 million tons each were consumed by the U.S.A. and Europe. Asia consumed three million tons, thereby showing an increase of 12 per cent over the previous years' consumption.

NEW LIGNITE DEPOSITS

A large amount of lignite coal has been found in Khari village, 20 miles from Bikaner, in Rajasthan. Five holes have so far been drilled and lignite was found in eight to ten feet layers in a wide area, at a depth of 257 to 340 feet. According to the State Mining Department, the brown fuel could be economically mined and put in the market for public consumption by May next.

Company Affairs

LAKSHMI MACHINE ISSUE

THE INDUSTRIALISATION of the Coimbatore area in new directions is progressing at a fast rate and many allied industries are being promoted. Lakshmi Machine Works Limited has a programme for manufacturing textile machinery of various kinds in collaboration with Rieter Machine Works of Switzerland, who are well-known for their products all over the world. There are already three units producing textile machinery in a big way. But with the licensing of a larger number of spinning units and the grant of permission to existing composite and spinning units for increasing their capacity, there is a large unsatisfied demand for textile machinery. In many cases, deliveries cannot be had earlier than 24 months and it is felt that indigenous production should be stepped up appreciably if large foreign exchange expenditure is to be avoided. The promoters of Lakshmi Machine Works, who are well experienced in the textile industry, hope that production in the first phase would commence before the end of this year. Considerable progress has been already made in regard to the construction of factory buildings at Periyanaickenpalayam, near Coimbatore. The foreign participants have agreed to take up equity shares for Rs. 30 lakhs towards the supply of know-how, plans and layout and for supplies of machine tools upto 12 per cent of the issued capital. The directors and their friends have already subscribed for equity shares amounting to Rs. 1 crore while the International Finance Corporation will be participating in the equity capital to the extent of Rs. 20 lakhs. The balance of Rs. 1 crore has been offered for public subscription and is underwritten. The foreign exchange content of expenditure will be met by the subscription to equity shares by the Rieter Machine Works as well as International Finance Corporation. Besides, there will be a loan of $960,000 from the International Finance Corporation and a loan for Rs. 40 lakhs in foreign currencies from the Industrial Credit and Investment Corporation. This institution will be giving additionally a loan of Rs. 15 lakhs in rupees. The first phase of the construction programme is expected to be completed by the middle of this year.

BHARAT STEEL OFFER

Bharat Steel Tubes Ltd. entered the market on January 28, 1964, to raise Rs. 42,90,000 through equity shares of Rs. 10 each and Rs. 30,00,000 through 9.3 per cent cumulative redeemable preference shares of Rs. 100 each. The applications for shares are required to be for a minimum of 50 shares or multiple thereof in the case of equity shares and five shares or multiple thereof in the case of preference shares. Only one-fourth of the total value of the shares need be sent on application while another one-fourth is payable on allotment. The balance will be payable by subsequent calls at the discretion of the directors. There will be, however, an interval of at least two months between the calls. The company was converted from a private limited company into a public limited company in August 1962 and is being expanded in order to manufacture steel tubes and pipes which form the arteries of every industry today. There is a growing demand for steel tubes and pipes for the flow of gas, water, steam, oil and petroleum. The needs of the country are being met by a smaller number of existing tube mills, but none of them happens to be in the northern region.

Bharat Steel has entered into an agreement with Messrs. Abbey Etna Machine Company, Perrysburg, Ohio, U.S.A., for technical and financial collaboration. This company has a standing of about 60 years in this line and has developed valuable manufacturing technology and data for the establishment of manufacturing facilities and the manufacture of these products. The collaboration agreement has already been approved by the Government of India. The collaborators will assist the company in various respects for a consideration of U.S. $200,000. The factory will be established near the railway station Ganaur, Punjab, which is at a distance of 30 miles from Delhi. The Punjab Electricity Board has agreed to make available 25,000 KW of power, which is expected to be sufficient for the requirements of the factory as well as the colony.

JAYANTI SHIPPING'S SIXTH

The sixth bulk carrier "Kanishka Jayanti" was delivered to the representatives of Jayanti Shipping Company Ltd. in Japan on January 16, 1964. Jayanti Shipping placed orders for eight such vessels with Mitsubishi Engineering Company Ltd. of Japan; the remaining two are under construction. "Kanishka Jayanti" is one of the largest Indian vessels. It can carry about 32,000 tons of ore, has a draft of about 33 feet and is equipped with some of the most modern navigational devices including radar and "loadicator." It has been chartered even before delivery: it will earn foreign exchange equivalent to about Rs. 50 lakhs per year. The total capacity of Jayanti Shipping Company Ltd. with the acquisition of "Kanishka" will be more than 3,65,000 DWT which is nearly 20 per cent of the total Indian registry. Jayanti Shipping now commands six bulk carriers including Kanishka, one oil tanker, and 12 cargo vessels making a total of 19 vessels. The plans of the company for 1964 include acquiring of one more oil tanker, the super-size 54,000 DWT Vikram Jayanti, two more bulk carriers and three combined oil (or ore) carriers of about 21,000 tons each.

WAVERLEY JUTE

The audited accounts of Wavverley Jute Mills Company Ltd. for the year ended May 31, 1963, disclosed a profit after providing for depreciation, taxation and Super Profits Tax at Rs. 3,02,633. Taking into account the balance brought forward from the previous year, the total sum available totalled Rs 3,68,905 out of which Rs. 1,50,000 have been transferred to General Reserve. The directors have recommended a dividend of 6.5 per cent on 15,000 preference shares and additional 5 per cent on these shares, absorbing Rs 86,250. On ordinary shares the directors have recommended 30 nP per share absorbing Rs. 25,000. The balance of Rs. 57,655 is proposed to be carried forward.

EAST ANGLIA PLASTICS

The Visakhapatnam area in Andhra Pradesh is being developed in a big way. Apart from Andhra Sugars which has expansion plans and which recently commissioned its units for producing acetic acid and acetic anhydride, East Anglia Plastics has a scheme for establishing a six crore rupees cellulose acetate flake factory at Visakhapatnam. The foundation-stone for this factory was laid on January 13, 1964 by Mr Lal Bahadur, the Chief Minister Mr N. Sanjiva Reddy presiding on the occasion. The raw materials required for cellulose acetate flakes are alcohol and cotton linters which are available in plenty within the State. The company has arranged for the import of plant and machinery with the help of French credit for Rs. 2.90 crores. This credit is repayable over a period of 13 years and has been guaranteed by the Andhra Pradesh Industrial Development Corporation.

MCKEE IN INDIA

Mr. Merrill Cox, well-known in the world of steel, has been elected President of Arthur G. McKee & Co. In 1945 the McKee organisation was invited by Government of India to investigate and report on India's steel potential. Its report is considered to be the basis of many developments of the steel industry in the country since then. The McKee organisation continues to maintain a live interest in the progress of our steel projects, including Bokaro. One of its subsidiaries, Western Knapp Engineering Co., is now designing and will build the Khetri Copper Refinery, India's first 20,000 ton capacity outfit which is estimated to cost about 35 million dollars. Through its Petroleum & Chemical Division, it is also active in India's plans for development of oil refineries. The McKee organisation is one of the pioneers in the field of petro-chemical industry and under the leadership of its recently elected President, Mr. Merrill Cox, it is confident of playing an increasing part in the building of industries around the world.

WELLMAN INCANDESCENT

At a meeting of the board of directors of Wellman Incandescent India Ltd., held on January 22, 1964, the directors decided to make the first and final call of Rs. 5 per share to make the equity shares fully paid. Call notices have already been issued to the shareholders.

NIMAR MILLS

The foundation-stone of Nimar Textile Mills was laid at Khandwa on January 20, 1964. With a capacity of 25,000 spindles, it is the first spindle mill at Khandwa, which has been selected because of its being a rich cotton growing centre and having adequate power and water facilities. It is only 43 miles from Burhanpur, which is a big consuming market for cotton yarn. The mill is expected to go into production by the end of the current year. I.F.C. has agreed to extend a loan; the company is expected to enter the capital market very shortly.

DEV.DAYAL TUBE

The governing board of the Bombay Stock Exchange has approved the application of Devidayal Tube Industries Ltd. for its share to be dealt in on the exchange. The general permission to do business in the share of the company will be notified to the members of the Stock Exchange shortly.

BANK RESULTS

CENTRAL BANK: The working results of the Central Bank of India for the year 1963 showed a net profit of Rs. 189.26 lakhs as compared to Rs. 179.6 lakhs in 1962. Taking into account the balance brought forward from the previous year, total funds available for distribution came to Rs. 190.19 lakhs as against Rs. 203.33 lakhs in the preceding year. The appropriation for the reserve fund was raised from Rs. 38.71 lakhs to Rs. 40 lakhs while the allocation for the special reserve was reduced from Rs. 58 lakhs to Rs. 39 lakhs. The bonus to staff will cost Rs. 5 lakhs more and will rise from Rs. 65 lakhs to Rs. 70 lakhs. The dividend has been maintained at 20 per cent, absorbing Rs. 63.28 lakhs. Final dividend of Rs. 32.77 lakhs was paid out of special reserves for 1962 and a sum of Rs. 33 lakhs will be drawn for this purpose.

UNION BANK: The net profit of the Union Bank of India Ltd. for 1963 after providing for taxation was placed at Rs. 27.38 lakhs as against Rs. 22.07 lakhs for 1962. The directors have appropriated Rs. 6 lakhs for the reserve fund and Rs. 50,000 for depreciation on bank's building. The equity dividend was maintained on the increased capital at 57 nP. per share, subject to tax. The total dividend amounted to Rs. 11.40 lakhs against Rs. 7.96 lakhs. A sum of Rs. 10.88 lakhs was carried forward after adjustments, subject to the payment of bonus to staff as against Rs. 1.40 lakhs brought in after providing for bonus in 1962

SYNDICATE BANK: The Syndicate Bank Ltd. (formerly the Canara Industrial & Banking Syndicate Ltd.) has made considerable progress during the year ended December 31, 1963. Its deposits went up from Rs. 32.65 crores in 1962 to Rs. 45.11 crores and advances from Rs. 18.27 crores to Rs. 27.83 crores. Investments on approved securities increased from Rs. 12.03 crores to Rs. 16.47 crores. The net profit, subject to audit, before providing for tax was Rs. 40 lakhs as against last year's Rs. 30 lakhs. The directors propose to transfer Rs. 9 lakhs to the general reserve, raising it to Rs. 75 lakhs as against a paid-up capital of Rs. 80 lakhs, set apart Rs. 14 lakhs for taxation and Rs. 5 lakhs for bonus to staff. The dividend will be maintained at 20% (less tax) on equity shares. The resources of the bank stand at Rs. 57 crores at the end of 1963 as against Rs. 39 crores in the preceding year.

INDIAN OVERSEAS: The net profit of the Indian Overseas Bank Ltd. for the year 1963 was Rs. 26.96 lakhs after providing for taxation including the amount brought forward as against Rs. 22.22 lakhs in preceding year. A sum of Rs. 6.75 lakhs has been transferred to the reserve fund against Rs. 4 lakhs only in 1962. The bonus to the staff will absorb Rs. 6 lakhs against Rs. 4 lakhs in the previous year. The equity dividend of the bank has been raised from 12 per cent to 14 per cent, absorbing Rs. 13.19 lakhs against Rs. 10.19 lakhs in the preceding year. The deposits of the bank at the end of 1963 were higher at Rs. 41.50 crores against Rs. 37.13 crores at the end of the previous year.

INDIAN BANK: The working results of the Indian Bank Ltd. showed an improvement in its net profit from Rs. 15.25 lakhs in 1962 to Rs. 17 lakhs in 1963. With the surplus of Rs. 1.44 lakhs brought forward from the previous year, the total amount available for distribution was Rs. 18.44 lakhs out of which the directors had transferred to the reserve fund Rs. 3.40 lakhs against Rs. 3.10 lakhs. The directors have recommended an increase in the final distribution from 6.5 per cent to 8 per cent by raising the bonus part from 1.5 per cent to 3 per cent. The bank had already paid an interim dividend of 7 per cent against 7.5 per cent distributed in 1962. This brought the total dividend and bonus for the year to 15 per cent.

STATE BANK OF PATIALA: The State Bank of Patiala, which is a subsidiary of the State Bank of India, earned a net profit of Rs. 5.35 lakhs in 1963 as against Rs. 3.12 lakhs in 1962. The directors have provided a sum of Rs. 1.97 lakhs for bonus to the staff and Rs. 10,000 for the staff welfare fund. The gross income increased from Rs. 74.42 lakhs in 1962 to Rs. 88.08 lakhs. The bank has opened seven new branches during the year taking the total to 63.

BANK OF AMERICA: The year 1963 witnessed a substantial growth in the case of the Bank of America. In a year-end report, President of the Bank, Mr. Rudolph Peterson outlined various elements of its progress. Its total resources approached the 15,000 million mark showing an increase during the year of $1,277 million. Deposits towards the end of the year were $13,243 million and outstanding loans $8,365 million. Investments in securities increased by nearly $87.97 million to $3,192 million and transactions in securities yielded a net profit of $1.46 million. Mr Peterson reported that a sum of $56.96 million was paid by way of dividends to more than 200,000 shareholders at an annual rate of $2 per share. The bank advanced more than 1.5 million loans to individuals and business institutions during the year.

CAPITAL ISSUES

Six companies have been authorised to raise capital amounting to Rs. 3.34 crores. Of these, one is a news agency issuing debentures to construct a multi-storied building in the Capital. The rest are issuing equities.

Press Trust of India, Ltd., is to issue debentures of the value of Rs. 35 lakhs divided into 3,500 7½ per cent debentures of Rs. 1,000 each for cash at par. The proceeds of the issue will be utilised for constructing a multi-storied building on the company's plot in Parliament Street, New Delhi.

Papanasam Paper Mills Ltd., a company incorporated in the State of Madras, is to issue capital of Rs. 1,99,93,400 in equity shares of Rs. 100 each for cash at par. Of the issue such number of shares as would qualify the scrip to be listed on recognised stock exchanges will be offered for public subscription by prospectus. The money will be utilised for setting up a paper and pulp mill.

National Buildings Construction Corporation Ltd., Delhi, a Central Government undertaking, will issue further capital

of Rs. 15 lakhs divided into 1,500 equity shares of Rs. 1,000 each for cash at par. The capital will be utilised for construction of buildings, roads and other civil works throughout India.

Asfalt Roofings India Ltd., a new company proposed to be incorporated in the State of Madras, is to issue capital of Rs. 30 lakhs, divided into three lakh equity shares of Rs. 10 each, for cash at par. Of the issue, such number of shares as would enable the company's shares to be listed on recognised stock exchanges will be offered for public subscription by prospectus. The money will be utilised for setting up an industrial undertaking for the manufacture of asphaltic roofings and allied products with foreign collaboration.

English Indian Clays Ltd., Kottayam, will issue capital of Rs. 30 lakhs divided into 30,000 equity shares of Rs. 100 each to be subscribed privately. Of this, shares of the value of not more than Rs. 15 lakhs will be offered at par to English China Clays Ltd., U.K., towards import of plant and machinery and technical know-how. The capital will be utilised for setting up of a China clay washing plant.

The Maharashtra State Farming Corporation Ltd., Bombay, a State Government undertaking, is to issue capital of Rs. 25 lakhs divided into 25,000 equity shares of Rs. 100 each to be subscribed privately. The money will be utilised for meeting the cost of movable assets of a capital nature taken over from the sugar factories.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951, during the week ending January 10, 1964. The list contains the names and addresses of the licensees, the articles of manufacture and annual installed capacity.

NON-FERROUS METALS AND ALLOYS

Natwarlal Shamaldass and Company, 94, Medows Street, Fort, Bombay-1. (Srikakulam, Andhra Pradesh). — Electrolytic manganese metal — 1,800 metric tons per annum; Manganese dioxide — 1,800 metric tons per annum. Indian Copper Corporation Limited, C|o. M|s. Gillanders Arbuthnot & Co. Ltd., P.B.No. 38, Regal Buildings, New Delhi (Bihar) — Blister Copper — 16,560 metric tons per annum; Sulphuric Acid — 54,000 metric tons per annum.

COAL

West Phularitand Colliery Co., "Sita Nomac", P.O. Dhanbad Distt. Dhanbad. (Dhanbad, Bihar) — Coal — 36,000 tonnes per annum. G. K. Gorai & Co., P.O. Chirkunda, Distt. Dhanbad, Bihar. **Name of the Undertaking.** Shree Lakhimata Colliery (Dhanbad, Bihar) — Coal — 21,000 tonnes, per annum.

ELECTRICITY EQUIPMENT

Beni Limited, 1, Crooked Lane, Calcutta-1 (West Bengal) — Train lighting dynamos — 150 Nos. per annum. Switchgears — 750 Nos. per annum. Kerala State Industrial Development Corporation Limited, Valleyambalam, P.B.No. 105, Trivandrum. **Proposed name:** Transformers & Electricals Kerala Ltd. (Eranakulam Distt., Kerala) — Transformers (1000 KVA — 50,000 KV A) — 6 lakhs KVA per annum. New Government Electric Factory, Byappana-Halli, P.B.No. 84, Bangalore-1. (Bangalore Mysore) — Transformers — 5,16,000 KVA per annum. Switch gears & Control gears — Rs. 1,20,000 worth per annum. Electric motors — 4,80,000 H.P. per annum.

ELECTRICAL CABLES

The Indian Cable Co. Ltd., 9, Hare Street, P.B. No. 514, Calcutta-1 (Bihar) — Railway signalling cables, 6 lakhs metres per annum.

RAILWAY ROLLING STOCK

K.T. Steel Industries (P) Ltd., K.T. Building, Broach Street, Bombay-9 (Ambernath, Maharashtra) — Automatic Vacuum Brake Cylinders for Railway Wagons, 6,000 Nos. per annum.

CHEMICAL MACHINERY

Investment Corporation of India Limited, Ewart House, Bruce Street, Fort, Bombay-1, Proposed name: Glasstek Ltd. (Poona Distt., Maharashtra) — (Capacity p.a.) Glass lined equipment, worth Rs. 55 lakhs; Water treatment equipment, worth Rs. 31 lakhs; Stainless steel and corrosion resistant Alloy Equipment, worth Rs. 8 lakhs. Arthur Import Export Co., 166, Dadabhai Naoroji Road, Bombay-1, Proposed name: R.K. Cardclothing Manufacturers' Ltd. (Punjab) — Card clothing for cotton waste woollen and worsted, wool waste and shoddy spinning industry, 1 lakh metres per annum.

CONVEYING EQUIPMENT

Electric Construction & Equipment Co. Ltd., P.O. Parbangla, Via Batanagar, 24, Parganas (Budge Budge, West Bengal) — Industrial lifting platform, 120 to 180 Nos. per annum.

BALL ROLLER AND TAPERED BEARINGS

Shri P. S. Jain, Rajpur Road, Delhi-8, Proposed name: P.S. Ball Bearing Co. Ltd. (Faridabad, Punjab) — Ball bearings Internal bore diameter 8 mm to 100 mm, 7,20,000 Nos. per annum; Thrust Ball Bearings, 1,80,000 Nos. per annum; Tapered roller bearings bore diameter 8 mm to 100 mm. 6,00,000 Nos. per annum; Cylindrical roller bearings, 2,40,000 Nos. per annum.

SEWING & KNITTING MACHINES

T.V. Sundaram Iyengar and Sons Pvt. Ltd., P. B. No. 21, Madurai, Proposed name: Singer Sundaram Ltd. (Madurai, Madras) — Domestic Sewing Machines components, 1,25,000 sets per annum; Industrial components, 20,000 sets per annum for model 103K10; Industrial components for model 31K15, 5,000 sets per annum.

INORGANIC HEAVY CHEMICALS

The Andhra Sugars Ltd., 28, Sarojini Devi Road, Secunderabad-26, — Chlorosulphonic Acid, 4950 tonnes per annum.

DRUGS AND PHARMACEUTICALS

Lepetite Ranboxy Laboratories Ltd., Okhla Industrial Area, New Delhi (Okhla, Delhi) — (New Articles, Annual Capacity): Nisolone Acetate 1 per cent Ointment for dermatologic use (5gm tubes) 120,000 tubes; Lepitiron 12,200 c.c. bottles (as per the revised formula, 1,20,000 bottles; Solvent ampoules (a) 10 c.c., (b) 5 c.c. 7,20,000 ampoules for each type. Substantial Expansion (After Expansion, annual Capacity); Ambramycin capsules 250 mg., 14,40,000 capsules (360 kg.), Nisone tablets (5 mg), 48,00,000 tablets; Pertranquil tablets (400 mg), 24,00,000 tablets; Vitamin 'C' injectable (5 ml. - 500 mg), 12,00,000 ampoules (6000 litres). Sandoz (India) Ltd., 3, Wittet Road, Ballard Estate, Bombay-1 (Maharashtra) — Intestopan tablets, 20 million tablets per annum; Nutrisan capsules, 4 million capsules per annum; Metules capsules — 8 million capsules (per annum).

COTTON TEXTILES

Shri B. C. Ghose, Gopalpur House, Jalpaiguri, Proposed name: North Bengal Co-operative Spinning & Sugar Mills and Industries Ltd. (Jalpaiguri, W. Bengal) — Cotton yarn, 12,500 spindles.

GLASS WOOL

Anil Hardboards Ltd., P.B. No. 10056, Lakshmi Insurance Building, Sir P.M. Road, Bombay-1 (Bhandup, Maharashtra) — Granulated Rock Wool (Mineral wool), 12,000 tonnes p.a.

PLYWOOD

Madhya Pradesh Timber Industries, Bhopal (Bastar, Madhya Pradesh) — Commercial plywood, 18 million sq. ft. p.a.

CHANGE IN NAMES (Owners or Undertakings)

During the week ending 10th January, 1964

(This information pertains to particular licences only.)

From M|s. Prem Industrial Corporation, Ahmedabad to M|s. Prem Conductors Private Ltd., Ahmedabad. From M|s. D.M.R. Auto Industries Ltd., Calcutta to M|s. Chopra Motors Private Ltd., Calcutta. From M|s. Indian Electrical Manufacturing Co. Ltd., Bombay to M|s. Premier Meters and Instruments Co. Ltd., Bombay.

BOOKS BRIEFLY

Conception and Contraception

JOSSLEYN HENNESSY

THE CONSUMERS' Association (14, Buckingham Street, London, W.C.2.) is a non-profit making private body, which carries out exhaustive tests on the quality, reliability, durability, and comparative costs of selected consumers' goods and publishes the results in its monthly review "Which?" (available to members only). Membership — subscription Rs. 13 a year — is open to anyone on written application.

C.A.'s latest report (Price Rs. 7 and available only by becoming a member) is on contraception. It compares the reliability, safety, and costs of twelve methods: the use of condoms and washable sheaths for men, diaphragms, cervicles, vault caps, and sponges for women, surgical sterilisation for men and women, the safe period, oral contraceptives, intrauterine rings, the douche, and prolonged lactation for women, and withdrawal for men. The main part of the report gives test results, brand comparisons, and "best buys", for 164 brands of chemicals and contraceptive apparatuses.

The report begins by describing the mechanism of human conception and the various methods of preventing it — with their advantages and disadvantages — and it ends with a section on the various courses open to childless couples anxious to have a child.

People have disagreed violently about birth control. The subject is, however, becoming better understood, and more calmly and sensibly discussed. C.A.'s only aim is to provide information for those people who want it. The report, which takes no sides in religious, or other, arguments for or against birth control, reveals that the user of contraceptives can easily be paying too much and be buying an unreliable product at the same time. Advertising is often misleading, and often disguised to look like disinterested medical advice; meaningless claims are made for products; prices bear no relation to effectiveness, and so on

No Ideal Method

The basic point which emerges from C.A.'s study of twelve methods of contraception is that not one is fool-proof or automatic; each requires some intelligence and care in its use. If you do not understand the bodily mechanism of conception, nor how the particular method selected works, there are ample chances that you will have an unwanted child. There is not one ideal method for everybody; the best method will differ for each individual. According, for example, as to whether you are willing, or unwilling, to go to a doctor or a clinic, whether you find certain methods troublesome or distasteful, or are bound by certain religious observances, say, Roman Catholic or Jewish, some methods will be open to you, others not.

While the full range of choice of the methods, chemicals and apparatuses discussed in C.A.'s report will be open to educated Indians, able to afford expenditure of between Rs. 20 to Rs. 100 a year, most of them are likely to be beyond the financial reach of villagers, or else impractical in the conditions of mofussil life.

Oral contraceptives — pills taken by the women — were found to give maximum reliability, but they require prescription and supervision by a doctor, and can cost up to Rs. 100 a year. The combination of a cap for the woman or a condom for the man plus, in each case, a chemical contraceptive, is given "very high reliability", with the use of a condom, or a washable sheath, for the man "slightly less reliable". From the viewpoint of the mofussil, the condom is probably the simplest form of birth control, although it is by no means infallible if carelessly used, and the percentage of defective condoms (with minute holes) ranges (according to brand) from 3 per cent to as high as 20 per cent. Moreover, condoms would seem to be particularly risky in India because they deteriorate if kept in hot or damp climates, and the annual cost may be up to Rs. 100.

Described by C.A. as "moderately reliable" are the use by the woman of (1) a sponge and a chemical, (2) a chemical alone, (3) the "safe period", and (4) withdrawal by the man. The cost of (1) and (2) is put at between Rs. 20 and Rs. 60 per annum.

Costs Nothing

From the villagers' point of view, the safe period (the only form of birth control permitted to Roman Catholics) should be ideal, because it costs nothing. But it requires intelligence, care, paper and pencil, and the ability to perform simple arithmetical calculations. The unsafe period is between the 12th and 16th day inclusive before the beginning of the monthly period and for 3½ days afterwards, so that the woman needs to know when the next period will start. Few can be sure about this. They therefore must know the earliest and latest dates, so that they can work out each month the range of days over which they may be fertile. This involves careful recording in a diary, or on a calendar, of first and last days over many months, preferably over a year. Even so, this is not a certain guide, because illness can disrupt the pattern. Having recorded the data, further calculations (simple for an educated woman) are needed to work out the safe period. One imagines that many village women would find all this too complicated and, of course, the method needs the husband's co-operation in abstinence for at least ten consecutive days in each cycle.

The practice of withdrawal by the man before his climax costs nothing and C.A. reports that many people are satisfied with it, although it has been condemned by many doctors and psychiatrists as putting too much emotional strain on both partners, and it requires great alertness and care. It is perhaps a somewhat too sophisticated a method to advocate among villagers.

The whole subject of birth control remains, even today, so embarrassing to so many people that proportionately many are likely to learn a great deal about the mechanics of human conception, the twelve ways of countering it, and the advantages and disadvantages of each, from this soberly factual C.A. report of 96 profusely illustrated pages.

(Note that prices quoted above are those in the U.K. and will doubtless differ from those current in India).

CORRECTION

The publications "Elements of Indian Income Tax" and "Practical Problems of Income Tax" reviewed last week have been published by Asha Publishing House, 74|6A, Baghbazar Street, Calcutta, and not by "Asia Publishing House, Calcutta", as was mentioned in error.

CHAIRMAN'S STATEMENT

INDIAN OXYGEN LIMITED

Sales Improve, But Rising Costs Affect Profit

PROGRAMME OF SUBSTANTIAL DEVELOPMENT AND EXPANSION DRAWN UP

The following is the statement circulated by Mr. N. Dandeker, Chairman, Indian Oxygen Limited, to the members of the Company with the annual report for the year 1963.

It is a pleasure and a privilege for me to have the opportunity of addressing you for the first time as Chairman of your Company since my appointment on 1st April, 1963.

The year under review began with a short, sharp but undeclared war with China, which ended as abruptly as it began. While it exposed large and unexpected areas of unpreparedness on our side in Weapons, Transport Equipment and Communications, it also disclosed to a surprising and welcome degree the underlying unity and resolve among the people at large, throughout the country, to resist the unprovoked aggression by every means and at whatever cost. In this context, the task for industry was to mobilise the national material resources without avoidable delay and to place at the disposal of our Government and our Armed Forces everything they needed to resist aggression. In this effort your Company has played its part to the best of its ability and resources.

PROFITS, TAXATION AND DIVIDEND

The result of the year's operations, before taxation but after providing depreciation of Rs. 59,66,478 (previous year Rs. 49,83,816), was a profit of Rs. 1,40,40,263 as against Rs. 1,35,49,869 last year. Compared to a sales advance from Rs. 8.88 crores to Rs. 10.21 crores the profit increase was indeed small. Considering, however the substantial increase in depreciation, coupled with the severely curtailed production at the Electrode Factory where activity was inhibited by acute shortage of core wire, and the general rise in costs resulting partly from the national emergency and partly out of inflation and the impact of the Finance Act, 1963, the trading results may be regarded as satisfactory.

The tax provision for the year including Rs. 9,00,000 for Super Profits Tax, amounts to Rs. 69,33,996, leaving a net profit of Rs. 71,06,267 as against Rs. 60,62,869 in the previous year. Out of this, a sum of Rs. 19,00,000 (previous year Rs. 6,50,000) has been transferred to the Development Rebate Reserve; this includes a further provision of Rs. 6,00,000 for the previous year. After adding Rs. 17,61,389 brought forward from the previous year, and transferring Rs. 32,069 to the Fixed Assets Replacement Reserve, almost the whole of the balance amounting to Rs. 69,00,000 has been transferred to General Reserve, as against only Rs. 10,00,000 so transferred last year.

After careful consideration of the Company's present and prospective resources position, and all other relevant circumstances including, in particular, the increasing burden of taxation in the context of the continuing situation of national emergency, your Directors have decided to recommend that the rate of dividend (subject to deduction of tax) should be maintained at 12 per cent. If this recommendation is accepted the dividend will be paid out of General Reserve.

SALES

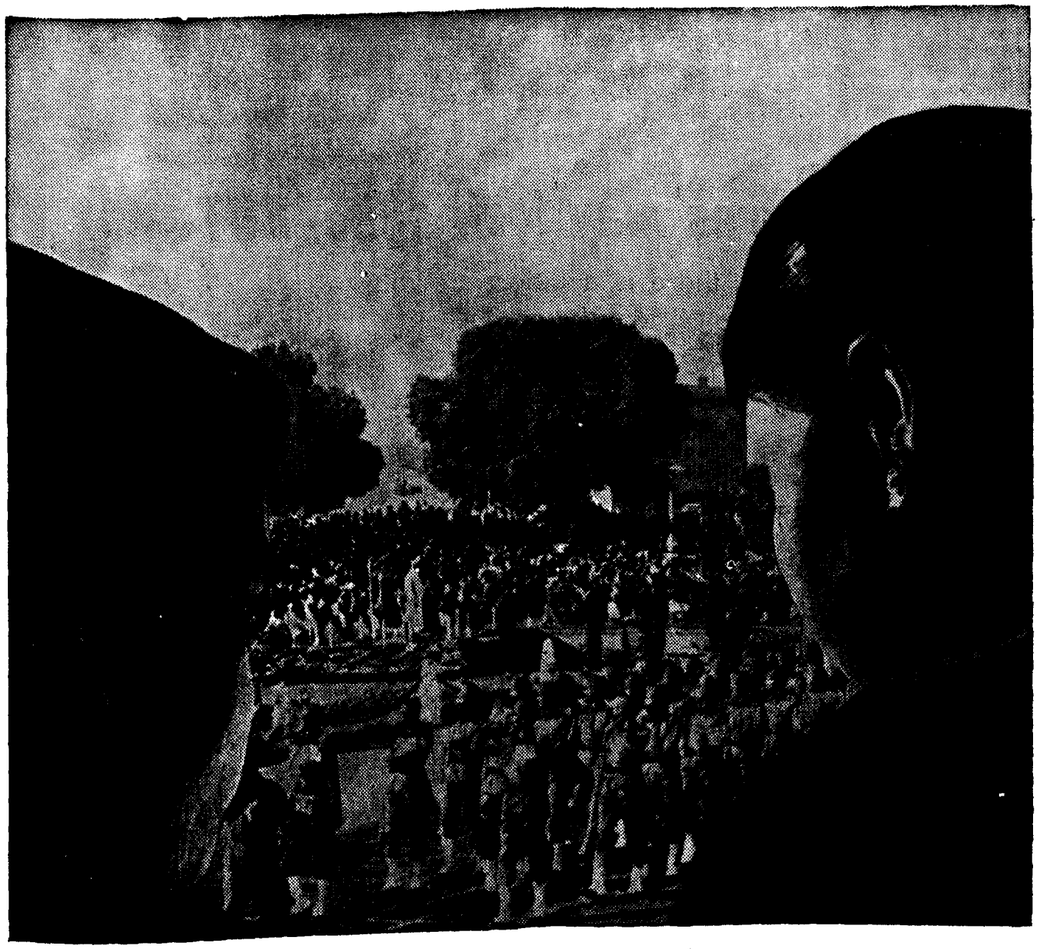
Sales for the year totalled Rs. 10.21 crores, an increase of 15 per cent over the last year's figure of Rs. 8.88 crores. In view of the difficulties your Company had to encounter during the year under review, this was indeed very satisfactory. Acute shortage of core wire persisted almost throughout the year, severely curtailing the output of electrodes at our factory at Khardah near Calcutta. It is a matter of great regret that despite the continuance of the national emergency timely attention was not given by the authorities to ensure the availability of core wire, with the result that electrode production in the country suffered a very severe set-back and caused considerable inconvenience to the engineering industry. There was also occasional failure of power which interrupted production activities at several of our factories, notably at the Electrode Factory, and also at Asansol and Madras.

Oxygen and dissolved acetylene sales showed considerable increases and the sales of gas-user equipment, electric welding equipment and medical products also improved substantially.

FINANCE

Capital expenditure incurred during the year was financed largely out of the Company's internal resources and amounted to Rs. 85,50,601 covering a number of projects throughout the country.

I am glad to report that the agreement with The British Oxygen Company Limited for a Sterling Loan of £500,000 to which reference was made by my predecessor in his statement last year has now been finalised; and it has also received the approval of the Government of India. With the support of this foreign exchange loan, the Company is now in a position to take in hand a major expansion programme covering a number of projects to which I shall refer in some detail in the paragraphs which follow. This expansion programme is expected to cost about Rs. 6 crores, spread over four years. It has been estimated that after taking into account the internal resources which will be generated over that period and the loan of £500,000, the Company will require additional rupee finance of about Rs. 2 crores for the expansion programme. I am glad to report that subject to the consent of the Controller of Capital Issues, arrangements have been made with The Punjab National Bank Limited, to provide us with this amount by way of medium term loan secured by the pledge of Debenture Stock.



DEVELOPMENT AND EXPANSION

In his statement last year my predecessor had mentioned that the second 400M3 oxygen plant was under erection at Bombay. That plant went into commercial production in May.

The buildings for the new factory at Hyderabad are in an advanced stage of construction. The dissolved acetylene plant is expected to go into production there within the next two months and the oxygen plant by July, 1964.

Construction of the Loxite Factory at Ranchi is expected to be completed early in 1964. Production activities were discontinued at the Burnpur Loxite Factory in January, 1963 and taken up partly (in a temporary structure) at the Ranchi site and partly at Bermo.

Keeping in view the general trend of demand for your Company's products in the near future, we have drawn up a programme of substantial development and expansion for the

The parade of freedom that never ends....

Fourteen years ago she watched the first Republic Day Parade, in her arms her baby son. The years have passed. Once again she watches the march past. Beside her stands her fourteen year-old boy, symbol in his eager youth of the young India he is part of. ☐ In those fourteen years for mother, for son, and for millions like them the world has changed. They have learnt new needs, achieved new fulfilments, accepted the new responsibilities of Freedom. ☐ Year by year has grown the ever-deepening awareness of a national unity, an integration reaching through and beyond the division of locality and language. ☐ The Parade of Freedom is a living symbol of national oneness. This Parade must never end..

NATIONAL INTEGRATION SERIES NO. 6

All tyres may look alike-BUT

there is a difference with

Firestone

four years ending 30th September, 1967. Several new projects have been proposed covering additional facilities for production and distribution of gases, production of user equipment and electrodes, and also for manufacture of plants. Our schemes include, of course, plans for reorganisation and modernisation of existing factories also.

In the field of industrial gases, the new projects include the installation of an argon purification plant at Bombay (for which an industrial licence has already been received), two 400M3 liquid oxygen plants one each at Calcutta and Madras, and many new installations at customers' works in various parts of the country.

An industrial licence has been obtained for the manufacture of welding and cutting equipment at our new factory for which land has been acquired at Taratala Road, Calcutta. Construction work will begin soon and it is hoped that the project will be completed by the end of 1966. It is intended ultimately to shift the activities of present Equipment Factory at Beliaghatta, Calcutta, also to the new factory.

In the sphere of electrode production, the Company has been granted an industrial licence for substantial expansion at Khardah Factory as also for a new Electrode Factory at Madras. The work of expansion at Khardah will commence soon; and as regards the industrial licence for the proposed Madras factory, clarification is awaited from the Government on certain points. Meanwhile, the land required for the Madras factory has already been acquired and it is hoped that it will be possible to commence construction work during the second quarter of 1964.

Mention was made last year of the Company's intention to undertake the manufacture of plant and machinery for producing and using gases. Your Company's application for an industrial licence for the manufacture of air separation plants and associated cryogenic equipment is now under the consideration of the Government.

Each manufacturing venture, whether for gas-producing plants, electrodes or equipment, will take the country one further step towards self-sufficiency for these essential products besides effecting valuable saving in foreign exchange. We hope therefore that the urgency and desirability of the projects outlined above will bring forth from the authorities concerned support and co-operation in full measure.

COMPETITION

The pressing demands for Industrial oxygen and dissolved acetylene thrown up by the national emergency were brought to your notice last year. I record with satisfaction that in spite of insufficiency of cylinders the Government demands on us for additional supply of gases were on the whole satisfactorily met and despite the shortage of core wire, our contractual obligation to Government for the supply of electrodes was fulfilled, although inevitably in both cases often at the cost of non-Government customers. It is hoped that the inadequacy of oxygen and dissolved acetylene supplies in the country, and also of electrodes which already existed and was highlighted in the difficult initial days of the national emergency and which still persists will persuade the Government to adopt a more practical policy of industrial licensing of new manufacturing units for these vital products. While the Government continues to be influenced by illusory fears concerning a supposed monopoly situation in these fields, your Company accepts the necessity for, and the fact of, competition. But it is only natural to hope that in view of your Company's resources, experience and stature in this field, as also in recognition of the quality of the services it has provided over the years, the Company's expansion schemes will not be held in check by the Government's restrictive policies.

I am glad to say that the Company has been entrusted with the management and operation of the tonnage oxygen plant, the first in the private sector, put up by the Tata Iron and Steel Company Limited, at Jamshedpur. This arrangement with Tatas is in pursuance of the power taken by your Company under one of the new Object Clauses adopted at a

meeting of the shareholders held on 27th September, 1962, and since approved by the Calcutta High Court.

We have also been approached by other producers of industrial gases to render them assistance 'inter alia' by way of technical advice on their plant and factory. In three cases we have already agreed to render such assistance. All this goes to emphasise that we are not in the least averse to the emergence of genuine competitors. Indeed, we hope that our standing and experience will, by helping others, foster a happy spirit of co-operation and healthy competition among the producers of industrial gases in this country.

PROSPECTS

From what I have said above it will be evident that I entertain a feeling of confidence and restrained optimism about the future prospects for the Company. We are about to enter upon a period of fairly heavy capital expenditure with full confidence and faith in the future of our country. It is a faith shared by The British Oxygen Company Limited also; in this connection we had the privilege of a visit in November this year by their Vice-Chairman, Lord Reith, who toured India extensively and visited five of your Company's factories in different parts of the country. But while investment of such magnitude as we have in view implies favourable long-term prospects, both as regards profits and growth generally, the short-term prospect must necessarily be viewed somewhat more conservatively because of the increasing debt and interest load until the new investments become fully productive.

MANAGEMENT AND PERSONNEL

On his retirement from India, Sir John Brown relinquished on 31st March, 1963, the office which as Chairman of your Company he had occupied since 11th June, 1958. Under his distinguished stewardship there have been remarkable developments of your Company's undertaking and the ground has been prepared for further expansion in future. I offer Sir John Brown our sincere thanks for his services to the Company and I also extend to him our warn wishes for further success in his new life in England.

Mr. P. C. Kavanagh, who had been the Company's Assistant Managing Director since 1st June, 1959, also vacated his office on 31st March, 1963. Mr. Kavanagh left us in order to take up a position with The British Oxygen Company Limited. Mr. Kavanagh's association with the Company extended over a period of more than 14 years, and I take this opportunity of wishing him success in the years to come.

Mr. S. K. Sinha, one of your Directors since 26th October, 1956, will retire at the Annual General Meeting; and though eligible for re-election he has, on personal grounds, decided not to seek it. In Mr. Sinha's retirement the Company will suffer a distinct loss. I thank him for his services to the Company, and would like him to know that he carries with him our sincere good wishes for the future.

In the Chairman's Statement on the 27th Annual Report and Accounts mention was made of the publication of a house journal called "Oxygen News". The employees' reaction to this mode of communication was so encouraging that "Oxygen News" commenced monthly publication in January, 1963. This house journal is fast becoming an effective medium of self-expression for the employees as also a secure channel of communication between the management and the employees.

I take this opportunity of recording with pride the contributions made individually by members of the Company's staff in furthering the national effort during the emergency. In particular I would mention the warm and generous response to the appeals for contributions both to the National Defence Fund and the Blood Bank. Sixteen employees were called up for active service, while their colleagues, working in factories and elsewhere, were also contributing towards the defence efforts.

21st December, 1963.

N.B.: This does not purport to be a record of the proceedings of the Annual General Meeting.

EASTERN ECONOMIST
Annual Number 1964

The Nation's leading economic weekly with the largest circulation in its class proudly presents in its latest Annual Number a stimulating discussion of the highly topical theme "THE BATTLE OF INDUSTRIAL PRODUCTION". It critically examines developments in major industries and relevant Government policies. Illustrated with colour-graphs, charts and statistical tables, this sumptuous Number is priced Rs 10|- per copy; available to subscribers of Eastern Economist without extra payment; Annual subscription Rs 65|-.

PROPOSED ACTIVITIES

To manufacture complete Blowroom Lines, Carding Engines, Lap Formers, Ribbon Lap Machines, High Speed Combers, High Speed Draw Frames, Speed Frames, Ring Spinning Frames, Double Apron Drafting Arrangements, and manufacture of the complete range of spinning machinery, accessories and Spare Parts to spin cotton and staple fibre yarns and allied kindred materials or products of the same design as those of **M|s. Rieter Machine Works Ltd., Winterthur, Switzerland.**

TECHNICAL COLLABORATION

The Company will embark on the manufacture of textile spinning machinery of all description in collaboration with the World renowned Swiss Firm of textile machinery manufacturers namely. **M|s. RIETER MACHINE WORKS LTD., WINTERTHUR, SWITZERLAND.** The collaboration Agreement is valid up to 31-3-1975.

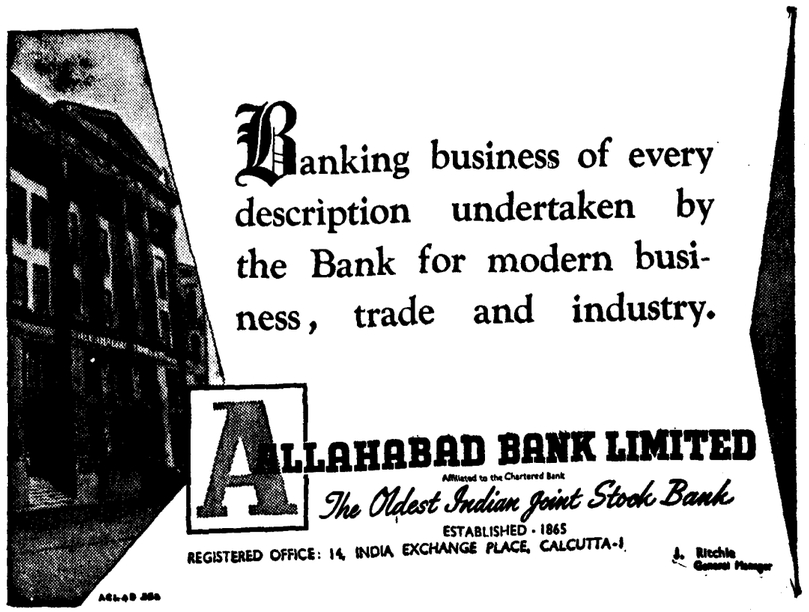
BUSINESS PROSPECTS OF THE COMPANY

While a number of established units are producing textile machinery and are straining at the leash to meet the country's requirements, the demands are far from being met. Experience of existing manufacturing units has proved that specialised skill and meticulous training make all the difference in securing a proper output and maintaining quality in production. With the foreign collaboration of such a veteran among textile machinery manufacturers as RIETER MACHINE WORKS LTD., WINTERTHUR, SWITZERLAND, the Company can ensure the highest efficiency in output, the incorporation of the latest refinements in textile machine making, and the maintenance of quality. The company hopes to place on the market textile machines of the same standard and quality as Rieters are themselves producing over the years, the first stage of production to commence in the latter half of 1964. It is expected that based on the present estimates, the Company will make sufficient profits to enable a fair dividend to be paid to the shareholders of the Company after meeting other obligations.

LOAN CAPITAL

The Industrial Credit & Investment Corporation of India Ltd., have agreed in principle to grant a loan to the Company in foreign currencies equivalent to U.S. $840,000 (about Rs. 40 lakhs) and a rupee loan of Rs. 15 lakhs. The International Finance Corporation, Washington, has also agreed in principle to grant a foreign exchange loan of U.S. $960,000 and they will also participate in our equity capital (in foreign exchange) for a sum of Rs. 20 lakhs. Scheduled banks have agreed to advance a block loan of Rs. 65 lakhs. All these loans will be secured by a legal mortgage ranking **pari passu** for all the institutions. The repayment will be in sixteen half-yearly instalments ending in 1975.

LOCATION OF THE FACTORY



The factory will be located at Perianaickenpalayam, about 11 miles from Coimbatore on the Coimbatore-Mettupalayam Railway route near the Railway Station. There will be a railway siding and easy access by roads. The Company has already purchased 111 acres 74½ cents of land. Adequate supply of water and power have been ensured.

PROGRESS MADE

Import licences for machine tools, component parts and raw materials have been obtained for Rs. 37,80,587. Essentiality Certificates also for the same for a total value of Rs. 34,86,247 have been received and necessary applications have been made for getting the import licences. Model machines from M|s. Rieter Machine Works Ltd., have been ordered and these will be got shortly. Indigenous machineries for the first stage of the project have also been ordered for. Building constructions are expected to be ready by April 1964 and the first stage of production is anticipated to commence in the latter half of 1964.

DATES OF OPENING AND CLOSING OF SUBSCRIPTION LIST:

The subscription list will open at 10 A.M. on Monday 3rd February, 1964 and will close at 5 P.M. on Wednesday 19th February, 1964 or earlier at the discretion of the Directors as soon as subscriptions approximating to the amount issued hereunder to the public have been received but not earlier than 5 P.M. on Thursday 6th February, 1964.

RECORDS AND STATISTICS

Foreign Collaborations

THE LIST of the foreign collaboration agreements entered into by Indian firms during the October-December quarter for 1963 released recently shows that of the 74 agreements, 16 were with British firms, 12 with American firms, 11 with West German firms, eight with Japanese firms, seven with French firms, three each with Italian and Swiss firms, two each with Belgian, Dutch, Yugoslav, Czechoslovak, Polish and East German firms and one each with Danish and East African firms. There is a wide variety of items taken up for manufacture which include power cables, automobile ancillaries, refractories, hand tools, heavy structurals, pipes of various types, cement making machinery, etc. The list below gives the names of Indian firms as well as foreign firms along with the items taken up for manufacture.

FOREIGN COLLABORATIONS—OCTOBER-DECEMBER 1963

S. No.	Name of Indian firm	Name of Foreign Firm	Item of Manufacture
		INDIA — U.K.	
1.	M|s. Binani Metal Works Ltd., Binani Building, 38, Strand Road, Calcutta.	M|s. Multicore Solders Ltd., Multicore Works, Maylands — Avenue, Hemel Hempstead, Hertford, England.	Solid and flux cored solder.
2.	M|s. Bell's Asbestos & Engg. (India) Pvt. Ltd., 24, Chittaranjan Avenue, Calcutta-12.	M|s. Sir W. H. Balley & Co., U.K.	Balley's Pressure Reducing Valves.
3.	M|s. The Daily Tej Pvt. Ltd., P. O. Box 1112, Naya Bazar, Delhi-6.	M|s. Purnell & Sons Ltd., London.	Reprinting and publication of three Weeklies — 'Finding Out', 'Knowledge' and 'Understanding Science'.
4.	M|s. Emcipi Electronics (P) Ltd., 6-L, Connaught Place, New Delhi.	M|s. Compagnie Francaise Thomson-Houston of France and M|s. Mining and Chemical Products, London, U.K.	Transistors.
5.	M|s. General Machinery Stores, Rajabahaur Compound, 24-BD, Hamam Street, Fort, Bombay-1.	M|s. R. H. Windson Ltd., Leatherhead Road, Chessington, Surrey, U.K.	Plastic breaking machines.
6.	M|s. Industrial Cables (India) Ltd., National Insurance Building, Parliament Street, P.O. Box No. 464, New Delhi-1.	M|s. Hackbridge Cable Co. Ltd., Hackbridge, Surrey, England.	Power Cables.
7.	M|s. India Pistons Ltd., Sembiam, Madras-11.	M|s. Associated Engg. Ltd. England.	Pistons, Piston rings, Cylinder liners etc.
8.	M|s.. Kirloskar Pneumatic Co. Ltd., Hadapsar Industrial Estate, Poona.	M|s. Westinghouse Brake & Signal Co. Ltd., U.K.	Compressors.
9.	M's. Kulkarni Foundries (P) Ltd., Hadaspar Indus.	M|s. Monometer Mfg. Co. Ltd., Savoy House, 115-116, Strand, London W.C.; and	Rotary Oil, Fired Furnaces.
		M|s. Whiting International, Harvey, Illinois, U.S.A.	Electric direct arc melting furnaces.
10.	M|s. Mahindra Owen Ltd., Gateway Building, Apollo Bunder, Bombay-1.	M|s. British Trailer Co. Ltd., Phoenix Works, Richmond Road, Trafford Part, Manchester-17, U.K.	Automobile ancillaries.
11.	M|s. Nestler Boilers Pvt. Ltd., Love Lane, Cross Lane, Byculla,	M|s. Nu-Way Heating Plants Ltd., U.K.	Oil burners.
12.	M|s. Octavious Steel & Co. Ltd., 14, Old Court House Street, Calcutta-1.	M|s. Becorit (C.B.) Ltd., 2, Leslie Road, Gregoory Boulevard, Nottingham, England.	Mechanical Steel Pit Props Greetschel Steel Link Roof Bars.
13.	(With an Indian party)	M|s. Permutit Co. Ltd., Gunnersbury, London W-4.	Ion Exchange resins and water treatment plants.
14.	Shri C. Ramabhupal Reddy, 'Challa House', Kurnool.	M|s. J. Brockhouse & Co. Ltd., U.K.	Leaf and coil springs for automobile and railways.

FOREIGN COLLABORATIONS—OCTOBER-DECEMBER 1963—Contd.

The Hard Facts of Economic Life

THE BUDGET Session of Parliament meeting next week will be called upon to face squarely the hard facts of our economic life. The ground has been prepared well. The Winter Session, it will be recalled, was involved in an agonizing reappraisal of our development policies when the mid-term review of the third Plan came before it. Although the doctors differed over the diagnosis as well as the treatment, they were at least agreed that something indeed had gone wrong with the economic health of the nation. The stagnation in agriculture and the arrested advance in industry were alike commented upon and in the case of the latter at least it seemed to be the general view that measures could and ought to be taken in the coming months to stimulate the economy. This opinion seems to be held particularly clearly and firmly by the Finance Minister.

Mr. Krishnamachari, in fact, has been perseveringly playing on the theme of economic revivalism in the past few months. Through a series of deft policy decisions in individual matters he has succeeded in building up a national awareness of the problem of stimulating the economy. In the process he has also roused expectations in the people that the Budget he will be presenting at the end of this month will offer a dynamic strategy for stepping up investment, production, employment, and consequently, economic progress and social welfare. It follows that not only our people but also people in other friendly countries who are assisting us and are interested in our industrialisation and economic improvement will be grievously disappointed if the Budget fails to provide a positive and purposive direction to the future course of the national economy.

Meanwhile, or rather simultaneously, another major thought has also come to influence the mind and the mood of the nation. It is possible that Dr. Lohia's notorious "three-anna" controversy has had something to do with this, but that apart, if the United States, in spite of its being the richest country in the world, has to worry about the "American poor" in its midst, it is only right and proper that this country, which contains within it so much of the massive Asian poverty, ought to be always painfully conscious of its problem of mass destitution. From this point of view the recent emphasis on the reduction of economic inequalities and the progressive elimination of concentration of wealth and economic power, to which the discussions both before and at the recent annual session of the Congress Party had given form and force, must be considered to be at least as relevant to the budget-making in which the Finance Minister must now be engaged as is the other main consideration of stimulating industrialisation and economic growth.

As for Mr. Krishnamachari himself, he has said enough on more than a few occasions to assure the nation that he is aware of both compulsions. Adopting a somewhat unorthodox practice, he has been thinking aloud on some of the propositions with which he will have to come to terms in his Budget statement on February 29. The speech he made in Jaipur some days ago, for instance, has been widely assumed to be indicative of some of the workings of his mind in this regard. In particular, his observation that a man was entitled to the fruits of his labour but a person who had done no work should not have the fruits merely because of the accident of birth, has been interpreted as indicating the possibility of the re-imposition of the Expenditure Tax, and increases in the rates of the Estate Duty and the Wealth Tax. We do not desire to enter into this kind of speculation at this stage, but we would like to make it very clear that our own view is

that the Finance Minister is, on the whole unlikely not only not to do anything in the fiscal field which would impede production or disturb the investment climate, but will also refrain from any move which would even make it seem to informed foreign or domestic opinion that his proposals might have the effect of holding up industrial expansion. We would, indeed, like to go further and suggest that he is likely to produce a Budget which in its totality would be constructive in its approach to and consequences for investment and industrial activities in the nation.

There are grounds enough to make this optimism not only respectable but reasonable. In the first place, no Finance Minister ever taxes wholly for the pleasure of it. It is only when he has to provide for increased spending, which becomes unavoidable in the context of the Government's major policy decisions that he turns to additional taxation after satisfying himself that estimated yields from existing sources of revenue would not give him the further finance needed. On the last occasion when Mr. Morarji Desai imposed a heavy dose of additional taxation, he had some such justification in the form of the sharply increased Defence estimates which he could not have provided for from the then estimated receipts from existing sources of revenue. This year the situation happily is different. It is a fair guess that the expenditure on Defence is, as was to be expected, trailing behind the provisions made for it in the current budget year.

Secondly, budget-making on the last occasion was influenced in its Defence part by the immediate reactions to the large-scale Chinese offensive within our borders. In this respect, again, the context has changed. Defence preparedness would now be viewed as a matter of the long pull rather than of the short heave.

Thirdly—and this is of the utmost importance—it is now possible to view the building up of our defence strength more in terms of strengthening the economic and industrial base than in terms of current spending on immediate programmes of limited military character. For all these reasons it is reasonable to argue that so far as the Defence estimates are concerned there can be no compelling justification for any new tax effort.

Then there is the question of development expenditure. It is being generally assumed that since it has been written into the Plan that development spending has to be stepped up from year to year, the Government has no alternative to imposing fresh taxation in successive budgets. This reasoning, however, is false. It is no secret that the former Finance Minister was fully convinced that the additional taxation he had imposed in the first two years of the third Plan would be sufficient to meet the Centre's obligations so far as the financing of the third Plan through a fresh tax effort was concerned. It is also no secret that, but for the Chinese aggression of November, 1962. Mr. Morarji Desai would not have imposed any substantial new taxation this time last year. We, therefore, do not see how the fact of progressively increasing development spending can be pleaded as justification for a large new tax effort this year. On any reasonable view of the case, the natural and normal growth of receipts from existing sources of revenue should see the Government through such increased commitments as they might assume in respect of development spending in the fourth year of the third Plan. Any other course could only mean that the Centre would merely be transferring to itself an unjustifiably large part of the burden of finding resources which State Governments have assumed as their obligation towards the fulfilment of the third Plan. Mr. T. T. Krishnamachari has been credited with the idea of introducing some degree of discipline in financial management in the areas of State Governments and public sector undertakings. If he means business, he should demonstrate it by resolutely declining to burden the Central Budget with the undischarged liabilities of those institutions or agencies.

We have been considering so far whether any new tax effort would be justified in the coming financial year and we have been led to the conclusion that there cannot be any. It is now desirable to ask ourselves a further question whether it is possible for the Central Government to contemplate reliefs and concessions in taxation to any significant extent. We would suggest that the possibilities are there and that they ought not to be ignored. Here we are firmly of the opinion that the poorest country (for its size and population) in the world ought to be ashamed of itself if it does not take a leaf out of the book of the richest nation in the world. Let us recall what the U.S. President had to say in his recent budget message recommending to Congress what he described as "a budget of economy and progress." President Johnson said:

> "In formulating my budget, I have been guided by two principles: I have been guided by the principle that spending by the Federal Government, in and of itself, is neither bad nor good. It can be bad when it involves overstaffing of government agencies, or needless duplication of functions, or poor management, or public services which cost more than they are worth, or the intrusion of government into areas where it does not belong. It can be good when it is put to work efficiently in the interests of our national strength, economic progress, and human compassion.
>
> "I have been guided by the principle that an austere budget need not be and should not be a standstill budget. When budgetary restraint leads the government to turn its back on new needs and new problems, economy becomes but another word for stagnation. But when vigorous pruning of old programmes and procedures releases the funds to meet new challenges and opportunities, economy becomes the companion of progress."

We very much hope that Mr. Krishnamachari too would approach the task of budget-making with this wholly admirable sense of frugality. We have heard a lot from political platforms about the national necessity for avoiding individual extravagance or social waste. We have heard it said that the rich should refrain from conspicuous consumption, the middle class practise thrift and even the poor reconcile themselves to sharp deprivations. Is it not only fair that the people in turn should demand that the Government too must observe similar restraints? In the past it had been the practice of successive Finance Ministers to come forward with

plausible pleas for not cutting down expenditure. We hope that the Government will not persevere in this cheap deception. The point that President Johnson stressed, namely the high desirability of releasing funds (currently mortgaged to wasteful or sterile spending) for the fulfilment of new needs or the exploitation of new opportunities, is extremely relevant to the Indian situation today.

The Finance Minister is well aware that sermons cannot stimulate production or new industrial activity. There can be no substitute for incentives. India must bid for investment capital in world markets and it, therefore, necessarily follows that Indian fiscal policies cannot be at gross variance with fiscal policies in capital-exporting countries. In other words, if the tax burden on investment or industry is reduced in the United States or Britain or other capital-exporting countries, the Government of India too must fall in line, otherwise the Indian economy will be progressively isolated from the fertilizing stream of world capital movements.

This, however, is only part of the story. Foreign capital is essential, but there has to be matching domestic capital so that foreign capital can be inducted into this country's industries. In any intelligent fiscal policy designed to promote economic expansion it is therefore necessary to ensure that the economic climate is good alike for foreign capital and domestic capital or for foreign enterprise and domestic enterprise.

Earlier, taking heart from the Finance Minister's enlightened and pragmatic statements on the requirements of economic expansion, the capital market in this country had shown some signs of reviving. Lately, the mood seems to have changed for the worse—and this not merely because of pre-budget jitters. There is a heavy feeling in the stock exchanges and elsewhere that, in the name of hunting down "unaccounted money" or dispersing wealth or large incomes, the Government might be tempted to raise the rates of some of the existing direct taxes or even introduce new direct taxes. As a result, recent capital issues relating to essential industries which the Government itself is keen to promote and speed up have failed with the public. Surely if this trend continues or is aggravated by acts of commission or omission in the coming Budget, the Finance Minister cannot expect the Government to succeed in stimulating economic expansion. We would, therefore, urge that the Finance Minister should make an earnest attempt to effect savings in public expenditure of the order of, say, Rs. 200 crores and use this saving to give fiscal relief and concessions both in order to relieve economic pressures of the less well-to-do sections of the community as well as to encourage productive effort among individuals in the higher income brackets and capital formation in the corporate sector.

A Report for Second Thoughts

ALTHOUGH it is more than a fortnight since the Bonus Commission signed and submitted its report to the Government of India and there have been references in the Press to the recommendations of the Commission, it is a pity that the authorities have not yet cared to release the report to the public. In the result, one has to be content with the necessarily scrappy reports in the Press.

Whether the recommendations are precisely as have been published in the Press or not, the reported proposals have already had a depressing effect on the stock markets. From the point of view of the markets by far the most important recommendation is the one concerning "prior charges." From what has appeared in the Press, a few important items of expenditure would appear to have been excluded for the purpose of determining what has been termed as "available surplus." These are believed to be: 1) development rebate, 2) super profits tax and 3) rehabilitation allowance. It is reliably learned that one of the members has taken strong exception to the exclusion of these items and has pointed to the likely consequences of such exclusion on the continued efficient functioning of industrial undertakings in the country. In the absence of the reasons that prompted the Bonus Commission to disallow these items, as also the stand taken by the dissenting member, it is not possible to offer any useful criticisms at this stage. However, if, as reported, these items have been excluded for purposes of computing "available surplus," the future of our industrial undertakings would certainly be seriously jeopardized. By reason of the far-reaching implications of the reported exclusion of these items, it is perhaps necessary to urge the early release of the Commission's report, so that the investing public may have an opportunity to make known its views before the Government takes action on the Commission's recommendations.

Another important question which is believed to have led to differences of opinion among the members of the Commission is that of the return on paid-up capital and reserves. The reported recommendation is said to be a return of seven per cent on paid-up capital and four per cent on reserves. The claim is made that this represents an increase over the Labour Appellate Tribunal formula of 1950. It is not clear from the reports in the Press whether the so-called increase from six per cent to seven per cent is from six per cent tax-free, that is 8.5 per cent taxable to seven per cent tax-free; in case the seven per cent is taxable, it would amount only to 4.9 per cent tax-free. In other words, instead of there being any improvement in the return, there would actually be a deterioration. Similarly, the proposed four per cent taxable return on reserves compares unfavourably with the four per cent tax-free that was available under the 1950 formula. Surely, considering all the changes that have taken place in the economic climate and in the yield pattern in the capital market, he would be a bold man, indeed, who could accept the reported percentage figures of return on paid-up capital and reserves as a fair return.

Many would naturally be interested in knowing

whether the Commission's recommendations are proposed to be made applicable to all industries in the same way, or whether the peculiar situation and circumstances of certain industries, like Mining and Plantation, not to speak of export industries like jute, have been given due weight in the application of the proposed bonus formula. Equally important would be the stand of the Commission on what should eventually be the pattern of bonus payment, in other words whether it should be based merely on profits or it should be also linked to productivity. Admittedly the linking of labour's earnings to productivity presents some difficulties, but these are not insurmountable and have, in fact, been overcome by the industrially advanced countries. If we have to compete with the manufacturers of these countries, as we must, in the world market, we will only be postponing the issue at our peril by refusing to face facts now. It is to be hoped that the Commission's report would throw some light on these and other crucial issues.

China's Other Offensive

YEARS AGO, *Eastern Economist* advanced the thesis that the Chinese have been India's traditional rivals. This is understandable, because both India and China have to contend with large populations and limited resources necessitating the emigration of large numbers of the nationals of both lands to other lands, far and near, in search of work and wages. The Chinese and the Indians have been confronting each other in many climes but mostly in South-East Asia. In these countries, both Indians and Chinese have now lived for generations, but, by and large, there are today more Chinese abroad than Indians. This may of course be explained away by the fact that the pressure of population in China is relatively greater; the Chinese are polygamous and, are, for that reason, perhaps more fecund. There is one other feature that distinguishes the two nationals. Whereas the Indians are mainly traders, the Chinese are for the most part craftsmen—carpenters, washermen and shoe-makers, etc.—and small cornershop merchants. As between the Indians and the Chinese living abroad, the Chinese are known to work harder and they are preferred, as evidenced by the fact that, almost everywhere, especially in Hong Kong and Singapore, one comes across more Chinese than Indians in the skilled trades in particular.

Until recently, the rivalry between the Indians and the Chinese did not become manifest but, thanks to China's recent aggressive postures, there seems to be a systematic and sedulous move, on the part of expatriate Chinese, to elbow out Indians, wherever possible. This is only to be expected, but what is surprising is the concerted bid that the Chinese have been making to gain a foothold in Africa. Communist China now sends out its citizens in large batches as experts (mostly agricultural) who, thanks largely to Africa's unexploited resources and its virgin soil, are able to produce demonstrable results, unlike in their own country. Equally naturally, they depict not only the erstwhile colonial powers of the West but also Indians as exploiters.

The powers-that-be in New Delhi are probably aware of all these developments. If they are, they have not taken the Indian people into their confidence. On the other hand, speeches made by some top-ranking Indian visitors to African countries of late confirm the suspicion that they are blissfully unaware of the many happenings in this part of the globe and their far-reaching implications to our people living there. For example, whereas we have been still considering requests of well-meaning African statesmen like Sir Ahmedu Bello, Sarduana of Sokoto (Western Nigeria), and of several other friends before him, to start joint industrial ventures, the Chinese have already gone ahead with all-out offers to help Africans, while the Japanese have done even better by sending a group (10) of cotton textile firms with the blessings of the World Bank, to establish a new cotton textile mill—Arewa Textiles Ltd.—in Nigeria in collaboration with two Nigerian development institutions. It is not clear what is preventing our Government and our industrialists (with rare exceptions), from taking a keener and prompter interest in the economic development of the newly independent States of Africa. In relation to both the Western colonial powers and the Chinese, we have certain advantages. For one thing, many Indians have been living there for some time and have been participating in the economic life of Africa. They know the local people, their languages and dialects. And quite a few of them have built up fortunes, for which one can think of no better use than such joint Indo-African ventures. While we have done everything in the past to prevent these fortunes from being brought to India, when the going was good, by our foolish and unimaginative tax laws, one new African State after another has since started putting innumerable obstacles in the way of repatriation of these fortunes. Finally, India's offers of economic aid will not smack of "neo-colonialism" in the eyes of the newly independent African countries which the Jeanneny Report has so vividly defined and condemned.

Notwithstanding all these inherent advantages, we have allowed the sands to run out. By doing so, we are not only denying ourselves a great opportunity but also letting a new powerful bloc—Sino-African—to grow up before our very eyes. Apparently China's drift away from Russia has prompted her to cultivate Africa and she has not been slow to make the point that, since both China and Africa are non-white, their destinies may be common (or is it Communist?)

Highlights of the Week

AN EVOLVING DEMOCRACY

DEMOCRATIC institutions in India are beginning to acquire a distinctive character of their own. If much has been said in disparagement of summit socialism—socialism achieved, that is, without a class struggle—a great deal has also been written abroad—often snottily—about the ineffectiveness of democracy which is imposed from above. Thus,—the argument runs—women do not make creative use of the equality which is given them from on high and for which they have not fought. Likewise, urban workers, who get wage increases from State awards rather than by collective action, cannot make up a successful trade union movement. Underlying this fallacious argument is a superstition of known provenance that suffering and violence alone chasten and discipline, and it has been falsely abstracted from experience in other historical contexts.

A foreign observer once mocked that the crowds at elections, as indeed those that visiting foreign dignitaries attracted, did not signify either political consciousness in Indians or any awarness of affiliation. Further argument—one supposes—directed against the experience of India where the State has been used as an instrument of progress both political and economic! The Nagaland elections, successfully conducted without clenching of fist and flexing of muscle, gives the lie to this view. The State in India has thus progressed beyond the rather restrictive image of it that exists in the minds of political theorists in Western democracies; it has become a creative agent which gives the people not only what they want but also what they ought to want. If nothing else, the Naga elections should serve to popularize the concept of equality as between men and women, for the Tribal Councils in this patriarchal society deny Naga women this privilege. Gaily decked women turned out in large numbers not only to vote but to watch this festive occasion.

The first general election to be held in Nagaland after its formal inauguration as a State of the Union proved to be an occasion for much enthusiasm and ended a week ahead of schedule. Details are now available about the election briefly noted in the January 24, 1964 issue of the journal. Despite threats from the hostiles, who would have liked to frustrate this opportunity given to the people of the State to elect their own leaders, the voters mustered in their thousands to exercise their new-found right of franchise. The unique occasion set new tasks for the administrative machinery in the State. A draft electoral roll was prepared and was adopted after suitable amendment and officials who were headed by Mr I. Sashimeren Aier, the Chief Electoral Officer and himself a Naga, received the requisite training for conducting the election. Polling stations were improvized in schools and post offices and even a cinema hall, we are told, was pressed into service. In all, 206 polling booths were set up in the 40 electoral constituencies carved out of Kohima and Mokokchung for the benefit of the 123,156 voters in the two districts. Tuenoang, the third district in the State, is a backward area and will not have general elections for another six years.

Campaigning in the State was vigorous and followed a recognizable pattern that has become familiar elsewhere in the country after three general elections. The occasion was marred by none of the dubious results of political sophistication, such as impersonation or doctrinaire electioneering which sometimes leads if not to violence certainly to bitterness. These—and it is a happy thought—are not necessary concomitants of democracy. No untoward incidents which detract from the fairness of the elections were reported. The rate of polling was more than impressive for a State where the people were being enfranchised for the first time. Curiously enough, voting was heavier in the rural areas—often at as high a rate as 95 per cent of the electorate in some constituencies in the Mokokchung district—suggesting a greater degree of political consciousness in the rural than in the urban areas.

The Naga Nationalist Organisation, which was provisionally in power before Nagaland was brought under the purview of the Constitution and thus into the mainstream of the country's political life, fared rather well capturing 33 of the 46 seats in the State Assembly. Fourteen candidates from the ruling party including four Cabinet Ministers were elected unopposed and the Tuensang regional council chose six members of the State Assembly by indirect election. The 59 candidates who contested the remaining 26 seats included Independents and many members of the Democratic Party who were headed by the retired IAS official, Mr. A. Kevichusa, and 11 of whom were eventually declared elected. Two Independents were elected and they have come out on the side of Mr. Shilu Ao's party, thus increasing the ruling party's strength to 35 in the 46-member Assembly.

THE SCIENTIFIC ATTITUDE

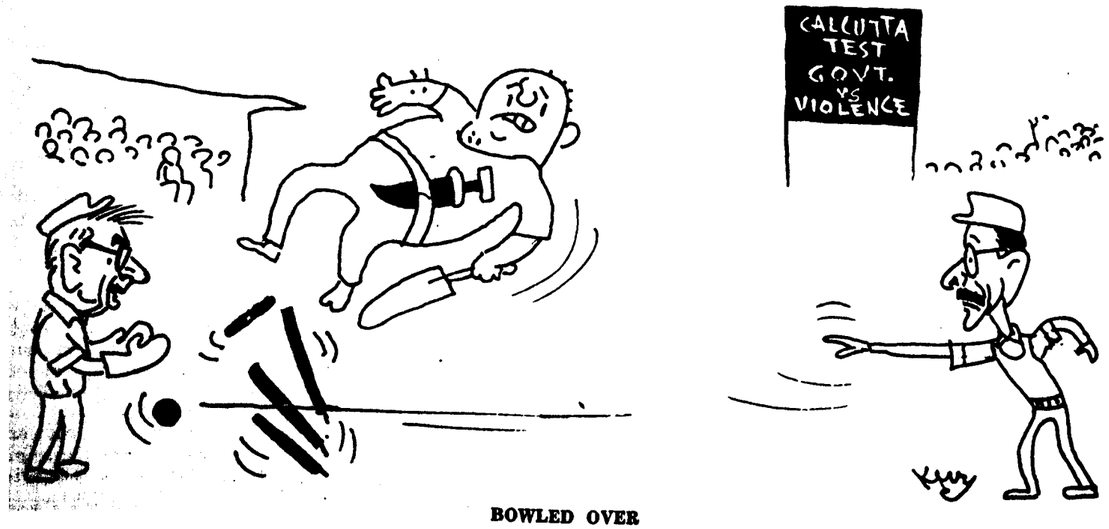
THE LATTER half of January witnessed a series of international and Commonwealth conferences and symposia which met in this country to discuss scientific and technical matters of common interest. To begin with, India played host to scientists from six countries who are represented on the Executive Committee of the Commonwealth Defence Science Organization. Formed in 1949 and called the Commonwealth Advisory Committee on Defence Science, it has had five meetings in the U.K., India, Canada and Australia. It has since been re-named and re-organized; the 1964 conference held in Kanpur and New Delhi was the first meeting of the new body. It organized a valuable symposium on corrosion research including aircraft protection, environmental studies, inhibitors and underground corrosion, and in its Delhi session, the Executive considered problems of Commonwealth interest bearing on military communications through satellites located in space.

The Indian delegates to the Conference rightly emphasized that defence research in this country was more preoccupied with the problem of equipping its fighting forces with the minimum conventional weapons and ancillaries for purely defensive uses; with the utilization of indigenous resources for this purpose; and also with problems of mountain warfare. Neither the country's financial nor its scientific man-power resources would permit her do more and wastefully to duplicate rudimentary research on rockets, satellites and other such sophisticated weapons—a stage, moreover, that has been left well behind in the more advanced countries. The CDSO, which primarily serves to coordinate scientific work on defence matters, was also called upon to consider the problem of defence science in developing countries and initiate a joint study of the problem of warfare in extreme conditions for their benefit.

Electronics

Lord Mountbatten (who would have suspected that he began as a radio engineer in the Navy?) was also visiting the capital not only for reasons of personal sentiment but for a "scientific" purpose. He is the Charter President of the Indian Division of the British Institution of Radio Engineers which is shortly to be renamed the Institution of Electronic and Radio Engineers in recognition of both its international character and of the growing importance of electronics in the modern world. As Chairman of the Bri-

tish National Research Electronics Council, he, too, was preoccupied with what he called the "retrieval of information" from the mass of learned papers and research reports in sifting which the specialized staff, however qualified they might be, would soon be unable to do without an electronic computer. In an after-dinner address to the Indian Division, Earl Mountbatten declared that the demand for the electronic computer which had a vital role to play not only in automation and control of machinery but in testing equipment was bound to grow faster than that for radio transmitters which was rising at the rate of 15 per cent. per year in the world market. No manufacturer could now afford to begin without assimilating the fruits of international research on electronics and without the man-power trained in the specialized techniques devised by such research. International co-operation in science was the answer and the Institution of Electronic and Radio Engineers was part of that answer.



Ten countries, all members of the Commonwealth Telecommunications Board, are also now in session to consider the development and maintenance of joint telecommunication facilities and to exchange technical information and the results of research. India has asked for a financial review of the existing arrangement for sharing of costs among members under which, she feels, she has been bearing a relatively heavier share of the total costs. All these conferences were, however, limited by a functional scientific purpose.

Pugwash

The Pugwash Conference on Science and World Affairs, which met at Udaipur between January 27 and February 1, surely represents an outstanding consummation of the scientific attitude. The age of the pursuit of self-definition under mutually exclusive political ideologies was over when Wittgenstein announced that philosophy was at an end and what remained were only the physical, natural and social sciences. Under the pressure of conformism, a scientist as indeed anyone else is often compelled to and must perhaps relate himself to his tradition or belief and define himself in terms of it; but on him has also devolved the task of seeing beyond the deadlocks that beset the rival political and social systems of today. And the Pugwash scientists have done this admirably by facing up to this responsibility. It was Einstein and Bertrand Russell, one a scientist and the other a philosopher, who were the principal signatories to an appeal made in 1946 by scientists the world over to heads of States in various countries warning against the dangers of the nuclear war that modern science had made possible. There have since then been memorable appeals for peace by dissenting scientists the world over.

The Pugwash Conference was attended by 77 delegates from 30 countries. India was represented at the Conference, which received the blessings of many national leaders including President Johnson and Mr. Nehru, by a team of eminent scientists headed by Dr. Bhabha. It has made a variety of recommendations to the United Nations, and its sage counsel epitomizes the wisdom of the Age of Reason. It called for internationalism in economic relations and declared that aid for developing countries, which it described as investment in a better world, must be detached from the context of the cold war. It pointed out that the gap in the standards of life between the developing countries on the one hand and those of the advancing nations on the other constituted a threat to world peace. It suggested that the best way of ending the cold war would be for joint teams, consisting of scientists and youth groups, to devote themselves to the problems of developing countries under UN aegis; the problem of salinity in the Punjab was an example of what could be accomplished in this manner. Also, UN jurisdiction should be established over outer space, oceans outside of territorial waters and Antartica, and the natural resources of these regions used for the benefit of humanity at large.

This group of scientists was not only among the first to suggest disarmament but also argued that the Government funds thus released should be available for the economic improvement of the poorer countries. These measures are surely the beginnings of World Government. Of course, the idea is by no means new. President Wilson proposed it several decades ago, but his idealism, which was a negative reaction against the horrors of war, was still not rooted in the maturity of institutions such as nation-states. Since then, the light, even if it has not become a single shining emanation, has been found scattered among many imaginations, but it was overlaid with, and obscured by, commitment to context-bound ideals. For instance, Bertrand Russell has always held that World Government was the only logical solution for the problems of our world. The inevitability of a supra-national authority has brought the world nearer the ideal and the recommendations of the Pugwash Conference afford a practical means by which it could be realized.

BOWLED OVER

The Working of Parliament

K. SANTHANAM

Next week Parliament will assemble in budget session —in many ways a continuation and in some ways a sequel to the interesting, and often exciting, work done in the previous session. In this article, Mr K. Santhanam considers some of the controversial aspects of the working of the two Houses on the previous occasion and draws important lessons for the proper functioning of parliamentary institutions.

In the next article, Mr A. K. Mukerji recalls some of the highlights of the last session in an effort to suggest that the story of Parliament is a continuing record of the nation's confrontation with its destiny, with the pauses between sessions being but mechanical breaks.

THE INDIAN Parliament is the ultimate guardian of national security, integrity, economy and social welfare of the people of this country. It is therefore of supreme importance that the working of Parliament should be such as to secure efficiently all these objectives. If the proceedings of Parliament are allowed to become ineffective or incoherent in these early years, it will imperil the future of Indian democracy.

I am afraid that sufficient attention is not being paid to a proper organisation of the business of Parliament. Its work may be broadly classified into legislation, budget and financial control, critical discussion of policies through motions and eliciting important public information through questions.

Obviously, legislation is the most important of these tasks. It is in this field that the functioning of our Parliament is the weakest. For instance, during the last session, four important bills were introduced, three in the Lok Sabha and one in the Rajya Sabha. Of these, only the Companies Amendment Bill has been treated with some care. It was referred to a Select Committee consisting solely of the members of the Lok Sabha. Ultimately, one of the important amendments made by the Select Committee with the approval of a majority of the Congress members of that Committee was reversed. It was passed by the Lok Sabha on the 17th of December and pushed through the Rajya Sabha on the 19th.

Needless Rivalry

In this connection it is necessary to point out that a needless spirit of rivalry and hostility is being allowed to develop between the two Houses. In the Constitution, the Rajya Sabha is placed on an equal status with the Lok Sabha in all matters except the voting on budget demands and the final passing of money bills. Even with reference to Appropriation and Money Bills, they have to be discussed in the Rajya Sabha and its recommendations have to be considered by the Lok Sabha. Therefore, there should be no hesitation in giving an equal status to the Rajya Sabha in all Committees. The Lok Sabha excluded the Rajya Sabha in the Select Committee on the Port Trust Bill, and as a protest the Rajya Sabha referred it again to its own Select Committee, though it agreed not to delay the bill. When the Companies Amendment Bill was referred to a Select Committee of the Lok Sabha alone, there was a great deal of indignation among the members of the Rajya Sabha, and it was only party discipline which prevented the setting up of a second Select Committee of the Rajya Sabha and the consequent postponement of the measure to the next session. I consider that such cavalier treatment of the Rajya Sabha is wrought with peril for the future, and I earnestly hope that party discipline will not be unwisely used to establish an artificial pattern of relations between the two Houses, which may prevent the evolution of harmonious working of Parliament.

Returning to the issue of legislation, there is no justification for not setting up Select Committees for the Gold Control Bill or the Press Council Bill, which were introduced in the last session. It is to be hoped that the Government intends to move for reference to Select Committees in the Budget session so that the bills would be adequately discussed in the next Budget session. Hasty forcing of legislation through the Houses at the end of a session virtually converts law into ordinance and is opposed to every tradition of parliamentary democracy. In the old Indian Legislative Assembly, there was no limit at all to speeches on Bills. Even though it may be necessary, in view of the present size of both Houses, to limit the time allotted for bills, to restrict them to two hours or three hours is to reduce law-making to a farce. In every session, legislation should be given the first priority and the first weeks should be devoted to it.

Under the British Cabinet system which has been adopted in our Constitution, the Parliament has no effective control over budget and finance. Bulky budget papers are distributed and much valuable information is given. Sometimes the Cabinet may yield to popular demand, especially if it comes from the ruling party, in respect of minor items of taxation, but, by and large, budget and financial measures cannot be changed without forcing the government to resign, which is inconceivable at present in India. Therefore, the only way in which Parliament can usefully deal with the budget is to divide the time allotted to general discussion, discussion of demands and discussion of the finance bill into discussion of general grievances, criticism of particular expenditures, and scrutiny of general financial policies. At present, the same points are repeated endlessly in all the three stages, and it is no wonder that many members choose to spend the time in the lobbies and the Central Hall, rather than follow the proceedings. A considerable number even go away from Delhi. To make Parliament attractive to the members themselves is perhaps the most important problem which the Speaker and the Chairman should tackle in consultation with senior members. The only way of effective financial control is to have Standing Committees for each Ministry or Department, as the case may be and insist on all new proposals being approved by those Committees.

Criticism of the economic and social policies of Government through motions sponsored by the Government or by the opposition is undoubtedly an important function of Parliament. But there is a tendency to have many general discussions in every session with the result that none has much effect. It will be a good convention if there is to be only one serious discussion in each House during any session. It is also desirable that the same subject should not be discussed in both Houses in the same session. In this connection, I may point out that the usefulness of these discussions is often lost by having too many speakers, especially from the Congress benches. It is a reasonable desire on the part of every Member of Parliament to speak at least once during a session, and in order to meet this desire some special motions, say for discussing general grievances, may be moved during which only five-minute speeches will be allowed. In all other motions on serious problems, only carefuly selected speakers should be put up, so that the debates may be instructive and of a high order.

The Question Hour is certainly an important source of obtaining valuable information from the Government. But unfortunately, there is a tendency to convert each question into a lengthy discussion. Some Members try to convert a speech into a question by stringing a series of allegations in the form of a single supplementary. The Speaker and the Chairman are naturally anxious to treat these Members as generously as possible. But this often results in reducing the number of questions which can be answered. Further, the practice has grown of asking questions on very minor matters like the working of

small government servants' co-operative stores, or the grievance of a remote railway clerk. The questions should be confined to problems of national importance for which the Central Government is responsible. To load the Question Hour with innumerable and insignificant questions amounts really to helping the Government evade having to face questions on more important public issues.

The working of the Indian Parliament at present is largely dependent upon the working of the Congress Parliamentary Party. The large number of members comprising the party makes it difficult to make it effective. Some feeble attempts are being made to have party Standing Committees for various Ministries, and now and then some discussions take place with the Ministers concerned. The party executive also can make itself felt on crucial occasions. But it is no exaggeration to say that the Congress Party in Parliament is a large, loose, and flabby organisation which functions rather fitfully and incoherently. Here again, I feel that the setting up of regular Standing Committees in the place of Informal Consultative Committees and party committees will be a great blessing to the Congress Party, while it will give honourable and useful work to members of the Opposition as well.

Doing the Left Twist

A. K. MUKERJI

WITH WIDE-EYED men (and a few women too), literally on the rampage, and those not merely in the ranks of the Opposition, whether Left or Right, but also twelve to a dozen among the Congress members too, the last session of Parliament was so much of a mad hatter's race in both the Houses that the headlines it hit in the newspapers for five weeks at a stretch might seem to sum up the soul of its substance. Actually, however, nothing could be more misleading as a conclusion. Neither the Opposition as such nor those on the Congress benches taken as a whole quite crowned themselves with glory, except negatively in some sense. The palm really went to the Government, to Mr. T. T. Krishnamachari in the main.

For the first time during the last six or seven years, if not a decade, it indeed looked the Government was in dead earnest about getting on with the job needing to be done. Opinion is bound to differ—and does differ for very good reasons—on whether what the Government sought to do was wholly right or properly conceived. Doing the Left twist was any way rather out of character for it. Nevertheless signs were unmistakable of a promising break with the confused admixture of good intentions at the level of amateurishness and downright shoddy thinking that passed for high policy in recent years.

Not to flick the needle too far away from where it belongs properly, it should be noted, however, that the compulsions were also oppressively *compulsive* for the Government to earn its keep on a currency negotiable on new terms. In fact the session began for the Government with a heavy log-book of odds staring it squarely in the face. The pressures and excitements of the monsoon session's no-confidence motion (the first ever to be moved in 16 years of the Congress Party's unbroken rule) had no doubt been laid with the debate that session on *the NEFA report and the evidence* of the Government's vigilance against a repetition of the shame and humiliation of the reverses suffered at the hands of the Chinese last winter. But apart from the fact that the odium that had loomed so large that session needed to be lived down in full, the matrix of a much more serious no confidence vote by the electorate was framed by failures on the economic front highlighted by the Mid-Term Appraisal of the third Plan. A new ghost was stalking ominously.

And, as if with all this and much else besides—the mounting sufferings and discontent of the people—the cup was not already brimful with bitterness, there was the next-to-impossible-to-stem tide of public anxiety and anger over corruption in the administration and, worse still, in high places. Rightly or wrongly, the impression that Mr Nehru was out of step with the widespread demand for intervention, first, in the Serajuddin affair involving Mr K. D. Malaviya and, then, in the affair of Mr Pratap Singh Kairon, the Chief Minister of Punjab, had made the position worse.

How far this soot-black backdrop led the Government to think of a specific strategy and the tactics relevant thereto is a question to which an answer can at best be speculative. But judging by the moves it made and the steps it took during the session, the surmise seems safe that these were part of some sort of a plan, howsoever amorphous and inchoate. On no other assumption does it seem possible to explain what was, to all appearances, a double-pronged drive—a "panzer" movement, more or less, to borrow a terminology from the military vocabulary of the last war.

Ranged, on one flank were the Bills, five of them in a row, which the Finance Minister moved ostensibly to secure his declared objective of putting the Government in "commanding positions" of the country's economy—an extension and variation, incidentally, of the policy of strategic controls he had first put into vogue during his earlier chaperonage of the Finance Ministry. Collaterally, the philosophy, if it may be so called, behind the strategy was proffered in Mr. Krishnamachari's "tour de horizon economic"—his "loud thinking" on the economic situation which some commentators have not altogether inapposiely described as Part A of his budget speech in the offing.

Superb Tactics

One guess is as good as another. But it should not be surprising if it turned out that the Finance Minister (with Mr. Nehru's concurrence, presumably) timed his statement with almost a superb sense of a master tactician. Much has been said—the point was made even in the Lok Sabha by Mr. Nath Pai (PSP)—about how the statement was unscheduled and had not been listed even on the day's Order Papers. More significant, however, is the fact that Mr. Krishnamachari chose to make it on the day following the conclusion of the Lok Sabha debate on the Mid Term Appraisal of the Plan.

Despite Mr Nehru's intervention, and Mr. Krishnamachari's own a day earlier, the debate had on the whole gone against the Government, and the Congress Party back-benchers themselves were far from convinced that the Plan scheme had not come up a boulder. Had it been the Finance Minister's calculated move to counter this overall sense of failure and disappointment, he could not have timed his statement any better. Taken together, the statement and the five Bills contrived to give the impression both of new activity on the economic front and of a break with a dreary past.

On the other flank, the Home Minister, Mr. Gulzari Lal Nanda, strove to contain the outcry against corruption. After much beating about the bush, the Das Commission was appointed to go into the Kairon Affair, the announcement about it coming at a time not too far away from the opening of the session. Then followed talks on vigilance and of a machinery on the lines of the Ombudsman in the Scandinavian countries both on the floor of the two Houses and in the Informal Consultative Committee of Parliament. Eventually, the announcement was made, setting up a Vigilance Committee for combating corruption, even if only in so far as it obtains in the services at various levels.

In this conspectus, the Finance Minister's programmatic (partly ideological too) blue-print is the centre-piece that needs close scrutiny. Not to go into details overmuch, the main

NATIONAL AND GRINDLAYS BANK LIMITED

(Amalgamating National Bank of India Ltd., Grindlays Bank Ltd., and the Eastern Branches of Lloyds Bank Ltd.)

Registered in London under the Companies Act of 1862 on the 23rd March, 1866. The liability of Members is limited.

Bankers to the Government in Aden, Kenya, Uganda and Zanzibar.

Authorised Capital ...	... £ 9,000,000
Issued and Paid-up Capital	... £ 5,703,000
Reserve Fund	... £ 5,250,000

Head Office : 26, BISHOPSGATE, LONDON, E.C.2.

London Branches :

54, Parliament Street, S.W.1.
13, St. James's Square, S.W.1.

BRANCHES throughout Aden, Ceylon, India, Kenya, Northern and Southern Rhodesia, Pakistan, Somalia, Tanganyika, Uganda, Zanzibar.

The Bank conducts all classes of Banking and Exchange Business throughout the world.

Delhi Branches :

Chandni Chowk ; Chandni Chowk, (Lloyds Branch) ; Bhichha Mal Building, Grand Trunk Road, Kamla Nagar ; Delhi Cloth Mills Premises, Bara Hindu Rao ; 10, Parliament Street, (Lloyds Branch) ; H Block, Connaught Circus ; 10-E Block, Connaught Place ; 1689, Arya Samaj Road, Karol Bagh ; Jeevan Vikas Building, Asaf Ali Road.

NGB/46A

RESERVE BANK OF INDIA
CENTRAL RECRUITMENT BOARD
BOMBAY

Applications are invited for the following posts in the Agricultural Credit Department of the Reserve Bank of India:—

(A) POSTS AND SCALES OF PAY:

(i) Rural Credit Officers: Rs. 430-430-55-815 EB-55-925-60-1045.

(ii) Economic Assistants:

(a) At higher pay centres: Rs. 255-15-270-16-398-21-419 EB 21-482-22-570

(b) At centres other than higher pay centres: Rs. 230-10-240-15-270-16-382 EB 16-398-21-503-22-525.

Note: Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scales.

In addition to pay, the selected candidates will be eligible to draw local pay, dearness and house rent allowances at rates prescribed from time to time. Local pay is not admissible to category (ii).

(B) QUALIFICATIONS:

(i) Rural Credit Officers: Applicants should

(a) possess very high academic qualifications of Indian or foreign Universities (preferably post-graduates) in Economics, Co-operation, Sociology or other social sciences and possess degrees which are either first class or high second class. Special study or knowledge of Rural Economics or Rural Sociology will be an additional qualification, **and**

(b) have a minimum of five years' experience in a co-operative department/institution or commercial bank out of which not less than three years should be in a responsible position.

(ii) Economic Assistants: Applicants should possess high second class Master's degree or a first class Bachelor's degree in Economics or Commerce of an Indian or foreign University. Specialised study in Rural Sociology will be an additional qualification. Due weightage will be given to the successful completion of the training courses conducted under the auspices of the Committee for Co-operative training, and/or experience gained in a co-operative department/institution or a commercial bank.

Note: Experience in community development, small scale and cottage industries, marketing, training and publicity etc. will be given due weightage and knowledge of more than one regional language will be an additional qualification.

(C) AGE LIMITS AS ON 1ST FEBRUARY, 1964:

(i) Rural Credit Officers: Candidates should not ordinarily be over 30 years of age but the age limit may be extended up to 35 years in the case of candidates with exceptionally good qualifications and/or experience of value to the Bank.

(ii) Economic Assistants: Between 18 and 24 years.

The maximum age limit is relaxable but not beyond 30 years in the case of:—

(a) Candidates possessing special qualifications and experience of value to the Bank;

(b) ex-employees of banking institutions whose services had to be terminated for reasons of economy or as a result of the banks going into liquidation;

(c) personnel retrenched from Government offices after at least one year's service applying through Employment Exchanges; and

(d) candidates belonging to the Scheduled Castes or Scheduled Tribes.

2. Applicants for the posts of Rural Credit Officers must remit with their application a fee of Rs. 7.50 and those for the posts of Economic Assistants a fee of Rs. 2.00 by cheque or bank draft on a **Scheduled Bank** payable at Bombay or by Postal Order drawn in favour of Reserve Bank of India, Bombay. **The application fee is in no case refundable.** In the case of candidates belonging to Scheduled Castes/Tribes the fee will be reduced to one-fourth.

3. Applications in the candidate's own handwriting in the prescribed forms obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Hyderabad, Trivandrum, Lucknow, Patna and Jaipur accompanied by copies (originals should not be sent) of certificates regarding age and educational qualifications, statements of marks secured in the Graduate and Post-graduate degree examinations and two testimonials should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before the **22nd February, 1964.**

4. Candidates already in service will be required to produce a proper discharge certificate from their employers in the event of their being selected at the time of their appointment in the Bank's service.

5. Candidates belonging to Scheduled Castes/Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

6. Candidates must be prepared to serve in any office of the Bank in India and to undertake tours when required.

7. Selected candidates will have to appear for interviews before the Selection Board at any of the Bank's offices.

8. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

9. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due". Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

10. Canvassing in any form will be regarded as disqualification.

objective vouched for is to get the economy moving. The basic premise to follow for achieving this end is that success in dealing with our basic economic problems "will hinge on the success that we achieve in stimulating and sustaining production and productivity....."

Obvious truisms but heartening none the less to have them reiterated, more especially since they are interlinked with Mr. Krishnamachari's accent on fostering increased industrial investment in some vital sectors and on promoting an overall higher rate of industrial production, including that in key consumer goods industries like cotton textiles and sugar. Not to leave goodness at this point, the Finance Minister has even gone ahead to announce two salutary relaxations. About 16 commodities of various kinds were freed from price control. At the same time, formalities of industrial licensing and capital issues were waived for enterprises of up to Rs. 25 lakhs.

A good beginning without doubt but whither is it pointed and how far is it designed to go? Rather than attempt to answer the question straight, it is fruitful to go by the clues the Finance Minister has himself provided. Controls have proved inhibitive, yet there is need for constraint on consumption. Credit supply must be adequate, but cheap money is poison. Budgetary outlook for the next year is not unsatisfactory but tax burden cannot be relaxed, nor deficit financing given up. Mr. Krishnamachari is no doubt committed to his stress on the need for "such forms of rationalization of the tax system" as are calculated to improve the economy's performance. But the rider to this is that this must be done "without disregarding the need for raising resources on an adequate scale"—an eloquent euphemism all told.

Loud Thinking

It is not improbable that the Finance Minister's dialogue—loud thinking, as he put it—was in the main with his Cabinet colleagues and the wild-eyed men behind them. As a realist fully cognizant of the implications of the mixed black and white state of the economy and anxious to prove that as the Finance Minister he is keen to have the wheels of the economy moving, albeit with the Government fully in command of all the controlling gears, he has after all to have the party give him the backing he needs. But it is precisely because his compulsions are so great and the limitations no less either that there would appear to be considerable room for misgiving over his obvious attempt to skate on thin ice.

Neither the Socialistic goal (both pre- and post-Kamaraj) the Congress is committed to nor the fact that the Plan is designed to attain that goal (consistently with democracy and without doing violence to the norms of fixed economy, be it stated) is really a matter open to question in this context. What is doubtful is the prudence of even appearing to kow-tow to the whims and fancies of the vociferous wild men and women of the 'Left' inside the Congress—the Menon and Malaviya crowd, for simple.

The risks Mr. Krishnamachari and other realists (not the so-called Rightists) are running by apparently being apologetic about the "Socialism" this irresponsible fringe loudly swears by are already all too obvious in good measure. Nationalization "per se", of banking more specifically, has become so much a fashionable button-hole that at the Congress Parliamentary Party's meeting towards the end of the session the enthusiasts almost succeeded in putting Mr. Krishnamachari and Mr. B. R. Bhagat in the dock.

The pointer is clear and ominous. Unless the realists put their feet down in time, the position might soon be insuperably worse for them—and the country. Let the Finance Minister at least not ignore that in the Press of the Congress 'Left' the hyenas (to use a phrase beloved of the Communists) are already howling for his blood.

The pity is that the situation need not have been so pitiable had the non-Communist Opposition in Parliament been better informed of realism and responsibility, and less disparate, than they apparently were throughout the session. The worst confusion was on the economic measures—the major proposals and policy indicators of the session. Barring the Swatantra Party and, to some extent, the Jan Sangh, the Opposition appeared in the main to be preoccupied in proving how much more vociferously they could go as far as if not further than the Communists. Going 'Left' with the Congress was easier still.

Missed the Bus

Even the Swatantra Party and the Jan Sangh spokesmen missed the bus because they either failed to see or were unprepared to acknowledge that antiquated slogans relevant to different times and different climes were not only unavailing; they were also out of focus in the context of Mr Krishnamachari's obvious bid to hasten slowly with, if not to hold, the progressivist's axe on the private sector. Mr. Masani, for instance, lost the game by taking up the extremist possible stand that could not but alienate quarters he could otherwise count on for support. This is true particularly of his contribution to the debates on the Plan Appraisal and the Company Law (Amendment) Bill, on both of which he had much to say that would, it is to be hoped, be pondered over irrespective of who it came from.

But lapses on the part of these so-called Rightists were minor compared to those of the Socialist phalanx (minus the Communists). Almost uniformly they left unattended the main job of proffering an alternative to the Government's prescriptions and panaceas. Even such a stalwart as Dr. Ram Manohar Lohia mostly went about hunting, as it were, for evidence to prove how T.T.K. was out to give succour to Big Business and how much of the people's money Mr. Nehru arrogated to himself or deployed for the benefit of his cohorts. For the rest, they were more equal than the equals—the Communists and the Congress "Left". No case was either soundly built or demolished by them, nor by the avowedly sea-green 'Left' incorruptibles. But the vote was cast for cutting the canal for bringing the crocrodile in, as a saying in Bengali goes.

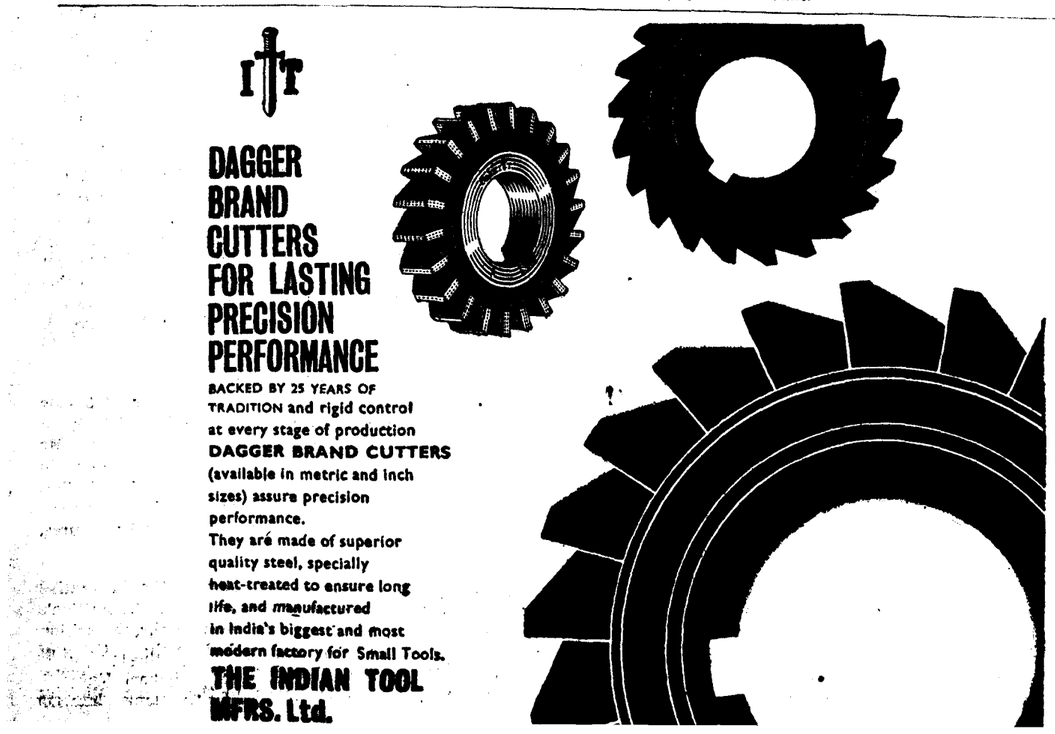
This penchant for swimming heftily in the Socialist (?) stream extorted heavy wages even when the Opposition (non-Communist) faced some of the more complex, non-economic, political issues. A case in point was the amazing near-identity emotionally, if not ideologically, with the Communists which the P.S.P. and Lohia Socialists, even some Independents, exhibited by the furore they kicked up over the extension to the Indian Ocean of some units or vessels of the US Seventh Fleet.

With all the concern they have for throwing the Chinese out and for meeting the Chinese threat, the Sir Galahads among the ranks of this group of Opposition indeed took up on the issue a position more adolescent than mature. Mr Nehru's stand — that there was no threat either to India's freedom or to the policy of non-alignment and that ships cruising in high seas beyond our territorial waters were anyway no concern of ours—was maturer by several measures, to put it frankly.

Only on the Bill seeking an extension of the Preventive Detention Act and on the issue of corruption the Opposition's record was less bleak. But how? The peak of the Opposition stand on Preventive Detention was reached on the last day of the Rajya Sabha's session when Mr. Atal Behari Vajpayee (Jan Sangh) threw out a challenge to the Home Minister

either to prove or to repudiate the Punjab Home Minister's recent allegation that certain Opposition parties were working in collusion with some foreign powers to subvert the Nehru Government. Mr. Nanda, of course, neatly (or is discreetly the proper word?) side-stepped the challenge. But for once it looked that it had been made difficult for the Government to get away by such subterfuge. Mr. Vajpayee announced the decision to go on fast until the serious allegation made by the Punjab Home Minister was properly sorted out.

But leave alone the fact that Mr. Vajpayee's threat to go on hunger strike was in effect a threat to exert extra-parliamentary pressure to secure a point found difficult to be pressed home with the Opposition's minority vote, Mr. Nanda scored quite comfortably on a couple of sizable counts. The provisions of the Act were less vigorous than those of the Defence of India Rules and Act; so long as anti-social elements and those given to violence were abroad, there was moreover need for a measure that offered prompt check without going through the time-consuming processes of ordinary laws. Despite the Communist furore (which was joined in, among others, by Mr. Tariq, a reputed protege of Mr. Krishna Menon, whom Mr. G. S. Pathak, a Congress M.P. and another one-time Menon-favourite, urged to go to Pakistan!) and the Communist-Lohia Socialist walk-out in the end, none of these points was really convincingly answered by any one in the Opposition.



The position was slightly better when the Opposition came to tackle the problem of corruption—an issue the discussion on which should, as Dr. Ram Manohar Lohia pointed out, in propriety have been raised by the Government but was instead left to be raised through non-official motions moved by Mr. Prakash Vir Shastri (Independent) and Mr. H. V. Kamath (P.S.P.), the latter through his motion on Ministerial perquisites. The debate (inconclusive) on both the motions was lively, Dr. Lohia and Mr. Shastri displaying themselves as Opposition sledge-hammers true to form.

But the end-result of their otherwise admirable exertions was to add precious little to what the man in the street already knows full well and feels strongly about, although the Socialist leader's quip about there being a "rule of whims" rather than the rule of law in our country might provide a good talking point to many. In any case, it seems difficult to understand whose interest Dr. Lohia served by doling out the thesis that corruption was inherent in the social virtue we traditionally attach to one's helping and being helped by one's relations and friends.

Running Down Nanda

Not un-understandably, the Opposition was united in running down Mr. Nanda's effort at curbing corruption through the Vigilance Commission which the Government, towards the close of the session, decided to set up. Corruption in high places —in political high places, to be precise—is outside the scope of the Commission. Even so as a first step towards doing something to curb the no less rapacious corruption in the services the appointment of the Commission certainly deserved to be welcomed.

The Commission is not free from lacunae. To take one example, although in appointing the Commission the Government has taken the initiative for implementing the recommendations of the Santhanam Committee, the vital task of carrying out administrative reform is proposed to be left to a body to be set up some time in the near future. Likewise, the Santhanam Committee's suggestion about receiving direct complaints from the public is to be implemented only when an Ombudsman-style of institution is set up. Nevertheless, with all its drawbacks the Commission has two distinct points to commend it. Though designed to function in an advisory capacity, its recommendations will have for the Government the force of the decisions of the Union Public Service Commission. The Commisison has, moreover, been empowered to investigate into any complaint of corruption or lack of integrity against any public servant.

WINDOW ON THE WORLD

Inflation in Western Europe

From Our Special Correspondent

PARIS.

M. ROBERT MARJOLIN, vice-president of the ECM Commission, speaking in Strasburg recently, has issued a serious warning to the six governments of the Common Market about the danger of "letting inflation instal itself permanently in our Community." Underneath the continued vigorous expansion of the Common Market economy, the signs of inflationary pressure are becoming more evident each month. True, production is still rising, as it has been since 1958, commerce is expanding and dollar inflows are excellent (when one counts in private capital arriving from abroad). And on all these scores, the outlook for 1964 is encouraging: the probable increase in the Community's gross national product for this year is 4.5 per cent, against 4 per cent last year.

On the other hand, production costs are rising, prices in many sectors have soared, the balance of payments on current account has deteriorated and the competitive position of the Community is in jeopardy. Though these are the classic symptoms of inflation, the situation is not serious as long as the expansion of world trade persists, but at the first contraction the Six would find themselves dangerously exposed. M. Marjolin concludes that firm anti-cyclical action by governments is required immediately, for the Community has all but exhausted its reserves of manpower while the firmer trend in raw material prices removes the cushion that to date has absorbed part of the rise in labour costs. These latter have, indeed, increased enormously in the last few years. Whereas industrial labour charges per unit of output were roughly steady between 1957 and 1959 (except in France), since then they have climbed steeply: between 1959 and 1963 the increase is estimated at 28 per cent in Italy, 21 per cent in France, 20 per cent in West Germany and 17 per cent in Holland. In contrast, in the same period labour costs per unit of output rose only 10 per cent in Britain and actually remained stable in the USA.

As a result, the balance of payments on current account (ignoring the capital flows that could be reversed very quickly) has deteriorated. Whereas transactions on account of goods and services left a surplus of $3,500 million for the Community in 1959, a small deficit appeared last year, and for the current year M. Marjolin forecasts a deficit of between $600 and $1,000 million. Up to 1962, he says, the reduction of the Community's current payments surplus could be considered a useful contribution to international monetary equilibrium, but this is no longer true. The Six are faced with the probability of a large deficit when they need a surplus to finance their long-term exports of capital on private and public account.

Excessive Demand

The basic cause of this unbalance is the excessive growth of global monetary demand in relation to the possibilities of increased production. For a time after the 1959-60 boom, demand for exports and investments did indeed slow down, but private consumption and State spending in the Community continued to rise rapidly, just when the shortage of manpower became acute. Now a recovery in export sales and in investments will add fuel to the fire. Governments have failed to use their budgets in an anti-cyclical sense; on the contrary, State spending has contributed to raising the head of steam. In 1963, as in previous years, current spending by public administrations rose by 11 per cent and investments by 10 per cent—while the gross product of the Community increased by 9 per cent in value and by only 4 per cent in volume. In short, governments have not managed to keep their outlays behind their rising revenues, when the increase in the latter was already due to price-inflation.

Before passing from this diagnosis to the remedies M. Marjolin suggests, one must counter an obvious objection: the vice-president of the Commission speaks everywhere of "the Community" whereas his own figures show that the inflationary menace is patent only in certain member-countries and is, notably, absent in West Germany. Is the "community approach" justified in an affair where counsels of moderation should more properly be addressed to certain individual governments? In reality it is and few in West Germany will question this global treatment of the affair—because they know that integration has gone so far that West Germany would be almost powerless to avoid "importing" an inflation that ravaged her principal trading partners. It is true that the Federal Republic alone among the Six has put the brakes on in time, but in today's Common Market no member can save his skin alone. German policy points the way to the other five, but if they do not follow it the results could be as awkward for West Germany as for them.

Revaluation of Mark?

In this connection, it is noteworthy that the first rumblings of a campaign in favour of yet another upward revaluation of the Deutsche mark have been heard. These were inevitable, for in the increasingly unified market of the six nations discrepant rates of inflation cause distortions that rapidly become embarrassing. West Germany trades with the other five more than with anyone else, so their inflation has caused an immense jump in her trade surplus. Thus, Italian imports from the rest of the Community rose by 30 per cent last year (against 24 per cent the year before) and French imports from the Community by 26 per cent (against 18 per cent), whereas West German imports from the Community increased by only 8 per cent (against 15 per cent). The consequence was that the Federal Republic's surplus in this trade jumped from $555 million to $954 million. Obviously, if this trend were to continue Bonn would have the unpleasant choice between importing inflation from neighbours, or up-valuing the German currency. Incidentally, this time (in contrast to 1961) there would be no question of Holland following suit, for that country is now in the inflationary camp along with the rest. Indeed, M. Marjolin singles it out for mention because of the patent inflationary danger of the boost in wage payments scheduled there for this year—which will be of the order of 15 to 18 per cent.

The case, then, has to be considered from the Community point of view, though the responsibilities for action lie more particularly with Rome, Paris and The Hague. All of them, to be sure, have already taken certain steps but the experts in Brussels are definite that the Italian programme is inadequate and incline to the view that the French stabilisation operation too will have to be made radical. It follows from the diagnosis that the first thing to be done is to reduce State spending throughout the Community. (M Marjolin, by the way, is a member of the French Socialist Party when not exercising his supernational functions in Brussels, so his advice on these points is innocent of arriere pensees.) Budgetary austerity, bringing back State outlays to only 3 to 4 per cent above last year's, is the first requirement in order to compensate for the ebullience of the other

elements in global demand. Those latter, also, must be acted upon by monetary policy designed to limit the growth of liquidities, and efforts must be intensified in search of a wages policy "that will incite various sectors to adopt their claims on the fruits of expansion to the necessities of the hour." To make this last point clearer, M. Marjolin adds that "workers have no interest in obtaining big wage increases that do not correspond to an equivalent increase in their standard of living."

Last year when an authoritative US document asserted that the dollar deficit would cure itself because West European wages and prices were rising fast while American were standing still, it was replied here that this was quite unlikely. It seemed improbable, indeed, that the Continental governments would sit with arms folded while inflation solved the Americans' problems for them at Europe's expense. And in fact, West Germany (where a wages spiral looked imminent a year ago) did move quickly to correct the trend, but similar action was taken much more slowly elsewhere in the region. Paris moved in September, which was certainly too late because the first signs of stabilisation are only now appearing, and, as M. Marjolin points out, it is not yet sure that they are sufficient. In Italy, corrective action was delayed much longer by the prolonged Cabinet crisis in Rome, and the way that crisis was resolved has hindered effective anti-inflationary measures since. Less expected was the break in the sound-money front in Holland at the end of last year, when traditional caution was abandoned for a policy of wage increases as adventurous as have been seen anywhere in Europe recently. In turn, Belgium and more markedly Luxemburg became enmeshed in inflationary toils.

At this point, accordingly, one must be rather less dogmatic than a year ago in rejecting the hypothesis that inflation of wages and prices in the Common Market will quickly restore the dollar's fortunes. Nevertheless, one may hold to the expectation that remedial action will be taken along the lines suggested by M. Marjolin before the situation gets much worse. One's reason for doing so is exactly the internal distortions produced by varying rates of inflation inside an increasingly homogeneous market, rather than the effects of inflation on the Common Market's external trade and payments. In theory the Six could take the line of least resistance and run a global deficit of proportions that the Americans would welcome, but the errant five could scarcely practise tariff disarmament in the face of a West Germany that, alone, was holding its prices steady.

**

The Common Market inflation is by no means limited to that Community. The Swiss Federal Council this week sent to the two houses of parliament its plan for a serious (though belated) attack on the inflation that is menacing the Swiss economy. In a country attached to liberal economic doctrines, the Federal Council's suggestions are regarded as "revolutionary" and are being qualified in the Press as leading to "dictatorship" over the economy, as exemplifying authoritarianism, interventionism, etc. These criticisms, however exaggerated, cannot be ignored because, in the Swiss "direct democracy", the Government's mild anti-inflation programme may have to be submitted to popular referendum and at that point the charge that the authorities were subverting the nation's liberal tradition could decide the vote. To the outsider, the Federal Council's proposals appear quite modest, and probably inadequate to stop the deterioration in the value of the Swiss franc, a process that for three years past has been going on as fast as anywhere in Europe except Italy.

Some of the causes of Swiss inflation were outlined here last year ("Inflation and the Swiss", May 24, 1963) but the situation has worsened steadily since. Switzerland is not importing inflation directly from the Common Market, in the sense that there exists a danger that West Germany will import it from the other Five during this year. Most Swiss trade is, indeed, with the neighbouring Community but Switzerland's principal trading partner is West Germany, whose prices have budged least in West Europe. The causes of the Swiss inflation are an ambitious domestic investment effort, and the influx of funds from abroad seeking the security and anonymity of the Swiss banks. This flow of money into a country whose own prices are rising by 3 or 4 per cent annually, and have been doing so since early 1961, is paradoxical: depositors lose purchasing power as fast in Switzerland as if they kept their money at home, it would seem. But they know that there is no chance of the Swiss franc being devalued (an upward revaluation of the currency, rather, would be indicated by the persistently excessive payments surplus, though that suggestion has just been rejected again by the Swiss authorities, no doubt because the country runs a sizable trade deficit). The money is coming, then, from places where a devaluation is feared and that is not the case in France and Benelux, whatever their present difficulties with rising prices.

Direct Intervention

The fact that the influx of foreign funds is one of the major causes of the inflation makes it impossible for the authorities to use the monetary weapon, as has lately been done in France, Holland and Belgium—for higher interest rates in Switzerland, while no doubt discouraging excessive local investment, would bring fresh floods of money from abroad. Even if foreign-owned deposits were denied the extra interest, Swiss banks would be encouraged to repatriate funds or at least would place less money abroad. Because they cannot use the interest-rate weapon, the authorities have turned to a series of direct interventions, designed to channel funds and to limit the expansion of liquidities, and it is these that are held to break with Swiss liberal traditions.

The measures that the Federal Council asks permission to take concern the destination of incoming foreign funds, the quantitative control of Swiss bank advances, and a brake on the building orgy. As to the first, it is (again) proposed that no interest be paid on foreign capital deposited in Switzerland and that, unless Swiss banks immediately re-invest this capital abroad in foreign currencies, it be frozen in a special account with the National Bank. Moreover, it would be legally forbidden to invest any part of these foreign funds in Switzerland itself, whether in stocks and shares, land, buildings or mortgages. Similar measures to scare away unwanted foreign capital are not new in Switzerland (and have indeed been copied by France and West Germany). The novelty is that Berne wants to transform the "gentleman's agreement" between the private banks and the monetary authorities into firm law. For some years past, the Swiss banks have been on their honour not to do any of the things that it is now proposed to outlaw, and this gentleman's agreement was renewed recently. Apparently, the honour system has not worked. Indeed, reputable Swiss bankers have assured me that it is almost impossible to prevent "leaks" of foreign funds into the domestic economy. They say that the big banks honour their obligations, but then Switzerland has almost as many banks as snowpeaks and not all the smaller ones (especially mortgage banks, attracted by the high rates available in building finance) can be relied upon to "sterilise" incoming funds.

The proposal to turn an informal obligation into a legal requirement is causing an outcry because it foreshadows governmental prying into the origin and use of bank accounts, a matter where Switzerland alone has preserved total banking secrecy; in fact, this secrecy is as much an attraction to foreign depositors as Switzerland's supposed stability and security. The authorities reply that the watch over foreign funds would be kept by the National Bank,

not the Government, so there would be no infringement of bankers' secrecy, and only when irregularities were detected would there be question of official enquiry and prosecution. Even so, it is more than likely that this suggestion will be turned down by the Swiss legislators when they debate the Federal Council's anti-inflation plan on February 17. But the proposal may serve the purpose of promoting a more rigid agreement between the Central Bank and private bankers which, while still informal, would have more chance of being strictly honoured in future.

Similarly with the control over the increase in bank advances, there exist "voluntary" arrangements between the private bankers and the Central Bank to peg these at safe limits, but the constant rise in liquidities shows that they are not being honoured. The Federal Council accordingly wants power to enforce limits on advances and mortgage lending, with a fixed annual quota of increase. Swiss business and banking are understandably reluctant to part with their informal, gentlemanly system that keeps overt government intervention to a minimum; they regard even the simplest official regulations, of a sort that are taken for granted in the USA or West Germany, as deplorably "socialist". But inflation is rapidly making nonsense of these antiquated manners. This is sad, no doubt, but it is absurd that a country, where for special reasons, the price of money cannot be raised, cannot exercise some control over the total volume of credit-creation. Inflation has killed more than gentlemanly manners, and if the Swiss seem slow to realise this one must remember that the inflation that began in their country in 1961 is their first direct experience of the malady. Prices, of course, have risen sharply in Switzerland before, as during the World and Korean Wars, but that was due to higher import prices; this is the first time that the virus has established itself in the Alpine confederation.

The alternative is that Switzerland will lose more than certain prized aspects of free enterprise in banking, because the inflationary boom threatens the country's independence. It is being financed to some extent by foreign capital, and relies very largely on foreign labour. There are over eight lakhs of foreign workers in the country (whose population is around five million), which is more than in West Germany, a nation more than ten times as big. To base industrial expansion on inflationary credit, foreign capital and foreign labour is to build on sand three times over, for all of these foundations can be withdrawn at short notice.

It was pointed out in the article of last May already referred to that the main weakness of anti-inflationary action to that date was the absence of any measures to curb the quite extraordinary building boom. The Federal Council now proposes such measures, and it is indicative of the survival of business freedoms in Switzerland that the suggestion that building requires official permits is denounced as "authoritarian" by the Press this week. Till now, indeed, one required to fulfill simple police formalities before building. The Federal Council urges that a permit first be obtained by constructors from the cantonal authorities, and this seems an elementary precaution in countries long fami-

liar with the contribution house-building can make to inflationary pressures. Further, it suggests that for the next 12 months there should be a total ban on construction of offices, theatres, sports grounds, holiday homes and cinemas, as well as on the demolition of existing housing that can still safely give service.

Considering the seriousness of the Swiss inflation, these measures are not particularly austere, and of course they are liberalism itself alongside the draconian intervention now being practised in neighbouring France to combat price rises not much more spectacular. Measures to neutralise hot money, limit credit creation and curb building are in application all over Europe now, not excluding West Germany. All that is curious in the Swiss case is that this is the first time they have been proposed there as law, and at that (this is what shocks many Swiss) with fines of Rs. 1 lakh attached for infractions. Inflation has at last brought the Swiss into the 20th century.

A New Development in Economic Theory

JOSSLEYN HENNESSY

LONDON:

THE CONTINUOUS increase in government expenditure has opened up a new branch of economic study—"cost-benefit analysis". The distinction is now made between social and private benefits and costs. An obvious "social cost" is the smoke from factory chimneys, which dirties neighbouring houses and washing pegged out to dry. An obvious "social benefit" is when a new factory is opened in an area of unemployment and creates social benefits over and above its own profits. Shopkeepers, maintenance contractors, and many others, will make profits which cannot be claimed by the firm which created the business for them.

In a recent issue of the "Moorgate and Wall Street Review" (published by Philip Hill, Higginson, Erlangers Ltd., 34, Moorgate, London. E.C. 2.), Mr. C. D. Foster points out that although in most industrial activities social benefits and costs are of no special importance, in some cases they may be, as the following example illustrates. In a particular upper river basin, where seasonal surpulses accrued, pumping during the dry season for extra irrigation reduced downstream flows. Pollution became high as the flows fell. In the delta area, salt sea water intruded many miles upstream, destroying the productive potential of many agricultural acres and threatening larger areas. Given drought, some people were able to inflict heavy social costs on others in drawing water, because they happened to be higher up the river.

The problem is not only that remedial measures must be taken on a large scale, but that without government powers it is difficult to demand payment in proportion to benefits received. Another consequence of water schemes may often be to improve navigation and to reduce flood risks.

Again, take road building. At present people pay for the use of roads crudely through petrol taxes or vehicle licences and not in relation to benefits received. In fact, a new road may reduce revenue received by the government, because less petrol is consumed with less congested traffic, using a shorter cut, while benefits accrue to road users in time saved, and risk of accidents lessened. There are also benefits and costs to others—pedestrians, residents, farmers etc.

Misallocation of Funds

Hitherto, no attempt has been made to estimate social and private costs and benefits, and enormous misallocation of public funds running into thousands of millions has resulted. Although it is not possible to value all benefits and costs, progress has been made towards valuing some of them, so that it is now possible broadly to assess the social rate of return of public investment.

The Economic Review of the National Institute of Economic and Social Research (2 Dean French St., London W.1.) recently pointed out that the cost to British Railways (and so to the tax payer) of carrying the traffic which the railways propose to abandon is £44 m., and the direct cost of providing equivalent services of buses and lorries on the roads is £6 m. The economies in direct costs are thus obvious, but what about the social costs? There is the direct cost of additional road expenditure required, the cost of increased congestion, the social cost of any additional road accidents, and any social costs from redundancies on the railways.

The main answers provided by cost-benefit analysis are that the closure of the lines and transfer of the traffic to the roads would only increase road traffic by half of 1 per cent, which is 9½ times less than the normal per cent yearly increase in U.K. road traffic, so that for the bulk of the railway closures the cost in terms of additional road expenditure and congestion would be small. The detailed analysis works out to a maximum of £14.5 m., leaving a margin of £29.5 m. in favour of railway closures. Mr. C. D. Foster observes that it is a scandal that the government should subsidise those people who use certain railway routes insufficiently to make them pay; it is a scandal not because to help those people who cannot afford to pay economic fares is necessarily a misuse of funds, but because subsidising the railways is a needlessly expensive way of doing so, as the National Institute's figures prove.

Profit Motive

More and more it is coming to be thought that cost-benefit analysis should be applied to all national industries. From the viewpoint of a free enterprise economy, there is, of course, no reason why the nationalised electricity, gas, and coal industries should not, like private enterprise, set prices and decide investments on a calculation of the profits. If they were run independently none would have monopoly advantages, except electricity in the provision of lighting. There are strong arguments, which ought to appeal to people of all political parties, in favour of insisting that the nationalised industries should be commercially run, profit-making concerns, whose profits could be passed on to the nation in cheaper prices, reduced taxation, or in increased public expenditure.

However, many people argue that nationalised industries should not make profits because they are run as monopolies and their profits would therefore be excessive, and others seem to think that it is "anti-social" for a public enterprise to make a profit. Very well. But if it is decided that they are not to make profits, then their "social value" is not measured by their profits. If the policy is that a nationalised industry is only allowed to cover its capital costs at 6 per cent p.a., it cannot be argued that 6 per cent is the return on the capital, because it could be that much higher returns could be earned, if permitted. The benefits are passed on to consumers in lower than market prices. It is therefore relevant to ask what consumers would be ready to pay if it were a profit making enterprise. This is a divergence between "social" and "private" benefit. An excellent example of such a divergence, and of the social cost of failing to apply cost-benefit analysis to it, is the U.K.'s notoriously inefficient nationalised telephone service. If it were run commercially, whether by the State or by private enterprise, it would be much more efficient. But since it is de-

BLUE STAR'S SERVICE TO INDUSTRY — 5

The invisible ingredient of a product that commands consumer loyalty is quality. A uniformly high quality can be maintained only through quality control—meticulous testing of the raw materials and careful checking of the product at every stage of manufacture. ■ Indian industry depends on Blue Star for modern material testing machines to ensure accurate quality control of metals, textiles, rubber, plastics, paper and concrete. ■ This is one of the many ways Blue Star serves Indian industry.

cided that it is not to be profit-making, there is a strong case for ascertaining what subscribers would be prepared to pay for improvements—and for investing accordingly. The social returns—for example, in faster economic growth now impeded in a small but serious way by long installation delays and other failures—might turn cut to justify a higher place for telephones in the queue for public investment funds.

The economic efficiency of public expenditure depends chiefly on: (1) A broad decision on what things need to be done; (2) the ascertainment of who and how many are likely (a) to benefit, (b) to lose; (3) the ascertainment of what money value the beneficiaries and the losers place on their gains and losses; (4) comparison of (a) various ways of achieving the same end and (b) the benefits and losses from each way; (5) a decision as to whether society wants to weight these values differently in the public interest.

Politicians must decide question (1) and (5), but economists can help to make public expenditure more efficient by applying the newly developed techniques of cost-benefit analysis to the other questions.

Arab Oil on the Boil

ERNEST BLUM

NEW YORK:

A MAJOR increase in Arab oil revenues is in the making. Months of behind-the-scenes manoeuvring between Middle East oil countries and eight major Western companies appears likely to break the old 50-50 formula for a split in profits. The bigger slice for the Arabs, and Persians, could add as much as $250,000,000 a year to their present yearly income of more than $1,500,000,000.

An early straw in the wind that a change is in the making was an agreement signed with Indonesia giving her a 60-40 deal. Venezuela already has what in effect is a 2-to-1 deal in her favour.

The Middle East oil-producing countries have been restive for a long time about the old formula, but the pressure for a change started in earnest at the 4th Arab Petroleum Congress in Beirut last November, when demands for a "fair share" of revenues swelled up to a clamour. Almost simultaneously, an emissary, Mr. Faud Rouhani of Iran, was negotiating with the oil companies in New York for a hike in income. The companies revealed that they were ready to bargain, and their offer was conveyed by Mr. Rouhani to a secret conclave in Riyadh, Saudi Arabia, at the beginning of December.

Laborious Bargaining

Since then other meetings have advanced the bargaining. As in all matters where big stakes are involved, the going is laboriously careful, but the realism of Arab demands and the hard-won experience of the companies in these matters has made a new agreement likely soon. Negotiations now are at the top-echelon level where Mr. Robert Brougham, Vice President of Aramco, one of the big concerns, in commuting between Riyadh and New York.

Mr. Rouhani, who is leading the Middle East side of the negotiations in his capacity as Secretary General of the Organization of Oil Exporting Countries, has put in a bid for changes in the profit formula that would bring in an additional $250,000,000 of revenues. It is believed that at this point the companies have a compromise offer worth about $150,000,000.

The present 50-50 formula for profit sharing is simple in appearance, but the technical workings are intricate. The companies first pay the host countries royalties at the rate of 12.5 per cent of gross sales of crude oil. In addition, the companies pay taxes. Finally, a supplementary payment is made which, added to the royalties and taxes, brings the total revenue up to 50 per cent of company profits.

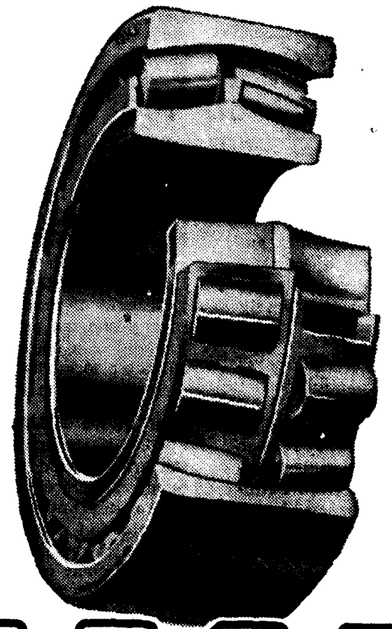
As it works out in practice, the oil-producing countries are actually getting more than a 50 per cent share. It works out that way because the accounting is done figuring oil sales at a posted price of $1.86 a barrel. Since the companies are actually selling below this price, Middle East revenues now amount to an estimated 53 per cent of profits.

What the Middle East is asking for specifically is an increase in the royalty component of their incomes. The royalties now are 12.5 per cent of the companies' gross oil sales. Mr Rouhani is asking for a rise to 20 per cent, which would bring in the estimated $250,000,000 in additional revenues.

There is an alternative scheme, which Mr. Rouhani has also put forth, long a point of contention. This is to retain a formula of receiving a half of the profits, but only after royalty and tax payments have first been deducted. Another proposal is a boost in the posted price per barrel to $1.90. All these formulas, however, ultimately amount to the same thing—more cash for the host countries.

Fair Share Demand

Oil is the major resource of the Middle East—the one the area must depend on in its urgent rush to development. The recent Arab Petroleum Congress voiced a good deal of disgruntlement about what the Arabs are now getting. A resolution demanding a "fair share of Arab resources to develop the Arab economies" was passed unanimously.



One point constantly pushed by the Arabs is that while the present complex formula gives them an approximate 50 per cent share in the profits from sale of crude oil, they have no stake in the other sectors of the vast oil business, such as transport, refining and marketing. This has led to much urging that the area get into the oil business for itself by home-grown refineries and shipping facilities. For the present, this is all fanciful talk, however.

Besides criticizing the companies, Arab opinion is directing its shots elsewhere. There is plenty of discontent with some of the feudal sheikhs, who are not averse to squandering much of their vast incomes. And there is rising demand for channeling oil profits to overall development of the whole area.

The ferment of change in Middle East oil policies comes at a time of stiffening world competition. New fields are being developed in the Sahara, and production there will soon reach a half million barrels a day. At the same time, the Soviet Union and Rumania are getting into the free-world market in a big way. Last year they exported 650,000 barrels a day, and this year the rate could go up to 800,000 barrels. A new 3,500 mile pipeline brings Soviet oil from fields beyond the Volga smack into the heart of middle Europe.

But increasing world oil supply comes in pace with vastly expanding demand. Industry forecasts are that free-world consumption of oil, now 21,000,000 barrels a day, will soar to 34,000,000 barrels within the next ten years. Beyond that, as industrialization widens, world consumption is likely to expand at an even steeper rate.

For the present, the expected hike in Middle East royalties will have to be absorbed by the companies, many analysts believe. The market situation is too tight to support much of a price rise. But sharpening Arab demands, as observers see it, are a fact of life that the oil companies are learning to take in their stride—FNS.

SKF

SKF designs and manufactures a complete line of all types and sizes of the four basic anti-friction bearings... ball bearings; cylindrical, spherical and tapered roller bearings. Because we make all types, you can always be sure of getting the right bearing in the right place.

Petroleum Products from Kuwait

By Our Special Correspondent

NEW DELHI:

AN AGREEMENT is understood to have been negotiated between the Union Ministry of Petroleum and Chemicals and the Kuwait oil delegation, which was here recently, on the supply of various petroleum products by Kuwait to India. Official sources, though reticent to disclose details of this arrangement, indicate that the quantities involved — mainly of middle distillates—are fairly sizable and that the prices quoted compare very favourably with those at which these imports are being effected by the international oil companies operating in this country. In some cases, the discounts offered by Kuwait are stated to be even higher than the Russian discounts. Kuwait is also said to have agreed to retention of part of her earnings from these exports for investment in oil refining in this country. She, however, has not yet shown any interest in the proposed refinery at Madras.

A high-level delegation from here is expected to visit Kuwait by the end of this month or shortly thereafter, for pursuing talks with the Kuwait Government on the latter's invitation to the Oil and Natural Gas Commission for participation in oil exploration and prospecting in Kuwait. The Kuwait Government is believed to have offered India minority share in this business.

Iran is also stated to be interested in ONGC collaborating with the Iranian Oil Company for oil exploration "on shore" there. If India wants to have "off shore" concessions also in Iran, she will have to make arrangements with some international oil company, which qualified for bidding for these concessions last year. An Iranian delegation is currently in New Delhi for pursuing talks on ONGC's collaboration with the Iranian Oil Company. These parleys were initiated by India last year.

**

Seven oil companies are understood to have so far submitted detailed proposals for the Madras Refinery. Five of these — Esso, Philips Petroleum, Mobil, Indiana and Standard — are from the United States and the other two — Burmah Oil Company and ENI — from Britain and Italy. Proposals from the other international oil companies which have evinced interest in this venture are still awaited.

The Union Government is understood to be of the view that if the proposals received for the Madras Refinery are attractive enough, they will also be considered — with necessary modifications — for the refinery planned to be set up at Haldia. In fact, both the Burmah Oil Company and Esso, with whom preliminary discussions in regard to the Madras Refinery have taken place during the last fortnight, have been asked to suggest the changes they would like to make in their proposals for the Madras Refinery to suit the requirements of the Haldia unit. The changes, it is gathered, will take cognizance of the somewhat different demand pattern for petroleum products in the Calcutta region and the development plans for Haldia Port which include construction of an oil jetty by the end of the current year. The Haldia Refinery is proposed to have a capacity of approximately 2.5 million tonnes per annum.

The Oil and Natural Gas Commission is optimistic that if all goes well, the first one-million-tonne capacity of the Koyali Refinery will be commissioned by the end of this year. The work on this unit till now is stated to have been proceeding more or less according to schedule.

About 15 days' further delay is likely in the commissioning of the first stage of the Barauni Refinery. Trial runs here are now expected to start sometime in April, instead of towards March-end as stated by the Minister for Petroleum and Chemicals, Mr. O. V. Alagesan, during the last session of Parliament. Oil India has announced that it is ready to supply crude to the Barauni Refinery. It has already completed filling in of crude oil in the Nahorkatiya-Barauni pipeline right upto Barauni.

For avoiding the last year's unhappy post-monsoon experience of the Noonmati Refinery, the Indian Refineries Ltd., has requested the Central Water and Power Commission to make a study of the behaviour of the Brahmaputra. The refinery authorities also propose to keep a close watch on this river during the next monsoon season. Steps are proposed to be taken expeditiously to ensure water from the Brahmaputra to the Noonmati Refinery as soon as indications are available about the river changing its course further.

**

Test drilling at Karaikal in the Cauvery Basin, it is learnt, has been postponed by about two months to March, owing to difficulties encountered in shipping drilling equipment to this place from Calcutta. Structural drilling near Pattukottai in this area for obtaining sub-surface geological information, of course, has been completed.

Off-shore drilling in the Gulf of Cambay is expected to be taken up by the end of this year. The Italian oil combine, ENI will be entrusted with this task on contract basis.

The structural well being drilled at Raxaul in the Gangetic Basin is expected to be completed to its contemplated depth of 4,700 metres in another week. A second well in this area is proposed to be taken up for drilling at Purnea in about two months' time.

**

The Assam Oil Company is understood to have drawn up an ambitious programme for stepping up production of crude from its Digboi oilfield. It proposes to go in soon for formation fracturing here on an experimental basis. To begin with, this technique will be applied to some 30 wells.

Formation fracturing involves injection of a fracturing fluid under sufficient pressure into the rocks bearing oil and gas. The injection of fracturing fluid and the propping agent opens up the existing fractures and creates new ones, thus improving the path for the movement of oil and gas. After the initial breakdown, the fractures are extended around the well-bore by continually injecting fluid under high pressure. As pressure is withdrawn, the new cracks remain open, held in place by the propping agent, usually carefully-sized sand. Messrs. Dowella Dollwe-Schlumberger Corporation, the world's leading contractors in the field of formation fracturing, will supply the necessary equipment and technical personnel to the Assam Oil Company for the experiment.

The production of crude oil from the Ankleshwar-Kalol oilfields, it is now expected, can be raised to 2.5 million tonnes per annum. Of these, 2 million tonnes will be available from the lower sands and the remaining 0.5 million tonnes from the higher sands. A flow of this order, it is estimated,

can be attained from these oilfields for a period of at least 15 years.

**

The steps taken by the Union Finance Ministry during the past four months for fostering economic growth have yielded wholesome results. Not only has confidence returned to the stock market, the downward trend witnessed in new company registrations after the Chinese aggression in October, 1962, has also been reversed. A facts sheet prepared by the Company Law Administration last week reveals that the number of new floatations went up from 92 in September, 1963, to 107 in October, 121 in November and 125 in December.

During the calendar year 1963 as a whole, however, there was witnessed a marked fall in new company registrations, compared to the previous year. Only 1,251 new companies were formed during this year with an aggregate authorised capital of Rs. 213.2 crores, as against 1,532 new companies registered in 1962 with a total authorised capital of Rs. 310.7 crores. Of the 1,251 new companies registered in 1963, 151 were public limited companies having a total authorised capital of Rs. 115.8 crores and 1,100 private limited companies accounting for an aggregate authorised capital of Rs. 97.4 crores.

The State of West Bengal retained its lead over all the other States with the new registrations in its jurisdiction totalling 254. Maharashtra came second with 245 companies, followed by the Union Territory of Delhi and Madras with 218 and 166 floatations, respectively. These four territories amongst themselves accounted for nearly 70 per cent of the new registrations during 1963. Ten new companies were incorporated in the Union Territory of Goa during this year.

The distribution of new companies registered in 1963 according to their authorised capital, reveals that out of a total of 1,251 companies, as many as 683 (54 per cent) were incorporated with an authorised capital of less than Rs. 5 lakhs each. Another 469 companies were registered with an authorised capital of Rs. 5 lakhs and below Rs. 50 lakhs each. Fifty-two companies were floated with an authorised capital of Rs. 50 lakhs and below Rs. 1 crore each. The remaining 47 companies were giant-sized, each having authorised capital of Rs. 1 crore or more.

**

An agreement was signed in Bombay on January 29 between Shipyard 3 May, Rijeka (Yugoslavia) and the Shipping Corporation of India for the supply of four coal carriers of the value of Rs. 5.2 crores. Each coal carrier is to be of 13,500 DWT. These carriers are being supplied to the Shipping Corporation of India under the current Yugoslav credit of $40 million and will start arriving in 1966. Under the same credit, an agreement was finalised last year for the supply of three passenger ships for the Konkan service (Bombay-Goa). The agreement for the supply of these three ships in 1965, costing Rs. 2 crores, was signed by the Chougule Steam Shipping Company of Goa and the Shipyard 'Tito' Kraljevica.

A special lighthouse ship, M/V Sagardeep, built by Shipyard 'Tito' Kraljevica, is on its way to Bombay and is expected to arrive in the next few days. This lighthouse ship will ultimately be stationed at Calcutta. Negotiations are also going on between Yugoslavia and the Government of India for the supply of several tankers of 5,000 DWT each, bulk carriers of 35,000 DWT each, general cargo vessels of 15,000 to 18,000 DWT each and passenger ships for coastal and overseas traffic in the fourth Plan. The funds for these vessels will be provided in the new credit Yugoslavia proposes to extend to India.

Six fish trawlers, of a total value of Rs. 30 lakhs, for development of fisheries in India, will also be supplied by Yugoslavia in 1964-65. An agreement to this effect is likely to be signed soon. Yugoslavia also intends to collaborate in building of 200 fish trawlers a year and for the manufacture of ancillary equipment for ship-building in this country.

Negotiations are as well under way with Yugoslavia for setting up two pig iron plants, with a capacity of 100,000 to 130,000 tonnes, at Udaipur (Rajasthan) and Hissar (Punjab). These are expected to cost Rs. 7 crores—the Udaipur plant Rs. 4.2 crores and the Hissar plant Rs. 2.8 crores. The foreign exchange allocation for the two plants is proposed to be made from the current Yugoslav credit.

For the setting up of the pig iron plant at Udaipur negotiations are being conducted between the Indian concern Kamani Engineering and the Yugoslav enterprise, INTRACO. The Hissar plant is proposed to be put up by the Punjab Government in collaboration with INTRACO. The establishment of these two plants will provide a base for the development of small-scale industries in these regions.

Yugoslavia is also supplying power equipment for the two units of 32 MW each for the thermal power plant to be built near Kanpur, in Uttar Pradesh. An agreement has been signed in this regard between the Yugoslav industrial association 'INGRA' and the Government of Uttar Pradesh. A number of power plants have already been set up in India with Yugoslav assistance.

A drilling team will be arriving from Yugoslavia in April for drilling oil wells in Assam. The contract for drilling these wells was signed in December, 1963.

Yugoslavia is as well collaborating with Indian entrepreneurs in the manufacture of electric measuring instruments and with TAFE of Madras for the production of agricultural tractors.

Possibilities are also indicated of industrial enterprises from India collaborating with Yugoslav enterprises for the manufacture of industrial goods in Yugoslavia. This collaboration is expected in the manufacture of boilers, air-conditioners, etc. An economic delegation from Yugoslavia is expected here shortly for discussions with the Government of India on how co-operation between the two countries can be increased further. The trade between India and Yugoslavia has gone up rapidly in the recent past. Among the goods imported by India from Yugoslavia last year were zinc, lead, aluminium, basic oils and seamless steel pipes. Exports from India included industrial goods such as machine tools, air-conditioners, pumps, electric motors etc.

**

The U.S. Agency for International Development (A.I.D.) is showing great interest in the development of truck manufacturing, paper, chemicals, tyres and synthetic rubber industries in this country. Mr. A. M. Vagliano, Director, Office of Capital Development and Finance, Near East and South Asia, of A.I.D., has had discussions in this connection last week with the Union Government, the Industrial Finance Corporation, the Industrial Credit and Investment Corporation of India and the representatives of these industries.

Increased assistance is expected to follow from A.I.D. for the development of these crucial industries. Knowledgeable circles opine that if a project in these lines of manufacture requires assistance to the tune of one to two million dollars, the assistance will be extended by A.I.D. directly. Help to a lesser extent may be routed through the IFC or ICICI. Synthetics and Chemicals is likely to be the first company to benefit from Mr. Vagliano's visit.

Besides extending help directly, A.I.D. guarantees repayment up to 75 per cent to any American lender (banks, insurance companies etc.) making available loans to Indian manufacturing concerns. This risk guarantee programme has been designed to foster American investments in India.

Mr. Vagliano is also understood to have had talks with the Union Government on the proposed Development Bank. He has expressed satisfaction over the U.S. assistance being put to effective use in this country.

**

The Indian Sugar Mills Association has cautioned the Union Government that sugar production this year may not exceed 2.53 million tonnes, as against Government's expectation of 3/3.3 million tonnes. Addressing a Press Conference here last week, the ISMA President, Mr. G. M. Modi, called upon the Government to devise a realistic policy for sugar so that output could be increased to at least 3 million tonnes. He suggested two alternatives: (i) institution of selective control under which the industry could be allowed to sell production in excess of last year's output in the free market; or (ii) replacement of the present 3-slab excise rebate granted to the industry on production in excess of 1961-62 by a 50 per cent rebate over last year's production. This way, Mr. Modi opined, the industry could secure adequate cane supplies in competition with gur and khandsari manufacturers. The Government, Mr. Modi added, should refrain from entering into further export commitments in the interest of the local consumer. He also expressed the view that for increasing production adequately during the next crushing season, cane prices should be uniformly fixed at Rs. 2 per maund, as against Rs. 1.75 per maund during the current season in some areas.

Athough the Union Food and Agriculture Ministry does not share the pessimism of ISMA on sugar production, it is understood to be bestowing thought on the suggestions put forth by Mr. Modi. The isssue is expected to be thrashed out by next week.

**

According to a Presidential Order issued on February 2, Mr. Lal Bahadur Shastri will perform such functions in relation to the business of the Ministry of External Affairs, the Department of Atomic Energy and the Cabinet Secretariat as may be assigned to him by the Prime Minister from time to time. The order incidentally does not contain any mention of the Prime Minister's work in the sphere of planning.

By virtue of another order issued by the President on the same day, Mr. A. K. Sen, Minister of Law, and Mr. Satyanarayan Sinha, Minister of Parliamentary Affairs, have been asked to hold on a permanent basis additional charges of the Department of Posts and Telegraphs and the Ministry of Information and Broadcasting, respectively. The two Ministers had been hitherto in charge of these portfolios on a temporary basis.

A third Presidential order issued on February 4, confirmed Mr. Raj Bahadur and Mr. Jai Sukhlal Hathi as Ministers in charge of the Ministry of Transport and Departments of Supply and Technical Development, respectively. These portfolios had been hitherto held by the four Ministers on a temporary basis.

**

The Union Finance Minister, it is understood, has requested the Ministry of International Trade to conduct a fresh review of the working of the export incentives schemes with a view to finding out their adequacy and checking their misuse by exporters.

Eastern Economist 20 Years Ago

FEBRUARY 11, 1944

The Bombay Plan may break down either because of organizational defect or social and political cleavages, but to suggest that such a modest plan involving only Rs. 10,000 crores over 15 years, will break down on the financial front—for lack of enough "savings", forsooth—is a strange misconception of the entire plan. An economic plan can be made to finance itself after a few years. Consequently, as long as the aggregate burden imposed during the first few years is kept within bounds, we can steepen the tempo of the entire plan almost to any extent we choose. This will not involve any additional burden after the first few years because the subsequent five-year plans will be self-financing and both the level of consumption and that of investment will increase at a higher minimal plan and an optimal plan. The Bombay Plan is our minimal plan—embodying the minimum contents of our national economic manifesto and is designed to provide us the national minimum by giving us the meagre sum of Rs. 11 per month per head after 20 years' efforts. In our optimal plan we could provide for a much steeper tempo than in the Bombay Plan. But to raise an outcry about inflation over the modest Bombay Plan, even before we have drawn up our optimal plan involving a capital investment of, say, Rs. 20,000 crores over 15 years, is somewhat premature.

Maharashtra's Industrial Expansion

From Our Correspondent

BOMBAY:

IN THE sober and dignified background of the Republic Day celebrations in Bombay this year, compared to the clamour and pageantry of the previous years, one could calmly reflect on the achievements of Maharashtra in the period of planning. With all the uncertainties and external factors which have had repercussions on growth factors, Maharashtra seems to have emerged as a strikingly successful State in her march towards industrial expansion. She has established for herself a unique place in the industrial map of India, contributing more than 20 per cent of the value added in the manufacturing sector; but there had always been the limitation of the lack of industrial spread to the hinterland of Maharashtra. It is appropriate to look back and see how far there has been a break from concentration of industrial growth, and the degree of balance that has been established under the impact of planning.

The indicator of the industrial licences granted by the Government of India within the State reveals that compared to 31 licences for establishing new units in 1954-55, there were 348 licences issued in 1956 to 1960 and for the period of 1961 to 1963, 256 licences were issued. Similarly, licences for new articles of manufacture and substantial expansion numbered only 88 in 1954-55, compared to 709 in 1956-60 and 474 in 1961-63. It will thus be seen that there has been a phenomenal expansion within about 2½ years since 1961 with 730 licences being issued for Maharashtra State for establishing new units, expansion of existing units or for manufacture of new articles. The diversification of industrial growth is more significant.

Some of the important lines licensed are organic and inorganic chemicals of various types, Polyster staple fibre, writing and printing paper, pig iron, coalite or semi-coke, sheet metal components, ferrochrome, and ferro silicon etc. The location of the units which are licensed indicates a careful selection, from the point of view of balanced development. Most of them are now in the suburbs of Bombay and in some of the under-developed areas; as for instance, the chemicals are being spread out in Kalyan, the paper industry in the Ahmednagar District, the caustic soda and chlorine plant in Vidharba, pig iron unit in Chanda district and ferro-chrome plant at Chiplun (Konkan). It is also interesting to know that some of the important units went into production during the past three years and most of the industries are in the private sector, which shows that despite the controversy over the roles of the public and private sectors, Maharashtra has given an example of complementary functioning of the two sectors, in the implementation of the industrial policy.

However, in the process of familiarising the industrially under-developed areas to the modern industrial sector, the impulse has mostly come from the investment of the Centre in public sector undertakings which is expected in the third Plan period alone to account for Rs. 45 crores. Apart from this the investments which go into industrial establishments, relate to the fertiliser-cum-gas factory at Trombay, the organic chemicals factory at Panvel, the expansion of the antibiotic project at Pimpri and the heavy structural plates and vessels at Wardha. Besides, in the central sphere, the undertaking for the manufacture of urea and nitro-phosphate can be mentioned as one that is likely to contribute significantly to the agricultural development of the State. This unit is expected to go into production in the current year and would have the capacity of about 90,000 tons of nitrogen. In the underdeveloped area of Kolaba district, there is another important project which is coming up near Panvel for the manufacture of basic chemicals and intermediate products. This plant is expected to meet the raw material requirements of dye stuffs, drugs, plastic industries and other miscellaneous demands. With an authorised capital of Rs. 12 crores and under the management of Hindustan Organic Chemicals Ltd., the project is to form the base for a number of ancillary industries in the area.

Over and above these major projects, there are 5 defence projects started by the Central Government in Maharashtra which will contribute in a large measure to the wider spread of industry in the State. The prominent among these, is the project for manufacturing MIG fighter planes. The defence projects are particularly located in the rural areas and provide opportunities for employment of a large number of persons, both at the construction stage and after production starts. A training centre has already been set up at Nasik to train candidates for skilled employment at the factory. It may not be out of place to mention some of the State public sector projects, namely, the Government Central Distillery of Maharashtra, which has the capacity of 2.7 million gallons of rectified spirit per annum. In 1963, the Distillery attained a maximum rate of capacity of 9,000 gallons per day.

The most important and distinct contribution of Maharashtra in the sphere of industrial development is the successful expansion of the cooperative sector. The progress of industrial cooperatives in Maharashtra is prominently highlighted by a study of the comparative position between 1946-47 and 1962-63.

In this period, the number of industrial cooperatives increased from 298 to 3,000, membership (artisans, craftsmen, entrepreneurs and workers), having risen from 40,000 to over 300,000. The aggregate share capital of the members is about Rs. 2 crores and the value of finished products is about Rs. 7 crores, the turnover having increased from Rs. 3 crores to about Rs. 9 crores. While the cooperative mechanism is being encouraged in the sphere of textiles and other industries, the sugar factories are an essay in the cooperative processing and marketing of agricultural produce. At present, there are 20 cooperative sugar factories, of which 17 are in production. Of the total share capital of the 20 units amounting to about Rs. 8 crores, Rs. 5.51 crores have been collected by the members. The total production of the 17 factories in 1962-63 crushing season was 287,753 metric tonnes.

★★

It has been a crowded week for engagements where observations on policies vitally concerning planning and economic development have been made both by visiting ministers and by leaders of industry. The thoughts on democracy and socialism which engaged the Bhubaneswar Session are still lingering. The right thing about this issue was said by Mr. S. G. Barve of the Maharashtra Ministry, who observed in delivering the third Memorial Lectures under the auspices of P. F. Madan scheme that "we have a national weakness for catchwords and heroic slogans as against cold deeds and pragmatic programmes. The public sector versus the private sector; cooperative farming versus peasant proprietorship; free enterprise against socialism; national planning versus decentralisation; endless disputations and controversies over these theories have occupied the central place in our public discussions throughout these years." He also emphasized that many of the differences voiced were purely semantic and referring to nationalisation of banks, he made it clear that "nationalisation was not in itself an elixir for economic growth." Though the issue of nationalisation may have been set at rest by its omission in the Resolution of the Congress at Bhubaneswar Session, morchas and rallies are not wanting in the city to raise the issue and consequently keep it alive at all levels.

Mr B. R. Bhagat, Minister of State for Finance and Planning, who was here last week, referring to the various aspects of planning in the period of growth made particular reference

The Thaw !

to the need for "selective approach in the future strategy of planning to put the nation's economy on a self-sustaining basis and assure a faster rate of growth." To give a concrete shape to this approach, he said a list of key industries has been drawn up in consultation with the representatives of industry. His admission of the failure of planning appeared to be more frank when he said that "the considerable momentum which was given to the economy towards the end of the second Plan period has worn itself out and in the first two years of the third Plan, the economy had been stagnating at a level which was causing serious concern" and "the grave danger of short-falls in several crucial fields in relation to the targets has to be avoided by all means, because, apart from creating a sense of pessimism and fatalism in the public mind, such a failure would completely upset the larger objectives of improving the standards of living of the people to certain minimum levels."

★★

Mr Manubhai Shah, Minister for International Trade had his share of warning to the trading community in stating that Government had decided to evolve a national contract to lay down the minimum norms that an exporter will have to observe. The contract would fix minimum national obligations on every exporter and its clauses would be super-imposed on every export contract; and the latter would be enforceable in a court of law, if any of its clauses was violated.

★★

As a representative of the business community, Mr Bharat Ram, President of the FICCI called for a greater association of the business community with the process of planning. Such association, he felt, was necessary to ensure that business and industrial organisations came to feel involved emotionally and otherwise in the shaping of the country's economic future. One has only to ask whether there has not been a surfeit of such association of the business community in the various committees, advisory and otherwise. Perhaps what he meant was that there should be more effective implementation of the suggestions of the business community.

Bandaging the Wounds

From Our Correspondent

CALCUTTA :

NORMAL CONDITIONS have rapidly returned to Calcutta, just as rapidly as the disturbances spread a few weeks ago, but as usually happens, these mass disorders leave a trail of problems behind them. Evacuees are of course returning to their homes, and it is officially claimed that over 90 per cent of the people who had fled have already been resettled. Yet constant police vigilance and special security arrangements for the areas where the members of the communities intermix serve as an uneasy reminder of the precarious nature of the communal peace which it is claimed has now been restored. The law and order problem of Calcutta has become enormous, especially after the recent disturbances. Communal passions apart, there are socio-economic causes of Calcutta's lawlessness—appalling living conditions, growing unemployment, soaring prices, greater congestion with further industrialisation of the area—and these have bred dangerous tensions which find expression in such outbursts of disorder as last November's food riots, organised attack on public transport with a view to paralysing the city's life and the communal disturbances of last January which have led to the loss of much valuable life and property.

It is, therefore, gratifying that the Centre has begun to take a more active interest in the affairs of this city. This is indicated by the visit last week of three Central Ministers —Messrs Nanda, Krishnamachari and Khanna—together to Calcutta to make a first-hand study of the situation and obviously to make an urgent examination of the State Government's claim for financial assistance on a large scale. The Union Finance Minister has discouraged all speculation about the Centre taking over the administration of Calcutta, but he has said enough to indicate that New Delhi will give all necessary financial assistance to the State to initiate measures for the clearance of Calcutta's slums—some 25 per cent of the population has been packed into these tragic hovels which are the home of all lawless elements—and to relieve congestion in this huge sprawling city which carries a record density in the world. Mr. Nanda's statement (as clarified by Mr. Krishnamachari at the Press conference) that the restrictions on the migration of the minority community from East Pakistan would be eased has been widely welcomed, although a section led by the leftists would prefer a policy of "open door" for all those who wish to come away. Since the Union Home Minister made that statement, the flow of refugees has perceptibly increased, but this time all new arrivals are being promptly despatched to Dandakaranya for resettlement there. In any case, the economic implications are obvious, but as Mr. Nanda has said, India has a moral responsibility towards the minority community in East Pakistan, and this country must discharge that responsibility honourably.

★★

The Indian Jute Mills Association's decision to do away (from 1st February) with the Working Time Agreement which was in force for quite a long time, is indicative of the better times which the industry has been experiencing for the past two years. The Agreement was reached in times when fibre supplies were insufficient and the market conditions unsatisfactory, in order to adjust the mills' working to available raw material supplies and the demand conditions in the goods market, but since the past two years, the industry has been operating to full capacity. The annullment of the Agreement is, therefore, a formal step. Reflecting these good conditions, output of jute goods has gone up steadily since 1961—from 970,300 tonnes in that year to 1,186,800 tonnes in 1962 and to 1,236,200 tonnes in 1963. Exports have moved up from 713,100 tonnes to 848,400 tonnes and to 867,000 tonnes, respectively; internal consumption has in this time gone up from 278,100 tonnes in 1961 to 303,000 tonnes in 1962 and to 867,000 tonnes in 1963.

★★

At the annual general meeting of the Mining, Geological and Metallurgical Institute of India, Mr. G. D. Massmann, president, emphasized the need to mechanise the coal industry if it is to achieve the targets fixed under the Plans. This must of course remain the industry's long-term objective, but there are some immediate problems crying out for urgent attention. Speaking at the annual dinner of the Institute, the Union Minister concerned, Mr. O. V. Alagesan, confirmed reports that for the first time in many years the supply of coal is ahead of demand. (It was at this meeting that the Minister announced that the Government would put up a refinery at Haldia based on imported crude, which would go into production in the second year of the fourth Plan). The excess of production over demand is not slight, as the Minister thought. Latest statistics show stocks currently accumulated at the pitheads amount to as much as 5 million tons,

Announcement of Public Issue

(This announcement is not a Prospectus)

Bajaj-Tempo LIMITED

Registered Office: Bombay-Poona Road, Chinchwad, Poona.

EXISTING AND PROPOSED ACTIVITIES:

The company was manufacturing about 1000 Tempo Hanseat three-wheeler vehicles per year, which are in use as pick-up trucks, delivery vans, autorikshas, refuse trucks, oil tankers etc. Production of these vehicles is now proposed to be increased to 4000 per year.

The company has now been licensed to manufacture in the same capacity Tempo Viking four-wheeler vehicles.

Both for production of Tempo Hanseat three-wheeler and Tempo Viking four-wheeler collaboration agreements have been entered into with Messrs. Vidal & Sohn Tempo-Werk GMBH, Hamburg-Harburg, West Germany.

LOCATION OF THE INDUSTRY:

The company has acquired about 118 acres of land on Bombay-Poona Road, Chinchwad (Dist. Poona). Construction of factory building is in progress and is expected to be completed by March 1964.

The manufacturing operations of the company are at present located partly at 126 Ghodbunder Road, Malad, Bombay, and partly at the new factory site mentioned above.

BOARD OF DIRECTORS:

1. **Shri Ramkrishna Bajaj**
   Chairman
   Bhagwati Bhuvan,
   Carmichael Road,
   Bombay-26.
   Industrialist
   Director of:
   Bajaj Electricals Limited
   Batala Engineering Co., Ltd.
   Hind Rectifiers Limited
   Radio & Electricals Ltd.
   Matchwel Electricals
   (India) Ltd. — etc.

2. **Mr. Curt Gebser**
   Am Radeland 125,
   Hamburg-Harburg
   (West-Germany).
   Engineer

3. **Mr. Rolf Bacher**
   Nurenbergstrasse 30,
   Weissenburg/Bayren
   (West-Germany).
   Engineer

4. **Shri Charat Ram**
   15, Kitchener Road,
   New Delhi.
   Industrialist
   Director of:
   Delhi Cloth & General Mills Co. Ltd.
   Jay Engineering Works Ltd.
   Bharat Ball Bearing Co. Ltd.
   Industrial Finance Corporation of India.
   Amar Dye Chemicals Ltd.
   Indian Drugs & Pharmaceuticals Ltd. — etc.

5. **Shri R. P. Nevatia**
   Pitale Prasad,
   Worli Seaface,
   Bombay-18.
   Industrialist
   Director of:
   Tikkand Iron & Steel Works Limited
   Kamala Engineering Co. Ltd.
   Kamla Buland Sugar Co. Ltd.
   Nagaon Cotton Mills Ltd. — etc.

6. **Shri N. K. Firodia**
   Managing Director
   243 Sion-Matunga Road,
   Bombay-22.
   Industrialist
   Director of:
   Godavari Sugar Mills Limited
   Kirloskar Industries Ltd.
   Oriental Power Cables Ltd.
   Kirloskar Electricals (India)
   Ltd. — etc.

	No. of shares	Nominal value in Rs.
a) AUTHORISED CAPITAL Equity shares of Rs. 10 each	10,00,000	1,00,00,000
b) ISSUED, SUBSCRIBED AND PAID UP Equity shares of Rs. 10 each fully paid	1,45,935	14,59,350
c) PRESENT ISSUE Equity shares of Rs. 10 each at par	6,52,710	65,27,100
OUT OF THE PRESENT ISSUE:		
A. Offered as Right shares to the existing shareholders resident in India and fully subscribed	1,85,000	18,50,000
B. Reserved for allotment against supply of Machinery, Plant and Equipment etc.		
(i) Messrs. Vidal & Sohn Tempo-Werk GMBH.	1,69,000	16,90,000
(ii) Mr. Rolf Bacher Weissenburg/Bayren (West Germany)	8,710	87,100
C. Now offered to the public for subscription in cash	**2,90,000**	**29,00,000**

TERMS OF PAYMENT:

On application Rs. 3

Balance Rs. 7 in three calls at intervals of not less than three months as may be decided by the Directors. No call shall exceed Rs. 3 per share.

UNDERWRITERS:

1. **The Central Bank of India Ltd.,**

Bangalore-6.

APPLICATION FORMS:

Forms of application for shares and copies of the Prospectus can be had from Underwriters or Bankers or Brokers to this issue or from the company.

DATES OF THE OPENING AND CLOSING OF THE SUBSCRIPTION LIST:

The subscription list will open at commencement of Banking hours on 10th February 1964 and will close at the close of the Banking hours on 18th February 1964 or earlier at the discretion of the Board of Directors but not before the close of the Banking hours on 12th February 1964.

maa.BT.3713

which is much in excess of the peak of 4 million tons in 1961. More significant is the fact that this heavy accumulation is not because of the old transport difficulties, which have almost disappeared, but because of a decline in consumption. In the circumstances, the question now being asked is what should be the right target for the third Plan to aim at—Whether the original target of 97 million tons, or 104 million tons which the Planning Commission was once thinking of, or just 90 million tons which is reported to be the latest revised target—but whatever the target is, the industry will need a lot of incentives to raise the extra production from the present level of around 63 million tons. Emphasis will have to be particularly placed on the production of superior grades. Overall coal production, it is true, is in excess of demand, but the industry is not producing enough of the higher grades, the production of which has actually declined over the past few years. The industry maintains that as long as coal prices are not more remunerative, it will not be possible to raise the production of the superior grades; nor will it be possible to undertake the programme of modernisation which is to be financed with the World Bank loan. (The World Bank team of experts which scrutinised the economic conditions of the coal industry supported the latter's case for higher prices, especially for the superior grades.) It is also a fact that due to the price policy pursued by the Government, the coal companies have not been able to build up adequate internal reserves with which to find sufficient plough-back for their modernisation or expansion schemes, and now that the profit outlook is uncertain, coal shares have been faring badly in the stock market, which in turn makes it difficult for the companies to raise fresh capital by the issue of new shares or through debentures; nor are they able to raise much money from banks, the Government's refinance arrangements notwithstanding. The Government's next move in the matter of coal prices as well as the industry's modernisation and expansion plans are anxiously awaited.

★★

Dr. K. L. Rao, Union Minister for Power, has gone back a happy man from last week's conference in Calcutta of State Power Ministers, which has at last decided to set up a regional electricity board for eastern India. West Bengal had been hostile to the idea from the start, fearing that the regional board would interfere with the prerogatives of the State boards to plan, generate and distribute electricity within their own areas. Dr. Rao assured the Ministers that the regional board would have only an advisory status and the prerogatives of the State Electricity Boards would be fully respected. Also, the economic argument that the regional grid to be set up by the new board would enable the region to derive the maximum possible benefit from its available fuel and hydro-electric resources, that the co-ordinated operation would lead to a saving of about 270 MW in installed generating capacity on account of diversity in load demands and reduction in standby capacity and therefore Rs. 22 crores in capital costs and Rs. 2 crores in annual running charges, and that an additional carrying capacity of 1 million KW would be available with no extra expenditure, appeared to carry conviction. The Eastern Regional Electricty Board would comprise the chairmen of the State Electricity Boards concerned, the D.V.C. chairman, State Government representatives and a representative from the Central Electricity Authority. Incidentally, this is the third regional board to be set up in India—the other two—one comprising the Southern States of Mysore, Madras, Andhra and Kerala, and the other consisting of the Northern States of U.P., Punjab, Delhi and Himachal Pradesh—have already been established. Under the third Plan programme for power development, six such boards are to be set up in the country; so the task is now half done.

★★

The Calcutta stock market is now in its usual pre-Budget mood of caution, so a dull trend continues. Investors fear that the Union Finance Minister may have to put up tax rates to meet the growing costs of both development and defence and he may even take stringent measures to trace "unaccounted money." It is unlikely, therefore, that the stock market will come back to life before Budget day. A particular class of shares which has suffered in recent weeks although for a different reason, is tea. The industry is expecting a smaller North Indian crop, and the average prices being realised at Calcutta auctions have been so far lower compared with those of the previous year.

Hunger for Funds

From Our Correspondent

MADRAS.

IT IS gratifying to note that the Andhra Pradesh Government also would be able to implement the third Plan schemes without any difficulty against the earlier apprehensions that it would be necessary to reduce the size of the Plan on account of the delay in some directions and the paucity of resources. It is even claimed that the target of Rs. 305 crores for the whole Plan period would be exceeded by Rs. 10 crores and that, if some favourable developments came about, the handing over of the Andhra Paper Mills to the private sector might not be found necessary. The State Government is probably expecting larger assistance from the Centre and also a larger share out of its tax revenues. Besides, the receipts from various sources, so far as the State is concerned, have been showing up well though there would be tangible relief only if the State Government's suggestion to the Centre for the implementation of the Nagarjunasagar project as a Central undertaking is accepted. There are many difficulties in the way as other States also are having big projects which will yield results only over a long period and which are accounting for a large slice of available resources. Some new formula might presumably be found by the Union Finance Minister by which it would be possible to extend larger support to projects which take a number of years to be completed. Meantime, it is happy to note that the pace of industrialisation in Andhra Pradesh has been more impressive latterly and the efforts made to improve power availability are yielding results. A gas turbo set, having a capacity of 10,000 kW, has been recently commissioned in Hyderabad while another set is under erection. A new unit of 15,000 kW is expected to be commissioned under the Tungabhadra scheme within the next three months. If the present happy position in Madras State continues to be in evidence it may even be agreed to supply power to Andhra in the latter half of this year. Arrangements may be made even for a longer period because Andhra Pradesh might be placed in a better position by the end of 1965 or early 1966. If power availability in Andhra can be improved the cement units can increase their output. The expansion plan of Panyam Cements would also start yielding immediate results.

The Hyderabad area particularly is growing in importance. Only a few days back, the sister unit of Aluminium Industries, which has its large factory in Kundara (Kerala), was opened by the Chief Minister, Mr Sanjiva Reddi. This factory will, in its initial stages, produce aluminium conductors. But there are plans for manufacturing cable-making machinery as early as possible. Mr Sanjiva Reddi took advantage of the opportunity to assure industrialists of every help from the State for promoting new industries. The Andhra Pradesh Industrial Development Corporation has been more active in recent months and has agreed to underwrite in a substantial way the issue of equity and preference shares of new undertakings. Several spinning units are proposed to be established in different parts of the State, while the arrangements for constructing a huge fertilizer unit at Visakhapatnam costing over Rs 32 crores are nearly complete. This company, which will be promoted by E.I.D.-Parry in collaboration with American interests, is expected to come on the market to raise its capital after the Central Budget is out of the way. There are other schemes too that are being given finishing touches.

★★

In Madras State, some developments in the industrial sector are taking place every month. Only recently the foundation-stone for the aluminium rolling mill having an installed capacity of 3,860 metric tons was laid by the Chief Minister, Mr. M. Bhaktavatsalam. This unit which will be erected in technical collaboration with Aluminium Limited of Canada, will cost Rs. 2.5 crores and two-thirds of the production in sheets, circles and utensils is earmarked for export. Jeewanlal (1929) Limited which is undertaking this project will be benefitted by the ready availability of sheets and circles from its own sources. The new mill is expected to be ready in 1965. Jeewanlal has also other plans to diversify its activities.

Mr. R. Venkataraman, the State's Industries Minister, who also addressed the gathering, explained to the industrialists who were present on the occasion, that there would be no difficulty in meeting the requirements of power for industrial purposes as between the Kundah project, the Mettur Tunnel Scheme and Neyveli thermal station, substantial quantities of energy would be available and industrial development could proceed unhindered. He actually stated that, in order to utilise available power and hasten the opening of Madras Aluminium Limited, which is engaged in constructing its plant for producing 10,000 tons of aluminium, virgin metal would be produced in the initial stages based on imported alumina. As virgin metal is in shortage, there will be a saving in foreign exchange on imports, while the plant for manufacturing alumina was being erected. There has been some unexpected delay in completing this project. It is now expected that, before the end of this year, virgin metal would be available from this source. On February 5, the foundation-stone for the new rayon-grade caustic soda plant, having a capacity of 60 tons daily, was laid by Dr. C. P. Ramaswami Aiyer, Chairman of the Company. The newly installed plant and machinery at the existing factory which will raise the capacity to 60 tons daily from 40 tons at present, are expected to be in operation in the next two months. Ultimately, total capacity will be 120 tons daily.

★★

The first Indian leather fair was inaugurated sometime back at the premises of the Central Leather Research Institute in Madras by Mr. Manubhai Shah, the Union Minister for International Trade. The exhibits at this fair gave an idea of the progress made by the industry in the finish of hides and skins. While the Central Leather Research Institute has been doing good work and the output of finished goods also has increased considerably in recent years, substantial quantities of tanned and untanned hides and skins are being exported to many parts of the country. The boost in exports to the U.S.S.R. and East European countries, particularly of pickled goats' skins, has been helpful in securing larger foreign exchange earnings and it was encouraging to know from Mr Manubhai Shah that in 1963 total exports rose by Rs. 7 crores to Rs. 42 crores. Mr. Shah, however, complained that only Rs. 5 crores out of this total were accounted for by leather and leather goods and that a lot more required to be done if a higher value was to be secured for the same exports through intelligent processing of hides and skins. The Union Minister seemed to be confident that as much as Rs. 20 crores can be earned annually through exports of finished leather and leather goods. He also gave an assurance that the required facilities for importing technical know-how and plant and machinery would be provided and that industrialists and traders should work on the basis of a target of Rs. 20 crores for the next year. There is no doubt that the value of exports can be doubled if only hides and skins could be sent out in a finished form. But it had been emphasized by a section of the industry that there should be a gradual period of transition and care should be taken not to lose the hold on our existing markets on account of reduced shipments of E.I. tanned kips. Madras exporters particularly have been specializing in these varieties which are being used as intermediate products by purchasing countries like Britain and others on the Continent of Europe. It is, however, pointed out that even bigger consumers might be agreeable to purchase finished leathers if they could be made according to their requirements.

The moving finger writes

I AM GLAD to see so many Ministers being confirmed in their temporary charges. A feeling of uncertainty, if not insecurity, is bad for anybody, Minister or mere mortal. I am particularly happy to find Mr Satyanarayan Sinha taking permanent charge of Akashvani Bhawan and all that goes with it. I hear that he is trying to get himself a new Secretary (for the I and B Ministry) and I wish him success.

One implication of the recent "confirmations", of course, is that not many new appointments to the Council of Ministers are being contemplated—at least for the time being. But I do hope that this does not mean that the Prime Minister cannot be persuaded to give more thought to the need for giving himself a Minister for External Affairs. 'The Times of India' I see, has written quite a strong editorial on this subject. But I am amused to find that its sponsorship of Mrs. Indira Gandhi for the job is rather half-hearted. The idea seems to be "better somebody rather than nobody".

I must hasten to add, however, that this newspaper has followed up with a brave front-page story of renewed efforts "in high Congress circles to bring Mrs. Indira Gandhi into the Central Cabinet as Minister for External Affairs." That a considerable number of what is described as "senior Congress men" is in favour of Mrs. Indira Gandhi joining the Cabinet is, of course, true enough and is no secret either. But the question is whether it is good for the Congress Party or the country that they should have their way.

In any case, I fail to see what is wrong with Mr. A. K. Sen. He has been in the Cabinet long enough to qualify for increasingly important responsibilities and he is certainly young enough to make it desirable that he should be given them. As for Mrs. Indira Gandhi, she undoubtedly has a unique position in national affairs as well as in the esteem and affection of the people, but she is one of those few rare beings in politics who could make their most useful contribution to the country's good by serving in a larger than "government-capacity". It is reassuring that she herself is resisting the move to get her into the Government. She is wise. Mr. Nehru too is resisting; he is wiser still.

**

Although the Presidential order relating to Mr. Lal Bahadur's functions empowers the Prime Minister to delegate authority to the Minister without Portfolio only in respect of the Ministry of External Affairs, the Department of Atomic Energy and the Cabinet Secretariat, it is clear from the Administrative order issued at the same time for the information of the Council of Ministers that Mr. Lal Bahadur will, in effect, look after most, if not all, of the routine and regular work of the Prime Minister except to the extent that files, papers or policy matters needing Mr Nehru's personal attention might be placed before him. It is perhaps as satisfactory an arrangement as may be expected in the circumstances.

Meanwhile, it is certainly good to find Mr. Lal Bahadur handling the delicate Kashmir situation with such finesse and firmness and I certainly agree that he deserves all the praise which he has received in the Press and elsewhere. At the same time, I fail to see how anything that has happened in Kashmir in recent weeks could be made to serve to bolster the case for appeasing Pakistan. On the contrary, if one fact was established more firmly than any other through the recent incidents in Kashmir and the reaction of the people of the Valley to those incidents, it is that Kashmir has now become very much more of an integral part of India emotionally than it is politically or in terms of the former provisions of the Constitution. There is certainly no substance in the stand that a decline in Bakshi Ghulam Mohammed's political fortunes must necessarily mean an improvement in the bona fides of Pindi, just as the welcome release of Khan Abdul Ghaffar Khan (happily timed for the Gandhi anniversary) is not necessarily to be contrasted with the detention and trial of Sheikh Abdullah.

**

In the course of his speech at the recent FAO seminar on farm forum broadcasts, Mr. Swaran Singh expressed the hope of being able to dovetail these arrangements for farm broadcasts into the larger aim for Panchayati Raj. In view of the dismal picture of agricultural production that emerged from the mid-term appraisal of the third Plan, it is necessary and right for the Agriculture Minister to hope. However, Ministers and officials, who, on such public occasions, tend to blur the vital distinction between their intentions and achievements, do themselves a disservice. In an atmosphere of hope which they themselves help to create, they are easily persuaded that what is needful has been done. It is, for instance, well known that community receiver-sets designed for mass listening are not readily available and not always in working order. The "catalytic agents" introduced by the radio or agricultural agencies to lead and conduct farm forum discussions in the village associating the listeners and to elicit the views and needs of villagers, would appear, judging from the results, to be ill-suited for their tasks. So, often, is the village-level worker who is entrusted with the follow-up work. An official of a department, presenting its achievements at the seminar, prefaced it with a sociological analysis of radio listeners and the social class to which they belonged. For instance, he said "....for people belonging to this group, the respect and regard of others for their intellect makes up for their lack of material success"; these are urban middle-class wage earners! This is at best spurious sociology reminiscent more of an advertisers' market research findings than the programme for the development of broadcasting of a public department. We do hope that listener research has the benefit of the advice of social scientists as has been claimed.

STATE TRANSPORT

EVERY THIRD bus in the country is owned and operated by a nationalised road transport undertaking.

The number of passenger buses owned by the public sector undertakings has steadily increased over the last decade. It rose from 10,420 in the first five year Plan to 17,962 at the end of the second Plan, representing an increase of 72.4 per cent. About 2,000 vehicles have been added to the fleet of the nationalised undertakings during the last three years and it is estimated that by the end of the third Plan, the number of buses owned by the nationalised undertakings would exceed 25,000.

Nationalisation of passenger road transport services is the declared policy of Government and this policy has been carried out in almost all the States on a phased basis and in conformity with the procedure prescribed for this purpose.

The amendments to the Motor Vehicle Act, 1939, after 1947 enabled the State Governments to cancel the private operators' stage carriage permits, so as to facilitate the taking over of the passenger services and running them departmentally. The Road Transport Corporations Act, 1950, provided for the establishment of statutory road transport corporations, with the participation of the Central Government, the State Government concerned and the public.

State Governments have provided about two-thirds of the capital of the existing corporations and the Central Government, in the Ministry of Railways, from 20 per cent to 33.3 per cent. There is no private capital in any of the existing corporations.

The total capital investment in the nationalised road transport undertakings, which was about Rs. 40 crores at the end of the first Plan, went up to Rs. 77 crores at the end of the second Plan. The third Plan expansion programmes of the nationalised road transport undertakings in the States (including Union Territories) have been estimated to cost Rs. 26 crores. This is in addition to the provision of Rs. 10 crores in the Plan as Railways' share in the road transport undertakings.

Nationalised passenger bus fleet is modern in most cases. The fleet of 15 out of 25 undertakings consists wholly of diesel vehicles, and more than 90 per cent of all the buses operated by the undertakings are diesel-engined. The vehicles used for the district and city services are mostly diesel engined. In the case of Himachal Pradesh and Manipur, which are operating hill services only, the trend, however, is slightly in favour of petrol vehicles.

The progress of nationalised passenger transport has been of an order which could not have been envisaged in 1916, when a limited company was first formed under the patronage of the then ruler of the former princely State of Gwalior. Today, out of all the States and Union Territories, Tripura is the only one where road transport has not yet been nationalised.

An important event in connection with the nationalisation of passenger transport services in the country last year was the formation of a Central Association of State Road Transport Undertakings. The Association will attend to the various requirements of the State transport undertakings in a regular and systematic manner on a long-term basis.

DIRECT TAX LAWS

The fifth meeting of the Central Direct Taxes Advisory Committee was held recently under the chairmanship of the Finance Minister, Mr. T. T. Krishnamachari. The items on the agenda related to Income-tax, Wealth-tax, and Super Profits Tax. One of the points discussed related to the provision in section 11 of the Income-tax Act that a religious or charitable trust which seeks to accumulate its income beyond 25 per cent of its total income should invest the accumulated income in Government securities. The question raised was whether a trust which derived capital gains from the sale of a capital asset would have to invest only the amount of the capital gains in Government securities or the entire amount of the sale proceeds. It was explained that the requirement of the law would be satisfied if only the amount of the capital gains was invested in Government securities.

Another point raised was that there was delay in the settlement of refund claims made by foreign shipping enterprises whose tramp ships operated at Indian ports. The Committee was informed that instructions had already been issued to the Income-tax Department to expedite the disposal of such refund claims.

Another point discussed was that if any disallowance or add-back had been made in the income-tax assessment of a particular year, and the assessee subsequently led fresh evidence in regard to the assessment for the next year, the matter should again be examined on the facts of the case and decided on its merits. It was pointed out that under the law the income-tax assessment for each year had to be made on the basis of the facts and evidence for that year. Thus, if the facts and evidence on any particular point for a later assessment year were different from those for an earlier assessment year, the Income-tax Department would certainly take the fresh evidence into consideration in making the assessment for that year.

There was also a discussion relating to the Super Profits Tax Act. It was explained that under the provisions of the Act and the rules framed thereunder, an assessee was entitled to declare the amount of deficiency relating to an earlier assessment year in his return for a year in which he had net chargeable profits. The deficiency would then be determined and set off against the net chargeable profits.

PL 480 FUNDS FOR INDUSTRY

Funds available for private industrial investment will be increased by Rs. 20 crores as a result of two agreements concluded between the Governments of India and the United States. The Industrial Finance Corporation and the Industrial Credit and Investment Corporation of India have each received a credit of Rs. 10 crores from the sale proceeds of agricultural commodities supplied to India under U.S. Public Law 480. The Corporations have extended assistance to several hundred concerns operating in a large variety of industries including aluminium, automobiles, cement, chemicals, textiles, engineering, glass, mining, paper, plywood, rayon, sugar and shipping. Recipients of their credits are distributed all over India. Special attention is paid in granting loans to the industrialization of the less developed parts of the country.

Both the Industrial Finance Corporation and the Industrial Credit and Investment Corporation of India received earlier loans of Rs. 10 crores each from P.L. 480 funds. The Industrial Finance Corporation also received two loans totalling $ 30 million in foreign exchange from the U.S. Agency for International Development and its predecessor, the Development Loan Fund. The Industrial Credit and Investment Corporation of India was granted a loan of $ 5 million (Rs. 2.4 crores) in foreign exchange by the Development Loan Fund. It also utilized a credit of Rs. 7.5 crores from the sale proceeds of steel supplied to India under the U.S. aid programme.

IAC JETS IT

Caravelle jet aircraft acquired by Indian Airlines recently have been put into scheduled services on 1st February. The Caravelles will reduce flying times between the metropolitan cities by nearly half as compared to Viscounts. The flying times will be 1 hour 50 minutes between Bombay and Delhi, 2 hours 30 minutes between Bombay and Calcutta, 1 hour 40 minutes between Bombay and Madras, 2 hours between Delhi and Calcutta, and 2 hours 35 minutes between Delhi and Madras. There will be one service in each direction on the five routes. The services will be supplemented by Viscount flights on the Calcutta/Bombay and Calcutta/Delhi routes.

Introduction of Caravelles on trunk routes will release some Viscounts for operation on the more important regional services. Viscounts will be put on the Bombay/Hyderabad, the Hyderabad/Bangalore, the Bombay/Bangalore, the Calcutta/Gauhati/Mohanbari and the Delhi/Agra/Lucknow/Banaras/Calcutta services. Viscounts have already been introduced on IAC's service to Kabul. As a result of the changes in operating equipment, the schedules of IAC will contain many changes in timings. From 1st February, nearly all of IAC's major routes will be operated by turbo-prop or turbo-jet aircraft. In addition, Jodhpur, Jabalpur, Raipur and Bhopal have been added to the IAC network.

With the introduction of Caravelles, Indian Airlines becomes the first domestic airline in the East to introduce pure jet aircraft on internal routes. The Caravelle seats 84 passengers, flies at 510 miles per hour at about 35,000 feet altitude and has rear-mounted engines that offer the smoothest and quietest flight ever.

NESCAFE COMES TO INDIA

The world famous NESCAFE Instant Coffee has now come to India in the form of 100 per cent. coffee produced in Punjab from Indian beans. The new NESCAFE has been prepared specially for the Indian palate as indicated by extensive consumer research carried out by the Nestles Company. The new blend is midway between the light, mild coffee preferred in the U.K. and the dark, strongly flavoured coffee favoured in France.

Swiss experience and know-how have been wedded to Indian enterprise in the setting up of Nestle's plant near Moga in Punjab. The company plans to export 25 per cent. of its product. It also proposes to undertake the manufacture in the course of this year of Nespray full-cream powdered milk and Lactogen Infant Feeding.

NEW MARKET FOR NAPHTHA

An outlet for naphtha is developing fast in Europe. Plants for naphtha-based gas manufacture are springing into existence. The development stems from some recently devised process for manufacturing gas economically from naphtha. Naphtha-based gas is particularly attractive in countries like the U.K. where the local gas industry has been looking wishfully for a source cheaper than the costly indigenous coal. In the U.K., the demand for naphtha for gas making alone is expected to rise, in a couple of years, to two million tons annually. In Germany and some other countries, too, these processes are spreading.

The development of this new outlet for naphtha is of significance to countries that have to worry about disposal of surplus light distillates. This problem afflicts our country, too. But the opening of a new market for naphtha will have an impact on refinery planning as excess refining capacity creates headaches for disposing of the surpluses in a variety of products.

Apart from removing the headache of disposal of excess light distillates, town gas based on excess naphtha will arrest the growth of demand for kerosene for cooking purposes. In a country such as ours these schemes will have an important foreign exchange saving potential.

BOKARO STEEL

A public sector company for setting up the Bokaro Steel Plant has been registered. Known as Bokaro Steel Limited, this Central Government undertaking will have a share capital of Rs. 100 crores. For the time being, its registered office will be in Delhi.

The Company will be in charge of the various steps necessary for erecting and running the Plant. It will deal, among other things, with acquisition of land, provision of raw materials, supply of power and water, recruitment of personnel, signing of contracts for equipment etc.

The detailed project report for Bokaro prepared by Dastur & Co. is now under examination by a Technical Committee, whose recommendations are expected to be available early. It is hoped that it will be possible to issue tenders for equipment for Bokaro between June and October this year. The Plant, which will specialise in the production of different types of flat products, will have an annual capacity of 1.5 million tonnes in the first stage, rising to 4 million tonnes in the second stage. Bokaro's products are likely to be available early in the Fourth Plan period.

INDO-AFGHAN TRADE AGREEMENT

A new trade agreement between India and Afghanistan has been signed. It will be effective from February 1, 1964 and will initially be for a period of one year and will be renewable for a further period of two years. The agreement provides for the exchange of specified goods such as dried and fresh fruits, asafoetida, cumin seeds, and medicinal herbs from Afghanistan and traditional items like textiles, tea, spices and other specified goods, such as engineering and electrical equipment, hard-wares, etc., from India. Such exchanges will involve an annual volume of trade of about Rs. 11 crores. Payment in respect of exports by Afghanistan of cotton and wool and by India of a specified list of non-traditional goods will be made in free foreign exchange.

TRADE WITH KOREA

The first trade agreement between Korea and India has been signed. The agreement provides for the exchange of commodities consisting mainly of non-ferrous metals such as zinc and lead and tungsten ores and concentrates from the Republic of Korea, and engineering goods and machinery, ferro-manganese, chemicals, pharmaceuticals, etc., from India.

NEWSPRINT FROM CANADA

The State Trading Corporation of India will import 25,000 tons of newsprint (valued at Rs. 1.5 crores) from M/s. Abitibi of Canada during 1964-65. The S.T.C. had earlier signed a contract with this firm for the import of 31,000 tons of newsprint during 1963-64 and supplies under that contract are now coming to an end. India imports about 90,000 tons of newsprint and sheets every year from the U.S.S.R., Canada, Scandinavian countries and Poland.

EXPORTS OF CHEMICALS TO IRAN

Iran imports a wide range of chemicals such as sulphuric acid, hydrochloride acid and those used in leather, metal and plastic industries etc. The indigenous production of chemicals in Iran is very small and is confined only to sodium sulphate, magnesium sulphate and iron sulphate. The bulk of Iran's requirements are obtained from West Germany, Britain, France, Holland and some other West European countries. Indian chemicals no doubt have a good scope, if exporters are prepared to extend facilities for deferred payment as is being done by Western Germany, Britain, France and Italy. The duties imposed on various types of chemicals vary. An import duty of 25 per cent ad valorem and commercial profits tax of 10 per cent ad valorem are charged on compressed, liquefied and solidified gases, sulpha dioxide, sulphurous acid, etc. Hydrochloride acid can be imported on payment of import duty of Rs. 6 per kilo and commercial profits tax of Rs. 3 per kilo. Customs duty of 25 per cent ad valorem and commercial profit tax at the rate of 25 per cent are charged on sodium carbonate, potassium carbonate, sodium bi-carbonate and copper sulphate.

Company Affairs

ASHOK LEYLAND

ASHOK LEYLAND witnessed a fall in its sales during the year ended September 30, 1963, by nearly 16 per cent as compared to the previous year. It did not indicate any decline in demand; on the contrary, all the time its order books were full. Lower sales were the result of continuous hinderances in the manufacture of chassis and engines. Mr. A. Ramaswami Mudaliar, Chairman, Ashok Leyland Ltd., acquainted the shareholders with the conditions that led to this untavourable working. A shortage of foreign exchange available for allotment to the automobile industry for the import of raw materials and the non-availability of various finished and semi-finished components from ancillary manufacturers resulted in serious reduction in output. In October, 1962, alone, the output was just 46 chassis against productive capacity of 300 and for ten days the chassis assembly line was absolutely inoperative. Similar circumstances in February, 1963, kept the productive machinery at a standstill for the whole month. The company did make strenuous efforts to increase the indigenous contents of its products, but the time lag in the shift from the imported to indigenous resources had to be considered. The Chairman indicated that on occasions the replacement involved unexpected difficulties despite the precautions taken to ensure that the corresponding indigenous components were of satisfactory specifications. By the time these difficulties were overcome in June and July, 1963, the shortage of electricity necessitating an 80 per cent cut in the supply resulted in the stoppage of production for another 12 days. The net result of these adverse conditions was that the assembly line was operative for three-quarters of the available working days and the output was only 2,411 chassis as against an expected output of 3,200. It is, indeed, admirable that the company has been able to tide over these adverse conditions and at the moment it is operating in a steady and satisfactory manner so that the output is expected to reach the level of 15 chassis per working day with an expected increase to 17 chassis before the end of the current year.

The Chairman outlined the expansion programme designed to increase production to 6,000 'Comet' chassis per year and to increase the manufacture of spare parts so as to raise the indigenous content of its products. The current indigenous content is of the order of 79 per cent involving foreign exchange allotment to the extent of 21 per cent of the value of complete chassis. This figure is to be progressively reduced to 10 per cent during the next 18 months. Plans have been completed for the manufacture of additional components including engine camshafts, engine timing gears and rear axle differential pinions. The Chairman also informed the shareholders that the Government had approved of the inclusion of a new model in its range of products. Based on the Leyland 'Beaver' chassis, a range of heavy duty chassis are to be produced and gradually engines, clutches, gearboxes, front axles, rear axles, steering gears etc., will be produced at the factory for the new range of vehicles. It is proposed initially to install capacity for the production of 2,000 'Beaver' chassis every year, which will ultimately be expanded to provide for an output of 5,000 chassis. In all the expansion programmes, Leyland Motors Ltd. of the U.K. came forward with financial and technical contribution and from time to time various executives visited the factory to give advice.

INDIAN OXYGEN

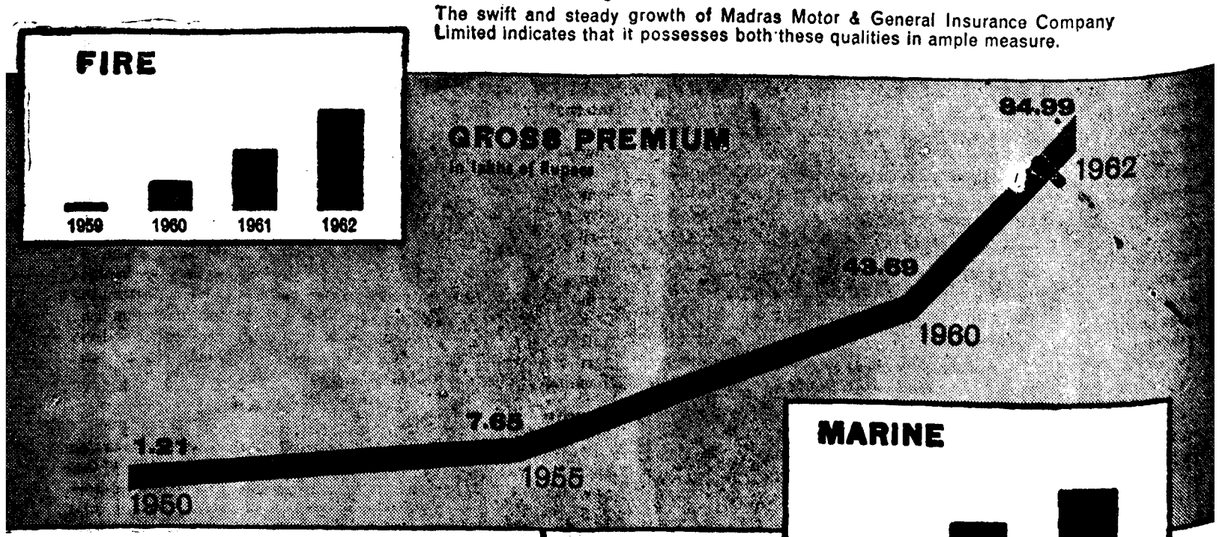
Not surprisingly, Indian Oxygen Limited was able to record higher sales during 1963 at a time when it encountered certain serious difficulties. While sale proceeds were around Rs. 10.21 crores, nearly 15 per cent higher than last year's figure of Rs. 8.8 crores, profits increased from Rs. 135.50 lakhs to Rs. 140.40 lakhs. Mr. N. Dandekar, Chairman of the company, gave an account of the circumstances that led to the results which were less favourable than expected. In the first instance, an acute shortage of core wire persisted almost through the year which curtailed the output of electrodes at the Khardah factory. Then occasional failure of power which interrupted production activities at the electrode factory and also at Asansol and Madras led to considerable fall in production. Despite these hinderances, the contractual obligations to Government orders were fulfilled by the company, apparently at the cost of private sector consumers.

The Chairman pointed out that the expansion programme taken up by the company which is expected to cost about Rs. 6 crores, is spread over four years. It has been estimated that after taking into account the internal resources and a loan of £500,000 promised by the British Oxygen Company Ltd., it will require additional rupee finance of about Rs. two crores. Subject to the consent of the Controller of Capital Issues, arrangements are being made with the Punjab National Bank to provide this amount by way of medium term loan secured by the pledge of debenture stock. While giving the details of the expansion programme, Mr. Dandekar stated that the second 400M3 Oxygen Plant under construction is likely to go into commercial production in May. The dissolved acetylene plant is expected to go into production at the new factory at Hyderabad within the next two months and the oxygen plant by July this year. The construction of the loxite factory at Ranchi is also expected to be completed shortly. In the field of industrial gases, the company proposes the installation of an argon purification plant at Bombay (for which an industrial licence has been obtained) and also two 400M3 liquid oxygen plants at Calcutta and Madras. It has obtained an industrial licence for the manufacture of welding and cutting equipment and this unit will be located at Taratala Road, Calcutta, which is expected to go into production by the end of 1966. It has also obtained an industrial licence for substantial expansion at Khardah factory as also for a new electrode factory at Madras. The Chairman indicated that the company intended to undertake the manufacture of plant and machinery for the production and consumption of gases. Its application for an industrial licence for the manufacture of air separation plants and associated cryogenic equipment is being examined by the Government.

BAJAJ TEMPO

Bajaj Tempo Ltd. will enter the capital market on February 10 with a public issue of Rs. 29 lakhs for 290,000 equity shares of Rs. 10 each. The proceeds of the present issue will be utilised for the expansion programme of the company. It has a manufacturing capacity of nearly 1,000 Tempo Hanseat three-wheeler vehicles which are used as pick-up trucks, delivery vans, auto-rickshaws, oil tankers etc. The production of these vehicles is now proposed to be raised to 4,000 a year. The company has also been licensed to manufacture in the same capacity Tempo Viking four-wheeler vehicles. For the production of both, it has entered into collaboration agreement with Messrs. Vidal and Sohn Tempo-Werk, GMBH, West Germany. It has acquired land at Chinchwad, near Poona, where the construction is in progress and is expected to be completed by March, 1964.

The company has an authorised capital of Rs. one crore and issued, subscribed and paid-up capital of Rs. 14.59 lakhs. The directors have decided to issue fresh capital worth Rs. 65.27 lakhs of which capital worth Rs. 18.50 lakhs has been offered to the existing shareholders residing in India



One of the fastest growing general insurance companies in India

MADRAS MOTOR & GENERAL INSURANCE COMPANY LIMITED

The stability of a general insurance company depends upon the continued patronage of its clients. The ability to expand the field of activities and serve new clients sets the pace of its growth.

The swift and steady growth of Madras Motor & General Insurance Company Limited indicates that it possesses both these qualities in ample measure.

1962	Rupees in Lakhs
Paid-up Capital	30.00
Reserves	23.16

and shares worth Rs. 17.77 lakhs have been reserved for allotment to foreign collaborators, Messrs. Vidal and Sohn Tempo-Werk and Mr. Rolf Bacher, Weissenburg, West Germany. The issue to the public has been underwritten by the Central Bank of India Ltd., Devkaran Nanjee Banking Company Ltd., Messrs. Harbans Singh Mehta & Co., New Delhi, Messrs. Raja Ram Bhasin & Co., New Delhi, Mr. Birdhichand Choadhry, Hyderabad and Messrs. P. Roy Co., New Delhi. The subscription list will close on February 18 or earlier at the discretion of the directors but not before February 12.

CENTURY'S DIVERSIFICATION

The Century Spinning and Manufacturing Company Ltd. has under consideration an ambitious programme of diversification of its activities. It proposes to manufacture a number of new items including synthetic rubber and rubber products, rayon pulp and other cellulose products, plastics, photographic goods and fuel oil and gas. The company can raise sufficient resources to implement its programme and a special resolution altering the memorandum of association of the company to enable it to undertake new activities will be placed before the shareholders at the extraordinary general meeting on February 21.

It proposes to manufacture synthetic rubber in an effort to supply another major raw material of the automobile tyre industry besides rayon tyre cord which is already being produced. The third Plan target in respect of synthetic rubber has been fixed at 70,000 tons but only one unit has been manufacturing it and there is a possibility for additional capacity to the extent of 40,000 tons. The proposed manufacture of rayon pulp is expected to help the factory considerably in obtaining quality rayon. It is planning to manufacture polymers required for the manufacture of synthetic fibres and plastics. The need to take up the manufacture of photographic goods is explained by the fact that the company is already in line for the manufacture of cellulose and cellulose derivatives and hence it is equipped to manufacture raw films and other photographic materials which have an ever-increasing demand.

The production of power and gas is proposed to be undertaken in response to its desire to obtain basic raw materials for the development of synthetic fibre industry from the feed stocks of naphtha steam cracking units and from coal distillation. Coal deposits suitable for setting up a low-temperature carbonisation plant have been explored in the Vidarbha regions of Maharashtra which will supply coke, coal gas and several by-products.

GWALIOR RAYON'S EXTENSION

Gwalior Rayon Silk Manufacturing (Weaving) Company Ltd. proposes to acquire the Punjab Cloth Mills Ltd. at Bhiwani in East Punjab at a cost of Rs 33.02 lakhs—Rs 7.02 lakhs for land and buildings and Rs 26 lakhs for plant, machinery and other assets. The mill consists of 18,000 spindles and 286 looms and has been granted a licence for another 9,000 spindles. It is understood that the Government is prepared to grant the mills a licence for additional 15,000 spindles. The proposed purchase is expected to enable the company to make experiments in spinning staple fibre and manufacture special yarns for use in the weaving division as also for sale to the art silk industry.

MCKENZIES ISSUE

Mckenzies Limited will shortly issue right shares to finance its expansion programme. It has finalised its collaboration arrangements with Mess Saxby, France, for manufacturing in India 'Saxby' products. It has made additions to plant and machinery during the year ended July 31, 1963, and steadily increased its production of railway wagons and floor cranes. It has already commenced the production of concrete vibraters and arranged for its marketing through Messrs. Voltas Ltd.

R. R. STEEL

R.R. Steels and Alloy Ltd. entered the capital market on February 4 with a public issue of 2,500 cumulative redeemable preference shares (10 per cent) of Rs 100 each and 36,750 equity shares of Rs 10 each. The subscription list will close on February 12 or earlier but not before February 7. It has an authorised capital of Rs 50 lakhs and issued capital of Rs 10 lakhs. Promoters, directors, their nominees and friends have subscribed 38,250 equity shares of Rs 10 each. It has been licensed for the manufacture of 3,000 tons per annum of steel castings, alloy and spring steel castings. The factory will be located in U.P. near Bareilly where land has already been acquired and will start production towards the end of 1964. The Uttar Pradesh Financial Corporation has sanctioned a loan of Rs 7.50 lakhs.

INTERNATIONAL COMPUTERS

International Computers and Tabulators Indian Manufacturing Company Ltd., entered the capital market on February 5 with the public issue of Rs 10 lakhs in equity shares of Rs 100 each. The issued capital is Rs 50 lakhs of which International Computers and Tabulators Ltd., London, will subscribe Rs 30 lakhs against the supply of technical know-how and plant and machinery. Indian directors and their friends have subscribed to the extent of Rs 10 lakhs. The company has a programme in the first stage to manufacture 4 types of machines—punches, verifiers, sorters and tabulators—rising from an output of 432 machines in the first year to 1,615 machines in the fifth year. It has also plans to manufacture goods for export markets and certain specialised components and spare parts. The capital outlay is estimated at Rs 71.73 lakhs. The factory will be located at Poona and will go into production shortly. Under the collaboration agreement, the U.K. firm will supply imported plant and machinery costing Rs 19.90 lakhs.

HINDUSTAN ELECTRIC

The Hindustan Electric Company Ltd. proposes to raise an additional capital of Rs 1.40 crores by the issue of 120,000 new equity shares and 20,000 cumulative preference shares (8.57 per cent) of Rs 100 each. The new equity shares will be offered in the first instance to the existing shareholders in the ratio of one share for each share held. The proposal is subject to the approval of both the shareholders and the Controller of Capital Issues. The proposed issue of the additional capital will be met by an increase in the authorised capital of the company from Rs three crores to Rs four crores so as to set up a new factory at Baroda for the manufacture of air blast circuit breakers, tap changers for electric locomotives, furnaces, control panels and other items. The company has already entered into a collaboration agreement with Messrs. Brown Boveri and Company Ltd., Switzerland, for implementing the project. The foreign collaborators will subscribe to the entire preference share issue, besides providing technical assistance.

RAMAKRISHNA STEEL

Sri Ramakrishna Steel Industries Ltd. proposes to enter the capital market next month to offer for public subscription 45,000 equity shares of Rs 100 each. The authorised capital of the company is Rs one crore in the form of 100,000 equity shares of Rs 100 each. Of the issued capital of Rs 50 lakhs, the promoters, the directors and their friends have agreed to take equity shares worth Rs 5 lakhs. The company's factory

at Coimbatore has been granted a licensed capacity of 4,800 tons of steel castings per year and it expects to reach the full capacity within two years.

YEMMIGANUR MILLS

The Yemmiganur Spinning Mills Ltd., Andhra Pradesh, entered the capital market on February 6 with an offer of 10,000 cumulative redeemable preference shares (9.3 per cent) and 9,800 equity shares of Rs 100 each for public subscription. The subscription list will close on February 14 or earlier but not before February 10. It has an authorised capital of Rs one crore and the proposed issue is that of 10,000 preference shares and 20,000 equity shares out of which promoters and their friends will take up 10,200 equity shares. The company proposes to set up a cotton spinning mill with 12,000 spindles at Yemmiganur (Andhra Pradesh) at a total cost of Rs 65.80 lakhs. It has already acquired land and the factory building is expected to be ready in the first quarter of the current year by which time plant and machinery from Japan will start reaching. It is expected that 6,000 spindles will go into production by the middle of the current year and the balance by the end of the year. It will produce coarse and medium cotton yarn to meet the demand from nearly 460,000 handlooms in the State.

REGISTRATION OF COMPANIES

Ninety-one companies with an authorised capital of Rs. 384.32 lakhs were registered in the Northern region during the fourth quarter ended December 31, 1963. The region comprises Uttar Pradesh, Punjab, Rajasthan, Himachal Pradesh and Delhi. Of these companies seven were public companies and 81 were private companies and three were associations not for profit. Five public companies and 54 private companies with an authorised capital of Rs. 75 lakhs and Rs. 175.77 lakhs respectively were registered in Delhi. Two public companies and 13 private companies and one association not for profit with an authorised capital of Rs. 60 lakhs and Rs. 19.45 lakhs respectively were registered in Uttar Pradesh. Punjab and Himachal Pradesh had 13 private companies with an authorised capital of Rs. 23.90 lakhs and two associations not for profit. In Rajasthan one private limited company with an authorised capital of Rs. 30 lakhs was registered. During the same period 25 companies with a paid-up capital of Rs. 35.27 lakhs went into liquidation and names of 14 companies with a paid-up capital of Rs. 1.79 lakhs were struck off the register of the companies.

During the same quarter 73 companies with an authorised capital of Rs. 1641.09 lakhs were registered in the Southern region comprising Andhra Pradesh, Kerala, Madras and Mysore and Pondicherry. Out of these 13 were public companies including two associations not for profit with an authorised capital of Rs 1025.99 lakhs and 60 were private companies with an authorised capital of Rs 615.10 lakhs. Madras had the largest number of registrations with 3 public companies and 37 private companies. It was followed by Kerala with 3 public companies and 14 private companies. Andhra Pradesh had one public company and three private companies, while Mysore had one public company and six private companies. Thirty-five companies with a total paid-up capital of Rs 36.44 lakhs ceased to work out of which 15 were struck off the register and 20 went into liquidation.

In the Eastern region during this quarter 93 limited companies with a total authorised capital of Rs 19.98 crores were incorporated. The region comprises West Bengal, Bihar, Orissa and Assam. West Bengal had 12 public limited companies and 69 private limited companies with an authorised capital of Rs 475 lakhs and Rs 363.50 lakhs respectively. Bihar had six private companies with an authorised capital of Rs 16.00 lakhs. Orissa had one public limited company and six private limited companies with authorised capital of Rs 10.00 crores and Rs 1.66 crores respectively. Assam had five private companies with an authorised capital of Rs 27 lakhs. During the period under review, 22 companies including one limited by guarantee went into liquidation and the names of 22 companies were struck off the register.

COMPANY LAW BOARD RECONSTITUTED

Under Section 10E of the Companies Act, 1956, as amended by the Companies (Amendment) Act, 1963, a Company Law Board has been constituted with effect from Saturday, February 1, 1964. Its composition is: Chairman, Mr. R. C. Dutt, Additional Secretary, Ministry of Finance, Department of Revenue; Member, Mr B. S. Manchanda, Joint Secretary, Ministry of Finance, Department of Revenue. The Government have decided to delegate to the Company Law Board most of the powers and functions at present vested in Government under the provisions of the Companies Act. The powers and functions previously delegated to the four Regional Directors of the Company Law Administration at Bombay, Calcutta, Kanpur and Madras will continue to be exercised or discharged by them.

It may be recalled that the powers delegated to the Regional Directors who will hereafter function under the Company Law Board relate to (i) the approval of the change of name of a company; (ii) calling of annual general meeting of a company where the management has failed to hold the meeting in time; (iii) appointment of auditors for a company where no auditor has been appointed; (iv) empowering Registrar to present a petition to the court for winding up of a company in certain cases; (v) grant of extension of time to the liquidator for calling a general meeting of a company or of creditors where the period of extension does not exceed six months; (vi) sanctioning payment to the contributories out of the company's liquidation account, where the claim does not exceed Rs 1,000; (vii) allow inspection of documents filed with the Registrar along with a prospectus; and (viii) making application to a High Court for the production and inspection of books and papers of the company where offences are suspected.

All the powers and functions under the Companies Act will henceforth be exercised either by the Company Law Board or by the four Regional Directors of the Company Law Administration, except the power to make rules, the power to appoint a person as public trustee under Section 153A and the powers and functions relating to (i) constitution of the Tribunal for enquiring into cases against managerial personnel, and issue of notification conferring on the Tribunal certain powers and functions at present conferred on the Court; (ii) conversion of debentures issued to or loans obtained from the Government by a company into shares of the company; (iii) companies engaged in specified classes of business and industry shall not have managing agents; (iv) appointment of the Advisory Commission; (v) laying of annual reports of Government companies before both Houses of Parliament; (vi) modification of the provisions of the Act in its application to Government companies and to nidhis and mutual benefit societies; (vii) delegation of the powers or functions of Government to such authority or such officer other than the Company Law Board; and (viii) submission of annual report on the working and administration of the Act to Parliament.

All approvals, sanctions, consents, etc., to be accorded by the Central Government under various provisions of the Companies Act will, hereafter, be accorded by the Company Law Board. The Registrars of Companies at various places will also function under the Control of the Board. The powers retained with the Central Government relate only to a very few matters which do not come up for consideration frequently but in respect of most of which Parliament is to be kept informed. Companies and members of the public should with immediate effect address the Secretary, Company Law Board, in respect of all matters arising out of the Companies Act other than those speciafically mentioned above. They should continue to address the appropriate Regional Directors in respect of matters dealt with by them under the powers delegated to them.

CAPITAL ISSUES

Four companies have been authorised to raise capital aggregating Rs 5.26 crores. Of these, two are issuing equities and one equities and preference shares. One company is offering part of its shares for public subscription by prospectus while another involves collaboration with two foreign companies. The consent of the Controller of Capital Issues is valid for 12 months in all cases.

Jayanti Shipping Company Limited, Delhi, is to issue further capital of Rs 210 lakhs divided into 2,10,000 equity shares of Rs 100/- each, for cash at par. Of this, 3,377 shares will be subscribed privately and the balance shares will be offered for public subscription by prospectus. The money will be utilised for financing three ore carriers and an oil tanker.

Kamani Industrial Corporation Limited, Jaipur, is to issue capital of Rs. 1,99,00,000/- in equity shares of Rs. 100/- each, to be issued for cash at par, except shares of the value of Rs 1 lakh to be issued for consideration other than cash. The capital will be utilised in the establishment of pig iron project at Udaipur (Rajasthan).

Poddar Projects Limited, a new company incorporated in West Bengal, will be issuing capital of Rs one crore divided into equity shares of Rs 75 lakhs and 9.5% preference shares of Rs 25 lakhs. The capital is required for the establishment of a cotton yarn spinning mill with 25,000 spindles at an estimated capital cost of Rs 190 lakhs.

Metal Profiles of India Limited (Proposed) will be issuing capital of Rs. 17 lakhs for the manufacture of cold rolled sections in steel and other metals. Forty-five per cent of the capital will be subscribed by two U.K. companies and the remaining 55% by Tata Iron & Steel Company Limited.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951—during the fortnight ending 25th January, 1964. The list contains names and addresses of the licensees, the articles of manufacture and annual installed capacity.

During the week ending January 18, 1964

IRON & STEEL

The Hindustan Iron and Steel Co., 8, Rajendra Deb Road, Calcutta-7 (Dum Dum, West Bengal) — Steel forgings 4,800 tons per annum. Shri Anandlal Hiralal, Station Road, Baroda, Proposed name: Gujarat Electrodes Pvt. Ltd. (Baroda, Gujarat)—Welding Electrodes 60 million R. ft. per annum.

ELECTRIC EQUIPMENT

The English Electric Co. of India Ltd., Pallavaram, Distt. Chingleput, Madras (Pallavaram, Madras) — New Article (*Capacity in Nos. per annum*): Electrical Ceramic fuse bodies of ratings 2, 800 amps., 7,20,000. Substantial Expansion: C.F.S. Units 30-300 amps, 12,000; C.F.S. Units 500-750 amps, 960; H.R.C. Fuses, 4,03,980; C.F.S. Boards, 720; Distribution fuse boards, 3,300; Overhead busbars, 2,220; Plug-in-boxes, 6,720; Fusegear components, 4,20,000.

INORGANIC HEAVY CHEMICALS

Mettur Chemical and Industrial Corporation Ltd., Metturdam, Mettur, Madras (Meturdam, Madras) — Caustic soda, 7000 tonnes per annum; Liquid chlorine, 4920 tonnes per annum.

DRUGS & PHARMACEUTICALS

Atul Drug House, 85, Dr. Annie Besant Road, Worli, Bombay-18, Proposed name: Laboratories Vifor (India) Pvt. Ltd., (Bombay, Maharashtra) — Flex-Flac PVC infusion complete with giving set in packs of 500 to 1000 c.c., 9 lakhs per annum. German Remedies Private Ltd., P.B. No. 1945, Bombay-1 (Maharashtra) — Buscopan ampoules, 2,40,000 Nos. per annum; Buscopan Dragees, 24,00,000 Nos. per annum; Buscopan Compositum Amps, 1,20,000 Nos. per annum; Buscopan Compositum Dragees, 12,00,000 Nos. per annum; Deriphyllin N-Digoxin Ampoules, 1,20,000 Nos. per annum; *Deriphyllin - N - Digoxin Dragees, 12,00,000 Nos. per annum.*

PAPER AND PULP

Titaghur Paper Mills Co. Ltd., Chartered Bank Building, Calcutta-1 (Titaghur & Kankinara, West Bengal) — Paper, 10,596 tonnes per annum; Pulp, 10,596 tonnes per annum.

During the week ending January 25, 1964

ELECTRIC EQUIPMENT

Shri C. S. Doshi, C|o M|s. Tropical Engineering Co., 21, Forbes Street, Fort, Bombay (Maharashtra) — (1) AC Generators 20,000 Kw. (2) DC Motors, DC Generators upto 50 Kw rating — capacity to be fixed later.

AUTOMOBILES

Orient General Industries Ltd., 14, Radha Bazar Lane, Calcutta-1 (Calcutta, West Bengal)—Control boxes (voltage regulators) for automobile dynamos—60,000 Nos. Ashok Leyland Ltd., Bank of Mysore Buildings, N.S.C. Bose Road, Madras-1 (Ennore, Madras)—"Beaver"—Heavy Duty passenger and goods chassis upto 16,340 Kgs—2,000 Nos. Shri Indar Singh, 1, Goela Lane, Civil Lines, Delhi (Faridabad, Punjab) —1. Carburettors 50,000 Nos. 2. Carburettor kits 50,000 Nos. 3. Fuel Pumps (electrical) 50,000 Nos. Shri Ramdas Motor Transport Private Ltd., Subhas Road, Kakinada (Kakinada, Andhra Pradesh)—Annual capacity after substantial expansion including New Articles in Nos. 1. King pins 1,20,000, 2. Water Pump Shafts—18,000, 3. Engine Bedding Bolts—6,000, 4. King pin Thrust Washers—12,000, 5. Clutch & Brake Pedal Shafts—24,000, 6. Wheel Bolts—36,000, 7. Shackle Pins—96,000, 8. Shackle Bolts—60,000, 9. Oil Seals—12,000, 10. Bus, lorry & Station Wagon bodies—180, 11. King Pin Units—24,000, 12. Shaft Pump rive and oil pumpgear—12,000, 13. Clutch & Brake Pedal Tubes—6,000, 14. King Pin Cotter Pins—18,000, 15. King Pin Thrust Bearings—12,000, 16. King Pin Bushes—24,000.

EARTH MOVING MACHINERY

Shri S. Rajagopalan Bagyasree, 24, 5th Main Road, Raja Annamalaipuram, Madras-28. Proposed name: Trac Industries & Components Pvt. Ltd., (Saidapet, Madras)—Track parts for crawler tractors and other crawler mounted equipment—1,000 sets.

AIR CONDITIONERS & REFRIGERATORS

Danfoss (India) Ltd., Bank of Baroda Buildings, Appollo Street, Bombay (Bombay, Maharashtra)—1. Thermostatic Ex-

pansion Valves 2,400 Nos. 2. Pressure Cutouts & Safety Cut-outs 6,000 Nos. 3. Starting Relays 1,20,000 Nos. 4. Motor overload protectors 1,20,000 Nos. 5. Hot Stamped fittings 3,60,000 Nos. 6. Pressure control for water and compressors air system 18,000 Nos. 7. Refrigeration Thermostats (Evoporative)—(after expansion)—96,000 Nos.

DRUGS & PHARMACEUTICALS

Hoechst Pharmaceuticals Ltd., Dugal House, Backbay Reclamation, Bombay-1 (Maharashtra)—Hostacaine Forte's 6,000 litres, Hostacaine Forte's 4,000 litres, Roncovite 20 million dragees.

COTTON TEXTILES

Elgin Mills Company Ltd., Kanpur (Uttar Pradesh)—12,500 spindles for the manufacture of cotton yarn. Kwality Spinning Mills Private Ltd., Udamalpet Road, Pollachi (Madras) 12680 spindles for the manufacture of cotton yarn. Shri Allum Karibasappa, Bellary. Proposed name: The Bellary Cotton Mills Ltd. (Bellary, Mysore)—12,000 spindles for the manufacture of cotton yarn. The Cannanore Spinning & Weaving Mills Ltd., P. B. No. 4, Cannanore Mahe, Pondicherry)—20,160 spindles for the manufacture of cotton yarn. U. P. Co-operative Spinning Mills Ltd., Handloom Section, Director of Industries, Kanpur (Shahganj, Uttar Pradesh)—25,000 spindles for manufacture of cotton yarn. Shree Bansidhar Spinning and Weaving Mills (P) Ltd., Naroda Road, Railwaypura, Ahmedabad-2 (Gujarat)—8,600 spindles for manufacture of cotton yarn. Shri Raghubir Prasad Singhania, 113|8, Swaroopnagar, Kanpur. Proposed name: Standard Spinning Mills (Uttar Pradesh)—12,500 spindles for manufacture of cotton yarn. Anantapur Textiles Ltd., 161, Netaji Subhas Road, Calcutta-7 (West Bengal)—1,000 spindles for the manufacture of cotton yarn. Ananda Kumar Mills Ltd., Siravanampatti P. O. Coimbatore-6 (Coimbatore, Madras)—12,904 spindles for the manufacture of cotton yarn. Shri Satish Chandra Malhotra, Manik Bagh Palace, Indore (Indore, Madhya Pradesh)—25,000 spindles for the manufacture of cotton yarn. The Krishna Kumar Mills Co. Ltd., 5|56 Wardon Court, Gowalia Tank Road, Bombay-26 (Mahuva, Gujarat)—7,040 spindles for manufacture of cotton yarn. Shri Chandulal Virchand, 989-Main Road, Nasik. Proposed name: Nasik District Co-operative Spinning Mills Ltd. (Nasik, Maharashtra)—12,000 spindles for the manufacture of cotton yarn. The Deccan Cooperative Spinning Mills Ltd., Ichalkaranji, Distt. Kolhapur (Maharashtra)—13,000 spindles for the manufacture of cotton yarn. Sri Palamalai Ranganathar Mills Ltd., Periyanaickenpalayam, Sri Ramakrishna Vidyalaya Post, Coimbatore Distt. (Madras)—12,848 spindles for the manufacture of cotton yarn. Sri Karunambikai Mills Ltd., Somanur P.O. Coimbatore (Somanur, Madras)—12,904 spindles for the manufacture of cotton yarn. Shri B. S. Chalukya, Chief Promoter, Jawahar Co-operative Spinning Mills Ltd., C|o. District Central Co-operative Bank Ltd., Latur. Proposed name: Jawahar Co-operative Spinning Mills Ltd., (Latur, Maharashtra)—12,000 spindles for manufacture of cotton yarn. Moradabad Spinning & Weaving Mills Co. Ltd., Moradabad (Moradabad, Uttar Pradesh)—6,000 spindles for manufacture of cotton yarn. Shri P. S. Rangaswami, L. N. Palayam Post, Via Palladam, Coimbatore Distt. (Gingee, Madras)—12,000 spindles for the manufacture of cotton yarn. Shri R. Srinivasan, Farm House, Athur P. O., Chingleput (Tiruvellor, Madras)—12,000 spindles for the manufacture of cotton yarn.

WOOL

Simplex Woollen Mills, Sadhana Rayon House, Dr. Dadabhoy Naoroji Road, Fort, Bombay-1 (Bombay, Maharashtra)—Powerlooms 8 Nos. purchased from registered capacity. British India Corporation Ltd., P. O. Box No. 5, Kanpur (Dharwal, Punjab)—Automatic looms 24 Nos., for the manufactu of woollen fabrics and blankets.

CANNED FRUITS

Assam Fruit Products Ltd., 15, India Exchange Place, Calcutta-1 (Silchar, Assam)—Orange products 800 tons per mon. Pineapple products 2200 tons per month.

CHANGE IN NAMES (Owners or Undertakings)

(Information pertains to particular licences only)

During the week ending January 18, 1964

From M|s. Niranjan Auto Pistons Ltd., New Delhi, to M|s Shama Pistons and Rings Ltd., New Delhi. From M|s. Western Mechanical Industries (P) Ltd., Bombay, to M|s. Hoist-O-Mech Ltd., Bombay.

During the week ending January 25, 1964

From M|s. Rasik Solvent Extraction Co., Jamnagar, to M|s. Vilas Udyog Ltd., Jamnagar. From M|s. Samraj Oils & Fertilizers, Madras, to M|s. Hind Mercantile Corporation Private Ltd., Madras.

LICENCES REVOKED OR SURRENDERED

(Information pertains to particular licences only)

During the week ending 18th January, 1964

M|s. Eastern Steel & Engineering Corporation Private Ltd., Calcutta — S.G. Iron Castings. M|s. Grant James Private Ltd., Calcutta — E.R.W. Steel Pipes. Shri Ghanshyam Kejriwal, Calcutta—Cast Iron Spun Pipes. M|s. Prakash Engineering Co. & Rolling Mills, Agra — Electric Furnace, Steel Ingots, Billets in Tools and Alloy Steel composition, etc. M|s. Sen and Pandit Industries Ltd., Calcutta — Cold Drawn Steel Wire. (Name of the Licensee): M|s. Kothari & Sons, Madras — ACSR & AA Conductors and VIR & PVC Cables. (Name of the Undertaking): M|s. South Indian Cable Co., Madras. M|s. Indo-American Electronic Corporation Ltd., Calcutta — Paper Capacitors, Electrolytic capacitors, and other types of ceramic capacitors. M|s. Orissa Cement Ltd., New Delhi — Slag Cement.

During the week ending 25th January, 1964

Shri C. Keshav Gopal Pithawalla, Bombay.—Malleable Castings, Cast Iron Castings, Steel Forgings. M|s. Kirloskar Brothers Ltd., Kirloskarvadi, Distt. Sangli—Hoists, Lifting Gears and Cranes (surrendered). M|s. Swedeshi Cotton Mills Co. Ltd., Kanpur—Cupramonium Filament yarn. M|s. Rajaniklal Co. Pvt. Ltd., Calcutta—Sanitary ware. M|s. Sone Valley Portland Cement Co. Ltd., Calcutta—Slag Cement.

BOOKS BRIEFLY

Bankers to the World

The World Bank: A Prospect: By James Morris; Faber and Faber, London, 1963; Pp. 195; 25 sh.

Reviewed by D. KRISHNASWAMY RAO

THIS BOOK was commissioned by Mr Eugene Black who retired from the Presidentship of the World Bank last year, but its author was left free to write what he liked—and evidently so, for he does say things in criticism of Mr. Black and the Bank along with a fair amount of praise.

Mr. Morris is neither an economist nor a statistician but an experienced journalist who has an eye for facts and a racy style of presenting them. His main theme is the part that the Bank has been playing in helping the underdeveloped two-thirds of the world achieve what he calls 'the technical revolution' that can lift them out of their present poverty.

The book opens with a frank discussion of the actualities of economic backwardness and of the implications of economic change, and then moves on to consider the role of the World Bank as a catalyst of Development. As a preliminary, there is thrown in a description of the Bank's offices at Washington, its multi-national staff and their ways of working and talking: things that we obviously cannot get from the learned tomes on the Bretton-Woods institutions or from the Bank's own Annual Reports! At the centre of the account there is a pen-picture—failings included—of Mr. Eugene Black who for fourteen years was President of the Bank and undoubtedly made it what it is today, the most successful of Specialized Agencies of the United Nations.

Then follows a discussion of the principles on which the Bank has so far conducted its operations and the criticisms that have commonly been levelled against it. There is naturally nothing new that is said here but it is all put in a very readable way, and to the lay reader it might come as a useful corrective to the wrong notions that are all too prevalent on this subject.

It is difficult, however, to understand why at this point the author should take us off on a very lengthy verbal detour—113 pages in a book which, counting in preface and index, numbers 195 pages—for the apparent purpose of showing from studies of five different situations in widely separated parts of the world what the Bank has been doing for the betterment of the poor countries. The areas chosen for the study are Ethiopia, Thailand, southern Italy, Colombia and the Indus Basin.

Each region is given a chapter to itself and each chapter follows the same pattern: an assortment of bits of history, geography, economics, sociology and, above all, scenic descriptions and personal impressions that would better befit a travelogue. With the best will in the world, one's interest flags after a couple of these five chapters which together constitute two-thirds of the book.

In the last chapter of the book we are back again at the Bank, its new soft loans counter, IDA, and things yet to come. Mr. Morris concludes with a vision of a future when countries which are members of the Bank would give up all forms of bilateral aid, and instead channel all loans and grants for the emergent nations through the Bank and its affiliate, IDA.

We lay down the book with the feeling that the lively member of the Bank's staff (page 49) who defied Mr. Morris to write an interesting book about the Bank was right after all. For the way the author has met the challenge is to write a little about the Bank itself and a lot about other things. We are told on the dust-jacket that "in fact this narrative is concerned as much with the World as with the Bank"—rather more with the World, we feel, than with the Bank. The mode of graphic description and personal narrative has less scope in Economics than in the other social sciences.

BOOKS RECEIVED

Clarification of the Monetary Standard: By Will E. Mason; The Pennsylvania State University Press, Pennsylvania; $7.50.

An Introduction to Positive Economics: By Richard G. Lipsey; Weidenfeld and Nicolson, London; 45s.

The Managed Economy: by Michael D. Reagan; Oxford University Press, New York. $6.00.

The Theory of Wages: by J. R. Hicks; Macmillan and Co., Ltd., London; 35s.

Efficacy of Public Enterprises: Ed. by V. V. Ramanadham; Allied Publishers Private Ltd., Bombay; Rs. 16.

The Law and Practice of Super Profits Tax: Allied Publishers Private Ltd., Bombay; Rs. 25.

India's Foreign Trade: by S. K. Verghese; Allied Publishers Private Ltd., Bombay; Rs. 15.

Readers' Roundtable

NATIONAL MINIMUM

DEMOCRATIC Socialism has become the declared goal and emphasis is being laid on raising the levels of income at the lowest along with the reduction of those at the top. It is widely recognised that provision of basic needs of every individual must be ensured and a national minimum comprising the essential requirements is established as speedily as possible. To the rank and file of the Congress Party, Socialism means nothing else but the people must have basic requirements at reasonable prices and clean administration at all levels.

Why has planned economic growth failed to provide the basic requirements at reasonable prices? It is largely because the planners assert that the economic expansion demands an increasing shift from production of consumption goods to fabrication of capital goods. How can we guarantee a national minimum of 18 ounces of nutritional diet even if 100 million tons of foodgrains is achieved by 1965? The foodgrain consumption had fallen from 15.7 ounces per head per day in 1954 to 15.4 ounces in 1960. What incentives have we provided to our farmers that we expect higher agricultural production? In respect of cloth, index has risen from 100 in 1951 to 117 in 1961. It does not even cover the population increase of 22 per cent during the same period. The per capita consumption of cloth had declined from 16.4 yards in 1954 to 15.7 yards in 1959. To assure a reasonable standard of life to the people, the production of foodgrains and cloth needs to be doubled from 1960-61's 80 million tons and nine million yards respectively by 1975-76. The Planning Commission has worked out that a man needs Rs. 30 a month for the barest necessities of life but the lowest 10 per cent in the country will reach the per capita income of Rs. 20-30 by about the end of the century, if the economic growth is stepped up by from five to seven per cent. It is hardly two per cent at the moment.

NEW DELHI. VIRENDRA AGGARWALA

COMPANY MEETING

ASHOK LEYLAND LIMITED
Ennore, Madras-57

Speech Delivered by Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon.), Chairman, Ashok Leyland Limited, to the Shareholders at the Fifteenth Annual General Meeting of the Company held on 27th January, 1964, at Ennore, Madras.

Gentlemen,

I have great pleasure in extending to you a cordial welcome to the Fifteenth Annual General Meeting of your Company.

The Directors' Report, Audited Balance Sheet and Profit and Loss Account for the year ending 30th September, 1963, have been circulated to you and, with your permission, I shall take them as read.

You will have read in the Profit and Loss Account that sales for the 1962-63 year were a little in excess of Rs. 10.92 crores, which is 16 per cent less than the corresponding figure for 1961-62, when sales were approximately Rs. 13 crores. This reduction does not represent any reduction in the demand for your Company's products. On the contrary, there is every indication that it will be some time before increased output can meet a demand greatly in excess of the Company's ability to supply. But the 1962-63 year was one in which there were continuous difficulties regarding the availability of materials required for the manufacture of chassis and engines. It is appropriate that I should acquaint you with some of these difficulties, which have made it a serious problem to maintain profitable trading.

A shortage of foreign exchange available for allotment to the Automobile Industry, for the import of raw materials not available in India and for finished and semi-finished components not yet manufactured in your Factory or not available from Indian Ancillary Manufacturers, caused shortages which resulted in serious reductions in output. In October 1962, these shortages resulted in the output for the month being no more than 46 chassis, against productive capacity for 300, and for 10 days the Chassis Assembly Line was inoperative. Similar circumstances in February 1963 made it impossible to produce any chassis at all for the whole of that month. A severe cut in the total foreign exchange allotted to your Company for the whole year under review, which it was impossible to counteract in the time available by reducing the imported content of a 'Comet' chassis, made it necessary to reduce deliveries of imported materials and this in turn resulted in overseas suppliers being required to discontinue shipments. Unavoidable delays in the re-establishment of supplies at a later stage, had a most adverse effect on our ability to maintain production schedules.

Because reductions in the amounts of foreign exchange available for the import of materials from overseas was anticipated, your Company has made strenuous efforts to increase the indigenous content of its products. To this end it has been the policy to make maximum utilisation of raw materials and semi-finished materials such as castings and forgings available from Indian sources of supply. Messrs. Ennore Foundries Ltd., a subsidiary Company, has been able to meet our demands for grey iron and for aluminium castings, but it has been difficult to obtain adequate supplies of steel castings, malleable iron castings and forgings. It will be appreciated that on occasions a decision to delete a component from import, replacing import by supply from an ancillary manufacturer, may involve unexpected difficulties, despite all the precautions which are taken to ensure that the corresponding indigenous component shall be satisfactory. Should the indigenous component be defective in any way after import has been discontinued, stocks may be completely exhausted before the defects can be eradicated; and, in that event, production can become seriously curtailed for a period. Such difficulties occurred on two occasions during the 1962-63 year, but steps have been taken to obviate a recurrence in future.

By June 1963, most of the year's difficulties having been overcome, production returned to normal. But in late June/July a shortage of electricity, necessitating an 80 per cent cut in the supply to your Factory, resulted in a complete shutdown of production for 12 days.

Summarising what is a tale of woe, your Company was only producing chassis from the Assembly Line for approximately three-quarters of the available working days during the year. Output for the year, had conditions been normal, would have been not less than 3,200 chassis. The actual output was only 2,411 chassis. This unavoidable failure to maintain production at a high enough level is reflected in the financial returns from the sale of your Company's products which has been referred to. However, I am happy to be able to advise you the material stock position has improved and the output of chassis and engines has become established at a steady and satisfactory level. It is anticipated the output will reach a figure of 15 chassis per working day in the near future, with an increase to 17 chassis before the end of this financial year. During the first 3 months of the current year the deliveries of chassis to our customers have been nearly twice the number delivered in the corresponding period of the 1962-63 year.

You are aware that your Company has been engaged in an expansion programme designed to increase production to 6,000 'Comet' chassis per annum, to increase the manufacture of spare parts and at the same time to increase the indigenous content of your products. You will have noted in Schedule 'D', included in the Balance Sheet, that during the year 1962-63 additional buildings and plant and machinery to a value of approximately Rs. 96.7 lakhs have been added to your fixed assets. The corresponding total addition for the two years ending 30th September, 1961 and 30th September, 1962 was Rs. 237 lakhs approximately. That is, the total expenditure on buildings, plant and machinery incurred for the implementation of the expansion programme has exceeded Rs. 3.33 crores. Because skilled labour has had to be trained from men with no previous engineering experience, supervisors also have had to be trained, machine tool deliveries have frequently been behind schedule and production has had to be maintained while installing new machine tools and moving others to make room for them, the expansion project has represented a major problem; and it will not be completed for another 5 to 6 months. In the meantime, your Company has had to maintain profitability in the face of underutilisation of installed capacity, heavy depreciation and interest charges on machines installed but initially not fully utilised and a degree

KOTHARI'S ECONOMIC GUIDE & INVESTORS' HAND BOOK OF INDIA

(Incorporating the Investors' Encyclopaedia)

25 years of useful service to the investing public, financiers, economists, students and the lay man—a Book with an International circulation among the people who count in economics and industry.

Financial and other particulars on more than 3500 industrial establishments—taxation measures—incentives and relief factors for foreign collaborators—surveys of economic development—special articles by industry's leading men and persons in authority—information on licensing and collaboration, Gold Control, personal savings etc., etc.

Classification of Sections with thumb index:

MARTIN BURN LOOK BACK TO OVER *180 YEARS OF SERVICE TO INDIA*

...to be able to compute this service by decades, not by years alone...to recall that our creed has consistently been the development of our country's resources through engineering and allied enterprises...to take pride in planning that makes the many units in our organization fall into a rational and complementary group and each one a leader in its particular field, a position which some of them, early pioneers in India, held even in the last century. For us looking back is a worthwhile proposition—an incentive to *move forward.*

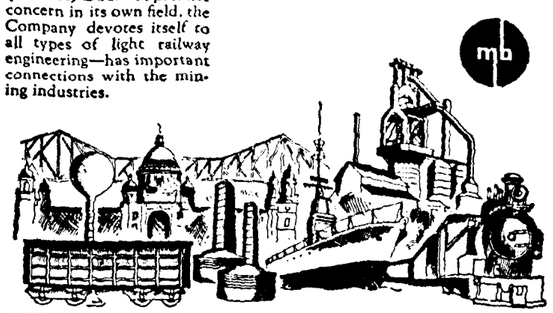
AMONG THE COMPANIES IN THE MARTIN BURN GROUP ARE:

THE INDIAN IRON & STEEL CO. LTD.: With a million ton integrated steel plant at Burnpur, the largest foundry in the Commonwealth at Kulti and its own collieries and iron ore mines, IISCO has an enviable record in production efficiency.

BURN & CO. LTD., HOWRAH WORKS: Pioneers in foundry practice in India, in structural steelwork fabrication and the manufacture of rolling stock—the origins of the Company go back to the year 1781.

BURN & CO. LTD., REFRACTORY & CERAMIC GROUP: Apart from stoneware pipes and chemical stoneware, the works of this group—eight in number and located in four states—manufacture nearly all types of refractories to meet the requirements of India's steel industry, power undertakings, railways, ordnance factories —in fact, any industry requiring refractory material for the maintenance of *furnaces.*

THE INDIAN STANDARD WAGON CO. LTD., SANTA: The oldest Indian unit started for the specific purpose of manufacturing railway rolling stock—has been mainly responsible for building up the wagon building industry. Also manufactures springs, forgings, pressings and stampings for heavy industry as well as automotive components.



THE HOOGHLY DOCKING & ENGINEERING CO. LTD.: Established in 1819, the Company has a shipbuilding yard, a dry dock and extensive workshops at Salkia.

ROBERT HUDSON (INDIA) LTD: A premier concern in its own field, the Company devotes itself to all types of light railway engineering—has important connections with the mining industries.

LIGHT RAILWAY COMPANIES: Some of the first feeder light railways in India, with six systems in five states.

ELECTRIC SUPPLY COMPANIES: Pioneers again in the generation and distribution of domestic power in India—serve 45 towns in Uttar Pradesh and Madhya Pradesh.

THE VAUGHAN BURN CRANE COMPANY LTD.: A collaboration with The Vaughan Crane Company Ltd. of Manchester – manufactures hand operated and electric overhead travelling cranes and chain pulley blocks.

MARTIN BURN LIMITED Calcutta New Delhi Bombay Kanpur Patna MBGC-22

of out-of-balance production. These are problems inescapable and inevitable during major expansion projects and your managers and executives and the workmen whom they supervise accept them as such. While I have no doubt you will be disappointed that it has not proved possible for the usual dividend to be maintained for the 1962-63 year, when you may well have looked forward to an improvement rather than a reduction from 8 per cent to 7 per cent, I suggest that in relation to the financial burden of the expansion programme occurring during a year in which reduced output became unavoidable, it has not been an entirely unsatisfactory year from the financial point of view. Unless any unforeseen difficulties arise, you can look forward to your Company benefiting from the results of its past labours and during 1963-64 the endeavour will be made to produce over 3,600 'Comet' chassis, possibly 4,000; and to reach a steady monthly output exceeding 400 per month before the year end.

You will necessarily be interested in knowing the extent to which the 'Comet's' indigenous content has been increased. To maintain output at a level which will ensure adequate profitability in the context of a continuing shortage of foreign exchange, it is obviously necessary for the maximum effort to be made to reduce the import of the materials required for the manufacture of chassis. The current indigenous content is 79 per cent in relation to the Company's latest application for licences, involving foreign exchange allotment, for the import of materials and components from overseas. That is, the value of the imported content of a chassis will be 21 per cent of the value of a complete chassis; and this figure will be progressively reduced to 10 per cent during the next 18 months. It will be your Directors' aim so to balance the increase both of the number of chassis produced and of the indigenous content of a chassis that the latter will reach the desired figure of at least 90 per cent, while the former will ensure an increase in revenue in keeping with the additional expenditure on plant and machinery installed to manufacture new components in your Factory.

Plans have been completed for the manufacture at your Factory of additional components including engine camshafts, engine timing gears and rear axle differential pinions; and for the purchase of additional semi-finished and finished materials from Indian Ancillary Manufacturers. These steps are designed to increase the indigenous content to not less than 90 per cent.

Your Directors decided recently that it was desirable to alter the method used in your Company to calculate annual allotments to Depreciation. From its inception the Company has used what may be called the "reducing book balance" method which is covered by Section 205(2)(a) of the Companies Act. In this method the value of assets is reduced annually by a fixed percentage which is deducted from the previous year's book value. It has the disadvantage that over the term of years during which an asset reduces to scrap value, the early depreciation allotments are high and reduce progressively year by year. Consequently, when new plant and machinery is installed depreciation charges are at their highest when full utilisation may not have been established and output is consequently below the level which will eventually be achieved. The alternative method of depreciation allotment which may be called the "straight line" method is arbitrarily to take 5 per cent of the installed value of plant and equipment as the scrap value; and to credit Depreciation Fund with an equal amount annually, being 95 per cent of the installed value divided by the numbers of years taken to represent the period during which the asset will reduce to scrap value. The new method, which is authorised by Section 205(2)(b) of the Companies Act, has been introduced with effect from 1st October, 1962; and no change has been made in the amount credited to Depreciation for the years up to 30th September, 1962.

Concurrently with the expansion of your Company's output facilities, Ennore Foundries Ltd. are also providing for the installation of additional equipment which will enable them to double their output of castings, thus ensuring that all demands on them will be met adequately. You will have noted that as at 30th September, 1963, your Company's investment in Ennore Foundries Ltd. was Rs. 23,72,990 out of a total issued and subscribed capital at that date of Rs. 94,92,000, the balance being held by Leyland Motors Ltd. and its nominees.

Your Company is continuing its efforts to establish an export trade. It is not easy to secure business in overseas markets because it is necessary to compete not only with other manufacturers in India, Europe and the U.S.A., but also with Leyland Motors who offer chassis similar to those produced at Ennore. It is only possible to secure orders, therefore, if the Ashok Leyland specifications, quality, after-sales service and prices are comparable to those of competitors. With the assistance of Leyland Motors, a start has been made in the establishment of an export market; and todate 66 'Comet' chassis have been sold to the Ceylon Transport Board, this including an order for 41 chassis secured during the 1962-63 year. It is confidently anticipated that the reputation which has been earned in Ceylon will assist in the task of extending sales to other overseas markets.

I am pleased to be able to inform you that the Government of India has recently approved the inclusion of a new model in your Company's range of products. Based on the Leyland 'Beaver' chassis a range of heavy duty chassis are to be produced at Ennore which will provide for the following types of vehicles:

i) A passenger chassis suitable for double-deck coachwork, similar to the Leyland 'Titan'.

ii) A passenger chassis suitable for maximum duty single-deck coachwork, similar to the Leyland 'Tiger'.

iii) A 4 x 2 goods chassis similar to the Leyland 'Beaver'.

iv) A 6 x 4 goods chassis similar to the Leyland 'Hippo'.

When a demand develops, as it is likely to do, the engines, clutches, gearboxes, front axles, rear axles, steering gears, etc., which will be produced at your Factory for the above range of vehicles, will be susceptible of incorporation in a 4 x 4 version of the 'Beaver' and a 6 x 6 version of the 'Hippo' chassis. This means that facilities will be created for the production of a range of chassis which, including the 'Comet', will eventually provide for gross train weights from 12 tons up to 32 tons.

In connection with the 'Beaver' Project, it is proposed initially to install capacity for the production of 2,000 chassis per annum. But planning will be so executed that the new buildings, plant and machinery can ultimately be expanded to provide for an output of 5,000 chassis per annum. The Leyland Motor Corporation has indicated its readiness to continue investing in the Company's equity in regard to any additional capital which will have to be issued in order to implement this Project. Leyland's investment would be utilised as heretofore for the purchase of plant and machinery in the United Kingdom.

In all the expansion programmes that I have envisaged, we have had the ready co-operation of Leyland Motors, not merely in financial contribution, but what is more important,

in their active assistance in the technical aspects of the expansion. Directors of Leyland Motors and senior executives have maintained their periodical visits to your Factory. Mr. Stokes spent some time at your Factory in March and Mr. West in February and December 1963, reviewing the progress made and giving valuable advice to the Management; and Mr. R. K. Robinson, Production Engineer, Leyland Motors, spent a considerable time at your Factory in January and March 1963, giving most useful and valuable guidance to our production staff. These visits have enabled the Management to organise and regulate our productive capacity better and I am sure I am voicing your wishes when I convey to the Leyland Directors and technical staff, our thanks for all their assistance.

Sir Henry Spurrier, owing to indifferent health, has ceased to be the Chairman of the Leyland Motor Corporation, but he continues to take interest in Ashok Leyland and in Leyland Motor activities in England and particularly in India, in his capacity as President of the Leyland Motor Corporation. We hope and pray that he will be restored to normal health and we shall continue to have guidance from his great experience.

Sir William Black has been appointed as Chairman of the Leyland Motor Corporation and Mr. D. G. Stokes as Managing Director and Deputy Chairman of Leyland Motor Corporation. Mr. West is Chairman of Leyland Motors Ltd. I have had personal contact with all these distinguished gentlemen, more than once when I was in England, and I can assure you of their deep interest in your Company and of their genuine appreciation of the progress that it has made.

Our relations with our employees have remained cordial throughout the year and the results which we have obtained in a very difficult year, were in no small measure due to the hard work and loyal service of the officers, staff and work people of your Company. I would like to convey on your behalf and on mine, our appreciation of their good work and our thanks for their loyal co-operation. I am not formally repeating myself if in this year's speech also, I refer to the work of the Managing Director, Mr. Collins, whose devotion to duty and absorbing interest in the progress of the Company have been most notable. His inspiring leadership has had no small effect on the work of other officers, staff and the workers in the Factory.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

RECORDS AND STATISTICS

L.I.C.: A Seven-Year Story

THE NEW business of the Life Insurance Corporation of India attained a peak at Rs. 745.96 crores for the fifteen months ending March 31, 1963. Table I shows that it had a steady rise during the past four years and was now more than double the level in 1958. Business outside India also improved to Rs. 11.24 crores as against Rs. 5.62 crores only in 1958. Table II shows the relative positions of the different zones. The Southern zone underwrote the highest new business during the period under review at Rs. 201.66 crores followed by the Western zone at Rs. 172.12 crores. The Central zone underwrote the lowest new business at Rs. 104.92 crores only. The average sum assured per policy improved slightly from Rs. 4,143 in 1961 to Rs. 4,220 in the period under review. This table also shows that the volume of new business is not dependent on the population of any zone. Northern zone's population in the 1961 census was 43 per cent of the population in the Southern zone, but its new business during the period under review was nearly 57 per cent of the new business in the Southern zone.

Tables III and IV give details in regard to new business in annuities. The number of life annuities underwritten was about 3½ times the "annuities certain" showing a marked preference for the former. The volume of business under this section, however, was not very large when compared with the total new life insurance business underwritten by the Corporation. Life insurance remains, by and large, a habit with the urban sections of the population, as 68.2 per cent of the sum assured of new business in the period under review was from urban areas as against 31.8 per cent from the rural areas. Nearly four-fifths of the people lived in rural areas while their share in the total life insurance business was less than one-third (see table V). The Corporation has been making efforts to mop up the savings in the rural areas, but not much success in this regard has been recorded. Table VI shows the distribution of new business in India according to the plans of assurance; the total number of Janata policies underwritten during the fifteen months' period was no more than 21,000 (for Rs. 171 lakhs only). This is a negligible share of the total new business and is indicative of the difficult field that the Corporation has still to cover.

The Corporation has introduced non-medical schemes in recent years in order to increase its business. Table VII shows that 21.2 per cent of the total sum assured of new business belonged to non-medical (general and special) schemes. That a majority of the life policies are underwritten for sums assured ranging between Rs. 3,000 to Rs. 10,000 is shown in table A. Approximately half the sum assured belonged to policies between this range. Policies for sums assured between Rs. 10,000 and Rs. 25,000 commanded only 15.7 per cent of the total sum assured. The number of policies for more than Rs. 100,000 was negligible. The fact that 96 per cent of the policies were for sums assured less than Rs. 10,000 indicated that insurance was, by and large, a middle and lower middle class habit.

During the last four years, the business in force of the Corporation has nearly doubled (See Table VIII). At the end of 1958, sum assured and bonuses relating to business in force were Rs. 1,682 crores, while at the end of March, 1963, the figure had risen to Rs. 3,168 crores, indicating an average rise of about 25 per cent per annum (simple). The business in force would have been at a much higher figure but for the rising lapse ratio which increased from 5.1 per cent in 1958 to 8.1 per cent during the accounting period under review. (See table B).

The investments pertaining to the life business of the Corporation at the end of March, 1963, are given in table IX which shows that their total book value was Rs. 683.2 crores out of which Rs. 16.80 crores related to investments out of India. A sum of Rs. 27.99 crores was invested on house property, Rs. 8.84 crores as loan on mortgage of property and

TABLE A

NEW BUSINESS ACCORDING TO SIZE OF POLICY

Sum Assured Group (Rs.)	Percentage of total new business	
	On the basis of number of policies	On the basis of sum assured
(1)	(2)	(3)
Upto 1,000	19.6	4.7
1,001 — 2,000	25.9	12.0
2,001 — 3,000	17.6	12.0
3,001 — 5,000	23.2	27.4
5,001 — 10,000	9.7	21.5
10,001 — 25,000	3.4	15.6
25,001 — 1,00,000	0.6	6.5
Above 1,00,000	..	0.3
TOTAL	100.0	100.0

Rs. 7.86 crores as loans to apex co-operative housing financing societies guaranteed by the Government. In other words, the total funds made available by the Corporation for housing finance societies and as mortgage on property was no more than Rs. 16 crores. This table also shows that the total stock exchange investments and loans and deposits guaranteed by the Government 'outside India' were valued at Rs. 15.71 crores, details of which are given in table X. The highest value of the Corporation's investments abroad was in Burma

TABLE B

LAPSE RATIO : 1958 - 1963

Lapses during	Lapse ratio (Percentage)
1958	5.1
1959	6.0
1960	6.6
1961	7.0
1-1-1962 to 31-3-1963	8.1*

* Annual ratio.

at Rs. 4.64 crores followed by Ceylon at Rs. 4.47 crores. The investments in the United Kingdom were valued at Rs. 63.66 lakhs only. A region-wise and State-wise distribution of stock exchange investments as on March 31, 1963, are presented in Table XI which shows that the maximum investment of the Corporation was in the Eastern zone at 16.14 per cent of the total followed by the Western region at 16.00 per cent. Only 53.51 per cent of the stock exchange investments could be allocated to the various zones, the balance being Central Government securities or other approved securities which could not be allocated to any of the regions. Maharashtra and West Bengal being industrial States commanded nearly two-thirds of the investments which could be distributed State-wise.

On a Good Wicket

WHEN THE Finance Minister presents his budget in Parliament later this month, he should certainly be batting on a good wicket. Last week we indicated some of the advantages he could avail himself of. As was suggested there, Mr. Krishnamachari will be under no compulsion to make any new tax effort of significance. Indeed, there cannot be any reasonable ground for any net addition to the Central taxation. This is because it ought to be possible for the Exchequer, at the existing levels of taxation, to meet all reasonable demands of public expenditure either on Defence or development. As a matter of fact if proper allowance is made for the natural growth in tax revenue and if the Government makes, as it should, an attempt to cut down wasteful or avoidable spending in Administration, Plan outlays or elsewhere, it should not be difficult for the Finance Minister to moderate the incidence of taxation on various sections of the community, including the investing and entrepreneurial classes, at least at some of the points at which the tax burden has now become clearly crippling.

In recent months Mr. Krishnamachari has been taking a number of decisions towards providing relief to hard-pressed sections of the community. His latest act has been to grant an *ad hoc* increase in the dearness allowance to Central Government employees. The Finance Minister, no doubt, is aware that gestures of this kind would be meaningless if, along with them, the existing tax burden is increased or the price level continues to go up. It follows that the budget which he is to present on the last day of this month cannot in reason impose any net new tax burden on the community. More important still, it ought to be borne in mind by the Finance Minister more than anybody else, that his good intentions in the matter of relieving economic and social distress are bound to be frustrated unless supplies of goods and services in the economy increase fast enough to place some restraint on the price level. It follows that, as a logical corollary to his recent decisions, he ought also to find place in his budget for such fiscal measures as would stimulate production and investment for more production in the future. In the recent past the gross national product, which represents the national resources available for consumption or investment, has tended to be a stagnant pool. If there is to be some replenishment of this reservoir, current production as well as investment for future production ought to be promptly stimulated, which is a task to be properly regarded as a prime responsibility of the budgetary policies to be enunciated soon.

We are aware that the Finance Minister has been doing some very profound thinking on the ways and means of activating the existing institutional forms of industrial financing as well as experimenting with new forms and devices. We have no doubt that Mr. Krishnamachari will have many fruitful ideas to expound in this regard both in his budget speech and subsequently. We are likewise conscious of the fact that the Finance Minister is keen on creating through his budget a stimulating climate in this country for foreign capital, both public and private.

A good sign is that the critical studies made on behalf of the World Bank of the various aspects of our development plans, policies and performance are being now responsively and intelligently studied in the Government of India, particularly the Finance Ministry. The object, here, is, evidently, to find out in what directions economic policies and procedures can be reasonably and suitably reorientated in order to make it easier for industrially advanced, capital-exporting countries and their governments to participate in this country's economic development in an increasingly effective manner.

The immediate concern, of course, is to see that the ground is properly prepared for the Aid-India Consortium, which is to hold its next meeting soon after the Indian Central budget, so that the governments in the Consortium might be persuaded to consider in the most favourable manner possible this country's request for further external assistance, particularly for the fourth year of the third Plan. But there is also the equally important purpose of impressing a much larger audience, namely, the sources of finance for foreign investment in the economically advanced countries. It has now been recognised that the aggregate level of inter-governmental assistance to this country's economic development has reached a level which will probably be its peak. In other words, broadly speaking, it is unlikely that this country will receive much more than a total of one billion dollars a year as development assistance from foreign countries for its further economic development. It is again, rather likely that it may become increasingly difficult to persuade the assisting nations to provide this order of aid indefinitely. Since India's need of external finance, however, is not going to decline in, at least, the next ten or 15 years, it is clear that there should be a sustained effort on the part of this country to supplement its receipts of foreign public capital with increasing amounts of foreign private capital. This is a trend of thinking which is also becoming prominent in aid-giving countries. For instance, in a speech delivered some time ago to the United Nations Special Economic Council explaining U.S. attitudes to the role of public and private capital in developing nations, Mr Jonathan B. Bingham, U.S. representative, said this:

"We believe the flow of public and private capital should go hand in hand. It would be foolish to assume that the flow of public funds will increase if the flow of foreign private capital decreases.

"On the contrary, since most aid to developing countries comes from private enterprise economies, it is logical to conclude that hostility to such investment is more likely to lead to a lessening than to an increase in the flow of public assistance. This could easily start a downward spiral in the flow of development capital which would please no one but the troublemakers of the world.

"It is our conviction that we must rather dedicate ourselves to an upward spiral involving an increasing flow of private investment in response to appropriate opportunities. Only in this way can we maximize the total flow of capital to the developing countries in the interest of their optimum growth."

Here it is interesting to note how small is the part of U.S. private export capital currently being invested in India. According to certain estimates, out of nearly $5 billion of total U.S. foreign investments around the world annually, India is receiving only about 32 million dollars. Surely, this is a sad commentary on the quality of the effort that has so far been made by us to develop any positive and purposive programme for attracting foreign private capital from the most important capital-exporting country in the world. Mr. Joseph P. Bourdrez, Adviser in the Indian Investment Centre, in a speech which he made in Bombay recently, gave some interesting statistics in this connection. He pointed out that, U.S. private investments in the countries of the European Common Market in 1950 were $ 647 million or only twice the amount of the present U.S. private investments in this country. But in 1962, U.S. private capital invested in the Six had grown to the enormous amount of $3,600 million. Mr. Bourdrez explains this tremendous increase in terms of the fact that, while in many fields the making of new investments in productive units in the home country was becoming comparatively less attractive, American entrepreneurs looking at the opportunities offered to them in Western Europe discovered that the profitability there was quite often likely to be higher than that of possible expansion at home. They discovered that the location of units in other markets, often for diversified products, would profit the stabilizing factor in a company's overall position, as ups and downs in different markets would tend to balance out. Mr. Bourdrez proceeded to say, "In practice this appeared to be so. One can hear from many U.S. industrialists the statement that the largest contribution to the profitability of their companies is often made by their overseas investments".

In a subsequent part of his analysis, Mr. Bourdrez pointed out that in Western Europe, too, industry had started moving towards a similar situation, "namely, a contraction in profitability of investment in the home area". As one Belgian industrialist put it to Mr. Bourdrez, "all industries will have to look more and more for investment opportunities overseas, because they can no longer produce economically enough in Europe". The moral of all this surely is that this country cannot continue to ignore the desirability of formulating positive economic policies which will enable it to obtain an increasing share of private capital from the United States, Western Europe or other advanced countries such as the United Kingdom or Japan, which may be seeking investment opportunities across national boundaries. The advantage which this country has in this respect is that it has a vast population which has been harnessed to economic development and is therefore potentially one of the most rapidly expanding markets in the world not only for mass production industries but for all industries over a wide range of goods and services. Currently, there is a rapidly mounting realisation in this country that it will not only be foolish but even criminal to lose time in developing industries. The importance and promise of industries such as petro chemicals, special steels, fertilizers and aluminium seem to have captured the imagination of the people and even of the Government, with the result that big, bold targets are being set up for the fourth Plan and the Plans beyond. But the achievements of these targets can be considered possible only if the order of capital and the quality of know-how—much of both of which will have to be obtained in the form of foreign investments—attracted to this country are, in pace and volume commensurate with its enormous requirements. This is the setting in which the forthcoming Central budget will be evaluated.

It is true, of course, that a single budget cannot turn the trick. But thanks to the follies of the past, it is now becoming imperative that a beginning should be made in the direction of right policies over a period. Investors, whether at home or abroad need assurance that the tax system would be pragmatic and not predatory, whether for ideological reasons or from other motives. The Super Profits Tax in particular and certain of the earlier fiscal innovations (some of which had happily proved short-lived) had done much damage to investors' faith that the Indian tax system would be basically steady, stable and capable at all times of bearing out the reasonable assumptions and expectations on which investment decisions are made. Whether and to what extent the damage is undone will certainly be one of the more relevant measures by which the Finance Minister's economic statemanship will be assessed when the Central budget is presented.

Eastern Economist 20 Years Ago

FEBRUARY 18, 1944

The railway budget presented in the Legislature on Wednesday last affords a striking instance of a theory-ridden Government playing with the welfare of the masses of the population in the name of anti-inflation. For there is not a shred of justification for the proposal to raise railway fares by as much as 25 per cent. Despite their notorious inefficiency and corruption admitted on all hands, the railways have from the mere financial point of view been doing extremely well since the war. The raid made on depreciation fund to the extent of Rs. 30 crores up to 1935-36 and the arrear contribution to the tune of Rs. 36 crores were not only fully paid off; but during the last five years the railways besides accumulating a depreciation fund which on March 31, 1944 will stand at Rs. 87.93 crores, have made a contribution to general revenues amounting to nearly Rs. 89 crores and built up a reserve to the extent of nearly Rs. 21 crores. The prospects of large earnings for the year 1944-45 are equally bright. Without any further increase in rates and fares railways could have met all the demands made on them and yet have sufficient surplus left for all their legitimate requirements now as well as in the post-war.

In the circumstances no concern which pretends to lay claim on its being run on a commercial basis would have chosen to put up the fares; and yet the railways using their monopolistic position have not only resorted to increased taxation but found ingenious explanations for their proposal, none of which can stand close scrutiny.

Hotels for Tourists

THE CASE for private enterprise has been repeatedly stated in these columns and elsewhere, but the truth must also be told about its responsibilities, the realization of which must not await paternalistic prompting and sermonizing by the Government. Initiative if not a sense of honour should impel what has been described as a "kept private sector" to grow out of a state of dependence. It is only right that the thought born of prudence should come from the private sector just as any lead to concretize this independence should also emanate from within the ranks. The immediate occasion for this homily is the sixth annual convention of the Federation of Hotel and Restaurant Associations which was held in New Delhi recently and was addressed by Mr. Raj Bahadur, Union Minister for Transport, and the Director-General of Tourism. Mr. Raj Bahadur emphasized the Government's view that, while private hoteliers were entitled to all assistance and encouragement, the public sector had a vital role to play in the provision of hotel accommodation.

Mr. Peter Wright's report submitted last year on behalf of the World Bank to the Aid India Consortium explicitly suggested that, before India sought external help for her foreign exchange resources, she should be asked to make a determined effort to earn some of it herself. He had suggested that foreign airlines collaborating with local tourist agencies should step in to serve India's visiting tourists in areas not covered by IAC services. The implied charge of lack of enterprise was directed not only against the Government of India but against Indian entrepreneurs as well. The Jha committee report that followed set the situation to rights somewhat by making less propagandist and more practical suggestions. It had recommended (a) the adoption by hoteliers of a programme of comprehensive hotel construction not only for rich tourists but middle-class ones; (b) the provision by State Gov-

ernments of better road and transport facilities; (c) the framing of comprehensive tour programmes, all found, at reasonable prices. The committee had argued that foreign exchange released to hoteliers to effect necessary improvements in their business should be viewed as a mode of investment designed to prevent "leakage transactions" in foreign exchange which did not pass through any authorized dealers in the country. A Classification Committee has since toured the country visiting 186 hotels in 110 cities with a capacity of 11,732 beds and has graded them according to an internationally approved star system. The rating was unanimously endorsed by the three members of the committee, one of them a representative of the Federation. There has been some grousing presumably because of cases of under-classification but the Transport Minister assured the convention that individual representations in this regard would be carefully looked into.

Tourist traffic has increased by 300 per cent over the last seven years as against a mere 11 per cent increase in the country's hotel-bed capacity. Further growth in tourism will be seriously retarded if hotel capacity was not extended suitably and fairly quickly; the immediate shortage appears to be of the order of 9,500 beds. If needless loss of foreign exchange resources is to be avoided, 36 hotels will have to be set up in 20 cities in India in order to provide room accommodation for 5200 persons. The Tourist Department has estimated that this programme would entail an expenditure of Rs. 25 crores of which Rs. 3.80 crores would have to be in foreign exchange.

So far four hoteliers have secured loans to the value of Rs. 148.12 lakhs from the Industrial Finance Corporation and another eight hotels an aggregate of Rs. 37 lakhs from State Finance Corporations. New hotels are exempt from taxation on six per cent of their capital for the first five years of their operation. The Department of Tourism also helps with quotas of steel, cement and imported capital equipment, which it secures from the relevant departments of the Union or State Government. Hoteliers are also being encouraged to seek foreign collaboration on terms specified by the Government and this should help both to improve standards and promote tourism. A study team sponsored by the National Productivity Council and the United States Agency for International Development has submitted a report to the Government after a detailed examination of the hotel and restaurant industries in Japan and the United States.

This is not all. There is no chef like the one who knows the preferences of every habitue or a waiter who appears from nowhere at the merest nod and executes every unspoken wish. In addition to the schools of catering and hotel management already existing in Bombay and Delhi, the Government has also recently started institutes of catering at Madras and Calcutta. A craft school for waiters and cooks is in the offing and the Planning Commission has already agreed to a provision of Rs. 3 lakhs for the purpose. Furthermore, the Government has decided that five students may be sent abroad each year to study "hoteliering". As for the Government it will set up hotels only in areas of tourist interest where private hotels do not exist.

One cannot ask for more. The facilities afforded to hoteliers have had the effect of virtually ranking hotels alongside of the 22 key industries listed by the Swaminathan committee. It is now up to the hoteliers to vindicate this liberal and preferential treatment accorded to them by the Government.

Rice Mills : Another Guinea-pig?

THE RESOLUTION on Democracy and Socialism adopted at the Bhubaneswar Session of the All-India Congress Committee pointedly stated that processing of agricultural produce, especially paddy, should not remain in private hands. This categorical statement against a particular sector, which is not very large in the national context, caused some surprise in view of the official declarations that the policy of nationalisation would be pragmatic. and purposive.

The resolution suggested that rice mills and other processing units should be operated under co-operative management and if it was not possible to do so in all cases, the Government itself should *progressively*—mark the word—take over the operation of the mills. There is, no doubt, that this slant in favour of marketing of agricultural products either through the State or through the co-operatives is not a healthy development.

What were the reasons which prompted the stalwarts of the Congress Working Committee to incorporate this suggestion in the resolution? Was it due to ideological reasons alone or was it under pressure of the Leftist wing in the Party that this step had been taken? Whatever the motivation, it is necessary to understand the area of operation of the rice mills and the part that they play in the economy. The census of manufactures (see Table I) for which data are available upto 1958, shows that there were 1,744 registered rice mills which came under the purview of the Factories Act. These rice mills processed not more than two million tons of rice in relation to about 32 million tons of output in the country. Mr. S. K. Patil, who was until recently the Union Minister for Food and Agriculture, stated at the Bhubaneswar Session that there were about 43,000 rice mills in the country. *Rice Economy of India*, a publication of the Ministry of Food & Agriculture, issued in February, 1961, put the total number of rice mills at not more than 28,000. Table II gives the State-wise distribution of rice mills in the first half of 1960. It shows that out of 28,149 rice mills, Madras had the largest number at 7,400 followed by West Bengal at 4,912 and Mysore at 3,060. A large majority of the rice mills were Huller type, the Sheller type mills forming only a negligible proportion of the total. The combined Huller-Sheller type mills also constituted a small fraction of the total. The numerical picture, however, did not give a true idea of the capacity of the different types of mills. The Sheller type mills and the combined type mills had much larger capacity than the Huller type mills. No data on capacity is available from any of the published sources.

TABLE I

RICE MILLS : 1947-58

	1947	1958
1. **No. of Factories :**		
(a) Registered	1,479	1,744
(b) Returns Received	1,268	1,452
(c) Coverage (percentage)	86	83
2. Average number of days worked	191	195
3. **Productive Capital Employed :**		
(a) Fixed Capital (Rs. Million)	48.6	71.4
(b) Working Capital (Rs. Million)	48.4	119.0
Total (Rs. Million)	97.0	190.4
4. No. of persons employed	51,126	57,831
5. Salaries & Wages (Rs. Million)	14.8	24.7
6. **Materials Consumed :**		
(a) Fuel, Electricity etc. (Rs. Million)	4.7	7.9
(b) Paddy, Oilseeds etc. (Rs. Million)	321.8	729.6
Total (Rs. Million)	326.5	737.5
7. Production (Rs. Million)	340.5	793.2
8. Value added by Manufacture (Rs. Million)	15.9	44.8

Source : Census of Manufactures

Table III gives the percentage of hand-pounded rice to total production in the various States of India. It shows that the States of Mysore and Madras have almost given up hand-pounding in favour of rice-milling. In the case of Mysore 95 per cent of the rice was milled through the rice mills. In Madras also hand-pounding of rice was only 8.2 per cent of the total. If these percentages of hand-pounding of rice are applied to the production figures of 1962-63, it will be found that out of the total output of rice at 30 million tons, about 18 million tons were hand-pounded and about 12 million tons passed through the rice mills. In other words, the rice mills handled about two-fifths of the total rice produced in the country.

Mr. M. Bhaktavatsalam, Chief Minister of Madras, has given a lead by expressing grave doubts about the wisdom of nationalising rice mills. Replying to the debate in the Legislative Assembly on the Governor's address, he said that the proposal to control agricultural operations will create a chain of adverse reactions. On the one hand, the producers may not be able to sell their produce at their price and to the parties of their choice, while, on the other, they may be forced to sell their rice at a price fixed by the Government and to the specified Government agency. It is highly likely that the producer himself will resent such an arrangement. This common sense on the part of an experienced Chief Minister of a rice-producing State should surely count for more than the amateurish enthusiasm of wild spirits such as Orissa's ex-Chief Minister who is yet to set up any of those village factories which he had promised himself sometime ago.

TABLE II

NUMBER OF RICE MILLS

State	Huller Type Mills	Sheller Type Mills	Combined Huller-Sheller Type Mills	Total
Assam	60	2	262	324
Maharashtra	1,459	71	331	1,861
Gujarat	1,533	128	129	1,790

West Bengal	70.2	4,340	3,047
	Total	30,325	18,606

Highlights of the Week

THE PRESIDENT'S ADDRESS

THE ADDRESS to the Budget session of Parliament, which began on February 10, 1964, by Dr. Zakir Hussain, who is now discharging the functions of the President of India, is so admirably factual a narrative presented without any dressing that it is not only unexceptionable, but it hardly sounds like a narration of achievements presented on behalf of a Government. At any time, the view the Government has of its own actions is important for other people but for this session in particular, it affords an important setting in which important decisions regarding its finances are taken, and one cannot help feeling that its modest optimism is justified.

The dust has settled on the mid-term appraisal controversies and even if some of the reproaches pronounced against the Government were well merited, it has always been quick to respond to legitimate criticism and surprisingly, quick to remedial action too. It is only natural that, in an underdeveloped country where agriculture accounts for such a large proportion of the national income, a 3.3 per cent. shortfall in output should so considerably retard figures for the rate of growth. The outlook for Indian industry during the coming financial year is a bright one as the President pointed out citing some less noticed facts. The first A.C. electric locomotive rolled out of Chittaranjan last year; Heavy Electricals in Bhopal has increased its output; the development of Kiriburu iron ore mines has been completed; Trombay has begun to export radio isotopes: agreements have been signed with Canada and the USA for the Tarapore and Rana Pratap Sagar atomic power stations.

The President expressed the Government's view that fair price shops, price support policies and other well-known measures taken by the State and Union Governments should suffice so to increase agricultural production as to match the rising levels of consumption of food. While no one doubts the sizable increases in urban consumption of food nor the migration of rural population to cities in search of jobs, the increase in agricultural efficiency should really have come first of all. It is only then that the country can be said to be truly placed on the road to industrialization 'without loss of national product.' Trite as it may seem, it is true that the extra supplies of grains that are now forthcoming at higher, supported prices come from buffer stocks and not from increased production as they ought to. Agriculture in this country will progress only when produce actually grown for the market is able to offset the fluctuations in production that could be ascribed to bad weather.

Actually it is for the political arrangements that a troubled Government was able to make during the financial year under review that it deserves fulsome praise. In addition to Goa, Daman, Diu, the former Union territories of Himachal Pradesh, Manipur, Tripura and Pondicherry graduated into a status of equality with the other States of the Union and now have their own Legislative Assemblies and Councils of Ministers. Nagaland, too, thus held its elections in January, and a properly elected Government is now in power in the State. The undoctrinaire and purposive political integration which began with Sardar Patel's policy towards the former Princely States has gone on unnoticed since his time and is now approaching its consummation. While the Chinese threat at the northern frontiers has receded, the President was unable to report to Parliament any progress in gaining acceptance by China for the Government's Colombo proposals, but surely no patriotic Indian could have stopped himself from hoping that General Ne Win's visit to Delhi had possibly something to do with a reasonable offer of negotiations by China.

The Emergency has nevertheless had unforseen but desirable consequences. The Army and Air Force have been expanded and modernized with arms and other aid received from the United States and Commonwealth countries. While the timely arrival of modern infantry weapons helped the Indian Army to tide over a crisis, more enduring arrangements are being made to develop an indigenous capacity for basic weapons. The ordnance produced in State factories during the year under review was double the figure for the previous year and contrary to misleading reports, Dr. Zakir Hussain was able to announce that preparations for manufacturing supersonic aircraft for the Air Force were going ahead according to plan. Also an announcement appeared last week that a factory to manufacture electronic devices for MIG planes was to be located in Hyderabad. The Vice-President also revealed that the country had received transport aircraft from the Soviet Union. Together with the Carribus from Canada, the third of the Avro-748s from the Kanpur depot which was handed over to the Air Force following the successful conclusion of its proving flights, the IAF is now well provided for its transport requirements of medium range. Dr. Hussain underlined the fact that the country's dealings designed to secure its defensive military potential had thus actively served to further its policy of non-alignment in world affairs.

The Test Ban agreement arrived at, in principle, between the Soviet Union and the United States and subsequently adopted by the United Nations was among the recent occurences in international politics that the Vice-President briefly alluded to. While assenting to the principle enunciated by Premier Khruschev that force should be renounced in the settlement of territorial or border disputes, Dr. Hussain expressed the hope that the principal powers concerned would find ways and means of implementing this principle and acting on it.

The admission of Kuwait to the United Nations and the recent emergence to independence of Kenya and Uganda were among the other subjects touched upon in the Presidential address. Dr. Hussain also expressed his Government's by now familiar hope that the other countries of Africa still in servitude would achieve their independence. Indo-Pakistan relations, the other hardy annual that comes up regularly for review both in the United Nations and the Presidential address, were as usual space as well as time-consuming.

SUPERSONIC LINERS FOR AIR INDIA

AIR INDIA'S Chairman, J. R. D. Tata, is reported to have placed an order with the Federal Aviation Agency for three supersonic aircraft to be used on its Atlantic run. While precise details of the deal are not available, it is clear from specialized aviation journals that there are only two major producers who offer supersonic aircraft in the world market—the SST (supersonic transport), now being developed in the USA, and the Concord, being developed by BAC-Sud, an Anglo-French enterprise. The American SST prototype is expected to be ready for route-proving flights by 1968. If it proves successful, there should be a supersonic liner in operation over the Atlantic by 1970-71, for it is only on flights between Europe and North America that these planes would be economical to operate. The supersonic plane proposed by Lockheed-California Company to the Federal Aviation Agency is designed to fly at 2000 m.p.h., nearly three times the speed of sound. It has a double delta wing and will carry 218 passengers.

It would appear that the American aviation industry has put everything it has by way of finance, skill and enterprise into the project. The plane is expected to have a gross weight of 400,000 lb., an empty weight of 100,000 lb. and will fly at speeds in the neighbourhood of Mach 2.2. (Mach is the speed of sound at sea-level i.e., 1100 ft. per second). The sonic boom is bound to be quite an explosion and also since this will be the first aircraft of its kind to take to air, a number of unresolved problems and drastic changes will be left over till the test-flight stage. It has been estimated that the loss will be of the order of £ 100 million only if the prototype fails, but if the project has to be abandoned after certification, the loss will be of £1000 million. Naturally, the cost of any changes made at the stage of final manufacture will be passed on to the airlines concerned. The technical details revealed by the manufacturers make interesting reading. Mach 2.2 is the maximum speed aimed at since, beyond that range, aluminium, if used as construction material, cannot stand the strain and will then have to be replaced by alloys, such as steel and titanium which are good up to speeds of Mach 4.5 or 5. Beyond that is the unknown space age which may well become a reality during the 'seventies.

The Anglo-French Concord, which will cost anything from £6 to £7.5 million, is also expected to be ready about the same time. The question which has caused much speculation in aviation circles is: who would produce the first supersonic airliner? Alternatively, the criterion of efficiency has been defined as: who would produce more of them in three or four years? The BAC-Sud seems to be more concerned with the transition from sonic to supersonic speeds, when the strain will more than double from the sonic level of 1.5 lb. per square foot. Although the operating cost of Concord will amount to 65-70 per cent. of that of subsonic jets, the seat-per-mile cost will only be five per cent. less, for it is only at speeds exceeding Mach 2.2 that engine efficiency will increase in direct proportion with the Mach number. The reduction in cost that would accrue to the passenger would not therefore be very considerable, for much of the outlay would be spent on effecting improvements in safety. The take-off speed of Concord has been given as 205 kt (one knot equals 1.85 kilometres) and it will have an approach speed of 150 kt.

The British Overseas Airways Corporation announced on February 8 that "the information supplied by the Federal Aviation Agency, charged with co-ordinating the project, has shown that the specifications of the American aircraft differ considerably from that of the Concord and it appears that the two aircraft will be complementary to each other rather than directly competitive. In these circumstances, it is in the interests of the British Corporation and the national French airline now to envisage the operation of both types of aircraft; they have, therefore, decided, with the agreement of their respective Governments, each to reserve six delivery positions for the American Supersonic transport. Coming as it does after the decision to place a contract relating to eight Concords, this reservation of deliveries places the BOAC in a good position in relation to those major international airlines who have signed contracts for the Concord ....".

"The Financial Times" of February 8 revealed that the Concord was planned to fly at 1450 miles per hour over ranges up to 3700 miles carrying about 100 passengers. But the UK Minister for Aviation has announced in Parliament that plans were being considered for an increase in its power and other changes that may achieve greater range and payload. Meanwhile, Sir Miles Thomas, Chairman of the BOAC between 1945 and 1956 has criticized what he calls the "wild rush" for the supersonic airlines. He is reported to have said that "until we know a little bit more about finance and accountancy of these supersonic aircraft, I am inclined to deplore the wild rush of airlines to get their names in the queue on an order sheet for an aircraft which has not yet been specified, of which the economics are hazy and which does even consist of a few feint lines on a drawing board". He thought that the aircraft should be put into the hands of the miliary for use either as freighters or simply as test aircraft before fare-paying passengers were taken abroad. In order, perhaps, to suggest that the speed of road transport arrangements made by airlines to carry passengers from the airport to the city-centre which compared unfavourably with the high speeds of the jet age, Sir Miles Thomas added that he had become interested in a company called "Speed Transport" which could provide quick transport between London and the airport, which was separated from existing traffic levels.

AN AFRICA POLICY

IT IS no accident that the African policies of the Government found the barest mention in the Presidential address. In truth we have been overtaken by the breath-taking events of Africa of the last few weeks that we are in great danger of being left without a policy. Mrs Lakshmi Menon, speaking in Bombay on February 5, clarified the issues involved.

If the object is not to apportion blame, the solution becomes clearer. When Gandhiji left South Africa in 1914, he returned to India to take up his unfinished work and his own view of the problem of Indians living abroad, necessarily conditioned by his times, was rather different. He was concerned with concretizing the legal status assured to Indians living in the Empire anywhere under the Imperial proclamation. Many of the Chinese indentured workers—they were at no time so numerous in South Africa and Gandhiji did as much for them as he did for his own expatriate countrymen—had returned home by the time. When it was realized in India that Imperial obligations to subject peoples were not being—and indeed could not be—fulfilled, the situation of Indians living abroad—in the African countries in particular—changed. Many left or to those who stayed on in these countries it became clear that they had to conform to the laws of the land.

Mrs Lakshmi Menon pointed out that Indians—many of them traders in Africa—did not adequately associate themselves with the aspirations of local peoples owing to unimaginative self-seeking at the worst or to a failure of sensibility at the best. The new regimes in many countries such as Kenya and Uganda have generously offered citizenship to non-African residents although over 1100 Indians returned to Bombay only the other day. They had been employed in the railways, the post offices and a number of other semi-technical occupations. They said that they had opted for return to India on the termination of their contracts. Mrs Menon's conclusion was that nothing more could be done in this regard unless "human rights" are actually "violated" as they are constantly in South Africa.

Dasappa Has His Day

By Our Parliamentary Correspondent

NEW DELHI : Tuesday

THE BUDGET Session of Parliament, assembling on Monday, got off on both feet, with the reading of the President's address being punctuated twice (instead of the usual once at the end) by the playing of the National Anthem by the attending band. It would, of course, be far-fetched to suggest that the premature playing of the Anthem as soon as the Vice-President had read the address in Hindi and was about to read it in its English translation, had been manoeuvred by the Lohia crowd. But the jubilation of that group over the fact that, at least because of fortuitous circumstances, the address had come to be read first in Hindi, was unmistakable. All this, of course, gave the DMK fanatics their chance to do their stunt which they did by boycotting the reading of the address.

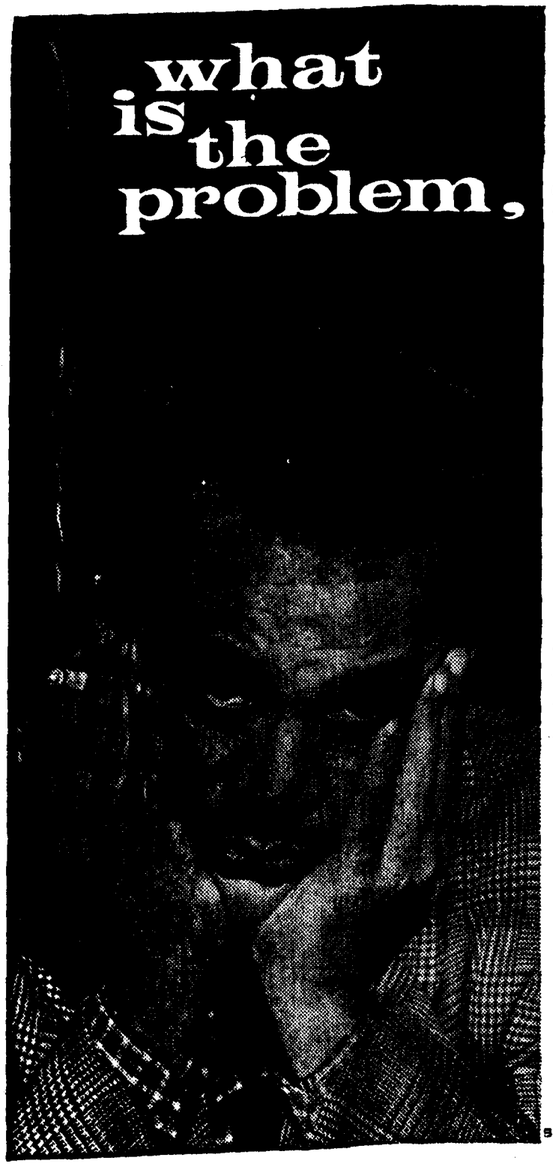
Certain passages in the address were promptly commented upon in the lobbies. It was pointed out, for instance, that the President's address was rightly firm in denouncing Pakistan for reviving tension and hostile feelings over Kashmir and for spurning this country's proposals for dealing properly and effectively with the situation created by recent outbreaks of communal violence in the two Bengals. It was, however, being asked why the passages dealing with the continuing Chinese aggression had been less forthright. One complaint heard in this connection was that nowhere in the address had it been reiterated that it continued to be the Government's policy to effect the removal of the invader from Indian soil. More on this theme will certainly be heard during the debate on the address.

On Tuesday, the PSP Group in Lok Sabha, assisted by others on the Opposition Benches (as well as some Independents), attempted to move an adjournment motion on the communal disturbances in East Pakistan, but succeeded only in securing from the Speaker an assurance that a day would be set apart for a discussion. Meanwhile, in a long statement on this and connected matters, the Home Minister strove to convince the House that "pressure would be maintained on the Pakistan Government to see reason and follow internationally recognized canons of behaviour in respect of their duty towards the minorities".

Note may be taken of the amusing sidelight on the rather innocuous Bill which the Finance Minister introduced in Lok Sabha on Monday to restrict the negotiability of currency notes inscribed with political propaganda. It appears that, earlier, there was agitated speculation, particularly in Calcutta and Bombay, that the Government would be demonetising hundred-rupee notes in an attempt to run "unaccounted money" to earth.

Although the general and superficial reaction to the Railway Budget was one of relief over the absence of any increase in passenger fares, the more thoughtful legislators are already asking whether the hiking up of freight rates year after year is not economically an unsound move although it may politically be an easy alternative. With production rising rather less than it must, such decisions as putting up freight rates can well add to the inflationary potential. Many among Mr. Dasappa's audience, again, were not quite impressed with the statistics paraded before them about improvement in railway performance. It has been suggested in this connection that much of the seeming improvement in operational efficiency is in reality due to the fact that, in a previous period, efficiency had been permitted to go down so much — and

RAILWAY BUDGET AT A GLANCE



(Rupees in crores)

	Actuals 1962-63	Budget 1963-64	Revised Estimate 1963-64	Budget 1964-65

that too, it is alleged, in part deliberately, in order to provide suitable conditions for large-scale indulgence in corrupt practices at many levels in the railway administration. Proceeding, it is argued that the improvement now claimed is therefore the result, largely, of the belated measures taken in the Railway Ministry to cleanse its fouled nest. Many informed MPs insist that the real facts about trends in productivity on the railways still remain to be found out and it is suggested that this is a job for an independent, outside body of experts well-versed in advanced railway management and operational practices as currently adopted in other countries with modern rail systems.

There is, however, general approval of the decision taken to step up the contribution to the Central Exchequer from the present 4.5 per cent to 5.75 per cent at least in respect of new capital made available to the Railways. There is little doubt that being a large and expensive user of scarce capital, the Railways should increasingly submit themselves to realistic financial tests and requirements. Finally, quite a few legislators have been amused by Mr. Dasappa's claim that the reduction in freight rates proposed in respect of a select list of goods has been motivated by a desire to readjust freight rates to costs of haulage. The less flattering reality appears to be that the Railways are heavily losing to road transport in the carriage of these and other items; the freight readjustments are thus only a bid to strengthen the Railway's competitive position.

The Railway Budget

The Railway Budget for 1964-65, presented to Parliament on February 11, 1964 by the Railway Minister, Mr. H. C. Dasappa, contemplated no increase in passenger fares or parcel rates.

A small increase of two per cent in the supplementary charge on goods freight rates including coal rates has, however, been proposed. This is to meet at least part of the cost of the recently sanctioned concessions to Central Government employees by way of increase in dearness, city compensatory and house rent allowances as well as improvement in the family pension scheme and in lower rated pensions. There will also be some additional commitment arising from Government's proposal that Railways should pay interest (dividend) at 5.75 per cent to the General Exchequer on fresh capital made available to the Railways during the Budget year and thereafter until the position is reviewed by the next Railway Convention Committee in 1965. For capital provided for the Railways up to the end of the current year, the 4.5 per cent rate as approved by the Parliament last year will apply. The increased interest rate is to reflect the increased cost of raising capital.

Simultaneously, a downward adjustment in the classification of some high rated commodities has been proposed, by way of rationalisation, which will reduce the freight rates on several items of finished products in consumer goods.

In respect of coal, a graduated increase in basic coal freight rates within a maximum increase of Rs. 3 per tonne, for distances from 501 kilometres and up to 2100 kilometres has been proposed. This measure, while raising some additional revenue, will also be a step towards rationalisation. The existing taper in coal freight rates for long distances requires review, so as to make freight rates on coal for such distances conform more nearly to the cost of its haulage as computed by recent cost studies. The proposed adjustments keep this objective in view.

The Railway Minister stated that many railway employees, who had hitherto preferred to continue under the Railway Contributory Provident Fund Scheme for retirement benefits would now elect pension in view of the enhanced benefits in lower rated pensions sanctioned from October 1, 1963 and the improvement in the Family Pension Scheme from January 1, 1964. With large numbers of railway staff in varying age groups coming over to pension, it is necessary for the Railways as a commercial department to even out the resultant fluctuating burden from year to year on account of pension payments. A Pension Fund was accordingly proposed to be set up, by making, an annual contribution from Revenue to the Fund on the lines of the provision made from Revenue for the Railway Depreciation Reserve Fund. An initial contribution from revenue of Rs. 19 crores will be made in 1964-65, part of which will be found by reducing the provision for Government contribution to Provident Fund, since the number of non-pensionable staff, hitherto under the Railway Provident Fund Scheme of retirement benefits, will correspondingly decrease. The net additional cost on account of the Pension Fund in 1964-65 will be Rs. 15 crores.

The proposal of the Government to raise the present 4.50 per cent interest (dividend) rate to 5.75 per cent on capital made available to the Railways after March 31, 1964, would mean additional resources to General Exchequer of a little over Rs. 1.5 crores in 1964-65 and nearly Rs. 5 crores in 1965-66 assuming the same capital outlay in 1965-66 as in 1964-65.

The aggregate of these additional commitments in 1964-65, would be of the order of Rs. 22 crores, made up of a sum of Rs. 20.5 crores under staff including the net requirements of the Pension Fund and the effect of the increased dearness allowance and city compensatory and house rent allowances and a sum of Rs. 1.5 crores as additional dividend to General Revenues. The expenditure chargeable to the Development Fund, which is a fund fed solely from the annual surpluses, was also mounting steadily with the persistent demand for more facilities for the steadily increasing passenger traffic, welfare measures, including housing, for the increasing number of railway employees, etc. An annual average surplus of about Rs. 19 crores in the second Plan had been found insufficient, and the Railways had been obliged to borrow from the General Revenues in the Second Plan period for financing works chargeable to Development Fund. It was essential not only to have enough surplus for the purposes of the Railway Development Fund but also to earn increased surplus proportionately with the increasing investments so that a reasonable return on the capital is maintained. The increase in freight rates recommended by the Railway Freight Structure Enquiry Committee in 1957 had been effected only in stages, reaching the average increase of about 13 per cent recommended by the Committee only on 1st July, 1962. The five per cent supplementary charge imposed thereafter, on 1st April, 1963, together with the proposed further two per cent, the Railway Minister pointed out, had to be viewed in relation to 33.5 per cent increase in the per capita cost of staff and in the price of coal since 1957.

Exemption from Surcharge

Export ore will be exempt from the proposed additional surcharge. The surcharge will also not apply to the Defence and the Posts & Telegraphs traffic, which is governed by separate tariffs, nor to the Railways' own departmental traffic. Since the increase will be only two in 110, it would amount effectively to 1.8 per cent only.

The adjustments in coal freight rates will not affect about 45 per cent of the total coal traffic which moves for distances up to 500 Kms, though the two per cent supplementary charge will apply. Even for movement beyond 500 Kms and up to 2100 Kms, the increase in no case will exceed Rs. 3 per tonne in the basic rate.

On the other hand, the proposed downward adjustment in the classification of certain commodities, which now bear the highest rates, will mean an appreciable reduction ranging between 3.9 and 23.5 per cent. For instance, at 500 Kms, the present rate of Rs.103.10 for traffic in wagon loads, of nitric acid, will be reduced by Rs. 18.10 per tonne, the rate of Rs. 88 for Safety Matches by Rs. 15 per tonne and the rate of Rs. 73 for rectified spirit, furniture and confec-

tionery by Rs. 2.90 per tonne. There will be corresponding reductions for traffic in smalls. The adjustment will serve, as in the case of coal, to bring the rates closer to the cost of haulage and reduce the present wide spread of rates.

The proposed two per cent increase in supplementary charge was too insignificant to affect retail prices. For instance, for a distance of 600 Kms, which is the approximate average lead of general merchandise, the levy will amount to about one-twentieth of a naya paisa per kgm of salt, about one-twelfth of a naya paisa per kgm of sugar, and about one-twenty-fifth of a naya paisa per kgm of foodgrains. For commodities charged at lower classification, the increase will be even less.

Additional revenue from the two per cent general increase in the supplementary charge is estimated at Rs. 7.5 crores and from the other adjustments at Rs. 3.5 crores, making a total increase of Rs. 11 crores, which will still be only about half the estimated value of new commitments (Rs. 22 crores) in 1964-65.

The financial results for 1962-63, the latest year for which complete accounts are available, reveal a net surplus of Rs. 42.56 crores as compared to the revised estimates of Rs. 23.20 crores. The increase was almost entirely from larger traffic receipts, which came to Rs. 566.79 crores, as against the revised estimates of Rs. 549.62 crores, due particularly to a spurt in goods earnings towards the closing months of the year. Ordinary working expenses amounted to Rs. 362.38 crores, approximating closely to the revised estimate of Rs. 363.14 crores.

Revised Estimates for '63-64

The present forecast of gross traffic receipts for 1963-64 is Rs. 622.22 crores, as against the Budget Estimate of Rs. 599.69 crores. The bulk of the increase is expected to accrue under passenger and goods earnings—Rs. 7.53 crores under passenger and Rs. 12.66 crores under goods. The increase in goods earnings is attributable largely to the increase in the higher rated general goods traffic, over budget anticipations of this traffic, which is expected to more than make up for demands for rail traffic in coal, export ore and raw materials for the steel plants not coming up to expectations.

The revised Estimate of ordinary working expenses comes to Rs. 393.34 crores net, against the Budget provision of Rs. 379.04 crores. The increase in a large measure is due to general taxation changes (inclusive of increase in diesel oil prices) and increase in the prices of controlled material like coal and steel, all of which were developments subsequent to the presentation of the Railway Budget for 1963-64 and have resulted in an increase in the working expenses of the Railways. In addition, an increase of Rs. 3.5 crores is estimated under staff expenditure, due to the increase during the current year in the rates of dearness allowance for lower graded Central Government employees as well as in the house rent and city compensatory allowances payable in certain cities and towns from January 1, 1964. The rest of the anticipated increase represents a variety of other items which could not be precisely assessed in the budget, such as provision under retirement benefits with the raising of age of retirement from 55 to 58, or items representing the effect of post-budget decisions, such as enlargement in the scope of night duty allowance and increase in the rates of mileage and overtime to staff. Staff and fuel costs together account for approximately 75 per cent of the total ordinary expenses, and post-budget developments materially affecting expenditure under these two heads have inevitably increased revenue working expenses. This increase of Rs. 14.30 crores, which figures in Supplementary Demands, is fully covered by the anticipated increase of Rs. 22.53 crores in gross traffic receipts.

The contribution to the Depreciation Fund charged to Revenue Working Expenses, will be Rs. 80 crores, the same as provided in the Budget Estimates for 1963-64. The surplus creditable to the Development Fund is now expected to be Rs. 37.75 crores, against a budgeted surplus of Rs. 31 crores, or Rs. 6.75 crores more.

Capital Expenditure

The Revised Estimates of net expenditure of a capital nature in the current year, on Works, Plant and Machinery and rolling stock, has been placed at Rs. 350 crores, against the Budget provision of Rs. 325 crores, necessitating Supplementary Demands here as well. From the overall resources point of view, the improvement of Rs. 6.75 crores which is expected over the Budgeted surplus, will just meet an increase of a little under rupees seven crores required to cover better delivery of materials and accelerated pace of execution of Plan works which is included in the net increase of Rs. 25 crores over the Budget. Out of the remaining excess of about Rs. 18 crores, over Rs. eight crores represents the effect, on the Railways' Development Programme in the current year, of the general taxation changes subsequent to the presentation of the Railway Budget and increase in prices beyond what was envisaged in the Budget. The balance of Rs. 10 crores represents the restoration—now found necessary—of a cut that was made in the original budget estimates with a view to regulating allotment of funds strictly to what would be necessary according to the progress of works during the year.

In a brief review of the Railways' fully satisfactory performance in relation to the third five year Plan targets, the Railway Minister recalled that, in terms of tonne kilometres, freight traffic had nearly doubled itself in the 10-year period covered by the first two Plan, the originating tonnage increasing beyond what had been carried by the undivided Indian Railway system during the heaviest year of the Second World War. The number of passengers increased by 310 million or by 25 per cent in the same period. The rate of growth of traffic has been further accelerating. Whereas the total increase in originating goods traffic during the second Plan period as a whole was 40.3 million tonnes, the increase in just three years of the current Plan is estimated to be nearly 38 million tonnes. Railways expect to lift about 194 million tonnes in 1963-64 and 211 million tonnes in 1964-65. The aggregate goods traffic expected to materialise in the last year of the current Plan is now placed at about 245 million tonnes in the Mid-Plan Appraisal.

The rate of increase in suburban passenger traffic in the first two years of the third Plan was of the order of 17 per cent. The aggregate increase in non-suburban passenger traffic during those years has been less than four per cent; it is, however, expected that in the remaining years of the Plan, the overall increase will mount up to 15 per cent provided in the Plan.

Strategic Lines

The total outlay, including Rs. 59 crores towards the cost of strategic lines in Assam and North Bengal, approved for the Railways in the third Plan at present stands at Rs. 1581 crores. The provision, including any increase that may yet be granted, is expected to be utilised fully by the end of the Plan period. During the three years upto March 1964, a sum of about Rs. 900 crores is expected to be utilised. On present indications, the Railways hope to meet about one-third of the cost of the Development Programme in the third Plan from their own resources which includes sums annually set apart for Depreciation.

Of the Rs. 283 crores or so, of foreign exchange requirements now estimated, an amount of nearly Rs. 200 crores had already been arranged, including Rs. 48.7 crores obtained, since the last Railway Budget, as loans for the Indian Railways from the I.D.A.—an affiliate of the World Bank—the U.S. Agency for International Development and the Export Import Bank of the United States. The balance would be arranged in the next two years.

In regard to the construction of new railway lines, priority has been accorded to the lines in Assam and North Bengal and the lines required for the export of iron ore. In the former category are the metre gauge extension of Rangapara North-Lakhimpur line to Kurkong Selek and the extension of broad gauge line eastwards to Jogighopa in Assam in continuation of the already opened broad gauge line to Siliguri with a ferry across the river Ganga between Farakka and Khejuriaghat. These projects are in full swing. Of the lines required for the export of iron ore, the major construction from Bailadilla to Kottavalasa is progressing according to schedule. Laying of an additional BG line, alongside the existing Hospet-Cuntakal metre gauge line, is also in progress.

Third Plan Lines

Out of the third Plan lines under construction last year, the Virudhunagar-Manmadurai line has been opened to traffic this year upto Aruppukottai as also the Hatia-Nawagaon line. The Kalkalighat-Dharamnagar line is also expected to be opened shortly. Three major lines—the Sambalpur-Titilagarh, Bimlagarh-Kiriburu and the Robertsganj-Garhwa Road—have been opened to traffic, the first two undertaken in connection with the movement of export ore and the third for movement of coal to the North and West. The construction of Salem-Bangalore line has made appreciable progress. To facilitate the export of iron ore from certain areas of the Mysore State, the construction of the Hassan-Mangalore line had been included in the third Plan. As a first step, a mixed broad-metre gauge link to the projected port site at Panambur has been sanctioned from the present Mangalore railway station.

The handling of traffic in imported foodgrains requiring to be moved northward via Poona is likely to be facilitated by a broad gange rail link from the Mormugao port, connecting with the Miraj-Poona section which is currently under conversion from metre gauge to broad gauge. A second proposal envisages the provision of a broad gauge, in place of the existing Hospet-Londa metre gauge line en route Mormugao port, this proposal being dependent on the prospects of iron ore exports in substantial quantities from the Hospet-Bellary region over and above the ore exports now going from the Goa area. Two engineering-cum-traffic surveys are in progress to examine the justification for broad gauge lines to serve these two objectives connected with the development of Mormugao port.

Electrifications & Dieselisation

The total route length electrified since commencement of the second Plan has now risen from 388 to 1463 route kilometres. Electrification of all the third Plan lines is expected to be substantially completed by the end of the Plan. As a result of re-phasing, adopted mainly to conserve foreign exchange, only two sections, namely the Howrah-Kharagpur section of the South-Eastern Railway and Nandgaon-Bhusaval section of the Central Railway would be carried over to, and completed early in, the fourth Plan.

The Indian Railways' fleet of diesel locomotives of all gauges has grown from 171 units on March 31, 1959 to 454 units at present, and of electric locomotives from 92 to 240. Over 21 per cent of the total net tonne miles of the rail traffic carried in 1962-63 was hauled by diesel and electric locomotives. The percentage has further increased in the current year and the pace of increase will be accelerated with the indigenous manufacture of diesel and electric locomotives which has been taken in hand.

The out-turn of indigenous capacity for the manufacture of wagon production has steadily increased and come up to about 3000 wagons per month. The target of production in 1964-65 is 40,000.

In 1962-63, Railways carried 178.8 million tonnes of goods traffic, exceeding the target set for the year by nearly three million tonnes and surpassing the Railways' performance of any earlier year. The Railways expect to lift in the current year a further 15 million tonnes in the aggregate. Due to reduced demands on rail transport, the increase under coal is now expected to be about 4.00 million tonnes against about 9.5 million tonnes anticipated earlier—a shortfall of about 5.5 million tonnes, notwithstanding the availability of both production potential and transport capacity up to the earlier forecasts. The smaller increase, than earlier anticipated, is now likely to be of about 0.5 million tonnes in the export ore and one million tonnes in regard to raw materials for steel plants other than coal. The slower increase in traffic in the above categories of goods is expected to be made up, to some extent, by traffic in general goods in which the increase is likely to be about 9.3 million tonnes—nearly double of what was anticipated earlier. At present all the freight traffic, which the Railways were called upon to carry, was moving as and when offered. The supply of railway wagons for coal movement, which was a cause for concern two years ago, is now fully adequate; in fact, further spare capacity is available and awaiting demand.

The Railway Minister drew the attention of Parliament to the interim report of the World Bank Team on coal transport in the country. The Team has commended the Indian Railways for handling successfully, within their limitations, the increase in traffic density of almost unprecedented rapidity during the last 12 years. The operating performance of the Indian Railways, according to the Team, compared very favourably with that of Railways of other more developed countries.

Budget Estimates for '64-65

Gross traffic receipts for the year 1964-65 have been estimated at Rs. 668 crores, of which Rs. 184 crores are expected to accrue from passenger traffic; Rs. 432 crores from goods earnings, including Rs. 11 crores from the proposed additional surcharge and other freight adjustments; Rs. 35 crores from 'other coaching' earnings and Rs. 18 crores from 'sundry' earnings.

Railways are preparing themselves to lift goods traffic aggregating 17 million tonnes more in 1964-65 than in 1963-64. This is expected to comprise seven million tonnes of more coal from Bengal and Bihar, two million tonnes more coal from the outlying coalfields, one million tonnes of other raw materials for, and finished products from, steel plants, one million tonnes of export ore and six million tonnes of general goods. It was, however, too soon, the Minister thought, to forecast confidently whether the extra traffic would, in fact, materialise to that extent, especially in coal and general goods.

The Budget Estimate of ordinary working expenses for 1964-65 is Rs. 414.68 crores, which is Rs. 21.34 crores more than the revised estimate for 1963-64. The contribution to the Depreciation Reserve Fund is provided at Rs. 83 crores including the additional contribution of Rs. 10 crores approved by Parliament last year. Allowing for dividend payable to General Revenues at the higher rate of 5.75 per cent on the fresh capital for 1964-65 and a further payment of Rs. 12.5 crores, the usual annual payment in lieu of tax on passenger fares for transfer to the States, the Budget surplus in 1964-65 is estimated at Rs. 30.87 crores which will be credited to the Development Fund. The estimated expenditure chargeable to this Fund in 1964-65 being Rs. 33 crores, there will be a small reduction in the closing balance of this Fund.

The Budget Estimate for works, machinery, plant and rolling stock, including "Open line works—revenue" for 1964-65, has been placed at Rs. 370 crores. This includes nearly four crores of rupees for railway user amenities.

Indian National Income

B. R. SHENOY

IT WOULD be generally agreed that the objective of economic growth is two-fold: continued improvement in the standard of living of the masses of the people and a narrowing of the income contrasts between the rich and the poor. Both aspects of the objective are of particular relevance to underdeveloped economies where considerable proportions of the people are ill-clad and also under-nourished, and there exists at the same time a thin upper crust of over-affluent people, who seem to be able to afford almost anything.

Judged by this double criteria, there has been little economic development in India during the past 12 years. Though statistics show an increase of 54 per cent in Indian national income during this period and this rate of increase compares very well with that of many industrialised countries, it may not be safe to infer from these statistics that the level of living of the Indian people has gone up correspondingly.

Per capita income is more meaningful of the progress of popular well-being than the total national income. During the census decade, 1951 to 1961, Indian population rose at an annual rate of 2.2 per cent; this deflates materially the impression of the economic stride forward which statistics of the aggregate national income might create. Per capita income rose during this period at a meagre 1.3 per cent per year.

Even this slow pace of increase in per capita income exaggerates the possible improvement in popular well-being. For a dependable picture of the latter, the statistics of Indian national income and, therefore, of per capita income need to be adjusted for the ballast they contain. First, part of the increase in these statistics represents unduly large outputs of non-consumer goods fabricated at the expense of the essentials of consumption. The measure of popular well-being is in the consumer goods content of national income. The lion's share of the domestic savings and foreign aid—50 per cent in the first Plan, 60 per cent in the second and even a higher percentage in the third is appropriated by the public sector undertakings. The output of this sector is almost wholly non-consumer goods. Part of the investments in the private sector is also devoted to the same category of production.

Strange Spectacle

This presents the strange spectacle of an economy of hungry and ill-clad people, being busily engaged in producing iron and steel, marvels of engineering, heavy chemicals, electricity, coal and the like, when the masses are so sorely in need of more food, more clothes, more shoes, more education, better roads, better storage and marketing facilities, more fertilisers, better seed, better agricultural implements and so on.

Secondly, part of the increase in the national income statistics represents the creation of excess production capacities and undue additions to inventories. In terms of national well-being this is a wasteful activity. Currently, it is only in one State, Kerala, that irrigation facilities, major and minor, are being used to capacity; the other extreme is Gujarat, where 60 per cent of capacity is unused. On an average about 71 per cent of capacity is in use. Two years back, in 1960-61, this average was 70 per cent; therefore it is not as if the excess capacity was being used up rapidly. Excess production capacities are placed at an average of 40-50 per cent in 40 industries.

Additions to inventories are inevitable in a background of inflation. Under the temptation of rising prices and profits, the trade adds to stocks; when the price rise is rapid, the more prudent consumers may join them. Except for brief breaks, we have had inflation in India for the past over 20 years and inventory build-ups are common. The uptrend in the prices of even commodities the supplies of which have risen faster than money incomes, is evidence of the undue additions to stocks. Foodgrains and essential imports have frequently received considerable speculative attention.

Thirdly, as the well-being of a people must be assessed by the economic condition of the masses, not from the overall magnitudes of the national income, due allowances must be made from the latter for the unmerited or illicit shifts of income, which are known to have taken place in favour of the upper-income groups on a considerable scale during the past decade. Such income shifts have resulted from inflation, from controls and from the undue expansions of the public sector.

The magnitudes of the income shifts from inflation—through corroding the incomes of the fixed and sticky money income groups, the masses of the people, and correspondingly adding to the incomes of a fraction of the community, traders, businessmen and industrialists—may be placed at an average of Rs. 880 million per year during the past seven years.

Unmerited Windfalls

Economic controls, by creating monopolies and semi-monopolies, bring unmerited windfall gains to the traders and industrialists protected by controls; they also give rise to illicit earnings through black market transactions, which controls provoke. Monopoly gains and illicit incomes are ultimately collected from the consumers and accrue generally to people in the better-to-do sectors of society. From this stand-point, import controls are among the worst form of controls. Import licences fetch enormous prices in the market, varying from 30 per cent to 500 per cent or more of their face value, depending upon the commodity concerned. Assuming an average price of 75 per cent, the illicit or unmerited incomes from import controls may be of an annual order of Rs. 4.7 billion. These colossal seems are shared among the corrupt functionaries of the State, the "contact" men and the recipients of the licences, all people in the comfortable money income class. When the Indian consumer purchases an imported commodity, or a commodity manufactured from imported raw materials, he makes a contribution from his meagre income towards the affluence of these people.

Public sector investment outlays have shot up from Rs. 19.6 billion in the first Plan to Rs. 46.0 billion in the second; they are placed at Rs. 80.5 billion in the third. These outlays are a potent source of illicit earnings by the privileged. Mr. R. L. Garner, formerly President of the International Financial Corporation, an affiliate of the World Bank, who has had opportunities of seeing this phenomenon in several parts of the world, has observed: "There is no denying that in many countries graft and corruption in public office lay a heavy tribute on resources which should go into development. The less developed countries have no monopoly on public corruption. But its toll is more destructive in the poorer countries than in the richer societies." This graft and corruption converts into private incomes funds which are accounted to have been invested. The percentages of such conversion may vary widely with projects and opportunities. Placing this at an average of 20 per cent, the anti-social income shifts from the undue extension of the public sector may be of an order of Rs. 1.85 billion during the second Plan period.

If to the above is added monopoly revenues and illicit earnings accruing from price controls, movement controls and other restrictions, the total anti-social income shifts may be of an order of Rs. 47.5 billion per year. This approximates to the average annual increase in Indian national income

INDOPLAST LIMITED,
makers of Thermocole, are
now producing styropor
in collaboration with
Badische Anilin & Soda Fabrik
AG (BASF) of West Germany.
styropor, the expandable
polystyrene invented by Badische
Anilin & Soda Fabrik AG, has
outstanding properties for thermal
insulation and is now being used
in the manufacture of Thermocole
and other polystyrene foams.
Its many applications include cold
storage, refrigerators,
walls, ceilings, floors, roofs
and packaging.

Not Wilde in his wildest imagination could have discerned this similarity in attitude. But there it is—both we and our clanking Canterville ancestor, have Pure Protection in mind. We, of course, do a better job of it, FLEXIBLE ALFOIL PACKAGING—so very much superior to anything known in the Middle Ages, or for that matter in 1963. Nothing can get past flexible foil packs; not germs, not odours, not even that ingenious man the unscrupulous retailer who has but a simple thought, adulteration. That's why reputable manufacturers of pharmaceuticals, confectionery and cosmetics insist on Alfoil protectio for their products.

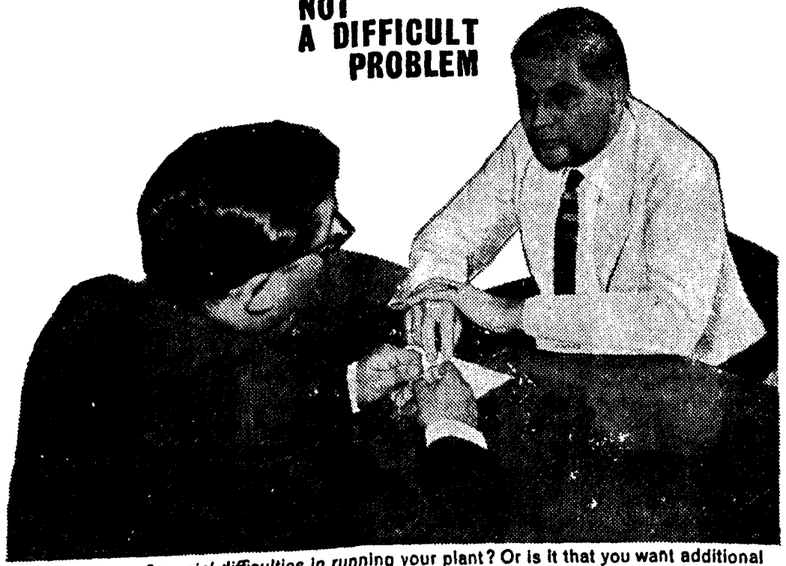
during the past seven years. If so the masses of the people have not been co-sharers in the expansions of the national income. The benefit of these expansions has accrued to the upper-income groups almost wholly. This suggests semi-stagnation at best of the economic well-being of the masses of the people.



We have supporting evidence of this semi-stagnation in the consumption of food and cloth. In the Indian context of poverty, the statistics of the consumption of these basic needs should be enough testimony of the improvement in the economic well-being of the people, at any rate until this consumption reached its norms. Per capita supplies of foodgrains per day have fluctuated downward in recent years; they were at 15.8 ounces in 1958, or below the jail rations of 16 ounces, the army rations of 19 ounces and the Third Plan target of 18 ounces. The per capita supplies per year of cloth declined from 14.7 metres in 1956 to 13.9 metres in 1960.

Further evidence of this semi-stagnation is in the wage rates of the industrial and agricultural workers. Despite an increase of nearly 2½ times in the output per industrial worker, real wages in industries rose by but 10 per cent in a decade. Agricultural wages have positively declined and in the context of rising prices, the indebtedness of agricultural workers has grown. Unemployment, the twin of poverty in underdeveloped economics, has risen.

Much play has been made of the statistical assessment that, while a generation ago the average expectation of life of the Indian people was 24 years, it jumped to 42 years in the "fifties and is estimated at 47.5 years currently." It has been argued that this remarkable progress "reflected better health, better food and better living conditions." The conflict between this demographic improvement and the data pointing to semi-stagnation reviewed above is more apparent than real. The expectation of life is influenced by public health conditions and the general level of consumption. The latter remaining the same, a betterment of public health conditions alone should prolong life expectation through reducing infant mortality and the general death rate. The eradication of malaria in British Guiana had led to a population burst, the rate of increase of the Indian settlers rising to nearly 4 per cent and of the Colony as a whole to 3 per cent. The credit for the extended life span in India should properly go to the D.D.T. campaign and other health measures; it does not reflect an improvement in the economic scene, though better public health conditions are apt, in due course, to add to productivity.

Those who seem to believe that the Indian economy is forging ahead should take a closer look at the economic indicators. The available data suggest that the country is slipping down an inclined plane of economic chaos, social conflict and maybe also moral decay. There is great danger that the topsy-turvy industrial structure that is being put up may come crashing to the ground if its main prop, foreign aid, should diminish or cease. The estimate of Indian national income for 1962-63 issued on 2nd November last shows a further decline in per capita income on top of a decline in the preceding year. This is the first time that per capita income has declined in two successive years. In the past a decline in per capita income has been generally followed by a substantial rise in the following year.

FINANCE FOR SMALL SCALE INDUSTRY? NOT A DIFFICULT PROBLEM

Are you having financial difficulties in running your plant? Or is it that you want additional raw materials to manufacture more—or some money to keep your plant running till you get enough from your sales?
Or it might be that you want a machine or two, to increase your production or to raise your status as a small scale industrialist.
Why not take your problem to the State Bank Agent who will be glad to assist you in all matters connected with your industry? Your security for finance is not the main consideration—what the State Bank seeks is your sincerity and capacity to produce more.
With over 1500 offices throughout the country THE STATE BANK OF INDIA AND ITS SUBSIDIARIES are at the nation's service.

WINDOW ON THE WORLD

Planning: A New Case

From Our Special Correspondent

PARIS:

THE DEBATE about the role of democratic "indicative" planning in free economies, which has been going on in West Europe since the relative success of the French plans was recognised, will come to a head this year. This is because all the members of the Common Market save West Germany have been converted to the doctrine (along with several neighbours like Britain and Spain), and the question is now posed of a regional economic plan covering the Common Market as a unit. The ECM Commission has drawn up an "economic programme" that it thinks applicable to the six nations jointly, and it will be on the agenda for 1964. Official West German opinion has not abated its opposition to any form of avowed planning (an attitude that is compatible with surreptitious government planning such as is rife in the "liberal" economy of the Federal Republic), and no spectacular conversion can be looked for just as Dr Erhard takes over the reins. The debate promises to be agitated, often because liberal doctrinaires refuse to see that what others call "planning" or programming has little to do with the totalitarian direction of affairs, of which nations like Germany have had recent and unhappy experience.

Obsessed with that experience, liberal opponents of such schemes as the Brussels Commission has outlined believe that any form of planning entails some or all of the following things: the fixation of rigid targets, a forcing of the rate of growth beyond what is "natural" or recently achieved, interference with the price mechanism and with free markets, a general reduction of competition, extension of State activity in the productive sphere, and finally (in order to protect this whole artificial mechanism from outside forces) a tendency toward autarchy. Indeed, it would not be hard to find cases where planning has meant just those things, e.g. in the various forms of totalitarian (communist or fascist) planning, and in the plans of some developing countries. However, this is not what the majority of West European nations have in mind now and it is not what has been practised under the name "planning" in France. It is interesting to confirm this, in the case of a nation that has just launched its first four-year plan, modelling its project closely on the French precedent and drawing on the advice of the World Bank.

Contrary Position

That case is Spain, whose 1964-67 economic plan was approved by the Cortes (in one of the few genuine debates that institution has had under the present regime) in the last days of December. On every one of the points mentioned above as constituting opponents' idea of planning, the Spanish plan adopts just the contrary position. That is, it does not set fixed targets, it projects a slower rate of growth than has been achieved in the past few years, it does not limit but rehabilitates the price mechanism and free markets, it aims to extend competition and to introduce it in departments where it has been lacking, it sets rigid limits to Government activity in production and, lastly, far from favouring autarchy, it is designed to make Spain an "open" economy by integrating it into the trade and finance network of the Western world. Faced with this paradox, liberal opponents may ask in what, then, the Spanish project resembles a "plan." The answer of the Spanish Plan Commissioner, Mr. Lopez Rodo, is that the scheme is precisely a copy of French planning methods in that "what we are seeking is to increase investments by a better selection and co-ordination of them, to rationalise our productive mechanism, and to favour a competitive market."

That the Spanish plan does not answer opponents' caricature of an economic programme is suggested by the mere fact that Spain should turn to the methods of her neighbours at just this moment. For, if a plan were either an extension of governmental activity or an attempt to pull an economy up by its bootstraps, then Madrid would have no use for it and would not have been advised to adopt one by the World Bank and the OECD. On the first point, the Spaniards and their advisers are agreed that excessive governmental activity has been the root cause of the country's recent stagnation, and the plan aims to correct it. As the OECD says, "The impressive apparatus created in the past decade to direct in detail the working of industry was supposed to make the country self-sufficient, but in reality it has been one of the causes of the chronic stagnation of exports and of the balance-of-payments crisis." The plan, then, is the means to root out, or at least rationalise, disorderly governmental intervention, by making State projects answer the same criteria of fitness as apply to all other activities in a co-ordinated programme.

Take-Off Stage

On the second point, the case is just as clear. Far from needing a plan because of hopelessness about recent development, Spain is credited in the latest OECD survey with having attained, since 1961, a stage of take-off—using that expression without the mystical connotation it has in the Rostow philosophy of history, i.e. allowing that what takes off is perfectly capable of belly-landing soon after. In other words, the economy has attained a self-propelling phase that would seem to dispense the authorities from providing further stimulants to growth in the immediate future. The economy has at last got moving and there are many signs that it will keep moving, so the plan is not intended to work any miracle but rather to ensure that development is harmonised and in particular that inevitable bottlenecks are foreseen in time and dealt with rationally.

Adoption of a plan at this point, therefore, suggests that for Madrid and its friends planning does not mean what people in Bonn affect to fear. This becomes clearer in the details of the document voted by the Cortes, and, incidentally, in the discussion of the plan in that pseudo-parliament, where the worst opponents found to say of it was that it was a means of "handing Spain over to international capitalism," i.e. to West Germany and the USA, principally. To be sure, the plan entails a style of economic management that would be more favourably viewed in Bonn and Washington than by the socialists who are more commonly credited with advocating national planning. To that extent, the rump fascist party in Madrid is better founded in opposing it than are the liberals in Bonn in decrying a Common Market economic programme.

This is so because the plan is based on the belief that economic development is promoted best by private initiative, provided the operation of initiative is assisted by voluntary coordination that supplements the co-ordinating effected by free markets and real prices. This voluntary harmonisation of a host of industrial projects takes place under Government auspices and is extended to the State's own projects which, in total, constitute the biggest business in any modern society, however liberal it may be. If there is any pushing around to be done, as liberals fear there must be in any plan, the most likely victims are just the State's own departments and corporations, since the demand for harmonisation and rationalisation will be directed at the biggest and most disorderly sector of the economy first—and that is the public sector in any country. By the way, this is exactly the reason why Italian businessmen have been converted this winter to planning in their economy, because they see a national plan as the only means to stem and put sense into the proliferating activities of Government.

Liberal Intention

Insisting throughout on the restoration of free markets and the price mechanism as the way to eradicate excessive protectionism and to bring irrational State projects to book, the Spanish plan is liberal in intention. But of course it recognises that free markets alone cannot handle such problems as the equalisation of conditions in a badly unbalanced country, the control of inflation in the process of development, the most reasonable allocation of resources, etc. That is why it provides for the co-ordination of activities, the harmonisation of the major economic options and the perfection and publication of all the information that can be gathered on what the various economic agents propose to do—why, in short, it is an indicative national plan. Targets are for the most part global or macro-economic, relating to such matters as the gross national product, public outlays and the relative shares of consumption and investment. Except for a very few basic industries like steel and electricity, the plan contains no detailed targets yet, i.e., no orders to this person or that to produce so much of a certain commodity, or else. All the targets it contains, and such as may seem feasible to fix as the plan goes along, will remain subject to revision, and indeed a procedure for systematic revision is an integral part of the plan itself. Direct Government intervention, outside of agriculture, is resolutely excluded in all productive activities.

There is no question, of course, of holding Spain up as an example for imitation in the matter of economic policy, and Spanish conversion to the planning doctrine adds no weight of conviction. The point is simply to show that, in yet another case, a West European country is having resort to democratic planning without any concession to the "socialist" temptations that are reputed to lie behind it. As for toalitarianism, which in liberal eyes contaminates to a greater or less extent all national planning, it can truly be said that in Spain in 1964 the thing that is least totalitarian is exactly its national plan, an innovation that marks the liberalisation and modernisation of an inefficient dictatorship.

Overheating in the British Economy

PAUL BAREAU

LONDON:

ECONOMIC EXPANSION in Britain has recently become unmistakeably tinged with inflationary symptoms. The increase in production has been eminently satisfactory — well in excess of the target figure of 4 per cent per annum, rather hopefully fixed by the National Economic Development Council. Now the all too familiar phenomenon of over-full employment and of excessive strain on some segments at least of the economy is beginning to appear. Wages are not merely creeping but bounding up. The NEDC economists, projecting the recent wage increases and increased overtime hours and earnings over the rest of the year 1964, estimate that the wages bill this year will rise by at least 8 per cent over 1963. The most optimistic estimate of the expansion in output of goods and services puts this at 5½ per cent. Here, therefore, is the inflationary gap returning to the economic stage.

Some effect of this has already been apparent in the overseas trade figures. Although both exports and imports rose by 7 per cent in 1963 as compared with 1962 the trends over the year were disquieting. The rate of increase in exports was declining towards the end of the year, while for imports it was increasing, as British industry began to restock in earnest in order to feed the steadily increasingly volume of output. There is still no evidence that the balance of payments is in deficit. Sterling remains stable in the exchange market. Moreover, if any pressure on sterling develops as a result of this restocking boom, there are ample reserves, and several lines of them, with which to take the strain.

But if the trends apparent in recent weeks continue, the danger will undoubtedly arise later this year, or in 1965. If it does and sharp corrective measures have to be taken to protect sterling, one of the victims will be the present highly satisfactory rate of expansion. We have not yet solved the problem of "expansion without inflation", even though Ministers and the Chancellor of the Exchequer in particular proclaim this parrot cry in almost every major speech they utter.

The Chancellor has, however, recognised the danger. In a speech which he has recently made he spoke of the need for a changeover from "rapid acceleration to a high and consistent cruising speed". This reflected recognition of the need for some fairly early specific measures to pull back the rate of growth to a more sustainable level. There is every prospect that the forces feeding this rate of growth will continue to operate, given the momentum which has been imparted to them. Consumer demand is being steadily fed by higher wages and higher profits. The Government has embarked on a large number of new capital projects which whether on roads, electric power, education and health will put further strain on the resources of the economy. Within the last few days has come the half-yearly Board of Trade Survey which shows that private capital spending in 1964 is expected to rise by 10 per cent.

Drift into Inflation

Since the economy is already showing signs of overheating, the drift into inflation is self-evident. If so far it has had so little effect on sterling and the balance of paymens, it is in the first place because the same tendency is apparent in so many other countries, and secondly because so much has been said about the increasingly close monetary co-operation between the major countries of the world and of the extent of the reserves available to repel any speculative attack on their currencies.

The Chancellor, nevertheless, is worried — and rightly so. He knows full well that the essential quality of official intervention in the regulation of the economy lies in good timing. Unless some corrective measures are taken in time, those that will be needed when the storm breaks will be needlessly harsh and merely repeat the lunacies of our two not so dis-

tant bouts of 7 per cent Bank rate with all that went into this contractionist mixture.

Alas, politics are interfering with good economics — not for the first, and, needless to say, not for the last time. Were it not for the fact that a General Election is impending, it is probable that Bank rate would have been raised from 4 to 5 per cent by now. The political inhibitions are there and this no doubt explains the rather pathetic eagerness with which the Government have been clutching at various proposals for stopping if not inflation, at least its consequences, by appeals and exhortations.

Appreciable Reduction

The recent Council meeting of NEDC was made the occasion for another appeal to the trade union leaders to exercise restraint in demands for higher wages. In order to secure their allegiance various proposals were made for parallel measures to influence prices and profits. It was suggested from the Government side that a Commission should be set up, comparable to the National Incomes Commission, to which any inordinately high or important increases in prices should be referred. Some of the employers on the Council even brought forward a proposal for a graduated tax on excess profits, the excess being measured in terms of the NEDC expansion target of 4 per cent per annum.

Needless to say the trade union representatives refused to play this ball. In any case they have not the power to commit individual trade unions in the matter of wages policy, and if they signed a general declaration in favour of restraint they would promptly be disowned. Moreover, they too are governed by political motives. If there are any concessions to be made from the trade union side, they will be reserved until such time as a Labour Government is in power — and the present indications are that this will be after the next General Election which must be held in 1964.

Apart from all other considerations, these appeals are poor economics. It is attempting the impossible to substitute exhortations and incantations for economic policy. If there is excessive demand for the available economic resources, be they human or material, wages and prices will sooner or later go up. The Government cannot hope to feed inflation with one hand and try to hold back the consequences with the other. It looks, therefore, whichever government is in power after the next General Election, as if some application of the economic brakes, whether through tax policy or through a restriction of credit and dearer money, will have to occur before the year is out. The sooner the process is begun the less will be the severity of the corrective measures.

In one respect credit must be given to the British Government for a decision of economic policy which will pull in the right direction and which will take a good deal of political courage to put into effect. This is the announcement that the system of price fixing, known as Resale Price Maintenance, is to be abandoned. This will open the door to a price cutting war in retail trade. Already cries of anguish are going up from the small shopkeepers. The proposal is undoubtedly packed with political dynamite but the Government may calculate though there are 200,000 small shopkeepers there are 30 million consumers who have the vote.

Gas Struck at Bogapani

By Our Special Correspondent

NEW DELHI:

GAS HAS been struck by Oil India in the second test well drilled by this 50:50 partnership concern between the Government of India and the Burmah Oil Company, at Bogapani, in its second concession area in Dum Duma, Upper Assam. The first well drilled in this region at Tanali is said to have proved only a dry hole. It has, therefore, been abandoned.

An assessment of the gas discovery at Bogapani obviously will take some time. The field, of course, is believed to be commercially exploitable. Gas has been found in the Bogapani well in two fairly thick horizons.

The failure to strike oil at Tanali and Bogapani has not disheartened Oil India. On the contrary, the discovery of gas is spurring the company to intensify its exploratory efforts. Four more test wells have been planned to be drilled in this area during the next financial year. Arrangements are said to be under way to start drilling the third well near Namrup in the near future.

In view of the rapidly growing demand for petroleum products in the country and oil being a wasting asset, Oil India is understood to be determined to continue its exploratory efforts in Dum Duma for the next three or four years at least.

Alongwith oil prospecting in the Dum Duma region, seismic surveys are intended to be undertaken soon in the Ningru area in NEFA for which the company was granted an exploration licence a few weeks ago.

Meanwhile, efforts are being made to develop the Naharkatiya-Moran oilfields in the first concession area of the company, to a production potential of 3 million tonnes of crude required to feed the Noonmati and Barauni refineries. This level of output is expected to be achieved well before the second one-million-tonne unit of the Barauni Refinery goes on stream in the second half of the current calendar year.

**

After a five-hour meeting here last week, the Steering Group for Iron and Steel has recommended that the fourth Plan should aim at production of 17.5 million tonnes of mild steel (ingots) — 16 million tonnes for meeting the domestic requirements and 1.5 million tonnes for export — 0.75 million tonnes of alloy steels and 4 million tonnes of pig iron. The Group has, thus, brought down its recommendation of August last for the production of 18 million tonnes of mild steel ingots in 1970-71, by 0.5 million tonnes. The new target suggested for alloy steels output, on the face of it, also is a scale-down from the one million tonne target recommended in August, 1963. But, in fact, it is a slight upward revision. The proposed production of electrical steels (180,000 tonnes) and low alloy high strength steel (100,000 tonnes) is not included in the 0.75 million tonne target. These are now considered as "tonnage" steels to be produced by large steelworks. The pig iron production target remains the same as recommended by the Steering Group in August last.

For achieving the production target of 17.5 million tonnes mild steel ingots by 1970-71, the Group has suggested raising of installed capacity to 18/19 million tonnes. This, it has recommended, should be attained through expansion of Bhilai to 3.25 million tonnes, of Rourkela to 2.5 million tonnes, of Durgapur and TISCO to 3 million tonnes each, of IISCO to 2 million tonnes, and by setting up a 4-million-tonne capacity steelworks at Bokaro, a 0.5-million-tonne unit based on Neyveli lignite and Salem iron ore and one more plant of 1.5-million-tonne capacity either in the Vizag-Bailadila or Goa-Hospet area. If two plants of 1.5-million-tonne capacity are to be set up in the Visakhapatnam and Gao areas during the fourth Plan period, one of these should be built only up to the blast furnace stage.

Dovetailing Stages

Top priority has been suggested for setting up the Bokaro Plant. It has also been recommended that instead of completing this steelworks in two stages of 1.5 million tonnes and 2.5 million tonnes, it should be pushed through straightway to a capacity of 4 million tonnes. Dovetailing of the two stages, it is thought, will require comparatively small capital outlay and should lead to more economical use of the steel mills. Taking up of the two stages of Bokaro simultaneously is envisaged to yield a production of 2.5 million tonnes of ingots by the end of the fourth Plan period.

So far as alloy steels are concerned, the Group felt that an output of the order of 3.2 million tonnes could be expected from the Durgapur Alloy Steel Plant, the Mysore Iron and Steelworks and the 13 private sector units which have made some reasonable progress. Further capacity will have to be created in this line of manufacture to fill the gap of slightly over 0.4 million tonnes. For this, the Group has recommended expansion of the Durgapur Alloy Steel Plant by another 120,000 tonnes and licensing of new units both in the private and public sectors. The Group has also suggested that the proposed Salem Steel Plant should be so designed as to be utilised for the manufacture of special steels. It has been further recommended that raw steel manufacturers should be given licences to create additional capacity for the production of alloy steels.

According to a note prepared for the Steering Group by Department of Steel, the additional capacity that will have to be set up for the production of alloy steels, should cater to the production of the following categories to the output levels shown against them.

	(In tonnes)
(a) Alloy & other machinery constructional steels such as En 8, En 16, En 18, En 32, etc.	100,000
(b) High Carbon and silico-manganese spring steels	43,000
(c) Free-cutting steels	169,000
(d) High speed, tool and alloy steels, including ball-bearing steels, high carbon high chromium steels, magnet steels etc.	47,500
(e) Stainless and heat-resisting steels	35,000
(f) Alloy spring steels, such as En 47, En 50 ..	9,400
(g) High alloy constructional steels such as En 21, En 23, En 24, En 28, En 33, En 40, etc.	10,700
TOTAL	414,600

About pig iron, the Steering Group has suggested that six more blast furnaces with an annual capacity of 400,000 tonnes each should be set up to fill the gap of 2.25 million tonnes between the present production and the 4-million-tonne target proposed for the fourth Plan. It has further recommended that most of the additional capacity for the production of pig iron should be created in the public sector as the private sector's performance in this sphere had been disappointing. Whether the new blast furnaces should be set up in the coal belt or on the coastline has been left to be decided

by the Government on consideration of the economics of the two propositions.

The acute position in regard to pig iron supplies is expected to ease somewhat towards the close of the current Plan as a result of setting up two blast furnaces at Bhilai (6th blast furnace) and Durgapur (5th blast furnace) ahead of steel-making. Orders for the sixth blast furnace at Bhilai are expected to be placed in the second or third quarter of this year. Those for the fifth blast furnace at Durgapur may be placed in about seven to ten months.

Tenders for Bokaro are expected to be issued between June and October this year. The feasibility report on the proposed steel plant in the Goa-Hospet area has been received by the Government. The report on the Visakhapatnam-Bailadila plant is expected by the end of this month. The project report on the Salem Steel Project is likely to be ready by June.

**

In view of the comfortable coal supply and the improved facilities available for its haulage to various parts of the country, the Union Government does not propose to give in future any subsidy or inducement for encouraging use of furnace oil in place of coal as energy producing material. This was indicated by the Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, at a meeting of the Joint Working Committee of the coal industry last week.

The Minister also stated that the Government decisions on industry's plea for an upward revision of coal prices could be expected by the end of this month. The Swaminathan Committee's report on the issue, he added, was receiving his consideration. He, however, emphasized the need for evolving a suitable formula for ensuring that the consumer paid for the quality of coal he actually received and expressed concern at the imbalance between the demand for and supply of coking coal.

Dwelling upon the pattern of coal supplies obtainable currently — scarcity of certain grades of coal alongside glut of others — Mr. Subramaniam said that the Government was studying the question of balancing production with demand, taking into consideration the quality as also the regional pattern of output and requirements. The Indian mining interests are said to have pointed out that any long-term rationalisation of coal production should take into account not only the demand pattern but also the resources available for raising coal.

Accumulating Stocks

Although the planned target for 1963-64 coal output had been fixed at 75 million tonnes, actual raisings during this year are estimated at not more than 68 million tonnes. But, despite this, pithead stocks have been accumulating and are currently estimated at around 5 million tonnes. Both the Government and the industry feel that this state of affairs has resulted from the slackening of the tempo of economic activity in the country. The industry, however, is said to have assured the Government at the last week's meeting that it was prepared to carry stocks somewhat in excess of the normal in view of the need to keep the development of energy resources ahead of requirements.

The industry, it is further learnt, impressed upon the Minister that what was required today was not only an increase in the price of coal but also removal of some other disabilities of mining. It asked for higher depreciation and depletion allowances on the ground that it was working mines on a three-shift basis which led to wearing out of the machinery and equipment at a rate much faster than under the normal working conditions. Mr. Subramaniam is understood to have assured the industry that he will take up this matter with the Union Finance Minister. He appeared to be favourably disposed towards this plea of the industry.

Among the other issues to which the industry's representatives drew the attention of Mr. Subramaniam were the enlargement of the list of mining machinery imports, correction of the loading line of BOX wagons by the railways, the legal requirements of providing cap lamps in gassy mines, further liberalization of subsidies for stowing and hard case assistance and implementation of the recommendations of the Experts Committee on re-grading of coal on the basis of calorific value. The Minister is said to have disclosed that a revised list of mining machinery imports was already being prepared by his Ministry for the guidance of the Finance Ministry. He also thought that since most of these imports were being effected under the World Bank loans, there should be no difficulty in granting the announced concessions on these imports. He wanted the Railway Board to instal weigh-bridges at all depots. Pending this, the loading line on box wagons could be rectified in consultation with the Coal Controller, who after analysing various qualities of coal, would be advising the Railway authorities about the volumetric density of each grade of coal. He promised to discuss the legal requirements of providing cap lamps in gassy mines with the Union Ministry of Labour with a view to removing hardships caused to small colliery-owners on this account. About re-grading of coal according to calorific value, the Minister is stated to have said that the Government had accepted the recommendations of the Experts Committee in principle, but would be implementing them in stages owing to some practical difficulties. He thought that an outlay of Rs. 24 lakhs for securing necessary machinery for undertaking this re-grading programme could be easily found.

After the meeting of the Joint Working Committee, some Indian coal mining interests are understood to have informally discussed with the officials and the Minister the implications of removing ceilings on the prices of "HH" (coking) and Grade II coals. They are believed to have expressed fears that this step would have very adverse effects on the fuel economy of the country. Many producers of medium grade coal might have to close down their mines, resulting in an irreparable national loss. They are understood to have further pointed out that once a mine was closed, its re-opening required a number of years.

**

The recommendations made by the Swaminathan Committee in its interim report on simplification and speeding up of administrative procedures relating to industrial licensing, it is learnt, not only cover requests for licences for setting up new units, but also those for the expansion of the existing ones. Expansion plans of the existing industrial units, therefore, will be treated in the same manner as applications for licences for new units for the expeditious issue of "letters of intent" and grant of sanctions in matters like capital goods clearance, capital issues, approval of foreign collaboration terms etc.

**

In a statement issued on February 7, Mr. K. C. Neogy confirmed the doubts expressed in "Eastern Economist" of January 17, 1964, that he resigned the Chairmanship of the Committee on Transport Policy and Co-ordination not on health grounds, but owing to two other reasons — (i) insufficient co-operation extended to the CTPC by the State Governments, the Planning Commission and other Governmental organisations; and (ii) the differences that arose on policy matters after the terms of reference of the World Bank Study Team, originally invited to make a "feasibility study" of the right modes of coal transport, had been widened to include inquiries into movements of other bulk commodities, the scope of railway rating on the basis of costs, shifting of traffic from railways to roads, problems of industrial location in relation to transport and the pattern of future investments in various forms of transport.

The widening of the scope of the World Bank Team's

study, Mr. Neogy asserts, amounted to a parallel inquiry being held by this Team on the issues entrusted to the CTPC. The freedom given to the World Bank Team to select persons whom it wished to co-opt in this country to represent the Indian view also contained, in Mr. Neogy's opinion, the risk of the country being confronted with recommendations which it might not be in a position to implement if they involved modifications of the established national policies that had social and political implications. He regrets that as a possible way out, his suggestion to adopt the Argentine model for enabling the World Bank Team to secure Indian participation in its deliberations on honourable terms, did not find favour with the Planning Commission. In the circumstances, Mr. Neogy says, he was left with no option but to resign his Chairmanship.

Pointing out how complex the problem of transport co-ordination is, Mr. Neogy asserts that nowhere in the world this problem has been solved satisfactorily. He has drawn attention in this respect to a report submitted by Mr. M. R. Bonavia, the British transport expert provided under the Colombo Plan to advise the CTPC, and hopes that in conformity with the precedents set by him, this illuminating document will soon be placed in the library of Parliament.

Now new non-official is likely to be appointed as Chairman of CTPC. Knowledgeable circles opine that Mr. Tarlok Singh, Member Transport, Planning Commission, may be entrusted with the task of completing the Committee's assignment.

Swatantrites in Sanguine Spirits

From A Correspondent

BANGALORE:

THE TWO-DAY deliberations of the third National Convention of the Swatantra Party at Bangalore were a notable success not only because of the large number of delegates—over 600—that were present but also because of the refreshingly businesslike manner in which the work of the Convention was conducted as scheduled. It is not surprising, therefore, that the assembled Swatantrites dispersed from Bangalore in a significantly sanguine frame of mind. One even sensed a perceptible change — almost a transformation — in their attitude from that of an opposition party that did not seriously believe it could ever come into power into that of one that would be ready to step in if the people were to demand it. Some of the realistic suggestions offered by the Party must have already set both the Congress and the other political parties thinking hard about their own solutions and strategy to meet the new situation. There is, however, a feeling, in certain still non-aligned sections of the public, that the unsparing attacks of the Swatantra Party on the Prime Minister were avoidably ruthless, even personal, and that, because of this, the Swatantra Party has possibly lost quite a few prospective additions to its ranks. But the defence of the Swatantrites seems to be that, inasmuch as the Prime Minister is all in all and that nothing can happen in this country without his consent, overt or covert, this seemingly personal attack on the Prime Minister cannot be avoided.

Whatever or however dim or distant the prospects of the Swatantra Party coming into power may be, there is no gainsaying the contention that, given certain prerequisites, Swatantra will emerge as the main opposition party both at the Centre and in the States (Swatantrites believe they may even form Governments in some States). These prerequisites are: (1) that the polarisation (as between the Leftists and the Rightists) must not be put off any longer, and (2) that, in such an event, the Swatantra Party must align or identify itself more closely with other Rightist parties, if it cannot bring about a merger of all Rightist parties, and clearly spell out a pragmatic economic policy. In fact, it is suggested in informed quarters, this must be the mandate it should ask of the electorate, a mandate on which it would fight the next elections. Judging from the proceedings of the Bangalore Convention, there would appear to be some hope of such a consummation. Take, for example, the resolutions on the Swatantra Alternative, on the State Monopoly of Banking, on Independent Non-Political Board for Licences and Permits, on the Constitution (17th Amendment) Bill and on Electoral Understandings. All these concern subjects or issues that must needs cut across party lines, save that of the rightists and the leftists. But, if all the Rightists make common cause at least in so far as these issues are concerned, there is no reason why a stable and strong Rightist front cannot be forged out. The sooner this is done, the better it would be, argue the sponsors of this view-point.

Now, to take the above resolutions one by one. In their resolution on the Swatantra Alternative, the Party has not only refuted certain allegedly wrong assumptions about the Swatantra stand on planning but has also clearly indicated its own approach to the problems of economic development. The test it proposes to apply in each case is one to which even Gandhites cannot take exception, for it is a test that had been suggested by the Mahatma himself, namely, "to ask if the step contemplated is going to be of any use to the poorest and the weakest members of the community". Considering that it is these members, in whose interests the party in power is supposed to be doing everything, but, at the same time, these happen to be the very people who are the least benefited, the very thought of such a fresh approach must be heart-warming to those concerned. It is unnecessary to list all that the Swatantra Party has said in its resolution on the subject. Suffice it to say that the Swatantra Party believes that its approach would lead to more rapid and less painful economic development. This approach does not need explaining, as some seem to think, for the simple reason that this approach is neither new nor novel, having been successfully tried out by other countries. Even after making allowances for ostensible differences in circumstances between India and these countries, it is permissible to maintain that, with a different orientation, better results than under the prevailing pattern of planning are possible.

On the question of nationalisation of Banking, the Swatantra Party has declared its outright opposition and questioned it in principle. The speeches made at the Bangalore Convention underlined the grave consequences of any such attempt to trifle with the functioning of banks for the country's delicate credit mechanism and pointed out that, far from helping the Government, it would create problems, both at home and abroad, such as the loss of a valuable market for Government securities and the impossibility of functioning abroad, especially in countries where State-managed banks are not allowed to operate. In Singapore, for instance, it was stated, the Bank of China was obliged to close down, despite the presence of a sizable Chinese population. Moreover, asked the speakers on this resolution: Is there anything that the Government of India cannot do now which it hopes it can do after nationalisation?

The trouble with the banking industry, as was made clear, is not the absence of adequate powers with the Government to control and regulate it, but the absence of a purposeful and effective enforcement of the available powers. To give a dog a bad name and to hang it may be a good strategy in

politics, but, in the economic sphere, it may prove suicidal. If the expected gains are not going to be real or substantial, any such drastic remedy as the one proposed is surely uncalled for.

The resolution urging that the control of the distribution of licences, permits and quotas be vested in an independent non-political board relates to a necessary reform that cannot be delayed any longer in the prevailing atmosphere, believes the Swatantra Party. Setting up anti-corruption or vigilance bodies, according to it, is only to nibble at a problem that has corroded public life much too much in this country. Mr. C. Rajagopalachari, the Founder of the Party, has been contending that licences, permits and quotas are granted under powers taken by the Government in modification of the Fundamental Rights and Freedoms guaranteed in Part III of the Constitution. The issue to him is, therefore, of the greatest economic as well as political importance. He has gone to the extent of demanding that all political parties must obtain a mandate on this issue from the electorate. He is impatient to wait till the next general elections for this and so would want this mandate to be secured even in by-elections. Those speaking on the resolution understandably reflected this righteous indignation of their leader. If the suggestion is accepted, "the country can expect to have a non-political statutory board free from all influences and political pressures and enjoying the same independent status as the supreme judiciary", reads this resolution.

Seventeenth Amendment

To the Swatantra Party must go the credit for having set in motion the agitation and studiously and sedulously mobilised public opinion against the proposed Seventeenth Amendment to our Constitution. The Swatantrites feel convinced that this is a dangerous attempt further to erode the already fast famishing Fundamental Rights guaranteed to the people of India by the Constitution. In particular, they are bitterly opposed to the extension of the expropritory principle, so far applied only to feudal landlords, to ryotwari holders as well as to every other type of land-ownership. By the already extended interpretation of the term "public purpose" and now by redefining the term "Estate", to include every form of landed property, even those small pieces owned by the humblest of peasants, the Party contends, the relevant bill now on the legislative anvil perpetuates "a gigantic fraud on the Constitution and on the people of India." Accordingly, the resolution adopted by the Bangalore Convention calls for unqualified resistance to what it describes as a further attack on the Fundamental Rights of the people. It has also promised the peasants and other interests affected by the proposed amendment that it would stand by them in resisting this attempt at snatching away their lands. If, however, the party in power should get the amendment accepted by reason of its majority in Parliament, the Swatantra Party has solemnly undertaken to have the amending legislation repealed. One can vividly visualise the prospect here of a reptition of the fate that befell the controversial legislation concerning the nationalisation of Britain's Steel industry under the Labour and the Conservative Governments.

Fundamental Differences

There is then the resolution on electoral understandings. Obviously, it is not easy to get all opposition parties, not even those wedded to the common objective of fighting the Communists, to come together. There are fundamental differences in the approach of these parties to several problems, but not until and unless all these parties agree to forge a common front will they be able to put an end to the prevailing anomaly of a party which has not got even 50 per cent of the total votes polled ruling the country as though it has been returned by an overwhelming majority, as Mr. M. R. Masani, General Secretary of the Party, has pointed out in his Report to the Convention. Swatantrites, it is argued, do not ask the different political parties to abandon their differing ideologies, but they would want them to co-operate only to avoid multilateral contests which give an undue advantage to the ruling party. By the way, this experiment has been tried in some cases and has yielded gratifying results. Notwithstanding this revealing and rewarding experience, he would be an incurable optimist indeed who expects a complete elimination of multilateral contests. For, even if the seemingly impossible common front becomes possible, there may be some obliging independents who can make mincemeat of the common front. Evidently realising this, the resolution falls back, in the last resort, on Swatantrites only and calls upon them to concentrate on hard, sustained and disciplined work to spread the Party message. The Swatantra Party claims, not altogether unwarrantedly, that only its policies provide a clear-cut and effective alternative to the Congress Government's policies. As things stand today, the Swatantra Party, despite all that it has achieved, thanks to its Founder's incisive thinking and intensive campaigning, cannot by itself dislodge the Congress. But if it should get all other Rightist parties such as the Jan Sangh jointly to declare at least a common economic policy which everyone of them agrees to stand by, the people of this country would be able more clearly to identify the different ideological groups and to make their decision as to whom they should support. If the goal is orderly progress and stability, it is evident, there is not very much more time left in which to achieve such a consummation.

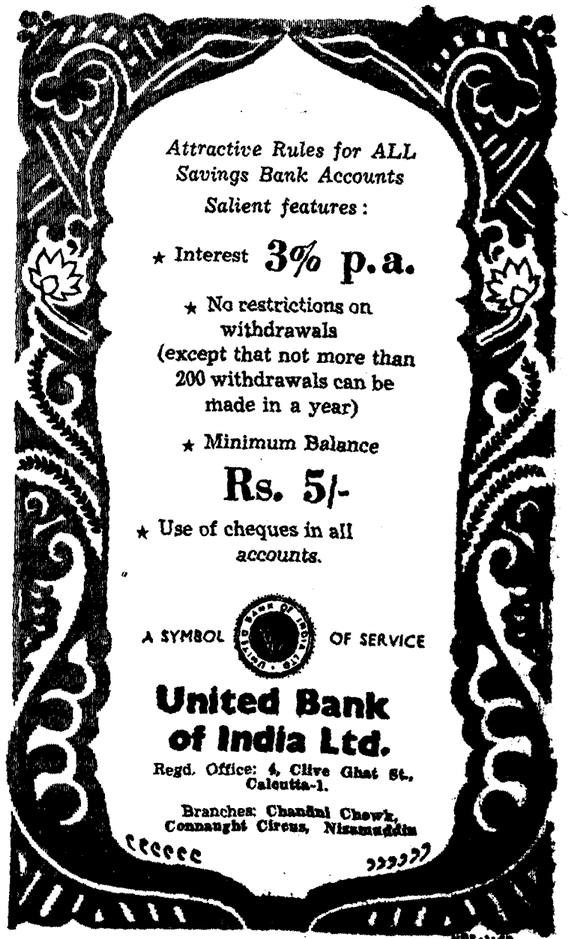
Dispersal of Industries

From Our Correspondent

BOMBAY:

IN THE emerging industrial complex of Maharashtra, as well as other States in the Western region, the small-scale industries constitute a large reservoir of productive capacity. How far this productive capacity is tapped fully both for normal development and for the pressures of emergency, would reflect ultimately the diffusion of industrial prosperity in the region as also the improvement of the conditions of the lower strata of the population. The concept of agro-industrial development has mainly influenced the formulation of the third Plan in the State of Maharashtra, particularly, the promotion of joint sector undertakings by State participation has been the major object to spread out industries of medium and small size, in the industrially backward zones. For this purpose, the Maharashtra Industrial Development Corporation has been planned, to organise among others, the development of industrial areas in the semi-urban and rural parts, with a Plan provision for advancing loans to the corporation of a crore of rupees. The latter is expected to finance further development activities by revolving its own funds that may be raised by the sale of plots. The provision of facilities in land, water supply and power to the public sector undertakings has also been taken note of in this programming of industrial growth in the neglected parts of the State.

Regarding joint-sector undertakings, pioneered by the Maharashtra State, the Plan target for State participation was Rs. 2.7 crores of which nearly a crore of rupees would have been invested by the end of the current financial year. Besides, the Plan target for provision of facilities for public sector undertakings of the Centre was a crore of rupees, of which, again nearly 60 per cent would have been spent by this year. Mr. S. G. Barve, Minister for Industries, after his recent talks with the Central Government, has emphasised that the expansion of the joint sector industries would be accelerated and where private sector is hesitant, the State would push through the industrial expansion on its own. He particularly referred to the possibility of Government taking over some five or six derelict textile mills and though this was not the general policy, this had to be done if the private sector did not take the necessary initiative and drive in running these industries. It was the preferred policy of the Government, as explained by him, to assist industrial expansion by participation of the private sector. But, at the same time, one would agree with him, that there are certain industries of crucial significance to the State which are lagging behind and which have not been taken up by the private sector for expansion. There are even some industries which need to be dispersed in the interests of plan growth and initiative has not so far come from the private sector to run these industries. In such cases, the State Government, he said, may have to use its own resources to promote expansion. He cited the case of pig iron project which has been on the programme for a couple of years, but for one reason or another, this has not yet taken shape.



**

The Small-Scale Industries Corporation of Maharashtra, which has been constituted last year, will serve as a stockist of raw materials, particularly iron, steel and non-ferrous metals required by the small-scale industries. In order to speed up the development of small industries in the rural areas, the District Industrial Board has been established on a pilot basis and these industrial boards, when they are extended to all the districts, are expected to operate with more vigour and give a fillip to the progress of the small-scale industries. Looking to the progress of the small industries so far, the end of the second Plan saw the establishment of only five industrial estates against the target of 10 estates in Maharashtra. The third Plan has proposed the establishment of 44 new estates, out of which, 2 are sponsored by the Government, 38 by the co-operative societies, 1 by the municipality and the remaining 3 by the functioning estates. Out of the government sponsored estates, one will be established in Poona for accommodating industries affected by the floods. The integration of industrial estates sponsored by the different authorities will naturally pose problems in due course.

The major problem with the small industries within the City of Bombay has been the threat of their being shifted to the suburbs. While it has been the policy of the State Government to encourage the shifting of the industries from the congested areas, the practical difficulties arising from this process, have halted this programme. It now appears that on the representation of the Federation of Associations of Small Industries in the western region, the Municipal Corporation of Bombay has decided not to issue notices on industries having a permit for a limited period to shift from their existing sites, unless they are categorised in the group of 'nuisance industries of a high intensity'. The State Industries Commissioner has also assured that they will not be asked to shift without being provided alternate sites. Besides, the Commissioner has stated the Municipal Corporation has included a number of industrial estates in the development plan for Greater Bombay, primarily meant for small-scale industries. Under the plan, 29 such sites are in the City and 8 are in the suburbs. This will show how still the City has a preference even for small-scale industries, possibly due to the facilities that are already available and lack of facilities in the suburbs. The estates contemplated in the City will comprise mostly of multi-storeyed structures, inevitable under the demands for space, while the suburban sites only will be developed as open plots. In fact, 4 of the estates in the City and 2 in the suburbs are nearing completion. The position on the whole shows the need for a further re-thinking on the location and pace of development of small-scale industries in Maharashtra, if the major policy objective is to be achieved.

**

A regional conference of the constituents of the FICCI in Gujarat, Madhya Pradesh and Maharashtra which met recently in Bombay revealed the usefulness of such periodical discussions as also the limitations of such meetings without adequate preparation on the vital subjects that affect regional development. The observations of the President of the FICCI covered a wide general field. However, the need for an intensive effort towards better co-ordination in the sales-tax policy pursued by the State Governments and uniformity in their administration was a point that received unanimous approval at the conference. He also stressed the impact of the sales-tax laws on our export performance and commended the action taken by the Maharashtra and Gujarat Governments in granting relief or concession in sales-tax on commodities exported. The inadequacy of power and other economic overhead facilities in the new State of Gujarat was prominently highlighted as a drag on the onward move of the economy. In this connection, it was appropriately stressed that the Narmada river project should be implemented with utmost

speed. Several views were expressed at the conference on the large leeway to be made up in improving the transport and communication facilities, particularly in the less developed areas and the removal of inter-State regulations and restrictions which hamper the development of road transport. It was felt very necessary to expedite linking of Kandla port with the hinterland if the port should develop as expected. And concern was also expressed at the inordinate delay in the construction of the proposed Jhund-Kandla broad gauge railway line. One useful suggestion made at the conference was that there should be meetings of businessmen at district and taluka levels; this would contribute significantly to the study of local problems and the practical difficulties at every stage of development. The regional conference of the FICCI could indeed be a powerful focal point if pointed study papers were prepared in advance for discussion on specific regional problems.

**

The Indian Merchants' Chamber, Bombay, has prepared a pre-budgetary economic survey and review of budgetary trends which deals with all the important sectors of the economy. It is shown that the additional taxation at the Centre will yield Rs. 800 crores more for the Plan period than was originally estimated. Including the tax effort at the State level, there will be an increase of Rs. 700 crores in receipts above the estimated target. This will take the proportion of normal tax receipts to national income to over 14 per cent as compared to 11.4 per cent indicated in the third Plan. Another analysis made by the Chamber regarding the income-tax data between 1953-54 and 1960-61 showed that the distribution of income for all individuals had shifted in favour of persons earning less than Rs. 5,000 per year. Again, the distribution of income for individuals earning more than Rs. 5,000 per year had shifted against higher income brackets. A comparison with the rates of direct taxation in the UK, the USA, Malaya and Japan (see table below) indicated that the rates of direct taxation in India were the highest at all income levels; only in the case of the UK and Japan the rates were slightly higher than that of India in the income ranges up to Rs. 26,666 per annum.

PERCENTAGE OF DIRECT TAXATION

Income (Rs.)	India	U.K.	U.S.A.	Malaya	Japan
13,333	6.9	7.7	2.9	2.5	15.6
26,666	17.6	18.8	11.4	6.9	23.0
40,000	27.7	22.6	14.8	10.3	27.5
53,333	35.9	24.5	16.9	12.9	30.6
66,666	42.5	26.5	18.7	15.6	33.6
80,000	47.7	28.8	19.9	18.7	35.3
93,333	51.5	31.6	21.6	21.7	37.2

Wanted: A Realistic Tax Policy

From Our Correspondent

CALCUTTA:

WELFARE BEFORE wealth and distribution before production —this has been the policy of the Government in pursuit of what it calls its broad socio-economic objectives. Consequently, the fiscal policy, which has been oriented towards that end, has succeeded in neither increasing wealth nor in promoting welfare. In his address at the third quarterly meeting of the Indian Chamber of Commerce, Mr. K. K. Birla sought to drive this point home. The main problem today, as Mr. Birla rightly emphasised, is not limitation of incomes, but their all round expansion through a higher rate of production and through larger savings and investment. Until the country's capital resources grow to a suitable point, any emphasis on social objectives would only remain ineffective. The Government's tax revenue over the past 12 years rose by 175 per cent, while the increase in national income over this period was only 54 per cent. The aggregate yield from taxation, said Mr. Birla, during the first three years of the third Plan was Rs. 1,900 crores against the tax target for the entire Plan period of Rs. 1,100 crores. It is obvious that the economy is unable to bear the tax load any further, so the rate of growth in industrial production and expansion has disturbingly slowed down. Mr. Birla urged rethinking on fiscal policy, pointing out that a tax system which does not stimulate simultaneous expansion in the country's productive activity is bound to do serious harm to the cause of economic progress.

**

What is happening to the heavy machinery complex which is being built near Ranchi in Bihar at such great cost? A fire at the Heavy Engineering Corporation's plant is reported to have destroyed Russian-built machinery including transformers, generators, fitted components for overhead electric cranes, electric cabinets, lathes, and milling machines to a total (estimated) value of about a crore of rupees. Another fire, it is reported, had broken out earlier, but damage, if any, has gone unreported. Public opinion is agitated by the fact that the authorities are extremely reluctant to disclose any materiil information. One inference is that security arrangements are insufficient; another is that fire fighting equipment is inadequate. A more serious thing to consider is that the loss of all this equipment will mean further delay in the completion of the project which has been given a pivotal position in the country's scheme of industrialisation.

**

It has been a persistent complaint of Assam that the financial help which has been available to it from the Centre for the State's five-year Plans are far less than what is required. The State had asked for an additional allocation of Rs. 14 crores for 1964-65, over and above Rs. 20 crores of Plan allotment, but the Centre, while tentatively promising Rs. 10 crores, actually gave a grant of Rs. 7.7 crores. Consequently, the State Government has little choice but to curtail such essential projects as power and flood control but reduction in these programmes would affect the State's economy very adversely. Flood damage to food crops apart from loss of life and property every year has been extensive and the State will not be able to attract industries as long as her present power deficiency persists. Moreover tea gardens in the State want more electricity to improve working facilities and living facilities for labour. The State Government is already committed to build a power grid for the gardens, but it has not the funds to do it. Therefore, the State Electricity Board is at present negotiating with the Tea Board for a loan. Side by side, the Government is pressing the Centre for giving at least Rs. 10 crores instead of Rs. 7.7 crores it has sanctioned, and according to a Press report quoting Assam's Minister for Industries and Planning, New Delhi is now inclined to restore the cut of Rs. 2.3 crores. Assam is also trying to get some P.L. 480 funds for her rural development programme, and a move has been made through the US Consulate in Calcutta.

**

In keeping with the current favourable trend in the new issues market and flotation of new companies, the number of companies newly set up in eastern India during the quarter ended December 1963, came to 93, as many as 75 being in West Bengal alone. The relatively underdeveloped State of Orissa had only seven companies, but in terms of the aggregate authorised capital this State's share was the most impressive. For the total of 93 new companies, the authorised capital altogether amounted to Rs. 19.98 crores. Orissa accounted, for Rs. 11.16 crores, whereas West Bengal with its figure of 75 had an authorised capital of Rs. 8.38 crores. The remaining 11 companies were distributed between the two other States of Bihar and Assam, the authorised capital in their case coming to only Rs. 44 lakhs. It is obvious that the new companies in Orissa are giant-sized, which are mostly additions to the growing industrial complex in northern Orissa, centred round the Rourkela steel plant. This State's industrial potential is vast and well known, but the chief hindrance has been the absence of an adequate network of roads and a system of transport which could make its mineral belt easily accessible.

**

The Union Minister for Transport, Mr. Raj Bahadur, made a sensible speech at the two-day conference of State Transport Secretaries and Transport Commissioners held in Calcutta last week, concerning the economic problems of the road transport industry. While asking the participants to offer their suggestions on such important questions as the organisation of the road transport industry into viable units, taxation of the industry, the problem of its finances and the need for co-ordinated development of roads and road transport, Mr. Raj Bahadur said that there was a definite case for making a proper study of the impact of taxation on the development of this industry. Transport operators have been complaining that taxes account for as much as 30 per cent of their costs, and these have become great disincentives retarding the growth of the industry. This is indicated by the fact that vehicles of all makes are not being readily absorbed by the industry, although the traffic demand on the road transport industry has been steadily growing. The study group appointed by the Union Ministry of Transport is now enquiring into taxation procedures obtaining in different States concerning the vehicles plying on inter-State routes with a view to rationalising and co-ordinating them, and thus ensuring that, while the operators make their legitimate contribution to the exchequer, they are not subjected to any avoidable hardship. Mr. Raj Bahadur wanted the States to co-operate with this group and furnish their answers soon so that the Road and Inland Water Transport Advisory Committee could have the group's report at an early date and consider the actions to be taken.

Power Plans for the South

From Our Correspondent

MADRAS:

NO APOLOGY is needed for again discussing developments in the power situation in Madras State. The years 1964 and 1965 will stand out as major landmarks in the history of the Madras State Electricity Board as, after the big addition to hydel generating capacity with the commissioning of three units under the Periyar scheme a few years back, the biggest additions to installed capacity will be effected in this and the next year. Indeed, with the completion of a number of projects in the next two years there will be a virtual doubling of installed capacity without, of course, taking into consideration the thermal units erected at Neyveli by the Central Government. If the developments in Neyveli are taken into consideration, it can be said that 1963 also was an important landmark in power generation as three units having a capacity of 50 mW each were completed in that year.

The implementation of schemes relating to the latter stages of the Kundah project, the two phases of the Mettur Tunnel Scheme, the execution of the Periyar Extension Scheme and the commissioning of first units on the Parambikulam project are expected to add to generating capacity by 580 mW towards the end of next year. In 1964-65 under the Kundah project alone it is reckoned that four sets will be commissioned, one each in Plant 1, 2, 3, and 5 accounting for a total 135 mW. The Mettur Tunnel Scheme will account for 100 mW, two sets of 50 mW each being involved in the first stage. As the fourth unit at Periyar also is scheduled to be completed by the end of this year, the fresh capacity created would be 270 mW. It is also hoped that the fifth and sixth units at Neyveli will come under steam taking the aggregate total for 1964-65 to 370 mW. In 1965-66, which is the last year of the current Plan period, the Kundah project will have another two units of 60 mW and 50 mW each. While the third and fourth units in the Mettur Tunnel Scheme will be able to generate additionally 10 mW, the first fruits from the Parambikulam project will also be derived in that year, two units in Sholayar accounting for 70 mW and one unit at Sarkarpathy for 30 mW, in all 310 mW. As it is expected that by March 1966, the seventh unit at Neyveli also will be completed, the new additions will amount to 410 mW or 780 mW including 200 mW from the Neyveli thermal station.

This bunching of projects will indeed result in a considerable improvement in the power situation though it will also bring in its wake new problems. The execution of the different projects has been carried out expeditiously and efficiently and the Madras State Electricity Board should probably be thinking about what it will have to do during the next Plan. Available water power resources in the State have been virtually exhausted and a search is going on now for harnessing relatively small falls. It is not expected that these new hydel projects will be able to account for more than 80 to 100 mW. It has, therefore, been emphasised that the Hogenekal project should be taken up as early as possible and the investigations completed thoroughly and without loss of time. It is not known what will be the decision of Mysore State. But with our neighbouring State busy with the construction of huge hydel projects, it would be helpful from the point of view of the consumers on both sides of the border if the Madras State Electricity Board was asked to handle the work on this project in a big way. There is a difference of opinion about the location of the project, the Madras Government's estimate being 800 mW if the project is located at Hogenekal and Mysore Government's estimate being 1,250 mW if it was situated within Mysore territory. The economics and feasibility of the respective schemes are, therefore, to be examined clearly and a satisfactory decision reached. Meantime, it has also been suggested that the Kalpakkam Nuclear Station should be constructed by the Madras State Electricity Board under the formal supervision of the Central Government as there seems to be a feeling that the work will be completed in a much shorter period if it were handled at the State level especially as the Canadian Government might be interested in providing the necessary equipment for this nuclear station after the example of the Ranapratapsagar project in Rajasthan. It is also not known what exactly will be the final decision on the proposal for installing thermal capacity based on coal for 300 mW.

The schemes for the fourth Plan will necessarily be different from those of the earlier three Plans when the Board was preoccupied mainly with the exploitation of available water power resources. There will obviously have to be some different thinking and a large number of schemes taken up which will maintain the tempo of development.

Immediately, the State's Minister for Industries and Electricity has emphasised the need for proper utilisation of available capacity. It is apprehended that for sometime there will

be idle capacity in the nights though during day the peak load problem would still be felt. Even now the indusrtial units are working on a staggered basis while agricultural operations are carried out during nights. With the completion of the smelter of the Madras Aluminium at Mettur, the expansion plans of Mettur Chemical and the promotion of many large industrial units, the utilisation of generated power during day time and even during night for part of the capacity will not arise. It is pointed out that Madras Aluminium smelter alone will consume nearly the whole of power generated at Mettur. It has also been suggested that the expansion of ingot capacity of this unit cannot be delayed for long. But there will still be the problem of minimum load during nights especially as the thermal stations have to be operated at optimum levels. Mr. Venkataraman, therefore, suggested a few days back that industrial units which are engaged in single shift working must take advantage of the improved power situation and introduce two shift working, the additional shift operating during nights. It is expected that with the extension of rural electrification, there might even be a surprising increase in the use of power for agricultural operations. If the whole situation is carefully watched in the next two years and the necessary adjustments are made there can be a substantial boost to industrial and agricultural production.

★★

The TVS group is embarking upon a new venture in the field of automobile ancillary industry to manufacture "foundation brake equipment" for all automotive vehicles manufactured in India. The project is likely to cost Rs. 2.5 crores; the factory will be situated at Padi, near Madras. The collaboration of Joseph Lucas (Industries) Limited, UK, and their associates, Girling Limited, Birmingham, UK has already been secured. The latter are the leading manufacturers in a wide range of braking systems and feed a large part of the European market. The TVS has decided not to raise any capital from the market in the first instance. Rs. 1.5 crores will be the paid-up capital while the balance will be arranged through borrowings from various sources. The paid-up capital to be subscribed by the group will be 51 per cent of the total while Girling Lucas will subscribe the balance 49 per cent. The collaborators will get only 2 per cent royalty taxable in India and another 1½ per cent royalty for technical assistance to be provided by them.

Currently, automotive brake equipment of different types originating from the UK, the USA, Italy and Germany are in use, and there is a considerable lack of standardization. This new venture will strive to achieve a high degree of standardization in designs and suitability. It will manufacture complete foundation brakes for passenger cars, trucks, trailers, tractors and allied hydraulic operating equipment. This is the first fully integrated project in India for brake equipment. The first India-made brakes will be marketed by April 1964. It is estimated that in the initial stages of production, the indigenous components will be nearly 85 per cent of the product and will rise to 95 per cent in the course of the next three years. The licenced capacity of the factory is 96,000 units per annum though the capacity to be attained by the end of 1965 will be around 50,000 to 60,000 units. But for a few lathes, etc., all the machinery will be imported and the collaborators will meet the foreign exchange requirements through their share of capital. It means that no foreign exchange expenditure is involved in the promotion of the project. When the unit attains its full capacity, it is likely to save the country's foreign exchange equivalent to Rs. one crore. Sixteen Indian technicians are already obtaining training in the UK factory of Girling and more will be sent if and when required. The price of the equipment to be manufactured by this factory ranges from Rs. 215 to Rs. 1500 per vehicle, depending upon the size of the equipment. It has been estimated that the prices of these brakes will be the same as the landed cost of equipment produced in the UK. There is a possibility of a reduction in prices in 1965.

PLANNING OR ANARCHY?

PLANNING IN THE USSR: I. A. Yevenko.
A comprehensive study of the methodology and problems of planning in the USSR. An important contribution to the study of economic planning in other countries also. pp. 250 Rs. 2.00

TWENTIETH CENTURY CAPITALISM: E. Varga.
An essay on the most important changes that capitalism has undergone during the last decades by a well-known Soviet economist. pp. 157 69 nP.

The moving finger writes

POLITICS IN the Capital are getting curiouser and curiouser. Not long ago everybody was saying that Mr. Nanda had done a good job in Kashmir. And yet no sooner had Mr Lal Bahadur been inducted into the Cabinet than Kashmir affairs had been quietly taken out of Mr. Nanda's hands and made over to the Minister without Portfolio. I am not saying that Mr. Lal Bahadur is a wrong choice or a poor one for the task. On the contrary, I gladly acknowledge that he has been an excellent diplomat in a difficult situation, combining tact and patience with decision and firmness. But what I am asking is why the Home Minister, who has not by any means proved inadequate, should have so promptly been put on the shelf so far as Kashmir is concerned. The present situation in our domestic politics being what it is, it is obvious that the nuances in the Prime Minister's dealings with his colleagues are bound to be widely noticed.

★★

It is equally strange that neither the Minister without Portfolio, who is supposed to be the Prime Minister's understudy in a sense, nor the Home Minister, who after all is No. 2 in seniority in the Cabinet, nor even the Defence Minister, who has been rather left alone in recent political speculations, apparently had anything much to do with Gen. Ne Win who paid a surprise visit over the weekend. The Chairman of the Burmese Revolutionary Council had an hour's talk with the Prime Minister at which no one else was present. Apart from Mr. Nehru, Mr Dinesh Singh, Deputy Minister in the External Affairs Ministry, was the only one (excepting the permanent officials) who is reported to have had any business discussions with the visiting General. Considering that our Burmese guest had obviously not come simply to enquire after Mr. Nehru's health and considering also the Prime Minister's own recent illness, I think that such goings on are rather unsatisfactory. It has been suggested that India's relations with China was among the topics which interested the Chairman of the Burmese Revolutionary Council. If that is the case then senior and concerned Ministers of the Government should have been let in on the talks. In the circumstances, I do hope there will be a full statement in Parliament on the Ne Win visit.

★★

I am raising these matters here for certain important reasons. I have an uneasy feeling that an effort is being made to reassert too soon and too dogmatically the totality of the Prime Minister's presence and leadership in the Government. Hence, perhaps, the curious spectacle of Mr. Nehru witnessing the Cricket Test Match or being present in Parliament for the Presidential Address, with a personal physician in attendance. I would, of course, concede that the Prime Minister is not wholly to blame. What must be held responsible are the elements of immaturity, opportunism or sheer political adventurism in the ruling party. For this reason I must confess that I am entirely unimpressed either by Mr. Mahavir Tyagi's determined clowning at the meeting of the Congress Parliamentary Party held on the lawns of the Prime Minister's house last Sunday or by the devout resolution adopted on the occasion calling upon Mr. Nehru to resume normal leadership soon. It seems to me that if a certain standard of political and personal morality is not developed among Congressmen, particularly their leaders, in the crucial months ahead, much of Mr. Nehru's own Life Dream of building a great India—impersonal except in its millions and both stable and strong by virtue of a leadership which has confidence in itself and can co-operate within itself for the good of the country—is bound to be frustrated. To put it bluntly, what is really needed now is for those in the leadership of the ruling party to make honest and reasonable use of their opportunities to convince the nation of their appropriateness or adequacy for the national needs and challenges that might crop up in the future. In any case, if people would huddle under a banyan tree on the least indication of an anxious or uncertain outside, the tree certainly should be the last to blame.

★★

Mr. D. Sanjivayya, lately Congress President, in one of his recent speeches urged Congressmen to set up a code of conduct. Mr. Sanjiva Reddy, admirably aided and abetted by the Congress Parliamentary Board, has now done so. Surely, the most electrifying good news to come out of political affairs in recent months was the prompt offer of the Andhra Pradesh Chief Minister to quit office in deference to an observation in a judgment of the Supreme Court in a case arising out of the nationalisation of road transport in Andhra Pradesh. It is to the credit of the Congress High Command that it has found courage to endorse Mr. Reddy's decision, since it is obvious that its attitude in this case is bound to be compared (to the embarrassment of persons in high places) with the position taken in the Kairon affair. As to Mr. Sanjiva Reddy, his status and reputation, in the result, are bound to go up and it is pleasant to note that he belongs to a younger generation of able Congress leaders who may well come to play an increasingly important role in national affairs in the not-too-distant future.

★★

Mr. Kamaraj, I learn, is staying, while in New Delhi, at the Madras House, which is the Guest House of the Government of Madras. While this may be an improvement on the earlier practice of Congress Presidents being provided with Central Government bungalows in the Capital, one might still ask whether it is at all right that public buildings, built and maintained out of the tax-payer's money, should be permitted to be utilised by political parties or their bosses. The Madras House, if I understand its purpose aright, is intended to accommodate Ministers and officials of the Government of Madras visiting the national Capital on official work — i.e. Government work. The Congress President is a member of the Madras Legislative Assembly, but he is not a Minister now, nor is he an official or a representative of the Madras Government visiting Delhi on Madras Government work. In the circumstances, I do not see how his use of Madras House can be justified.

★★

I see that the E. A. Ministry has sponsored a demonstration tour of Japan by P. C. Sorcar, the well-known Indian magician. The Japanese Government and the Japanese people, of course, are themselves great wonder-workers. I am not talking here of pulling rabbits out of hats, but of the far more useful tricks such as the building up of one of the world's most productive and dynamic economies under almost all the limitations that can be imagined. I can hardly wait for Budget Day to find out whether our Government has by any chance become wise to a Tokyo trick or two of working an economic miracle. That miracles alone may perhaps be able to save this country from its economic stagnation is certainly a relevant thought.

Trade Winds

INTERNATIONAL FINANCIAL TRENDS

PRESENTING the annual survey of the activities of the International Monetary Fund, its Managing Director, Mr. Paul Schweitzer, summarized the main financial and economic developments in the world during the last two years. He pointed out that 1962 was a year of generally favourable developments and that this trend, on the whole, continued in 1963. In both years, economic activity expanded in most of the industrial countries. In 1963, the cyclical upswing that began in the United States about three years ago accelerated, there was a revival in activity in the United Kingdom, and most of the other countries continued to increase output under condition of high level of employment. The continued upward trend in some of these countries had its effect on wages and prices, especially in Western Europe. Increasing inflationary pressures in these countries have recently called for corrective action. In contrast, there has been continued relative stability in costs and prices in the United States and the United Kingdom. On the whole, there has been progress towards a better equilibrium in world payments during the last two years. However, capital movements among the industrial countries have, at times, caused strains during these two years. Large out-flows of capital earlier in the year 1963 have recently induced the United States to intensify its programme of action to reduce its overall payments deficit. However, the payments imbalance of the United States, even though calling for continued vigilance, appears, on the whole, to be approaching not unmanageable proportions.

It is also encouraging that international financial trends among the developing countries as a group, have improved somewhat during the last two years. The downward movement in the prices of primary products has been reversed and the value of exports of the primary producing countries has recently risen, at least at the same rate as world trade. Nevertheless, it must be recognized that the majority of these countries still face considerable difficulties in carrying through their policies of economic growth and in achieving a reasonable balance in their international transactions.

In general then, the international financial scene has been calm. Among industrial countries, there has been further progress in monetary co-operation and the monetary system as a whole has operated smoothly.

LEIPZIG FAIR

With the theme of "Technical progress in the service of free international trade", the German Democratic Republic's famous Leipzig Spring Fair will take place from the 1st to 10th March, 1964. The Fair will be comprised of two main sections, the technical and the consumer goods sections. There will be 60 Fair groups with a total exhibition space of 3,00,000 sq. metres. About 60 countries will be participating in the Fair. Besides all industrial European countries, there will be exhibitors from 11 Asian countries, 10 African countries and 9 American countries, including the United States. Visitors from 90 countries are expected to come and see the 64 Leipzig Fair.

The Directorate of Exhibitions, Ministry of International Trade, will set up an "Indian Collective Pavilion" and co-ordinate and arrange the display of exhibits and samples from the interested Indian parties. The Indian exhibits at the Fair will cover more than 1,000 square metres. The character of the Indian exhibition is now changing from year to year. While at the beginning the main stress was put on such traditional goods as handicrafts and textiles, India's exhibition at the Leipzig Fair now reflects more and more the growing industrialisation and economic strength of the country. Next to primary products such as tea, coffee, tobacco, cashewnuts, spices and oil cakes, the exhibits now include an increasing number of engineering goods such as machine tools, electric motors, automobile and bicycle parts, electric cables, scientific instruments, chemical and pharmaceutical products, etc.

PARIS FAIR

The Government of India have decided to organise participation in the forthcoming Paris International Fair, which is scheduled to be held at Paris from May 17 to 28, 1964.

The Fair offers an opportunity and effective media for publicising Indian merchandise and the products of newly developing Indian industries not only in France and its adjoining countries but also in the former French territories in Africa from where a large number of businessmen and industrialists usually visit the Fair. It is, therefore, designed to give both visual and commercial publicity to a selected range of India's exportable merchandise for which a market in that area could be developed.

Apart from the display and visual publicity of Indian goods, information on their quality, utility, price range, availability and full addresses of the suppliers in India, their terms of trade etc. will also be disseminated in the Fair.

EXPORT-IMPORT ADVISORY COUNCIL

In the interests of better co-ordination, the Export Promotion Advisory Council and the Import Advisory Council have been merged into one and named "Export-Import Advisory Council". The functions of the re-constituted Council have been enlarged in the context of the fast developing world trade and the need to conserve India's foreign exchange. The Council will, inter alia, advise Government on policies and programmes of foreign trade, make suggestions on import-export policy and procedure, export promotion, import rationalization and substitution, and discuss the difficulties of the trade, manufacturers and consumers as a result of the operation of import-export controls. The Minister of International Trade will be the Chairman of the Council and its members will include representatives of the established importers, actual users, export promotion councils, commodity boards and other organizations of importers and exporters. The first meeting of the Council will be held in New Delhi on 26th and 27th February, 1964.

INTERIM WAGE INCREASE

The Government of India have accepted the recommendations of the Central Wage Boards for Iron Ore Mining industry and for Limestone and Dolomite Mining industries, for interim wage increase for workers. The concerned employers have been requested to implement the recommendations as early as possible. The minimum emoluments of unskilled workers are to be raised to Rs. 2.50 per day or Rs. 65 per month. Emoluments include basic wages, dearness allowance, cash food subsidy and/or value of food concessions in cash or in kind, but not bonus. All workmen will get a minimum interim increase of Rs. 7.80 per month (or 30 nP. per day). Workmen whose total emoluments are Rs. 100/- and above, but less than Rs. 150/-, will get an interim wage increase of Rs. 10.40 per month (or 40 nP. per day) and those who get Rs. 150 and above shall get Rs. 13 per month (or 50 nP. per day).

In those cases where workmen are already getting an interim wage increase as a result of recommendations of the Iron and Steel Industry Wage Board, no further interim increase will be given. The amount of interim relief shall be shown as a separate item till the final recommendations of the Wage Board are made and thereafter such final recommendations will prevail. The interim wage increase is to be paid with effect from January 1, 1964.

The wage increase will, however, have the effect of increasing the cost of production of iron and steel and will also affect the industry in respect of exports. Though the Wage Board could not yet examine these points carefully, it is expected to submit its recommendations to Government on these points in due course.

ELECTRIC FURNACE EXPERT

Mr. H. Sanders, a leading British expert on industrial furnace applications, is now touring India, meeting metallurgists and engineers and acquainting business executives with new, improved techniques of melting and heat treatment of ferrous and non-ferrous metals. An authority in electric furnaces, Mr. Sanders has spent 30 years on industrial furnace development work with A.E.I.-Birlec in Birmingham, which is perhaps the largest industrial furnaces organization in the world. He is visiting industries in West Bengal, Madras, Mysore, Kerala, Maharashtra, Madhya Pradesh, Punjab, Rajasthan, Uttar Pradesh and Delhi. While in Delhi, he will deliver a lecture at a joint meeting of the Institution of Engineers (India), the Indian Institute of Metals and the Indian Institute of Foundrymen, on 20th February, 1964.

AIR FRANCE

Air France's new office at Scindia House, New Delhi, formally inaugurated by the Vice-President of India, Dr. Zakir Hussain, is among the most modern of the 180 Air France Agencies spread all over the world. In his speech, the French Ambassador, Mr. Garnier, recalled that the importance of Delhi as a tourist centre had been steadily growing over the years. Referring to Mr. Rieffel, Air France's Regional Manager for South Asia, the Ambassador pointed out that the number of travellers who leave Delhi for Europe or the United States and fly direct to or through Paris, had increased by 40 per cent. during the last one year (from 1962 to 1963).

The bilateral air agreement between the Indian and French Governments permits the Air France four weekly frequencies through India, East bound and West bound. Hence, Air France is now operating three flights a week through Delhi and one flight a week through Calcutta, East to Bangkok, Saigon, Manila, Hongkong and Tokyo, and West to Teheran, Tel-Aviv, Rome and Paris.

LUFTHANSA INCLUDES AMSTERDAM

With effect from 1st April, 1964, Lufthansa will include Amsterdam in its European network. There will be a daily flight between Frankfurt and London via Amsterdam. Lufthansa used to maintain regular services to Amsterdam on this route, before the war.

FICCI PRESIDENT

Mr. K. P. Goenka, a well-known industrialist of Calcutta, has been unanimously elected President of the Federation of Indian Chambers of Commerce and Industry for the year 1964-65. Mr. Goenka has been on the committee of the Federation since 1948 and became its Vice-President last year. He has been closely associated with a number of governmental committees and public bodies such as, Export Promotion Advisory Council, Reserve Bank of India, Central Tea Board, etc.

EXPORT PRICES OF CARDAMOM

The Government of India has refixed the minimum export prices of different grades of cardamom as follows: **Alleppey Green Cardamom:** AGEB—Cardamom extra Bold Rs. 19.50; AGB—Cardamom Bold Rs. 17.50; AGS—Cardamom Superior Rs. 16.50; AGS 1-Shipment Green-1 Rs. 15.50; AGS 2-Shipment Green-2 Rs. 13.50; AGL-Light Rs. 11.50 (No change); **Coorg Green Cardamom:** CGEB—Extra Bold Rs. 19.50; CGB-Bold Rs. 17.50; CGI-Superior Rs. 16.50; CG2-Coorg Green or Motta Green Rs. 15.50; CG3-Shipment Rs. 13.50; CG4-Light Rs. 11.50 (no change); **Mixed Cardamom:** MEB-Mixed Extra Bold Rs. 19.50; MB-Mixed bold Rs. 17.50; MS-Mixed Superior Rs. 16.50; MSI-Mixed Shipment I Rs. 15.50; MS2-Mixed Shipment II Rs. 13.50 and ML-Mixed Light Rs. 11.50 (No change).

The ceiling prices as at present in force will remain unchanged.

MICA EXPORTS BANNED

Exports of Mica under any form other than fabricated Mica have been banned. Shipments of unfabricated mica will, however, be permissible if irrevocable letter of credit to the extent of at least 90 per cent of the invoiced value of the goods has been opened in favour of the exporters. Shipments of the following varieties of Mica will be allowed only at, or above, the minimum f.o.b. price per kg. indicated against each: No. 3 Book form splittings 1st quality Rs. 41.80, 2nd quality Rs. 37.40; No. 4 Book form splittings 1st quality Rs. 37.40, 2nd quality Rs. 31.90; No. 4½ Book form splittings 1st quality Rs. 31.90, 2nd quality Rs. 27.50; No. 5 Book form splittings 1st quality Rs. 28.60, 2nd quality Rs. 24.20; No. 5½ Book form splittings Ist quality Rs. 19.80, 2nd quality Rs. 16.50; No. 6 Book form splittings Ist quality Rs. 12.10; 2nd quality Rs. 9.90; No. 3 Loose splittings Rs. 30.80; No. 4 Loose splittings Rs. 26.40; No. 4½ Loose splittings Rs. 22; No. 5 Loose splittings Rs. 19.80; No. 5½ Loose splittings Rs. 11; No. 6 Loose splittings other than cheap loose Rs. 4.40; No. 6 Ist Loose splittings Rs. 3.85; No. 6 2nd Loose splittings Rs. 2.75; No. 6 3rd Loose splittings Rs. 2.20; and No. 6 cheap Loose splittings Rs. 1.65.

Certain fabricated varieties of mica viz., micanite, built-up mica, mica tapes, mica cloth, mica silk, mica paper, mica folium, all varieties of mica cut or punched to specified shapes and sizes and mica powder will continue to be allowed to be freely exported without any stipulation of letter of credit and without any fixation of any export floor prices.

EXPORT PARTNERSHIP

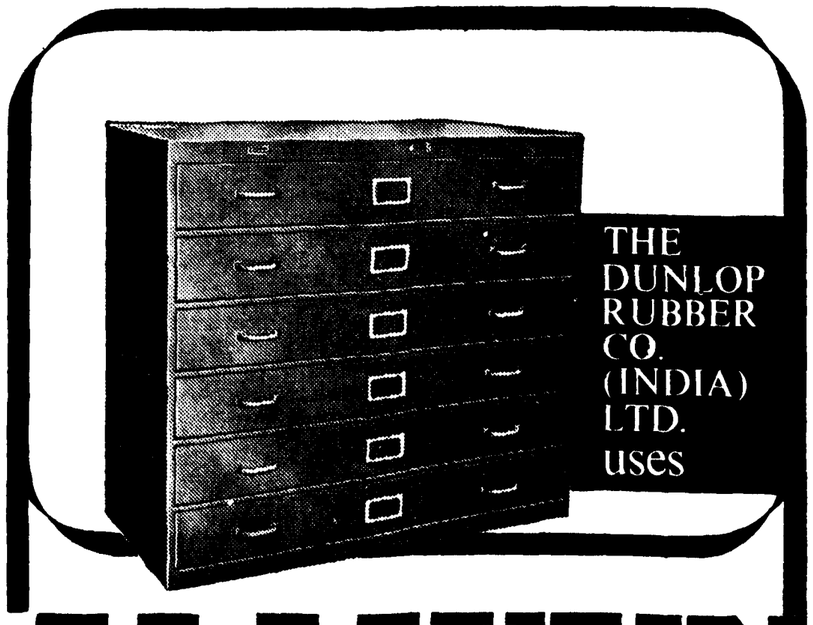
The two leading British manufacturers of traction equipment have joined hands to form an export partnership known as the British Rail Traction Group (BRTG), which will handle export business from the U.K. for a.c. electric traction, employing the single-phase 50 cycle system, and also for new d.c. electrification schemes.

BOARD FOR BOKARO

Bokaro Steel Limited—the public sector company for setting up the Bokaro Steel Plant—will have an eight-man Board of Directors. Mr. N. N. Wanchoo, Secretary, Department of Iron and Steel, Ministry of Steel, Mines and Heavy Engineering, will be Chairman of the Company. Mr. K. M. George, now Chief Engineer of the Central Engineering and Design Bureau of Hindustan Steel Limited, will be Managing Director. Besides the Chairman and the Managing Director, the other six members of the Board of Directors are:

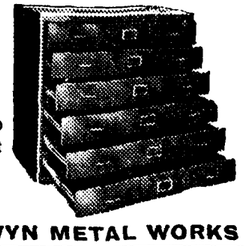
Mr. K. L. Ghei, Additional Secretary, Ministry of Finance; Mr. N. M. Wagle, Managing Director, Greaves Cotton & Co. Ltd., Bombay; Mr. K. Sreenivasan, Director, South India Textile Research Association, Coimbatore; Dr. A. K. Bose, Director & General Manager, Guest, Keen, Williams Ltd., Calcutta, Mr. T. P. Singh, Development Commissioner, Bihar Secretariat, Patna and Mr. G. D. Khandelwal, General Manager, South-Eastern Railway, Calcutta.

Bokaro Steel Limited was registered in New Delhi on



January 29. This Central Government undertaking, which will have a share capital of Rs. 100 crores, will be in charge of the various steps necessary for erecting and running the Plant.

IRON ORE EXPORTS

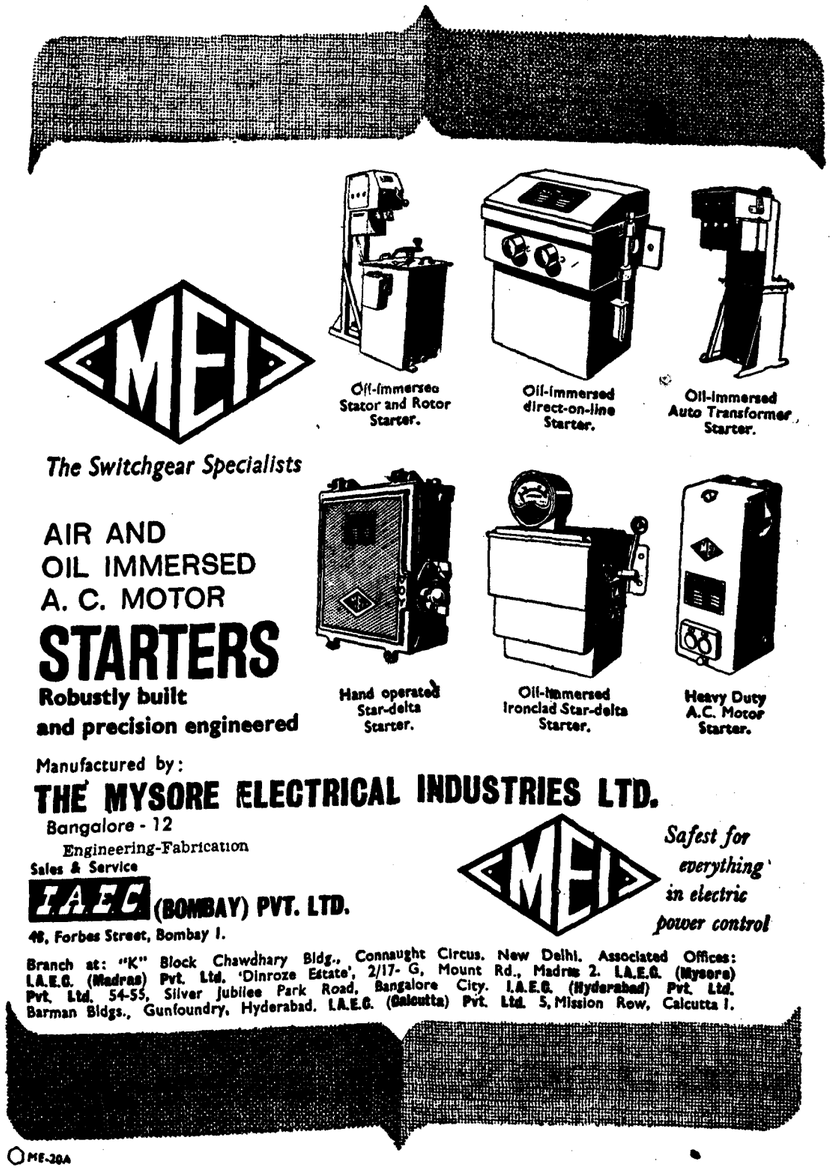


In 1962-63, the value of the exports of all commodities, including re-exports, from India was of the order of Rs. 694 crores of which iron ore contributed about Rs. 20 crores. Iron ore exports stand fourth in importance in terms of value, the first three being jute, tea and cotton textiles.

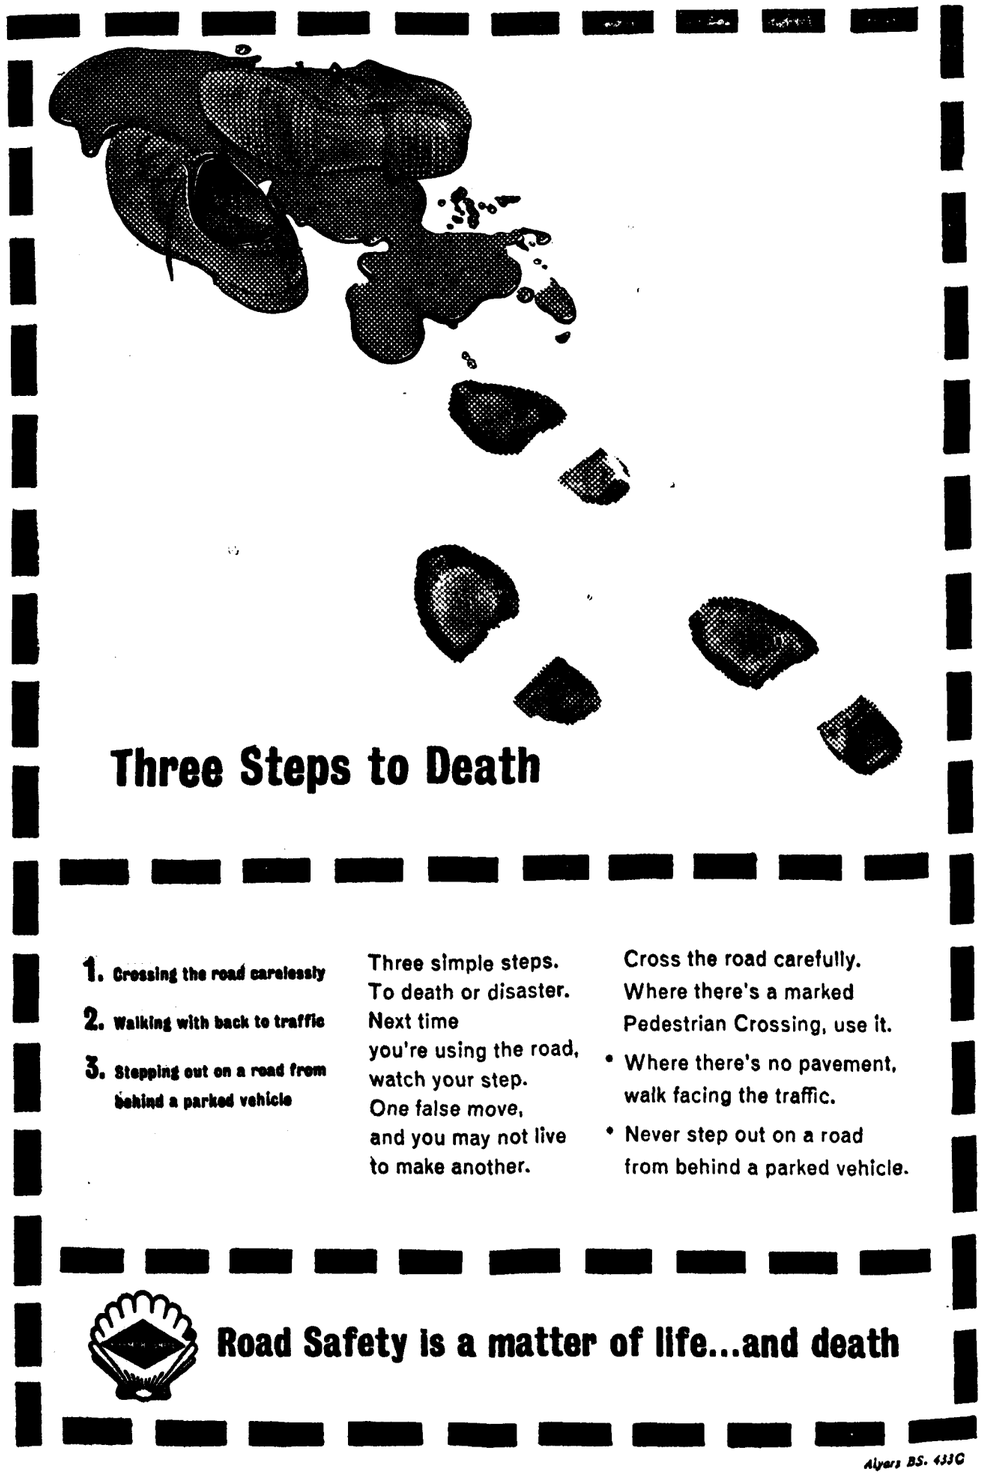
The Minerals and Metals Trading Corporation has set an export target of 25 to 30 million tons of iron ore to be attained at the end of the fourth five year Plan as against the anticipated export of 16 million tons (including 6 million tons from Goa) by the end of the third five-year Plan.

The Corporation has also drawn up plans to make Indian iron ore more competitive in Japan. At present the sea freight from India to Japan is 8 points as against Brazil's 3.7, Chile's 4.3 and the USA's 5.2. This is due to the fact that ports in India are not able to berth larger size vessels. Consequently, the loading of iron ore cannot be more than 1,000 to 2,000 tons per day. India's plans provide for the development of its ports so as to facilitate their receiving ore carriers and loading them at the rate of 2,000 tons per hour.

ALLWYN
STEEL FURNITURE



44"H X 45"W X 30"D
Plan Filing cabinet



THE ALLWYN RANGE OF FINE STEEL FURNITURE includes wardrobes, beds, swivel chairs, executive desks, standard tables, tubular chairs, utility cabinets, filing units, racks, stands, locker cupboards, trays, waste-paper baskets.

HYDERABAD ALLWYN METAL WORKS LTD., Sanatnagar, Hyderabad.

ASP/HAM-F-9

Bombay Office : Agra Road, Bhandup, Bombay-78.
Showrooms at : 15'1, Asaf Ali Road, New Delhi.
8A, Chowringhee Place, Calcutta.
150A, Khivraj Mansion, Mount Road, Madras.
216, Gunfoundry, Hyderabad.

Company Affairs

VOLTAS TO ISSUE RIGHTS

VOLTAS LIMITED has been continuously expanding its manufacturing activities so that its turn-over has increased by nearly 100 per cent during the last four years. The capital structure, on the other hand, has remained unchanged since 1956 when it was increased to Rs. 255 lakhs. Mr. J. D. Choksi, Chairman of the Company, in his statement appended to the annual report for 1962-63, highlighted the need to raise fresh funds for its expanding activities. He, therefore, informed the shareholders that proposal for a rights issue will be placed before the annual general meeting for approval. The demand for fresh funds had become inevitable after the construction of a new factory at Thana has been taken up. Being the pioneers in the field of air-conditioning, it proposes to carry forward its manufacturing plans to attain self-sufficiency and for that it proposes to take up the manufacture of compressors. Apart from air-conditioning it proposes to concentrate on the manufacture of materials handling and mining equipment and a few other projects in which it will participate as promoters, shareholders and selling agents.

The Chairman pointed out that the company believes in running an efficient marketing machinery to ensure proper distribution of its products. While it offers pre-sale facilities like information and advice so that the customers can choose the equipment which is precisely required by them, it also has the reputation of providing after-sales service which forms an important part of its successful marketing. Its technical after-sales service covers quality guarantees to keep machinery or equipment sold in workable condition for a predetermined time at a total or partial cost of the suppliers, manufacturers or distributors. Even though cost of such an obligation is substantial, it tries to render this service as desired by the customers. Mr Choksi pointed out that in Bombay alone there are 15,000 air-conditioners that require service and for which the company's air-conditioning and refrigeration division receives nearly 200 calls a day. The company provides an adequate number of trained servicemen and sufficient equipment to run this type of after-sales service. For this it has its own training schemes to feed its service force. Another aspect of this after-sales service is the assistance received by the customers in obtaining spare parts. The company's inventory of spare parts, therefore, contains nearly 80,000 items representing an investment of over Rs. 2 crores. This costly after-sales service enhances its reputation and creates a wide and steady market. It also helps the company to understand the performance of its products and the reactions of its customers.

CENTURY'S BONUS ISSUE

The directors of the Century Spinning & Manufacturing Co Limited, have decided, subject to the sanction of the Controller of Capital Issues and of the shareholders in general meeting, to capitalize a part of its reserves to issue bonus shares on the basis of one equity share for every five equity shares held. The directors have also decided not to recommend any further dividend on the equity shares for the year ended December 31, 1963. It may be pointed out that it is the fourth time that the management of the company has proposed to issue bonus shares. It issued one bonus share for each share held in 1947. In the following year again, the company issued one bonus share per one held. In 1961 the company sanctioned one bonus share for four shares held. The bonus issue now proposed will raise the capital of the company to Rs. 3 crores.

BHASKAR TEXTILES

Bhaskar Textile Mills Ltd. are likely to enter the market shortly to raise a sum of Rs. 14 lakhs by the issue of equity shares and Rs. 7 lakhs by the issue of 9.5 per cent cumulative redeemable preference shares. The entire issue has been underwritten. A sum of Rs. 14 lakhs has already been subscribed by the promoters, directors, their friends and associates. The company proposes to install a cotton spinning mill with 15,000 spindles at Jharsuguda in Orissa. Construction of buildings is progressing and the unit is expected to be commissioned in the third quarter of 1964. The total outlay on the project is expected to be Rs. 109 lakhs.

COROMANDEL FERTILISERS

Arrangements are being finalised for the Rs. 4-crore public issue of Coromandel Fertilisers Ltd. It is a joint venture of E.I.D.-Parry Ltd. of Madras, International Mineral and Chemical Corporation, U.S.A., and California Chemicals Corporation, U.S.A., licensed to set up a fertiliser factory at Vishakhapatnam. California Chemicals Corporation will subscribe for consideration other than cash for Rs. 56.18 lakhs, the International Mineral and Chemical Corporation for Rs. 51.59 lakhs and E.I.D.-Parry for Rs. 6.35 lakhs. The total capital issued for consideration other than cash will, therefore, be Rs. 1.16 crores. California Chemicals Corporation will subscribe for cash Rs. 1.53 crores, International Mineral and Chemical Corporation Rs. 1.36 crores and E.I.D.-Parry Rs. 42.98 lakhs. The public issue will account for Rs. 4.01 crores.

The company has been granted an industrial licence for the manufacture of complex fertilisers and urea. The estimated cost of the project to reach the stage of production is Rs. 31.29 crores including working capital of Rs. 2.74 crores. The foreign exchange component of the capital cost will be Rs. 15.75 crores, a part of which will be met by the subscription to the share capital of the foreign collaborator, and partly by a loan from Export-Import Bank.

JAYANTI SHIPPING

Jayanti Shipping Company Private Ltd. proposes to issue capital worth Rs. 2.10 crores divided into 210,000 equity shares of Rs. 100 each at par. Of this 3,377 shares will be subscribed privately and the balance will be offered to the public for subscription. With this issue, the company will have issued its total authorised capital of Rs. 5 crores. This floatation is meant to finance three combined oil and ore carriers of 21,000 DWT each and one oil tanker of 55,000 DWT. It may be added that Jayanti has recorded gross earnings of nearly Rs. 4.30 crores during the nine months beginning from April 1, 1963 to December 31, 1963. Out of this, its earnings on foreign voyages have been nearly Rs. 3.20 lakhs. It has acquired within a period of nearly three years of its operation 12 cargo vessels of over 10,000 DWT each, six bulk cargoes of 33,250 DWT each and one tanker of 33,000 DWT. It expects to reach a capacity of 600,000 DWT shortly.

NATIONAL ENGINEERING INDUSTRY

National Engineering Industries Ltd., of Jaipur, has recently received a loan of $4.3 million (Rs. 2 crores) from the U.S. Agency for International Development. The credit will meet the foreign exchange costs of erecting a new tapered roller bearing plant with an annual capacity of 11 lakh bearings and of expanding the capacity of the existing ball bearing and straight roller bearing plants by 24 lakh bearings per annum. This will result in a net saving to India of $2 million (Rs. 1 crore) in foreign exchange annually. Federal Mogul Bower Bearings, Inc., a major U.S. manufacturer in the field, will provide technical assistance for the establishment of the new plant and also will train several Indian technicians in the United States. The entire project to be financed under the loan is expected to be in operation by the end of 1964. The loan will bear an interest rate of 5¾ per cent and will be repayable by the firm in 10 years, including a grace period of two years. In order to reduce the impact on India's balance of payments, the loan agreement will provide for National Engineering Industries, Ltd. to make repayment in rupees on

the above schedule to the Government of India. The Indian Government in turn will repay the principal to the U.S. Government in dollars in instalments spread over forty years, including a ten-year grace period.

HONG KONG AND SHANGHAI BANK

The directors of the Hong Kong and Shanghai Banking Corporaiton have announced that subject to audit the profit of the Bank for the year ended December 31, 1963, including dividends received from Mercantile Bank Ltd., the British Bank of the Middle East and subsidiaries, amounted to £2,982,270 (HK $47,716,320) after providing for taxation etc. It proposes to pay a final dividend of 11 shillings per share making a total distribution of 16 shillings a share for the year.

BANK OF PATIALA

The directors of the State Bank of Patiala have reported that the net profit for the year ended December 31, 1963, was Rs. 5.35 lakhs. A sum of Rs. 1.50 lakhs was proposed to be transferred to reserve fund, Rs. 1.97 lakhs to bonus to staff and Rs. 10,000 to staff welfare fund. The dividend proposed to be paid at the rate of 5 per cent per annum, would absorb a sum of Rs. 1.75 lakhs. A sum of Rs. 52,000 was proposed to be carried forward.

NEW STANDARD ENGINEERING

New Standard Engineering Company Ltd. celebrated its Silver Jubilee recently. During these 25 years, it has grown from a small workshop that employed five workers to a manufacturer of a wide variety of engineering goods employing nearly 2,300 workers. Gradually it has added many new items to its list of products so that today important items like blowroom lines for textile mills, pneumatic power hammers and drop stamps, electric furnaces, electric overhead travelling cranes and disc filters for coal washeries are being produced in considerable quantities. During these years it has secured the association of various foreign collaborators and the latest instance is that of Indabrator Ltd. set up in financial participation with Wheelabrator Corporation, U.S.A., and Tilghman's Ltd., U.K., for the manufacture of shot blasting equipment. Mr. R. G. Saraiya, Chairman of the Company, while welcoming Mr. S. G. Barve, Minister for Industries, Maharashtra State, who visited the Goregaon works of the factory recently, indicated that the company proposes to establish a technical consultation organisation. Moreover, a small training school which turns out 60 apprentices a year, is also proposed to be enlarged into a polytechnic with the help of the State Government.

ALKALI AND CHEMICALS

The Alkali and Chemical Corporation of India has reported during the year ended September 30, 1963, a net profit of Rs. 110.87 lakhs after provision for depreciation. A sum of Rs. 33.50 lakhs has been provided for taxation and Rs. 25.23 lakhs have been transferred to development rebate reserve. The directors have proposed to transfer a sum of Rs. 5 lakhs to general reserve. An interim dividend of Rs. 0.75 per ordinary share, subject to tax, absorbed Rs. 23.25 lakhs. The directors have now recommended the payment of a final dividend of Rs. 0.75 per ordinary share of Rs. 10 each, which will absorb another Rs. 23.25 lakhs.

The directors have reported that sales at Rs. 8.13 crores were considerably higher than the last year's figure of Rs. 6.95 crores. The net profit was also higher despite writing off a loss of raw materials and stores valued at Rs. 18.99 lakhs. The company recorded a peak output of polythene during the year and the new rubber chemicals plant was commissioned and the manufacture of the first range of products was taken up. The company concentrated on high quality paints and pretreatment chemicals and the output of hydrochloric acid was particularly encouraging. The construction of the new intermediate density polythene plant was reported to be nearing completion and the production was expected to start shortly. The company was also going ahead with its plans for a new resin unit.

MADRAS RUBBER FACTORY

Madras Rubber Factory Ltd. during its operations from October, 1960 to September, 1963, recorded a profit of Rs. 21.52 lakhs. A sum of Rs. 18.40 lakhs has been transferred to development rebate reserve. Dividend on equity shares at the rate of 32 nP per original share and 2 nP per right share will absorb Rs. 4.13 lakhs. This is the first balance sheet of the company as it went into commercial production only in June, 1963. It faced a serious trouble because of the failure of the water chilling system which delayed the commercial production. The average daily output during the remaining months of the period under review was nearly 200 tyres. Now that the unit has overcome the initial problems, it has extended its output to include various tyres for jeeps, cars, motorcycles and scooters and its present daily output is nearly 700 tyres. These tyres have been accepted as original equipment by various motor vehicle manufacturers. It has also secured orders for the supply of tyres and tubes to the Defence Department, some leading transport operators and several State transport undertakings. It has started exporting Mansfield tyres and tubes and active steps are being taken to develop the export market.

SANDVIK ASIA

Sandvik Asia Ltd., Poona, which has taken up the manufacture of Sandvik coromant tungsten carbide tips and tools in collaboration with the Sandvik Steel Works of Sweden, will introduce this item into the market shortly. Sandvik coromant tungsten carbide tips and tools are known for their quality and precision and special care has been taken at the Poona plant to manufacture cemented carbide products under the strict quality control. For the last two years Sandvik Asia Ltd. has been manufacturing Sandvik coromant rock drill steel equipment which is being marketed by Atlas Copco (India) Private Ltd. Tungsten coromant tips and tools are being marketed in India by the manufacturers themselves.

COMPANY REGISTRATIONS

Ninety-eight companies with a total authorised capital of Rs. 1,367.62 lakhs were registered in the Western region comprising Maharashtra, Gujarat and Madhya Pradesh during the quarter ending December 31, 1963. During the corresponding quarter last year 78 companies with an authorised capital of Rs. 871.45 lakhs were registered. In the Union Territory of Goa five private limited companies with a total authorised capital of Rs. 40 lakhs were registered. During this period 19 companies went into liquidation as against 23 in the previous quarter. Names of 22 companies were struck off the register.

UNIT TRUSTS

The Unit Trust of India set up under the Unit Trust of India Act, 1963, started functioning from February 1, 1964, with its Head Office in Bombay. Mr. R. S. Bhatt has been appointed chairman of the Trust and Mr. V. G. Pendharkar, Economic Advisor to the Reserve Bank as the executive trustee. Besides the Chairman and the executive trustee, the board of trustees of the Unit Trust comprises Dr. B. K. Madan, executive director, Reserve Bank of India, Bombay, Mr. N. M. Wagle, managing director, Greaves Cotton & Co. Ltd., Bombay, Mr. B. Mitter, managing director, Andrew Yule and Co., Calcutta, Mr. P. Brahmayya, Chartered Accountant, Messrs. P. Brahmayya & Co., Madras, Mr. S. D. Srinivasan, managing director, Life Insurance Corporation of India, Bombay, Mr. N. A. Krishnan, managing director, State Bank of India, Bombay, Mr. H. T. Parekh, general manager, Industrial Credit and Investment Corporation of India, Bombay, and Mr. R. L. Tuli, general manager, Punjab National Bank, New Delhi.

The Unit Trust will have an initial capital of Rs. 5 crores, half of which will be contributed by the Reserve Bank, Rs. 75 lakhs by the Life Insurance Corporation, Rs. 75 lakhs by the State Bank of India and the balance of Rs. 100 lakhs will be offered for subscription to scheduled banks or the other financial institutions in the private sector. If this contribution falls short of Rs. 100 lakhs, the Reserve Bank will make it good and may later on transfer it to the private sector institutions if necessary. The Trust will deal in stocks, shares and securities, but not in immovable property. It will formulate a scheme in accordance with which the units having a face value of not less than Rs. 10 and not more than Rs. 100 will be sold at prices determined by the Trust having regard to the dividends declared. There will be no limit on the number of units which can be purchased by or held by unit-holders. At least 90 per cent of the gross income of the Trust, less the management and other expenses, will be distributed to unit-holders. Dividends will be declared and distributed once every year.

CAPITAL ISSUES

Seven companies have been authorised to raise capital aggregating Rs. 3.17 crores. The consent of the Controller of Capital Issues is valid for 12 months.

Kumardhubi Engineering Works Limited, Calcutta, is to issue (i) 7,37,280 equity shares of Rs. 3 each to be issued at a premium of 20 per cent to the existing shareholders, (ii) 1,84,320 bonus shares of Rs. 3 each on capitalization of share premium and (iii) Rs. 40 lakhs in 7 per cent debentures.

Special Steel Limited, Bombay, is to issue capital of Rs. 46 lakhs. Of this, Rs. 26 lakhs will be in equity shares of Rs. 100 each and Rs. 20 lakhs in 20,000 9.3 per cent cumulative redeemable preference shares of Rs. 100 each for cash at par. The money will be used for the manufacture of prestressed concrete wire, card clothing wires, ball bearing wire and other spring steel wire.

Universal Road Service (Private) Limited, incorporated in Maharashtra State, is issuing further capital of Rs. 40,34,500 divided into 40345 equity shares of Rs. 100 each, for cash at par.

Southern Switchgear Limited, a new company incorporated in Madras State, has been given consent to issue capital of Rs. 30 lakhs, divided into 3,00,000 equity shares of Rs. 10 each. The shares will be issued privately, for cash at par. Shares of the value of Rs. 10 lakhs will be offered to the company's U.K. collaborators, Brush Electric Engineering Company Limited.

Assam Cements Limited, Shillong, a State Government undertaking, will issue capital of Rs. 65,74,900 divided into 1,57,490 equity shares of Rs. 10 each and 50,000 6 per cent cumulative redeemable preference shares of Rs. 100 each to be issued for cash at par.

Assam Gas Company Limited, Shillong, a State Government undertaking, will issue further capital of Rs. 27 lakhs divided into 27,000 equity shares of Rs. 100 each to be issued privately for cash at par.

Nestler Boilers Private Limited, Bombay, is raising fresh capital of Rs. 40 lakhs divided into equity shares of the value of Rs. 30 lakhs and preference shares of the value of Rs. 10 lakhs.

LICENCES ISSUED

The following licences have been issued under the Industries (Development and Regulation) Act, 1951—during the week ending 1st February, 1964. The list contains the names and addresses of the licensees, articles of manufacture and annual installed capacity:

METAL PRODUCTS

Jaipur Metals and Electricals Ltd., Near Railway Station, Jaipur (Rajasthan) — Phosphor Bronze wire and strips — 600 Metric tons.

COAL

Loyalka Brothers, Bonbiddi Colliery, P.O. Barkar, Distt. Burdwan (Salanpur P.O. Distt. Burdwan, (West Bengal) — Coal 30,000 tonnes.

ELECTRIC EQUIPMENT

Beni Ltd., 1, Crooked Lane, P.B. No. 2152, Calcutta (West Bengal) — Electric Motors D.C. 24 volts to 440 volts ¼ H.P. to 25 H.P. — 1,000 Nos. Generators D.C. for battery charging 12 to 32 volts, 0.5 KW to 10 KW — 2,500 Nos.

MINING MACHINERY

Killick Nixon & Co. Ltd., Killick House, Home Street, Bombay (Kurla-Powai Road, Chandiwali, Maharashtra) — Drilling equipment and accessories — 25 Nos.

DRUGS & PHARMACEUTICALS

Standard Pharmaceuticals Ltd., 67, Dr. Suresh Sarkar Rd., Calcutta-14 (Serampore Distt., Hooghly, West Bengal) — Penicillin 10 mega million units.

COTTON TEXTILES

Cawnpore Textiles Ltd., Kanpur (Uttar Pradesh) — Cotton yarn 12,500 spindles; Kharar Textile Mills, Kharar (Kharer, Punjab) — Cotton yarn 13,000 spindles; Shri Haji A. B. Hakeem, Chief Promotor, The Malegaon Co-operative Spinning Mill, Malegaon (Malegaon, Distt. Nasik, Maharashtra) — Cotton yarn 12,000 spindles; Kothari Textiles Ltd., Oriental Buildings, Armenian Street, Madras-1 (Madras) — Cotton yarn 25,000 spindles; The Sri Venkatesa Mills Ltd., Venkatesa Mills P.O., Udamalpet (Udamalpet, Madras) — Cotton yarn 25,000 spindles; The Premier Mills (CBE) Limited, Pulankinar P.O., Udmalpet Taluk, Coimbatore Distt. (Madras) — Cotton yarn 25,000 spindles.

JUTE TEXTILES

The Kelvin Jute Co. Ltd., Mcleod House, 3, Netaji Subhas Road, Calcutta-1 (West Bengal) — Wide Hessian (Carpet Backing Cloth) 50 broad looms.

WOOLLEN TEXTILES

The British India Corporation Ltd., P.B. No. 5, Kanpur (Uttar Pradesh) — Automatic looms 24 Nos. for the manufacture of woollen fabrics and blankets.

SUGAR

The Indian Sugars & Refineries td., 139, Medows Street, Fort, Bombay (Hospet, Distt. Bellary, Mysore) — 250 tons of sugarcane per day.

CHANGE IN NAMES (Owners or Undertakings)

During the week ending 1st February, 1964

(This information pertains to particular licences)

From M/s. Gandhi Electric Industries Pvt. Ltd., Bombay to M/s. Emco Electricals Pvt. Ltd., Bombay; From M/s. Vijayakumar Spinning Mills, Dasarahalli, Bangalore District to M/s. Badhra Spinning Mills Pvt. Ltd., Dasarahalli, Bangalore District; From M/s. Commonwealth Spinning & Knitting Mills (P) Ltd., Ludhiana to M/s. Raghubir Singh, Felt Mills Ltd., Ludhiana.

LICENCES REVOKED OR SURRENDERED

During the week ending 1st February, 1964

(Information pertains to particular licences only)

M/s. Ramakrishna Industrial Pvt. Ltd., P.O. Coimbatore — Cast iron spun pipes; Name of the Licensee: M/s. Mill Stores & Bearing Co., Calcutta; Name of the Undertaking: M/s. Electric Steel & Tools Manufacturing Co., Calcutta — (1) Forged Hand Tools like spanners, pliers wrenches, etc. (2) Forgings for other industries; M/s. Sundaraj Textiles, Kalapatti P.O., Coimbatore — Cotton Textiles; Shri Mannalal Agarwal, Indore City — Cotton yarn; Shri P. S. Kalani, Indore — Cotton yarn; Shri M. P. Goenka, Khurja — Cotton yarn; Shri Darshan Lal, Dehradun — Cotton yarn; M/s. Jai Bharat Oil Mills, P.O. Khairtal, Distt. Alwar — Vegetable oil from oil cakes and cotton seeds; M/s. Shakkar Udyog Pvt. Ltd., Bombay — Cotton seed oil; M/s. Tungabhadra Industries Ltd., Kurnool — Cotton seed oil; M/s. Rohtas Industries Ltd., Dalmianagar — Slag cement.

BOOKS BRIEFLY

From Status to Contract and Back Again!

Workers, Factories, and Social Change in India: by R. D. Lambert; Oxford Univ. Press; 1963; Price 40sh.

Reviewed by JOSSLEYN HENNESSY

THE CLASSICAL interpretation of the Industrial Revolution is that it completed the disruption of a "feudal" society, based on inherited ascribed status, and substituted a "modern" society, based on contract between man and man leading to a self-made, achieved status. A society governed by contract is competitive: it makes clear the direct connexion between personal effort and reward, and as the majority of men are average citizens, neither unduly hard working nor unduly lazy, wealth in a truly competitive society is inevitably unequally distributed: it goes to exceptionally hard-working, frugal, or gifted people; indeed, it is the unequal distribution which is among the more important incentives to more production and material progress. Society based on contract is dynamic, based on status is static.

The paradox of our time is that while popular opinion rejects contract and competition as inegalitarian, it insists on the economic growth which comes from a dynamic society. Dr Lambert's book strikingly demonstrates that the trend away from contract back to status is as true of industrializing India as it is of industrialised Britain. Both countries are hurrying towards the stage in which all jobs will be the closed preserves of members of particular trade unions (as formerly of particular castes), whose traditional occupation they are, thus giving the worker an inalienable status. Once accepted as a union member, and once engaged in a job, it is the worker's status, not the quality of his performance, which entitles him to employment. The quality of performance must, of course, be sufficiently high not to outrage loose customary standards, but to excel above that minimum level attracts sanctions from the union. The difficulty that Indian and British factories have in dismissing a worker solely on grounds of inefficiency, the unions' day-to-day pressure and the threat of a strike in the U.K., and of a strike or a suit in the Labour Court in India—all emphasise status and customary standards of work in established techniques rather than the need to increase output by the higher productivity in constantly changing technologies that characterise a dynamic society.

Dr Lambert cites as a common feature of India's factory system the existence of a job complement whereby the total number of permanent jobs is fixed, either between the union and the factory, or as a Labour Court award applying to an individual factory or to a whole industry. The agreement or award fixes the ratio of men to machines, skilled categories, wage systems for each type of work, fringe benefits, etc. Significantly, those workers covered are known as "permanent" employees. They are entitled to compensation when work is not available, a specified number of days on paid sick, annual, and casual leave, annual bonuses, provident fund membership, and whatever other rights may be agreed. India follows the practice of several European countries in providing dearness allowances tied to the cost of living. In many Indian companies, dearness allowance fluctuations are more important to a worker's total wage than piece-rate performance or an increase in the basic wage as a new level of skill is attained.

Cost of living allowances apart, the workers connect pay rises not with increased productivity, or with the prosperity of their company, but with an across-the-board wage increase expected to emerge from the next round of union-employer negotiations. In a competitive economy, factories would eventually reach a point at which their increased costs could no longer be passed on as consumers resisted increased prices, and wage rises would be halted by the threat of dismissals or by the bankruptcy of the employer. In planned economies, the government avoids the difficulty by inflation, thus creating wasteful allocation of resources and further reducing the dynamism of the economy. The achievement of an occupational status divorces effort and reward and makes the labour force in a factory, or in an industry, inelastic. Status may create social justice, but the trouble is that neither in Europe nor India are workers, managers, or professional classes content with social justice: they want the rising wages and standards of living that come from a competitive dynamic society, in which contractual effort receives its contractual reward. What to do?

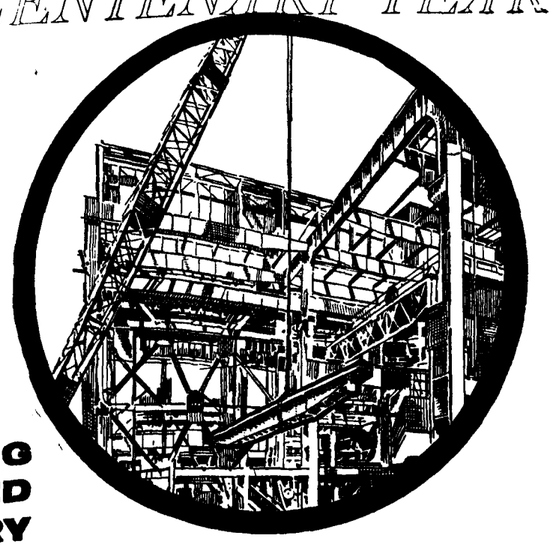
FACTS ON POLAND

Concise Statistical Year Book of Poland, 1963, published by the Central Statistical Office, Warszawa; available from Foreign Trade Enterprises "Ars Polona," Warszawa, Krakowskie Przedmiescie 7; price: not mentioned.

A few years ago, it was rather difficult to obtain official information regarding the growth of the East European economies including that of Poland. Recently, Governments in those parts of the world have started publishing details of their economic progress in the various fields; the pocket book under review is a good example of the thorough manner in which much useful information can be packed into a little more than 200 pages. It is interesting that national income in Poland rose by about six to seven per cent per annum between 1955 and 1962 and that per capita income improved, on an average, by five per cent per annum (simple) in relation to 1955. On the whole, the Polish economy has been doing well and expansion has been recorded in almost all sectors. Incidentally, one-fourth of the national income is still obtained through what is described as "non-socialised economy."

Readers' Roundtable

MONOPOLY ON WHEELS !



Sir,—According to a recent news report the Central Government is taking steps for the formation of a watch-dog Committee on Monopolies in the Private Sector during July, 1964 and that two officers of the Finance Ministry are to go abroad to Italy and Britain to study the working of the Monopolies Commission there.

But when the monopolist is the State itself who will protect the citizen against the State? For example look at the way in which the Madras State Transport system is working. About 70,000 passengers are hauled in each day in just 450 buses and inefficiency, bad manners on the part of the departmental staff, untold miseries to the poor passengers, and loss of thousands and thousands of man-hours just waiting for the elusive bus—these are the daily routine happenings. Even the conductors, drivers and other transport departmental staff are not satisfied with their pay and service conditions and the most tragic part of it is that the department is not making enough profits !

A Government which is dedicated to the welfare of its citizens should first of all set things right by giving the people an efficient, comfortable, cheap and speedy transport system before it ventures into other State operated business undertakings. The sad truth today is that when the Government gets hold of the goose that lays golden eggs, the ungrateful bird refuses to oblige with just plain eggs let alone golden ones and the sufferer in this sad experiment is the hard hit tax-payer.

MADRAS V. L. N. CHARI

BIRD'S CENTENARY YEAR

ENGINEERING TO AID INDUSTRY

The expansion of industry depends largely on the timely supply of engineering products and services. The Bird-Heilgers Group, with water treatment, coal washeries, castings and structurals, refractories, pneumatic equipment, springs and research, is playing a significant role in providing basic requirements for a wide variety of industries.

Deploying the skills acquired over a hundred years, the Bird-Heilgers Group is making important contributions to the economy . . . through planned diversification and expansion.

COMPANY MEETING

VOLTAS LIMITED

Chairman's Statement

The following is the Statement by Mr. J. D. Choksi, Chairman, Voltas Limited, circulated to the Members of the Company, with the Annual Report for the year 1962-63.

"It gives me great pleasure to report excellent results for this ninth year of our operations. We have how reached, I think, a stage from which there is no going back. Our problems have increased, but so have our achievements. The shareholders can claim a fair share of our success for they have given us, through the years, much encouragement and support. We shall need both these at the present moment.

As you know a proposal for a rights issue will be placed before the annual general meeting for approval. The capital structure has remained unchanged since 1956 when it was increased to Rs. 255 lacs. This latter sum, along with profits retained in the business have supplemented our cash credit facilities from banks and have sufficed so far to provide the company with the funds needed for its expanding volume of trade. Our sales have increased by 100% in the last four years, and as the expansion in our manufacturing activities has taken concrete shape with the start of construction of our new factory at Thana, the demand for fresh funds has become inevitable. Pioneers, as we are, in the field of air conditioning, we propose to carry forward our manufacturing plans in this field to a further stage of self-sufficiency. Once we are able to manufacture the compressors required by this industry, the company will have gone a long way towards meeting the backlog of demand created by import restrictions and the additional requirements of the defence forces, of Government and industrial undertakings and offices, to say nothing of growing requirements for 'comfort cooling.' After air conditioning, our manufacturing activities will be largely concentrated on materials handling and mining equipment and in other joint venture projects in which your company is interested and will participate as promoters, shareholders and selling agents.

Finance has, accordingly, to be provided for the manufacturing unit, and for shares in the joint ventures and finally for working funds. The Directors' Report indicates steps taken for procurement of the additional funds which include a rights issue to shareholders. I think shareholders will agree with me that the terms of issue (which require the approval of the Controller of Capital Issues) are reasonably attractive.

The tax demand on last year's profits, in spite of the additional reserves provided to meet it in the company's accounts, proved to be substantially higher than anticipated. On the same scales this year's taxes work out to approximately 65% of the profits. A tax system, so devised as to leave to the shareholders of a company, rich and poor alike, 35% of the profits for dividends (on which again taxes will be payable at rates applicable to individuals rising to 87%), rehabilitation and expansion plus contingencies can only lead ultimately to a negation of democracy in which private enterprise can play a worth-while role. The only justification for such measures would be when the nation is in a state of dire peril. We can only hope, that notwithstanding the heavy burdens on the national exchequer, the impact of these self-defeating tax measures will be substantially curtailed in the Finance Bill of 1964, bringing some relief to trade and industry and placing them in a better position to develop and expand and so meet the challenge of the Plans.

Let me now carry a stage further the main theme of my statement last year. In any marketing activity, the customer is king, and customer satisfaction is the axis on which the sphere of marketing revolves. Voltas, in conforming to the criteria of dynamic marketing has, therefore, assigned as important a role to its service, as it has to its sales.

Essentially, Voltas' trading operations are in themselves an economic service to the community, since they ensure the equitable distribution of goods at fair prices on a nationwide basis. Yet over and above Voltas' actual selling activities are the services it renders before and after sales. It is this complementary aspect of our marketing functions that I would like to describe.

While it is our practice to offer such pre-sales information and advice of a technical nature as enables a customer to choose equipment or materials that are profitable to his venture, the greater part of the company's services comes after sales; Voltas' after-sales service is now a by-word in the country. This reputation has been achieved over years of careful planning and execution. It is our strong conviction that after-sales service is an important phase of the whole plan of marketing. After-sales services, if adequate, create continuous customer goodwill and confidence and stimulate repeat orders and establish brand loyalties.

After-sales service, in the widest sense, is any service rendered to a customer after the transaction of sale is made. It is any service performed after an order is booked or after a formal agreement to sell and buy has been reached. Basic after-sales services include good packing, quick deliveries at the customer's convenience, timely presentation of invoices that are easy to read and understand, courteous methods of collecting outstandings and a helpful attitude in settling claims which may arise.

The company's technical after-sales services mainly cover quality guarantees to keep machinery or equipment sold in workable condition for a predetermined time at the total or partial cost of the supplier, manufacturer or distributor. The cost of these obligations is substantial. But the Company tries to render that type of service as is close to the requirements of the customer.

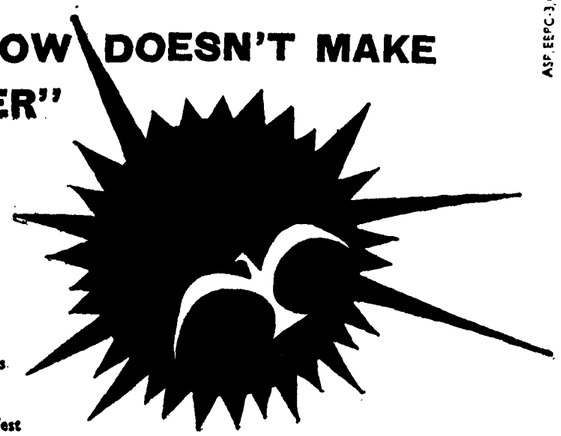
Many of you are familiar with the Voltas Crystal room air conditioners and, as you know, air conditioning for comfort-cooling enters into the personal life of people. To ensure that our clients enjoy the comforts of air conditioning without interruption, our services are so organised as to enable a telephone call requesting service to be attended to without appreciable delay in most centres of the country. You will realise what this means in a city like Bombay, where there are 15,000 air conditioners that require service by the company and in which Voltas' air conditioning and refrigeration division receives about 200 calls a day. As much thought and planning must go into the devising of an after-sales service system as is accorded to a production plan. Consequently, the company has to provide for an adequate number of trained servicemen, for suit-

able equipment and facilities and sufficient working capital as would be provided in any large scale activity in an industrial or business organisation.

To provide for this and, at the same time, to maintain a high standard of service, the company has its own training schemes to feed its service force. Every six months, about 40 trainees receive basic training at our Chinchpokli Works and are then absorbed by the various divisions for more specialised and on-the-job training.

On a wider scale, where the company's clients are project authorities, Voltas' after-sales service assumes even greater significance. As many of you are aware, your company supplies giant machines like bulldozers, excavators and cranes that are used for the larger projects of the nation. The standing charges and operating cost of any one of these machines vary from Rs. 50 to Rs. 250 per hour. One can fairly visualise the extent of the loss to the nation in the event of a breakdown of such machinery. In most cases, the company's service staff not only erect these machines at project sites, but also train the customer's own works forces to take over their maintenance and working with a minimum loss of time and efficiency.

Another aspect of after-sales service is the assistance a customer receives in obtaining spare parts. Severe import licence restrictions make it impossible for us to maintain our own stocks of spare parts at levels which we consider fully adequate for customer requirements. However, in many ways, we assist customers, including Government projects, in obtaining import licences for essential parts and in storing and distributing them. The company's own inventory of spare parts contains 80,000 items, representing an investment of over Rs. 2 crores with an organisation of close on 175 persons. The company goes a step further in ensuring customer satisfaction by assisting its dealers in establishing their own service schemes and service stations and by training their personnel.



The costs of after-sales have to be controlled if these are not to run away with profits. But judicious expenditure in after-sales service is in the best interests of good business. After-sales service acts as a market builder. When the services prove satisfactory, the company's reputation and that of its products are enhanced and a wider market created through customer satisfaction and goodwill. Moreover, after-sales service helps the company to watch continuously the performance of a product and to gauge market reactions. It provides a feedback service on which to base the development of better products.

23 percent of the company's staff are directly or indirectly assigned to various forms of service. This alone will give a measure of the importance we attach to this aspect of marketing. In the present phase of national development, in which most items of equipment are in short supply, the importance of keeping installed equipment in working order can easily be assessed. We hear much these days about the necessity of nationalising the import and distribution trades of this country. Few of the radical 'nationalisers' may be aware of the obligations and services that are involved in importing and distributing technical equipment and machinery such as I have tried to outline in this statement. The oft maligned "middleman" may appear in a different light if the service aspects of distribution and marketing are properly understood.

I should like to close this statement by expressing the appreciation of the Board and all of you for the excellent services performed by the organisation as a whole during the year."

Note: **The above statement is not a report of the proceedings of the Annual General Meeting which will be held on the 27th February, 1964.**

"ONE SWALLOW DOESN'T MAKE A SUMMER"

ASP.EEPC-3.63

There is a market for quality Indian products abroad. During 1962 engineering goods worth Rs. 11 crores were exported to various countries, including highly industrialised countries like the U.K., U.S.A. and West Germany. But our present export of engineering goods is hardly 2 per cent of total production compared to exports by industrialised countries accounting for 25 to 50 per cent of their total production. You can help the country tide over its foreign exchange crisis by boosting your exports. We can give you advice that will facilitate your exports.

RECORDS AND STATISTICS

Revival of Capital Market?

ANALYSING FIGURES of new issues during the five months ending January 1964, the Directorate of Research and Statistics in the Company Law Board has arrived at the conclusion that the capital market has staged a recovery in relation to the slackness which prevailed a year ago. The official viewpoint is contained in the handout reproduced below; the so-called revival which made the directorate jubilant is already petering out because of the oblique hints contained in some of the statements made by responsible (irresponsible?) sections of the Congress Party to track down "unaccounted money" and to apply a ceiling on incomes and wealth.

Total amount of new capital proposed to be raised by the companies in the form of preference and equity capital from the capital markets during the five months' period ending January, 1964 was Rs. 25 crores as compared with Rs. 10 crores during the preceding five months of April-August, 1963 and Rs. 4 crores issued during the corresponding period of five months ending January, 1963. The marked increase in the amount of new capital raised in the country in recent months is one of the indicators of the fact that the depressed conditions in the capital markets which came in the way of industrial expansion in the first and second quarters of the current financial year have come to an end; this improvement to a large extent may be attributed to the new economic and financial policies announced by the Government in recent months.

New Companies

The above finding is based on the study of the prospectuses issued during the five months period 1st September, 1963 to 31st January, 1964 made in the Directorate of Research and Statistics in the Company Law Board. It confirms the earlier conclusion of the Directorate derived from the study of the trend of new company registrations that there has been a big increase in the new companies in the October-December, 1963 period which demonstrated the revival of promotional activities after months of subdued activities. The study of prospectuses reveals that out of Rs. 25 crores raised during September, 1963-January, 1964 period, Rs. 22 crores were proposed to be raised in the form of equity shares and Rs. 3 crores in the form of preference shares. A major portion (i.e. 54 per cent) of the capital to be raised during the period was floated during the month of January, 1964 and the remaining 46 per cent was raised during the earlier four months. The larger amount of capital raised during January, 1964, in spite of the usual uncertainty which develops in January-February due to impending budget proposals, seems to strengthen the inference that the recent changes in the economic and financial policies of the Government have raised the level of confidence in the capital markets.

The study further discloses that out of Rs. 25 crores covered in the 35 prospectuses, approximately Rs. 14.3 crores were actually offered to the public during September, 1963—January, 1964 period as against Rs. 5.6 crores out of Rs. 10.1 crores in the April-August, 1963 period and Rs. 2.2 crores out of Rs. 3.8 crores in the corresponding period of the last financial year. While the extent to which the institutional underwriters have underwritten and might have taken up the shares in the case of some issues is not known very precisely, the fact that the company promoters offered a big 'chunk' for subscription to public, demonstrates their optimism in this regard to the public response and conditions in the capital markets.

Out of 35 issues floated during the five months period of this financial year, 18 were by completely new companies accounting for 68 per cent of the total capital issued, whereas only 32 per cent was issued by existing companies as additional capital. During the five months ending January, 1963, the capital raised by completely new companies formed only 48 per cent of the capital raised during the period. Thus, during the last five months not only was the amount of new issued capital much higher but the amount raised by completely new companies in the total capital was also very high.

An analysis of the size of the capital raised in the country during the period shows that 9 out of the 35 issues were of a size exceeding a crore of rupees, whereas in the corresponding period of the last financial year there were no issues of such a big size and only two out of 22 during the period April-August, 1963. Details about the capital issued during the periods September, 1963—January, 1964, April—August, 1963 and September, 1962—January, 1963 are set out in Tables I, II and III.

Increased Exports in 1963

TOTAL EXPORTS during the calendar year 1963 will set up a new record. The total exports in 1963 (based on the actual exports of the first 11 months) are estimated to be in the neighbourhood of Rs. 785 crores i.e., an increase of Rs. 98 crores in total net exports or about 15 per cent more, as compared to Rs. 687 crores which were the total net exports in 1962. This rate of increase, which has been achieved in 1963, has also been the highest so far.

The statement below gives exports of major items during 1962 and the estimated exports during 1963 (based on the actual exports of first 11 months of 1963). It might be observed that the rise in exports has been well-spread over a number of commodities notably in jute manufactures; tea; sugar; vegetable oils; H. P. S. Ground nut; oil cakes; pulses; cashew kernals; fruits and vegetables; tobacco; hides, skins and leather; steel scraps; iron ore; engineering goods; textiles (including handlooms); handicrafts; carpets; chemicals and marine products.

For the first time in the recent years not only have exports of cotton textiles not declined but on the contrary they have increased. Black pepper and raw wool are the only items worth mentioning among those few whose exports have declined. The internal consumption of raw wool has increased because of defence requirements. In black pepper the world prices have declined considerably.

It will be seen that an increase of about Rs. 100 crores in 1963 has been due to the larger quantity exported, though in a few selected commodities the higher unit price has also contributed to the extra earnings. It is also encouraging to note that for a number of items, in spite of decline in the unit price, export earnings have increased due to the increased quantum exported.

Free Resources

Another salient feature emerging is that most of the increased export earnings came from the free resources rather than from rupee area countries, which accounted for increased earnings. The increase of about Rs. 85 crores in export earnings was registered from free resources and less than Rs. 15 crores increase in exports was from the rupee area countries. Again, most of the increase in export earnings was achieved in items whose exports were made without any incentives or assistance. Aided exports, which form a small proportion of our total exports, have shown modest increase. Export sector industries, agricultural commodities and some other items continue to receive Government assistance in maintenance, modernisation and diversification.

The anomaly of high cost and rising consumption at home and extensive search of markets abroad is a short-term solution and cannot be taken as normal. Only increasing national production will be able to fulfil rising domestic demands and increasing demands for exports. Exports success is a function of total economy and as such cooperation of all sectors of economy in this national task of increasing exports is most vital.

Greater emphasis is now to be laid on improving the quality, packing, design, after-sale services and selling techniques. It is also necessary to establish a "code of ethics" for exporters and export manufacturers and producers.

While the broad class of exporters and export commodities have shown a healthy tendency for quality control, for sample adherence and pricing for exports, there have been a few noticeable instances of slackness in quality maintenance and fulfilment of contractual obligations. The question of removing unhealthy competition and under-cutting prices has also to be vigorously tackled by all the sectors of economy and Government. It is also necessary to stop abuses and mal-practices in foreign trade by firm action wherever called for. Government have taken stringent and firm action in the few cases of mal-practice and abuses. Export of zari goods, export of garments made of art silk and synthetic fabrics and export of stainless steel have been totally banned. Continuous care and vigilence and severe action will have to be taken in rooting out any mal-practice or abuse. All these can be accomplished by evolving and implementing a broad "code of ethics" by all the interests concerned.

Important Events

Some important events are taking place in the beginning of this year, 1964, which are of importance to export promotion. The Institute of Foreign Trade will start functioning shortly and would help to provide various services for export promotion. The Export Inspection Council has started functioning in the field of quality control and preshipment inspection. The Export Credit & Guarantee Corporation (ECGC), which has been established, will be providing more liberal and speedier facilities in the field of export credit. The Council of Trade Fairs and Exhibitions will help in commercial publicity, holding and participating in trade fairs and exhibitions and market promotion. The Marketing Development Fund is assisting in market research, commercial publicity, trade promotion, commodity and area surveys, after-sales services and commercial information and statistics.

The first World Trade Conference will be held, under the auspices of the United Nations, in March 1964 at Geneva. This Conference has aroused great hopes among less developed countries. The right of full and free access for raw materials and manufactured goods from the less developed countries to the markets of industrialised countries in bigger quantities and of better prices and improved terms of trade alone will provide the less developed countries with the means to finance their rising import bills and would help to secure for the less developed countries a solid economic foundation. The economies of the richer countries and their capacity for reconversion and innovation in production fields make it possible for them to bear the cost of the desired changes in the pattern of world trade.

The export climate at present though satisfactory, needs to be strengthened and calls for all round efforts and cooperation to increase and diversify the production for enlarging exportable surpluses at competitive prices.

Imports have also been kept under strict watch and scrutiny. Import substitution and import rationalisation are being brought about. As a result, there has been a reduction of about Rs. 40 crores in total imports at Rs. 977 crores in the first 11 months (January-November) of 1963 (for which period final figures are available) as compared to Rs. 1,017 crores which was the total imports for the first 11 months (January-November) of 1962. Thus, the increase in exports and saving in imports has improved the overall trade balance, the trade deficit having been reduced from Rs. 401 crores during January-November 1962 to Rs. 274 crores during the corresponding period of 1963. Sterling balances of India as in the last week of January 1964 stood at Rs. 111.7 crores.

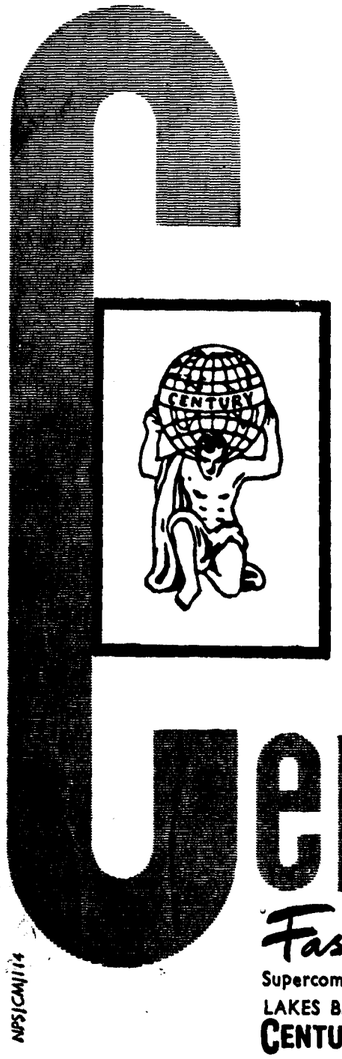
EASTERN ECONOMIST
Annual Number 1964

The Nation's leading economic weekly with the largest circulation in its class proudly presents in its latest Annual Number a stimulating discussion of the highly topical theme "THE BATTLE OF INDUSTRIAL PRODUCTION". It critically examines developments in major industries and relevant Government policies. Illustrated with colour-graphs, charts and statistical tables, this sumptuous Number is priced Rs 10|- per copy; available to subscribers of Eastern Economist without extra payment; Annual subscription Rs 65|-.



Enquiries and orders to our agents, leading book-sellers, or direct to our offices.

An Exercise in Unwisdom

THERE ARE perhaps two reasons, but both sentimental, for not dealing harshly with the Railway Budget this year. This is the present Railway Minister's maiden budget—and Mr. H. C. Dasappa, again, has only recently joined the Central Cabinet after a meritorious innings as Chairman of the Estimates Committee of Lok Sabha. Unfortunately, there can be no place for sentiment in journalism and we, therefore, make no apology for choosing to describe the Railway budget which Mr. Dasappa presented to Parliament last week as an unhappy exercise in economic unwisdom.

In the first place, granted that there is a genuine need for raising more revenue for the Railways by charging railway users more, the Railway Minister ought to have the political courage to increase passenger fares rather than freight rates. There are several sound economic reasons why the course suggested here would have been a better alternative to the one which the Railway Minister has chosen to adopt. In terms of development, there is a clear case for giving precedence to outlays on increasing the capacity of Railways to move more goods than to outlays on expanding its passenger services. It follows that, whenever there is a choice to be made between an increase in fares and an increase in freight rates, an increase in fares should normally be preferred so that the community's demand for more passenger services is kept under reasonable restraint. Secondly, in a potentially inflationary situation such as the one in which we are now situated, it is imprudent to add, however marginally, to the cost of carriage of goods at various stages of processing for the market, such as raw material, the semi-manufactured or finished stage. In the third place, Parliament and public opinion are apt to be more sensitive to proposals for increased fares than with regard to proposals for increased freight rates since the impact of the former is more immediate, direct and clearly defined. And, therefore, when a proposal for an increase is made, the Railways' case is liable to be subjected to far closer scrutiny when fares are involved than when freight rates are in question.

This is the second successive Railway budget in which a general increase has been applied to freight rates. This weakens the Railways' contention that they are seriously engaged in the progressive rationalisation of the rate structure. It is true that, in the present budget, the upward revision in freight rates on coal and the reductions in respect of certain high-rated commodities have been linked in the Railway Minister's speech with findings of studies of costs of haulage. This claim, however, is not sufficiently impressive because, for one thing, cost studies of the kind mentioned are relevant to the purpose of rationalising the rate structure only when they are sufficiently numerous and extensive. On the present occasion, it is only too clear that expediency rather than any of the sterner virtues has dictated rate revision. For instance, in the case of the reductions proposed, the dominant factor is road transport to which the Railways have been steadily losing high-rated traffic.

The Railway Minister has pleaded that additional commitments on account of the new Pension Fund Scheme, increased dearness allowance and other allowances to staff and higher dividend to general revenues had made it necessary that he should try to step up receipts by putting up the freight rates. Surely such an argument cannot be accepted as a self-evident truth. There is enough proof over the years that, as in the case of the general budget, so also in the case of the Railway budget, receipts are systematically underestimated. In such a stubborn context of tax budgeting, it really becomes difficult to assess how prudently in fact railway finances are being managed. A deliberate policy of under-estimating revenue not only invests budgetary decisions, raising fares or freights, with

arbitrariness as well as waywardness, but also leads to a situation where thrift and economy are at a discount. To take only the most recent trend, the revised estimate of gross traffic receipts for 1963-64 is at Rs. 622 crores as against the budget estimate of Rs. 599 crores and this increase significantly has taken place in a period during which, as is generally conceded, the national economy had slowed down. In this sense, there is surely need for more evidence to be produced than has been presented in the Railway budget papers to justify an increase in fares.

Secondly, there is also the all-important question of productivity. It is true—and it is right—that the Railways are being called upon to incur additional expenditure on staff benefits as every other employer in the country is being called upon to. It is also true—and it is, again, right—that the Railways are being asked to pay a more economical and realistic rate on the capital it uses. Finally, it is true—and once again right—that the Railways will have to earn a surplus which bears some relation to the vast capital at charge. But when all this is said and granted, it is also true that the Railways should not be allowed to fall into the bad and pernicious habit of trying to meet these and other obligations by a repeated exercise of its semi-monopolistic position in the transport economy of the nation. The danger in a situation where Railway revenues are booming from year to year while the Railway administration nevertheless seems to be in a position to levy heavier and heavier tolls on the users of its services—without having to submit to any strict scrutiny of its performance, financial or technical—is surely fraught with the grave risks that the importance of higher productivity will gradually be lost sight of in the management of our Railways. Already there seems to be some complacency in the Railway administration and a disturbing tendency to pat oneself on the back. It is clear that it is not at all being realized that Indian Railways are years behind Railway systems in modern countries in financial management and operational techniques. The fact that for the second year in succession the Railway budget has sought to step up freight rates seems to us to be sufficient provocation for Parliament to go deeply into the question of productivity and performance on the Railways. There is a case, possibly, for an expert Railway Commission to investigate to what extent financial practices, management and technical operation on the Indian Railways have benefited or are benefiting from the gains in experience or know-how recorded and utilized elsewhere in the world.

Strengthening Railway Finances

THE PICTURE of railways' performance presented to Parliament last week is reassuring to the extent that a steady progress is being maintained towards strengthening of their financial structure. Partly this is due to the improvement that has been effected in the operational efficiency of railways over the past few years, but largely it has been the outcome of the growth in traffic and the enhancement and rationalisation of passenger fares and freight charges on the lines recommended by the Freight Structure Enquiry Committee.

The gross traffic earnings of railways which in 1961-62 amounted to Rs. 500.50 crores, went up to Rs. 566.79 crores in 1962-63. The revised estimates for the current financial year place the gross receipts at Rs. 622.22 crores. These are expected to grow further to Rs. 668 crores during the next year — to Rs. 657 crores on account of the growth in traffic and by Rs. 11 crores owing to the proposed adjustments in freight, including the levy of a two per cent supplementary charge on all basic freight rates, other than export ore. Discounting the element of under-estimation in the budget and taking note of the measures being devised to raise the tempo of economic activity in the country, with a view to making up at least part of the leeway left in the implementation of the current Plan during the first three years of its operation, it will be no exaggeration to say that the gross receipts during 1964-65 would go up at a rate substantially higher than of the last three years.

It is gratifying to note that the increase in earnings is not being completely wiped out by higher working expenses and that various reserves are receiving increased allocations. The ordinary working expenses of railways went up from Rs. 325.33 crores in 1961-62 to Rs. 362.38 crores in 1962-63. They are placed around Rs. 393.34 crores during the current financial year and at Rs. 414.68 crores in the next. Appropriations to the Depreciation Reserve Fund have been stepped up from the current financial year by Rs. 10 crores over and above the amounts stipulated under the Railway Convention. Against the allocations of Rs. 65 crores to this account from the railway receipts in 1961-62 and Rs. 67 crores in 1962-63, the accrual to DRF from the revenue during the current financial year is to be Rs. 80 crores. It will go up to Rs. 83 crores in the next financial year. Adding the depreciation on account of the Chittaranjan Locomotive Works and the Integral Coach Factory and interest on the available balance, and deducting the cost of works charged to this Fund, the net balance in it at the end of the next financial year is expected at Rs. 49.65 crores, against Rs. 34.95 crores at the end of March this year and Rs. 22.84 crores and Rs. 29.19 crores at the close of 1962-63 and 1961-62, respectively. With capital-at-charge at the end of 1964-65 anticipated to go up to Rs. 2,389.4 crores, the meagre amount left to the credit of DRF should suggest over-capitalisation of railways. But the Railways Depreciation Reserve stands in a class by itself; it does not provide for the replacement of the total quantum of depreciation of the existing assets.

Alongwith increased allocations to the Depreciation Reserve Fund, dividend payments to the General Revenues have been stepped up from 4.25 per cent of the capital-at-charge in 1962-63 to 4.50 per cent in 1963-64. On the fresh capital to be made available to the railways during the next financial year, the dividend payment will be at the rate of 5.75 per cent. This has been necessitated by the mounting costs of raising capital in the internal market and the high rates of interest payable on some foreign loans secured for the railways. The additional contribution on this score next year is placed at Rs. 1.5 crores, raising the payment to the General Revenues to Rs. 93.73 crores from Rs. 82.53 crores during the current year. In 1962-63, this payment amounted to Rs. 68.76 crores.

The major beneficiary of the improved financial position of railways, of course, have been the Development Fund. The position of this Fund started deteriorating rapidly after 1952-53 when withdrawals from it exceeded appropriations (the whole of revenue surplus plus interest on the balance held in the Fund) by a wide margin. During 1958-59, 1959-60 and 1960-61, the Development Fund had even to borrow loans from the Exchequer so that the works charged to it could be provided adequate resources. Thanks to the record surplus of Rs. 42.06 crores available in 1962-63 and the addition of Rs. 70 lakhs on account of interest, the appropriations to this Fund could outstrip withdrawals, leaving Rs. 29.68 crores as balance at the end of 1962-63. The Rs. 37.75 crore surplus expected this year will impart further strength to this Fund. Alongwith Rs. 1.35 crores available as interest, it will be possible to add to it a net amount of Rs. 9.35 crores. During the next financial year, withdrawals are expected to be somewhat of a greater magnitude than the appropriations. But should the surplus in this year turn out to be larger than Rs. 30.87 crores estimated — it, indeed, must be so in view of the expectations of traffic growing at a rate faster than assumed by the Railway Minister — there should be a further addition to this Fund instead of a marginal lowering of it to Rs. 40.78 crores.

The Revenue Reserve Fund which is expected to share the revenue surpluses along with the Development Fund, however, has had to remain content with the accretions from interest only. During 1962-63, a sum of Rs. 2.02 crores was added to it, raising the balance in it to Rs. 57.39 crores. Further additions of Rs. 2.16 crores and Rs. 2.27 crores are expected during the current year and the next one. The total balance in this Fund will, thus, be raised to Rs. 61.82 crores at the close of 1964-65. It is significant that no raids have been made on this Fund after 1955-56, despite the strains which railway finance had to undergo in the three years to 1960-61.

Apart from the above three reserve funds, another one — Pension Fund — is planned to be created next year with an initial allocation of Rs. 19 crores. This is considered necessary in view of the fact that the improvement effected in the family pension scheme since January this year is bound to lure a larger number of railway employees to this scheme. And since they will be under various age-groups, expenditure on account of pensions will have to vary from year to year, for many years to come. Expenditure during the next financial year is estimated in the neighbourhood of Rs. 4 crores. This will leave a balance of approximately Rs. 15 crores to the credit of this new fund.

The growing credits available in the Railways Depreciation Reserve Fund, Development Fund, the Revenue Reserve Fund and the Pension Fund should stand the Central Exchequer in good stead as they can be utilized by it to ease its ways and means position.

The improved financial position of railways is also proving helpful in making available increased resources for their third Plan development programmes. It is, indeed, heartening that railways, by and large, have been able to adhere to schedules and the Plan expenditure is being incurred by them according to the stipulated phased programmes. Out of a total outlay of Rs. 1,581 crores expenditure to the tune of Rs. 908.26 crores would have been incurred by the end of the current financial year. A provision of Rs. 370 crores has been made in the next year's budget and hope has been expressed that the entire stipulated outlay would be utilized "alongwith any increase that may yet be granted" — railways intend to ask for additional allocation for the Plan programmes owing to development costs going up after the last year's heavy dose of taxation administered by the Union Finance Minister. Of the Rs. 908.26-crore outlay on the development programmes expected to be incurred by 1963-64, a sum of Rs. 204.10 crores would have come from the Depreciation Reserve Fund, Rs. 74.06 crores out of the Development Fund and Rs. 33.05 crores out of the revenue receipts. Of the Rs. 370-crore proposed outlay in 1964-65, Rs. 71 crores are envisaged to be drawn from the Depreciation Reserve Fund, Rs. 33 crores from the Development Fund and Rs. 13 crores straight from the revenue receipts. It is anticipated to provide nearly 33 per cent of the total third Plan outlay out of railways' own resources.

Although the comfortable loading facilities available with the railways today are primarily the outcome of the slackening tempo of economic activity in the country, they must, however, be given credit for the commendable progress being made by them in implementing the third Plan development schemes. It is hoped that they will continue to pursue their expansion plans in right earnest and will not be lulled into complacency with the somewhat easing of the transport bottlenecks. There is particularly need to augment railways' capacity to carry general goods traffic for which demand is growing at a rate faster than original-

ly anticipated. With the downward adjustments proposed in the freight rates of some high-rated consumer goods traffic, this demand is bound to go up at a more rapid pace during the next two years. The development of the general cargo carrying capacity should as well be not at the expense of the capacity being developed for the carriage of coal and raw materials. A lead over requirements in this respect needs to be maintained if for no other reason than for obviating the repetition of the post-1958 unhappy experience. The downward revision effected by the Planning Commission, in the Mid-term Plan Appraisal, of the goods traffic likely to originate in 1965-66 — from 260 million tonnes to 245 million tonnes — contains an element of hazard parallel to the 1958 second Plan pruning.

For meeting the mounting working expenses and further strengthening of the various reserve funds as also for making available additional resources for development, railways as well have to improve their operational efficiency a good deal more than has been done in the past twelve years. The over-all operating-cum-efficiency index of railways (base 1938-39 = 100) is said to have shown improvement from 100.6 in 1951-52 to 117.2 in 1962-63 and 118.4 in 1963-64. The rolling stock and the line capacity is being more intensively utilised. This is evident from the various efficiency ratios compiled by the Directorate of Statistics and Economic Advice Branch of the Railway Board. But two crucial indices regarding fuel consumption have shown progressive deterioration since 1960-61. Fuel consumption, both for goods and passenger traffic on broad as well as metre gauge railway systems, has gone up. This may be due partly to the decline in the quality of coal supplied to railways, but the malady appears to be deeper rooted. Shunting operations too have shown deterioration since 1960-61 except in the case of metre gauge goods trains. Wagon turn-round also leaves much to be desired. Although in the case of broad gauge railways only 11.1 days were required for wagon turn-round during April-November, 1963-64, as against 11.6 during the corresponding period of the previous year and 11.2 days in 1960-61, the time taken is much in excess of the expectations of the Planning Commission which thought that during the third Plan period it could be reduced to 9.5 days. In the case of metre gauge railways, wagon turn-round, in fact, deteriorated from 8.34 days in 1961-62 to 8.35 days in 1962-63. There has been an improvement to 8.61 days during the period April-November, 1963, over the 8.78 days required during the corresponding period in 1962-63. But here too the time taken far exceeds Planning Commission's hopes of reducing it to 6.5 days by 1965-66.

The railways also have to meet more squarely the criticism of their operational efficiency, which alleges that much of the seeming improvement in efficiency is in reality due to the fact that in the previous years efficiency had been permitted to go down, partly deliberately, in order to provide suitable conditions for large-scale indulgence in corrupt practices at many levels in the railway administration. There is need to expedite plans of modernisation of our railway system through introduction of modern traction power, automatic signalling, use of automatic mechanical instruments for flaw detection, changing over of wagons from screw couplings to automatic central couplings, etc. Operational efficiency of railways in the West, particularly in the USSR, is being achieved through the innovation of importing the largest measure of modern sation and reducing obsolescence to the minimum. Management efficiency requires to be stepped up through enforcement of greater discipline on the staff, particularly when per capita cost on railway employees is going up at a strident pace. The simplification and modernisation of accounting techniques initiated recently is a step in the right direction.

Soaring Prices of Silver

SILVER PRICES in this country took an upward course in the past few weeks and, at one time, touched a new peak at Bombay at Rs. 269 per 100 kilograms (.999 fineness). The latest pressure on prices was caused by the rising demand both for industrial uses and for the manufacture of jewellery, though it is not known how much silver is absorbed every year in industrial uses and what part of the demand is due to increasing demand for silverware and jewellery. Except for the driblets which used to enter this country through the northern border in the past—which meagre source has now dried up — there is no inflow of the white metal. The domestic price, therefore, is determined by the impact of demand on limited stocks since the output of silver within the country is negligible.

A rising trend in silver prices has also been witnessed in the international markets since the close of 1961. In the New York and London markets, silver prices took a sudden spurt in the last quarter of 1961 and the same trend has continued; the price of silver reached $1.29 per ounce — the price at which the US Treasury was obliged to surrender silver against the dollar certificates. Consumption in the United States has been racing ahead of output for the past many years and the price of silver at $1.29 per fine ounce was the highest recorded during the last 43 years. At this price the silver content of a standard dollar coin commands market value equivalent to a dollar; if the price of silver moved above this level, the metal content of the coin would be priced higher than its value as money. Since the US Treasury is required by the statute to redeem paper money (in the form of silver certificates) against silver, the Treasury has been busy in converting the silver certificates into silver which, again, is currently meeting a part of the market demand.

The table below gives production, consumption, imports and exports of silver in the United States. It shows that output of silver in the US has been almost stationary since 1960 around 36 millions of ounces per annum and was estimated to be of that level in 1963. The demand for industry and arts has ruled above 100 million ounces between 1959 and 1963 and was placed at 106 million ounces in 1963. Coupled with the demand for silver for coinage purposes at 86 million ounces, the total consumption of silver in 1963 was estimated at 192 million ounces. In other words, the total consumption of the white metal was larger than its output by 156 million ounces in 1963. A part of this demand was met by the excess of commercial imports over exports at 29.9 million ounces but a lion's share of the uncovered demand was met from the treasury stocks up to 147.2 million ounces in 1963.

SILVER IN THE UNITED STATES

(In Millions of Ounces)

	1959	1960	1961	1962	1963

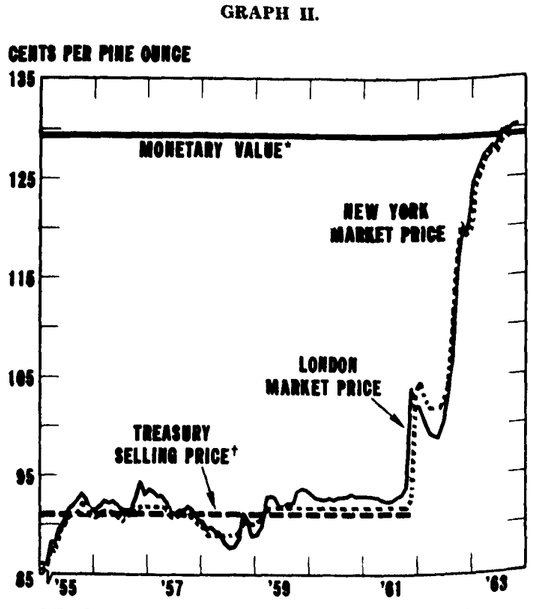
GRAPH I.

Silver Production and Consumption, 1940-63

Graph I also highlights the same trend in production and consumption in the United States and in the rest of the non-communist world. Since 1947 production has been almost static in the United States while it has been slightly rising in the non-communist world. The gap between production and consumption in the United States has been steadily widened over the years mostly because of the demand of the white metal in the arts and industry. A similar trend has now been seen in the rest of the non-communist world wherein from 1959 onwards, the demand of silver for coinage, arts and industry purposes has outstripped production. In other words, the United States cannot now to any large extent depend upon supplies of silver from the rest of the non-communist world in order to fill its gap.

Graph II shows the trend in silver prices both in the New York and London markets since 1955. It will be seen that between 1955 and 1961 the fluctuations in the prices of silver were of a marginal type,

the price having ranged between 85 and 95 cents per fine ounce. The spurt recorded in the end of 1961 to 105 cents and then to the monetary value of silver at 129.29 cents in 1963 was a new record causing extreme pressures on the available supplies of silver both in the US market and in the rest of the non-communist world. It may be recalled that the President of the United States in November, 1961, issued directions to the Treasury to gradually withdraw five and ten dollar silver certificates and the gap to be filled by additional issue of Federal Reserve notes. This step had to be taken because of the virtual exhaustion of the "free" stocks of silver. The President also authorised the Federal Reserve Bank to issue $1 and $2 notes to replace silver certificates of these denominations which had tied up about 1,300 million ounces of silver for backing. This legislation came into effect in June, 1963, and the Federal Reserve Bank began to issue $1 "bills" at the end of November. Till September 1963, 250 million ounces of silver were, thus, freed while 189 million ounces of silver still remained as currency backing. Together with 1300 million ounces remaining as backing for $1 and $2 silver certificates and taking into account 38 million ounces of "free" silver and a few other items, the Treasury silver stocks are now estimated at 1,600 million ounces.



In view of the mounting demand for silver, it is feared that even these stocks of 1,600 million ounces are not likey to last for long. Secretary of Treasury, Mr. Dillon, however, holds the view that the Government, through the legislation already passed, will be able to acquire silver enough for coinage for the next ten to fifteen years. As the market price of silver is slightly above 129 cents per fine ounce, the disposals of Treasury's silver may be larger than was anticipated earlier by the US Government. The width of the gap between production and consumption is such that the Treasury may have to dispose of sizable volumes of silver each year to keep the market price below the monetary value of the standard silver dollar. This continued practice of withdrawing silver from the treasury stocks will bring nearer the day when the market price will pierce through the ceiling of 129 cents per fine ounce. At that stage the silver coins will once over again be melted in order to recover more than the face value of the coin.

Will the United States demonetise all its coins? There is no indication if this drastic step will be taken in the near future. The Treasury is reported to have stated in May, 1963, in a memorandum submitted to the Senate Banking and Currency Committee that it considered "it unwise to abandon coins before it is absolutely necessary to do so". This view has been presented because silver coinage in the United States dates back to 1792 and people have come to attach considerable importance to possessing silver coins. Even a shift from silver to any of the base metals will create a great imbalance in the demand and supply position of the base metals as well.

The hope has been expressed by the Treasury that in view of the rising silver prices, new supplies of silver might be developed somewhere in the world. Also, it is possible that the demand for silver may fall as a result of changes in technology. May be, some of the countries will give up using silver in their coins and will thus, increase the supply of silver. In the photographic industry, which is a big consumer of silver, some substitutes for silver salts may be discovered. Thus, there are a number of possibilities, though of a vague nature, for changing the present position of demand and supply.

In this country, all the silver coins were demonetised long ago and all the new coins are of base metals. The demand for silver has emerged, by and large, due to the age-old tradition of using silver ornaments, especially by the poorer sections of the society. Part of the increase in demand has also emerged from speculative investments in silver because of the reduction in activities in gold due to the controls imposed on the yellow metal. The upward trend of silver prices may not be arrested because there are no sources of new supplies and the demand continues to increase under the stress of rising incomes and increased industrial uses.

GRAPH II.

U.S. Treasury and Open Market Spot Silver Prices
1955-63
(Monthly Averages)

* The "monetary value" of silver is the value at which the metal content of the standard silver dollar, established in 1837 at 0.7734375 fine ounce, is worth $1; this makes a full fine ounce of silver worth $1.2929.... † Price at which the Treasury, at the San Francisco Mint, sold silver prior to November 28, 1961.

Note: The New York price is that quoted by Handy & Harman.

Highlights of the Week

KASHMIR IN SECURITY COUNCIL

THE SECURITY Council of the United Nations adjourned 'sine die' at the suggestion of the Moroccan delegate after Mr. Bhutto of Pakistan had earlier, in vain, asked for a short adjournment to keep alive the debate during the present session of the Council. From the point of view of India, this has been not a wholly unfavourable development since neither the clear resolution of the Council asked for by Sir Patrick Dean nor the consensus suggested by Mr. Adlai Stevenson was really acceptable to India.

Replying, on February 10, to a vituperative speech made by Mr. Bhutto, Mr. Chagla warned the Security Council that any one should "think a thousand times before he would disturb the situation which has existed since India became independent". He declared that India would not submit to intimidation and to Pakistan's threat of "bloodshed and war". "The bond that Pakistan finds with the people of Kashmir .... is not common nationality; it is not common race; it is not common tradition or common history; but the mere bond of religion". India repudiated a philosophy which equated nationality with religion. Mr. Chagla recalled that, on April 10, 1963, Mr. Chou En-lai had declared at a Press interview that Pakistan had explained the purpose of its military alliance (with China) as gaining ascendancy over India. In a series of forceful and rhetorical questions, Mr. Chagla asked to know if Mr. Bhutto was prepared to concede the same right (of self-determination) to the Pakhtoons and to East Pakistan; to the people of Bahawalpur on whose ruler accession had been forced by the Pakistan Government; and to the subjects of the Khan of Kalat.

The "very bottom" of the old resolutions of the Council regarding the plebiscite, Mr. Chagla argued, had been knocked out by Pakistan's own conduct. The continuing presence of Pakistani forces in Kashmir and the progressive induction of Pakistan-trained military personnel and of war-like equipment obtained by virtue of Pakistan's membership of military pacts and the conclusion of a pact with China, which had no common border with Pakistan, were all flagrant violations of UN resolutions.

King Charles' Head

Speaking on February 10, 1964, Sir Patrick observed that the Kashmir problem had baffled "the collective wisdom of the Security Council for 15 years". Citing a long list of UN resolutions which accorded with his view, Sir Patrick reiterated his Government's position on the right of self-determination for the people of Kashmir. He urged that their final disposition should be effected "in accordance with the will of the people expressed through the democratic method of a free and impartial plebiscite conducted under the auspices of the United Nations". He thought that it was unrealistic for the Council to consider the Kashmir problem purely "in terms of the legal effect of the Maharaja's instrument of accession."

In effect Sir Patrick Dean emphasised that the accession was a legal and not a political act. He identified the view of one of the parties to the dispute with the "principles of the Charter" wholly ignoring the fact that a UN Commission had suggested other means for the resolution of the dispute if a plebiscite was not feasible. The statement has angered many members of Parliament belonging to the major parties, some of whom suggested severance of India's ties with the Commonwealth. Yet others met Sir Paul Gore-Booth, the British High Commissioner in India, to protest against his Government's stand on the Kashmir debate in the Security Council. In proof of his country's friendly feelings, the British High Commissioner cited the readiness with which Britain had helped India with arms after the Chinese invasion and his country's "economic effort" which had greatly helped India's development.

He argued, however, that the British delegate at the UN had only called for an attitude to the status of Kashmir, which did not confine itself only "to the terms of the legal effect of the Maharaja's instrument of accession".

Honest Brokers All

A common point of view underlay all the seven other speeches in the Security Council: the parties to the dispute should get together to arrive at a mutually acceptable settlement. Mr. Adlai Stevenson, the U.S. representative, urged the need for a consensus and recalled that US support to all earlier resolutions of the Council had been accorded on the principle of self-determination and suggested mediation by U Thant, the UN Secretary General. He also added that the differentiation of the people of Jammu and Kashmir and those of India should be maintained. Mr. Castrillio Justiniano of Bolivia, who recalled India's support to anti-colonial causes and to the struggle for the growth of the developing countries, said that any new resolution must reflect the reality "which is being modified constantly". While he did not cast doubt on old resolutions, he suggested that "it will be necessary to seek new ones". Prof. Hajek of Czechoslovakia held that nothing new had happened to modify the essential nature of the dispute. He said that all unresolved problems between India and Pakistan which were linked by geography, identical ethnic origin, historical experience and a common civilization, were due to their colonial past. The Kashmir problem was thus only an example of the division created by colonial rule in Latin America, Asia, Africa and elsewhere. He thought that the two countries should themselves resolve their differences and devote their energies to economic development. Mr. M. Roget Seydouz of France was concerned with "the fragile character of balance" in the sub-continent and suggested a progressive treatment of the Indo-Pakistan problem which also respected the feelings and beliefs of both the parties.

Dr. Ferdereniko of the Soviet Union, who came from his sick bed "for the sake of India" as he put it, pointed out that he found it difficult to see that anything new had arisen. He said that only those who wanted to divide Asia would use differences of religion and other factors separating India and Pakistan for purposes which had nothing in common with the preservation of peace and security. He believed that the accession of Kashmir to India represented the final decision of the people of that State and that any differences between India and Pakistan should be solved through mutual agreement by the peaceful procedure which Mr. Khrushchev had commended for territorial disputes. The Norwegian delegate said that while it was not for him to suggest the terms of compromise, any solution must have the agreement of not only of India and Pakistan but the people of Kashmir itself, if it was to be an abiding solution.

This is no solution but a respite — nevertheless one that goes some way to meet India's point of view. The strong reaction that the debate provoked in the Government of India and in members of Parliament and the direction that the refugee problem is taking in this sub-continent all reinforced the effect of Mr. Chagla's able advocacy of India's case in the UN.

The Displaced Persons

Sir Patrick Dean implied that India's case in Kashmir was too legalistic based as it was, according to him, on the instrument of accession. Many Indian ideals have in the past been run down either as Utopian or hypocritical but the con-

cept of the secular state cannot surely be one of them. Here is no rationalist excess implemented in callous disregard of human values. Secularism in India is no irreligious protest, and if Mr. Nehru, principally among others, has presented what is really India's destiny as a conscious moral choice, it is a credit to their powers of persuasion. It must be still true of many people who have in recent times come into society that they come up against religious obstacles in their mind when they seek to articulate their affinity with fellow-members of modern social institutions. Notwithstanding that, there is an undoubted element of condescension in Sir Patrick's insistence on treating Hindus and Muslims as two nations and in his implied equation of the communal problems of India and of Pakistan.

The fact that 4.5 million persons of the minority have come away to this country since 1947 cannot be dismissed as a flight in search of better economic opportunities. As many as 70,000 persons have left their homes since the time of Dacca and Narayanganj riots and such property as they had in East Pakistan and entered this country with or without migration certificates. Some members of Parliament blamed the Government of India for not insisting on the reciprocal responsibility of the Pakistan Government towards its minorities. Surely there is no place for the futility of diplomatic protests in this moment of danger to the lives of those men and women who have managed to survive, in this moment of a faceless fear that assails these wronged and hapless people in an insecure land. Equally ridiculous is the plaint of Mr. Habibullah Khan, the Home Minister of East Pakistan, that the India Government is encouraging them to return to this country. The uncertain future that awaits them in this poor country, on which they will be an undoubted burden for some time at any rate, can hardly be described as an incentive. What the Government of India is doing for these displaced persons is the minimum that it owes, in the words of Mr. Nanda, 'to man and to God'.

THE U.P. BUDGET

THE BUDGET that Mr. Kamlapathi Tripathi presented to the U.P. Vidhan Sabha on February 13 is in many ways representative of the coming times. That "we are all socialists now" was a slur cast on the new economics that came into vogue in Britain of the inter-war period, but it is becoming true of a deceptively similar context in this country. In the Bhubaneswar Congress session it was pointed out by those looking for coherence that socialism had come to mean different things to different men, and, indeed, the specific projects towards that end envisioned by different people were bewilderingly different. There were of course the few who were firmly rooted in the realities of the Indian economic situation whatever they made of that knowledge; but, thanks to the comprehension of opinion that had been achieved within the ranks of the Congress, the budgetary and fiscal policies of State Governments have come to acquire some uniformity and are determined by the needs of a poor and ill-provided economy which, as Mr. Tripathi pointed out, is common to all State Governments. Success will, however, largely go to those who happen to be in power which is perhaps what has made politics in the States so contentious and hazardous in recent times.

Mr. Tripathi's budget speech certainly had the virtue of modesty. He claimed no more than that his budget was only a step in the direction of Socialism and wisely added that this happy consummation could not be brought about by a single State in the country. Apart from this virtue, Mr. Tripathi's budget suffers from all the weaknesses peculiar to all State budgets. Uncovered deficits, while in themselves not alarming, turn out to be due to a misdirected caution in the estimate of receipts, which would be more in place in the imaginative screening of expenditure. Thus the actual budget figures for 1962-63 reveal a surplus and the estimated deficit of Rs. 5 crores for 1963-64 did not in the sequel exceed Rs. 1.22 crores -- an eventuality that the Finance Minister could not have been unaware of since the proposals he had promised during previous Budget session did not materialize. Mr. Tripathi's budget proposals for the forthcoming year again leave open the means of finding Rs. 11.59 crores -- representing this year's deficit. In the event, the under-estimating of receipts will account for part of this sum and he hopes further that (a) new measures to be brought up later; (b) prevention of tax evasion and; (c) the recovery of tax arrears will take care of the rest. During the third Plan period, Rs. 497 crores are to be spent in Uttar Pradesh, of which Rs. 147 crores was to come from the State's own resources. The increase in the yield of State taxation has been of the order of Rs. 18 crores during the first two years of the Plan, but the rate will have to increase perceptibly if the Plan target is to be realized. However, the shortfall itself does not call for any drastic remedies since, during the first three years of the Plan, only half the Plan outlay has actually been expended.

Kind Hearts and Coronets

Thanks to the vastly extended function of the State in India, budget speeches in this country read more like a report on the Plan or a definition of policy than like a statement of accounts. The U.P. Budget for 1961-65 thus tells of detailed schemes to consolidate and extend agriculture in the State. More tube-wells are to be dug; an irrigation extension service will explore and support private irrigation facilities. Agricultural policy is to be piously aimed at increasing sugarcane yields through intensive cultivation and through rotation of crops, called "package schemes" in the case of cereals, oil-seeds and potatoes -- a case, perhaps, of a repentant sinner trying to come to terms with his conscience!

The State Government intends to rehabilitate and modernize some of the old sugarcane mills and the State-owned fair price shops which will dispose of the entire production of "atta" from the flour mills as also wheat imported into the State. The fair price shops already sell sugar at controlled rates in the countryside.

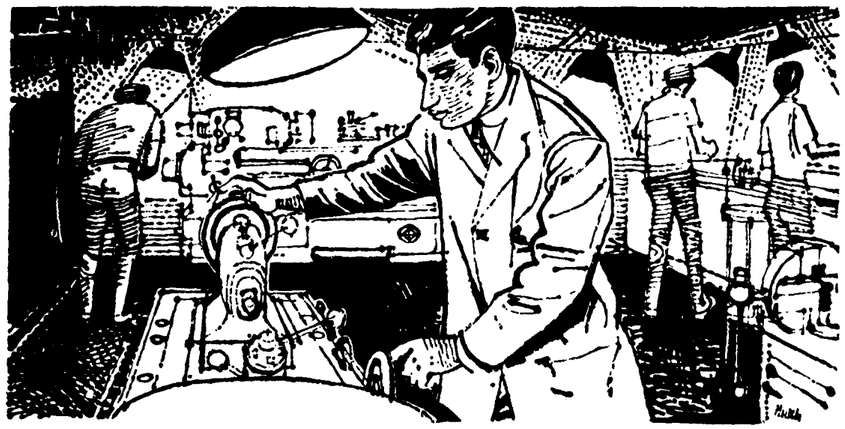
Last year a bill to levy a cess on land was kept in abeyance, strangely enough because of the emergency. This year, the State Government has gone one further and abolished the 1962-63 surcharge on land revenue. While everything is to be said for relief of any kind to farmers, the tax-payers have a right to expect economic returns on money spent or invested in agriculture for that is ultimately the only reliable way in which such expenditure can be sustained in the long run. The State's rabi crop for the last financial year was an exceptionally poor one so much so that the State Government has asked 175,000 tonnes of wheat and 150,000 tonnes of rice from Central stocks. The off-take in the fair price shops has reportedly increased at the rate of 300 per cent. A cement factory to be set up in Dalla in Mirzapur district has been included in the third Plan and the antibiotic factory in Rishikesh in that district is expected to go into production during the current financial year.

A study team of the Planning Commission which investigated conditions in four backward districts of eastern Uttar Pradesh had recommended large-scale investment in these areas some of which was to come from Central projects. Mr. Tripathi has asked for large Central assistance on this account.

Non-developmental expenditure has increased by over Rs. 20 crores in the last three years. Many of the schemes to be started during the current year will serve to make a large number of State Government servants permanent, to give them and school teachers in the State a variety of gratuity and pensionary benefits.

Textiles are major earners of Foreign Exchange— the label 'Sanforized' can help increase Cotton Exports!

Over 3500 years ago, textiles headed India's list of exports; Arab dhows carried them to Persian Gulf ports and they were sold in the markets of Greece and Rome. Everywhere, Indian fabrics were richly prized and highly priced. Today, they are still major earners of foreign exchange— and will earn more in the future as Indian mills produce increasing quantities of better quality, finished cloths and new foreign markets are tapped. The label 'Sanforized' can be of tremendous help in the sale of Indian cottons abroad. Recognised the world over, this trademark is known and trusted by millions of consumers in 49 countries as denoting a uniform standard of shrinkage control. In India, the label 'Sanforized' has helped to improve the quality and enlarge the variety of cotton fabrics. In the markets of the world, the label 'Sanforized' can be of inestimable benefit by helping to build bigger, more profitable textile exports.



'SANFORIZED'
REGD TO MK

Issued by Cluett, Peabody & Co., Inc (Incorporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark 'SANFORIZED', or permit its use by authorised registered users, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

In Factories, Hospitals, Schools, Public places...

PUT AN END TO THE DANGERS OF

SUDDEN DARKNESS

In factories sudden darkness can cause injury and damage to machinery. Emergency lighting is the obvious safeguard—and that's where Keepalite comes into its own. Keepalite is an automatic emergency lighting system employing lead-acid storage batteries which are automatically triggered into operation by the actual mains failure. Modern methods of control and 'trickle' charging mean that Keepalite equipment has outstandingly long life and requires minimum of maintenance. That's why architects everywhere specify Keepalite as sure inexpensive protection for factories, hospitals, schools, banks and public places.

KEEPALITE

AUTOMATIC EMERGENCY LIGHTING EQUIPMENT

The Sad Case of Sir Patrick

By Our Parliamentary Correspondent

NEW DELHI: Tuesday.

ALTHOUGH A good deal of the time of the two Houses had been taken up in the discussion of the President's Address, many Parliamentarians seemed to take more interest in the question who would be replying to the debate on behalf of the Government than in the debate itself. At one stage there was even feverish speculation whether there would be a clash in the Cabinet or, as some lobby comments chose to put it, a show-down between the Prime Minister's senior-most colleague, on the one hand, and the Minister without Portfolio, on the other.

Better informed or at least less excitable observers were however emphatic at all times in discounting the likelihood of fire-works. They pointed out that Mr. Lal Bahadur, at any rate, would be the last person to force the issue in matters such as these. It was conceded, at the same time, that, as matters stood, it was only proper and reasonable that Mr. Nanda, by virtue of his seniority, should be given the option to reply. In the event, this particular matter has been settled in a way which ought to be more or less satisfactory not only to the individuals directly concerned, but also to all others interested in the smooth working of the Cabinet. It has now been decided that Mr. Nanda will reply to the debate in both Houses, but Mr. Lal Bahadur Shastri might intervene, also in both Houses.

Mr. Krishna Menon's speech on Friday, in which he castigated Britain over the attitudes struck by its representative in the Security Council debate on Kashmir, was certainly the highlight of the Parliamentary proceedings since the session began. Mr. Krishna Menon is probably the most articulate performer in the entire Parliament and when he gets an opportunity, as he did on this occasion, to strike a note which is bound to be echoed in the sympathies of his audience, it naturally becomes all too easy for him to carry the listeners with him, no matter what reservations they may have about him or about his works in general. For what "The Statesman" justly described as "one of his ables speeches ever in Lok Sabha", Mr. Menon was repeatedly cheered by legislators on all sides of the House. As was usual with him, he used sophisticated legal arguments as well as mere political broadsides with equal effect. He characterised Britain's attitude as a violation of the U.N. Charter and of the pre-Independence tripartite agreement to which Britain was a party. It is doubtful that he actually succeeded in convincing anybody that the British stand on Kashmir in the Security Council was a part of "a process to get back her empire by the back-door", but by the time he had ended his denunciation, it was obvious that there was a general inclination to suspect the worst of "perfidious Albion".

Counsel of Despair

Sir Patrick Dean, indeed, has turned out to have made not only an extremely provocative speech himself, but also to have been the cause of provocative utterances from others. Mr. N. C. Chatterji, agreeing with Mr. Krishna Menon, declared that Kashmir's accession was no more a live issue and that it did not lie either with Britain or any other country to attempt to reopen it. Another strong speech was made by Mr. A. D. Mani in the Rajya Sabha, where the latter went to the extent of saying that India should consider leaving the Commonwealth — a counsel of despair which, happily, was only sporadically heard in either House. Mr. G. S. Pathak, speaking more in sorrow than in anger, seemed to be voicing a widely prevalent sentiment both inside Parliament and outside when he expressed a feeling of distress that a friendly country such as the United Kingdom should have put India on par with Pakistan in the matter of treatment of minorities.

An interesting feature of the discussions on the President's Address was that while all speakers were naturally keen on our country as a whole having better administration, some of them seemed to be particularly keen on Kashmir having it. Indeed, the feeling that the people of Kashmir has been mis-governed, are being mis-governed and should not be allowed to be mis-governed by a local clique, seemed to cut across party barriers. Thus, while Mr. N. C. Chatterji (Independent), among others, demanded the abrogation of Article 370 of the Constitution and full and immediate integration of the State with the rest of the Union, Mr. P. N. Sapru (Congress) was critical of the "unclean" administration in Kashmir and suggested that there should be either an all-party government in the State or President's rule promulgated. Incidentally, both Mr. H. V. Kamath (P.S.P.) and Mrs. Renu Chakravarty (Communist) urged what they called a "political" approach to the release of Sheikh Abdullah as against a "legalistic" approach.

Extreme Views

On the President's Address two extreme views have been heard. There was Mr. Bhupesh Gupta (Communist) in the Rajya Sabha who had tabled as many as 126 out of the 209 Amendments on the Motion of Thanks. Mr. Gupta's discontent with the state of affairs in the kingdom of Denmark was so great that he could not even bring himself to utter a word of praise for Mr. G. L. Nanda's universally admitted firm and fine handling of the Calcutta disturbances. On the other hand, the Communist leader groused that the Government of India had failed to anticipate the communal rioting in East Pakistan and its repercussions in West Bengal. At the opposite pole stood Mr. B. N. Bhargava (Congress), also of Rajya Sabha, who was so impressed with the beauty and perfection of the President's Address that he could express his satisfaction adequately only in Hindi verse. Poets are alleged to be the unacknowledged legislators of the world and although Mr. Bhargava, besides being a poet or at least a versifier, is also a legislator — not unacknowledged by any means, but truly and duly gazetted as such —, he seemed to have failed, as I must regretfully record, to impress his fellow Parliamentarians. Thus, undeterred by Mr. Bhargava's eulogistic effusion, Mr. Dayabhai Patel (Swatantra), proceeded to describe the Government as a "sick government", a description which his party leader, Mr. N. G. Ranga, speaking on the same day in the Lok Sabha, annotated by saying that the Government was suffering "from a jaded spirit and political bankruptcy".

Mr. Range further charged the Government with having failed on all fronts and pointedly remarked that, while today India was more isolated than ever before, "our political and international enemy, China, has improved her position". He also found fault with the Government for doing "nothing at all" to protect the interests of Indians in the newly independent African countries or in Burma, Ceylon and Malaysia. The Swatantra leader condemned the Constitution (17th Amendment) Bill as a measure affecting the "self-employment and land holdings" of millions of peasants and plugged Swatantra propaganda by criticizing the increase in land revenue in several States. Finally, in a characteristically hard-hitting passage, Mr. Ranga argued that what was happening in Kashmir now was the result of "our depending upon one-party

rule" and pressed home his advantage by warning Parliament (and perhaps a larger audience as well) that the same consequences would follow in the rest of the country "if the people are not able to have an effective opposition."

It was left to Mr. J. B. Kripalani to deliver a really withering attack on the general competence of the Government. The Acharya declared in a characteristic outburst of irony that while he could not deny the Government its "legal right to misrule the country", he would certainly challenge its moral right to do so. He said: "Our people feel that the health of our nation has been fast deteriorating. Our economy is in such doldrums that it is impossible for millions of our people to keep body and soul together. Our public life is riddled with corruption, nepotism, graft, inefficiency, indifference and these have sapped the moral fibre of the nation. No statistics are required to prove all these to the people .... They feel these conditions within the marrow of their bones, if any marrow is left in their bones. Our foreign policy has miserably failed. We have no real friends left in the world." Underlining this point Mr. Kripalani permitted himself the wry remark that, in the latest Security Council discussions on Kashmir, "even our great friend Russia" was more concerned with the "susceptibilities of Pakistan and the Western block than with our rights."

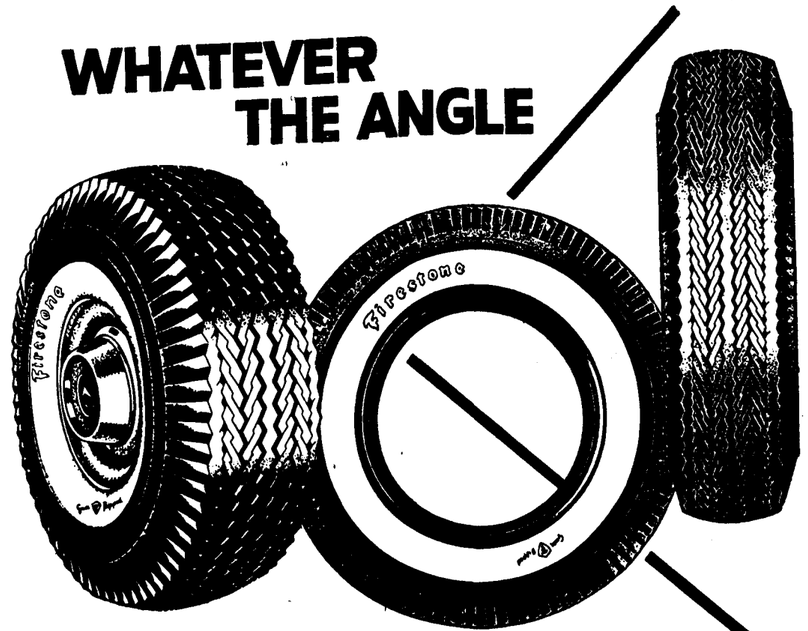
Keen Curiosity

An amusing aspect to the debates was the keen curiosity shown by Opposition speakers in the affairs of the ruling party consequent to the Prime Minister's illness. Thus Mr. Ranga took it upon himself to advise the Prime Minister that the latter should divest himself of the responsibilities of the Foreign Ministry. Not stopping there, he went on to demand that a person who was acceptable to "all democratic parties should be appointed Foreign Minister". Having made that somewhat strange suggestion, the Swatantra leader further counselled the Prime Minister that he should not accept the advice tendered in certain quarters that he should nominate for the post of Foreign Minister some one who was "not far" from his political thinking and "personal affections". Another Opposition speaker who evinced similar interest was Mr. H. V. Kamath whose advice, however, was on slightly different lines. Although he would rather that the ruling party elected a new leader, Mr. Kamath was gracious enough to express his willingness to settle for a Deputy Prime Minister who, he urged, should be appointed without any further delay. Such weak-kneed compromise naturally could arouse nothing but disgust in Dr. Lohia who, as might be expected, was quite convinced that "a sick Prime Minister" should not continue at the helm of affairs.

With so much to distract Parliamentary speech-making, it was perhaps not surprising that economic affairs failed to receive their due share of notice. In the few speeches where some attention was given to this subject, the speakers were more interested in tub-thumbing on the theme of Democratic Socialism than in giving serious and constructive consideration to the basic problem of stimulating the economy and stepping up the rate of growth. There were, no doubt, a few positive and useful suggestions such as that of Dr. L. M. Singhvi (Independent) who urged the establishment of a desert development authority to give some economic security and stability to the people in the famine areas of Rajasthan, Gujarat and Punjab. His concern was topical since, currently and in the recent past, there has been extensive suffering from drought and its consequences in the Bikaner and Jaisalmer regions of Rajasthan. Equally relevant, but on a wider canvas, was the anxiety shown by many speakers on the rising trend of prices. But such parts of the discussion in either House as attempted to touch on the nation's economy certainly failed on the whole to deal with the basic and urgent issues relevant to the sustenance of economic progress. The speech of Mr. Sachindra Chaudhri (Congress) was perhaps an exception. He did try to go into the larger aspects of economic stability and expansion and he argued that although the country had accepted a pattern of socialist economy, there should nevertheless be greater utilisation of the know-how and experience of those in the private sector.

Among other issues which engaged the attention of Parliament in the past week were the plight of Hindus in East Pakistan and the reception and relief of such of them as might be seeking refuge in this country, the identity of those who have been arrested for stealing the holy relic from the Hazratbal shrine and the present state of the State of Emergency. The Home Minister's statement that this country would not place any difficulties in the way of immigrants from East Pakistan has certainly been received well and has helped to relieve the tension which was being worked up by certain opposition groups. Mr. Nanda's performance elsewhere was less adroit. After considerable "humming" and "hawing", he came out with the names of the persons who had so far been detained in connection with the theft of the holy relic and whom it is intended to bring to trial. One of the speakers on the President's Address had claimed earlier that the disclosure of the identity of the suspects would result in dispelling the clouds of allegations and insinuations hovering over the devoted heads of certain National Conference leaders. But it is doubtful that Mr. Nanda's announcement has quite fulfilled this hope. The Home Minister, however, did say enough to lend support to the belief that Pakistan's hands, in the matter of the theft of the holy relic, are far from clean.

The Emergency had few enthusiasts in Parliament. Even Dr. Hare Krushna Mahatab from the ruling party felt compelled to plead in the Lok Sabha that the people should not be acclimatized to a permanent State of Emergency lest nothing happened if a "real emergency" arose. It must be recorded, however, that Mr. M. S. Gurupadaswamy (PSP) in Rajya Sabha took the view that it would be imprudent to ask for the discontinuation of the Emergency as there was mounting danger from both China and Pakistan. At the same time, he took exception to what he described as the abuse of Emergency powers "to suppress workers". The question of abuse or misuse of Emergency powers figured also in the speeches of two Communist stalwarts in Rajya Sabha, Mr. Bhupesh Gupta and Mr. P. Ramamurti, the former having moved a resolution demanding the lifting of the State of Emergency. Mr. Gupta condemned the Constitution (Eigh-



ANNOUNCEMENT

In view of the fact that the Central Budget will be presented on Saturday, February 29, the publication date of the next issue of "Eastern Economist" has been postponed by a day, from Friday, February 28 to Saturday, February 29. This issue will carry a Leading Article on our first impressions of the Budget which will be subsequently discussed in detail in the Special Budget Number to be issued on Friday, March 6, 1964.

The Special Budget Number will, as usual, analyse all aspects of the Budget proposals and the various Budget documents and present a view of the national economy in the context of the Budget statement of fiscal and economic policies. This Special Number which will be illustrated with graphs and diagrams will be priced Rs. 5 per copy, but will, as usual, be available to subscribers without extra charge.

INDIAN AIRLINES

teenth Amendment) Bill as a move to "legalise illegality". Mr. A. B. Vajpayee (Jan Sangh), who was also highly critical of alleged political discrimination in the use of the Defence of India Rules, made the interesting suggestion that the State of Emergency should be restricted to the border States of NEFA, Assam, Bengal, Jammu and Kashmir and Punjab, a proposal which had the broad support of Mr. A. D. Mani, who proposed that the Emergency should be applied to an area within hundred miles of our border with China and Pakistan. The political undertones of the debate were underlined by speakers from the ruling party also. Mr. Sudhir Ghosh, for instance, alleged that "a particular political tribe" in the eastern States would even be prepared to form a puppet government with Chinese assistance.

Meanwhile, a Private Members' Bill was introduced in Lok Sabha last Friday for amending the Constitution to provide for the approval of the proclamation of Emergency issued by the President under Article 352 by Resolutions of both Houses of Parliament. Mr. Yash Pal Singh, who fathered the Bill, explained that in his view Parliament should have an opportunity every six months to examine whether the extraordinary powers granted to the Executive were not being misused. The same M.P. introduced another Bill to amend the Requisition and Acquisition of Immovable Property Act, 1952, in order to provide for compensation for acquired property on the basis of market price at the time of acquisition; the present position is that compensation cannot exceed twice the price of the property as on the date of requisition.

Apart from these and other Private Members Bills, a Government Bill providing for the constitution of a special tribunal for investigating into the misbehaviour or incapacity of a judge of the Supreme Court or High Courts was also introduced in the Lok Sabha on Friday. The proposed special tribunal would frame charges, investigate them and report to the President. The report will be placed before each House of Parliament after which, as is already provided under the Constitution, an address could be presented to the President by each House of Parliament for removal of the judge concerned.

Question Hour

Guarantees For Foreign Capital: Replying to questions on the investment guarantee agreement currently under discussion between India and West Germany, the Union Finance Minister told Lok Sabha last week, that India would like to follow in the case of other countries as well, the pattern of arrangements reached with the United States in respect of guarantees to private US investors here. There were certain differences in the arbitration proposals put forth by West Germany and those agreed to with the United States. These were being considered.

Social Security: Mr. Krishnamachari also stated in Lok Sabha that a committee of officials was examining the question of social security. The Government, he asserted, was deeply concerned about this matter. The drawing up of a programme in this regard would depend on certain facts that were being elicited.

Mahalanobis Report: Mr. Bhagat told Lok Sabha that the report of the Mahalanobis Committee on distribution of national income was expected before the end of this month. The Committee's secretary had prepared a draft report and one of the members, Dr. Madan, had submitted a report on concentration of economic power with banks. These were being studied.

Sugar Production: Mr. Thomas stated in Rajya Sabha that sugar output during the current crushing season up to February 7, 1964, had been of the order of 1.527 million tonnes, as against 1.323 million tonnes in 1962-63, 1.213 million tonnes in 1961-62 and 1.386 million tonnes in 1960-61. He expressed his inability to give a precise estimate of the likely sugar production this year on the ground that the season was still on. There was no proposal for further increase in the minimum price of sugarcane, he added.

Replying to questions in Lok Sabha, the Union Minister for Food and Agriculture, Sardar Swaran Singh, however, said that he expected that sugar output this year would touch the level of about 3 million tonnes required to meet the domestic demand and export commitments. He did not share the pessimistic note struck by the Indian Sugar Mills Association about a fortnight ago, suggesting that sugar output during the current crushing season would be only of the order of about 2.5 million tonnes, owing to large-scale diversion of cane to gur production. Referring to ISMA's demand for a higher price for sugar produced beyond a certain quantity, the Food and Agriculture Minister stated that after a careful consideration of the issue, the Government of India had come to the conclusion that this proposal could not be accepted. Prevalence of two different prices for sugar and sugarcane, resulting from the acceptance of this proposal, would create confusion in the market.

Fire at Ranchi: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, told Rajya Sabha that police investigations into the recent fire at the Heavy Engineering Corporation, Ranchi, were still continuing. It was estimated that about 100 packages in all had been damaged. The total value of equipment contained in these was estimated at about Rs. 45 lakhs. It was yet to be determined whether any portion of this equipment could be salvaged and used by importing only replacements for the damaged components. Replying to a call attention notice later in the Lok Sabha, Mr. Subramaniam revealed that the head of the Russian experts had examined the damaged packages with a view to assessing the effects on the production programmes of the Corporation. He was of the opinion that by transferring some machine tools and other articles meant for other shops to the reduction gear department, which was scheduled to go into production during 1964, it would be possible to maintain the current year's production programme. If, in the meantime, supply of these equipments for the medium and heavy machine shops was not arranged, the production programme of 1965 was likely to suffer.

Eastern Economist 20 Years Ago

FEBRUARY 25, 1944

It is strange that the Transport Member should take pride in the efficiency of his administration while the facts are just the reverse. One would like to know, for instance, as Sir P. Thakurdas has put it "why his department did not foresee the threatened shortage of coal and did not press the Government to compel mine-owners to raise the miserably low wages (despite the opinion of our Calcutta contemporary to the contrary—Ed.) paid to workers in such good time as to avoid the crisis". Again the working expenditure has been rising to an astonishingly high level. Comparing 1939-40 with the budget year 1944-45 the staff bill has risen from Rs. 35 crores to Rs. 50.36 crores and the coal bill from Rs. 2.73 crores to Rs. 9.70 crores. There is no hope either that these high costs will decline even after the war. For, as the Chief Commissioner of Railways has stated: "The coal and wages bill which is at present about 73 per cent of the working expenses will for some years after the war remain at a high level." The extravagance of running the 520 grain shops in the interests of the staff is clearly seen in the wide gap between the budgeted expenditure of Rs. 3 crores and the actual expenditure of over Rs. 10 crores. In the name of anti-inflation any kind of expenditure is increased and every kind of taxation imposed.

V.T.K.—A Life of Enduring Service

TARLOK SINGH

WITH Mr. V. T. Krishnamachari's death on February 13. 1964, came to an end a rich life of constructive endeavour and of enduring public service. Less than two months ago he was engaged in intense discussions in the Planning Commission over measures to deal with the present lags in agricultural production in the spirit of a national emergency. In particular, he urged the speeding up of a number of irrigation projects which were already well advanced and steps to hasten the pace of utilization. Shortly before this, he presided over the sessions of the fourth Indian Cooperative Congress, identifying himself with the delegates who had assembled from every part of the country and guiding them on all vital issues. A few weeks earlier, he had carefully read through the chapters of the mid-term appraisal of the third Plan and noted the weaknesses which would demand urgent attention.

Sixth Sense

These three instances, chosen at random from the closing period, are typical of the outlook and continuity of effort which Mr. V. T. Krishnamachari brought to bear on all his work for the Planning Commission. He knew, as it were, through a sixth sense, what was important and what was practicable; yet, he approached each such issue with an understanding of the larger whole of which it formed part. In his mind, rapid progress in agriculutre was the key to the success of all our plans and the means by which greater divergence between urban and rural levels of living could be avoided. But community develpoment and cooperation provided the essential foundation for agriculture; in no other way could the life of the peasant and the village community be comprehended as a whole. Without them, the welfare state could not become a reality and the ideals set in the Constitution would remain unfulfilled. Thus, behind every task he attempted and every institution he supported there ran a continuing thread, a deep attachment to the nation's aspirations and a growing concern that knowledge and research and efficient administration were as vital to success as soundly conceived plans and nationwide efforts to harness the energies of the people and strengthen the spirit of mutual obligation and service. His close association over the years with Planning and Community Development, and with the National Co-operative Union, the Indian Institute of Public Administration and the National Council of Applied Economic Research and, earlier, with the Delhi School of Economics were essentially reflections of a comprehensive and integrated philosophy of economic and social development and his view of how best he could serve this goal. In his words:

> "The adoption of scientific methods in the widest sense by all rural families cannot be brought about without social transformation—changes in the traditional patterns of society and changes in attitudes and outlooks. The improvement of rural life is essentially a human problem: how to change the outlook of the seventy million families living in the countryside, arouse enthusiasm in them for new knowledge and new ways of life, and fill them with the ambition and the will to live a better life."

This was the peaceful transformation he sought to achieve through the Community Development movement. This indeed was the unifying principle in much that he strove for after independence, his testament for the future.

But the roots went much further back. The preparation had been long and thorough. Mr. Krishnamachari's work in Baroda is well-known and widely remembered. The village extension services and the social reforms he initiated were pioneer efforts in their own day and left a lasting impress. In whatever he did, there was the earnest approach of an informed and studious mind, a penetrating insight, an ability to seize swiftly whatever he knew to be essential and the willingness to resolve doubts and difficulties with courtesy, friendliness and good judgment.

These were among the many qualities which marked his work in the Planning Commission for more than a decade. His contribution to the Plans was not merely outstanding; it was unique. There were few important ideas in the Plans with which he was not directly associated; in fact, several of them were due to his own initiative and lead. Thus, in the first Plan itself, some of the policies and perspectives for which this Plan has a seminal interest came from him, notably, community development and the national extension service, long-term and integrated approach in the development of natural resources, specially in irrigation and power, policies for the conservation of mineral resources and the establishment of the Programme Evaluation Organization and the Research Programmes Committee. In the second Plan, he carried forward the basic approach to what has since grown into Panchayati Raj and to planning at the district, block and village levels, and led the campaign for a large agricultural effort as the keystone of ambitious planning. In the outline of the third Plan, he placed greatest stress on assuring the minimum amenities to every village in the country and the utilization of the manpower resources of rural areas through rural works and the intensification of agriculture. He also laid the foundation for the series of studies now under way in the field of natural resources. Mr. Krishnamachari always took his colleagues with him and their respect and esteem for his judgment and knowledge and the cooperation of the Chief Ministers of States and the Union Ministers greatly lightened his burdens.

Progressive Outlook

These are at best illustrations of the perception and foresight, the progressive outlook and the deep understanding with which Mr. Krishnamachari approached problems of development. His labours continued beyond his formal relinquishment of the office of Deputy Chairman of the Planning Commission. In leisure, he was able to explore some problems more fully. His two books, 'Planning in India' and 'Fundamentals of Planning in India' and an earlier collection on Community Development contain a great wealth of information and offer valuable insights for the future.

In recalling but a few of the contributions which Mr. Krishnamachari made since the inception of the Planning Commission, one is only too conscious that here was a man of large proportions, of rare talent and wisdom, always modest, kindly and generous, a most conscientious worker, a person wholly committed to the progress and welfare of all sections of the people and of all regions and one who spent himself, according to his own lights, in constructive national service of the highest quality. Whatever their sphere, such men beckon to the future. They remain young to the last. Their work lives, yet remains unfinished. Both in what they achieve and in what they leave to others to fulfil, their lives are a challenge and a guide to those who follow.

Rational Location of Industry

JOHN A SHUBIN

The author, now visiting this country on sabbatical leave from New York University where he is Professor of Economics, presents here a stimulating point of view on how the proper location of industries could serve India's long-term industrial ambition. He is the author of two publications: 'Managerial and Industrial Economics' (Ronald Press, New York) and 'Business Management' (Barnes and Noble, New York).

INDIA'S SIZE and abundant resources endow her with an enormous growth potential which makes self-generating industrialization readily attainable. Even though the supply of capital may be slim, far-sighted planners can harness the growth potential inherent in a country of immense resources and market scope for early self-sustaining economic development. They can achieve this with fewer economic controls (though more selective) than those which usually prevail.

The speed with which India capitalizes on her growth potential depends not only on the rate of capital formation and the direction of development, but on the effectiveness with which she organizes and locates industries along economically rational lines. Planners must not only locate industries planned for establishment in the years immediately ahead, they must, at the same time, locate the future industries of national scope a decade ahead. Heavy capital outlays involve decision-making regarding location and industrial organization, which, if based on an incomplete grasp of the nature of the problem, lead to built-in industrial dislocation and both lopsided development and irrational dispersal of industries and a dissipation of investment, making for a wasteful production-pattern of long duration.

Policy-makers must not ignore the productivity potential that derives from the geographic division of labour, a factor well appreciated by both the European Common Market and the Comecon. Taking note of the advantages of geographic specialization of production enjoyed by advanced countries and from the knowledge of this hindsight, planners must, if they are to attain early take off, evolve and project, 15 to 25 years in advance, a high-productivity pattern of geographic specialization of production. Moreover, when a surplus is practically non-existent for 90 per cent of the population and economic progress aspires to improve social welfare, policy-makers have no alternative to the adoption, wherever possible, of efficient capital-cheap, mass-production methods for industry. Industrial planners must, at the outset, (1) employ a logical approach for organizing and establishing capital-cheap mass-production systems of output (wherever prudent) and rationalising the structure of industry, and, then (2) employ a location procedure appropriate to an under-developed economy for locating industry so as to arrive at a rational pattern of geographic specialization of production for the economy as a whole.

RATIONALISATION AND LOCATION OF INDUSTRY

The rationalization of industry obtains gains in productivity (1) through the output of "economy" product models, wherever possible, (2) through the design of products for maximum interchangeability of components, (3) through minimizing the input of scarce materials, (4) through use of production patterns that minimize the input of capital (i.e., through use of capital-cheap production methods), (5) through wider factory adoption of a process-related product line pattern for output of goods, and (6) through the horizontal and vertical combination of plants so as to attain scale economies and intensive use of infrastructure. The foregoing productivity gains (widely enjoyed by advanced countries) that derive from the rationalization of industry are briefly amplified below to indicate that they are readily attainable.

Productivity gains derive from the output of high-utility economy-type models, as do many producers in advanced countries when they aim to expand sales (cars, refrigerators) to the markets of lower income brackets and export markets. A product analysis and simplification programme for an industry's product lines can eliminate non-essential differences and superfluous types and varieties. The designing of components for common use in similar products (radios) and in process-related products (typewriters and business machines) obtains not only improved quality, but the greater interchangeability of parts, yielding big savings. For instance, a single efficient diesel engine designed for trucks, buses, and tractors extends the application of mass-production methods, which lower costs by reducing the amount of factory machinery and tools needed, the amount of inventory stocks required, etc.

Products and processes can be engineered to minimize the input of scarce materials by avoiding the over-designing of components and parts, by designing parts so as to use a substitute material or a lower grade material, and by seeking out or developing processing methods that conserve materials.

The minimizing of capital input (the adoption of capital-cheap methods of output) can be achieved in a number of ways. Engineers can minimize the input of capital by, first, designing products so that they can be put out by economical processes and by maximizing the interchangeability of components, as earlier indicated. Engineers, too, can specify expensive efficient machine methods only for the production line alone. But they would specify less capital-intensive methods and inexpensive facilities for the handling of materials in process, inspection, and other operations that take place in plants. Through multiple-shift production, managers gain intensive use of machinery, thereby reducing depreciation charges per unit of output.

The organization of an industry's divisional units (plants or groups of plants) so that each may specialize in the output of a process-related product line reaps productivity gains from economies of scale. The grouping of products (or their components or parts) on the basis of process-relatedness (the grouping of items that are put out by the same or similar process), simplifies the problem of production and extends the application of mass production methods. This production policy permits the setting up of efficient process-specialized plants, some broadly specialized and some narrowly specialized, that can be tooled up for long production runs. This production approach not only reduces production costs but lowers inventory stocks, increases adaptability of production, and increases the incremental capital output ratio (ICOR).

The horizontal and vertical combination of plants obtains economies because it permits greater use of high-speed machines that reduce the machine cost per unit of output, permits elimination of some terminal operations, permits bulk buying of material and the lowering of stocks of materials, permits the full-time use of highly qualified managerial and technical experts, etc.

To facilitate the locating of industries, analysts ascertain the proportionate cost of materials, labour, production, and market-

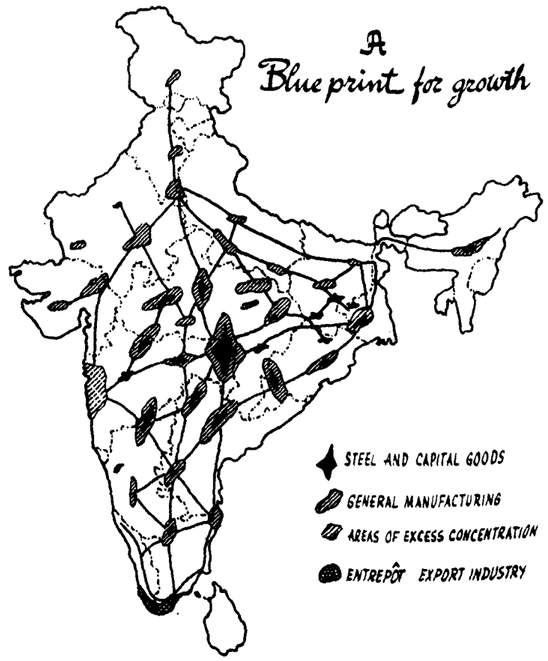
ing in the output of goods so that they may identify the primary location determinants or the "high-cost" factor that influences the location decision. For their initial analysis, analysts may, therefore, identify an industry as being material-oriented, labour-oriented, market-oriented, or oriented to complementary industries, e.g. industries related on the basis of common processing technology, joint use of refrigeration plants and port terminals, or the joint exploitation of research brains, as in the case of electronics and pharmaceuticals. In locating an industry, analysts must determine the net impact of the various location determinants ("pulls") by computing comparative advantage on the basis of the long-term (the future) relevant costs.

Labour-oriented industries, in the strict sense, are becoming less common with the increasing mobility of labour and the planning of economic growth. An early locating of major or national industries provides ample time for the establishment and gestation of appropriate schools to turn out the required skilled labour, engineers and technicians, so that the labour "bottleneck" need not disadvantageously influence location or retard industrialization in an economy of planned, rational growth. The economy, too, enjoys the benefit of early establishment, at the right place, of the research laboratory for early and timely integration of research with an infant industry struggling with problems of technology during its infancy. Because scientists and engineers can be legitimate lobbyists, the early rational location of laboratories helps insure that industries are rationally located. **Market-oriented industries** are more typical in fields of late-stage production, as in the case of producers of business machines, machine tools, and cosmetics who locate accessible to a major consuming area for effective technical communication with purchasers and for effective marketing. **Material-oriented industries,** analysts locate at the source of materials when the proportionate cost of material transport is relatively high and processing materials at the source (e.g. ore beneficiation, canning), appreciably lowers monetary shipping costs. When decision makers do not apply the proper time horizon and do not correctly appraise future transport possibilities (e.g. air cargo, tankers for orange juice and for wine shipment), an existing special distribution of resources or a historic location of an industry (i.e. textiles) can abnormally or disadvantageously influence the location of related industries (machine building) or plants dependent on basic industries for materials. A sound grasp of the economics of location is paramount for planning economic development and for obtaining a rational allocation of the nation's resources, particularly in countries experiencing a fast pace of growth in those key segments of the economy that will decidedly influence the pattern of future development of industry, demography, and society generally.

Appropriate Cost Analysis

The location of a single plant or a big enterprise in an advanced country generally involves a comparatively small capacity addition relative to the size of the economy, and typically, location is determined on the basis of the lowest unit cost of production and distribution. This conventional location procedure, more appropriate for an advanced economy or for a relatively stagnant one, essentially adapts new capacity to an existing economic environment and pattern of geographic specialization of production which has gradually evolved, as producers in high cost areas were weeded out by the competitive process and the automatic operation of the law of comparative advantage (i.e. weeded out to the extent that industry is not monopolistic and a sellers' market not of long duration).

When comparatively small increments to capacity (i.e. relative to the size of the economic sector) are to be located, the conventional location procedure would obviously identify the various location "pulls" as being essentially "external." In a developing economy (assuming rational planning), the simultaneous location of related industries (or their divisional units) obviously converts these "external" pulls into "internal" economic inter-relationships.



Conceptually, planners can identify the "ideal" location for an industry (or for its divisional units) on the basis of the lowest long-term unit cost of output computed in terms of the future cost of materials, production and distribution of products to market areas. In a developing economy, planners must essentially evolve a rational pattern for geographic specialization of industry by assessing the regional distribution of resources, analysing the projected (future) economic structure (particularly industry inter-relations and structure), and using future costs (the relevant time horizon) to determine the location of industry on the basis of the "calculated" law of comparative advantage.

Policy makers should be aware that logically planned industrial segments or complexes (particularly on the basis of simultaneous establishment of a cluster of related plants and infra-structure) essentially create the economic environment necessary for optimum production. Relatively large increments to capacity, therefore, call for cost computations conceptually appropriate for a planned industrial structure and pattern of development.

Design and Location of Complexes

By cross-classifying industries on the basis of such characteristics as the degree of technological similarity (i.e. with reference to processes, materials, distribution channels), and infrastructure required, analysts are able to design industrial complexes for a given major field of production that contain features which make for adaptability as well as scale economies. Industrial complexes would, of course, differ with respect to the scale (bigness) of optimum size, number of plants that comprise the complex, and whether they call for a single location or can be designed for multiple location.

Industrial planners can, therefore, design high-productivity complexes for ease of expansion, convertibility, and

Distributors in Delhi: **SHIVLAL KANHAYALAL, Katra Nawab. Ch. Chowk; HAZURASINGH MANOHARSINGH, Katra Rathi, Nai Sarak; RUGGANMAL PURANCHAND, Katra Choban Ch. Chowk; RAKESH & RAJESH CO., Katra Rathi, Nai Sarak; ANAND SILK STORE, Katra Subhash, Ch. Chowk.**

breadth in range of work that they can perform (i.e. with respect to degree of specialization). They would locate, on the basis of comparative advantage, industrial complexes in the region and area that yields the highest long-term increasing returns. Analysts well appreciate the economic potentialities that derive from industry inter-relationship. Similarity (and complementariness) among related industries tends to grow as engineers increasingly design related products for wider interchangeability of major components.

In determining the location of an industry, analysts first ascertain the extent to which an industry is technologically related to other industries, both the present and the future industries planned for establishment. Analysts should combine and integrate a complementary group of industries so as to make up rational complexes, in order that the national economy may reap the inherent scale economies and enjoy the production flexibility that derives from effective structuring of industries. Generally, the locating of well-designed complexes of related industries at a single centre (or a few centres) reduces transport cost per ton, lowers the level of material inventory stocks that must be prudently carried, as well as gains scale economies. Since they feed one another, these industrial complexes are "self-contained' for purposes of "internal" production, while conforming to geographic specialization in terms of supplying national and international markets with products of high-unit value.

The Gains of Geographic Specialisation

The rational structure of industry obviously yields big economies. When planners go further and employ economic logic to locate industries, the resulting geographic specialization of production which they obtain achieves additional benefits from external as well as internal economies and it can achieve a productive dispersal of industry which can markedly stimulate general economic development.

For instance: (1) Producers in a specialized industrial area find greater opportunity to apply mass production methods because of the presence of complementary establishments. (2) Lower transportation and distribution costs derive from the use of appropriate transportation facilities and terminals and markedly smaller overall material inventory stocks. (3) The industry's incremental capital output ratio increases and gestation time declines (requiring less investment and time to create a given increase in output capacity) from the more intensive use of specialized infra-structure and mass-production methods of output. (4) Greater production adaptability, (enabling the industry to readily put out new models, prototypes and military hardware) stems from the presence of complementary producers, including larger jobbing-type feeder plants. (5) A well-equipped laboratory supported by a sizable production unit assures a flow of technological innovations that maintains the industry's competitive position in international trade. A research centre for a given field of production (e.g. radio and television sets, or electronics) for example, quickly and economically establishes indigenous output of components and production of quality at low costs, expands exports and improves the country's balance of payments position. The larger among the developing countries can not only avoid the emergence of economic irrationality, they have, in fact, an excellent opportunity to develop a rational, highly productive and adaptable economy. Much depends on the planners' capacity to identify a sound structure for an industry and how to arrive at it and the capacity to identify industry inter-relationship crucial for location strategy.

Policy makers must conceive the nation's economic growth and the location of industry from a broad, long-term point of view, and they must evaluate the impact of industrialization and industry location on the economy as a whole and on its various regions. Their growth plans must derive from cogent economic logic that demonstrates that their proposals can attain national goals more effectively than alternative proposals.

INDIA: RATIONAL LOCATION

Location planners must develop a sufficiently broad and integrated dispersal of industry and other economic activity to attain general as well as selected economic growth, and they must provide adequate flexibility to accommodate shifts in emphasis of development that may stem from technological progress or other forces.

On the basis of a survey of resources and production technology and a projected structure of the economy, planners can design the outline of the country's geographic specialization of production for a decade or two ahead. Their location projection would outline the economy's transportation and power system, the geographic specialization of agriculture and other extractive industries, and spacial distribution of heavy industry, general manufacturing, and other economic activities. Because economic activity is inter-related and the location of certain industries influences the location of other industries, planners pursue a logically sequential, a chain reaction, path (periodically back-tracking) for locating industries. Successively, they locate industries, taking into account the relevant costs.

For their initial outline of geographic specialisation of production, planners focus on major resource-based industries (the agricultural and metallurgical) and the national infrastructure — the transportation and power system. Location analysts well know that long-term power costs drop as power output rises, the range of transmission increases, and the emerging power "grid" improves the reliability of supply. (The projected growth of power and transport systems provides the derived demand, the market, for equipment to be put out by plants that analysts locate in appropriate areas). Analysts, too, can anticipate cheaper transport as the system expands, having been early inaugurated because of long gestation time. The expansion of transportation opens up regions. By linking small trading and producing centres, it enlarges the market scope, providing basis for adoption of larger-scale methods of production. Thus, from the grass roots level, the professional planner evolves a scheme for geographic specialization of industries as outlined below.

Agro-Based Industries

To promote growth, rural developers carry out a detailed survey of an area's economic potential — a study of future crops, emergence of key transportation cross-road points, an estimate of the character of economic development in the area, and availability of other resources, e.g., limestone for output of cement. In this way, they locate a viable production centre for a cluster of related enterprises that, in time, can evolve into a rural manufacturing centre. These rural nodes of growth may be comprised of such agro-based industries and services as textile mills, paper mills, vegetable oil mills, dairies, veterinary dispensaries, meat packing plants, repair shops, agricultural colleges, extension service, and hospitals. On the basis of careful preparation and so that these selected strategic "growth" points may acquire momentum and flower, rural developers programme the simultaneous emergence of a number of the more closely related enterprises. The early emergence of rural production and cultural centres and experienced professional personnel offers planners alternative sites for manufacturing centres and, incidentally, the flexibility needed for effective economic growth.

On the basis of continuing surveys, planners can project the nature of an area's future production. They uncover locations for such resource-tied industries as that of fertilizer plants, lumber and pulp mills, petroleum and petro-chemical plants, bauxite mines and alumina and aluminium plants, and other non-ferrous mining and smelting facilities. Planners would rate

resources for future exploitation on the basis of richness, accessibility, and feasibility for optimum size extracting and processing facilities. Planners study the transportation and power system in determining the economic feasibility of production at promising locations. Areas of low-cost power, for instance, can be designated for future electro-chemical and electro-metallurgical plants. Survey of markets, nature of an area's resources, and the future cost of extraction and processing do help planners to identify and characterize the kind of the specialized production that will eventually emerge in a given area. In order that they may attain a single labour market, more intensive use of local infrastructure and greater momentum for growth, rural developers, where economically feasible, locate near an agro-based production centre one or more complementary facilities—fertilizer plant, pulp mill, cement plant.

Steel and Heavy Engineering Centres

Areas well endowed with deposits of iron, coking coal, and limestone are obviously areas for iron and steel centres. Cost studies generally identify coal mining rather than iron mining centres as locations for steel works that yield lowest costs. Special conditions, including the pull of large markets and adequacy of transporation may, however, permit economic location of steel works at both ends—at ore mining centres and at coal centres. Where coal is readily accessible but deposits of iron absent, water borne supply of ore permits erection of steel centres. A long-range projection of the national infrastructure, the location of future steel-consuming industries would indubitably identify a number of profitable new steel centres, which in the short run could put out structural steel to expand national infrastructure.

Though the natural perspective plan could forecast the future steel demand (say, for a decade ahead), it would not clearly indicate the market areas that will consume steel. The markets for finished and semi-fabricated steel are determined by the future location pattern of metal consuming industries—centres that will produce plant machinery, tractors, trucks, etc. In order that they may correctly specify the type of steel finishing capacity needed, planners must identify the future areas of the steel consuming industries and the kinds of semi-fabricated steel required. By taking into account shipping costs to these future markets, planners could more adequately evaluate the relative productiveness of potential steel producing centres.

In programming expansion of steel capacity, planners are patently involved with the problem of locating the specialized divisional units (process-related product lines) of the heavy engineering industries—centres for the output of heavy machinery, railways rolling stock, structural steel and other capital goods. Planners' cost studies generally favour the location of many of the heavy fabrication-and-assembly works at iron and steel complexes. The early planned linking of such works to steel rolling mills would yield economies from vertical integration, permit more intensive use of infrastructure, and increase the I.C.O.R.

Planners, moreover, must design the most efficient pattern of specialization (rational process-related product lines) for the heavy engineering industry for the period of full-blow geographic specialization of production. They can pre-determine the future specialization for the industry's various divisional units by, first, analysing the perspective plan's output targets (say, for the mid 70's) for capital goods, and, then group the items that call for similar processing technology so that they may form a number of rational product lines that can be efficiently put out.

Expansion over the years would generally call for the additional kinds of production specialization (generally narrower specialization) and the need for the reallocation of production and the recasting of specialization among the different production centres. The rapid expansion of the heavy engineering industries raises the problem of how to eventually obtain effective specialization in the industry. The general indivisibility (the "lumpiness") of capital (plant facilities) poses the problem of securing effective transition (if possible, without heavy obsolescence) to the desired specialization of the divisional units of the industry.

Perspective Planning

Perspective planning that anticipates such problems would clearly project the direction of industrialization, thereby markedly facilitating the location and programming of the heavy engineering industry so as to minimize the problem of inherent indivisibility of capital in the field of production, i.e., to minimize the difficulty of attaining good specialization for the short run and its easy transition to the ideal long-run specialization.

For the earlier period of economic development, planners must correctly determine the initial emphasis in the direction of development, the types of goods to be provided indigenously and, conversely, the goods to be imported. Professional planners often find it wise to import needed quantities of consumer goods, foregoing for a time the provision of capacity for these items, and concentrating development resources for the more rapid expansion (bigger increments of specialized capacity) in those fields wherein productive capacity is more indivisible. In this way they conserve both planning effort and scarce resources (and, also, prescribe less austerity) and more quickly attain the ideal long-run specialization, as well as circumvent the need, in many fields of production, for conversion of short-run to long-run specialization.

Professional planners obtain effective transition of short-run

to the ideal long-run specialization by analysing the vertical stages of production and the products to be put out in the remaining industrial segments where indivisible productive capi- that is involved. Such analysis aids in identifying the "ideal" plant location and specialization for early-stage, intermediate-stage and final-stage plants so that, in the end, planners can arrive at an optimum combination of specialized plants for each multiple-plant unit.

For items to be put out in larger volume, planners would formulate process-related product lines so as to permit erection of specialized plants for efficient output. For items to be put out in small quantities (industrial instruments, military hardware, prototype products for laboratories), planners would group and formulate a number of broader product lines on the basis of broader process-relatedness and erect somewhat more versatile output capacity. Here the economy would enjoy as much specialization as is possible.

New items to be put out in small quantities would be placed to the appropriate special-purpose "job-shop" complex. As items in such a complex increase in output volume, planners would erect specialized capacity for their output. In short, planners would provide more specialized production facilities for new capacity and they would reallocate production lines so that the economy could move to a more sophisticated high productivity system of production, that is readily obtainable by competent professional industrial planners.

Machine-Building Centres

The increasing demand for sugar, dairy products, textiles and other processed farm products creates in the agro-based industries a derived demand for machinery to equip new plants and re-equip old ones. The analyst aims to locate the machine-building industry for accessibility to the scattered agro-based industries (the market) so as to attain economical distribution. He aims for an efficient marketing system and technical communication with the equipment users in order that the industry may readily improve machine models. By locating the industry (i.e. its specialized divisional units) accessible to the present and future market as a whole, he will offset whatever larger raw material hauls that may be entailed. The locating of industrial complex at one central area (later new divisions at two or more places) attains not only the intensive use of infra-structure and advances from a research centre closely geared to the needs of the industry, but a number of internal economies. These economies will come out of a system of more or less specialized plants (parts fabricating plants and assembly plants) rationally organized to turn out process-related items.

Assessing all the economic factors and the need for a progressive industry, the analyst locates the complex in the centre of the Subcontinent. His location decision is influenced by the long-term economies that are to be generated by a rationalized industrial complex, the benefits from market accessibility and the decreasing long-term cost of transport for raw materials. The analyst projects an optimum size industrial complex (feeder plants and all) to put out machinery, though he knows, on the basis of perspective targets, that such capacity cannot be utilized in the years immediately ahead. The analyst, however, is confident that he will uncover closely related production which will profitably take up the available capacity. Carrying out field research to substantiate his desk-office location study, the analyst undertakes to locate a related industry—that of farm machinery and tractor production.

Farm Machinery & Tractors

The development of agriculture will determine the types and quantities of farm machinery that will be put out in the years ahead. The farm machinery industry will undoubtedly loom large in the industrial sector. The planners will initially project for early establishment one centre for this industry to be followed by two or more. The specific models (i.e. a versatile combine, an all-purpose tractor) to be put out in mass quantity essentially depend on the opportunities for increasing farm yield through mechanization. Though accessibility to iron and steel sources play an important roll in locating the industry, the substantially greater advantages to be derived from good accessability to the markets (because of the bulkiness of the items and high freight charges) dub this industry as decidedly market-oriented. Nonetheless, the analyst takes into account the collective impact of all the physical and economic influences in determing the most economic location for the industrial complex for the long pull. The analyst ascertains the location yielding the lowest future cost of output independent, for the moment, of location projections for related industries that are emerging in the pattern of the future geographic specialization of production. He notes happily that the location coincides, more or less, with the location of the machines building complex earlier located in the centre of the Subcontinent. The Central Industrial District will now produce at a rate of output approaching that of the optimum capacity earlier projected. Moreover the industrial area will generate pronounced internal and external economies. The analyst, too, finds that the tractor works will do best in the Central Industrial District. The related ancillary plants will include a diesel engine plant, tool and die shop, and other feeder plants.

Machine Tool Centres

The manufacture of machine tools is one of the most intricate lines of output of all the engineering industries. Their production calls for the kind of highly skilled labour generally available at major industrial areas. Because the product (machine tools) is of high value, accessibility to sources of steel is not a factor of location. Moreover, its high unit value permits shipping to distant markets. On the basis of location patterns in advanced countries, the analyst would locate a major part of this decidedly market-oriented industry (i.e. its major complex of plants) at the major industrial centres of the country. Location at the market, that is, at the major machinery producing centres (centres for combines, tractors, trucks, and plant machinery), is obligatory because of the need for provision of parts and repair service, close technical communication with machine users, and development and testing of improved models.

Location at a major industrial area would mean the availability, from existing feeder plants, of important components (motors, control devices, etc.), forgings, castings, and other semi-fabricated parts. The use of the same plant ancillary system that supply the tractor, trucks, and other related industries would mean the availability of high-quality, lower-priced components and less need of investment in ancillary plants. This, of course, increases the industry's capital output ratio. For long-term efficiency and technical advancement of the industry, each of the machine tool industry's divisions would specialize in the output of one type (e.g. lathes or shapers) of machine tool of standard make and several specialized models and sizes. Each specialized division of the industry should be located accessible to the major users (the machine-building and other engineering industries) so as to attain the kind of close technical association necessary for the industry's advancement, with progress being underpinned by adjacent well-established machine-tool research centres.

India's size and growth potential demands nothing short of a highly developed machine tool industry, putting out the lion's share of its capital requirements. (Highly specialized machine tools would of course require importation). A projection into the 1980's would show up several divisions of the industry each located and closely associated with a major industrial region comprised of related industries. An early development and projection of the country's rational geographic specialization of industry is mandatory for the rational progressive growth of this key industry and for the successful

long-term industrialization of the subcontinent. Ill-conceived, scattered locations of machine-tool plants, during the early stages of development would mean that some of the plants would not effectively conform to the rational geographic specialization of industry. Without the economic and technical environment necessary for progressive development, ill-located plants would remain retarded, putting out obsolete models at high costs.

Motor Vehicle Centres

On the basis of economic analysis, planners would centrally locate the motor vehicle industry (output of cars, trucks, buses, jeeps) so as to obtain efficiency in the distribution of the vehicles and the maximum economies from use of mass-production methods of output. He would, at the same time, seek a location that would call for the smallest investment to establish plant capacity for output of vehicles. The locating of the industry in the centre of the Subcontinent would obtain an efficient distribution of vehicles and repair parts to the surrounding market areas. The tractor industry's distribution channels may provide a ready system for marketing the truck share of the output. The existing infra-structure and system of ancillary feeder plants would supply diesel engines, tyres, tubes, axles and other required items that go into the assembly of vehicles. Moreover, the well-developed machine tool industry in the area and the machine-building complexes and tool and die shops could readily fabricate the required plant facilities. The vehicle industry could be established by a surprisingly low-investment.

The presence of a large community of scientists, experienced engineers and well-established research laboratories would, as a normal process of industrialization, naturally and patently, lead to the designing of a high-utility economy line of vehicles, mass-produced on the basis of maximum interchangeability of component for the domestic market and for an expanding export market of the hemisphere.

In anticipation of possible over-expansion of the Subcontinent's Central industrial area, industry analysts would plan a branch assembly plant for location in the northern basin and in the southern region of the Subcontinent. Expansion of the industry in the areas would (as pre-planned) step up the demand in these areas and take up the pre-planned available output capacity of the divisional units of related engineering industries projected for establishment at optimum scale.

The structuring and locating of an optimum size industrial district is illustrated by the Central Industrial District for capital goods output (machinery, agricultural equipment, machine tools, and motor vehicles) located in the central area (say, for instance, within a score or two miles of Nagpur) of the Subcontinent (see map). The analyst had individually located the complexes (divisional units of the capital goods industries) to demonstrate that each selected location was determined on the basis of the economies of location. The analyst could have just as well located the industrial district as a whole on the basis of location economics.

The Central Industrial District (essentially a rationalized capital-goods industrial complex) would primarily consist of a merger of specialized complexes engaged in the output of industrial machinery, machine tools, agricultural machinery and tractors, and motor vehicles. The pattern of the emerging geographic specialization of industry would consist of a rationally dispersed constellation of inter-related specialized industrial complexes — the Central capital-goods complex, steel and heavy engineering complexes, and a number of specialized manufacturing complexes ("general manufacturing") each putting out related consumer and capital-goods. Each of the latter specialized complexes would exploit a major field of technology in the production of a material-related, process-related, or market-related product line. Taking into account the peculiar techno-economic inter-relationships between the industrial complexes, the analyst locates each industrial complex on the basis of material orientedness, market orientedness, technological complementariness and the long-term potentialities of transportation. He would, for instance, locate — a "business machines, precision products and electronics" centre; a "pharmaceutical and cosmetics" centre; a "plastics and rubber products" centre, etc.

Entrepot Industries

Area surveys will continue to identify resources for organized exploitation. Some may be unique geographic situations. For instance, the unique geographic situation of the southern tip of the Subcontinent offers an opportunity for establishing

Why should anybody demand disclosure of Ministers' assets?

entrepot industries (see map). The increasing expansion of merchant shipping in the years ahead indicates that immense quantities of low-priced raw materials will flow past the southern tip of India. This means that low-priced raw materials can be readily imported, produced, and exported as final products. For example, grain can be distilled into whisky for export, crude oil refined into fuel oil (for refueling ships) and into petro-chemicals items for export, natural rubber converted into rubber products for export, etc. Readily available low-price material permits setting up optimum size plants for processing the materials into semi-manufactures and final products. Part of the output would go for home consumption, a large share would be exported. The economic feasibility of setting up optimum size plants more readily in southern India than in other areas of the hemisphere is the economic logic of the argument.

Rationalising Production

Industrial economists continue their analysis of output targets for goods, in the perspective plan in order that they may design rational lines of production and plants for location in rural and other areas. For example, they would, on the basis of process-relatedness, and demand-relatedness, make up a product line for output of radio and television sets, a product line for output of home electrical appliances, a product line for output of business machines, etc. For each industry, they would essentially structure a rational optimum size complex (a divisional output of the industry), though they know that the capacity of the initially projected complex cannot be fully used in the immediate years. Analysts overcome the inadequacy of demand (i.e. overcome the indivisibility of demand) by grouping two or more process-related and demand-related complexes to make up an optimum size industrial district, with capacity appropriately "cut back" to that required. How this is done is explained below.

The analyst is keenly aware that he rationalizes production and attains economies of scale by designing a production system (comprised of two or more related complexes) wherein assembly plants putting out separate product lines receive components supplied by a common group of specialized ancillary plants of optimum size. Stated conversely, he sets up optimum size specialized ancillary plants to supply components (including interchangeable items) to groups of final assembly plants each of which puts out a separate line of products. In this fashion the analyst merges (telescopes) "capacity" in the earlier stages of production of two or more process-related complexes.

The rationalization of production begins (as we recall in our earlier reading) at the product design stage wherein he designs (wherever economically prudent) high-utility economy-type products for maximum interchangeability of components for output by capital-cheap mass-production methods of production. If the process-related lines of product are also demand-related, he augments scale economies from production with scale economies derived from employing a mass destruction system and an economical system for supplying of repair parts and product maintenance.

The National Plan for economic growth gradually steps up agricultural output by promoting and bringing about a shift from a lower to a technically higher level of output of crops by means of the adoption and use of improved seeds, fertilizer, mechanised methods of output, etc. The expansion of agricultural output enlarges the rural growth points. To complete the cycle necessary to arrive at full-blown geographic specialization of production, analysts successively revert to the rural industrial nodes, the growth points. They find appropriate growth points for the location of carefully-selected inter-related manufacturing enterprises (i.e. small optimum size complexes).

To take up unused resources for the promotion of economic growth, the analyst continues to design high-productivity specialized industrial districts of appropriate size (i.e. avoiding excess concentration) to put out capital goods and consumer goods. On the basis of economic analysis, he locates the industrial districts to obtain rationally dispersed geographic specialization of production. His location pattern is designed to draw labour from areas of excess to areas of sparse population where productive employment is being created (see map).

Analysts can achieve balanced economic development by programming pre-designed vertical industrial segments (a group of related projects vertically linked to the stages of production from primary raw material to final product) in conformity to a pre-determined pattern of geographic specialization of industries. The vertical segments for development should be programmed in an economically logical sequence to maintain balanced growth. The programming of neat vertical segments can be gradually stepped up to a rate that absorbs available resources. As programmed development continues it shifts resources from a lower to a higher level of production technology, thereby increasing productivity and generating a rising G.N.P. (Space does not permit elaboration on this companion planning process related to pre-determined geographic specialization for obtaining balanced accelerated economic growth).

WINDOW ON THE WORLD

Faster E.C.M. Duty Reduction

From Our Special Correspondent

PARIS:

WHEN THE Council of Ministers of the Six meets in Brussels on Feb. 24 and 25, it will have a surprise entry on its agenda: the West German proposition to double the tariff cut scheduled for Dec. 31 next. Tariffs on manufactures traded between the Six are already only 40 per cent of what they were before the Rome Treaty came into effect, because in addition to the successive 10 per cent cuts foreseen by the Treaty an extra reduction of the same amount was decreed two years ago. Another normal 10 per cent reduction is due at the end of this year, and the West Germans are suggesting that it be 20 per cent instead. Thus internal tariffs in the new year would be a mere fifth of their original level, at which point very many of them cease to have any real protective effect. The full customs union would be in sight, three years before the term set in the Rome Treaty.

This acceleration is not surprising, for once firms have seen that ultimately tariffs will be abolished altogether and made their dispositions accordingly, they do not mind how fast duties fall. For example, take the hypothetical case of Italian and West German refrigerator manufacturers marketing their goods in France and Benelux. They might not wait for each 10 per cent reduction in import tariffs in order to cut their selling price in proportion. Rather, with the object of getting established in the market before their rivals, they will start selling as though the duty were already zero, paying the tariff out of their profit margin meantime. The sooner the duty goes, the sooner they cut this loss. Conversely, makers of refrigerators in France and Benelux have not delayed their defensive action until tariffs are zero. They have effected the required concentration, made the necessary investments, completed arrangements for specialisation and so on; once they have done all this, they are ready to see duties reduced rapidly — especially if their plans include some market-splitting pact with foreign rivals, which will bear fruit as other nations' duties are reduced.

Business Plans Ahead

Of course, that would be the most favourable of cases, and one could find instances where every six or 12 months' respite was appreciated by firms that were having trouble adjusting to increasing competition. But any industry that needed the full 12 years allowed by the Rome Treaty to get ready for the customs union would be a condemned industry. In general, business plans several years ahead, and is not embarrassed when what it planned for comes about rather earlier than expected. So much so that one may prophesy that if the Six accept the West German plan for a 20 per cent cut in tariffs at the end of this year, the remaining 20 per cent duties will soon seem unnecessary and will probably be abolished before 1967. It will be remembered that the first acceleration of tariff disarmament was due to French initiative; the latest one is a German idea and has not been unfavourably received by French industry. The major Common Market industries, then, are agreed on the feasibility of hastening toward a customs union and there is no question of sectional opposition such as has dogged the introduction of free trade in farm produce.

However, that does not mean that such suggestions are innocent of ulterior political motives on the part of the governments that sponsor them. For example, the original French move to reduce internal tariffs more quickly than planned had an obvious purpose: it brought forward the date at which the Six had to approach the common external tariff. Every time internal duties go down 30 per cent, the Six are bound to move a third nearer the common tariff on goods imported from outside, the French and Italians going down a third and the Germans and Benelux up a third. At the time, freer imports from outside Europe happened to suit French domestic policy, whereas to make imports from outside Europe harder for Germany and Benelux meant giving French exports a relative advantage there. More generally, Paris was anxious to assert the Common Market's individuality by erecting the uniform tariff barrier around the region.

The Kennedy Round

Naturally, the Germans do not have that objective in mind when making their suggestion this month. Instead, they are thinking of the Kennedy Round of tariff negotiations with the USA and other outsiders. In his recent Press conference, President de Gaulle indicated that concessions to outsiders, while welcome in principle if genuinely reciprocal, should take second place to consolidation of the Six's own economic unity. Bonn has taken him at his word, replying, "Very well then, let us hasten the customs union in our territory and then there will be less reason to object to making the concessions required in the Kennedy Round". The move is astute, in that it undermines the French argument that it is Paris that has Continental economic unity at heart while the Germans are forever hankering after freer trade with outsiders.

In fact, as the West German proposal is laid out more frankly one will find that Bonn is making a conditional offer: if the tariff talks in Geneva go well and if the French make no obstacle to a reduction of duties on both sides of the Atlantic, then the six-nation customs union will be hurried up. In other words, when the French urged speedier tariff disarmament it was with the idea of marking off the Six from the rest of the world; when the Germans make the same suggestion today it is with the contrary object of ensuring that at Geneva the Six open up their market to the rest of the world. Reactions to this proposal in France and in Italy are different depending on whether one consults private industry, or the State which has to bear in mind the interests of the farming community as well as of secondary industry.

Industrialists generally are favourable; the prospect of genuinely equal concessions between the Common Market and the USA attracts them as much as speedier tariff disarmament inside the Common Market. The operative phrase, however, is genuinely equal concessions, not just apparently equal reductions of low Common Market duties and high US (and British) tariffs. On this point, the preparation of the Kennedy Round is at present paralysed; committee meetings scheduled for this month have been postponed and there is some gloom in Geneva about the possibility of starting the negotiations in May. The situation is that the Six have informed the USA that over 1,000 of its duties are exorbitantly high in comparison with their own tariffs, so that it will not do to halve both. They suggest that the higher American tariff be reduced by 50 per cent, while the lower Common Market duty be clipped by only 25 per cent. For all other duties, where US and European levies are roughly comparable, the straight 50 per cent reduction would be acceptable — though even there, there are reservations on both sides about particular items that one party or the other wants excluded from the bargaining.

On all this, however, there seems to be no difference of opinion between industrialists in the various Common Market countries. West German firms are no more anxious to make gifts to US exporters than are firms elsewhere in the region. In the most sensitive sector of all, chemicals, the successors of I. G. Farben are keenly aware of the enormity of the American proposals, for US imposts on chemicals are by far superior to Common Market duties. Thus the latest suggestion from Bonn—speedier internal customs disarmament in return for liberalism in the Kennedy Round — drives no wedge between the Six at the level of private industry.

Not so at the governmental level. Here the agricultural issue complicates everything. The Kennedy Round covers farm produce as well as manufactures, so liberalism in Geneva would entail concessions to American exporters of such produce —whereas the German quid pro quo of faster tariff reduction inside Europe does not cover trade in primary produce, but relates only to manufactures. Obviously, the French will be asking for more substantial measures of economic unification between the Six before committing themselves to concessions in Geneva. The only explicit pre-condition set by President de Gaulle so far is that the agreement on trade in farm produce reached in Brussels just before Christmas should be translated in reality, in the form of detailed regulations. Actually, progress there has been surprisingly rapid. It had been feared that West Germany and Holland, for example, might try to take back in detail what they were obliged to concede in principle in December. That has not happened, and if there is any delay in promulgating the new regulations it will be due only to the considerable technical difficulty of setting out extremely complicated regulations in four languages.

Having got so much in return for a promise to be cooperative in the Kennedy Round, it would be characteristic if the French now tried to get even more before keeping their vague promise. Specifically, they will be tempted to force an agreement on uniform cereals prices throughout the Common Market, along the lines of the Mansholt plan. Paris is in two minds about this because uniform grain prices would mean (in addition to lower revenues for German farmers) higher revenues for French farmers — and the moment is not well chosen for that, granted that France is combating inflation. Still, it is in this direction that Paris will seek to bind the Six more firmly together before confronting the Americans in Geneva. The prospect of quicker duty reductions in Europe is not regarded as adequate compensation.

Tax Cut Will Stimulate Expansion

By GUY SIMS FITCH

WASHINGTON:

NOW THAT the long-discussed federal income tax reduction is nearing final Congressional approval — probably to become law by the end of this month — it is appropriate to examine what its impact is likely to be on the American economy. The estimate of President Johnson's Council of Economic Advisers is that the cut in taxes — now estimated at a total of about $11,600 million — would add about $30,000 million to economic activity each year. This estimate is based on the expectation that the money released by the tax cut will find its way into certain patterns of spending and investing, in line with past experience and anticipated developments.

When the two-stage tax cut will be in full effect from January 1, 1965, the after-tax incomes of individuals in the United States would be about $9,000 million higher than they are now. In addition, corporate after-tax earnings would rise by about $2,500 million, and on the basis of past experience, it can be expected that corporations would step up their dividend payments to individuals by nearly $1,000 million. Thus, the total increase in consumer spendable income would come to about $10,000 million. Past patterns suggest that consumers will spend between 92 per cent and 94 per cent of this additional income, or approximately $9,000 million. This increase in spending, or demand for goods and services, would spur higher production and hence lead to higher employment, payrolls, and earnings. And these increases, in turn, would generate still further increases in incomes and spending. Again using experience as a guide, and applying carefully devised formulae, Government economists estimate that the chain reaction set off by an initial $9,000 million in consumer spending actually would mean an $18,000 million rise in overall economic activity.

Meanwhile, as industrial production rose in response to rising sales, and as companies began to feel the direct impact of lower tax rates on their own operations, business men would have a further incentive to increase their investments in new plant and equipment and their outlays on inventories. It is significant that the latest private survey already shows a substantial upgrading of investment plans — to a figure about nine per cent above last year's record total as against the four per cent rise projected only a few months ago.

It is reasonable to assume that anticipation of an early tax cut, along with the general vigour of economic activity, has been instrumental in this development. It would not be surprising to see the capital investment total, which usually follows business trends, rise even more as economic activity continues to move upward. The income tax cut also has a buoyant effect on public spending, even if federal outlays do not rise very much. As federal tax cuts help raise incomes, they would tend to increase State and local revenues by an amount estimated at close to $3,000 million under present conditions. This would stimulate more spending by State and Local Governments on schools, hospitals, roads, and other public facilities and services. Higher incomes also would help accelerate the buying and hence the building of new homes.

Chain Reaction Principle

Government economists place the combined total of this enlarged public and private industry spending at between $5,000 million and $7,000 million a year. Applying the chain reaction principle as before, they see total economic activity spurred by as much as $10,000 million to $14,000 million thereby. Adding this to the $18,000 million impact resulting from consumer activity, makes for the grand total of about $30,000 million.

All this is essentially a simplification — perhaps an oversimplification — of a complicated economic process, and there is no guarantee that things will turn out as exactly as projected in all details. If they do, it will make for a signal triumph in the realm of economic theory and practice. Barring unforeseen circumstances, the tax cut certainly figures to have the desired effect of further accelerating what is already a vibrant expansion. Thus, it promises to bring significantly closer the goal of a fully employed economy, one making optimum use of its vast productive resources.

This is AEI today

LARGEST SUPPLIER OF ELECTRICAL EQUIPMENT TO INDIA

...and among the world's major manufacturers of electrical equipment. AEI's origins go back more than 60 years. Today, Associated Electrical Industries Limited embraces such famous names as British Thomson-Houston, Metropolitan Vickers, Siemens Edison Swan, Henley's, Ferguson Pailin, Birlec and Hotpoint.

60 factories...100,000 employees

The Commonwealth's largest electrical manufacturer, AEI has 60 factories and 100,000 employees the world over—engaged

in every field of electrical activity. AEI is the centre of five main groups controlling twelve product divisions and all subsidiary companies. Each division offers specialisation in design, production, sales and service *plus* the vast research, development and financial resources of AEI as a whole.

40 years is a responsible age

AEI's history in India dates back forty years and includes association on such massive projects as the heavy electrical factory at

Bhopal, the Durgapur steel works, and the Bhakra dam project. The AEI factory in India has been supplying industry and the home with a wide range of equipment since the 1930s. The range now includes furnaces, motors, motor control gear, transformers, switchgear, fans and lighting fittings. The famous MAZDA lamps are also marketed in India by AEI.

82-AIP-11A

It's great to be No. 1!

In India and abroad, AEI has a succession of 'firsts' to its credit. Punjab's first major power project at Jogindernagar uses AEI

equipment. India's largest generators, installed at Bhakra, are made by AEI. Assam's 720 mile oil pipeline—India's most ambitious scheme of its kind—will use AEI equipment. AEI built the world's first jet engine, powered the first gas turbine ship, developed Britain's first electron microscope and constructed the first ever water-cooled generator.

Planning 6,000 futures

AEI's training scheme is the most comprehensive in the electrical industry. More than

6,000 apprentices are training at AEI factories in the U.K. They come from all over the world. In India, AEI has advised on the establishment of a training school at Bhopal. It is attached to Heavy Electricals (India) Limited and can train 3,000 men at a time. 250 AEI U.K.-trained engineers are now working at Bhopal; another 150 Bhopal-destined engineers are training with AEI U.K. In addition, 500 Indian engineers have taken their training in AEI's U.K. factories. This is a record believed to be unsurpassed by any other electrical engineering company operating in India.

What could AEI be doing with 700 scientists?

AEI spends over 6 crores of rupees annually on research and development. More than

700 scientists are employed in extensive laboratories attached to the main AEI groups in Britain. This vast complex of laboratories and personnel has one ultimate aim: to benefit the man in the street by effectively contributing to progress in electrical science and technology.

AEI PRODUCES EVERYTHING ELECTRICAL FROM LILLIPUTIAN TRANSISTORS TO THE WORLD'S BIGGEST TURBINE GENERATORS

Principal Products

Steam and gas turbines and generators • Hydro-electric generators • Marine propulsion equipment • Electric drives for rolling mills and mine winders • Electric furnaces • Traction and railway signalling equipment • Transformers and switchgear • Power and telephone cables • Motors and their control gear • Electronic apparatus and radar equipment • Particle accelerators, electron microscopes and mass spectrometers • Industrial controls, instruments and meters • Semiconductor devices and power rectifiers • Private and public telephone exchanges and other telecommunication equipment • Lamps and lighting fittings • Heating equipment • Electromedical apparatus • Nuclear power station equipment • Domestic appliances

Plea for Tax Reforms

By Our Special Correspondent

NEW DELHI:

IN ITS new study dealing with the foreign investor and tax reforms, the National Council of Applied Economic Research has come to the conclusion that the incidence of taxation in this country on the branches of foreign companies as well as subsidiaries is heavy and this discourages inflow of foreign investments. The foreign investor seeking to set up a branch abroad "will find that the tax burden renders India a less attractive place for investment than several other countries". Table I, below, showing the corporate tax rates on foreign branches in India and some selected countries, reveals that the corporate tax on foreign branches is the highest in India at 63 per cent, as against 30 per cent in the Philippines, 40 per cent in Malaya and 53.75 per cent in the U.K. The incidence in the case of a subsidiary making 100 per cent

TABLE I

CORPORATE TAX RATE ON FOREIGN BRANCHES

Advanced countries	Tax rate on foreign branch	Developing countries	Tax rate on foreign branch
Japan	49%	Philippines	30%
Australia	40%	Malaya	40%
United Kingdom	53.75%	Peru	37%
France	50%	Columbia	40%
Canada	51.5%	Venezuela	45%
		India	63%

dividend distribution is still higher in India at 67.5 per cent as against 44 per cent in Japan and 35.25 per cent in the Philippines (see table II alongside).

The Council has made a set of twelve recommendations — five in regard to personal taxation, two in respect of taxation of registered professional firms and the remaining five in regard to corporate taxation. They are:

1. As regards the concession offered to foreign technician, the restriction by which the tax exemption is denied if the idividual had been resident in India in any of the four financial years immediately preceding the year in which he arrives in India, should be removed.

2. The time limit of six months for tax exemption for foreign managerial personnel should be extended and they should be treated on par with technicians in constructional or manufacturing operations.

3. In view of the additional expenditures incurred by foreign personnel serving in India, a system of tax-free allowances may be constituted. This should take account of two special requirements of foreign nationals: (a) recurring expenditure on education of children and/or maintenance of other dependents in home countries, and (b) actual expenses incurred on medical treatment. The system of special allowances should, of course, specify maximum limits.

4. The taxes on the investment income of a non-resident individual, when his income consists only of dividends and/or interest, should be limited to 30 per cent, without any additional tax liability. Moreover, the non-resident individual should not be required to file any returns of income.

5. Pensions of foreign personnel should be charged to tax at the scheduled rates applicable to residents without taking into consideration the foreign incomes of these individuals. Further, in the case of foreign employees, Government may permit the trustees of superannuation funds to take out insurance policies with insurance companies of their home country, if they so desire. Indian taxes due on pension would continue to be paid by the trustees.

6. Registered firms in legal, accounting and similar professions, which are prevented by Indian laws and regulations from forming themselves into companies, may not be subjected to income-tax on the registered firm as such.

7. The partners of a registered professional firm may be allowed tax relief in respect of contributions to approved superannuation and provident funds, now restricted in the income-tax law to employees only.

Company Taxation

8. In order to make the "tax-holiday" granted to new enterprises more effective, carry-forward facilities should be built into the relevant section of the income-tax law.

9. The rates of super-tax and super-profits tax, applicable to foreign investment in different forms, should be revised in order to reduce the disparity in this respect between India and other capital-importing countries.

10. Taxes on inter-corporate dividends to foreign companies should be gradually eliminated. As a first step, the rate may be reduced to 25 per cent from the existing 35 per cent on dividends which do not enjoy the super-tax exemption under Section 99(1) (iv) of the Income-tax Act. Correspondingly, the rate on dividends from Indian companies engaged in industries specified in Parts A and B of the Fifth Schedule to the Income-tax Act may be reduced from 25 to 15 per cent.

11. The combined rate of income and super-taxes on royalty income to foreign companies may be reduced from the existing rate of 50 per cent to 35 per cent, which is the rate of taxes in inter-corporate dividends to foreign companies.

12. In dealing with private and closely-controlled public

TABLE II

Country	Total Tax-burden on subsidiary making 100 per cent dividend distribution
India	67.5 per cent
Japan	44.0 „ „
Australia	49.0 „ „
New Zealand	50.0 „ „
United Kingdom ..	53.75 „ „
South Africa	35.25 „ „
Philippines	35.25 „ „
Malaya	40.00 „ „
Canada	51.5 „ „
Venezuela	45.0 „ „
Peru	49.5 „ „
Columbia	43.6 „ „
France	37.5 „ „
Italy	38.0 „ „
Netherlands	47.0 „ „

companies, Indian-tax law should recognize the principle that such concerns have varied needs to plough back profits for the expansion of their business. These needs may exceed the statutary percentage now permissible under the law. Companies should, therefore, have the right of appeal against the application of the penal provisions. This appeal may be made direct to a Board of Referees, constituted for the purpose. Further, Indian subsidiaries of foreign private and closely-held public companies may be exempted from the penal provision of Section 104 of the Income-tax Act, as the question of evading progressive personal super-tax rates does not arise in the case of corporate shareholders.

★★

The Bhilai Steel Plant is expected to reach a capacity of 1.8 million tonnes steel ingots per annum by the end of the current calendar year. This achievement is considered possible due to the timely supply of steel structures, refractories and other equipment from the U.S.S.R., as also from indigenous sources, and owing to the experience gained in steelworks construction by Indians over the past few years. The expansion of Bhilai to 2.5 million tonnes ingots capacity will be completed by the end of 1965.

Raising of the capacity of this plant from one million tonnes ingots to 2.5 million tonnes ingots involves addition of: (1) three coke oven batteries with 65 ovens each and suitable expansion of the by-products plant; (2) two blast furnaces of 1,719 cubic metres hearth volume each (the existing three blast furnaces have a hearth volume of 1,033 cubic metres each); (3) four open hearth furnaces, each with a hearth capacity of 500 tonnes (out of the six existing furnaces of 250 tonnes capacity each, one is to be converted into a unit of 500 tonnes capacity); (4) one wire rod mill; (5) marginal expansion of the rail and structural mill, continuous billet mill, merchant mill and the other shops and units of the plant; (6) one sintering belt with an area of 50 sq. metres; (7) one turbo-generator of 12 MW capacity; (8) expansion of the iron ore mines at Rajhara and the limestone mines at Nandini; and (9) a slag processing plant, consisting of granulation slag aggregate and slag wool units. It is hoped that one blast furnace, two coke oven batteries, two open hearth furnaces and the turbo-generator will be commissioned during the course of this year.

A noteworthy feature of Bhilai's expansion to 1.8 million tonnes ingots capacity by the end of this year shall be that it will be attained without interfering with the current production. An indication of this is available from the fact that although expansion work was started over a year ago, Bhilai achieved its production target for the current financial year nearly six weeks ahead of schedule.

The percentage of indigenous contribution in the expansion programme has also increased substantially over that for the one-million-tonne plant construction. An outstanding example of this is the reduction in the number of Soviet specialists engaged on expansion to only one-third of the number employed for setting up the original one million tonnes ingots capacity. The indigenous fabrication of steel structures has risen from 14 per cent under the one-million-tonne stage to 31 per cent under expansion. Supply of equipment from indigenous sources has risen from 10 per cent to 30 per cent and that of refractories from 15 per cent to 43 per cent. The capital required for expansion will be 40 per cent less than what is needed for setting up a new plant of the same capacity.

Thanks to the production of self and super-fluxing quality sinter at the Bhilai Steel Plant, for the first time in India, and its utilisation in blast furnaces there, it has been possible to reduce the coke consumption to about 800 kgs. per tonne of hot metal, as against 917 kgs. indicated in the project report. In view of the satisfactory working, capital repairs of Blast Furnace No. 1, which were due in the beginning of 1963, in accordance with the accepted norms for such repairs, are proposed to be undertaken only after the Blast Furnace No. 4 is commissioned.

★★

The Panel of Economists, which had its first meeting last week in connection with the drawing up of the fourth Plan, is understood to have recommended that in the interest of reducing economic inequalities and for ensuring a minimum standard of living for all, trading in foodgrains should, as far as possible, be confined to the public sector and the Plan should be given orientation towards employment. For raising the tempo of economic activity, the Panel is said to have suggested that manufacture of consumer goods which might be considered as essential under the present consumption pattern but which can be easily dispensed with by the nation, should be judiciously eliminated.

For the benefit of the Panel, the Planning Commission has undertaken special studies on the desirable revised consumption pattern, basic industries development, expectations of foreign private investments and growth of international trade and agriculture. These are likely to be completed by the first week of April when the Panel meets again.

★★

The Union Minister of Finance, Mr. T. T. Krishnamachari, introduced in the Lok Sabha this Tuesday new supplementary demands for grants for the current financial year to the tune of Rs. 179.11 crores. This is the third batch of supplementary demands presented by him in 1963-64.

Of the Rs. 179.11 crores grants now sought, a sum of Rs. 34.82 crores relates to revenue, Rs. 55.29 crores to capital and the balance Rs. 89 crores to loans and advances. Thirty-four demands have been put forth under "revenue." The important ones among these are: Rs. 7.92 crores for payment of States as their share in Union excise duties; Rs. 7.29 crores for Posts and Telegraphs; Rs. 4.25 crores for grants-in-aid to States, including the new States of Nagaland and the Union territory of Goa, Daman and Diu; Rs. 3.14 crores for stationery and printing; Rs. 2.5 crores for purchase of building materials for the Central Public Works Department and Rs. 3.75 crores for rehabilitation of goldsmiths.

The increase of Rs. 55.29 crores under "capital" is distributed over 17 demands included in which are Rs. 25 crores for purchase of foodgrains, Rs. 10.91 crores for construction of residential and other civil buildings in Delhi, Rs. 5 crores for transfer to Special Development Fund of loans received from the United States under P.L. 480 and Rs. 4.27 crores to meet the expenditure on the purchase of additional stores for the Posts and Telegraphs Department.

The additional provision of Rs. 89 crores under "loans and advances" is being sought for payment of loans to States (Rs. 85 crores) and the Industrial Finance Corporation (Rs. 4 crores).

The total additional requirements of Rs. 179.11 crores will, however, be set off to the extent of Rs. 102.06 crores by increased receipts, recovery adjustments, surrenders, etc. The net outgo from the Consolidated Fund, therefore, will be of the order of Rs. 77.05 crores. The cuts totalling Rs. 3 crores in the current year's budget for the Council of Scientific and Industrial Research, imposed last year in view of the emergency, have been restored.

★★

An institute to cater to the needs of heart patients and for undertaking research in cardiac diseases is proposed to be set up in Delhi within the next two or three years in memory of late Mr. Rafi Ahmed Kidwai. The institute will also have a convalescence home for children suffering from rheumatism. A 17-member committee headed by the Vice-President, Dr. Zakir Hussain, has been set up to undertake the building of this institute with assistance from the Union Ministry of Health and donations from philanthrophists.

★★

Italian firms of late have been quite actively collaborating with Indian projects. Their collaboration today extends to a wide range of industries, including nitrogenous fertilizers, aluminium, petroleum, electric transmission lines, penstocks, rayon and staple fibres, electrolyzers for hydrogen chlorine and caustic soda, chemicals and dyestuffs, anti-biotics and other pharmaceutical preparations, motor tyres and tubes, teleprinters, permanent magnets, etc. The collaborations of Italian firms in the manufacture of Fiat cars, Lambretta and Vespa scooters is, of course, well-known.

The first and most important among the Italian firms to collaborate with a public sector project in India was the Monticatini of Milan, a pioneer in the field of nitrogenous fertilizers. In 1955, this firm was awarded a contract for the expansion of the fertilizer factory at Sindri. The Sindri factory was originally designed to produce ammonium sulphate. It was then proposed to increase its capacity by including the manufacture of urea and double salt (ammonium nitrate-sulphate). The Monticatini, with assistance from another well-known Italian firm, undertook this task and completed it by setting up four new units at Sindri: (i) a unit for the synthesis of ammonia with a daily capacity of 189 tons; (ii) a unit for urea production with a daily capacity of 70 tons; (iii) a nitric acid unit with a daily capacity of 225 tons and (iv) a 'double salt' unit with a daily capacity of 400 tons. These two firms were awarded another contract in 1959 for the supply and erection of part of the plant for the production of urea from lignite at the Neyveli fertilizer factory in Madras State. This plant, now under construction, will have a production capacity of 500 tons of urea per day and is estimated to cost about Rs. 18 crores.

In 1960, the Madras Aluminium Company was established with the technical and financial collaboration of Montecatini for erecting and working a plant for the production of aluminium and its alloys at Mettur in Salem District of Madras State.

The ENI of Italy signed last year an agreement for the construction of five oil and gas pipelines in Gujarat. These pipelines, with a total length of 350 k.m., are being laid between Cambay and Dhuvaran, Ankleshwar and Utoran, Ankleshwar and Baroda, Ankleshwar and Koyali, and Koyali and Ahmedabad. The construction of these pipelines is being handled by SNAM-SAIPEM, a branch of ENI. This Italian oil combine has also been given contracts for laying three product-pipelines in East India — two connecting the Barauni Refinery with Calcutta and Kanpur and the third one connecting the Noonmati Refinery with Siliguri. The work on the last-mentioned project has been in progress for the past eight months. The agreement for the construction of Noonmati-Siliguri, Barauni-Calcutta and Barauni-Kanpur pipelines was signed with the Indian Refineries Limited. ENI is also assisting the Oil and Natural Gas Commission in oil exploration at Raxaul. It is likely to get a contract for "offshore" drilling in the Gulf of Cambay.

Italy has extended credits to India to the tune of $98 million — $53 million in 1962-63 and $45 million in 1963-64. It is expected that another credit of $53 million will be made available by it during 1964-65.

★★

Platt Bros. (Sales) Limited, Oldham, England, a member of the Stone-Platt Group, has been awarded a £7,500,000 (Rs. 10 crores) contract by the State Trading Corporation of India for the supply of the most modern machinery for 17 textile mills which, when set up, will enable India to increase exports of yarn and cotton cloth.

Platt Bros. (Sales) Ltd., has specialised in this form of "package deals" for the textile industry. In the past few years, similar projects have been contracted by this firm with the Philippines, Indonesia, Sudan, Egypt and Guinea. It will be supplying to India cardroom spinning and doubling machinery valued at approximately £5,000,000. This includes the company's latest high-speed equipments such as High Production Cards, Century Combers, Globe Draw Frames and Super Spinner Ring Frames. These were shown for the first time at the recent Textile Machinery Exhibition at Hanover to international acclaim. A new range of blowroom machinery will form part of each mill's equipment.

Deliveries will start this year. Many of the mills to be equipped with this machinery have been allocated to eleven co-operatives of cotton-growers. A new mill will also be established in Goa.

Amongst the major contributing firms associated with Platts are British Northrop Sales Ltd. (Weaving machinery), Leesona Holt Ltd. (Winding machinery), Mather & Platt (Exports) Ltd., (Finding machinery), Joseph Hibbert & Co. Ltd. (Sizing machinery), and the Longclose Engineering Co. Ltd. (Dyeing machinery), both members of the Stone-Platt Group, and William Ayrtons & Co. Ltd. (Specialised finishing machinery).

★★

Close on the heels of the symposium held in Calcutta by the Loewy Engineering Ltd., of Bournemouth, England, and W.H.A. Robertson & Company of Bedford, England on February 11, on rolling mill subjects and steel extrusion, a second

symposium was held on this subject in New Delhi last week. A team of engineers led by Mr. R. T. Hayes, Director and General Manager of Loewy, gave a series of talks on Rolling Mill subjects and Steel Extrusion with particular emphasis on modern mill developments. Several interesting and informative colour and sound films were shown on the rolling of aluminium, hot extrusion of steel and production of seamless steel tubes by the extrusion process.

The symposia held at Calcutta and New Delhi were well attended and the keen interest in the subjects discussed was evident by the wide variety of technical questions put to the team. The team comprised Mr. R. T. Hayes (leader); Mr. R. M. L. Elkan, Technical Director, Loewy; Mr. L. G. Course, Technical Director, Loewy; Mr. A. Robertson, Sales Manager, W. H. A. Robertson; Mr. J. Tracy, Chief Development Officer, Loewy; and Mr. M. R. Harvey, Sales Engineer, Loewy.

The Loewy Engineering Company is known for its specialisation in design and manufacture of hydraulic presses and rolling mills. The Loewy plants are in operation in many parts of the world. It is expected that the activities of this company would expand in this country as a result of the two symposia.

Reduced Cost Through Fuel Efficiency

From Our Correspondent

BOMBAY:

THE FIRST three years of the current Plan have seen a trend of rising costs in industry. The impact is particularly felt in the concentrated industrial zone of Bombay. The methods suggested and introduced to reduce industrial costs should, therefore, receive highest priority. As a part of its programme of assistance to industry to step up productivity and cut the cost of production, the National Productivity Council has chosen the Bombay industrial area as the first zone for the introduction of its new service, the 'fuel efficiency service.' The new service, which has been processed by two Colombo Plan experts and taken up at the direction of the Government of India, envisages the introduction of elementary fuel efficiency measures which, at a rate of 10 per cent reduction in consumption, would imply a saving of coal worth about Rs. 38 crores a year. Mr H. V. R. Iengar, the Chairman of the N.P.C., inaugurating last week a seminar on effective fuel utilization, sponsored on the occasion, observed that the new service was a constructive contribution and was of immense importance to industry not only in reducing the cost of production, but also in relieving simultaneously the pressure on transport.

Self-Improvement Methods

The objective of the N.P.C. in recommending this service was to invite the attention of industry to the need for following methods of self-improvement through production techniques like better planning, inventory control and cost control. In fact, Mr Iengar wondered why such a sound method of reducing costs, which was recommended 16 years ago, should have been left to lie in cold. Perhaps, this was due to the indifference of the Government in the absence of compelling circumstances in India to practise fuel economy. The advanced industrial countries like the United Kingdom, even now, had in their schedule such methods which would reduce costs. This may also be attributed, he said, to the sheltered market in India where manufacturers were able to sell anything at any cost. However, compelling circumstances have now become pronounced and it is necessary that in a mixed economy, particularly when wastages and lags are being noticed, there should be every effort to effect savings and conserve resources, besides bringing about efficiency in production.

As indicated by the statistical data that were made available by the British Expert Team which toured the country, in some factories, as much as 50 per cent of coal consumed could be saved. The team concluded that about 10 per cent of the consumed coal could be saved by 'First-Aid Measures' and by stimulating fuel efficiency in the industry. The total consumption of coal in India was around 72 million tons per annum and 10 per cent of that would amount to a saving of Rs 38 crores, as already mentioned. It was possible to effect at an average, a saving of 25 per cent of the coal in some of the factories.

This fuel efficiency service would be of particular importance, not only to the State of Maharashtra but to Gujarat and other areas in the western zone which are very short of fuel requirements for their industrial development. On account of heavy load on the electricity supply in Maharashtra, the future industrial development would greatly depend upon the increase in the energy available for industrial consumption. As will be seen from the pattern of development, the generation of electricity by type has considerably changed in the decade of planning. Though with the completion of the Koyna project, the percentage of the hydro generated electricity may substantially increase, there is always the need for generation of power through thermal stations and the conservation of the resources in coal is of utmost importance.

Gujarat's Needs Urgent

The case of Gujarat is all the more urgent in this respect, because, the net output of industries is sought to be increased to about Rs. 400 crores in 1975-76 compared to Rs. 150 crores in 1955-56. Correspondingly, the industrial power requirements from public utilities alone would reach a level of about 4,300 million kwh. per annum by the end of the fifth Plan compared to 520 million kwh. in 1955. Even assuming that the proportion of power required for uses of other industries and railways will remain constant, a total demand for power in the Gujarat State in 1975 would be over 5,400 million kwh., requiring an installed capacity of 1,400 mw. This would mean nearly 370 per cent increase in the installed capacity over the next 15 years. The question therefore arises as to the extent to which the power resources of the State can meet this demand. It is clear that the power from hydel projects may not be available till the end of the fifth Plan and it would be necessary to design additional thermal power in the third and fourth Plans. If the bulk supply of hydel power cannot be obtained even on the modest scale as assumed, thermal power would have to be planned on a much larger scale. This poses the essential need for relying on other sources of fuel for generating thermal power, namely, a) indigenous resources of coal and oil; b) coal imported from other States; and c) nuclear power. In regard to the first source, coal deposits of nearly 20 to 30 million tons have been identified in the Thanagadh area of Saurashtra. Intensive prospecting of this coal occurrences would assume urgency, because, the discovery of many large deposits of coal would reduce the price of fuel and hence the cost of generating thermal power in Gujarat. However, in the near future, the State would continue to depend to a large extent on imported coal for meeting the fuel requirements of its industries and power stations. Even at present, the cost of coal in Gujarat is undoubtedly high. About 40 per cent of Gujarat's coal requirements are drawn from the West Bengal-Bihar area and 60 per cent from Madhya Pradesh. Gujarat would become more attractive for starting new industries only when coal supplies could be made available at reduced cost; and from this point of view again, intensive surveys of the coal occurrences require to be undertaken immediately. It is in this background that the introduction of fuel efficiency service in the existing factories of the concentrated industrial area of Gujarat should be viewed.

**

While inaugurating the Third Quarterly Meeting of the AIMO, Mr G. L. Mehta pinpointed a few facts which are highly relevant for accelerating the pace of industrial development. He called upon the industrialists to launch a new 'swadeshi movement' by preferring indigenous raw materials and components to imported ones. While it was a fallacy, no doubt, to think that imports could be cut altogether when the country was in the process of industrial development, there should be an endeavour to choose indigenous materials to the greatest extent instead of looking for only foreign makes. How far such a shift is possible under the present technique and scale of priorities in industrial development, could be ascertained only on a survey which would assess the availability and suitability of indigenous raw materials and components in this country. It is however a matter of opinion how far the spirit of swadeshi would encourage the use of indigenous raw materials even if they are of a lower quality and of higher price, as recommended by him. The important point that was touched by him was the need for devising techniques set to Indian conditions and not by merely imitating techniques employed in advanced countries. He observed that India could not afford luxuries of products as in the U.S.A. "We should have the second best in many things," and added that "certain types of machines obsolete in other countries might be suitable to India." Even here, possibly, the whole industry may not be one with him, as in a period of initial development, and growth, what is required is the emphasis on quality and also on efficiency of the highest order.

**

Speaking as the Chairman of the Indian Investment Centre to a Press Conference, Mr G. L. Mehta referred to the recent revival in investment industry from abroad especially from the U.S.A. and revealed that a business delegation from that country would visit India some time in April, 1964. The imposition of the Super Profits Tax and the political developments in the neighbouring countries like Ceylon and Indonesia, as also the talks on bank nationalisation were all factors, which to a large extent made the foreign investors reticent in the matter of considering collaboration arrangements with Indian entrepreneurs. According to him, except for the Super Profits Tax, the tax rates in India were not prohibitive; rather, the foreign investors were impressed by the incentives for development in corporate taxation and also the profitability of the industries in India which appear to be higher than that offered in many other countries. But, he observed, that personal taxation of non-technical personnel upset the foreigners, especially the British. He suggested that Indian entrepreneurs who sought foreign collaboration should build up an organisation capable of taking advantage of such collaboration. In this connection, the new and small entrepreneurs showed a greater degree of care in framing and implementing collaboration agreements. Mr. Mehta also reviewed the progress of the activities of the Investment Centre in the last three years and said that 57 projects involving a capital outlay of Rs. 50 crores assisted by the Centre have obtained Government's approval. Foreign equity participation in these projects was of the order of Rs. 5.5 crores; and of the foreign collaborations in the joint ventures which have matured, 31 were from the U.S.A., 8 from the U.K., 5 from Japan, 4 from West Germany, 3 from France, 2 from Canada, 2 from Belgium and one from Switzerland.

**

The business community in Bombay has received with restricted welcome the Railway Budget. While, generally, there is no criticism of the graduated revision of freight rates for coal and imposition of a 2 per cent surcharge on all goods traffic, circles closely connected with industry, are apprehensive that this will have an adverse effect on the costs of coal-using industries and also retard the dispersal of industries away from the coal belt. However, it is a matter for examination whether all coal consuming industries would be affected, as, in some of the controlled industries, adjustment is allowed in the retention prices in the event of a rise in the cost of fuel, freight or other elements in the price.

Dismembering the Giant

From Our Correspondent

CALCUTTA:

AFTER FIFTEEN years of existence, and much good work, the Damodar Valley Corporation is now facing dissolution. This is the meaning of the "functional reorganisation" of the Corporation which the Central Government is proposing to carry out, in consultation, of course, with the State Governments concerned. But the reason given for the proposed reorganisation by Dr. K. L. Rao in Parliament last week, was somewhat misleading. Dr. Rao said that since the main objective of flood control had been achieved to the extent possible, it was now proposed to reorganise the D.V.C. on a functional basis. Under the contemplated scheme, the Centre would take over the power generating and distributing assets; the State of West Bengal would be given the irrigation aspects; and all other residuary aspects like fisheries and soil conservation would be distributed between the States of Bihar and West Bengal. Under the terms of the Damodar Valley Corporation Act of 1948, the project was conceived as a multi-purpose one for the unified development of the Damodar basin. Therefore, flood control was not the only immediate objective, but one of several which included irrigation, generation and transmission of electricity, navigation, soil conservation and the promotion of public health in the valley and its agricultural, industrial economic and general well-being. But for some strange reasons, the concept of unified development of the basin as a whole was abandoned in 1958 by the State Governments concerned; yet, in spite of the contraction in the objectives, the multi-purpose character of the project has remained unaffected.

In the circumstances, to state that the D.V.C. needs to be reorganised because its main objective of flood control has been fulfilled "to the extent possible", is to beg a lot of questions, and this is what Dr. Rao has done. If the Corporation has been able to carry out its main task successfully, surely then that should not be the ground for its dissolution. On the contrary, the machinery should be strengthened to concentrate on the other objectives with greater vigour; and if possible, should be entrusted with more such work. (In fact, the D.V.C. has done a tremendous amount of work during the constructive phase of its existence in the period 1950-59 which corresponded roughly to the first phase — during this period, it built four large dams, three hydel stations and two thermal power stations, one great barrage with a 1,600-mile network of irrigation-cum-navigation canals and several industrial townships to mention the main ones. Even

Durgapur and the proposed steel plant at Bokaro can be counted among the indirect benefits which have flowed from this project). No, Dr. Rao did not give the real reason, which is that the two State Governments concerned — those of West Bengal and Bihar — do not wish to continue to project as a co-operative national endeavour, each determined not to forgo even a tiny part of the benefits and rights that it considers its legitimate due. Since the Centre is unable to do anything to curb the bickerings between the two States, it is taking the easy way out by proposing the dismemberment on "functional lines".

But the Centre cannot stop the trouble with just this. In the first place, the reorganisation would involve retrenchment of labour and staff, and already the employees' unions have been actively protesting against the proposed step. Secondly, who shall be in charge of the Tenughat high dam scheme, an important D.V.C. project in Hazaribagh district of Bihar, primarily meant to supply water for the proposed Bokaro steel plant? The West Bengal Government has been waging a determined fight against the dam project on the ground that it affects the interests of the State, and is much less likely to agree to the construction of the high dam if it becomes a Bihar State project. And third, will the power generating and distributing assets function as well as they do now when run departmentally by the Central Government, or even by some separate body which may be constituted for the purpose? Not likely because then they will no longer be exposed to the same public scrutiny as the affairs of the D.V.C. have been. In spite of much criticism, some genuine, some inspired, the record of the Corporation in the matter of power production and distribution has not been unsatisfactory. On the contrary, the record has been particularly good. From a total of 1,554 kW of electricity produced in 1960, the D.V.C. has steadily raised its power output over the years to 2,778 kW in 1963. No competent person has yet tried to prove that the performance should have been better.

★★

The address of the West Bengal's Governor on the opening day of the State Legislature last week, was brief and, as usual, gave an account of the Government's achievements in various fields including education, agriculture and industry. It was the briefest address delivered by a head of this State so far, but the main burden of the address was the State's food problem. Miss Naidu shared the Chief Minister's optimism in assessing the food supply prospects and the situation she said was likely to be "comparatively easy". The Governor, however, ignored the question of procurement altogether. The Government's food policy does not ensure that paddy can be procured from the producers at the prices fixed, and this has led the rice millers to stop purchasing paddy in the countryside pending furhter official measures. She viewed with equal satisfaction the progress of West Bengal's third five-year Plan. The State, she said, would not only be able to reach the financial target of Rs. 293 crores over the five-year period, but might be able to raise more from its own resources than what it had undertaken to do. It is even hoped that the outlay for the Plan might total Rs. 320 crores at the end of the period because of the extra effort which the State is making to find funds. Reviewing the progress of the State's industrial projects, the Governor said that of the big schemes, the coke oven plant and the tar distillation plant in Durgapur had already been in full production. The Durgapur-Calcutta gas grid was commissioned last July and 5 million cubic feet of gas was being inducted into Calcutta city every day. Work on the projected chemical complex in Durgapur based on benzol and naphthalene, was already in progress, and the State was trying to have a fertilizer plant set up soon.

★★

The jute industry is understandably worried by the demands which its workers have just put forward. At a meeting, over which the West Bengal Labour Minister presided, the workers have demanded an assurance that the variable dearness allowance now being paid under the Wage Board's award will not any time be reduced below the present level of Rs. 32.50. Retrenchment and retirement benefits for all workers "forced to retire at the stipulated age" and a guaranteed minimum wage for piece-rate workers are among the other demands pressed. If the industry accepts these demands, the award of the Wage Board itself would be substantially modified only after six months of the enforcement, but what worries the industry more is the fact the pressure on cost will considerably increase. Already, the implementation of the Award is costing Rs. 35 crores more. But if the workers' demand were to be accepted, the industry would have no chance of relief when the cost of living index moves down. [Under the Wage Board's Award, the dearness allowance has been fixed at Rs. 32.50 on the basis of a price index number of 425 (with 1939 as the base year) and would rise or fall by 20 nP. for every point of increase or decrease]. The retirement age for male workers is fixed at 58 and that of female workers at 55, but the employers have the option to retain a worker beyond these ages if they consider necessary. Equally, they are free to superannuate workers when they have reached the prescribed age limits. It is this right of the employers which the workers now seek to nullify by demanding that even when superannuated workers are retired, they must be paid retirement and retrenchment benefits beynd the gratuity provided by the Award.

Satisfactory Estimate

The all-India final estimate of the jute crop for 1963-64 should be very satisfactory from jute industry's point of view as well as that of the country. Compared with the revised estimate the final shows a rise of 1.3 per cent in acreage from 2.1 million acres to 2.13 million acres. The increase in raw jute production amounts to 9.3 per cent — from 5.40 million bales to 5.91 million bales. A particularly gratifying thing is, that the yield per acre has gone up from 1,028 lbs to 1,100 lbs. Among the jute growing States reporting a rise in acreage are West Bengal and Orissa as they had favourable weather conditions at the time of sowing; those reporting higher production are Assam, West Bengal and Orissa due to good weather conditions during the period of plant growth. In Assam's case, it was the absence, of heavy floods, which contributed to the increase both in acreage and production. Bihar alone shows a decline on both counts, as this State had unfavourable weather at the time of sowing and later, floods during the period of plant growth. Thus the industry has every prospect of continuing to work to full capacity, for the current half year at least. The export performance so far has been good and compares well with the previous year, although the big rise shown in latest figures for gunny stocks with the mills gives the contrary impression. The accumulation is on account of the communal disturbances of January which badly affected the loading activities at the port as well as due to the shortage of lighters there.

★★

The Government of Assam proposes to call a conference of the tea gardens in the State to discuss the financial difficulties which the estates have come up against in implementing their development plans. The committee which the State Government has set up to review the tea industry's complaints has prepared a tentative agenda for the proposed meeting; the main item for discussion, however, is going to be the unwillingness of commercial banks to agree to terms of a 'pari passu' credit arrangement, under which a second mortgage on garden estates will be permissible when taking a loan from the Tea Board for development purposes. The banks provide working capital on hypothecation of the crop as well as on the basis of a first charge on the tea gardens' assets, and the accommodation from them is, therefore, as important, perhaps more, as the development loan which the Tea Board is to provide. Yet replanting and development of the gardens must continue in order to raise production; in some cases even to maintain production at the existing level. The gardens are also willing to build labour quarters according to the State Government's specifications, but after mortgaging their assets first to commercial banks and then to the Tea Board, they have no security to offer for the loans which the Assam Government has been offering. In the circumstances, intervention of the Reserve Bank or the Central Government is called for.

The conference should also discuss what harm the Assam Government's policy towards the tea industry has been doing. The carriage tax which the State had levied, and which was declared 'ultra vires' by the High Court of Assam a few months ago, was in fact an excise duty in a different form. The State Government has stopped collecting the tax, but it has not refunded the several crores which it had taken before the Court gave the ruling. Presumably, it wishes to go on appeal. It does not allow tea gardens to buy rice from the open market fearing that that might upset the market stability, but it does not ensure the supply of rice to tea gardens either. Also, it does nothing to help them to obtain their requirements of fertilisers and coal regularly and in adequate quantities. A representative body of tea interests recently voiced these grievances against the State Government.

★★

Fort Gloster Industries is yet another Indian concern—one of the few so far—in which the International Finance Corporation, the World Bank affiliate, will invest a total 1.2 million U.S. dollars in the shape of loan and equity participation—the loan portion of the investment is $ 812,000 and the participation in equity capital will be $ 400,000 through a purchase of 10,000 equity shares at the rights offering price of Rs. 190 each. The Continental International Finance Corporation, a subsidiary of the Continental Illinois National Bank and Trust Company of Chicago, is participating with the International Finance Corporation in this transaction. Fort Gloster Industries, of Calcutta, is a well known jute manufacturing company which was established in 1890, but in 1960 it undertook the first diversification of its manufacturing activity by branching off to electric cables under a technical assistance agreement with British Insulated Callender's Cables Ltd. The company's cable factory in Calcutta is at present producing various types of high quality vulcanised rubber-insulated cables. These facilities are now proposed to be expanded by extending production to paper-insulated, lead-covered power cables, railway signalling cables, mining cables insulated with plastic and vulcanised rubber. It is expected that the new manufacturing capacity will be in production by 1965. The company is also concurrently engaged in modernising its jute manufacturing facilities and installing new equipment for the production of wide hessian to meet the rising U.S. demand for carpet-making cloth.

Another leading Calcutta company, the engineering firm of Kumardhubi, will shortly issue bonus and rights shares in order to strengthen its capital base for financing expansion and modernisation schemes. This compay's existing paid-up and subscribed capital is Rs. 27.65 lakhs. It is now proposed to raise the capital to Rs. 55.28 lakhs — Rs. 5.52 lakhs through a bonus issue and Rs. 22.11 lakhs through a rights issue. The demand for the products of the Kumardhubi Engineering Works has been good, and last year the Company paid a dividend of 15 per cent taxable. The general meeting of the company which will consider the proposed capital issues has been convened for March 10.

Dearer Rice Again

From Our Correspondent

MADRAS:

A DIFFICULT situation prevails in the Madras State in regard to the availability of rice due to the absence of rain in the rice-growing tracts in the past few weeks and the virtual depletion of the Mettur reservoir. It is now apprehended that the yield of the crop will be considerably affected and that there might be even failures in some of the districts. In the rice granary, Thanjavur District, serious efforts are being made to save the standing crop by making water available from Mettur in rotation. But it is now felt that in spite of the best arrangements, the yield will be considerably lower as the rain God has not been helpful. This is perhaps the reason why after a decline in prices for paddy in some centres, where harvesting operations had begun, prices have come back to the old high levels. There was for a time a stalemate on account of the unwillingness of millers and agents to buy rice because of the policy adopted by the Government in respect of procurement, but when it became clear that supplies from Andhra would not be easily forthcoming and the rice crop in Madras State also would not be large, holders are reserved. Meanwhile, consumers of Andhra rice, particularly of Nellore varieties, have been held to ransom and the retail price of Nellore rice is quoting at the highest level in living memory. Small stocks of old rice are no doubt arriving in Madras City. But there is no prospect of any pronounced decline in prices until the Andhra Government adopts a more helpful attitude and the procurement policy is not so strictly applied in regard to exports of rice to Madras. It has also been complained that in the Nellore area large stocks of new crop paddy have accumulated and the growers have not been able to sell their produce readily. The administration is reported to be unwilling to issue permits expeditiously even though the traders were prepared to comply with the conditions imposed by the State Government. Unless the restrictions in regard to movement of rice within a zone are relaxed and larger sales can be effected through fair price shops, there is very little prospect of a decline in prices for various grades of rice to the former levels. This position is in complete contrast to the conditions that prevailed in the second quarter of last year.

★★

It is rather unfortunate that the reaction to the Railway Budget proposals for levying an additional supplementary surcharge of 2 per cent and a revision of the freight rates on coal as they relate to long-distance movement, have created a misleading impression. As it had been feared that the Railway Minister might make an attempt to raise passenger fares and freight rates all round, the decision to make only small changes came as a great relief to operators in the stock markets. But it has not been realized that the increase in the supplementary surcharge is in addition to the increase effected in earlier years and that the reduction in the subsidy incurred by the Railways in respect of long-distance traffic might have undesirable effects in the coal deficit areas. Even now there is a deliberate policy of encouraging the switch-over from coal to furnace oil in the case of cement units where it has been found that coal supplies were irregular and costly on account of the long distances involved and handling at many points. From the Railways angle it cannot be disputed that the loss incurred in the movement of coal over long distances should not be heavy. But it would not also be correct to take too narrow a point of view as only the overall position should be taken

into consideration and the Government should be prepared to make the necessary adjustments out of equalisation funds wherever necessary. It is now feared that cement units in the South will have to pay more for their coal supplies and that where movement is by the sea-cum-road there will have to be a large subsidy. Even otherwise, the industry has been representing to the Government for an upward revision of prices as costs of production have risen significantly since the last enquiry and the increases in prices granted so far have been inadequate.

It is now pointed out that, with the prospect of coal becoming even costlier over a period and the difficulties involved in moving coal over long distances, it would be advantageous for the industry to use furnace oil as far as possible. If this trend gains momentum, it should be examined whether small losses incurred in the movement of coal cannot be borne by the Government if the alternative is to spend large amounts of foreign exchange for importing furnace oil. It is no use saying that the additional requirements are being secured against rupee payment as in the last analysis these imports have to be paid for by export of Indian goods. The factories in the Southern States are naturally anxious to take advantage of the opportunity provided by the Government to use larger quantities of furnace oil as it is easier to handle and has greater calorific value. It is felt, therefore, that a suitable subsidy by the Government would be helpful. Even under the present arrangement there is not much complaint when using furnace oil while the operation of the coal subsidy scheme has been seriously criticized.

The improvement in efficiency of cement even with the use of furnace oil is no doubt to be welcomed. But if long-term trends are taken into consideration it will be readily recognised that the growth of the cement industry will come about mainly in this part of the country as large limestone deposits are available only in Maharashtra, Madras and Andhra Pradesh. As all these three States are far removed from the coal areas, there would naturally be a big increase in the consumption of furnace oil which is not quite desirable until such time as the output of refined product based on *indigenous* crude oil had been significantly raised. It is stated that some of the kilns in the existing factories are already operating on furnace oil and there are proposals for others changing over to this type of fuel at an early date if the Government are agreeable to the switching over from coal by the cement units concerned.

**

The Municipal elections now being held in Madras State have a special significance. The political parties opposed to the Congress are making an effort to present a united front while the Congress organisers have been going all out to eliminate the D.M.K. and Swatantra candidates from as many places as possible. There is a tough battle going on in Madras City and it is hard to predict at this stage what will be the ultimate outcome. But the results of the elections held in different centres clearly show that the D.M.K. and Swatantra party candidates have suffered a greater defeat than the Congress candidates. In fact, the resounding successes in Coimbatore and Madurai and the securing of majorities in other places for the Congress have given rise to the feeling that the D.M.K. party has been losing ground. There has been, of course, an unexpected reverse for the Congress in Tirunelveli. But the vote in this centre is regarded as more anti-Congress in character rather than pro-D.M.K. What is, however, more striking is the fact that Independents have been elected in large numbers and in some areas, they are in a position to decide which party's candidate should be the Municipal Chairman.

The moving finger writes

THE SECURITY Council debate on Kashmir has ended with the Government of India laying claim to a sense of relief and the Government of Pakistan determined to be hopeful. If Mr. M. C. Chagla is to be believed, India has scored a famous victory since Pakistan's demand for a plebiscite did not pass muster. If, on the contrary, Mr. Z. A. Bhutto is to be trusted, things have gone so well for Pakistan in the recent debate that its Foreign Minister could hardly hold his soul in patience till mid-March when, or a little later, he expects to raise the issue again in the Security Council.

Meanwhile, in this country—outside those official circles, variously described by special correspondents of newspapers as "authoritative" or "informed"—there is little disposition to hide the anxiety felt at the isolation which we have had to endure in the Security Council. That we should feel offended and angry at Britain's partisan attitude is no doubt entirely natural and proper. But this ought not to blind us to the fact that this country could not get support from any source whatsoever for its basic proposition that Pakistan was the aggressor in Kashmir and that she should be named and dealt with as such. Even the Soviet representative was not prepared to endorse the Indian position in the categorical manner in which it has been the purpose of Indian diplomacy in the last 16 years to persuade world opinion or at least friendly foreign opinion to view the issue. This is why the Indian public mind has become so uneasy over the latest Soviet attitudes.

The anxiety, however, could be exaggerated. On the practical question of the accession of Kashmir to the Indian Union, the Soviet delegate has certainly not wavered or equivocated in the least. On the contrary, he bluntly told the Security Council that the Soviet Union adhered to its well-established position that a decision had already been taken by the people of Kashmir and that that decision should be deemed to be final. It follows that the Indian people and their Government could continue to depend on Soviet support in resisting any attempt at reopening the issue of accession through a Resolution or any other device of the Security Council. This is certainly one of our chief diplomatic assets in the Kashmir affair, but this should not blind us to the fact that everywhere else our diplomacy in the matter of Kashmir has been left lonely, weak, humble and naked. It is no small matter that two leading nations of the Western world, the United States and the United Kingdom, which have always been ready to befriend and assist this country's endeavour to develop itself economically as well as its effort to defend itself against China should so obviously sincerely believe that this country could do more than it has done or is willing to do to seek a peaceful settlement of its differences with Pakistan over Kashmir. Surely, this is a matter which cannot be disposed of by angry speeches in Parliament against the British Government or protest interviews with the British High Commissioner in India.

**

I am glad to find so much enterprise, initiative and ingenuity among Members of Parliament as was evinced in the crop of Private Members' Bills introduced in the Lok Sabha. Even as it was being reported that several Members of the Executive of the Congress Parliamentary Party were reportedly in favour of proposals to improve the living conditions of Members of Parliament, Mr. N. R. Laskar of the Congress Party, catching Time by the forelock, introduced a Bill to enable Members of Parliament to travel by air on payment of the difference between first class railway fare and air fare. Mr. Laskar's proposal is only a part of a more comprehensive programme which is being sponsored by influential Congressmen.

There is a suggestion, for instance, that the salary of a Member of Parliament, which is Rs. 400 a month at present, should be raised to Rs. 500 and that the daily allowance during sessions, which is currently Rs. 21, should be stepped up to Rs. 31. There is also a plea that M.P.s should be allowed free telephone calls up to 10 per day. Firm believer as I am in everybody trying to improve his standard of living, I can have nothing against our Parliamentarians' effort to do so. I would, however, suggest that, considering the competence and capacity of our telephone systems, the free phone facility claimed for M.P.s should be modified to the extent that where an M.P. does not, in fact, avail himself fully of the 10-call limit fixed for this concession, he should be re-imbursed in cash for the free calls he could have made but did not. This might be an incentive to legislators to refrain from burdening the telephone services unnecessarily.

Meanwhile, the Minister for Parliamentary Affairs, who has been informally sounding Members of Parliament belonging to various parties on this question of emoluments, is stated to have found considerable sympathy for the proposals which are at present being canvassed. The Swatantra Party, however, is an exception. Members of that party seem to take a mischievous pleasure in wanting to stick to the practice of austerity to the disadvantage (and embarrassment) of legislators of other parties not equally blessed in the matter of membership of those holding privy purses.

Dr. Lohia's reactions have not been published, but should be predictable. He would certainly protest that since (according to him) a third of the people have to subsist on three annas a day or less, it would be a sin for their representatives in Parliament to vote themselves a rise in salary from Rs. 400 to Rs. 500 per month, but I also expect him to accept the increase on the different ground that if the Prime Minister, who is also an M.P., could be allowed to spend Rs. 25,000 per day on himself (as Dr. Lohia alleges he is doing), there is no reason why other M.P.s should concede their inferiority to Mr Nehru by being content with making very meagre claims on the public funds.

**

I see that 'Eastern Economist,' in its editorial columns, was recently asking for economy in Government expenditure. I wish the Editor had saved his breath, for I firmly believe that it is not only futile but even harmful to exhort the Government to practise economy. See what has been happening in the case of travel expenditure on Central Government Ministers. Last year, it appears, each individual Minister was spending somewhat less on this account than what he did in the preceding year. But the total expenditure, nevertheless, went up, the reason being that the number of Ministers had meanwhile increased. No wonder everybody is talking of a Rs. 2,000-crore Central Budget.

Trade Winds

NEW PROCEDURE FOR INDUSTRIAL LICENSING

WITH A view to enabling the applicants to know as early as possible whether Government is prepared to consider favourably the proposals put forward by them, only "letters of intent" would normally be issued in the first instance. Intending entrepreneurs are to address their applications to the Co-ordination and Licensing Progress Section (C.L.P. Section) of the Ministry of Industry, which will act as the co-ordinating Ministry for all industries. The applications, which are to be made in the existing forms 'D', 'E', 'EE', etc., are to be sent in original with 10 spare copies, accompanied by a treasury challan for Rs. 50|- deposited under the Head "XXIX, Industries-Miscellaneous Central". Pending amendment of the existing forms of application, applicants are also required to indicate their requirements, if any, of coal, while forwarding applications for industrial licences.

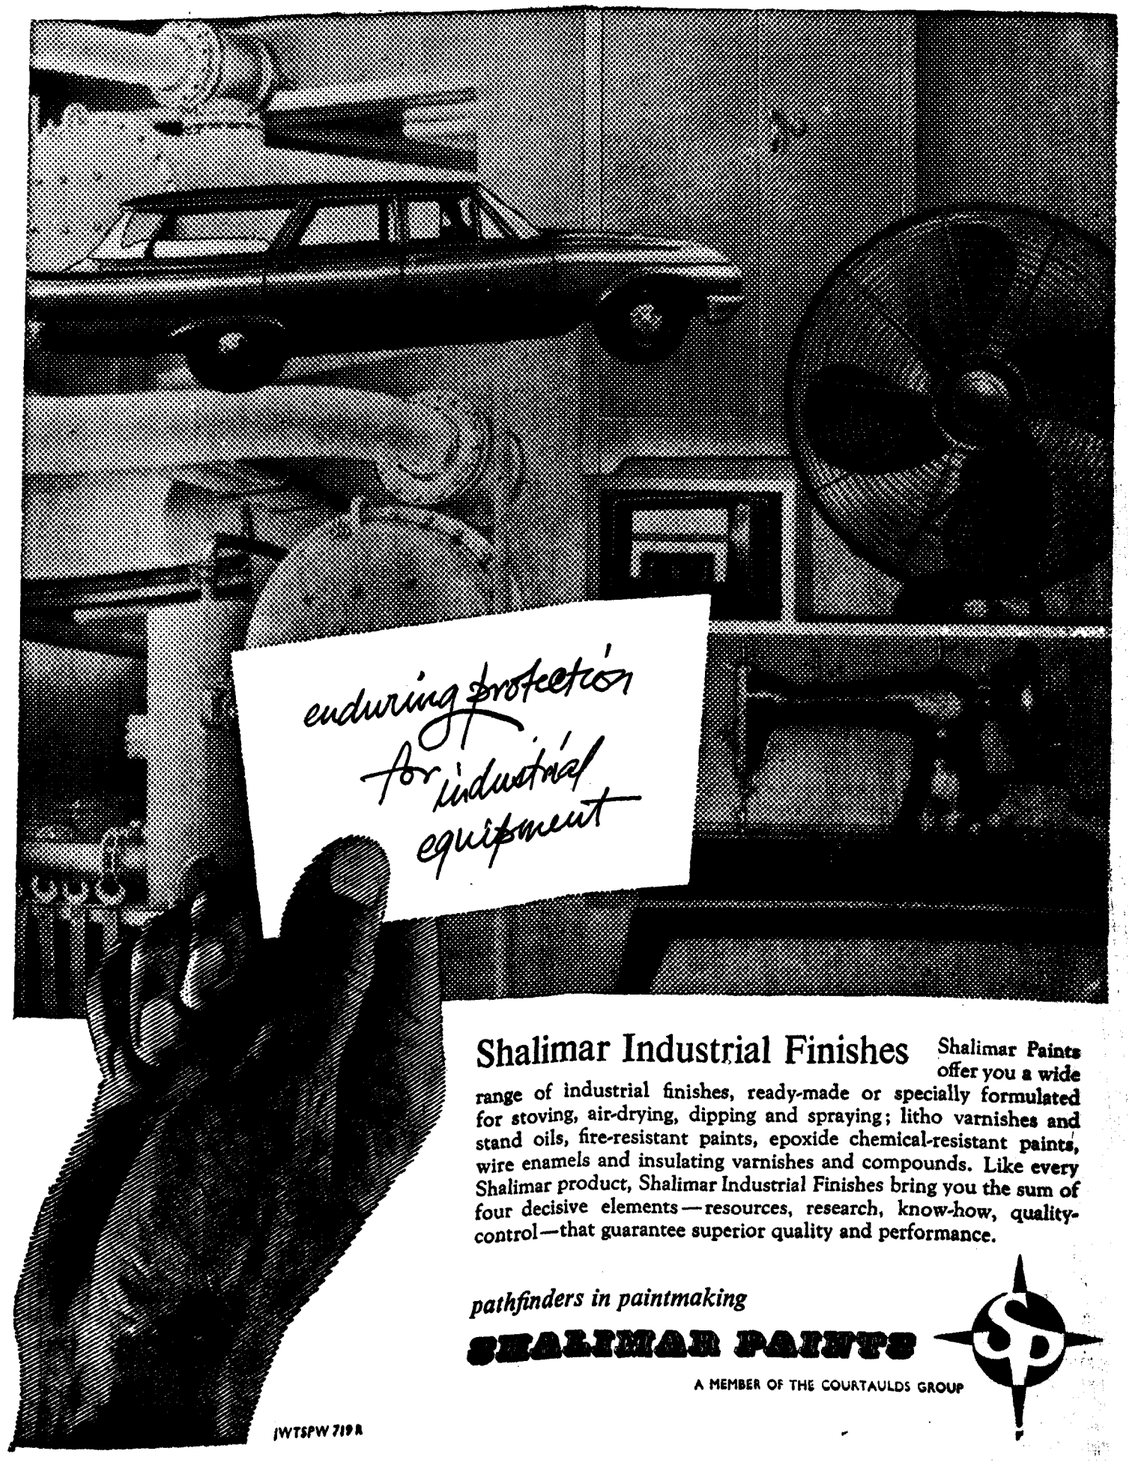
Each application will be serially numbered in the order of receipt and the applicant will be informed of the serial number allotted to the application for future reference. All future correspondence by the applicant is to bear this reference number.

Letters of intent to be issued henceforth will indicate the period for which they will be valid. Within the period specified in the letter of intent, entrepreneurs are to finalise other aspects of their schemes such as foreign collaboration, arrangements for import of capital goods, proposal for issue of capital, etc. and submit these applications for clearances to the authorities concerned. If the applicant does not make adequate progress within the stipulated time, the letter of intent would automatically lapse and requests for extension of time would not ordinarily be entertained.

In respect of certain industries which have been categorised as 'Key Industries,' a revised procedure will be followed for clearances, subsequent to the issue of a letter of intent. All applications for the subsequent clearances such as import of capital goods, approval of foreign collaboration terms and consent for issue of capital will be considered simultaneously. Entrepreneurs who have been issued licenses or letters of intent for setting up further capacity relating to any key industry are therefore required to send simultaneously to the C.L.P. Section in the Ministry of Industry the applications for import of capital goods, approval of the terms of foreign collaboration and for consent for issue of capital. The applications for import of capital goods and for consent for issue of capital should be accompanied by treasury challans for the requisite amount, as prescribed. All these applications in the respective forms should be sent in original, accompanied by 10 spare copies of each, to the Co-ordination and Licensing Progress Section in the Ministry of Industry, giving also the serial number communicated to the applicants earlier at the itme of acknowledging their applications for industrial licences. This procedure applies only to the setting up of additional capacity in respect of 'key' industries whose list will be reviewed and published from time to time. The list of key industries, as at present, consists of the following: Pig Iron, Alloy Steel, Ferro-chrome and other ferro alloys except ferro-manganese and ferro-silicon, malleable iron castings, steel castings, steel forgings, Structurals (Heavy), Industrial Machinery, Cranes, Machine tools including small tools, dies, jigs and fixtures, Automobile ancillaries, Coating Abrasives, Electric Winding Wires, Fertilizers, Sulphuric Acid, Caustic Soda and Soda Ash, Rubber Chemicals, Petro-chemicals including synthetic rubber, Pesticides, Paper and Paper Board, Cement and Pulp (Cellulosic).

STATE TRADING IN MINERALS

With a view to promoting exports of mineral ores and regulating imports of metals, the Minerals & Metals Trading Corporation has been set up by the Government of India. The new Corporation has taken over from the S.T.C. the existing trade pertaining to mineral ores, concentrates, metals and other allied commodities along with the assets and liabilities existing on that date concerning such business.



The most important item in the field of activities of the new Corporation will be iron ore. (India is at present exporting 9.5 million tonnes of iron ore, out of which 5.5 million tonnes is from Goa). As the iron ore trade faces severe competition in the world today, it is of vital importance that various necessary steps are initiated to make Indian iron ore competitive in the world markets. But the export of iron ore requires well thought-out and co-ordinated plans for mining, road development, railway transport, port facilities and freight arrangements. Of equal importance is our relationship with the foreign buyers, and this depends on our understanding and appreciation of their requirements and needs and our ability to meet them. Experience has shown that when the foreign buyers are convinced of our intentions and of the merit of our future plans and the pace of implementation, they do show considerable accommodation to our immediate short-term difficulties. It is in this spirit that our biggest buyer, Japan, agreed to sign a two-year contract with us for deliveries upto March, 1965. Other important buyers are West Germany, Italy, Czechoslovakia, Rumania, Yugoslavia, Poland, Hungary and German Democratic Republic. Contracts with these buyers are already in existence. Recently a delegation from Yugoslavia visited India and negotiated a contract for the purchase of 3,00,000 tonnes of our iron ore during 1964. An additional quantity of 1,00,000 tonnes may also be bought by them during the course of the year.

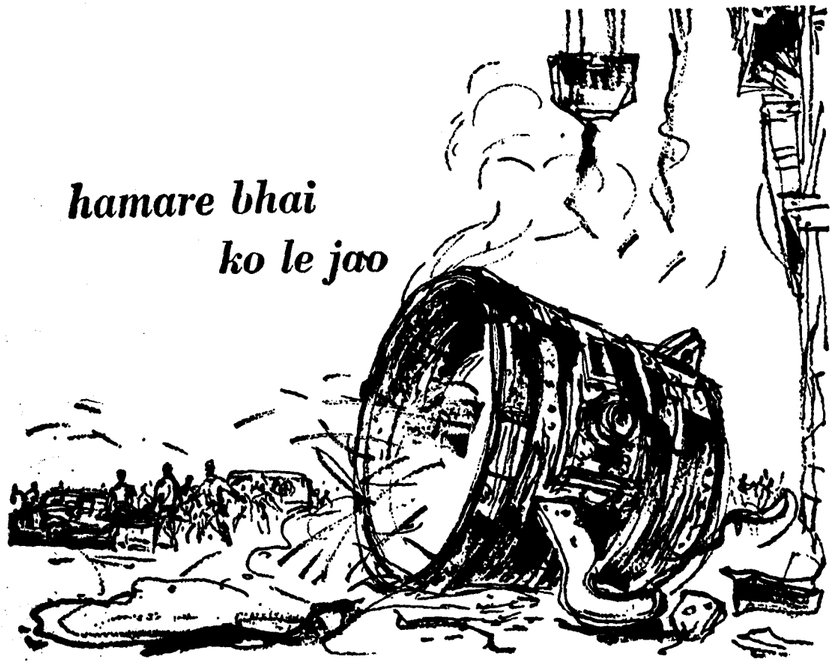
With a view to stabilizing prices and rationalizing distribution, the Corporation would also undertake, at the instance of the Union Government, import and|or international distribution of minerals, ores and concentrates and metals including iron and steel and their alloys and semi-manufactures. In this connection, the Corporation will also enter into such special arrangements as 'linked deals' and 'barters'.

CERAMIC INDUSTRY MEETS

Inaugurating the 28th Annual General Meeting of the Indian Ceramic Society, the Union Minister of Supply and Technical Development, Mr. Jaisukhlal Hathi, purposefully refrained from referring to the difficulties of the industry, be they of transport, power, fuel or even of foreign exchange. He pleaded that these difficulties were really of our own making and had resulted from our drive to industrialize the country in the shortest possible time. If we did not have ambitious programmes for industrialization, none of these difficulties would have arisen. Mr. Hathi said that if there was an overall shortage of fuel, it was for the industrialists to take steps to reduce its consumption, and that, if there was a shortage of imported raw materials, the industrialists should try to discover indigenous substitutes, and so on.

In his welcome speech, the Chairman of the Reception Committee, Mr. B. N. Bhaskar, constrained to point out the hindering influences on the industry, of governmental policies and plans. He pointed out that the refractory industry was asked to gear up production in order to meet the third Plan requirements of steel industry which was expected to reach the target of ten million tons by 1965-66. But in actual practice steel production was not expected to go much beyond 6.5 million tonnes. This, he pointed out, had led to a glut in the refractories market. Mr. Bhaskar added that

Shalimar Industrial Finishes



Shalimar Paints offer you a wide range of industrial finishes, ready-made or specially formulated for stoving, air-drying, dipping and spraying; litho varnishes and stand oils, fire-resistant paints, epoxide chemical-resistant paints, wire enamels and insulating varnishes and compounds. Like every Shalimar product, Shalimar Industrial Finishes bring you the sum of four decisive elements—resources, research, know-how, quality-control—that guarantee superior quality and performance.

JWTSPW 719 R

It happened some years ago in the steel melting shops at the Jamshedpur works. A large ladle, carrying 75 tons of molten iron, suddenly crashed to the ground with a deafening noise from an overhead crane. The spattering sparks and red-hot metal seriously injured a number of brick-layers working at what seemed to be a safe distance. The air was rent with the frenzied shouts of the men and the hissing of steam.

The first ambulance could remove only five of the injured to the hospital. General Manager Keenan could take only three more in his car. He chose the three who had a better chance of survival than the rest. One of these men, a Hindu worker, however, refused to go. "Do not take me away", he said. Disregarding his own agony, he feebly nodded towards a half-burnt Muslim colleague, and said: "*Hamare bhai ko le jao.*" As Keenan recalls, "The Hindu who was in pain and danger of death remembered, not that the Mohammedan was of a different faith, but that he was his brother."

This feeling of comradeship, born of the common bond of labour, is the spirit that characterises Jamshedpur, where industry is not merely a source of livelihood but a way of life.

GIVE FREELY TO THE NATIONAL DEFENCE FUND

even then, paradoxical as it might appear, there was the unfortunate desire of steel plants to have their own refractory units. Referring to mineral wool industry, he said that this was a small-scale industry and had established manufacturing units of a capacity much larger than the demand and that, at the top of it, the Bhilai Steel Plant proposed to produce 38,000 tonnes of mineral wool per annum at Bhilai. He said that he was at a loss to understand the reason for it as it would in no way help the utilization of slag, a waste material with steel plants. Mr. Bhaskar suggested that planning should be done for much longer periods and that for some industries, we should have a picture of development for the next 20 to 25 years. He said, "It is certainly disheartening, even demoralizing, that in one Plan the private industry in some fields is asked to develop its production capacity and in the following Plan, it suddenly learns that the Government is setting up a few factories in that very field in the public sector."

Replying to Mr. Bhaskar, Mr. Jaisukhlal Hathi pointed out that over-production of some types of refractories would be natural in a developing economy because it was comparatively easier and quicker to set up capacity for producing refractories than to set up a steel plant. He added that in most of the advanced countries there was surplus capacity for refractories which became handy when additional capacity for steel making was desired. The Minister stressed that our refractory units—at least the ones producing steel quality bricks—were not really under-worked. Moreover, we have not yet reached self-sufficiency in steel and considerable capacity would have to be added in the future five-year Plans. But in case of refractories it is just as we would like to have power, transport and other facilities developed before we need them. A readily available capacity for refractories would always be required for developing steel industry. As a matter of fact, while, on the one hand, there is over-production in certain types of refractory units, India is importing considerable quantities of refractories (Rs. 7 crores per annum for refractories for steel plants only). Such refractory items as sleeves, high grog ladle bricks, stopper heads and blast furnace quality bricks, are also in short supply in the country. Mr. Hathi advised the industrialists to pay attention to the indigenous production of these items and to lower production costs and raise quality of the products.

Regarding steel plants having their own refractory units, Mr Hathi said that, in principle, he did not see anything wrong in it. He pointed out that the Tatas and the Indian Iron had such plants and that at least one such unit in the public sector should serve as a useful model unit. He said the same argument applied to the mineral wool industry.

In his presidential address, Mr. U. P. Ganguli said that in Europe, the industry was experiencing a boom, the production was of the finest quality and provided increased employment opportunities. In addition to their own internal demand, which was very great, they had a vast export market in Africa, South America, North America, Australia and the Middle East. Mr. Ganguli pointed out that the European countries were not in a position to meet their full export demands and that, therefore, India had a good opportunity to exploit these markets. He advised his fellow industrialists to take full advantage of this opportunity.

Referring to production costs, Mr. Ganguli pointed out that in the glass industry, soda ash was a very important raw material constituting 30 to 35 per cent. of the total batch and that the price charged by the State Trading Corporation was about 2-1/2 times more than the international price. The same situation prevailed in the case of other important raw material. Mr. Ganguli said that the present export figure of Rs. 25 lakhs for glass could easily be raised to a crore of rupees if the price of soda ash was lowered. He added that even for many other industries in the group, if a price subsidy on the basic chemicals was given, the prices would fall and exports would increase.

AIR FREIGHT CONSOLIDATION

The International Air Transport Association has approved a world-wide air freight consolidation programme. This programme is to come into effect on April 1, 1964, subject to Government approval. According to the IATA Traffic Director, Mr. Don Reynolds, the programme is designed to safeguard the interests of all concerned with air freight—shippers, forwarders and agents as well as airlines. It reflects the increasing importance that the airlines of the world are placing on air freight. Many airlines today are operating all-cargo aircraft, and several have introduced into service large turbo-prop and jet freighters, capable of lifting upto 100,000 lbs. of cargo.

The Association has also released the first three volumes of projected world-wide passenger air fares table, entirely produced by electronic computer. The volumes, containing about 1,20,000 key fares between some 30,000 pairs of points, are available to member airlines in printed form, magnetic tape or punched-cards. They contain passenger fares which will go into effect on April 1, 1964. Using certain IATA agreed fares construction rules and operated milages as basic information, an IBM 7090 computer capable of 2,00,000 operations per second produced the tables in 70-machine hours. Such work previously required months of effort by the individual tariff staffs of TATA's 93 member airlines. The computer working group comprising tariff and computer experts from 10 airlines was formed more than five years ago to guide the continuing programme as it directly affects airline traffic, and is currently under the chairmanship of James McGuire, Vice-President of Pan American Airways Inc.

The Association will release shortly the first world-wide regulations for containers and pallets which are specifically desiged for speed and ease in handling air freight on the ground and in the aircraft. A 124-page volume of the IATA register of containers and pallets has been prepared and will become effective on April 1, 1964. It shows design and construction and lists the special uses of some 54 containers and pallets owned and registered by airlines, shippers,, freight forwarders and container manufacturers. The containers and pallets will permit faster door-to-door service and provide greater protection for the goods shipped, by way of reduction in exposure. Loss through damage or pilferage, already very low in air transport, will be virtually eliminated. Mechanical equipment is available for use with most of these unit load devices to provide maximum speed in loading and unloading.

SHAFT SINKING CONTRACT

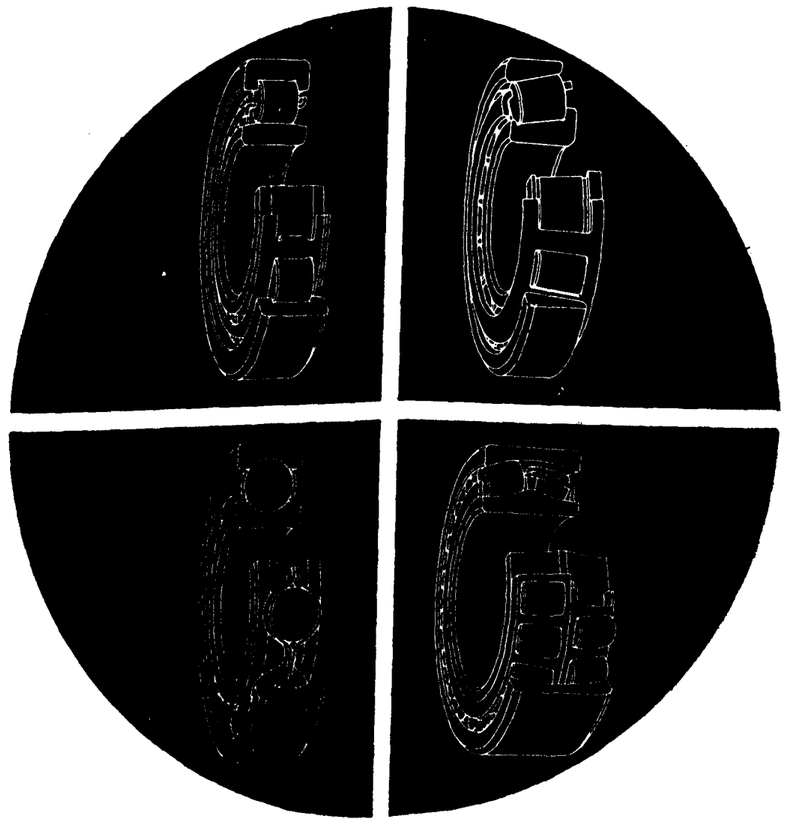
A contract worth £800,000 (Rs. 1.07 crores) for developing the Jitpur and Chasnalla collieries in Bihar State has been secured by the Indian branch of the Cementation Company Limited. The contract is being carried out for the Indian Iron and Steel Company Limited with the International Construction Company Limited as consulting engineers. The contract will include the sinking of three 17-foot diameter concrete lined shafts to depths of nearly 1300 ft. at Chasnalla colliery and the deepening of three existing shafts at the Jitpur colliery.

Company Affairs

UNIVERSAL CABLES

THE UNION Minister for Steel, Mines and Heavy Engineering inaugurated on February 16, the plant set up by Universal Cables Limited at Satna in Madhya Pradesh for the production of electric power cables. The company has been licensed to produce annually 624 miles of paper insulated cables and 240 miles of thermoplastic cables on a single-shift basis. Working on a triple-shift basis, however, the company could, with its existing complement of machines, reach an output of up to 2,000 miles of paper insulated cables, apart from the production of other types. In view of the rapid development of power generation and distribution in the country and the equally rapid growth of the demand for power cables, it is felt to be in the national interest to provide for increased capacity in the industry and Universal Cables has applied to the Government for stepping up its output on a multiple-shift basis.

Meanwhile, the limited availability of imported raw materials for industry is causing serious difficulties. Discussing this problem, Mr. M. P. Birla, Chairman of Universal Cables, in his speech welcoming Mr C. Subramaniam and inviting him to inaugurate the plant, pointed out that power cables being an essential development item, it had in any case to be imported to the extent it could not be manufactured within the country and since imports of cables would certainly cost more foreign exchange than the import of some of the components required in its manufacture, he emphasized the desirability of the Government providing for the industry's full requirements of imported components. At present, the authorities seem to have ruled that a new plant would be entitled to only one-third of its requirements of imported raw materials in the first year of its functioning and two-thirds in the second year and must wait for three years before it could get its full quota. Mr M. P. Birla questioned the logic of this arithmetic and pointed out that it should not and does not take three years for a power cable plant to come into full production. So far as Universal Cables is concerned, Mr Birla said that the plant would be able to go into full production without any delay provided imported raw materials were made available in sufficient quantities. He was also confident that, once the Government authorized multiple-shift working, the investment of Rs. 2.25 crores made in the plant could be exploited to the full benefit of the country by production being stepped up to 2,000 miles of paper-insulaed cables, besides cables of other specifications.



The plant of Universal Cables at Satna could lay claim to many distinctions. In the first place, it has had the benefit of technical collaboration of British Insulated Callender's Cables Limited, London, which is the largest firm in its field. Mr G. M. Smith, pledging BICC's continuing interest in Universal Cables and paying a tribute to the Indian partners for setting up a modern plant in a modern factory, said that BICC was the parent nucleus of a group of associated companies in 138 countries with nearly a century of experience in cable manufacture. It commands full facilities for research, installation and transmission of electrical energy for power and communication purposes and these resources have been employed without stint in installing the equipment at Universal Cables and also in training the company's staff. Another noteworthy feature of Universal Cables is that it is one of the two plants manufacturing power cables in the country which are equipped to make cables of a special quality, viz., the mass-impregnated non-draining type. Its foreign exchange requirements of Rs. 80 lakhs have been met in equal parts by the Commonwealth Development Finance Company and the Industrial Credit and Investment Corporation of India. Of considerable interest is the fact that the plant has been constructed and commissioned within a period of 18 months from the date of issue of licence for the import of machinery.

SATNA CEMENT

The plant of Universal Cables at Satna is a new adjunct to the cement factory there which, on its 100-acre site, is the heart and centre of a well-planned and well-maintained modern industrial township. Started in 1959 with an initial capacity of 750 tonnes per day, the Satna Cement Works is now undertaking an ambitious programme of expansion which would increase its capacity and output by another 1,000 tonnes of cement per day. This expansion programme was also inaugurated by Mr. C. Subramaniam on February 16, when he switched on the new raw mill. Satna Cement Works, which is a unit of the Birla Jute Manufacturing Company Limited, has further plans for expansion as well, depending on the availability of limestone in sufficient quantities and in suitable quality in the neighbourhood. Expressing his appreciation of industrial progress through the setting up of new industries and the expansion of existing ones as in Satna, the Minister emphasized the importance of raising the standards of management practices in industry, whether in the public sector or the private. He suggested that there should be co-operation between Government and industrialists in this matter so that high technical and managerial skills, which are scarce today, could be utilised to the best advantage of the nation and at the places where they are most needed. Mr. C. Subramaniam appealed for a steady improvement in labour productivity and in this context stressed the contribution which modern and enlightened management practices as applied to Labour Relations could make. He agreed with Mr. M. P. Birla that it was desirable to speed up administrative procedures in order that there might be no avoidable delay in the processing and execution of industrial schemes. Planning was desirable and regulation necessary, but both should serve the primary purpose of promoting more economic progress quicker.

CENTURY RAYON'S TYRE CORD PLANT

The Century Rayon complex of the Century Spinning and Manufacturing Company Ltd., which is located at Kalyan, some 35 miles from Bombay, made a precious new acquisition on February 15 when its recently built tyre cord plant was formally inaugurated by the Chief Minister of Maharashtra, Mr. V. P. Naik. The plant will manufacture viscose tyre yarn, used in the manufacture of tyre, which is at present being mostly imported from abroad. The rated capacity of the plant is 5 million lbs, or about 2,300 tonnes per annum but already the output is running at the rate of more than eight tonnes per day. The total monthly requirement of rayon tyre cord in the country is about 900 tons, costing foreign exchange to the extent of Rs. 6 crores per year. With its present rate of production, the Century plant, on which a total capital outlay of Rs. 4.5 crores has been incurred, would save the country foreign exchange to the extent of Rs. 1.6 crores per annum. The company hopes to develop the capacity of its tyre cord plant to 10 million lbs. per annum by the end of this year. This expansion scheme of the company would involve an additional capital outlay of Rs. 3.7 crores. The capital goods licence for this expansion is awaited. Meanwhile, the company has also applied for further expansion of capacity of its rayon tyre cord plant to 15 million lbs. per annum. The company has also submitted an application to the Government

SKF

A team of qualified engineers will solve your problems and ensure you have "The Right Bearing in the Right Place."

THE SKF BALL BEARING CO. PRIVATE LTD.,
Mahatma Gandhi Memorial Building, Netaji Subhas Road, Bombay.

for the manufacture of nylon tyre cord which is preferred for heavy duty and aircraft tyres.

The Century tyre cord plant is a truly international enterprise in which the Birla Group has collaborated with Dutch, Swiss and German partners. Messrs. Algernene Kunstzijde Unie, N.V. of Holland and Messrs. Vereinigte Glanzstoff-Fabriken, A.G. of West Germany have shared their know-how with their Indian partner and supplied the equipment. Another well-known foreign enterprise Messrs. Ing. A. Maurer, S.A. of Switzerland, have also associated themselves with the Engineering of the project. Mr. G. D. Birla, speaking on the occasion of the inauguration of the plant, pointed out that the foreign collaborators were leaders in the world's man-made fibre industry. According to Dr. L. Vaubel, who represented Glanzstoff on the occasion, his company is the oldest and the largest German producers in the field of man-made fibres and was also one of the pioneers in developing tyre cord made from high-tenacity rayon. The Dutch collaborators, Messrs. A.K.U., is a parent company having control in Glanzstoff and many other companies throughout the world. Messrs. A.K.U. is also one of the biggest chemical companies in Holland. The Swiss collaborator, again, has extensive international experience in setting up synthetic fibre plants in many parts of the world and, in this capacity, is no stranger to India.

Describing some of the more important activities of the Century organization in the industrial field, Mr. G. D. Birla pointed out that Century Rayon was the first concern in the world to make rayon grade pulp from bamboo. He also gave an indication of Century's plans for the development of new industries in the coming years. Mr. V. P. Naik, Chief Minister of Maharashtra, speaking subsequently, emphasised that in the context of the rapidly growing population, it had become imperative that this country should increase its agricultural and industrial production. He underlined the need for the setting up and development of more and more industries and welcomed the large and constructive part which is being played by leading industrialists in this area of national effort.

ATUL'S SODA PLANT INAUGURATION

The Gujarat Chief Minister, Mr. Balwantrai Mehta, inaugurated the Rs. 150-lakh caustic soda plant of Atul Products Ltd. last week. The plant, which will produce 20 tons of caustic soda along with caustic potash, sodium sulphide, liquid chlorine and hydrochloric acid, was erected and commissioned by the West German firm, Messrs. Friedrich Uhde GMBH. In his inaugural speech, the Chief Minister congratulated Mr. Kasturbhai Lalbhai, Chairman of Atul Products Ltd., for establishing the new plant in a backward area like Bulsar, in Gujarat. He advocated the dispersal of industries in such areas in order to prevent over-crowding in cities. The Chairman of the company pointed out that in selecting the site for the new caustic soda plant, certain factors had been kept in view and one was that this place had facilities in regard to supply of water. Moreover, it was considered that it would be better to have such big chemical plants away from big cities.

Tracing the growth of this company, Mr. Kasturbhai Lalbhai indicated that it was in 1949 that the company started making preparations to undertake the manufacture of direct dyes, acid dyes and sulphur black, and it was in 1953 that it started manufacturing dyestuffs there. It obtained technical know-how for dyes manufacture from the American Cyanamid Company, and later on made arrangements with Lederle, a subsidiary of the American firm to start the production of drugs and pharmaceuticals here. Around 1960 the Lederle Company changed its name to Cyanamid India and took Atul in partnership. Now a wide range of drugs and pharmaceuticals and about 200 varieties of dyes for use in cotton textiles, rayon, jute, leather and paper industries are being produced by Atul Products and companies associated with it. As different types of acids are used in the manufacture of these products, the company set up plant to produce sulphuric acid, olium and nitric acid, while the erection of chloro-sulphonic acid plant is now in progress. It was in this context that the company thought of setting up a caustic soda, plant. During these years its investment has increased considerably. In 1953 the investment in Atul was of the order of Rs. 2.5 crores which has gone up to Rs. 20 crores and may touch Rs. 30 crores when the intermediate plants are completed by 1966-67.

MODI INDUSTRIES

Modi Industries Limited proposes to enter the capital market with a public issue of Rs. 50 lakhs on February 24. The subscription list will close on February 26 or earlier at the discretion of the directors. It proposes to issue 5,000 registered debentures (7 per cent) of Rs. 1,000 each to be issued at par. It has an authorised capital of Rs. 1.50 crores and issued, subscribed and paid-up capital of Rs. 73.39 lakhs. The present issue will raise funds to expand the activities of the company. An electric furnace, re-rolling mill and wire drawing plant, for which necessary industrial licences have been obtained from the Government of India, are being installed. The existing activities of the company include the manufacture, distribution and selling of sugar, soaps, vanaspati, refined oil and other vegetable products, stearic acid, glycerine, hurricane lanterns, torches, arc welding electrodes, paints, varnishes and colours, oxygen and acetylene gases, carbon dioxide gas, industrial alcohol and spirits, etc. The entire issue of debentures has been underwritten.

COCHIN REFINERIES

Cochin Refineries Ltd., a public sector undertaking set up in collaboration with Phillips Petroleum Company of the USA and Messrs. Duncan Brothers and Company Ltd., of Calcutta, holding 20 per cent and two per cent of its equity share capital respectively, with the Government of India holding 51 per cent shares, proposes to enter the capital market for the public issue of Rs. 58 lakhs in 58,000 equity shares of Rs. 100 each. The subscription list opens on February 24 to close on February 27. It has an authorised capital of Rs. 15 crores and issued capital of Rs. seven crores out of which capital worth Rs. 6.42 crores has already been subscribed and paid up. The present issue is not underwritten, but Phillips Petroleum Company has offered to take up, without charging commission, any shares which are not subscribed by the public. The company proposes to establish a petroleum refinery with a capacity of refining nearly 2.5 million tons per annum. It will provide a new refining capacity for catering to the needs of Southern India. Phillips Petroleum Company have arranged for long and medium term dollar loans from the USA, and will also provide the necessary technical services in the construction, operation and management of the refinery including the training of the Indian personnel for all posts.

PHILLIPS PETROLEUM

Phillips Petroleum which is participating in the setting up of the Cochin Refinery, has a long history of production and marketing of crude oil and natural gasoline and its products. During the last decade it has also flourished as a producer of petrochemicals also so that it has grown into one of America's most diversified petroleum companies with assets around $1,735,000,000 at the end of 1962. Its gross income in that year was $1,261,000,000 and it paid dividends worth $63,600,000 at the rate of $1.85 per share.

KANORIA CHEMICALS

Kanoria Chemicals and Industries Ltd. entered the capital market on February 17, with a public issue of Rs. 80 lakhs made up of 15,000 redeemable cumulative preference shares (9.5 per cent) of Rs. 100 each and 50,000 equity shares of Rs.

10 each. The subscription list will close on February 24, or earlier but not before February 20. It has an authorised capital of Rs. five crores and an issued, subscribed and paid-up capital of Rs. one crore. The entire present issue is underwritten. The company proposes to manufacture caustic soda, chlorine and chlorine products. The factory is located at Renukoot in Uttar Pradesh where the building is nearing completion. It has been granted loans aggregating Rs. 1.23 crores by the Industrial Finance Corporation of India.

KUMARDHUBI BONUS ISSUE

Kumardhubi Engineering Works Ltd. has proposed to offer 194,320 equity shares of Rs. three each fully paid-up as bonus shares in the ratio of one bonus share for every five held. Immediately after this allotment, the company proposes to issue 737,280 new equity right shares of Rs. three each at a premium of 60 nP. a share in the ratio of two new right shares for every three existing shares, including bonus shares allotted as on the same date. After the issue of bonus and right shares, the equity capital of the company will be Rs. 55.90 lakhs in 1,843,200 equity shares of Rs. three each against the present capital of Rs. 27.65 lakhs in 921,600 shares.

TUNGSTEN OF INDIA

Tungsten of India Ltd. proposes to enter the capital market shortly with an equity issue of Rs. 12.50 lakhs. An equivalent amount will be subscribed by the directors and their associates and friends. The company has a Rs. 40-lakh project for the manufacture of 60 million metres tungsten filament in collaboration with a Hungarian firm. The filament factory is to be located at Poona. Plant, machinery and equipment will cost Rs. 28 lakhs, building and installations Rs. 7 lakhs and the working capital required will be Rs. 5 lakhs. Out of the total cost of Rs. 40 lakhs, a sum of Rs. 25 lakhs will be raised by the capital issue and the remaining Rs. 15 lakhs by loan.

BAGLA ALLOY

Bagla Alloy Steel Ltd. will enter the capital market shortly to raise Rs. one crore from the public. It has an authorised capital of Rs. 2.50 crores — Rs. 50 lakhs in 50,000 (9.5 per cent) cumulative preference shares of Rs. 100 each and Rs. 2 crores in 2,000,000 equity shares of Rs. 10 each. The issued capital will be Rs. 1.50 crores — Rs. 1.25 crores in equity shares and Rs 25 lakhs in preference shares. The directors and promoters have agreed to subscribe equity shares of the value of Rs. 43.27 lakhs and the foreign collaborators Rs. 6.73 lakhs for consideration other than cash. The balance of Rs. 75 lakhs in equity shares and Rs. 25 lakhs in preference shares will be offered for public subscription. The company has been licensed to manufacture 19,800 tons of alloy and special steel every year. It will produce silico maganese alloy steel flats, rounds and squares. The licensed capacity will be raised to 30,000 tons and the new plant to manufacture springs will be added at a later stage. The plant will be located near Kanpur. It has entered into a technical collaboration agreement with a French producer.

VOLTAS

During the year ended August 31, 1963, Voltas Ltd. recorded net sales of the order of Rs. 32.42 crores, nearly 15 per cent more than the previous year. Net profit, after taxes, came to Rs. 84.67 lakhs as against Rs. 66.48 lakhs last year. A dividend at the rate of 14 per cent, subject to tax, has been proposed to be paid. The directors have proposed to raise funds to finance the construction of new unit at Panchpakhadi near Thana, which will cost nearly Rs. 3.3 crores. A debenture issue of Rs. one crore, carrying interest at the rate of 7 per cent per annum, was offered in January this year and was over-subscribed. An issue of two right shares to the existing shareholders for every five shares held at a premium of 25 per cent, subject to the consent of the Controller of Capital Issues, will realise nearly Rs. 1.27 crores. The balance is proposed to be raised from internal resources and additional cash credit facilities from banks. Negotiations for a foreign exchange loan to cover the cost of imported plant and machinery for the manufacture of a complete range of air conditioning equipment are expected to be concluded shortly. Preparatory work for the manufacture of compressors and air conditioning equipment at the Thana works is progressing. In regard to the scheme for the manufacture of small-size domestic refrigerators, for which the company holds a licence, considerable progress has been achieved. Foreign exchange loan has also been obtained for the power factor correction capacitor project.

ICICI

The Industrial Credit and Investment Corporation of India Ltd. has proposed to step up the equity dividend for the year ended December 31, 1963, to seven per cent, taxable from 6½ per cent, taxable, in the previous year. The higher distribution is a sequel to the improvement in the Corporation's performance. The net profit after providing for depreciation amounted to Rs. 57.88 lakhs against Rs. 46.38 lakhs for the previous year. Out of the profit the directors have provided Rs 14.50 lakhs for the special reserve and Rs. 11 lakhs for the general reserve. The dividend distribution will absorb Rs. 35 lakhs.

FORT GLOSTER

The International Finance Corporation has agreed to provide loan and share capital amounting to approximately $1.2 million (the equivalent of Rs. 5.7 million) to Fort Gloster Industries Limited of India, to assist in the financing of a Rs. 40 million programme for enlarging and diversifying the company's electric cable manufacturing facilities., Continental International Finance Corporation, a subsidiary of the Continental Illinois National Bank and Trust Company of Chicago, is participating with IFC in this transaction. Other financing for the project is being provided by the Industrial Credit and Investment Corporation of India (ICICI), which is lending the company approximately Rs. 6 million, and by a rights offering of shares to existing shareholders of Fort Gloster Industries which is expected to raise an additional Rs. 6 million.

Fort Gloster Industries Limited, a jute manufacturing company, at present has a share capital with a total par value of Rs. 8.4 million, consisting of 63,000 equity shares and 21,000 first and second preference shares. As part of a diversification programme, the company began the manufacture of electric cables in 1960 under a technical assistance agreement with British Insulated Callenders Cables Ltd. The cable factory in Calcutta is at present producing various types of high quality, vulcanized rubber-insulated cables. The company now proposes to enlarge these facilities and extend its production to include the manufacture of paper-insulated, lead-covered power cables, railway signalling cables, mining cables and various types of cables insulated with plastic and vulcanized rubber. The new manufacturing facilities are expected to be in operation in 1965. Concurrently, the company is engaged in modernizing its jute manufacturing facilities and installing new equipment for the production of wide hessian to meet the rising demand for jute backing for tufted carpeting in the United States.

CAPITAL ISSUES

Three companies have been authorized to raise capital aggregating Rs. 10.90 crores. They include Indian Refineries, a Central Government Undertaking, which is issuing equities worth Rs. 9.15 crores. Another company, proposed to be incorporated as a Central Government Undertaking, is also issuing equities. The third, a private company, will issue 7 per cent Fifteen Year Debenture Stock. The consent of the Controller of Capital Issues is valid for 12 months in all cases.

Indian Refineries, a Central Government Undertaking, is to issue further capital of Rs. 915 lakhs divided into 91,500 equity shares of Rs. 1,000 each to be issued at par. Of this shares of the value of Rs. 90 lakhs will be issued for consideration other than cash and the balance shares will be subscribed for cash. The capital will be utilised for financing the Barauni and Gauhati refineries and the product pipe lines project.

The Central Road Transport Corporation Limited, New Delhi, proposed to be incorporated as a Central Government Undertaking, will be issuing capital of Rs. 50 lakhs divided into 50,000 equity shares of Rs. 100 each, 50 per cent of which would be issued for consideration other than cash and balance in cash. The money will be utilised for maintaining the movement of supplies in the States of Assam, Bihar etc.

Indian Oxygen Limited Calcutta, is to issue 7 per cent Fifteen Year Debenture Stock of the value of Rs. 125 lakhs in connection with the company's scheme of expansion at Bombay, Calcutta, Madras and Vishakhapatnam estimated to cost Rs. 610 lakhs.

LICENCES ISSUED

The following licences have been issued under the Industries (Development and Regulation) Act, 1951 — during the week ending 8th February, 1964. The list contains the names and addresses of the licensees, the articles of manufacture and the annual installed capacity.

IRON AND STEEL

J.B. Advani-Oerlikon Electrodes (P) Ltd., Radia House, 6, Rampart Row, Fort, Bombay-1 (Madras) — Electrode Core Wire 3600 tons. Telepole Manufacturing Co. Ltd., Jeevan Vihar, Parliament Street, New Delhi (Faridabad, Punjab) — Telescopic tubular poles 4,800 tons.

OTHER METALS

The Indian Aluminium Co. Ltd., UCO Bank Building, Parliament Street, New Delhi-1 (Alwaye, Kerala) — Aluminium rods 5,000 metric tons.

ELECTRIC EQUIPMENT

Gandhi Electric Industries (P) Ltd., 94, Medows Street, Fort, Bombay (Maharashtra) — Welding transformers 1,080 Nos.

X-RAY EQUIPMENT

Elpro International Ltd., 20, Graham Rd., Ballard Estate, Bombay-1 (Maharashtra) — Flouroscopic screens 600 Nos., Intensifying screens 2,640 pairs.

CONVEYING EQUIPMENT

Associated Cement Companies Ltd., 121, Queen's Road, Bombay (Mysore) — Electric overhead travelling cranes 1,200 tonnes.

MACHINE TOOLS

Coimbatore Pioneer Mills Ltd., P.O. Peelamedu, Coimbatore-4 (Nilambur, Coimbatore, Distt. Madras) — Geared head centre lathes 480 Nos.

DRUGS & PHARMACEUTICALS

Pfizer Pvt. Ltd., P.B. No. 10104. 163, Backbay Reclamation, Bombay-1 (Maharashtra) — Diadin tablets 1.2 million tablets, Diadin injection 12.000 litres. May & Baker Ltd., Bhandup, Bombay-78 (Maharashtra) — 'Lysivane' brand Ethopropazine 1,80,000, 'Intraval' sodium brand thiopentone sodium B.P. 4,80,000 ampoules. The Managing Director, Hindustan Antiobiotics Ltd., Pimpri (Poona) (Near Poona, Maharashtra) —Penicillin 24 mega million units.

COTTON TEXTILES

Mahalaxmi Fibres & Industries Ltd., 5, Synagogue Street, Calcutta-1 (Bihar) — Cotton yarn 13,000 spindles. Takhatpur Powerloom Weavers Co-operative Society Ltd., P.O. Baripada, Distt. Mayurbhanj, Orissa (Takhatpur, Orissa) — Cotton yarn 12,000 spindles. The Berhampur Powerloom Weavers Co-operative Society Ltd., Berhampur Distt. Ganjam, Orissa (Bernampur, Orissa) — Cotton yarn 12,000 spindles. Vishwa Bharti Spg. & Wvg. Co-operative Society Ltd., D-48, Gujarati Society, Nehru Road, Bombay (Bhiwandi Distt. Thana, Maharashtra) — Cotton yarn 25,000 spindles. Mahendra Mills Ltd., Ahmedabad-9 (Gujarat) — Cotton yarn 25,000 spindles. The Branch Manager, the M.P. Handloom Weaver's Central Co-operative Society Ltd., Gopalbag, Jabalpur, Proposed name: Madhya Pradesh State Handloom Weaver's Co-operative Spinning Mills Ltd., (Burhanpur, M.P.) — Cotton yarn 12,000 spindles. Akola Sahakari Girni Ltd., Chairman Central Co-operative Bank Ltd., Akola, Maharashtra (Akola, Maharashtra) — Cotton yarn 20,000 spindles. Shri L. G. Varadarajulu, Transport House, Karur (S. India), Proposed name: Standard Textiles (Private) Ltd., (Vedasandur, Madurai Distt., Madras) — Cotton yarn 12,000 spindles. Shrimathi Parvathi Ayunan, M.L.A., Palayakottai (via) Erode (S. India) (Thiruchirapally Distt., Madras) — Cotton yarn 12,000 spindles. Shri R. Natarajan, 3,-Sriramnagar South, Madras-18, Proposed name: Sri Nadiambal Textile Mills (Arenthangi, Thanjavur Distt. Madras) — Cotton Yarn 12,000 spindles. Shri B. Rajagopal Naidu M.L.A., Gudiyatham (North Arcot), Proposed name: Shri Lakshmi Saraswathi Textiles Ltd. (Arni, South Arcot Distt. Madras) — Cotton yarn 12,000 spindles. Lakshmi Mills Co. Ltd., Avanashi Road, Pappanaickenpalayam, Coimbatore-1, (Coimbatore, Madras) — Cotton yarn 25,000 spindles. Shri J. Thomos; Managing Director, A.V. Thoman & Co. (India) Ltd, 2/21, First Line Beach, Madras (Thuckalay, Kanyakumari Distt. Madras) — Cotton yarn 12,000 spindles. Shri S.K. Sundarantamier, 'Lavanya', Cathedral Post, Madras-6 (Sholingur, North Arcot Distt. Madras) — Cotton yarn 12,000 spindles. Shri A. Chokalingam Panayapathi, Jriehy Distt. (Chinnasalem, S. Arcot Distt. Madras) — Cotton yarn 12,000 spindles. Shri T.N.M. Arunachalam, 25, Dwarka Colony, Mylapore, Madras-1 (Sivaganga, Ramanathapuram Distt., Madras) — Cotton yarn 12,000 spindles. T.P.S. Hariram Saith, Mukkudal P.O. Tinnevelly Distt., Madras State, Proposed name: Sokkalal Cotton Mills (Alangulam, Tinnevelley Distt., Madras) Cotton yarn 12,000 spindles. Shri A. P. S. Ayyemperumal Nadar, Virudhunagar, Proposed name: Palaniandavar Textiles Ltd. (Sullakarai, Virudhunaugar, Madras) — Cotton yarn 12,000 spindles.

CHANGE IN NAMES (Owners or Undertakings)

During the week ending 8th February, 1964

(Pertaining to particular licences only)

From M/s. National Steel Strips (P) Ltd., Calcutta to M/s. Industrial Strips Ltd., Calcutta. From M/s. Gandhi Electric Industries Ltd., Bombay to M/s. Emco Elektra Private Ltd., Bombay. From M/s. Bogilal Laharchand Pvt. Ltd., Bombay to M/s. Batliboi & Co. Pvt. Ltd., Bombay. From M/s. Bengal Linn Ltd., Calcutta to M/s. Bengal Linn (Industrial Furnace) Ltd., Calcutta.

LICENCES REVOKED OR SURRENDERED

During the week ending 8th February, 1964

(Pertaining to particular licences only)

M/s. Bharat Ishpat Udyog Ltd., Calcutta — Forgings. M/s. Mahendra Electricals Ltd., Nadiad, W. Rly. — Cable Boxes and Associated Accessories and Paper and P.V.C. Insulated Control Cables up to 11 K.V. M/s. Electrical Manufacturing Co. Ltd., Calcutta — Capacitors. M/s. Laldee Private Ltd., Delhi — Bicycle Rims. Shri L. N. Shah, Bombay— Glass Manufacturing Machinery & Ceramic Machinery. M/s. Murarka Engineering Works, New Delhi — Industrial knives. M/s. The New Commercial Mills Co. Ltd., Ahmedabad — Cotton waste yarn.

		(80.96)	(61.89)	(38.27)	(35.06)†	(32.22)

Note: Figures in brackets represent per cent of rail movement to production (and imports) and are affected by the fact that while the production figures relate to the calendar years in respect of industrial commodities and to the respective crop years in respect of agricultural commodities, the figures of rail movements refer to the financial years commencing from April 1. The rail movements of certain commodities are also further affected by the duplication involved in the process of retail distribution, creation of reserve stock or dumps, carry-over stock, etc, as explained in para 9, page 10, of the March, 1962, Review.

¶ See the general note above. Out of 61.4 million tonnes of rail movement during 1962-3, 53.5 million tonnes originated from coal fields and the remaining quantity (7.9 million tonnes) of coal was booked from other points, viz., washeries, coastal ports after sea movement from Calcutta, coke oven plants, coal dumps, etc.

* Figures represent, besides imports, production of pig iron for foundries and finished steel only.

** Figures include fabrics manufactured in decentralised sector also.

† Revised from the figures shown in the February, 1963 Review.

†† Estimated as the figures of sugarcane were merged in these years with fruits and vegetables fresh.

‡ Estimated

£ Includes 'Iron ore'.

EASTERN ECONOMIST
Annual Number 1964

The Nation's leading economic weekly with the largest circulation in its class proudly presents in its latest Annual Number a stimulating discussion of the highly topical theme "THE BATTLE OF INDUSTRIAL PRODUCTION". It critically examines developments in major industries and relevant Government policies. Illustrated with colour-graphs, charts and statistical tables, this sumptuous Number is priced Rs 10|- per copy; available to subscribers of Eastern Economist without extra payment; Annual subscription Rs 65|-.

Enquiries and orders to our agents, leading book-sellers, or direct to our offices.

A whistle blows, it's a penalty...and referee Vaidya's decision is always correct!

On the field, he's an athletic, fast-moving figure. Watching the ball carefully. Keeping an eye out for infringements—fouls, off-sides. His decisions are never questioned, for Vaidya is respected by players and spectators alike. Not so long ago, he was a crack football player. He was chosen to represent India at the Olympics, but an accident kept him out. Today, he referees with skill, intelligence and good judgment... qualities which Vaidya brings to bear on his work as Technical Foreman at Burmah-Shell's Lub. Oil Blending Plant at Bombay.

'RECIPES' FOR OVER 300 LUBRICANTS

'Every engine and moving part,' says Vaidya, 'needs lubricating oil.' And it's Vaidya's job to supervise the blending of over 300 grades of lubricants. With the help of his colleagues, he ensures strict quality control in production so that the oils are on specification.

TODAY, AS EVER, PEOPLE LIKE VAIDYA ARE WORKING FOR YOU

'Work must be balanced by physical exercise and relaxation,' says Vaidya. 'That's why I play football and bridge.'

Vaidya and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work...working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

A Budget for Second Thoughts

A MULTI-PURPOSE rather than a purposive Central budget this. And like so many of our multi-purpose projects, it risks its performance disappointing its promise and its realizations falling short of its expectations. That the Finance Minister genuinely desires to stimulate the economy and that he believes that this budget would do this need not be doubted. Part A of his speech is replete with evidence on this score. Part B, however, is not all in the same breath. It would be churlish not to acknowledge the bouquet of fiscal blessings presented to the corporate sector, but the flowers have their thorns. The substitution of the super profits tax with a far more restrained surtax on companies is a distinct gain the value of which is immensely increased by the extensive preferential treatment granted to a number of selected industries and the consolidation or continuation of various tax advantages accruing to new companies, but the Finance Minister's professed concern for strengthening and stimulating the investment climate is not borne out by his decisions on the taxation of dividends and the capital gains in bonus shares.

It is indeed an odd idea to seek to enforce dividend restraint by taxing *all* dividend distribution; Mr. Krishnamachari should certainly be able to appreciate the reasonableness of introducing a reference to a datum line. In the case of bonus shares, the Finance Minister's proposal ignores the fact that the amount in the bonus shares is already twice taxed, first in terms of basic corporate taxation and again through the special tax on bonus shares. If the Finance Minister is keen on logical neatness, he may certainly treat the bonus element in bonus shares as capital gains, but, then, his concern for logical tidiness ought to persuade him to drop the tax on bonus shares. Otherwise the discouragement to investment in shares is bound to be considerable enough to offset a good part of the attractiveness of the other incentives which he has been at pains to provide for the capital market and the corporate sector.

The budgetary sensation of last February was the super profits tax. The sensation this year surely is the murderous onslaught on men of property. Where Mr. Morarji Desai had fired a blunderbuss, Mr. T. T. Krishnamachari has used a rifle with a telescopic sight. The Desai budget with its plethora of indiscriminate levies on all and sundry was mass killing on an epic scale. The present Finance Minister has decided in favour of well-directed genocide. Under the pretext of moderating the unearned advantages of inherited wealth and on the excuse of reducing economic inequalities, the Finance Minister has taxed the capital and consumption of the small number of the Big Rich to the point of rapid extinction. The Ancient Athenians — who knew better than all subsequent practitioners of the art of democratic government — understood and were afraid of the savagery inherent in the tyranny of the majority. The Finance Minister, crawling under the shadow of Bhubaneswar, has decided to dispose of a minority economic class as an expendable clutch of parasites. Others who might believe that this class has a positive role to play in the national economy as a catalyst of capital formation and business enterprise cannot but think that he has committed an error of judgment — or an act of passion — of a kind which even totalitarian economies, in their retrospective wisdom, are beginning to doubt the sense of. Here, of all places in the budget, there is need for saner second thoughts.

India Before Geneva

MR. MANUBHAI SHAH'S recent preview of the position that India will take up at the 123-nation conference on world trade due to begin on March 23 came none too soon — after due allowance has been made for the need of caution and reticence. In Africa the decade of the "wind of change" has been overtaken by squalls that blow fitfully, and expectations regarding higher standards of life are running high. In terms of principles we have a stake, too, in the issues that sway and inspire the Latin American peoples.

Now, first, to Mr. Shah's proposals outlined briefly in an interview to the Czech News Agency. He modestly announced his view that the forthcoming conference on world trade in Geneva was only "the first step" in the direction of the ideals it sought to achieve. He pointed out that the General Agreement on Trade and Tariffs arrived at in Ottawa in 1948 was "limited" and had not enlisted the participation of erstwhile nations-at-war and other countries which became free since. He emphasised that the principal problem was that of "the expansion of the exports of less developed countries". Of course, they also sought to trade more among themselves. Over 70 per cent of the world's peoples living in the less developed countries had benefited but little from the spectacular increases in world trade of recent times.

The Union Minister for International Trade then went on to enumerate, according to his concise order of priorities, the steps which he thought necessary to eliminate the factors obstructing the smooth and increased flow of international trade. The first of these was an agreement on fair prices for exporters of primary produce "with a built-in escalation clause", and these are to be secured either through "commodity agreements" or through the existing international "compensatory monetary system" designed to regulate such agreements. Perhaps it was just as well that he did not add that the commodity agreements — which incidentally lie outside the purview of GATT — themselves suffer from the bias which restricts the benefits of world trade to a privileged few. To say that they are available only for a short list of commodities which the well-to-do themselves produce or want badly may be a truism, but the hardship resulting from the commodities left out is certainly real. For instance, many of the developing countries do not have the foreign exchange necessary to operate, say, on the London Commodity Market with a view to stabilizing price levels. The resulting loss in terms of trade is by now too well-known to bear repetition. The transition from the first to the second list of commodities will require far more than a change of heart; it will require some re-orientation of attitude in the more prosperous among the 123 nations due to meet at the Conference.

India's second proposal is that all restrictions of a non-tariff character on primary produce of the underdeveloped nations seeking entry into the economies of the advanced countries should be removed. At present these quantitative restrictions apply variously to primary products, semi-processed goods and manufactures. Mr. Shah conceded, however, that any "specialized sector of the economy" in the advanced countries affected in consequence should be relieved by "bilateral or multilateral arrangements in respect of a few items". Also the internal duties levied on many of the commodities militated against increased world trade. The fact of the matter is that the tariff walls, which have been built up by the industrialised countries with a fervour reinforced by Marshallian energy, are inward-looking. It is true that the GATT ministerial conference of June 1963 generously offered to forgo any reciprocity in the scaling down of these tariffs which they held to be unilaterally desirable. (In any case, the backward countries could just not do without these nominal tariffs which provided protection to their nascent industries and were moreover revenue-yielding). Mr. Shah, however, was quick to point out that there, in fact, existed a reciprocity if only the GATT countries would take a long-range view and look for it.

"The industrialized countries are not only highly industrialized but are also automatized", he said. The high degree of automatization that has been gradually introduced in the Western European and American economies after the war renders the familiar argument based on cheap labour invalid. The knocking down of these walls was the condition of increased world trade, since it is only in the measure that the export earnings of the primary producers increased could they provide progressively expanding markets for the leading nations of the industrialized West. Mr. Shah proposed that either GATT should be so reformed and enlarged that it can bring about these results or that a more representative and new international trade organization should be formed for the purpose, the latter not only to implement but to "sustain" these measures over a long period of time.

Asked under "what conditions" international trade became effective for the participants, Mr. Shah replied with a maxim: "Poverty anywhere is a menace for prosperity everywhere"; peace was the condition of progress. The first guiding principle was the restoration of the "balance in favour of the less developed countries". The international division of labour, which Mr. Shah held to be desirable, must, however, he added, be tempered by a regard for "the conditions and stages of development". The more industrialized countries should open their markets from developing nations who must thereby be permitted to build up their less capital-intensive industries. They must also be enabled to increase their earnings from exports which should in increasing measure be of semi-processed goods or end-products rather than raw materials. This is how international trade is linked to the development of backward economies. Such a policy need not be based on altruism for it would simultaneously enable the industrial nations to attain regions of "higher technologies".

Other proposals made in this regard by Dr. Raul Prebrisch who has been described as a "brilliant Argentinian economist" had much airing in the international Press before they were published on February 15 in the form of a UN report. Also, a French proposal, not yet circulated among member countries, has nevertheless been widely known and discussed. They are both characterized by a bold and other-regarding imagination.

The report prepared by the Argentinian Secretary General of this 123-nation World Conference on Trade and Development, which is being called under UN auspices in accordance with a resolution tabled by Soviet Russia many years ago, dwells on, firstly, as to why it is desirable to go beyond the General Agreement on Tariffs and Trade. The conviction, Dr. Prebrisch says, grew on him that "some kind of trade organization was needed" and that "practical action in the field of trade and development was the primary responsibility facing the United Nations in this decade". Western countries are, however, believed to be "cool towards the proposal". Dr. Prebrisch's reasons for concluding that it was necessary to go beyond GATT were that (a) the organization was not universal, having only 61 full and 13 associate members and excluding, as it does, most of the Communist countries; (b) it dealt with, in a fragmentary, if satisfactory manner, problems of international trade as between industrial nations but was not concerned with the trade of developing countries among themselves or that between them and the industrial nations; and (c) the problem of development must be tackled in general terms "on various fronts with clearly defined objectives".

He has suggested that the Conference should further consider commodity agreements, compensatory financing, re-adjustment of external debt, differences between developing nations, etc. While offering a solution, he argues that if preferences were worth introducing at all, "they should be clearly adequate in relation to the magnitude of the problem". Free entry would, of course, be the best solution. Failing that, they should get the same terms that obtain as between themselves.

While the developing nations will probably subscribe to much of what Dr. Prebrisch has said, there is a danger—points out the London *Economist* — that the GATT nations might treat this as a Conference merely of developing nations and retreat from this impracticable Havana idealism into their own cosy and exclusive organisation. Besides, asks the *Economist*, what is to be the relation between "independently influential organization like the World Bank and the IMF" and any compensatory mechanism that this Conference on world trade might set up? Perhaps the article by the UK High Commissioner in India which we publish elsewhere in this issue and in which H.E. Sir Paul Gore-Booth has attempted to emphasize the positive and constructive content in Britain's attitudes to the greater flow of trade across the world in general and between industrially advanced countries on the one hand and developing countries on the other may provide a corrective to fears such as those the *Economist* has aired.

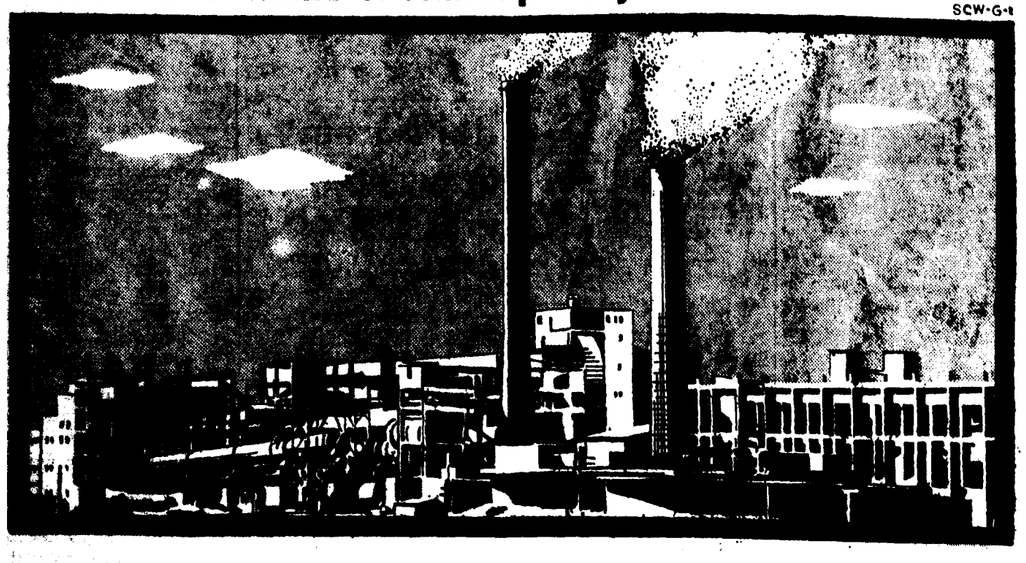
Eastern Economist 20 Years Ago

MARCH 3, 1944

India's fifth war budget which Sir Jeremy Raisman presented on Tuesday last is unsensational. To an anxious public which had somehow or other been prepared for all sorts of drastic measures in the name of anti-inflation, it came with some measure of surprise. There were two notable reasons for this. In the first place explicit recognition is given to the first principle of war finance which informed opinion in this country has incessantly demanded, viz., that a further substantial increase in the demands on India's resources "would impose a severe burden on her economy which has already shown distinct signs of overstrain and might even lead to a serious breakdown." How far this theoretical recognition is followed up in actual implementation, the events of the coming year will more than show. But past experience belies any sanguine expectations. Meanwhile, official acceptance of the principle is a distinct triumph for public opinion in this country. In the second place, the tax proposals, onerous as they are coming on the top of the increased burden which the country has been carrying in the last three years, are nevertheless modest. From a Government which only a week before came forward with the atrocious proposal to impose a 25 per cent tax on travel in the name of anti-inflation, any indiscriminate series of levies might have been quite well expected. Fortunately, the impositions are far less sweeping than what might have come from a Government with its present record of antipathy to public opinion and indifferece to fiscal canons.

SATNA CEMENT WORKS forges ahead... steps up production from 750 tonnes to 1750 tonnes of cement per day

Started in 1959 with an initial output of 750 tonnes per day, the Works undertook an ambitious programme of expansion and has now been geared to produce 1750 tonnes of cement per day to meet the growing needs of the nation.



Khajuraho—symbol of the finest in Indian temple architecture, is also our trade name and signifies cement of the highest quality. That we are now able to produce per day 1000 tonnes more of this quality product is a matter of pride to us... and rightly so.

STATESMANSHIP Vs. BRINKMANSHIP

IF INDIA would that Time solve the Kashmir dispute, Pakistan seems to be determined to deny Time a chance. Rawalpindi's frequent badgering of the Security Council, it is clear, is not motivated by anything like an absolute faith in diplomacy. President Ayub and his advisers are evidently equally willing to try other means. The Keran episode in which an Indian police patrol party was ambushed near the ceasefire line in Kashmir is only one of the more outrageous acts in what appears to be a planned programme of provoking incidents. It is significant that Pakistani provocation has not been confined to the Kashmir region but has also been active along the Assam border. This shows that the Ayub Government is committing itself to a deliberate policy of creating tension in the relations between the two countries and maintaining a state of active hostility. This attitude becomes all the more sinister when considered in the context of the stagy fraternization in which Premier Chou En-lai and President Ayub are currently engaging themselves for the benefit of a world audience.

Face Facts

In the course of a statement on the Keran incident which he made in the Rajya Sabha on February 26, the Defence Minister assured the House that, while the Government of India was alive to possibilities of further Pakistani mischief, it was fully satisfied that our Defence forces along the ceasefire line were well prepared to face any concerted military action by Pakistan. While it is true that the first purpose of the Government of India should be to think in terms of military security in the threatened areas, it cannot be denied surely that, in the light of the Ayub Government's avowed and established purpose of keeping alive the Kashmir issue — if necessary by practising brinkmanship — it is very desirable that we, on our part, should be able to think in terms more positive than that of masterly inactivity in securing a settlement of the Kashmir dispute. Defence preparedness against Pakistan's aggressive proclivities could only be a part of the answer. The trend of proceedings of the Security Council, when it recently considered the Kashmir dispute, surely pointed to the fact that opinion in that world body was clearly in favour of this country adopting a more positive approach to a resolution of its differences with Pakistan over Kashmir. That this point of view cannot be to our liking is true enough. That its justice or soundness could be disputed is evident enough. All the same what ought to matter to us really is that we have just not been able to carry world opinion with us in our contention that Pakistan being the aggressor in Kashmir cannot claim to have any right to question that State's accession to the Indian Union. This being the case, it seems to us that Government of India would do well to seek an end to a state of affairs which is doing no good to either country, by taking steps to reopen the negotiations. It could be said, of course, that Pakistan had not shown any inclination in the past for a settlement based on negotiated modifications to the ceasefire line. That is true enough, but the only way to make Pakistan budge from its intransigent position is to bring diplomatic pressure to bear on it through the United States and Britain. Once we decide that this is the best means of finding a way out of the impasse, it ought not to be difficult for us to work out in consultation with these and other friendly countries the basis of a new approach which the Government of Pakistan would not be in a position easily to spurn or sabotage. At the moment there is justifiable resentment in this country towards the U.K. and the United States for their partisan advocacy of Pakistan's case in the Security Council. But it would be unwise to let this anger blind us to the fact that the undeniable interest which those two countries are taking in the restoration of normal relations between Pakistan and ourselves could be a valuable diplomatic asset to us once we succeed in putting forward positive proposals which could convince them that our interest is not by any means less genuine.

Take the Initiative

Seen from this angle, Mr. M. C. Chagla's otherwise admirable statement in Parliament on February 24 on the work of the Indian delegation to the U.N., seems to fall short of the needs of the situation. It may be that we have succeeded, as Mr. Chagla claimed, in laying once and for all the ghost of a plebiscite in Kashmir. But the fact remains that the growing Peking-Pindi conspiracy and collaboration against the security of this country does present us with a problem which we cannot safely refuse to deal with, and since we cannot, for obvious reasons, think in terms of a military initiative, we ought to be able to apply our mind to the possibilities of a diplomatic initiative. Our position in this respect has fortunately been strengthened by the demonstrated loyalty of the people of Kashmir in recent weeks to the Indian Union and their clear desire for closer integration. Here, Mr. Lal Bahadur's exertions of the last few days in the matter of reorganizing the Government of Jammu and Kashmir so that it may be able to command wider and more positive support from the people have been most timely and useful. While it may be true that Kashmir is not the only part of India or, indeed, of the world which could do with a better administration, its peculiar placement in the pattern of Indo-Pakistani relations has certainly made it desirable that every effort should be made to fashion its Government in a way which commands the respect and confidence of the people of Jammu and Kashmir. Mr. Lal Bahadur's success in this direction should be a prelude to a more positive and pragmatic policy on the part of the Government of India towards the Kashmir issue. To leave the initiative in this matter to Pakistan could well be dangerous to peace and progress in the sub-continent since Pakistan has lately shown that it is liable to exercise this initiative in a destructive — and possibly disastrous — manner.

BETTER LATE THAN NEVER

FOR THE first time since nationalisation, the Life Insurance Corporation has stepped up the rates of bonuses. The bonuses declared at the fourth valuation are higher than at any of the preceding valuations. The bonus on life insurance policies issued by the Corporation has been increased from Rs. 16 per thousand per annum declared for the two-year period ended December, 1961, to Rs. 17.50 per annum per thousand. In the case of endowment assurance policies, the bonus rate has been enhanced from Rs. 12.80 per thousand to Rs. 14 per thousand. A proportionate increase in bonuses of erstwhile insurers has also been declared. The increment in the bonus rates has been made possible by the increased profit earned by the Corporation. The inter-valuation period for the first time was for 15 months from January 1, 1962 to March 31, 1963. It consisted of two periods of three months each in which the earned surplus was negligible and only one period of nine months in the middle in which the earned surplus was concentrated. Because of the uneven character of the life insurance business, the premium income was "greatly concentrated" in the closing months of the year; the earned surplus under such conditions was practically negligible during the first three months of the year and was mainly concentrated in the last nine months.

While the increase in bonus rates is to be welcomed, there was perhaps greater justification for such a decision when the results of the third valuation were announced than at present. For, the third valuation of the assets and liabilities of

the L.I.C. had recorded even more satisfactory results — the same favourable mortality experience as now, but a higher average net rate interest and a lower renewal expense ratio. The results of the fourth valuation, on the other hand, show that, whereas there was no change in mortality experience, the average net rate of interest during the inter-valuation period was fractionally lower, being 4.08 per cent, as against 4.14 per cent during the previous valuation, and the renewal expense ratio was somewhat higher than for the preceding valuation period, being 14.13 per cent as against 12.42 per cent. Of course, in their report, the actuaries have explained the reasons for both the lower interest rate and the higher expense ratio, but, in the absence of strictly comparable data by reason of the variation in the valuation periods, these have to be accepted at their face value. As regards mortality basis, the fear expressed in this journal in December, 1962, that at least for the next two valuations, the L.I.C. might not have in hand the results of its detailed investigation into the mortality experience during 1961-64 seems to have been justified. For the latest valuation also the same mortality basis as was employed in respect of the third valuation has been used and it is stated that, before making any change, the L.I.C. "would like to wait till the results of the detailed mortality investigation for the period 1961-64 become available". It is, however, comforting to note that the Corporation has already taken the investigation in hand.

A comparison of the four valuation results shows that the number of policies has increased from 5.68 million policies assuring Rs. 1,472.81 crores at the first valuation, to 6.93 million policies assuring Rs. 1,997.15 crores at the second valuation, to 8.58 million policies assuring Rs. 2,738.92 crores at the third valuation and to 9.5 million policies assuring Rs. 3,160.69 crores now. Similarly, there has been an improvement in the surplus available for distribution, if one proceeds on the basis of the average for the latest 15-month valuation period and that for the different periods of previous valuations. Notwithstanding this and despite the prospects for a further rise in life insurance business being reasonably bright, it is a moot point whether the return to participating policyholders, as well as to the Government of India, will continue to maintain the same upward trend as heretofore, what with the threat of a further sharp rise in the expense ratio and the relatively uncertain outlook for surpluses in the years to come.

THE UNCOVERED GAP

THE PUNJAB budget for 1964-65 showed an over-all deficit of Rs. 1.58 crores. The Finance Minister, Dr. Gopichand Bhargava, indicated in his budget speech that the gap was likely to increase to about Rs. 11 crores as the Government had plans to provide additional funds for tackling the problem of floods and for the promotion of agriculture including reclamation, horticulture, animal husbandry and industries.

The revenue receipts for 1964-65 were estimated at Rs. 113.67 crores as against the revenue expenditure at Rs. 112.91 crores, revealing a deficit of Rs. 24 lakhs only. The revenue and capital budgets together indicated a surplus of Rs. 3.42 crores, but this figure took into account the sum of Rs. 3.66 crores from the measures under the Temporary Taxation Act, 1962, which had been earmarked for the betterment of scheduled castes. The Government had plans to add another sum of Rs. 1.14 crores to this fund, thus, raising it to Rs. 5 crores. The net result of these additions and subtractions will be that the State will have a deficit of Rs. 1.58 crores. This gap had been left uncovered by the Finance Minister because he hoped that he would be able to borrow a substantial amount from the people, especially for flood control schemes. No fresh taxes have been proposed in the budget.

It has been decided to make an ad hoc increase of Rs. 5 in dearness allowance admissible to all Class IV employees, excepting sweepers, so as to ensure a minimum salary of Rs. 70 per month. The Finance Minister also indicated that the Government intended to raise the minimum wage steadily to Rs. 100 per month and it would consider the question of an increase in emoluments in a suitable form during the year under review. An increase of 12.5 per cent in compensatory allowance in the hilly areas and 10 per cent in the Mahindergarh district has been provided for employees drawing a salary not exceeding Rs. 850 per month with the objective of attracting the right type of personnel in these areas. The Finance Minister also stated that the Government was paying greater attention to the development of hilly areas; the plan outlay for the hilly areas for 1964-65 was Rs. 540 lakhs. For roads and communications alone Rs. 68 lakhs had been provided in the current year and Rs. 86 lakhs in the next year.

Discussing the trend of rising prices of essential commodities in the State, the Finance Minister said that the Government had constituted a committee in order to restrict the margin of profit at wholesale and retail levels. He, however, held out the threat that, if the prices of foodgrains did not come down, the Government would not hesitate to resort to State trading. It was the policy of the Punjab Government to raise the incomes of the lowest strata in society to about double the current level and it had set the goal of achieving this target within the next five to seven years. For this purpose the Government had been concentrating its efforts on agriculture and allied occupations. This broad objective, according to the Finance Minister, could be achieved provided agricultural production in the State was doubled. The floods in the Punjab had caused extensive damage despite the fact that the State had already spent about Rs. 21 crores on flood control. He estimated that an almost equivalent amount might have to be spent during the next two years on essential schemes of flood control.

NATIONAL INCOME

THE LATEST estimates of national income of India released by the Central Statistical Organization, indicate that the increases in national income and per capita income in real terms were 5.0 per cent and 0.5 per cent respectively during the first two years of the third five-year Plan. The mid-term appraisal of the Plan, which was discussed in the Lok Sabha in the last session, and is currently being debated in the Rajya Sabha, also dilated upon the same stagnation in levels of living. The third five-year Plan had envisaged a rise of more than 5 per cent in national income in each one of the five years of the Plan, whereas the actual achievement has been at half that rate. In other words, the improvement in the living standards of the people in the first two years of the Plan was almost negligible at 0.5 per cent, if the increase in per capita income can be taken as an indicator. The latest estimates for 1962-63, which are still tentative and preliminary, place India's national income (at 1948-49 prices) at Rs. 13,370 crores as against Rs. 13,060 crores in 1961-62 and Rs. 12,730 crores in 1960-61. Per capita income (again at 1948-49 prices) was estimated at Rs. 294.7 in 1962-63, Rs. 294.3 in 1961-62 and Rs. 293.2 in 1960-61. In view of the high margins of error which are associated with these estimates, the small changes in the year to year figures do not carry any significance. All the three years have seen an almost freezing of the per capita income at the level of Rs. 294, implying that the unforeseen influences in Indian agriculture have wiped out whatever gains were made in the secondary and the tertiary sectors of the economy. Since 1950-51, India's national income has increased by 51.1 per cent and per capita income by 19.1 per cent, both at constant 1948-49 prices. How these increases in income have got distributed, has been investigated by a special committee — popularly known as the Mahalanobis Committee — which, it is reported, has already submitted the first part of its findings to the Prime Minister, who is the Chairman of the Planning Commission.

Lengthening Shadows of Stagnation

By Our Parliamentary Correspondent

NEW DELHI: Tuesday.

A MAJOR departure was made this week in presenting the economic survey ahead of the budget papers instead of distributing it along with the budget. The Finance Minister, Mr. T. T. Krishnamachari, has taken a realistic view in releasing the economic survey earlier so as to give an opportunity to the members of the Lok Sabha and the Rajya Sabha to make a thorough study of the economic trends for the preceding year and make their constructive suggestions after careful thought.

To a certain extent, it is correct to say that the economic survey has not covered any new ground. The marathon debate that Parliament had on the appraisal of the third Plan had touched upon almost all the aspects in the Indian economy. The sluggish rate of growth of the economy had come in for severe criticism and the economic survey also has, once again, put stress on the acceleration of the pace of the economy. Giving an indication of the outlook for the coming year, the survey has rightly pointed out that "the acceleration of economic growth must be achieved in an environment of reasonable stability of prices if the level of living at the most vulnerable points in the society is to be protected". Already there were disconcerting reports from various parts of the country that against earlier optimistic forecasts of a bumper crop in 1963-64, the latest reports were not very encouraging. The rabi crop of wheat in Northern India seems to have suffered because of the cold spell and for want of winter rain, while rice prices in the Southern States have also moved upward indicating that the output has not been as high as it had been expected. If the overall production of foodgrains in 1963-64 should remain around or below 80 million tonnes, it will be the third stagnant year in succession. The imports of wheat and rice under PL 480 will, no doubt, mitigate the misery of the people to some extent, but the rising expenditure on development and defence will not fail to impinge heavily on the price line.

The Railway Budget

The general discussion on the Railway Budget in the Lok Sabha brought home the truth that the budget after all was not so colourless as had been imagined by some of the commentators who had rushed to pen their stories after a rapid reading of the budget papers. The debate in the Lok Sabha brought into sharp focus some of the major failings of the railways such as over-crowding, late running of trains, pilferage, defective catering services and unhelpful attitude of the railway authorities. Mr. Hem Raj (Kangra) whose speech was highly critical and who, as is the custom, ended meekly (being a Congressman) with the words "I support the Railway Budget" did great service to the Indian Railways by pointing out that the rosy picture presented by the Railway Minister was not supported by the audit report. The Railway Minister had stated that "the thefts of booked consignments as well as of carriage and wagon fittings and other railway material from yards, workshops, stores and loco-sheds have been controlled". Mr. Hem Raj, quoting from the audit report, said the "compensation on claims on account of loss due to pilferage of goods and perishables have been increasing on the railways during the last four years". The figures cited in the report showed that the percentage of pilferage was 6.41 in 1959-60 but had risen to 6.75 per cent by 1962-63. Again, he gave a humanistic touch to the debate when he said that the three-tier sleeper coach was highly inconvenient for the passengers. In the lower-tier whenever a person tried to get up, he had to be cautious to put his head in the correct position, otherwise there was a danger of his head getting a severe knock. He was right when he said that the three-tier seats were "nothing less than rigorous imprisonment" and there was need for converting them into two-tier coaches in the larger interest of the third-class passengers who were responsible for the bulk of the railway passenger revenue.

Taking up the case of the small collieries, Mr. A. S. Alva said that complaints had been received that the collieries were not notified about the allotment of wagons and the allotted time was insufficient. They were supposed to load the wagons in five hours while very often there was no intimation regarding their time of availability. If they did not load within the allotted brief time, they had to pay heavy demurrages. These grievances of the collieries, he said, required immediate redress. He also drew attention to the railway sidings which are not sufficiently strong. The catering department of the railways came in for severe criticism from many members and it was felt that the passengers did not get their money's worth.

A hard-hitting and pungent speech by Mr. U. M. Trivedi exposed the various ills from which the Indian Railways suffer. He gave a number of instances of inefficiency, corruption, mal-administration and wastage. Two of these deserve a special mention here. According to the latest railway report, 5,984 persons were killed every year by railway accidents. Mr. Kashi Ram Gupta was kind enough to promptly re-translate these figures into casualties per day which came to as high as 20 (excluding the holidays!) This daily loss of life created a lot of resentment amongst the members. Mr. Trivedi's reference to the first report (Third Lok Sabha) of the Public Accounts Committee also evoked great interest. He read out the following excerpt from the report:

> "A siding at Halisahar was being used from 1947 for stabling condemned wagons in dispute with Pakistan Government and the special surveys conducted in 1963-57 revealed that 3,930 feet of railway track with fittings valued at Rs. 28,000 had been stolen. In addition, component parts of the wagons stabled on the siding valued at Rs. 1.56 lakhs were stolen between 1950 and 1957".

The manner in which the assets of the railways are frittered away through negligence is, indeed, exasperating. This is only one of the many similar cases. Mr. Trivedi also recalled the well-known case of 40 wagons which had been removed by Pakistan in 1947 from Jammu (Tawi) which were lying on our side of the border. The debate illustrated the point that while all Railway Ministers are anxious to raise additional revenue by enhancing the fare or freight rates, they tend to ignore certain essentials in management which can make all further imposts almost unnecessary.

Question Hour

Bank Nationalisation: Intervening during the Question Hour in the Rajya Sabha on February 18, the Union Minister without Portfolio, Mr. Lal Bahadur Shastri, reiterated that it was not advisable to nationalise banks at this stage. He said, "We do not say it is a question which could not be considered. The only point is if we can take other steps to control banks and regulate them, we should do it". Among the steps taken by the Finance Ministry in this regard, Mr. Shastri listed the powers to control and regulate the appointment of directors and executive officers of banks. The Prime Minister, Mr. Nehru also intervened and stated that the Indian Ambassador in Washington, Mr. B. K. Nehru, had not sent any message or report on the likely reaction of the United

States to the proposal for nationalisation of banks.

Postponement of Projects to Fourth Plan: The Union Minister for Finance, Mr. T. T. Krishnamachari, told the Lok Sabha last week that the postponement of any project from the third Plan to the fourth one had not been the result of lack of internal resources. Whenever a project was postponed, it was due to reasons or circumstances beyond the control of the Government. The Deputy Minister for Planning, Mr. C. R. Pattabhiraman stated that it was likely that some third Plan projects might not get a real start by 1965-66. These included the Organic Intermediates Plant (Panvel), Phyto Chemical Plant (Kerala), Basic Refractory Project (Bhilai), Heavy Structural Works and Heavy Plate and Vessel Works (Wardha), Precision Instruments Project (Kerala), Ball and Roller Bearing Project, Heavy Compressor and Pump Project, and Marine Diesel Engine Factory. The reason for delay in the implementation of these schemes, he said, was that their preliminary stages had taken more time than anticipated. Mr. Pattabhiraman added that nothing had been so far done in regard to the proposed second Heavy Structural Works and the second Heavy Plate and Vessels Works.

Stock Exchanges and Unit Trusts: Mr. T. T. Krishnamachari revealed in the Lok Sabha that the Government did not favour stock exchanges contributing to the initial capital of the Unit Trust of India. In a written answer, he stated that a representation had been received from the Calcutta Stock Exchange suggesting that the recognized stock exchanges in the country should be included among the contributors to the initial capital of the Unit Trust. The suggestion was examined and it was decided not to accept it.

Foreign Exchange Rules: The Deputy Minister for Finance, Mrs. Tarakeshwari Sinha, ruled out in the Lok Sabha any relaxation of measures imposed last year to conserve foreign exchange. The apparent improvement in foreign exchange reserves compared to the position a year ago, she pointed out, had to be judged in the light of the country's obligations abroad. Foreign exchange reserves, excluding gold held by the Reserve Bank, amounted to Rs. 182.67 crores on February 14 this year, as against Rs. 147.81 crores on February 15, 1963. The obligations in respect of principal repayments and interest due during the 12-month period following February 14 this year, were of the order of approximately Rs. 50 crores more than during the 12-month period following February 15, 1963.

Income-Tax Assessments: The Minister for Finance disclosed in the Rajya Sabha that the total number of individual assessees for income-tax, super-tax and surcharge had increased from 4,99,621 in the first year of the second Plan to 9,40,246 in the first year of the third Plan.

Coal Exports: The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, disclosed in the Lok Sabha that, keeping in view the increased production of coal and necessity to earn foreign exchange, the Government of India had decided to increase exports of coal. It was to export during the next financial year 1.6 million tonnes of coal (40 per cent Sel. "B" and 60 per cent grade one) to Pakistan and 30,000 tonnes to Japan. Another 2.66 million tonnes of coal had been offered for export to Burma during 1964-65. Exchange earnings from coal exports to Pakistan and Japan were estimated at Rs. 5.4 crores and Rs. 15.95 lakhs, respectively. If exports to Burma materialised, they would bring in about Rs. 2 crores in foreign exchange. No formal demands for coal had been yet received from Nepal. Nepal, however, had not to pay for Indian coal in foreign exchange.

Tractors: Mr. Subramaniam also told the Lok Sabha that it had been programmed to produce about 40,000 to 50,000 small tractors per annum. This was on the basis of the estimate of demands made recently by the Union Food and Agriculture Ministry. Mr. P. C. Sethi, Deputy Minister in the Ministry of Steel, Mines and Heavy Engineering, said that two firms had already been licensed for the manufacture of small tractors and power tillers up to about 27,000 numbers per annum. He added that three more schemes had also been approved in principle. The question of licensing additional capacity was under consideration.

Printing Machinery: It was stated by Mr. Subramaniam in the Lok Sabha that nine new schemes, with a production capacity of about Rs. 5.9 crores per annum had been approved for the manufacture of printing machinery. This was in addition to the existing installed capacity in terms of value for about Rs. 84 lakhs a year. The Government has decided to set up a standing panel for this industry, with representatives of industry, Government and technical experts on it, so that development in this line may be accelerated.

Aircraft Manufacture: The Minister for Defence Production, Mr. Raghuramaiah, stated in the Lok Sabha that the HF 24 Supersonic Fighter Aircraft being developed at Bangalore would soon go into squadron service. The aircraft was undergoing various tests and the Orpheus engine was being developed. On MIGs manufacture, Mr. Raghuramaiah said that it would be difficult to anticipate by which date the whole MIG complex would be ready. He was not aware of any perceptible or avoidable delay in the execution of the project. The project, he added, was divided into three parts —the airframes would be manufactured at Nasik, engines at Koraput and the electronic equipment at Hyderabad. It was not unusual for the engines to be manufactured at one place and the airframes at another. The project reports had been received and were under the examination of the Government. The civil works at the Nasik factory had already begun. Mr. Raghuramaiah did not agree that MIGs proposed to be manufactured in India would become obsolete by the time production was started. "As we manufacture, we will also incorporate the necessary modifications", he pointed out.

Ordnance Production: Mr. Raghuramaiah also disclosed in the Lok Sabha that trial production at the proposed ordnance factory in Maharashtra would start before the end of 1964 and bulk production in 1965. A substantial portion of the plant and machinery for this project was being financed by the United States as part of its aid programme. It was expected to arrive before the end of June next. Assistance from the UK had been secured for meeting part of the expenditure on another ordnance factory proposed to be set up. Procurement of plant and machinery from abroad was proposed for four more ordnance factories and for the modernisation of the existing ones as and when felt necessary and available.

Panvel Chemical Plant: The Minister for Petroleum and Chemicals, Mr. O. V. Alagesan, disclosed in the Lok Sabha that the production programme of the chemical factory proposed to be set up at Panvel, was being revised in the light of the report submitted by the technical committee of experts. The tenders for the caustic soda, chlorine, sulphuric acid, nitric acid, inert gases, steam and refrigeration units had been received and were under examination. The final decision on them would be taken when the availability of foreign exchange was known. The land for the factory and its services had been acquired and the general lay-out for the factory buildings settled. Plans and design for organic buildings were in an advanced stage of preparation in consultation with the collaborators.

Free Trade Zone: The Minister for Industry, Mr. Nityanand Kanungo, stated in the Lok Sabha that the Kandla Free Trade Zone was expected to start functioning partly by about the middle of next year. The first exports from the Zone would be expected to begin during the second half of 1965. The types of industries to be set up here would be decided after a scrutiny had been made of the applications now being invited. The details of the various potential industries were being worked out. The execution of the development works would start in April next.

Export Trade: India's deficit trade balance showed an improvement in 1963 as a result of increase in exports and decline in imports. This was stated in the Lok Sabha by the Minister for Industry, Mr. Nityanand Kanungo. Exports during 1963 at Rs. 791 crores showed an increase of Rs. 104 crores over the previous year. The trade deficit was reduced from Rs. 439 crores in 1962 to Rs. 296 crores in 1963.

Santa Cruz Airport: The Deputy Minister for Transport, Mr. Ahmed Mohiuddin, stated in the Rajya Sabha that new navigational aids were being installed at the Santa Cruz airport at Bombay. A precision approach radar had been obtained and would be installed by the end of this year. An air-route surveillance radar was proposed to be put up before the end of the third Plan. A new instrument landing system was planned for the runway under the fourth Plan. The International Wing of the terminal building at this airport was being airconditioned for the comfort of passengers.

Cochin Shipyard: The Minister for Shipping, Mr. Raj Bahadur, informed the Lok Sabha that the next round of talks between the Union Government and the Mitsubishi Company of Japan on the construction of the Cochin Shipyard would begin in Tokyo in the first week of April. He was hopeful that these talks would result in an agreement with the Japanese concern.

Mr. Raj Bahadur gave the following information on shipping in the two Houses of Parliament:

Mechanization of Ports: The existing mechanized cargo handling facilities at the ports in India, such as fork lifts, tractors, mobile cranes and jitney motors, are being augmented according to requirements. The possibilities of providing modernized bulk handling equipment are considered from time to time.

New Ships: The Shipping Corporation of India has placed orders for the construction of four 13,400-ton coal carriers with a Yugoslav shipyard. The Government has also permitted a private shipping company to enter into an agreement with a Belgian shipyard for the construction and supply of one coal carrier.

Additional Steamer: Arrangements have been finalised for engaging an additional steamer for lifting the UK bound cargo of about 5,000 tons for which shortage of shipping space had been reported. Arrangements have also been made to avoid shortage of shipping space in Bombay and Saurashtra ports.

Damage to Food Crops: The Minister of State for Food, Mr. A. M. Thomas, informed the Lok Sabha that there had been extensive damage to rabi crops in several districts of Punjab, U.P., Delhi, Rajasthan and Madhya Pradesh. It had not been possible as yet to make a quantitative estimate of the damage caused.

The Minister for Food and Agriculture, Mr. Swaran Singh, informed the House that larger imports under PL 480 were contemplated this year. These would help in meeting the situation caused by the damage to rabi crops. Mr. Thomas added that the decision on the extension of the PL 480 Agreement of May, 1960, by one year beyond June, 1964, was expected to be taken in the next few months. This would enable all the shipments of wheat under this agreement to be completed. So far, 9.44 million tonnes of wheat and 737,600 tonnes of rice had been imported under this agreement out of the total provision of 16 million tonnes of wheat and one million tonnes of rice. The total value of the wheat imported so far amounted to Rs. 348.67 crores and that of rice to Rs. 51.61 crores.

The following other information was provided in the two Houses of Parliament:

Bonus Issue: The Bonus Commission's Report has been circulated to various Union Ministries and the State Governments for their comments. The Government would give further thought to this matter after these comments are available.

Provident Fund: The Union Government is considering the question of extending the enhanced rate of Provident Fund to twelve more industries. These are: tea (other than plantations in Assam), coffee, rubber, pepper, iron-ore mines, manganese mines, limestone mines, gold mines, industrial and power alcohol industry, asbestos cement sheets industry and coffee curing establishments.

Wage Board for Textiles: A second Wage Board for the Textile Industry is likely to be announced within the next couple of months. The terms of reference and the composition of this Wage Board are being finalized.

Outlays for Agriculture: The outlay approved for various agricultural programmes for the next year is of the order of Rs. 146.7 crores, as against the finally approved outlay of Rs. 127.5 crores for 1963-64.

Family Planning: The Government has under consideration a proposal to manufacture family planning accessories in the public sector. Licences have been issued to the private sector manufacturers for the production of 92.55 million numbers of rubber contraceptives per annum. Three more schemes have also been approved with a combined annual capacity of 242.98 million pieces of rubber contraceptives, 41.4 million foam tablet and 0.48 million tubes of contraceptive jellies and pastes.

Cowdung Gas: A small plant of about 60 c.ft. capacity, costing about Rs. 350, has been designed for producing cowdung gas. It is currently under test by the Village and Khadi Industries Commission.

Transmitters: The Union Government is considering purchase of two transmitters of 400 KW each from Czechoslovakia to counteract Chinese propaganda.

"PINDI-CHINI BHAI BHAI!"

How to Expand World Trade

H. E. Sir PAUL GORE-BOOTH
(U.K. High Commissioner in India)

PRACTICAL success over the years is a good test of policies and philosophies. At any rate the representative of a country which has built up, through skill and enterprise, an export trade of over Rs. 5,000 crores a year, approaches in what I might call an ambitiously pragmatic spirit, the great economic challenge of today — how to expand world trade as fast as possible with benefit to all and unfair advantage to none. Trade flows in the first instance from enterprise. Enterprise proceeds from individuals and groups who are prepared not only to take risks to get rewards but to build up the very special expertise of selling abroad which is the product of local research, long experience and much hard work. How are the reserves of manufacturing and commercial skill and talent in every country to be encouraged and developed and harnessed for the good of the international community?

Nursing a National Economy

When this question was posed in Britain in national terms at the beginning of the Industrial Revolution, there developed what seemed to be the obvious answer, "Laissez faire" — give free play to demand and supply, and the things which people genuinely want will be supplied with the greatest efficiency by those most able to make and sell them.

"Laissez faire" had, strictly economically speaking, certain advantages. It recognised the fundamental point that, if wealth is not allowed to come into existence, there will be nothing to share out anyway. However, serious defects began to show themselves. The check of competition on unrestricted private enterprise could be frustrated by private combinations; if the private enterprise race is to be fair, the runners should have an opportunity to start level; the community as a whole may need and want things (such as leisure, space, pictures, libraries, health services, national insurance) which individuals and groups acting in a strictly business capacity do not provide. Hence all genuinely democratic countries have insisted more and more that the play of acquisitive instincts and economic forces must be tempered by social justice.

In Britain we have developed a mixed economy in a free political society. Our nationalized industries now employ two million people, about eight per cent of the total labour force. Their investment demands are heavy, more than £1000m. (Rs. 1300 crores) per year. The political forces which brought about the nationalisation of the coal-mines coincided with economic necessities. The demand for the capital to develop the coal-mines for the maximum benefit of the community had already outrun the capacity of private resources. Electricity supply similarly requires investment on a massive scale. Major undertakings such as railways, gas, electricity could not go on being operated purely for private profit without depriving sections of the community of services which had come to be accepted as necessities. Nevertheless we like to see enterprises, whether public or private, paying their way as nearly as possible in commercial terms. This is, after all, as good a test of efficient house-keeping as any. The national coal gas and electricity industries are doing this. Our railways are at present under searching examination and re-organisation because they do not.

We approach the problems of international trade with the sort of philosophy which has served us well in building up our national economy. We believe in trade for its own sake and not as a political weapon. We believe in multilateral trade under the most liberal possible rules, because we think this generates the highest level of trade. It is broadly true that the most successful trading countries in the world are those which have tended to be the most liberal. They have found that it is in their interest to spread both opportunities and risks; they know that excessive protection is a two-edged weapon, for they have to keep their own customers in business as well as themselves. It is often tempting to try to guide trade into bilateral channels. In the short term this may be sound sense, in so far as it fosters the growth of new production, and of new trade with new markets, and amounts to something more than the mere artificial diversion of traditional and natural trade flows. But multilateralism is, in our experience, the right target for the long term. Excessive bilateralism may grow into something like a restrictive practice. It tends to raise costs. It deprives one side, or both, of the flexibility and opportunities which competition provides. When it comes to capital goods and raw materials, to be forced to shop in a restricted market can in the longer run be damaging to the national interest.

★★

In the world of multilateral trade, success does not depend on any particular pattern of national economic resources as the following table illustrates:

TRADE IN 1962

	Imports	Exports	Total Trade	Population (millions)	Trade per head in Rs.
U.S.A.:	7738	10171	17909	187	960
Federal Germany	5847	6316	12163	55	2200
U.K.:	5989	5053	11042	53	2100
Netherlands:	2547	2183	4730	12	3900
New Zealand:	326	378	704	2.5	2800

Source: U.N. Commodity Trade Statistics.

The U.S.A., self-sufficient in food, with access to virtually the whole range of fuel and raw materials within its own borders and with all the skills necessary to process them is, nevertheless, the biggest (aggregate) trading country in the world. Britain and Germany each run a trade two-thirds the American size with less than a third of the population. Reckoning per head of population, the Netherlands, which has never had any significant raw materials, is at the top of our list. New Zealand, despite difficulties of isolation and distance, by intelligently exploiting its asset of perennial grass land is, reckoned per head, one of the biggest trading nations in the world.

Sharing Prosperity

It is one of the most interesting trends of the last few years that trade is developing fastest among the most developed countries. Between 1959 and 1962, trade between developed countries increased by 24%. If the comparison is confined to industrial goods, the figure rises to 34%. This illustrates the benefits of multilateralism and freedom to compete with the minimum restraint. Britain and Germany, for instance, keen competitors in world markets, run a trade with each other of over Rs. 270 crores each way. How can the developing countries share this propensity of the developed countries to trade more and more intensively with each other?

One policy, which we have for long followed in Britain, is to keep our doors as wide open for foodstuffs and raw materials as we possibly can. Even if developing countries develop industries at an increasing rate, this liberal import policy is bound to remain of fundamental importance. We have deliberately avoided self-sufficiency in our domestic agricultural policies and we are trying to lead the way in pushing doors wider open for the new manufactures of the developing countries.

The following table gives some idea of the pattern of imports of primary products by the major importers:

MAJOR IMPORTING COUNTRIES OF FOOD AND RAW MATERIALS

(Rs. Crores)

	Food and Live Animals	Beverages and Tobacco	Inedible crude Materials	Minerals fuels and Lubricants	Total	Per Head
U.S.A.	1548	202	1385	871	4006	210
U.K.	1927	168	1179	712	3986	750
Federal Germany	1307	132	1040	505	2984	540
Japan	334	18	1125	496	1973	210
Italy	372	28	675	385	1460	290
France	530	163	658	552	1912	200
Netherlands	310	29	280	328	947	790
Belgium and Luxembourg	235	33	386	214	868	910

Source: U.N. Commodity Trade Statistics.

If the demand for these raw materials had been growing recently, at steady or increasing prices, in direct ratio to the development of industrialisation in the importing countries, the most obstinate of our international trade problems would be much nearer to solution. But unfortunately this is not happening. Primary products, despite the name, are not necessarily the simplest to produce. They emerge, in most cases, as the last link in a long chain of planning, cultivation, mining, refining, processing and so on. They are often out of phase with demand for this reason and their prices tend to fluctuate accordingly. On the other hand the industrial processes which use them tend to develop rather fast. Manufacturers are always trying to economise in raw materials, to switch from one to another to gain small advantages of weight, strength, whatever it may be. And the search for substitutes, synthetic or otherwise, is ceaseless.

The following table shows how imports into Britain from some developing countries have tended to fluctuate over the last five years:

BRITISH IMPORTS

(£ Millions)

	1958	1959	1960	1961	1962	1963
India	139.4	142.6	148.5	144.9	135.9	140.8
Afghanistan	3.5	2.5	3.7	3.7	4.2	5.0
Burma	6.9	7.9	10.1	10 0	11.3	11.3
Ceylon	46.4	39.7	41.0	40.3	42.0	41.5
Indonesia	10.9	5.6	6.0	6.0	10.7	9.2
Iran	56.2	56.9	48.6	48.9	35.4	35.0
Federation of Malaya	40.3	35.6	41.0	37.9	28.9	25.4
Pakistan	19.8	25.7	29.2	25.0	29.3	28.1
Philippines	2.6	3.4	4.5	4.0	3.0	3.7
Thailand	3.7	2.0	3.8	7.2	8.3	5.2

Source: Trade and Navigation Accounts of U.K.

This table illustrates the difficulty of expanding imports of raw materials at a steady developing rate. Between 1955 and 1961 prices of primary commodities fell by 10% while prices of manufactured goods rose by 10%. Prices of primary commodities have latterly recovered but not yet significantly enough to indicate a reversal of the trend. It is natural therefore that those developing countries which pay their way in the world at present largely through supplying raw materials to their more developed partners should be demanding rules of trade which assure them of a fair return.

Problem of the Gap

The narrowing of the trading gap between the more and the less developed countries has to be tackled by all practicable means. The problem will be solved only by hard and prolonged effort on the part of both the developed and the developing countries. We may get to the solution more quickly if we avoid the temptation to believe that some new institution, organization or formula will provide a magic answer. We should build on what we have and on what has proved its usefulness in practice.

It has been a long and arduous process to establish the general "most favoured nation" system which is now accepted by the contracting parties to the General Agreement on Tariffs and Trade. It is to be noted that the G.A.T.T. was born by generalising the ideas enshrined in the whole range of bilateral agreements on the pattern of the first agreement which Richard Cobden negotiated with France in 1860. The idea came first and the institution afterwards. The G.A.T.T. operates pragmatically. It has not waited for the perfect or universal organisation before getting on with the job. That is why it has such solid achievements to its credit. It has brought to an end the tariff war between the industrialised countries, and it has cleared away a whole range of quantitative restrictions. On five occasions it has engaged in multilateral negotiations in which tariffs have been reduced or "bound" (i.e. held down to a stated level) on products accounting for approximately half of the world's trade. We shall soon, in the G.A.T.T., be entering a negotiation which will, we hope, cut tariffs in the major industrialised countries by 50%. All countries in the world (not merely in the G.A.T.T.) will benefit from these tariff cuts.

The G.A.T.T. has not confined itself to the industrial tariffs of the industrialised countries, but has been increasingly studying measures to reduce the lag between the developing and the fully industrialised countries. It has sponsored an action programme aimed at reduction and eventual elimination by industrialised countries of barriers against the trade of the developing countries. (As an illustration, agreement has recently been reached between Britain and the European Economic Community to remove customs duties on tea and tropical timber). The G.A.T.T. is also developing machinery for closer study of the problems of developing countries. It is ready to study any device or arrangement which holds out any practical possibility of expanding the trade of developing countries.

Commodity Agreements

Commodity prices raise difficult problems. Who can decide what is the fair price for both the producer and the consumer? Prices determined by agreement may initially appear satisfactory. But precisely for this reason they may hasten the search for substitutes, synthetic or otherwise. Price increases encourage new producers and may soon develop new surpluses and new vested interests. It is not easy to persuade countries to refrain from growing or mining something which looks as though it will pay its way satisfactorily.

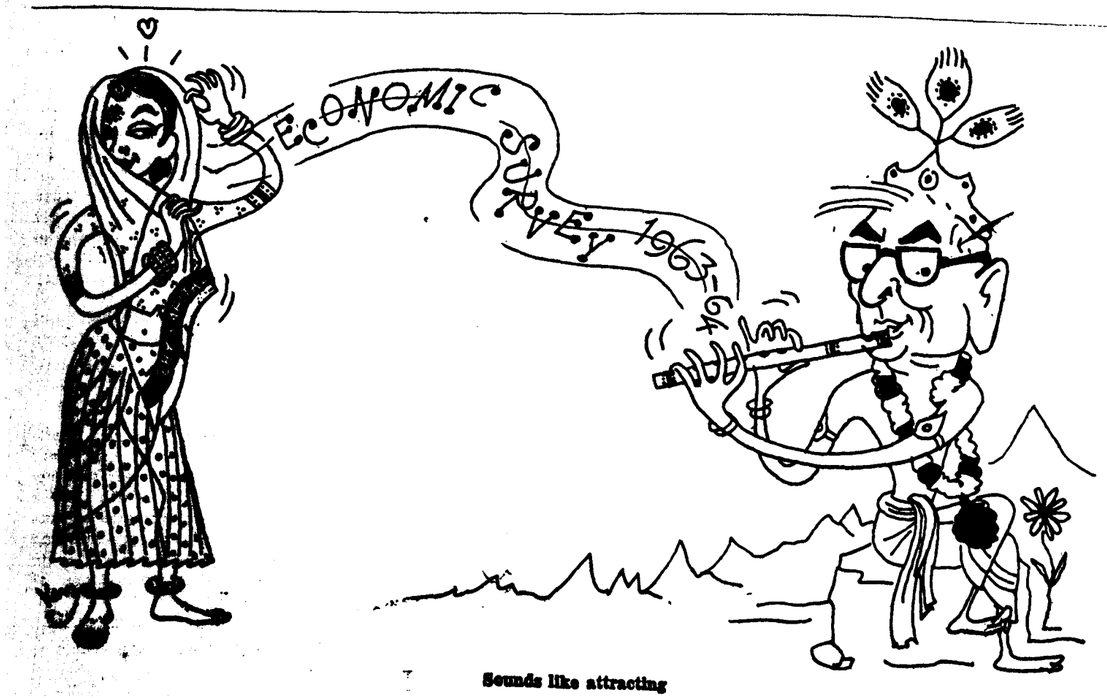
We believe, however, that there is a place for commodity agreements and are in fact a party to all such agreements as

far negotiated. The special use of such agreements is to damp down excessive fluctuations of price and supply in the short term. Carefully negotiated agreements may in this way make a significant contribution to reconciling the interests of producer and consumer. But to interfere with the long term flow of supply and demand is a vastly complex and difficult undertaking and may, in the name of regulation, put a brake on progress.

Investment & Development

There is a further direction also from which we must continue to attack the problem. This is to speed by aid and investment the process of industrialisation in the developing countries themselves. As I have already mentioned, trade flows fastest between countries which are most industrially developed; this is an encouraging pointer to future possibilities.

British capital and know-how contributed overwhelmingly in the last century to the development of the United States. That country has now become our biggest market. By the end of this century, as the British Chancellor of the Exchequer, Mr. Reginald Maudling, has recently said, India could become the most important market in the world for British goods. We might then see Indian investment in Britain beginning, as a counterpart to our investment in India.



The developing countries have largely and wisely advanced by means of mixed economies. Private industry has expanded but the size of investments needed for the basic plants on which industrialisation depends is, in many cases, quite beyond the capacity of private interests to supply. Investment in development must, therefore, take the form of governmental loans and aid as well as the investment of private funds, know-how and skill. Britain's governmental co-operation in development in this way, in addition to a steady flow of private investment into countries which offer a suitable climate, is now running at £180 million per year in the form of loans, grants and credits.

I have tried to indicate the way in which we in Britain look at world trading problems. We see as the major problem today the reduction of the gap between the developed and the developing countries by every possible means: reducing tariffs; eliminating quantitative restrictions; modifying domestic policies in the light of the needs of developing suppliers; negotiating agreements to stabilise commodity prices; investing all the resources that can be spared in development overseas. This in short states the objectives which we shall be pursuing at the United Nations Trade Conference which opens in Geneva on March 23rd and in the negotiations which will be continuing throughout the year in the G.A.T.T.

We would not reject any proposal which seemed to us to have some practical hope of success and we would hope that such proposals would accord with our general philosophy of the most liberal possible approach to trade in a multilateral trading world. We view the urgent need to solve the problem of the gap between the developed and the developing countries as something which should be pursued for its own sake, and we look on financial aid, and the provision of technical assistance as in some sense a moral duty. At the same time there is, and must be, a degree of enlightened self-interest about this view, since prosperity flows over the boundaries of countries. We cannot provide any sort of assistance unless we have the resources to provide it from. These resources cannot be built up without a healthy trade. It is largely because of the high level of trade between the industrialised countries that they are able to make a start today on fulfilling the obligation to co-operate with the developing countries in removing the disparities between the nations.

**

Finally, we see trade as an agent of peace. Of course there have been, and are, exchanges of goods which are not peaceful. But international trade by and large means international interdependence of livelihoods. It means, especially where there is freedom of circulation, friendships across international frontiers. It means that the best and cheapest things in one part of the world can be at the disposal of the rest. All these things are ruthlessslessly interrupted, if peace fails. So as a trading nation, we find ourselves peculiarly devoted to peace and, as a peaceful nation, we only seek peacefully to pursue our trade.

Sounds like attracting

WINDOW ON THE WORLD

The Value of the Deutschemark

From Our Special Correspondent

FRANKFURT:

THE RUMOURS of a possible upward revaluation of the Deutschemark referred to here recently have since then gained enough currency to attract a denial from Mr. P. Schweitzer, director of the IMF, not to mention repeated contradictions of the West German authorities. Mr. Schweitzer included the Dutch florin too, as unlikely to be revalued, but of course no one had seriously suggested that in the event of an appreciation of the Deutschemark the Dutch would be able to follow suit as they did in 1961. As was pointed out here, the Dutch now belong in the inflationary camp of the Common Market, and their situation looks like worsening this year: wages will rise, 10 per cent in theory, probably 15 or 16 per cent in practice, while a payments deficit of 500 million florins is expected for 1964. The florin, then, is once and for all "unhooked" from the German mark and may be dismissed from the following discussion. In fact, the Dutch authorities made a mistake in March 1961 when they decided on the spur of the moment to imitate the German revaluation of which they had had no advance warning; and this is a mistake they would be unable to repeat today even if they wanted to for reasons of prestige.

The case of the Deutschemark is very different, and it is not hard to see the reasons that, without making a revaluation desirable or even likely, would prompt interested parties abroad to canvass the suggestion. Briefly, the situation is that the Federal Republic is scoring a large, persistent and even increasing trade surplus; a similarly large and presistent payments surplus is also evident; and finally there is an influx of foreign capital into West German banks which is in danger of swelling further for at least two reasons. Firstly, the Swiss are taking further steps to discourage the entry of foreign funds and the French have acted similarly, and this tends to divert money to West Germany. Secondly, despite all the official denials that revaluation is contemplated, speculators will be tempted to gamble on it, and as their funds pour into Germany the eventuality comes to look more probable, leading to further inflows, and so on; in this domain it is really true that nothing succeeds like success.

One may well begin at that point to list the arguments against the likelihood of a revaluation, because if its motive were to discourge the transfer of capital, then there is no evidence (cases of upward revaluation are rare, admittedly) that it has ever succeeded in doing so. Naturally, once the awaited decision to up-value is announced, gamblers take their profits and there is some reflux of funds, but other owners of capital who seek security rather than quick exchange profits seem to be impressed by the strength of a currency that can afford to up-value and convert their money into that currency. However illogical this may be, it is a fact and explains why within a few years of its last exercise in revaluation the Federal Republic is again faced with a large payments surplus.

Apart from the fact that revaluation, then, would not necessarily scare away floating funds for long, the Federal authorities have other good reasons for not considering it. It is sure that up to March 1961 the Deutschemark was undervalued; in fact it had been so ever since the monetary reform of 1949. It was so much under-valued that, at the time a more generous margin of appreciation would have been preferable to the small percentage actually decided upon. But it is too late now to take a second bite at the cherry, for one cannot argue (the large payments surplus notwithstanding) that the mark is under-valued today. At least not in relation to all currencies, and not to the main ones (the dollar and the pound sterling). In other words, the current trade and payments surpluses are coming from West Germany's commercial and monetary relations with a small group of countries, namely her partners in the Common Market, and not at all from her relations with the USA and Britain who happen to be her main rivals on most world markets.

Thus in the past 12 months, West Germany has imported very much more from the USA and has incurred a widening deficit in that trade. Her "dollar gap" in 1961 was 2,603

EASTERN ECONOMIST
Annual Number 1964

The Nation's leading economic weekly with the largest circulation in its class proudly presents in its latest Annual Number a stimulating discussion of the highly topical theme "THE BATTLE OF INDUSTRIAL PRODUCTION". It critically examines developments in major industries and relevant Government policies. Illustrated with colour-graphs, charts and statistical tables, this sumptuous Number is priced Rs 10|- per copy; available to subscribers of Eastern Economist without extra payment; Annual subscription Rs 65|-.

million DM, it was 3,171 million DM in 1962, and rose to 4,127 million DM last year. True, this large deficit was almost entirely wiped out by the West German surplus in trade with the rest of the Common Market: 2,401 million DM in 1961, 2,039 million DM in 1962 and 3,803 million DM last year. It is significant that suggestions for a fresh upward revaluation of the mark have not come from within the Common Market; her partners know that the German trade surplus with them is due to their own errors and is to be removed by correction of those errors rather than by treatment of the symptom, their "Deutschemark gap". Rather, the suggestions in that sense have come from the USA, a country that already enjoys a large surplus in trade with West Germany and would gain an even larger one in the event of revaluation. They are part of the US campaign to the effect that the Six owe the dollar a living, and should finance America's payments deficit painlessly by incurring an ever greater dollar gap in trans-Atlantic trade.

Disguised Effects

Given their source, these arguments are unlikely to cut any ice, even if (or especially if) supported by British hints to the same effect, since the Germans know that outside the territory of the Six their main competitors are the Americans and the British. The fact is that West German production costs have risen in the last few years much faster than in the Anglo-Saxon countries. The adverse effects of this deterioration in German competitiveness have been disguised, in the global trade returns, by the accident that costs were meantime rising even faster elsewhere in the Common Market — and, for the moment, German trade with the Common Market is expanding more quickly than its other external trade. This is natural, since the Six are reducing their internal tariffs and otherwise stimulating regional trade; enjoying a competitive advantage during this process of forming an expanding market, West Germany inevitably scores a large trade surplus with the other five. But the process of installing the six-nation customs union will be complete within a few years (maybe as little as three years if tariff disarmament is accelerated) and thereafter regional trade will not grow so much more quickly than trade with outsiders. Besides, by then the other five will surely have righted the unbalance by bringing the inflation of costs under control, i.e. down to the West German level.

The global West German trade surplus, therefore, is no argument for revaluation. When analysed as to its origin, it appears that revaluation is contra-indicated as regards Germany's trade with (and in competition with) the USA and Britain. It could be suggested only as a means to wipe out the immense surplus with the rest of the Common Market. But would it even be a sensible suggestion in that connection? The Six form a monetary bloc in process of emergence, and are bound to consider such problems from a community point of view rather than each from an independent nationalist standpoint. And when the six Finance Ministers put their heads together it becomes reasonable to argue that an upward revaluation of the mark is no more indicated than a devaluation of the lira (to take an example that is hypothetical but far from fanciful). Such retorts have been made before today when nations began urging each other to alter the value of their currencies, but they have no force in normal international monetary relations; on the contrary, they are quite cogent within the European Economic Community. More generally, the Germans can tell — already are telling — their partners that the responsibility for correcting the present gross unbalance in internal trade and payments lies with them and not with Bonn. The Community would be no sort of community at all if its internal difficulties were to be dealt with by the lightning surgery of unilateral surprise revaluations, instead of by harmonisation of economic policies.

The question is definitely a community one if one takes note of the fact (which currency speculators seem to have overlooked) that West Germany's trade partners have changed with the introduction of the Common Market. Last year her principal clients were, in order, France, Italy, Holland and Belgium-Luxemburg, i.e. the rest of the Common Market, followed only then by the USA. So it is the other five who are primarily responsible for the large increase in West German exports last year (plus 10 per cent); in fact German exports to the rest of the Community rose 25 per cent in the two years 1961-63. It happens that Germany's main supplier remained the USA, followed then by the five of the Common Market. Thus a solution to her embarrassing surplus problems must lie in co-operation with her partners. A simple upward revaluation would benefit far and away most the country that is her main supplier but only her fifth client, the USA.

One may conclude that the time is not yet to speculate on a revaluation of the Deutschemark. That time may come, nonetheless: if and when the Six decide to freeze their mutual exchange rates as a first step toward introducing a common currency for the Common Market. Before doing that, they would want to be sure that their exchange rates (as between themselves, rather than in terms of gold or the dollar) were reasonable, i.e. liable to stand up to the future evolution of economic relations inside the Community. That might well require an adjustment of parities, the mark perhaps going up and the lira down and so on. It would be a joint operation undertaken in cold blood, and not in response to temporary unbalance. But that eventuality lies far in the future.

LISTENING POSTS

Superior Coal Prices Raised

By Our Special Correspondent

NEW DELHI:

THE UNION Government is understood to have decided to allow an increase of 75 nP. and Rs. 1.25 per tonne in the prices of Grade I-equivalent coking coal and selected grades coking coal, respectively. An announcement to this effect is expected shortly.

The increase in these superior quality coal prices, however, is being granted subject to the condition that the industry agrees to sampling at the destination i.e. at the steel plants to which these categories of coal are supplied. Hitherto, coal was sampled and analysed at the loading points. The new stipulation, it is understood, is being placed in view of the complaints that the Union Department of Mines has been receiving from the steel plants about the poor quality of coal supplied to them.

No increase in the prices of non-coking coals, supplied to all the industrial establishments other than steelworks, is being granted for the present. The matter is said to be still under the consideration of the Government. According to reliable sources, the Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, told the Gonsultative Committee of Parliament attached to his Ministry, on Wednesday, that he would soon take measures to make the mining of medium and lower grade coals also "economic".

The increase in coal prices that is being allowed presently obviously will be disappointing to the industry particularly to the producers of non-coking coals who, after their discussions with the Government recently had come to entertain hopes of reasonable incentives being granted to them as well for raising production. This belief of theirs had been further strengthened in view of the World Bank Team on Coal suggesting a fair increase in the prices of these coals also and the fairly sizable sums having been advanced to them by the Government and the World Bank as loans for import of mining machinery for developing their mines. The increase in the prices of higher grades of coking coal, it is learnt, will benefit only about 50 collieries out of over 800 working at present.

**

Much satisfaction has been caused in both the official and non-official circles here at the conclusion of an agreement this week between the Governments of India and the United States, providing for a loan of $225 million (Rs. 107 crores) out of the $435 million aid promised by the latter under the aegis of the Aid-India Consortium for 1963-64, to finance commodity imports required to carry forward the Indian economy. The broad commodity import groups for which this credit will be available are: steel, non-ferrous metals, lubricants, fertilizers, machinery and machinery parts, sulphur, rubber, tyre cord, carbon black, caustic soda, DDT, chemicals, vehicle components and other components. The list, of course, is flexible; some of these commodities may even be substituted by new ones at Government of India's request. When shortages occur, the Government of India can use part of this credit to import a product in short supply in order to bring down its prices. The bulk of the commodity imports under this loan — approximately 80 per cent — is for meeting the needs of the private industry.

The credit, channelled through the US Agency for International Development, is repayable over a period of 50 years, with no repayment of the principal falling due within the first 10 years. Interest charges will be three-fourth of one per cent per annum for the first 10 years and two per cent per annum for the remaining period of 40 years.

The balance $215 million out of the $435 million assistance promised by the US for 1963-64 is to be utilised for specific projects.

The United States extended to India non-project assistance totalling $460 million (Rs. 219 crores) during the first years of the current Plan. With the loan announced this week, the total non-project aid made available by the U.S. for the third Plan so far, comes to $685 million (Rs. 326 crores). It is 48 per cent of the total US commitments (under the Aid-India Consortium) of $1,415 million (Rs. 674 crores) for the three years 1961-62, 1962-63 and 1963-64. The rest of this assistance has been provided for specific projects. The United States has in the recent past contributed to building of 20 power plants and made available railway equipment, such as diesel locomotives and signalling equipment, under "project" aid.

Including the aid being provided by the United States under P.L. 480, the total assistance that India will get in 1963-64 from this friendly country will be approximately $880 million (Rs. 419 crores). Of this, $441 million (Rs. 210 crores) will be in dollar grants and loans and $439 million (Rs. 209 crores) in the shape of about 3,600,000 tons of wheat, cotton, rice, powdered milk and other food products. These products are now arriving in India at an average rate of 10,000 tons per day.

**

Meeting here at a conference last week-end under the shadow of strindently rising food prices and failure of rabi crops at various places in North India, the State Food and Agriculture Ministers are understood to have taken three important decisions — (1) tightening of licensing controls on foodgrain dealers; (2) provision of a more realistic price for procurement of foodgrains; and (3) implementation of the decision taken at the Bhubaneswar session of the Congress for socialisation of the rice milling industry.

It was agreed that all the State Governments should fall in line with West Bengal and Andhra Pradesh in modification and enforcement of the model Foodgrain Dealers Licensing Order circulated to them recently by the Union Ministry of Food and Agriculture. This Order requires all licensees to deposit security ranging between Rs. 500 and Rs. 1,000, depending on their turnover, which would be forfeited for breach of any licensing provision or regulatory directive issued by the Government. The Order also stipulates that price lists should be displayed prominently at all shops and the retailers registered with wholesalers should sell foodgrains in accordance with the instructions issued by the marketing authorities in the regulated markets or other such bodies as may be recognized by the Government for the purpose in the case of unregulated markets. It prohibits licensees from charging higher prices for foodgrains than those fixed by the Central or the State Governments.

In regard to procurement prices, it was decided that these should not only be related to cost of production, but also contain an element of incentive for increasing production. Apart from "floor" prices for various foodgrains,

"ceiling" prices may also be fixed in the interest of consumers. As against the target of 750,000 tons of rice fixed for procurement from the States of Andhra Pradesh, Madras, Madhya Pradesh, Punjab and Uttar Pradesh this year, nearly 3,15,000 tons are said to have already been procured.

On socialization of the rice milling industry, it was generally agreed that every State should examine the conditions prevailing in its jurisdiction and work out a detailed plan for action. The position will be reviewed in about two months' time at another conference to be called for this purpose. Meanwhile, it was agreed that the new rice milling capacity should be exclusively in the co-operative sector. Regarding movement of rice from one State to another, it was favoured that it should be in accordance with an agreed monthly phased programme so that there were no undue movements in the lean periods.

The importance of strengthening the State Food Departments, especially the inspecting staff, was also stressed at the conference. The Central Government is understood to have indicated that it would consider the question of giving financial assistance to help States to maintain adequate inspecting staff for ensuring strict enforcement of rules against profiteers and hoarders in foodgrains.

**

On the basis of the contemplated capacity targets for the fourth Plan for nitrogenous fertilizers (2 million tonnes), soda ash (1.2 million tonnes), caustic soda (0.8 million tonnes), and petroleum refining (25 million tonnes — this has been recently raised to 30 million tonnes), the machinery and equipment requirements of these industries during the fourth Plan period are annually placed at Rs. 24 crores, Rs. 3.6 crores, Rs. 6 crores and Rs. 17.6 crores (approximately Rs. 28 crores for a 30 million tonne target), respectively. The indigenous capacity for fabrication of these plants and equipment at present is stated to be only meagre. There is, thus, a tremendous scope for sponsoring additional capacity in these lines of manufacture. The Union Government is anxious that Indian entrepreneurs should go in for the manufacture of machinery and equipment for these chemical industries so that the drain on foreign exchange resources could be mitigated. Tie-ups with the leading foreign manufacturers in this respect are favoured. But it is considered desirable that the prospective Indian entrepreneurs should not only seek collaboration for items which they will manufacture themselves but also for those which they will sub-contract to others. This implies that they should seek complete designs and working drawings for the machinery and equipment proposed to be manufactured by them.

Foreign capital participation in petroleum refining and manufacture of fertilizers, soda ash and caustic soda is also favoured by the Government.

**

Trade between India and Nepal is proposed to be doubled during the next five years as a sequel to the replacement of the existing trade and transit treaty between the countries (due to expire in October next year) by a new five-year agreement to be concluded in accordance with the GATT and other international conventions. The Union Minister for International Trade, Mr. Manubhai Shah, had discussions in this regard with the Nepal Government during his last week's three-day visit to Kathmandu.

According to a joint communique issued at the conclusion of Mr. Shah's visit to Nepal, India will also co-operate with this Himalayan kingdom in her industrial development. Long-term loan facilities are proposed to be provided by India for this purpose. To begin with, a credit of Rs. 100 lakhs has been promised. Nepal will repay it in 15 years with 3 per cent interest per annum.

The loan will be utilized for starting new enterprises in various parts of Nepal through the State-owned National Industrial Development Corporation. In the immediate future, it will be available for setting up paper, plywood, cotton and woollen textile manufacturing units. (A cotton textile mill with 12,000 spindles will be shortly set up in Nepal by Birlas). If Nepal so desired, India will also be willing to consider the establishment of a cement plant in that country at a suitable place where adequate raw materials are available.

An all-India industrial exhibition is proposed to be held at Kathmandu next autumn.

**

Messrs. Hilton's Hotel Corporation of the United States, it is learnt, has shown interest in providing technical and financial collaboration to the Indian hotel industry. It is said to have had recently exploratory talks in this connection with the Union Ministries of Finance and Transport.

The Government of India is not averse to foreign collaboration in this field, provided it is available on reasonable terms. The Ad Hoc Committee on Tourism has also favoured this idea on three considerations. Firstly, such an arrangement will help in meeting part of the foreign exchange cost of the hotel industry which has to be expanded at a rapid pace in the interest of fostering tourism. Secondly, if the collaborating foreign hotel belongs to a large group, the hotel sponsored in India would receive the benefit of publicity and promotion done by the foreign company. Thirdly, the hotels set up with foreign collaboration can become pacesetters in new techniques and methods of hotel management.

**

The Union Ministry of Transport is understood to have communicated to the State Governments new model rules framed by it in consultation with the State Governments and the other concerned interests, on issue of permits for inter-State operation of vehicles engaged in tourist traffic. The State Governments have been asked to publish these rules in the official gazettes under section 133 of the Motor Vehicles Act, 1939, and bring them in force with effect from May 1, 1964. The main change proposed in the existing rules is that in respect of the fifty tourist taxis and ten contract carriages which are to be licensed by each State or the Union Territory for operation throughout India for tourist traffic, in terms of a decision taken on the recommendation of the Ad Hoc Committee on Tourism, the permits will not require counter-signatures from the other State authorities.

There is no proposal under the consideration of the Union Ministry of Transport to relax the existing rules in regard to other vehicles operating on inter-State routes.

**

The Government of India has arranged to refund to the International Monetary Fund the first instalment of $25 million out of the sum of $250 million (Rs. 119.04 crores) drawn from the Fund on August 1, 1961. The rest of the amount has to be repaid to the Fund by the end of July, 1966.

The Fund provided India under this credit $110 million (Rs. 52.38 crores) in U.S. dollars, $60 million (Rs. 28.57 crores) in Pound-Sterling, $45 million (Rs. 21.43 crores) in Deutsche Marks, $15 million (Rs. 7.14 crores) in French Francs, $15 million (Rs. 7.14 crores) in Italian Lira and $5 million (Rs. 2.38 crores) in Japanese Yen.

Apart from the outstanding balance of $225 million, India has a standby arrangement with the Fund for $100 million effective for one year from August last year. No amount, however, has been drawn as yet from this standby credit.

**

At a Press Conference held here last week, Mr. Bruno Leuschner, Deputy Chairman of the Council of Ministers, German Democratic Republic, told newsmen that the G.D.R. was prepared to supply India complete plants, equipment and machinery to a far greater extent than hitherto and on more favourable terms. The G.D.R. has made some proposals in this direction. Details of these will be finalized by experts from both the countries in the near future. The proposals submitted by the G.D.R. cover supply of equipment for power stations, transport and mining machinery. In exchange, the G.D.R. is willing to buy from India more textiles, mica, coffee, tea, spices, tobacco and several other items.

The German Democratic Republic is currently supplying technical know-how and machinery to about 40 Indian firms. It is prepared to go in for joint ventures with the private sector. In this regard, it is awaiting specific proposals from the Indian entrepreneurs. Specific proposals have also been made by the G.D.R. to the Union Government for expanding trade between the two countries which now amounts to Rs. 25 crores both ways.

Talks have also been held between the G.D.R. delegation and the Union Ministers regarding further development of Indo-G.D.R. relations in the fields of science, cul.ure, education, public health, art, literature, broadcasting and sports. The signing of a cultural agreement between India and the G.D.R. was announced at the last week's Press Conference. The highlights of this agreement are:

(i) The German Democratic Republic will provide in 1964, 15 scholarships for Indian post-graduates for further studies in science.

(ii) At the invitation of India, the G.D.R. shall send five post-graduate scientists to undergo further studies here for a period of one to two years, and three scientists in the field of agriculture and technology to work in India for several years.

(iii) In the field of general education, 30 Indians will undergo practical training in the G.D.R. for periods ranging between one and two years. A delegation of pedagogues from India will be invited by the G.D.R. to study her educational system.

(iv) In the field of public health, five medical doctors from India will undergo further studies in the G.D.R. in special fields of medicine for a period of one year. The G.D.R. is also willing to assist India in setting up a Hygiene Museum.

(v) In the field of art and literature, the G.D.R. will hold an exhibition of sculptures in India and also participate in the third International Film Festival to be held in New Delhi. A group of artists from G.D.R. will also visit India.

Mr. Leuschner regretted that his country had been excluded from the coming World Trade Conference in spite of the fact that it was one of the highly industrialized countries in Europe. He supported the principle of international division of labour. India could manufacture tropical engineering machinery for export to East Germany, he said.

Maharashtra Budget: A Mixed Bag

From Our Correspondent

BOMBAY:

THE FINANCE Minister of Maharashtra, Mr. S. K. Wankhede, would perhaps earn the reputation of being the first in presenting not only a surplus budget, but a budget which also has a new direction in approaching the problems of development in the State and in providing relief to the lower strata of society. There would, no doubt, be dissatisfaction, still, in sections of the low income and wage groups that the quantum of benefits is not adequate or commensurate with the pressures of demand on them. What is most significant is the change in the direction and for that, the Finance Minister should be congratulated. The revised estimates of the State Budget for 1963-64 show a revenue surplus of Rs. 5.4 crores; the net effect of the capital transactions in the year would leave a surplus of Rs. 1.4 crores, thus making up a total over-all surplus of Rs. 6.8 crores, for the current year. No doubt, the bouyancy in the revenue receipts is largely due to the increased receipts under additional taxation measures introduced in the first three years of the third Plan. At the same time, one should not minimise the dynamism in the economic activities of the State which has also contributed to the surplus position. In 1964-65, the Budget estimates a revenue surplus of Rs. 51 lakhs. Accounting for capital transactions expected in the budget year, the overall position would, however, show a net deficit of Rs. 9.8 crores; and that will have to be met by judicious budgetary planning. This, the Finance Minister has attempted to do.

The relief to the low income and wage groups is fairly widespread. The concessions relate to the sales-tax on food, clothing and drugs amounting to Rs. 25 lakhs; relief for pensioners costing Rs. 11 lakhs; benefits of dearness allowance to the Government staff and additional rebate of sales-tax on diesel oil costing the exchequer in all Rs. 2.50 crores.

As pointed out, while the State budget has enthused certain sections and also disappointed others, in respect of the quantum of relief, the approach to the budget itself should be viewed in the background of the progress of the economy in the State. There has been a striking evidence of growth, the State income rising from (at 1955-56 prices) Rs. 1,004 crores in 1955-56 to over Rs. 1,400 crores in 1962-63. This gives a total rise of 39.5 per cent. The per capita income in the same period has risen from Rs. 292 to Rs. 343, a rise of about 17.5 per cent, at constant prices. That would indicate the strengthening of the economy in the State, when compared to other States and the all-India average growth. Particularly in agriculture, the triennial average of foodgrain production for 1961 - 62 was 30 per cent higher than the average for 1952-53. There was also a significant progress in the rural areas as indicated by the strengthening of the economic and social overheads.

In the sphere of industry, the value added by manufacture in the State increased from Rs. 232 crores in 1959 to Rs. 299 crores in 1961. The State's share of industrial production in the country was 26 per cent in 1961. While there is no indication of the position as at the end of 1963, it is believed that a major part of the all-India rise in the index number of industrial production from 139.4 in 1961 to 163.4 in September 1963, was contributed by the State of Maharashtra. This is supported by the increased consumption of power by industries in the State.

The power-generating capacity which was 530,000 k.w. at the end of 1956 rose to 1,010,000 k.w. at the end of March, 1963. The output of electricity increased to 2,743 million k.w.h. in 1962-63 from 2,249 million k.w.h. in 1956. The consumption of electricity by industries rose from 1,235 million k.w.h. to 2,396 million k.w.h. in the same period. The number of working factories increased from 6,979 to 8,762 and the workers employed, from 6.9 lakhs to 8.1 lakhs in the period. In

the transport sector, the road length would increase from 33,600 k.m. in March 1956 to 43,000 k.m. in March 1964. These are the highlights of the State's progress in the economic sphere under the impact of planning. However, the budget shows the consciousness of the long way that has yet to be covered in bringing a reasonable standard of living throughout the State.

Mr. Wankhede, in presenting the budget, has expressed Government's concern over the spiralling rise in prices. Following the general trend in the wholesale prices, the retail prices in the urban areas in the State increased by 7 per cent between December, 1962 and the end of 1963, the prices of foodgrains alone advancing by about 9 per cent. He was quite realistic in explaining the factors which led to this price rise, as being due to the demands of funds for capital formation and for defence production, in the absence of a corresponding rise in the production of consumer goods. He also took note of the effects of Central and State taxation which were inescapable and the shortages in rice, sugar and other essential commodities. Regarding the defects in distribution, he observed, it was an all-India occurrence and was frequently due to the circumstances beyond the immediate control of the State as also the difficulties of transport and artificial maladjustments between supply and demand. With a vision of a balanced development for the State and the interests of the rural community and the lower income groups of the urban sector in formulating the budgetary policy for the State it is quite reasonable to expect that the economy of the State would be further strengthened in the future and Government resources would also be improved to move forward to greater momentum in the economic effort.

**

Mr. Asoka Mehta, Deputy Chairman, Planning Commission, did not provide the realistic approach to the strategy and policy for economic growth and all-round dynamic action to increase production and productivity that was sought by Mr. J. D. Somani in his address at the last annual general meeting of the Indian Merchants' Champer, but he did not fail to discuss the need for more production and productivity urged by Mr. Somani. As a matter of fact, Mr. Mehta recognised the need for a considerable increase in production all round — by 1970, he visualised the need for a rise of about twice the present of foodgrains, sugarcane and oil seeds and of about five times in consumer goods, a five-fold increase in the output of steel and petroleum products, a six-fold expansion in electricity, cement and chemicals, and more than twelve-fold growth in steel and machinery, as compared to 1960-61. And, to bring this about he also realised the need for increased investments. He even conceded that, alongside a high rate of investment, there must also be a high enough rate of profit on the investment made. Yet, surprisingly enough, he spoke also of a curb on growth of income. A curb on conspicuous consumption is understandable, but what is the relevance of a curb on the growth of income in the context of the country's needs today? Unless there is a strident rise in income, alongside of a curb on conspicuous consumption, the available savings for investment cannot increase materially and certainly not to the extent of one per cent in the rate of savings and investment every year for the next ten years, as Mr. Mehta himself wants to ensure even a modest rate of growth of seven per cent.

Mr. Mehta spoke of a decade of intensified drive towards development accompanied by certain "corrective devices". In this connection, besides the curb on consumption, which is obviously one such, he also made a mention of "familiar measures at re-transferring incomes to correct the stubborn disequalising forces in development." At the same time, he made the significant remark that the country could rely only marginally on benefits through income redistribution. In other words, in order to achieve the objective of a faster rate of growth, according to him, apart from increased production and productivity, another available solution would appear to be "certain alterations in the process of income generation itself." Does this mean that Mr. Mehta is thinking in terms of a further increase in the share of national income accruing to the Government? It is true that there is today, an observable trend towards an increase in the share of Government in the gross national product of many countries, including even free enterprise countries like the USA and West Germany. But those who allude to this trend seem conveniently to forget that, thanks to the dynamism and diversity of modern economic development, especially in the advance countries, the increased share of the Government is the result of Governments participating in new fields of enterprise; seldom do they impinge on existing lines in which free enterprise is already engaged. For instance, there is hardly any talk of nationalisation of banking in those countries. The net result of the visit of Mr. Mehta to the Chamber, therefore, seems to be that the IMC President did not get any assurance from the Deputy Chairman of the Planning Commission that "ours should be a truly mixed economy with the public and private sectors functioning as one national sector." Evidently, the Bhubaneswar thesis of democratic socialism only permits of the private sector "being tolerated on sufferance or on grounds of political expediency."

If this is the case, it only serves to substantiate Mr. Somani's assertion that, in their impatience with the intractability of problems to be tackled, the authorities tend to succumb to the temptation to advocate adoption of measures and policies which are largely borrowed uncritically from outdated socialist dogmas. The need of the country at present is a calculated and critical borrowing of the best features of both capitalism and socialism, a distinct trend observable in respect of both types of economies today.

The Search for Funds

From Our Correspondent

CALCUTTA :

TWO EASTERN States — West Bengal and Bihar — have presented their Budgets for 1964-65 to their respective legislatures, this past week. A third, Orissa, will soon present its own, but the Chief Minister of that State has already declared that there will be no fresh taxation proposals in his Budget, an extraordinary thing to do before the Budget is actually presented perhaps, but nevertheless reassuring from the taxpayer's point of view. The Bihar Budget shows a surplus—a small one of Rs. 51 lakhs — but this may disappear in the course of the year, because in the capital Budget for the year on account of Plan schemes, a gap of Rs. 3.75 crores has been left uncovered. Bihar may also have to incur additional non-Plan expenditure to implement the recommendations of the Pay Revision Committee concerning Government servants. The Chief Minister, who also holds the Finance portfolio, has warned that subsequently it will be necessary to tap fresh resources through extra taxation and loans and through more economical operation of the Government's commercial and semi-commercial schemes. (The total receipts for 1964-65 are estimated at Rs. 197.27 crores and the expenditure budgeted for is Rs. 196.76 crores.)

A major feature of the Bihar Budget is that the provisions for rural development schemes and education have been substantially stepped up. The allocation for industries has actually been reduced, while that for agriculture has been raised. Among major items of capital expenditure, the largest single is multi-purpose river schemes which receives Rs. 15.51 crores; Rs. 1.70 crores has been allocated for agricultural improvement and research, but only Rs. 66 lakhs is provided for industrial development schemes. Education gets Rs. 17.69 crores, compared with Rs. 15.77 crores in the previous financial year, agriculture Rs. 5.73 crores (Rs. 4.58 crores) and community development Rs. 8.99 crores (Rs. 6.06 crores). The Chief Minister has also announced that a more liberal family pension scheme for State Government employees will be introduced from the next financial year (1964-65). This is in addition to the benefits which they may get under the recommendations of the State Pay Revision Committee, which are at present under the Government's active consideration. The Government also proposes to raise the pension of all categories of its employees as part of its social security programme.

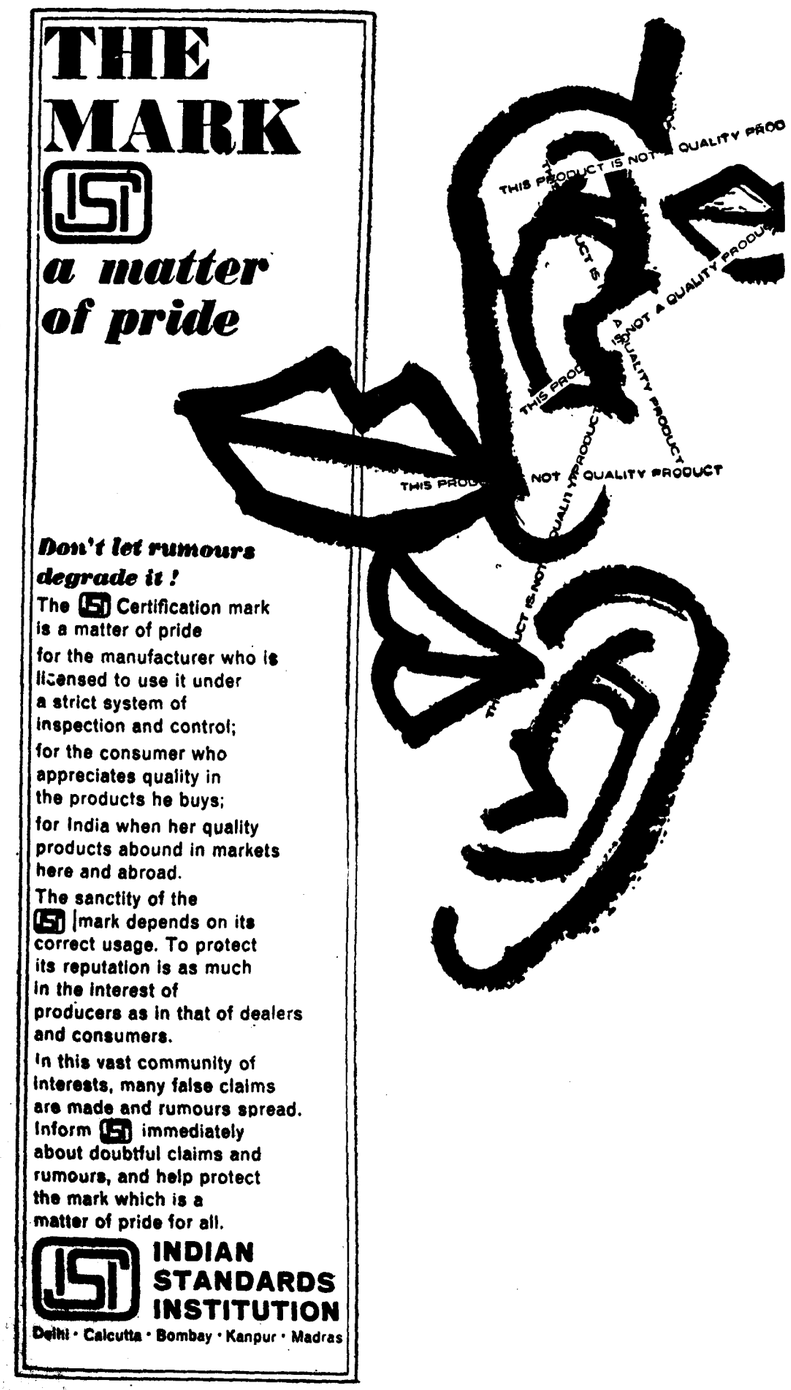
The West Bengal Budget for 1964-65 shows a net deficit of Rs. 2.46 crores (revenue receipts Rs. 135.52 crores; revenue expenditure Rs. 129.91 crores plus Rs. 8.19 crores outside the revenue account minus Rs. 11 lakhs opening balance), and the Finance Minister proposes to cover this deficit by levying a higher stamp duty on the transfer of immovable property and similar transactions, increasing registration fees and additional revenue expected from land reforms. He also proposes to raise a loan of Rs. 7 crores from the market later in the year. Like Bihar, West Bengal too proposes to provide additional benefits for State Government employees — in West Bengal's case, these take the form of increased dearness allowance for Government employees as well as teachers of Government-aided schools, involving a recurring expenditure of Rs. 4 crores every year.

Central Assistance

The Finance Minister, Mr. S. Mukherjee's speech emphasised the need for further Central assistance to the State in view of the peculiar economic problems which West Bengal has been facing. During 1963-64, Central assistance amounted to Rs. 57.8 crores, and a similar order of assistance is expected during the next financial year. But in order to support his case for more Central aid, the Finance Minister pleaded that growing urban unemployment and underemployment in the countryside and the continuous influx of refugees made demands on the resources of the State which it was not in a position to meet. Moreover, as the progress of Plan schemes went, West Bengal had been ahead of any other State in India, and its per capita development expenditure was even higher than in Maharashtra where per capita taxation is much higher than in West Bengal.

West Bengal's employment problem is not only more difficult than it is in the other industrially advanced State of Maharashtra, but the problem has certain peculiar features. The former is much too over-populated, which explains the slow rate of growth in the per capita income in spite of further industrialisation. Between the years 1955 and 1962, the number of registered factories in West Bengal rose from 2,974 to 4,616, but in the decade 1951-61, the population increased to about 35 million from 26.3 million — a rise of 33 per cent against the all-India average of 21 per cent. West Bengal has practically no cultivable waste land, so any increase in the per capita income can come only from the industrial sector. Yet the percentage of workers to the total population has come down from 34.5 to 33.2 in the 1951-61 decade, whereas in the rest of India, the trend was in the reverse direction, the percentage of workers having gone up from 39.1 per cent to 43 per cent.

In the circumstances, West Bengal must strengthen and expand her industrial sector, and the Government has moved the Centre to locate more of the latter's industrial ventures in the State. The need to tackle the acute unemployment problem makes it imperative for the State to push ahead with the third Plan schemes. The Planning Commission has fixed the ceiling for West Bengal's Plan expenditure at Rs. 250 crores, subject to the condition that it could be raised by Rs. 43 crores more provided the State found the extra money from its own resources. (The State Government had originally submitted a Plan costing Rs. 341 crores). West Bengal has already raised more than the Rs. 90 crores which the Planning Commission has fixed as its share in a total outlay of Rs. 250 crores. In the circumstances, the Centre should raise its promised share of Rs. 160 crores by at least Rs. 27 crores. The State has to spend Rs. 9 crores on account of increased salaries for teachers and Rs. 31 crores on power development, since power shortage has proved a great impediment to industrial expansion in the State.



Looking Ahead

The Sachdev Committee has estimated the current requirements of power in the State at 1,184 MW; since the Committee made the estimate a couple of years ago, power requirements have increased by another 35 MW. Taking into account all the existing and new sources of supply including that from the D.V.C. the total deficit now amounts to 561 MW. To meet this deficit, the State Government has sanctioned power projects, including expansion of existing installed capacity, for a total capacity of 788 MW, but of this, a firm supply of 545 MW of salable power will be available from the end of the third Plan. It is also necessary to look ahead in matters like power generation, as the demand will undoubtedly grow with the progress of industrialization. The Central Government's Power Survey Committee has estimated that power demand at the end of the fourth Plan in West Bengal would be 2,200 MW. For this, the State Government would have to plan for more generating units, and it is estimated that a further investment of Rs. 200 crores would be necessary to raise power supply to the desired level by the end of the next plan period.

A significant statement by the Finance Minister in his Budget speech was about the role the private sector will have to play in the economic development of the State. "The State Government lays great emphasis on the role of the private sector in industrialization," Mr. Mukherjee said. The Government has decided to set up an advisory organization—a long-felt need—consisting of representatives of the Government and industry to review industrial prospects in the State. The Organisation will help remove bottlenecks of different types with the help of the State and Central Governments and "will devote itself to hastening the pace of industrialisation in the State." Mr. Mukherjee thinks that it will help private enterprise in many ways, particularly in getting over all the difficulties now being experienced in setting up new industries and expanding existing ones.

**

A review of the current economic problems of eastern India was made by Mr. A. R. Foster, President of the Bengal Chamber of Commerce and Industry, in his address at the Chamber's annual meeting last week. Mr. Foster emphasized the importance of this region to the economy of the country as a whole, but uncertainties in the supply of rice, the basic foodgrain for the region, and transport and power shortages were hampering economic activity in eastern India considerably. These deficiencies need to be removed quickly; otherwise, the region may not be able to continue its past year's excellent record in the export field. Another serious problem of the region, which Mr. Foster called the "first and greatest" is that of the city of Calcutta. This vast conurbation is at once the administrative nerve centre, the market, the manufacturing area and the port and distribution centre

for the greater part of the industries and enterprises which are to be found throughout the Eastern States. "We owe the great existing development of industry and trade in this area to its natural advantages and resources, but whether it will continue to develop and whether there will be, in particular, that great increase in secondary industry and trade which should naturally follow, will depend very materially on whether Calcutta's problems can, if not solved, at least be substantially ameliorated," Mr. Foster said. This is exactly what the World Bank has said about the role of Calcutta in the economic development of the region, but unfortunately, funds for developing the city on more modern and manageable lines have not been adequately forthcoming.

**

Tea is a major export commodity, which is mainly produced in eastern India. Its exports have gone up steadily over the past two years. In 1962, India exported 193 million kilograms of tea valued at Rs. 120 crores in foreign exchange; in 1963, the volume of exports went up to 223 million kilograms, earning Rs. 132 crores of foreign exchange. The prospects for the current year are not good, as the North Indian crop has fallen short and the price trend is less satisfactory. It was, however, good to hear Mr. B. C. Biyani declaring (in his presidential address) at the annual meeting of the Tea Packeters' Association that the trade is determined to increase packet tea export. But there is a special excise on packet tea, which Mr. Biyani rightly criticized as discriminatory. His view has been upheld by the Central Excise Reorganisation Committee. The Government apparently thinks otherwise. The excise has encouraged the selling of tea in loose form in the internal market, even though it is obviously less hygienic. Mr. A. S. Bam, chairman of the Tea Board, who also addressed the meeting, however, defended the special levy on the ground that it was meant to encourage the export of packet tea since the differential duty was refundable on export. The additional duty also reduced the burden on tea producers by spreading the collection of excise duty over two stages, thereby giving the benefit of deferred payment of a substantial portion of the excise duty. The single point collection of excise duty might cause hardship to the financially weak gardens. But Mr. Bam still gave no satisfactory explanation why the packeters must be placed at such a disadvantage against those selling loose tea in the internal market. Is it the Government's policy to promote exports at the expense of home consumers? The need for exports is admittedly great, but an industry like tea, so vulnerable to fluctuations in world demand, should not be made to depend on exports so completely. An internal market can serve as a great cushion for the industry in times of declining world demand, and should, therefore, be nourished, and not starved, as the present official policy appears to imply

Shortfall in Resources

From Our Correspondent

MADRAS :

THE ANDHRA PRADESH BUDGET for 1964-65 presented by Mr. K. Brahmananda Reddi on Friday last is in line with general expectations. With an agitation against the levy of higher taxes on land going on and the unwillingness of the various State Governments to levy additional taxation, the Andhra Pradesh Finance Minister also has chosen to adopt the line of least resistance in spite of the fact that there is a big gap to be closed and the next financial year is expected to finish with a sizable negative cash balance. The State's resources, however, have grown at a fast rate in the past few years and the revised estimates for the current year disclose a significant surplus of Rs. 2.31 crores on revenue account, there being an increase in receipts under the revised estimates by Rs. 10.69 crores. As the tempo of work on many projects was also quickened and additional sums were allotted for power projects, there was a net increase in expenditure on revenue account by Rs. 8.49 crores. With some increased allotments in the capital budget as well, the current year was expected to close with a cash balance of Rs. 1.84 crores against Rs. 2.46 crores at the end of 1962-63.

With the anxiety to implement many big projects in a short period and with the greater emphasis laid latterly on industrial development, there is now confidence that the Plan outlay for 1961-66 will be comfortably exceeded if only Central assistance was liberalised in respect of the Nagarjunasagar Project. Even otherwise, the total outlay for the third Plan had been raised by Rs. 7.7 crores to Rs. 312.70 crores. By the end of 1963-64, it is estimated that an expenditure of Rs. 166.22 crores would have been incurred leaving a balance of Rs. 146.48 crores to be spent in the remaining two years. The State Government had, therefore, suggested to the Planning Commission that the allotment for the financial year be fixed at Rs. 72.54 crores. The latter felt, however, that there should be a pruning of these allotments as the required resources were not in sight. The State Government has, nevertheless, decided to stick to its original allotment of Rs. 72.54 crores as otherwise the effort required to complete the target in the final year would be something beyond the capacity of the administration.

The higher level of Plan expenditure, the grant of additional dearness allowance to the Government employees drawing salary upto Rs. 300 per month, the extension of the compensatory allowance to a larger number of Government employees and the revision of pay scales on the basis of the recommendations of the Two-man Committee would naturally be reflected in a much higher level of expenditure. It is no doubt expected that gross borrowing through open market loans would be Rs. 11 crores, the same as previously, even though it is not yet clear what would be the decision of the Central Government in regard to the method of raising loans. Receipts are expected to increase by Rs. 6.95 crores over the revised estimates for the current year to Rs. 136 crores even with existing taxation. Some of the measures introduced last year and the revision of the sales tax structure will be helpful in bringing about larger receipts. But even without providing for the payment of additional dearness and compensatory allowances, it was expected that there would be only a nominal surplus of Rs. 15 lakhs while there would be a big deficit in capital budget resulting in a negative cash balance of Rs. 3.29 crores. The overall deficit was estimated at Rs. 5.13 crores after utilising the small revenue surplus. The deficit, however, would now be increased to Rs. 5.23 crores because of the payment of additional allowance to the employees in the next year by Rs. 1.94 crores.

It is not clear how and why the deficit has been left uncovered. It is probably expected that the Central Government would be agreeable to provide larger assistance for the Nagarjunasagar project though it is not known whether it would be prepared to implement this project as a Central undertaking. It has actually been urged by Mr. Brahmananda Reddi that, pending a settlement of the problem, the recovery of interest charges on the Central loans for Nagarjunasagar project should be postponed. What exactly will be the deci-

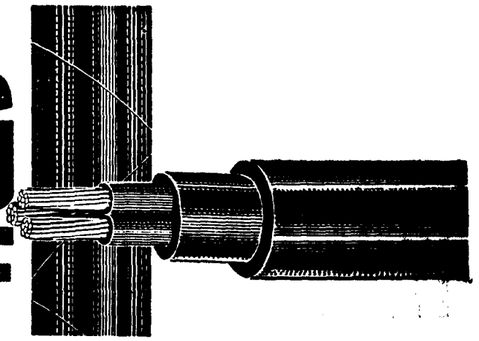
sion of the Centre remains to be seen. But there is force in the argument put forward by the Andhra Pradesh Government, as the expenditure incurred on this mammoth project by the end of this Plan would have aggregated to Rs. 90 crores while another Rs. 50 crores would have to be spent during the next Plan. It will take a long time for the results out of this large expenditure to be realised. It has, therefore, been complained that the outlay on this scheme, which is costing nearly one-sixth of the budget on plan account every year, has prevented the Government from embarking on other big schemes which would yield quicker results and benefit the local population immediately.

The Nagarjunasagar project has, no doubt, to be developed in the present circumstances. with greater vigour. But it would be worthwhile to examine whether besides this project, other medium-sized schemes can be undertaken and a much larger increase in production achieved during the next few years. While this is necessary from the national angle, the State Government would appear to be more anxious to develop the industrial sector and install additional capacity for generating electricity. The impact on plan expenditure of these and the industrial sector has so far been not quite significant.

Distinct Improvement

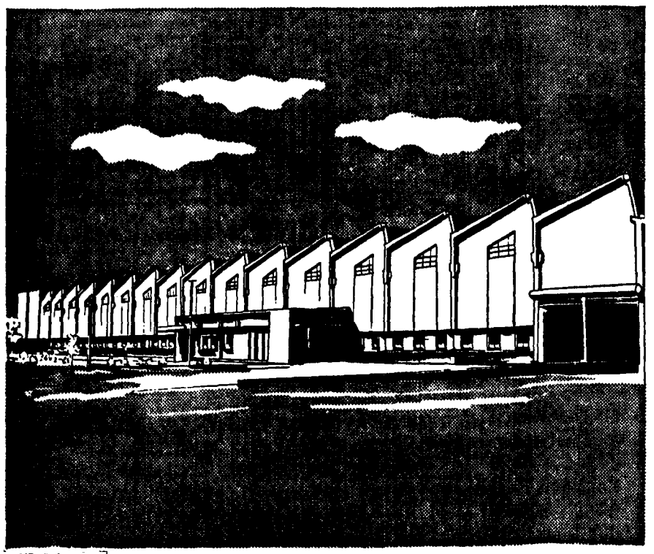
But it is now expected that the Central projects will take shape in the next two years and there will be a distinct improvement in the power situation with the installation of the second gas turbo set and the commissioning of new units under the Tungabhadra Hydro Electric scheme. The thermal unit at Nellore also will start functioning in a short period. But the real improvement in power situation will come about only when the thermal stations at Ramagundam and Kothagudem are completed in the next two years and about the same time many industrial projects will reach the production stage. The huge factory of Coramandel Private Limited alope will consume large quantities of power. It will be located at Visakhapatnam. Arrangements are being made to construct another fertilizer plant at Kothagudem. Mr. Brahmananda Reddi has stated that efforts are being made to erect a huge steel plant at Visakhapatnam. For meeting the water requirements of steel plant the Railway Reservoir scheme has been investigated and the project report sent to the appropriate authorities. A similar report on the Meghadri-Gadda scheme is under preparation and would be sent to the Centre soon. It is emphasised that the location of a large steel plant in the State would stimulate the growth of a number of ancillary small-scale industries throughout the region and will have a catalytic effect. Mr. C. Subramaniam himself has been pointing out to the need for a coastal-based steel plant, and it will be interesting to know what will be the ultimate decision of the Central Government. In the private sector, the cotton textile industry is expected to grow considerably in stature while there will be a large number of sugar and cement units and various other factories are under construction and there will be a jump in the output of chemicals and fertilisers. The whole character of the economy might undergo a major change in the next few years.

★★



The absence of any fresh taxation in the State Budgets presented so far, with the exception of West Bengal, has given rise to the feeling that other State Governments too might be unwilling to impose fresh taxes and court unpopularity. The Madras Budget is to be presented on the same day as the Central Budget. It is very unlikely that Mr. Bhaktavatsalam will decide to levy additional taxes as only last year new heavy levies were imposed. The absence of surprise in State Budgets has naturally led to greater activity in the stock markets and plantation shares are very active. In the past few days, there has been a definite firming up of prices following encouraging advices from Bombay. As the Union Finance Minister has chosen to take a deliberately optimistic view of the immediate outlook and the impression has gained ground that, apart from there being no additional taxation, there may be possible tax reliefs, a further sharp rise in prices for select scrips has been recorded. Textiles shares like Madura Mills, Travancore Rayon and South India Viscose have been very active while many other industrials like India Cements, Aluminium Industries, Ashok Leyland and Mettur Chemicals have been outstanding. The last mentioned scrip has come for active buying on reports of excellent working results in the current accounting period and, with the firmer trend of chemical shares in Bombay. It is reliably learnt that the profits of Mettur Chemicals in the first half of 1963-64 are even slightly higher than the profits for the whole of 1962-63. The directors have, naturally, decided to maintain the interim dividend on an increased equity capital and it is generally expected that there will be no difficulty in servicing a larger capital in the next year even though the new caustic soda factory will be in full operation in 1965-66 and the benefit of the programme for manufacturing chlorine based chemicals will also be reflected only in the results of the subsequent year. The recent issue of equity shares for Rs. 60 lakhs is stated to have been considerably over-subscribed. Those who had applied for additional shares will receive only partial allotment. The preference issue was not fully taken by the existing shareholders. But the Life Insurance Corporation has offered to take up the unsubscribed balance with the result that Mettur Chemicals has been successful in raising the large sum of Rs. 1.80 crores in preference and equity shares in a short period. This is indeed a gratifying achievement.

★★



In the Budget proposals of the Madras Corporation for 1964-65, it has been suggested that the professional tax of Rs. 2|- levied on those belonging to the lowest income groups should be removed while Corporation employees receiving salaries up to Rs. 400 per month should be given an additional house rent allowance of Rs. 5 per month. There are also proposals for providing mid-day meals for a larger number of school children while more schools are to be opened for girls. These proposals had been made by the D.M.K.-dominated committee with a view to winning votes though the proposals will be finalised only when the new Council comes into being early in March. On the basis of existing taxation, it is expected that there will be an increase in revenue to Rs. 6.26 crores from Rs. 5.76 crores in 1963-64. It is estimated that there will be a deficit of Rs. 6 lakhs, same as previously. There will not be really any loss on account of the removal of professional tax in the last bracket as the existing staff can concentrate on the collection of arrears of professional tax which are outstanding for a long time and for heavy sums. The Corporation has obviously to streamline its own organisation and make the best use of available funds as, with the helpful attitude adopted by the State Government and growing revenues, it is in a position to do much better service for the citizens of Madras. The newly elected Council could probably bestow greater attention to many outstanding problems.

ANNOUNCING THE OPENING OF UNIVERSAL CABLES LTD.

IN COLLABORATION WITH BRITISH INSULATED CALLENDERS' CABLES LTD., U.K.

A Birla enterprise collaborates with a British organization - BICC - the largest cable manufacturers in the world - to produce cables of the highest quality for India. Paper-insulated mass-impregnated non-draining cables, thermoplastic cables, cables for power, cables for control, cables for railway signalling, cables for mines, cables for every industry.

The latest BICC technical know-how, the most up-to-date machinery and a completely air-pressurised factory-the first in India—all these guarantee power cables equal to the world's best in quality and performance.

This inauguration has a two-fold significance: it marks a milestone in India's endeavour to become self-reliant in power cables, and secondly, Universal's turnover of three crores a year saves substantially in foreign exchange.

The plant was inaugurated by Shri C. SUBRAMANIAM, Union Minister for steel, Mines and Heavy Engineering, on Sunday, February 16, 1964.

The moving finger writes

THE BUSINESS world seems to have developed a split personality in its attitude to the impending Central budget. One part of it seems determined to be cheerful—and I am not referring simply to the stock exchanges where I see that the bulls are adventurous without being reckless. The Finance Minister has deliberately been building up a climate of expectations over the past many months. Taking as his base the Mid-term Appraisal of the third Plan, which has drawn attention to the slackened growth of the economy, Mr. Krishnamachari has been proceeding step by step in the direction of building up a pattern of corrective action. So far, he has performed a little and has promised a lot. Naturally the public and the business community expect his forthcoming budget to make a significant contribution towards the fulfilment of the hopes he has sedulously fostered.

This apart, there is great respect all over the place for Mr. Krishnamachari's knowledge and technical skill where the management of the economy is concerned. Consequently, the natural expectation is that his budgetary policies would make a reasoned and reasonable contribution to stimulating the economy. The Finance Minister has made no secret of his desire and determination to practise economic growthmanship.

At the same time, in another part of its mind, the business community is equally naturally harassed and harried by fears and anxieties. The frequent references by the Finance Minister to what he has been describing as "unaccounted money," the apprehension that, following the Bhubaneswar session of the Congress Party, pressure might be brought to bear on the Government to speed up socialist policies and the shadow cast in advance by the coming Mahalanobis Report on the distribution of wealth and economic power in the community have all combined to produce a certain amount of nervousness. As a result, there are many areas in the business world where it is felt that although the economic policies of the Central budget might, on the whole and in the long run, promote economic growth, there could still be in it specific decisions which could produce an adverse reaction on investment and enterprise. Symptomatic of this nervousness was the persistent rumour that, as a measure of proceeding against "unaccounted money," the Finance Minister might decide to demonetize hundred-rupee notes. The Reserve Bank has rightly come forward to deny any such intention on the part of the Government, and while this may give the quietus to this particular gossip, it is clear that until Budget Day, there is bound to be a lot of speculation over how the Finance Minister might propose to deal with the problem of "unaccounted money" which he has been talking about so long.

**

Incidentally, there have been reports that the Congress High Command (or the Congress President) has written to the Finance Minister suggesting that he should take note of the Bhubaneswar proceedings in framing his budget proposals. This account is more fanciful than factual. What seems to have happened actually is that it was mentioned in the Working Committee that the Government should take note of the Bhubaneswar Resolution on Democratic Socialism and also the Congress President's speech in framing its economic policies in and through the Central budget. The Prime Minister seems to have responded by saying that a copy of the Bhubaneswar proceedings referred to might be sent to the Government and on being asked further to whom exactly this should be sent, he had reportedly mentioned that the copy might be sent to the Finance Minister. Following this, one of the General Secretaries of the All-India Congress Committee seems to have forwarded the Bhubaneswar papers to Mr. Krishnamachari with a formal covering letter. It may perhaps be added here that any direct attempt by the Congress Party (or any office-bearer of that party) as such to influence the budget proposals through a direct communication to the Finance Minister might be a breach of the conventions to which parliamentary government must conform. It is, therefore, gratifying to learn that no impropriety has been committed.

**

Mr. Swaran Singh's attempt to play sugar daddy to the public is surely sickening. Everybody seems to know, barring the Food and Agriculture Minister, that the output of sugar this year is most unlikely to be more than between 2.5 million and 2.6 million tons, and yet Mr. Swaran Singh has been naive enough to inform State Governments that their sugar quotas might have to be reduced since sugar production is not likely to reach 3.3 million tons. The Food and Agriculture Minister ought to be aware by now that fancy figures such as "3.3 million tons" or even the "three million tons" which he mentioned in Parliament a few days ago, have ceased to have any relevance to current trends in sugar output. If, nevertheless, he refuses to face facts, it must be due either to his inherent mental laziness or his characteristic weakness for believing that all evil could be simply wished away.

I had always felt that Mr. Swaran Singh was not the Minister for portfolios which called either for really imaginative planning or for detailed and arduous home work. In my view, his custodianship of the Steel portfolio during the formative years of the steel development programme has certainly had a lot to do with all the delays and disappointments the nation has had to put up with in that vital sphere. Now, for no reason that I can think of, he has been picked by the Prime Minister for the job of putting the nation's agriculture on its feet. I should certainly be surprised if he proves that he can do the pulling and pushing which the task demands.

It is true that Mr. Swaran Singh has not been long enough in the Food and Agriculture Ministry to show results, but the point is that he seems to have been there long enough to have learnt already to complain that the weather is letting him down. I suggest that the Prime Minister should now proceed to make the Weather God our Food and Agriculture Minister. After all, those primitive peoples who turned to worship the Sun and the Moon, or the Tree and the Snake, or the Clouds that did not come, or the Winds that would not blow, knew what they were doing.

V.B.

Trade Winds

TRADE POLICY FOR DEVELOPMENT

A REPORT presenting the main issues facing the United Nations' Conference on Trade and Development (which will meet in Geneva from March 23 to June 15, 1964) has been issued by the Secretary-General of the Conference, Mr. Raul Prebisch. The objective of the conference is to formulate a new trade policy for development. The export of primary commodities in general is expanding relatively slowly while the demand for imports of manufactured goods has tended to grow rapidly. The resulting imbalance constitutes a serious external bottleneck which will have to be eliminated if development is to be accelerated.

One of the objectives of the United Nations Development Decade is to attain average annual growth rate of five per cent in the income of developing countries by 1970. This target is not much higher than the 4.4 per cent rate of the previous decade. The rate of growth of five per cent can in no sense be considered fully satisfactory because it would mean an annual rate of increase of only 2.6 per cent in average per capita income, in view of the rapid rate of population growth which tends to slow development. Nearly half of the capital invested in the developing countries goes to meet the needs of this increased population; hence there are less resources available for raising the overall level of living. At the rate of five per cent, unless population growth slows down, it would take 80 years for the developing countries to reach the present average per capita income level of Western Europe and approximately 40 years more to reach that of the United States. For the least advanced countries, accounting for one-half of the population of developing areas, the period of time required to reach the present West European standards would be not less than 200 years.

The report points out that it would be extremely difficult, if not impossible, for many developing countries to reach the growth rate of even five per cent unless ways can be found to eliminate the growing gap between their export earnings and their import needs. External resources of the developing countries can be increased through additional exports of primary products, through more exports of manufactures or through additional foreign aid. As an essential condition for success, the various measures adopted should be integrated to achieve a rate of growth of the external resources of developing countries which, given the terms of trade, should be sufficient to enable them to obtain the level of imports rising by at least six per cent per annum every year.

Dealing with primary commodities and industrial goods of the developing countries, the report states that quantitative targets should be set for their entry into the markets of industrial countries. On the subject of industrial preferences, it is suggested that, within a pre-determined value, the industrial countries should establish a quota for admitting manufactured goods from the developing countries free of duty, but they could exclude a schedule of items, constituting a reasonable percentage of the total goods they import, from these perferences. Manufacturers from developing countries thus excluded from the scope of preferences should be admitted by the industrial countries on the usual most-favoured-nation basis. All the developing countries, regardless of their level of development, would be eligible to avail themselves of the preferential system until the relevant quota is reached. But there would have to be periodic review of the flow of exports; and if exports from one or more countries increased so much that they did not leave sufficient room for those from the others, limitations could be imposed.

The report also suggests that preferences granted by developing countries to the industrial countries should be brought to an end. Two kinds of measures—commodity agreements and compensatory financing—are envisaged, in the report, to guarantee the purchasing power of exports of primary commodities. Commodity agreements are recommended as a means of improving prices and maintaining a price parity with manufactures. Compensatory financing is imperative to the extent that it may not be possible, through commodity agreements, to prevent the exporting countries from suffering losses because of deterioration in the terms of trade. The compensatory resources might form part of a fund administered by international credit institutions, at either the international or the regional level, in accordance with the rules approved by governments.

Discussing groupings of developing countries, the report adds that, in order to encourage industrialization and to pursue a more rational import substitution policy, developing countries should form preferential groupings on as broad a scale as possible. These groupings should be supplemented by payments agreements between their member countries. The GATT rules now in force would have to be amended to take into account the consequences or the structural inequalities between industrial and developing countries.

GLASS AND CERAMICS

Inaugurating the reconstituted Development Council for glass and ceramics in New Delhi, the Minister of Industry, Mr. Nityanand Kanungo stressed the importance of developing indigenous technical know-how and of creating agencies for the training of technical personnel. The Minister stated that the production of glass and glassware had increased from 100,000 tonnes in 1953 to 250,000 tonnes in 1963. He added that during the past ten years, the installed capacity for the refractory industry had increased from 300,000 tonnes to nearly 900,000 tonnes per annum and that the industry was confident of achieving its third Plan targets.

Glass, ceramics and refractories together account for an annual turnover of over Rs. 50 crores. These are essentially feeder industries, catering to basic industries like iron and steel, chemicals, drugs, automobiles, etc. In addition, the ceramics industry also provides materials for construction, sanitation, electric generation and many other industries.

The ophthalmic glass and lenses are proposed to be manufactured in the public sector at Durgapur in collaboration with the U.S.S.R. The factory, which will have a capacity of 300 tons per annum, is likely to go into production in the beginning of the fourth Plan. Other items which will be produced for the first time are glass fibre, improved type of laboratory glassware, glass insulators and plate glass. Even small items of glass and glassware such as tubes and rods for thermometers, syringes and instruments have been given special encouragement for production so that all types of glass and glassware should be made in India by the close of the third Plan.

INDO-PHILIPPINES TRADE

An official Indian delegation, which visited the Philippines early this month to explore possibilities of expanding trade and economic co-operation between the two countries, had talks with the Philippines Government. It was agreed that the two Governments should encourage mutual visits of businessmen. The Indian delegation extended an invitation to the Philippines Government to send a trade delegation to India.

INDO-BULGARIAN TRADE PACT

A new five-year trade and payments agreement between India and Bulgaria has been signed. The agreement, which is operative from January 1, 1964, envisages trade both ways of about Rs. 9 crores in 1964 and Rs. 10.5 crores in 1965. The total trade both ways in 1963 was worth Rs. 6.2 crores. Bulgaria will buy from India engineering goods including tropicalised motors, diesel engines, pumps and sewing machines, drugs and pharmaceuticals, chemical products, cotton textiles, leather sandals (chappals), rolled steel products, tyres and de-oiled cakes apart from traditional items like tea, coffee, jute manufactures and shellac. India will continue to import from Bulgaria electric hoists, cranes, power cables, transformers, steel products, machine tools, ball bearings, mining locomotives, automatic looms, battery-operated trucks, pig iron, zinc, chemicals, capital goods etc.

WAGE BOARD FOR BANK OFFICERS

Addressing a Press conference in New Delhi, the President of the All India Bank Officers' Association, Mr. R. C. Chakraborty, said that they had suggested to the Union Labour Minister to appoint a wage board to look into the service conditions of banks' officers. He said the proposal would necessitate major changes in the provisions of the Industrial Disputes Act, 1947, so that the supervisory staff in banks may be brought under its purview. According to Mr. Chakraborty, the aim of the Association was to have one national organization of the employees of the banking industry—from "messengers to managers"—on the British pattern. At present, the nomenclature "supervisory staff," instead of "workmen," excluded bank officers from the purview of the Industrial Disputes Act.

COST INFLATION

Commenting upon the Railway budget, the President of the Bharat Chamber of Commerce, Mr. H. S. Singhania, said that it was unfortunate that the railways, being the largest public sector undertaking, should have thought it proper to give a lead in releasing a cost-push force in prices by the promulgation of two per cent surcharge on goods freight. Mr. Singhania added that the incidence of freight was aggravated due to loss on pilferage and the usual charging of wagon freight on capacity basis irrespective of the average lower wagon-load. Among the items of exemption export commodities had not been included. This was anomalous because, on the one hand, the Government professed to promote exports and, on the other, imposed fresh burdens on the cost structure of exportable goods. Specific concessions granted to a few items could not extricate the export goods from the general cost-push.

SUGAR MILLS PROTEST

Apropos the proposed increase of two per cent in goods freight in the Railway budget for 1964-65, the Committee of the Indian Sugar Mills Association, Calcutta, has represented to the Railway Minister that the freight on sugarcane which was already very high and which had to be borne by the growers, was adversely affecting cane supplies to the factories by encouraging cane diversion to gur and khandsari. The Committee has, therefore, urged for exemption of sugarcane from the proposed increase, in the interest of increased sugar production.

ORE TO JAPAN

The Kiriburu and Bailadila mines are scheduled to start exports of iron ore in 1964 and 1966, respectively. These projects have been taken up with the active collaboration of our largest buyer, Japan, which has contracted to buy six million tons of ore per year from these two mining areas on a long-term basis. According to a 10-year agreement signed on March 19, 1958, Japan contracted to purchase 20 million tons of iron ore from Kiriburu mines. According to the 15-year contract that Japan signed with the Minerals & Metals Trading Corporation on March 6, 1960, iron ore totalling 60 million tons will be exported to Japan from Bailadila mines.

COAL DEVELOPMENT

Preliminary work is in progress on the National Coal Development Corporation's second deep-shaft mining project at Monidih, located in the northern part of the central Jharia region. Like Sadamdih, this project is also being developed with Polish collaboration. Prospecting and drilling work has been completed and the project report is expected soon. A feasibility report for the project has already been received from "CEKOP", a Polish firm. For the first time, a regional integrated planning scheme is being evolved in this region to set up a model colliery township with adequate facilities for communication, electricity, water, sanitation and community welfare. This would serve as a pattern for all coal mining townships to be developed in the central Jharia region which has enormous potentialities for coking grade coal.

ELECTRO-NICKEL

An improved form of primary nickel in strip form for coinage applications has been developed by the International Nickel Company of Canada, Limited. Known as "electro nickel" strip, it is of uniform gauge and is comparable to wrought nickel in mechanical properties and ease of fabrication. It is of special significance to the mints throughout the world that the improved strip will substantially reduce the cost of producing pure nickel coins. The cost to the mint of making finished nickel coins will be reduced by about 30 per cent.

AUSTRALIAN WHEAT

India has signed a contract for the purchase of 1,71,000 tonnes of Australian wheat which will be shipped to this country before the end of June, 1964. According to Mr. Moroney, the Chairman of the Australian Wheat Board, India is regarded as a traditional and valuable customer for Australian wheat and in recognition of this fact, the Board has reserved a substantial quantity of wheat from the 1963-64 crop, in case India should require it this year.

JUTE PRODUCTION

The Union Ministry of Food and Agriculture, in its All India Final Estimate of Jute for 1963-64, has put the current year's area and production of jute at 21,30,000 acres and 59,10,000 bales (of 400 lbs. each) respectively. As compared with the partially revised estimates for 1962-63, the estimates for 1963-64 show an increase of 1.3 per cent in area and of 9.3 per cent in production. The yield per acre during the current year works out to 1,110 lbs. as against 1,028 lbs. of last year, showing an increase of 3 per cent. The increase in area has been reported by West Bengal and Orissa and is attributed to favourable weather conditions at the time of sowing this year as compared to last year. The increase in production is shared by Assam, West Bengal and Orissa and this is also attributed to more favourable weather conditions during the period of growth of the crop.

EXPORTING FOOD PRODUCTS

Indian bananas made their first appearance in the Soviet Union in November, 1963. Out of the 11,000 tons shipped to Odessa, 300 tons went to Moscow. The Indian bananas were highly appreciated by the Russians who are looking forward to increased supply from India in the near future. The Soviet Union has also placed orders for canned pine apple and canned mango, and mango and pipe apple juices from India during the current year. The only organization authorised to handle imports of fruit products into the Soviet Union is "Prodintorg (G-200, Moscow)."

Company Affairs

NATIONAL AND GRINDLAYS BANK

LORD ALDINGTON, Chairman, National and Grindlays Bank, in a statement circulated with the annual report of the bank spoke highly of the remarkable leadership provided by Mr. J. K. Michie during the last 18 years which had brought this bank to the present dimensions in its centenary year. To provide an idea of the task accomplished by Mr. Michie, the Chairman, stated that in 1946 the bank's deposits were around £62 million which by the end of 1963 were nearly £283 million. The advances during this period increased from £13 million to the present figure of £160 million. The bank spread its operations widely so that its branches increased from 163 as against 29 in 1946. It is, indeed, a magnificent record and Lord Aldington expressed his sentiments rightly when he said that he was glad to have Mr. Michie as his colleague on the board of directors.

In its centenary year the bank has achieved an envious position by having its assets at £356.9 million. Profits at £679,318 were not as high as in 1962 but the positive aspect of this performance was that the bank's profits from its widely separated branches overseas were higher this year than the previous year. Out of these profits, a sum of £150,000 has been placed to reserve fund. The half-yearly dividend proposed was unchanged at seven per cent making 14 per cent for the year.

Lord Aldington touched briefly the performance of the Finance and Development Corporation Limited, a subsidiary company, which recorded a profit of £29,301. During the year under review the capital of the Corporation was increased by the issue of 500,000 new shares of £1 each fully paid. Its resources were also increased by borrowing outside the bank. The fixed term loans granted in the last 15 years have been of considerable benefit to the overseas customers of the bank in the public and private sectors and have proved of lasting advantage to the economies of these countries.

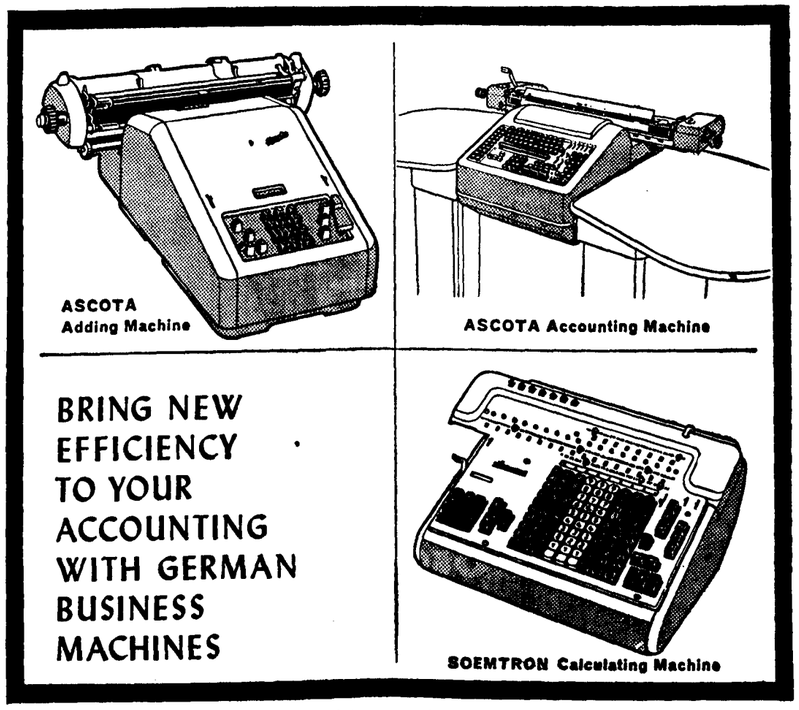
The Chairman pointed out that in its second year, the Exporters' Refinance Corporation Ltd. made a marginal profit. Its turnover increased gradually and new exporting customers made use of its services so that fresh facilities were provided to encourage exports. Lord Aldington stated that in the context of the Indian economy the bank always wishes to play its part in financing India's exports as it has been doing in the case of her main crops for the last 100 years. He welcomed the creation by the Government of India of the new Export Credit Guarantee Corporation Limited.

The Bank has accelerated its drive for an increase in its deposits in the light of the new banking legislation which will raise the level of minimum holding of government securities after September 16, 1964. If the bank does not increase its deposits, the new legislation is bound to affect its ability to lend and its earning power. The Chairman pointed out that a high level of industrial investment in India, although financed partly by foreign loans, inevitably put a further strain on the banks when the money conditions were tight. The Industrial Development Bank which is to be created shortly following legislation will be of considerable help in this respect.

Referring to the Bank's growth in some other Asian countries, the Chairman indicated that Burma and Ceylon posed serious handicaps to its operations. In Burma, nationalisaion took away its business in February, 1963. A settlement on compensation was made and the bank was paid K. 500,000 which represented a loan granted by the bank to its Rangoon branch. But the settlement of its main claim for compensation has not yet been finalised. In Ceylon the bank offered a large part of its loans and overdrafts to Ceylon nationals and also offered help to small scale industrial enterprises approved by the Government. Soon, however, its operations were hampered by the restrictions placed on the opening of new accounts by the Ceylonese nationals. Naturally, the deposits of the bank declined during the year. Its performance in other countries like Pakistan, Kenya, Uganda, however, improved considerably.

STATE BANK OF PATIALA

The annual report of State Bank of Patiala reveals an all round progress achieved during the year ended December 31, 1963. Deposits reached a figure of Rs. 17.29 crores as against Rs. 13.41 crores at the end of the previous year. It may be added that a major increase was achieved in fixed deposits. During the same period advances also increased to Rs. 6.50 crores as against Rs. 4.30 crores last year. This was a significant improvement in the performance of the bank in the sense that the ratio of advances to deposits improved to 37.59 per cent as against 32.07 per cent at the end of 1962. The gross earnings for the year were around Rs. 88.08 lakhs as against last year's figure of Rs. 72.42 lakhs. This improvement was reflected in the year's profits. After making necessary provisions, the net profit recorded was nearly Rs. 5.35 lakhs against last year's Rs. 3.12 lakhs. The directors have proposed to transfer a sum of Rs. 1.50 lakhs towards reserve fund, Rs. 1.97 lakhs towards bonus to staff and Rs. 10,000 towards staff welfare fund. The directors have proposed the payment of a dividend at the rate of five per cent per annum which will absorb Rs. 1.75 lakhs. The authorised capital of the bank at Rs. one crore and the issued and paid-up capital at Rs. 35 lakhs remained unchanged. The entire issued capital of the bank comprising 35,000 fully paid-up shares of Rs. 100 each continues to vest in the State Bank of India. With the transfer of Rs. 1.50 lakhs from the profit of the current year, the reserve fund now stands at Rs. 26.70 lakhs and is 76.29 per cent of the paid-up capital.



The improvement in the bank's performance was witnessed in terms of its area of operations too as the year was marked by the opening of seven new branches at Goraya, Jhajjar, Kalka, Kharar, Ludhiana (Millerganj), Rajkot and Simla so that by the end of 1963 the bank had as many as 63 offices as against 56 last year. As in the past, the bank continued to extend facilities to small-scale industries and the total credit limits sanctioned during the year rose from Rs. 78.82 lakhs to Rs. 110.04 lakhs and the number of units financed from 89 to 122. It also extended facilities to the co-operative institutions. The total credit limits sanctioned to co-operative institutions increased from Rs. 65.68 lakhs to Rs. 69.05 lakhs during the year under review. The number of units financed doubled to five. Warehouses of the Punjab State Warehousing Corporation and Central Warehousing Corporation within the operational area of the bank were sanctioned credit limits aggregating Rs. 88.50 lakhs to 110 parties at 34 warehousing centres as compared with Rs. 87.77 lakhs to 109 parties at 24 warehousing centres at the end of the previous year.

BAJAJ TEMPO

The directors of Bajaj Tempo Ltd. have reported that their company's issue of Rs. 29 lakhs made up of 290,000 equity shares of Rs. 10 each has been over-subscribed. It entered the market on February 10. The proceeds of this issue are to be utilised for its expansion.

P. S. BALL BEARING

P. S. Ball Bearing Company Limited proposes to enter the capital market shortly to raise Rs. 25 lakhs from the public to finance its Rs. 110-lakh project. It has an authorised capital of Rs. 2 crores—Rs. 150 lakhs in 1,500,000 equity shares of Rs. 10

Let these upto-date, reliable machines take over the tedious lengthy calculations of your business. It means greater accuracy combined with substantial savings in time and manpower.

ASCOTA ACCOUNTING MACHINES
For automatic handling of complete accounting procedures.

CELLATRON, SOEMTRON, ASCOTA CALCULATING & ADDING MACHINES
For arithmetical and statistical calculations. Various models available to suit practically every type of calculation.

each and Rs. 50 lakhs in 5,000 (9.3%) preference shares of Rs. 100 each. The issued capital is Rs. 60 lakhs of which equity shares of Rs. 25 lakhs have been subscribed by directors, their friends and associates and preference shares of Rs. 10 lakhs will be taken up by the Punjab Government. The balance of Rs. 25 lakhs in 250,000 equity shares of Rs. 10 each will be offered for public subscription. It proposes to set up a factory near Ballabhgarh in Punjab to manufacture different types of ball bearings, It has entered into a technical collaboration agreement with Osaka Bearing Manufacturing Company Limited, Japan. The production is expected to commence this year.

INTERNATIONAL INSTRUMENTS

The inauguration of production at the International Instruments Limited was performed by the Governor of Mysore recently. This unit located in Bangalore proposes to manufacture a group of vital ancillary automobile components called dashboard instruments. It comprises speedometer, pressure gauge, vacuum gauge, temperature gauge, ampere meter, etc. Two other important items being manufactured by the company are speedometer cables and tachograph. It may be added that tachograph is a valuable badget for road safety in all heavy vehicles as it records every movement of the vehicle during the 24 hours of the day and, therefore, is a watch-dog against speed and careless rash driving. The unit has been established in technical and financial collaboration of the German firm. Messrs. VDO Tachometer Werke Adolf Schindinv G.m.b.H. These instruments produced by this company are already on the road as original equipment of Mercedes Benz and Leyland vehicles, Hindustan Motors, Bedford trucks, Standard cars, Enfield three-wheelers, etc.

BANK OF INDORE

The deposits of the State Bank of Indore recorded an increase of six per cent. from Rs. 11.99 crores to Rs. 12.70 crores during 1963. The advances during this period rose from Rs. 7.05 crores to Rs. 7.88 crores. Income from interest and discount increased from Rs. 56.34 lakhs to Rs. 63.56 lakhs and that from commission, exchange and brokerage from Rs. 8.18 lakhs to Rs. 10.90 lakhs. The net profit of the bank after making usual provisions amounted to Rs. 5.53 lakhs against Rs. 5.14 lakhs last year. During the year the bank opened three more branches making a total of 34 at the close of 1963.

INDIAN ALUMINIUM

The directors of Indian Aluminium Company Limited have recommended the payment of a final dividend of rupee one on each ordinary share (in respect of which the par or nominal value has been fully paid up) and a dividend of Rs. 6.25 on each preference share, both subject to taxation, for the year 1963. Sales during the year amounted to Rs. 13.89 crores against Rs. 10.50 crores during 1962. Net profit for 1963 was Rs. 1.60 crores after providing for Rs. 1.24 crores in depreciation and depletion, Rs. 7.50 lakhs for Development Rebate Reserve and Rs. 2.15 crores for income-tax and super profits tax compared to Rs. 1.26 crores net profit after providing for Rs. 1.06 crores for depreciation and depletion, Rs. 61.50 lakhs for Development Rebate Reserve and Rs. 52.50 lakhs for income-tax for 1962. The increase in the volume of sales and profit during 1963 was due largely to the extra output obtained from the production facilities commissioned during 1961 and 1962. Currently the Company is engaged in the construction for the expansion of the smelting capacity at Alupuram to 10,850 tonnes of aluminium ingot per annum and the establishment of an aluminium foil rolling mill at Kalwa in Maharashtra with a capacity of 2,500 tonnes per annum. The construction is proceeding according to schedule and the new production facilities are expected to be commissioned by 1965. During 1963 the Company was granted industrial licences for a further expansion of the Alupuram smelter to 15,850 tonnes per annum, and for installing a rod mill for the conversion of this additional smelter output of 5,000 tonnes ingot into electric conductor rods. Initial steps have been taken for the implementation of these plans.

ELGIN MILLS

The annual accounts of the Elgin Mills Company Limited for the year ended September 30, 1963 reveal a profit of Rs. 69.58 lakhs. The directors have proposed to separate a sum of Rs. 14.05 lakhs towards depreciation, Rs. 8.59 lakhs towards development rebate reserve, Rs. 8 lakhs towards provision for previous year's tax and Rs. 23 lakhs towards provision for taxation for the year under review. They have also transferred Rs. 9.50 lakhs towards rehabilitation reserve and Rs. 13.44 lakhs towards dividend reserve. They have recommended dividend on ordinary and vendors shares at the rate of Rs. 1.75 per share of Rs. 10 each, subject to tax. This will absorb Rs. 11.03 lakhs.

Although there was an increase of Rs. 92 lakhs in sales which touched a figure of Rs. 722.55 lakhs, the profit was slightly lower because of a rise in the prices of cotton, increased labour cost and general rise in price of all stores. The directors have pointed out that the prices obtained for finished goods could not be increased due to voluntary price control on cotton textiles. Moreover, substantial orders received from the Government for defence requirements were executed on marginal profits. The company carried out its programme of renovation and modernization. The installation of additional 12,000 spindles is proceeding satisfactorily and these are likely to go into production by the end of September 1964. The company proposes to install a further 6,500 spindles in accordance with the permission granted by the Government to all textile mills to install additional spindles to the extent of 7½% per cent. of their existing capacity.

DALMIA IRON & STEEL

The directors of Dalmia Iron and Steel Limited have announced a profit of Rs. 40.09 lakhs during the year ended September 30, 1963 as against Rs. 33.65 lakhs during the previous year. A sum of Rs. 13.36 lakhs was provided for depreciation and Rs. 8.75 lakhs for taxation. The directors have proposed to transfer Rs. 4.50 lakhs towards development rebate reserve, Rs. 4.50 lakhs towards general reserve and Rs. 10 lakhs towards dividend equalization reserve. They have recommended the payment of dividend at the rate of Rupee one per share, subject to deduction of tax, which is to be paid out of the dividend equalization reserve.

It is reported in the annual review that the three tons arc furnace commissioned in November 1962, is running only at 33 per cent of its rated capacity due to the non-availability of power. After the installation of extra feeder by the Calcutta Electric Supply Corporation Limited, and the revised allocation of power by the Government of West Bengal, power supply did improve after February 1963. The rated capacity of steel casting and grinding media of 3,600 tons and 6,000 tons respectively could not be achieved during the year under report as it could not import the equipment from France under the French credit arrangements. Now it is trying to import the equipment from the USA under the DLF Aid. The production capacity of the spun iron pipe plant has been increased to 45,000 tons per annum but unfortunately the capacity could not be utilized due to acute shortage of pig iron. The Govern-

ment has now given top priority to the pig iron industry and is also envisaging to import pig iron.

PLATT BROS.

Platt (Sales) Ltd. of England, have agreed to supply modern textile machinery worth Rs. 10 crores (£7.5 million) for 17 mills in India. A contract to this effect was signed in New Delhi recently between the representatives of the company and those of the State Trading Corporation of India. The modernisation of the mills is likely to enable the country to increase its exports of yarn and cotton cloth. Platt Bros. will be supplying cardroom spinning and doubling machinery valued at nearly £5 million. This includes Platt's latest high-speed machinery such as high production cards, century combers, globe draw frames and super spinner ring frames, which were presented at the recent Hanover Textile Machinery Exhibition. A new range of blow room machinery will form part of each mill's equipment. Deliveries of the machines will start this year.

TUNGABHADRA INDUSTRIES

It is reported that Tungabhadra Industries Ltd. recorded a profit of Rs. 7.82 lakhs during the year ended September 30, 1963. The directors proposed to separate Rs. 15,000 for development rebate reserve, Rs. 5 lakhs for general reserve and Rs. 3.06 lakhs for dividend reserve. A dividend at the rate of Re. one has been proposed to be paid on ordinary shares of Rs. 10 each. During the year under report, it recorded higher output of vanaspati, refined oil and hard oil at about 19,000 tonnes as against nearly 15,000 tonnes last year. It exported its products valued at nearly Rs. 85 lakhs. It has secured a licence to import mazzoni soap plant having a rated capacity of nearly 10 tonnes a day. The directors have also finalised the plans to put up a glycerine recovery plant at Kurnool.

VICTOR GASKETS

The plant of Victor Gaskets India Ltd. was formally inaugurated recently by Mr. V. P. Naik, Chief Minister of Maharashtra. Mr. O. W. Clifton, the Executive Vice-President of the Victor Manufacturing & Gasket Company of USA, specially flew over to Bombay to be present on the occasion. Victor Gaskets India Ltd., a joint venture of Anand Automobiles and the Victor Manufacturing & Gasket Company Ltd., of Chicago, Illinois, USA was registered in April 1962 and went into production six months later. It has been licensed to manufacture 36,000,000 gaskets per annum. It has recently been granted a separate licence to manufacture oil seals for automobile industry and earth-moving equipments. It has a well-equipped tool room required to manufacture a wide range of gaskets for all applications. Goodyear India Ltd. is distributing Victor gaskets in the Indian market.

CAPITAL ISSUES

Three companies have been authorised to raise fresh capital amounting to Rs. 3.45 crores. Of these, one is a State Government Undertaking issuing equities worth Rs. 2 crores. The other two companies are issuing equities and preference shares. One of them involves foreign collaboration. It will offer such number of shares for public subscription as would enable the company's scrip to be listed on recognised stock exchanges. The consent of the Controller of Capital Issues is valid for 12 months.

Andhra Pradesh Industrial Development Corporation Ltd., State Government Undertaking, is to issue capital of Rs. 2 crores divided into 20,000 equity shares of Rs. 1,000 each to be issued privately for cash at par. The money will be utilised for giving financial assistance to industry in Andhra Pradesh and for the promotion of industrial projects taken up by the Corporation.

Podar Mills Limited, Bombay is to issue Rs. 95 lakhs capital divided into Rs. 55 lakhs equity in shares of Rs. 10 each, and Rs. 40 lakhs preference shares of Rs. 100 each and carrying not exceeding 9.5 per cent rate of interest. All the shares will be issued for cash at par and will be offered to the existing shareholders of the company. The capital will be utilised for installing a new cotton mill of 25000 spindles at Jaipur and for modernisation and rehabilitation of existing subsidiaries at Bombay and Jaipur etc.

Shama Pistons & Rings Ltd., a new company incorporated in the State of Delhi, is to issue capital of Rs. 50 lakhs, divided into 3,50,000 equity shares of Rs. 10 each and 15,000 Preference shares of Rs. 100 each. Out of the issue, shares of a total value of Rs. 2,52,700 will be issued to Karl Schmidt of West Germany and SIM S.A. of Switzerland, at par, partly for cash and partly for consideration other than cash. Out of the remaining shares (to be issued for cash at par) such number of shares, in each class, as would enable the company's scrip to be listed on recognised stock exchanges will be offered for public subscription by a prospectus. The proceeds will be utilised for setting up a new industrial undertaking at Ghaziabad (U.P.) for manufacturing Pistons, Piston Rings, Piston assemblies etc. for internal and heat combustion engines.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951, during the week ending 15th February, 1964. The list contains the names and addresses of the licensees, the items of manufacture and the annual installed capacity.

COAL

National Coal Development Corporation Ltd., "Darbhanga House", Ranchi. (District Surguja, Madhya Pradesh) — Coal 0.60 million tonnes.

CEMENT MACHINERY

MecNally-Bird Engineering Co. Ltd., Chartered Bank Building, Calcutta-1. (Khumardhubi, Distt. Dhanbad, Bihar): Cement Mill Machinery 2 plants per annum (of capacity of 600 tonnes per day each.)

CONVEYING EQUIPMENT

Electric Construction and Equipment Co. Ltd., 9, Kalliprasanna Singhee Rd., Calcutta-2. (Budge Budge, Distt. 24 Parganas, West Bengal): Electric Overhead Travelling Cranes — 96 Nos. (1,440 tonnes) per annum.

COTTON TEXTILES

Shri Kunj Bihari Hada, C/o 42, Garden Reach Rd., Calcutta-24. (Diamond Harbour Area, 24 Parganas, West Bengal): Cotton yarn 12,500 spindles.

LICENCES REVOKED OR SURRENDERED

During the week ending 15th February, 1964
(Information pertains to particular licences only)

M/s. Herman & Mohatta (India) Pvt. Ltd., Bombay: Electric Overhead Travelling Cranes and Gantry Cranes. M/s. Ballabram Badrinarain, Calcutta: 1. Lathes, 2. Shaping Machines, 3. Drilling Machines, 4. Hacksaw Machines, 5. Power Presses, 6. Screw Presses, 7. Shearing Machines, 8. Rivet Making Machines and 9. Wire Nail Making Machines.

STATE BANK OF PATIALA

REPORT OF THE AUDITORS

TO THE STATE BANK OF INDIA,

We, the undersigned Auditors of the State Bank of Patiala appointed under sub-section (1) of Section 41 of the State Bank of India (Subsidiary Banks) Act, 1959, do hereby report upon the Balance Sheet and Accounts of the Bank as at 31st December, 1963.

We have audited the foregoing Balance Sheet and the Profit and Loss Account and the accounts relating thereto of the Head Office and the returns submitted and certified by the Branch Managers, which returns have been incorporated in the above Balance Sheet and accounts and report —

(i) that, in our opinion, the Balance Sheet is a full and fair one, containing all the necessary particulars and is properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by books of the Bank;

(ii) that where we have called for any explanation or information, such explanation and information have been given to us and have been satisfactory;

(iii) that the transactions of the Bank which have come to our notice have been within the powers of the Bank;

(iv) that the returns received from the branches of the Bank have been found adequate for the purpose of our audit:

(v) that the Profit and Loss Account shows a true balance of Profit for the period covered by such account;

(vi) that, in our opinion, the Balance Sheet and the Profit and Loss Account are drawn up in conformity with the law; and

(vii) that, in our opinion, books of account have been kept by the Bank as required by law.

Delhi,
Dated : 6th February, 1964.

COMPANY MEETING

NATIONAL AND GRINDLAYS BANK

Expansion in Centenary Year

The Annual General Meeting of National and Grindlays Bank Limited will be held on April 2, in London.

The following are extracts from the statement of the Chairman The Right Hon. Lord Aldington, P.C., K.C.M.G. C.B.E., D.S.O. circulated with the report and accounts for the year 1963.

It is my privilege to report to you upon the Bank's Centenary Year. I want to place on record the thanks of your Directors to Mr. J. K. Michie, for the purposeful leadership with which he guided the Bank's affairs so successfully as Chairman for close on 18 years, until he retired from the chair on 31st December, 1963.

Some idea of the size of the task that this Bank accomplished under his leadership — and some indication of his wide understanding, foresight and courage — can be gained from these few figures. In 1946 when he became Chairman our deposits were £62 million, they are now £283 million; our advances were £13 million; they are now £160 million; we had 29 branches in 1946, we now have 163. And during these 18 years most of the territories in which we operate have experienced a rate of political, social and economic development that would have surprised our founders. We cannot expect that the challenge to us in these important overseas countries will grow less formidable in the future, and the Bank will always be grateful to Mr. J. K. Michie for the example he has set.

I am greatly strengthened in seeking to maintain the high standard of my predecessor by having as my Deputy, Mr. Ronald Mann, and we are both fortunate indeed in our colleagues who form the Board — and happy that Mr. Michie has agreed to remain one of them.

THE ACCOUNTS

The consolidated balance sheet continues to show a general expansion in our business. Total assets at 31st December last were £356,915,796. It will be noted that we have changed our practice this year to accord with that of leading banks in the world and have included for the first time an amount of £59,874,545 for confirmed Credits, Guarantees and Endorsements. Without that figure our assets are about £20,000,000 higher than they were in December 1962.

Profits at £679,318 are not as high as in 1962, but the increase that year, as my predecessor stated, did not arise from our overseas operations. I am glad to be able to report that our profits from our widely spread banking overseas were higher this year than last.

Out of the year's profits the sum of £150,000 has been placed to Reserve Fund, which, when taken with the consolidated carry forward, is now a little more than our issued capital.

The half-yearly dividend proposed is unchanged at 7 per cent, making 14 per cent for the year.

NATIONAL AND GRINDLAYS FINANCE AND DEVELOPMENT CORPORATION LIMITED

As last year the profit £29,301 has been retained in the subsidiary company and is included in the Consolidated Profit and Loss Account.

During the year the Finance and Development Corporation's capital was increased by the issue of 500,000 new shares of £1 each fully paid. In addition the Finance and Development Corporation's resources were increased by borrowing outside the Bank. The fixed term loans granted in these last fifteen years have been of benefit to our overseas customers in the public and private sectors and we believe also a lasting advantage to the economies of their countries.

EXPORTERS' REFINANCE CORPORATION LIMITED

In its second year the Exporters' Refinance Corporation made a small profit. Its turnover is increasing at a healthy rate as new exporting customers make use of its services and new facilities are developed to help export.

INDIA

The action by the Government and the country to marshal the resources necessary to meet the challenge from China included an unprecedented budget and strict control over credit. The rate of growth in the economy has been slower in the past two years than in the years of the first two Plans. But there were clear signs in the latter half of 1963 of more expansionist policies.

Money conditions have varied more than normally. In the first quarter of 1963 money was exceedingly short and the inter-bank calls rate reached 6½ per cent. By the middle of the year that rate had fallen to under 1 per cent for a short period and it remained at a fairly easy level until December when taxation payments pushed it up to about 5 per cent.

It is not my intention to try to analyse India's economic problems or her progress in solving them. But it would be a mistake to let the period of slower growth, perhaps better called a period of consolidation, blind us to encouraging factors of great importance not least the steady rise in export earnings which will be one of the principal keys to India's prosperity.

This Bank will always wish to play its part in financing India's exports new and old as we have in financing the export of her main crops for these last hundred years. We welcome the creation by the Government of India of the new Export Credit and Guarantee Corporation Limited.

A high level of industrial investment although financed partly by foreign loans inevitably puts a further strain on the banks when money conditions are tight. The Industrial Development Bank which is to be created shortly following legislations will greatly help in this respect.

In 1963 if we had not been able to increase our deposits through the new branches and by our drive for an increase in savings accounts, we should not have been able to go so far to meet the demands made upon us for industrial development. Under the new banking legislation, we have to increase our holding of Government securities in India quite substantially before 16th September, 1964. This is bound to affect our ability to lend, and our earning power, unless we gain our share of increased deposits.

I have full confidence in the Bank's ability to help in India's future development, and in the wish of our friends in India that we should do so.

PAKISTAN

I have these same feelings about our ability to help in Pakistan's future and about our position there. The rate of industrial expansion and the volume of exports generally are important factors for us to watch. Both were satisfactory in 1963. And it is encouraging to know of the increase in last year's wheat and sugar crops and of the expected increase in the 1963-64 rice crop. The finance of cotton and jute exports, and their manufactures, remains of particular importance to us. Cotton exports in 1962-63 were almost double the year before. Raw jute exports at the end of 1963 seem to be just below the level of a year earlier, but exports of jute manufactured goods were 12 per cent higher.

Foreign private investment will continue to be welcomed in industries where large capital and high technical skill is involved.

The policy of directing a large proportion of available investment resources to East Pakistan was continued and the results of this policy are becoming apparent. Examples of this are: the construction of an oil refinery and a steel works near Chittagong and a number of projects for flood control and irrigation. These should lead to a needed increase in agricultural production. The development of East Pakistan has always been handicapped by poor communications, inevitable in a land of so many rivers, and determined steps are being taken to improve them. The big hydro-electric project on the Kornufuli River at Kapti east of Chittagong had become operative, and electric power from it is now available in Dacca and Narayanganj. This new supply of electric power will greatly facilitate the completion of Government's plans for a further substantial expansion of the jute manufacturing industry and encourage the establishment of other industrial projects.

CEYLON

We and the other British banks play an important part in financing both Ceylon's overseas trade and her industrial development as well as her tea, rubber and coconuts. We were able during the year to correct misleading reports that we confined our facilities to British owned firms. In fact a large part of our loans and overdrafts have been to Ceylon nationals or firms they control. In 1963 we offered a sum to help small-scale industrial enterprises approved by the Government, and we could do more in this and other ways to strengthen Ceylon's economy, if we were not hampered by restrictions placed on the opening of new accounts with us by Ceylonese nationals. As a result of these our deposits have declined in the past year.

BURMA

Nationalisation took from us our business in Burma on 23rd February, 1963. As reported to you last year, it was expected that a settlement on compensation would be made within three months. We have received K. 5 lakhs which represented a loan granted by the Bank to its Rangoon Branch but there is still no settlement of our main claim for compensation.

The profit earned up to 23rd February, 1963 has not been remitted and has therefore not been included in our profit figures for this year.

EAST AFRICA

The independence of Kenya was achieved on 12th December, 1963 in circumstances far more promising than most prophets could have predicted. That this was so is due in the main to the political leadership of Kenya and to Mr. Malcolm Macdonald.

The future of the East African Common Services Organisation now rightly falls to be decided by fully independent governments but we should not be impatient if they take a little time before deciding about this and about Federation. Anyone responsible for banking in East Africa can have little doubt about the economic advantages to the territories of full and free co-operation between them, but other factors have rightly to be taken into consideration before final decisions can be taken. A separate but related question concerns the formation of a Central Bank. In solving this too regard has to be had to the different economic, political and social conditions in the territories.

The serious events of mid-January and the decisive action initiated by all concerned show how closely Kenya, Uganda and Tanganyika are linked in sentiment and in security. That the wounds to cofidence generally should be able to be healed so quickly is a credit to all the governments concerned and a sign of the potential strength of East Africa. It is wrong to lay too much stress on inevitable feelings of uncertainty about the future. Economic progress has not been unsatisfactory in recent years, and there is no reason why it should not be maintained given stability.

GENERAL

After dealing with the bank's activities in African countries, the Chairman's statement continues:

After a year when Britain's visible trade exports have reached new records it is perhaps right to emphasize the value to that trade of the British overseas banks and the importance of the so-called invisible exports which accrue from them. The growing interest in our aims and problems taken by U.K. High Commissioners and their staffs, and by the Government in London, is both welcome and encouraging. If, as I hope, this country is further to expand its investment in Commonwealth and other developing countries — and to request others to do the same — it is also right that Britain's policies and actions should foster its existing investment in those territories.

Overseas, each year adds to the importance of the help we can give to the development of industry, new and old, in each territory. This often requires longer-term finance than that to which bankers were accustomed earlier in the century.

We can only guide our varied business successfully and ensure the right lines for its future development, if the General Management and Directors have themselves a close and constantly refreshed knowledge of conditions in each territory. Our branch managers, chief managers and the superintendent in East Africa keep us fully informed but I am sure we shall be right to maintain the practice of encouraging visits from London. In 1963 Mr. Gillespie, Mr. Mann and I visited between us many of the branches in India, Pakistan and Ceylon and participated in the Centenary celebrations there. It was enormously valuable to us to meet so many of those who bank with us.
